Every year since the mid-1970s, *Datapro 70* has asked selected users what they think of their mainframes and midrange systems. Since the inception of the Datapro Computer Users Survey, the large-system environment has undergone quite a few technological and economic upheavals. Top-end mainframes can now process more than 120 million instructions and hundreds of on-line transactions per second.

While technological innovation has been impressive, large-systems' growth slowed to single digits during the mid-1980s, signaling the beginning of a maturing industry at the upper end of the market. Slower growth has forced IBM, still the dominant large-systems vendor, to revise its long-term growth strategies and has forced weaker competitors to consolidate holdings, sell off less profitable operations, or merge with other companies.

CHART 1. 1989 SURVEY RESPONDENTS BY INDUSTRY

This report presents the results of Datapro's 1989 survey of computer users. More than 400 mainframe system users, including those of most popular mainframes, detailed their system environment and usage. They also shared their assessment of the systems and of vendor support. This information should be of great value to prospective users who are evaluating computer systems.

Naturally, such industry realignments have impacted our survey over the years. In 1980, for instance, the survey included 11 large-systems vendors. These consisted of IBM and IBM-compatible vendors and the old BUNCH companies (Burroughs, Univac, NCR, Control Data, and Honeywell). Since then, some BUNCH companies have merged with other companies, and others play diminished roles at the high end of the market.

This year, four large-systems vendors are examined in depth: Amdahl Corporation, Bull HN Worldwide Information Systems, IBM Corporation, and Unisys Corporation. Scant responses from Control Data, National Advanced Systems (NAS), and NCR users forced us to combine these vendors in a category called "Other Mainframes."

Of the vendors considered in this survey, IBM now commands about 68 percent of the worldwide large-systems market, according to International Data Corporation (IDC), the Framingham, Massachusetts market research firm. Unisys ranks a distant second with a 9.6 percent market share, followed by Amdahl (6.2 percent), Bull HN (5.4 percent), NAS (4.9 percent), and Control Data (3.3 percent).

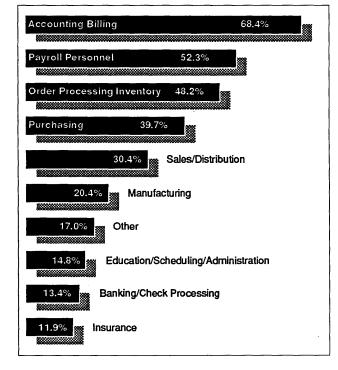

IBM and Unisys lead the U.S. large-systems vendors in size and relative influence. IBM and its family of MVS operating systems represent the proprietary large-systems standard, while Unisys has emerged as the strong non-IBM/MVS alternative.

Amdahl and NAS, two vendors that have successfully exploited the IBM/MVS compatible market, sell systems in alliance with their Japanese partners, Fujitsu and Hitachi, respectively. In addition to selling IBM price/performance alternatives, Amdahl and NAS have also attempted to develop value-added features for their product lines. Amdahl, for instance, offers a native implementation of UNIX.

Unisys has remained competitive through acquisitions, strategic alliances, and OEM agreements, allowing the company to quickly enter new markets, such as UNIX, open systems, system integration, and networking. Unisys

CHART 3. TOP 10 APPLICATIONS IN 1989

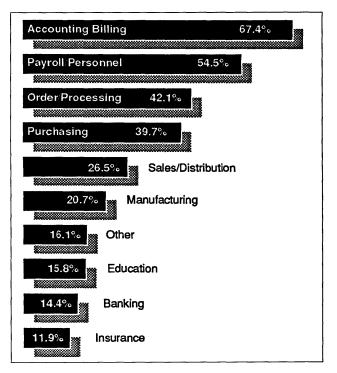

Chairman W. Michael Blumenthal embarked on the merger strategy, believing his company could not be taken seriously as an IBM alternative without developing IBMscale resources.

Bull HN (formerly Honeywell Bull Inc.) is composed largely of former Honeywell Information Systems users. Honeywell Inc. began slowly withdrawing from the computer business in 1987 when it formalized an alliance with Groupe Bull of France and NEC of Japan and renamed the company Honeywell Bull Inc. In 1989, Groupe Bull acquired a larger share of the company from Honeywell, renamed the company to reflect the realignment, and is now firmly in control. Groupe Bull owns 65.1 percent of the company, Honeywell owns 19.9 percent, and NEC owns 15 percent.

Of the surviving BUNCH companies, Control Data appears the least stable. To cut costs and revive its mainframe business, Control Data has sold off Imprimis, its data storage division, and several other businesses. CDC also killed off ETA Systems, its supercomputer subsidiary.

Before examining this year's survey results, a word about operating systems is in order. A critical issue among IBM, Unisys, and the remaining large-systems participants revolves around open versus proprietary systems. While virtually all survey respondents continue to use proprietary systems, such systems have somewhat fallen out of fashion during the last few years. It is difficult to port applications written for one such system to another and equally difficult to integrate hardware platforms using proprietary systems. To a great extent, proprietary systems have made it difficult for the old BUNCH companies such as Control

CHART 4. TOP 10 APPLICATIONS IN 1988

Data to expand their customer bases and inject new life into their mainframe businesses. This has forced all the remaining mainframe vendors to embrace open systems and UNIX. Except for Amdahl, which has marketed a UNIX-based operating system for the mainframe for some time, however, UNIX has had little impact at the mainframe level thus far. IBM and Control Data, for instance, have yet to deliver long-awaited, mainframe-level UNIX products. Subsequently, respondents could only rate proprietary systems.

THE 1989 QUESTIONNAIRE

This report summarizes screened survey responses from 411 mainframe users. (For results of our minicomputer users survey, see *Datapro Reports on Minicomputers*.)

In multiple-part questions, Datapro asked users to describe their system and model, configuration, technological and organizational environment, budget, and plans.

Another group of questions asked users to rate 23 specific aspects of their computer systems. Categories rated include ease of operation, reliability of system, reliability of peripherals; maintenance service (responsiveness and effectiveness); technical support (troubleshooting, education, and documentation); manufacturer's software (operating system, compilers and assemblers, and applications programs); ease of programming; ease of conversion; and overall satisfaction. Additional ratings include timeliness of hardware installation; timeliness of software installation; ease of expansion; compatibility of terminals, peripherals, and software carried over from other systems; power/energy efficiency; productivity aids; vendor soft-

ware support; and ease of keeping up with and implementing vendor changes to hardware/software.

We also asked users if they run certain software packages in the following categories: database management systems, data management systems, application development tools, performance monitors, security systems, and communications software. Detailed user ratings of mainframe software will be described by individual product reports in Volume 3 of *Datapro 70* throughout the coming year.

Finally, we asked users if the computer system did what it was expected to do and if they would recommend their computer system to others.

METHODOLOGY AND SURVEY RESPONSE RATE

The 1989 survey results are based on results received from 6,925 questionnaires mailed to U.S. mainframe and minicomputer users. As in years past, most of the mailing addresses were obtained from the computer database of International Data Corporation (IDC). Mailing addresses for Amdahl and NAS sites came directly from each of these vendors. To improve the response rate and statistical validity, users who did not respond to the first mailing received a second mailing some weeks later.

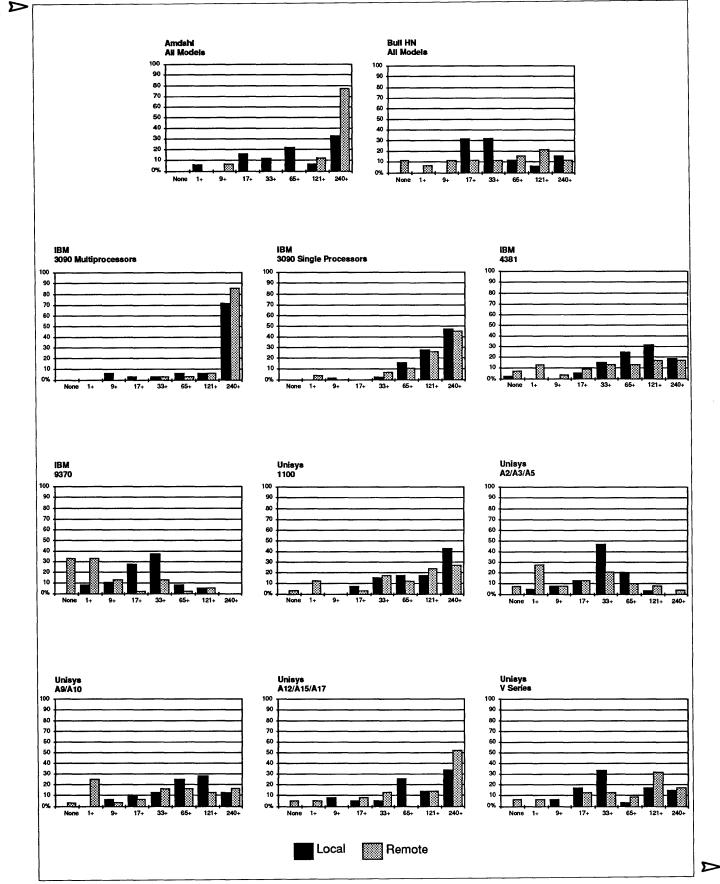

The size of the mailing is admittedly smaller than previous years. In 1987, for instance, Datapro mailed 15,026 questionnaires. The smaller mailing can be attributed to two factors. First, Datapro senior editors were more selective this year. We asked IDC to supply us with users who installed the newest mainframe and mini systems. With some notable exceptions, older systems no longer marketed were eliminated from consideration. We continue, however, to include responses from IBM 308X users even though the model line was recently discontinued. Since the 308X has remained popular, it is interesting to compare how users rated 308X models versus IBM 3090 models, the follow-on line.

Second, protracted delivery dates for new models have impacted the survey. For instance, Unisys 1100 mainframe customers (the old Sperry base) are now migrating to the long-awaited Unisys 2200/600 follow-on series. This newest model line was delivered about the same time our survey was mailed, the second quarter of this year. Too few 2200/600s were delivered at the time to generate any responses for these newest models. Subsequently, most former Sperry users could only rate their existing 1100 models, which appear once again in this year's survey.

Each questionnaire allowed users to rate one computer system. Recipients were encouraged to reproduce the form to rate additional systems. Senior Datapro staffers analyzed the returns and judged some invalid for one or more of the following reasons:

- more than one system model was rated on a single form
- the response was a duplicate
- · the form was received after the deadline
- rating section of the questionnaire was not completed
- systems rated were not mainframes or minis, or

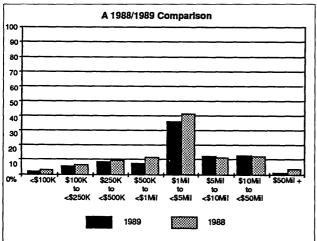

CHART 8. TOTAL ANNUAL BUDGETS FOR INFORMATION SYSTEMS

In addition, system models receiving fewer than 18 valid responses were grouped together under "Other Mainframes" or "Other Minicomputers."

Of the 6,925 questionnaires mailed, Datapro received 1,156 responses, or about a 17 percent response rate. Of the 1,156 responses, 132 were judged invalid, giving us 1,024 valid responses. Of these valid responses, 411 rated mainframe systems, while the balance rated minicomputers.

Datapro batched the valid returns by manufacturer and model and sent the returns to Datavision Research of Princeton, New Jersey for tabulation of the results. Information related to mainframe characteristics and user demographics is stated as percentages, while user rating questions were tabulated as weighted averages. Users were asked to rate systems using a 10-point scale. A rating of 10 represents "excellent" and a rating of 1 represents "poor." Tallied numbers for each value are multiplied by the corresponding weight. The average is then taken by dividing the sum of the products by the total number of responses for that category.

GUIDE TO 1989 SURVEY RESULTS

Most of the collected data appears in reference tables at the end of the report under the following headings:

Table 1. Mainframe Characteristics and Ratings—by Vendor and Model

Table 2. Mainframe Characteristics and Ratings—Recap by Vendor

Table 3. Mainframe Plans for 1989-90—by Vendor and Model

Table 4. Mainframe Plans for 1989-1990—Recap by Vendor

Tables 1 and 2 are each formatted as pairs of facing pages: characteristics on the left and ratings of the same systems or vendors on the right.

To further explore the implications of this year's survey results and how they compared to results from previous years, additional charts and graphs have been prepared. The charts and graphs provide profiles of this year's respondents by industry, application mix, and information system budget allocations. Other charts illustrate system configuration characteristics and analyze buying plans. Finally, Charts 11 and 12 present overall ratings comparisons by vendor and summarize key ratings categories by specific models.

Industry and Applications

Users were asked to identify the industry that best describes their organization and their principal application mix. Another question asked users to state the size of their total annual information systems budget for equipment, software, services, and staffing.

Chart 1 summarizes the industries represented in the survey by rank. Chart 2 summarizes industry distribution by each vendor. Charts 3 and 4 summarize the top 10 applications for 1989 and 1988, respectively.

The industry-related charts profile the types of respondents who answered this year's survey. The charts should not be construed to reflect true market penetrations for each vendor.

Industry data does reveal certain consistencies across vendors. As illustrated in a series of bar graphs, manufacturing ranks as the most popular industry type among all the vendors and in the overall mainframe results. The top five mainframe markets continue to be manufacturing, banking/securities/finance, government, retail/wholesale, and education, the same as last year's survey but in a different order. At least two or three of these top-ranked industry types also appear within the top five industries by vendor as shown in the bar graphs within Chart 2.

In addition to industry rankings, Charts 3 and 4 show the most popular user applications by rank. Note that the current applications appear in order, starting with the most popular (accounting/billing). Remarkably, the first six items on the list have kept their exact rank for several years, and the next four have kept their approximate rank.

Method of Acquisition	1989	1988	1987

6. Image Processing (12.2%)	6. Optical Disk Devices (6.3%)

Chart 8 graphically illustrates information systems annual budgets and compares last year's budget allocations to this year's. Similar to 1988, many MIS budgets fall within the \$1 million to \$5 million range.

System Acquisition Alternatives

We asked how users acquired their systems: outright purchase, rental/lease from the manufacturer, or third-party lease. This is a major and complex user choice, affected by system availability, predicted residual values, tax considerations, and intangibles such as confidence in the financial health of the alternative suppliers.

The response breakdown between the three options has shifted dramatically since *Datapro 70* first posed this question back in the mid-1970s. With some variation from year to year, the acquisition method remained fairly evenly divided among the three from 1974 to 1983. But after 1984, the trend clearly shifted to outright purchase at the expense of leasing systems from the vendor. Since 1984, purchase percentages have stayed within the 50-plus range, while vendor leasing percentages have remained in the teens. Interestingly, third-party leasing has remained within the mid-20 to low-30 percent ranges every year since 1974. Figure 1 shows acquisition trends for the last three years.

The reason for the shift to outright purchase has been quite apparent to large-systems watchers. IBM, in particular, has been encouraging its user base to purchase rather than lease. Outright sales give vendors substantial revenues and profits the first year after a new product introduction rather than incremental revenues stretched out over an extended leasing period. To ensure consistent purchase revenues, vendors regularly announce product-wide performance enhancements—so-called midlife kickers designed to encourage the customer base to trade up to more powerful models. In 1985, for instance, IBM announced the 3090 Series, a follow-on to the highly successful 308X Series. In 1987, IBM announced the 3090 E models, more powerful versions of the original base models. Then, in 1988, IBM announced still more powerful 3090 S models and a new version of the MVS operating system, MVS/Enterprise Systems Architecture (ESA).

Hardware Configurations

Typical size of system main memory continues to grow as vendors continue to raise maximum memory ceilings. With the announcement of IBM's ESA/370 architecture, for instance, IBM raised the virtual storage limit from 2 gigabytes to a possible 16 trillion bytes. Of course, the memory needs of most users are a bit more modest than that. Chart 5 illustrates the most commonly reported range for each vendor's respondents. Chart 6 shows the most common ranges for selected high-end systems.

Configuration data from previous Datapro surveys shows users have been gradually increasing memory capacity over the years. Four years ago, only 2 percent of the respondents had more than 32 megabytes of main memory. In 1987, 7 percent had more than 64 megabytes. In 1988, 10 percent reported having more than 64 megabytes, and 4 percent reported having more than 128 megabytes. This year, 12 percent reported having more than 64 megabytes, and 6 percent had more than 128 megabytes.

Disk capacity for most respondents falls between 1.2 gigabytes and 150 gigabytes, about the same as last year. About 17 percent of both Amdahl and IBM users, however, report capacities greater than 150 gigabytes. Amdahl, IBM, and several others now offer triple-capacity disk products.

► The survey also reveals that respondents, by overwhelming numbers, purchase their disk products from their mainframe computer vendor. Of the relatively small number of respondents that purchase disk devices from IBM plugcompatible vendors, about 6 percent purchased them from Memorex, making the company the front-runner among such vendors.

We also asked users how many local and remote workstations/terminals they were using. Chart 7 shows the usage of local and remote terminals by manufacturer and model.

Planned Extensions/Acquisitions

We asked how users were planning to spend their enhancement/acquisition dollars in 1988-89. Charts 9 and 10 show approximate user rankings of the most popular hardware and software plans, respectively, and how these plans compared to last year's.

Additional data communications facilities and hardware expansion top the hardware list as they have for several years. On the software side, most plan to purchase more software from the manufacturer and more software from other suppliers, the same as last year.

Compared to last year, there appears to be more interest in optical disk devices among respondents. Overall, 13.4 percent said they planned to acquire such devices, compared to 6 percent last year. Amdahl respondents (28 percent) and IBM 3090 multiprocessor respondents (38 percent) appeared to show the highest interest in optical devices this year.

Relatively higher percentages of IBM mainframe respondents also plan to look into image processing. This could be attributed to IBM's aggressive plans in this area, al-

CHART 12. SYSTEM/MODEL ASSESSMENTS— THREE SUMMARY RATINGS

though it must be noted the survey does not ask users to state what specific products they plan to buy or from whom. In 1988, IBM introduced an integrated image processing line using scanners and an optical disk jukebox device obtained from other vendors.

On the software side, respondents continue to express strong interest in software applications that will help them reduce programming backlogs or which make systems more accessible to users who are not DP professionals or experienced programmers.

Respondents also appear to be showing modest interest in a UNIX operating system, particularly since several mainframe vendors now offer or plan to offer UNIX options at the mainframe level. About 8 percent of all respondents said they planned to acquire a UNIX system. Among Amdahl, Bull HN, IBM 3090, and Unisys respondents, interest was slightly higher, typically 10 or 11 percent. IBM's version of UNIX for the mainframe, AIX/370, is now scheduled for availability in 1990.

User Satisfaction Ratings

Consistent with our belief that what users think is extremely important, we asked them to rate their computer systems, associated software, and vendor support using the 10-point scale explained earlier. User ratings for 23 specific categories are summarized in Tables 1 and 2 at the end of this report.

For an enhanced contrast overview of the summary vendor ratings, Chart 11 distinguishes above- and belowaverage ratings.

This year, as in previous years, users were asked to rate their overall satisfaction, whether their system performed as expected, and whether they would recommend their system to other users. Chart 12 summarizes these three key rating categories by model in snapshot fashion.

Several listed systems received comparatively lower ratings in one or more of the categories, probably because they have reached the end of a product cycle or have been discontinued. Discontinued systems include the IBM 308X and the Unisys A2/A3/A5. The Unisys 1100 Series, although still available on a limited basis, has been replaced by the recently delivered Unisys 2200/600.

This leaves three remaining systems with relatively low ratings, the IBM 9370 and the Bull HN systems. Bull HN respondents rated the DPS 7000 and DPS 8000s. As the chart discloses, 89.5 percent of Bull respondents said the systems performed as expected, but only 78.9 percent would recommend the systems, the lowest for any vendor in this year's survey. The relatively low level of recommendation may be attributable to customer uncertainties regarding Groupe Bull, the company's new majority owner.

Finally, there's the much maligned IBM 9370, a midrange system first announced in 1986. Originally, IBM marketed the 9370 as a competitive response to the popular Digital Equipment VAX machines, but because of several wellpublicized shortcomings—mostly software related—the machine never lived up to IBM sales expectations. Relatively low user assessments as shown on the chart reflect these problems.

THANK YOU

Datapro extends a sincere thanks to everyone who responded to our 1989 Computer Users Survey. We hope that this compendium of users' opinions will be of significant value to you, and we look forward to hearing from you again next year.
