The main body of the document is a grid of 12 columns and 12 rows of data fields. Each field contains faint, illegible text and vertical barcodes. The grid is organized into a structured layout, likely representing a data table or a series of related records. The text within the fields is too light to be transcribed accurately, but the overall structure is consistent across the entire page.

1.0 GENERAL INFORMATION  
-----

1.1 PROGRAM ABSTRACT  
-----

This program will functionally verify and exercise RQDX1 or RUX50 Controller/Disk Drive subsystems. It is designed to verify that the subsystem is functioning correctly and operating within design specifications.

1.2 SYSTEM REQUIREMENTS  
-----

1.2.1 HARDWARE REQUIREMENTS  
-----

LSI - 11/23 processor with 28K or more of memory, console device (eg. VT100) and RQDX1 or RUX50 controller board and attached RD51 or RD52 WINCHESTER drive(s) and RX-50 FLOPPY drive(s)

1.2.2 SOFTWARE REQUIREMENTS  
-----

This diagnostic is designed to run with the Diagnostic Supervisor as described in paragraph 2.0.

1.3 RELATED DOCUMENTS AND STANDARDS  
-----

XXDP+ SUPERVISOR/USERS MANUAL CHQUS  
UQSSP UNIBUS/Q-BUS STORAGE SYSTEMS PORT  
MSCP MASS STORAGE SYSTEM PROTOCOL

1.4 DIAGNOSTIC HIERARCHY PREREQUISITES  
-----

NONE

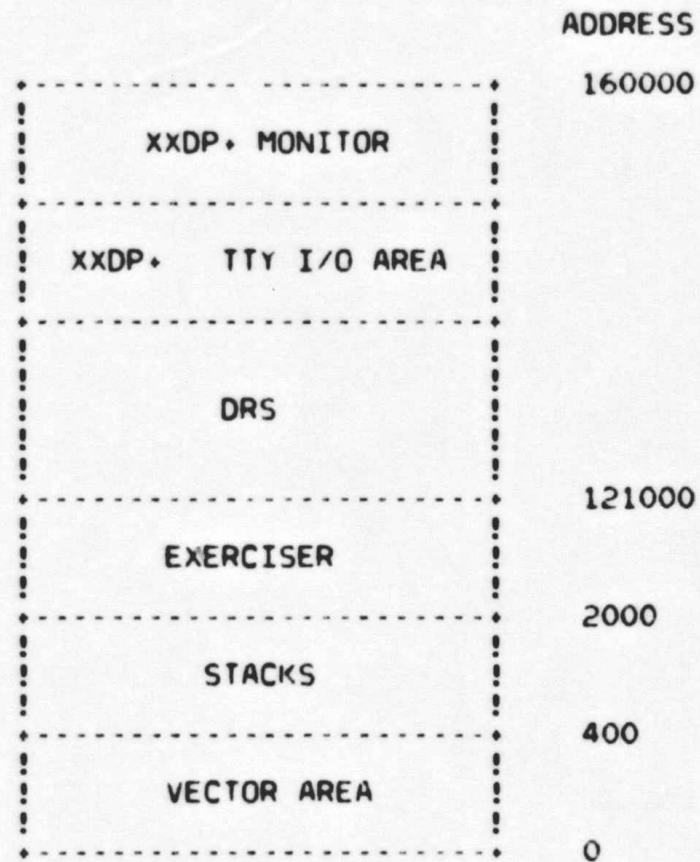

1.5 ASSUMPTIONS  
-----

The hardware, other than the subsystem being tested, is assumed to work properly. False errors may be reported if the processor, memory, etc., do not function properly.

## 2.0 OPERATING INSTRUCTIONS

-----

This is a Rev C Supervisor Diagnostic: for operating instructions, please see chapter 5 of XXDP+ operator's manual. They are no longer included in the diagnostic because it is desired that a change in those instructions not require a re-assembly of all Supervisor Diagnostics.

## 2.1 HARDWARE QUESTIONS

-----

The following series of questions collect the parameters necessary to identify each disk subsystem.

### Hardware Configuration Questions

-----

The program will ask the following questions in response to a START command (non-script).

#### 1. CHANGE HW (L) Y ?

Answer NO to use the pre-built answers for all hardware questions. This program will be released pre-built to test three units with default answers shown below. The pre-built answers may be changed at any time with the setup utility. Answer YES if you want all the hardware questions to be asked.

#### 2. NUMBER OF UNITS (D) ?

No default. Answer with the number of disk drive units to be exercised or tested. This answer will determine how many times the following questions are asked. A range of 1 to 4 units may be specified. A unit number will be assigned sequentially from 0 by the Diagnostic supervisor for each unit.

#### 3. IP ADDRESS (O) 172150 ?

Enter the address of the IP register of one RQDX1 or RUX50 as addressed by the processor with memory management turned off. The program expects an even 16-bit address in the range of 160000 to 177774. 172150 is the default.

```

: C 0283 1
: C 0284 1
: C 0285 1
: C 0286 1
: C 0287 1

```

4. VECTOR ADDRESS (O) 154 ?

Answer with the interrupt vector of the same RQDX1 or RUX50 controller described in the above question. A vector address in the range of 4 to 774 may be specified. 154 is the default.

5. BR LEVEL (D) 4 ?

Answer with the bus request interrupt level used by the above controller. Levels 4 through 7 are acceptable. 4 is the default.

6. DRIVE NUMBER (D) 0 ?

Enter the logical unit number for one drive associated with the IP address above. Drive numbers are in the range of 0 through 15. The number entered here must match the unit plug on the front panel of the drive, and must be within the range implied by the jumper (LUN0-7) on the RQDX1 or RUX50 controller board. 0 is the default answer.

7. TEST ENTIRE CUSTOMER DATA AREA OF THIS DISK (L) Y?

This question is asked to give the opportunity of limiting the addressing range over which the testing will be performed. An affirmative answer will cause no limits to be imposed for the unit in question. A negative answer will cause limits to be imposed, as defined by the following four questions.

8. LOWER OCTAL WORD OF BEGINNING LBN ADDRESS (O) 0?

Enter in octal the less significant 16-bit word of the lowest LBN address in the test range. The value may be from 000000 to 177777.

9. HIGHER OCTAL WORD OF BEGINNING LBN ADDRESS (O) 0?

Enter in octal the more significant 16-bit word of the lowest LBN address in the test range.

10. LOWER OCTAL WORD OF ENDING LBN ADDRESS (O) 150477?

Enter in octal the less significant 16-bit word of the highest LBN address in the test range. 150477 is the highest LBN address for an RD52.

: C 0300 1  
: C 0301 1  
: C 0302 1  
: C 0303 1  
: C 0304 1

11. HIGHER OCTAL WORD OF ENDING LBN ADDRESS (0) 0?

Enter in octal the more significant 16-bit word of the highest LBN address in the test range.

Note:

The four previous questions are usually software Parameter questions, but since three diifferent disk drives exist on the subsystem, this becomes a unit by unit question. It is possible to specify an LBN which is too large since we are dealing with different drives. The program will check for block number bounds, and, if they are exceeded, will assign the maximum bounds for that drive.

12. EXERCISE ON CUSTOMER DATA AREA ON THIS DISK UNIT (L) ?

Answering YES will destroy any customer data that is on the disk; therefore, the following warning message will appear, followed by a confirmation prompt:

\*\* WARNING - CUSTOMER DATA AREA WILL BE OVERWRITTEN! ...  
CONFIRM (L) ?

This question will default to NO if the operator has decided to bypass the hardware questions. Otherwise, there is no default.

## 2.2 SOFTWARE QUESTIONS

-----  
Software Parameter Questions

The program will ask the following questions in response to the START, RESTART, and CONTINUE commands.

## 1. CHANGE SW (L) Y ?

Answer NO to bypass the following questions in this section. This question should normally be answered NO when the Exerciser is first run. A NO answer will cause the Exerciser to select the default parameters shown with each question below. Then, depending on the errors detected, it may be desirable to change this answer to YES to alter the test parameters and further isolate the problem.

## 2. ENTER TIME AS HHMM (EXAMPLE: 1305) (D) 0 ?

Enter the time of day (in 24 hour format). DRS does not like to see leading zeros in numeric values entered. For example, for 14 minutes past midnight, you would enter 14, and for 30 minutes past 3 in the afternoon, enter 1530.

## 3. ERROR LIMIT (D) 32 ?

Enter the number of hard errors allowed before a unit is dropped from testing. A number in the range of 1 to 65535 will be accepted.

## 4. TRANSFER LIMIT IN MEGABYTES (0 FOR QUICK PASS) (D) 0 ?

When the specified number of bytes have been transferred to/from a unit, the unit will be dropped from testing. When all units are dropped, an end-of-pass will be indicated. This is the method used to determine how long the Exerciser is to run.

The only other way the Exerciser will declare end-of-pass is if all units are dropped because the error limit on each is exceeded. However, the operator can always abort the program at any time by typing CONTROL-C.

5. PERCENTAGE OF 'FIXED DISK' OPERATIONS OUT OF TOTAL OPERATIONS (D) 99 ?  
In order to maintain typical usage for the devices of this exercise, a certain percentage of operations must be directed to the RD51/52s (the rest go to the RX50s). It turns out that this percentage is very high (as indicated by the 99% figure given as the default). It may be desirable in some cases to direct more activity to the RX50s. This is easily done by directing a smaller percentage of the operations to the RD51/52s. The numbers associated with usage are adjusted internally by the program according to drive type and percentage.
6. CLEAR STATISTICAL TABLES AFTER PRINTING (L) N ?  
Answering YES causes the statistical fields to be cleared to zero after the report is printed (either at end of pass, or at operator request). Otherwise, cumulative totals are maintained.
7. REWRITE BLOCKS WHEN "FORCED ERROR" DETECTED ON READS (L) Y ?  
On encountering a bad block on the RD51 or RD52 disk (during either a read or a write operation), the RQDX1 or RUX50 controller will revector the logical block to another physical location on the disk. This operation is transparent to the user. However, if the revectoring was done subsequent to a write operation (i.e. the write operation detected the bad block), the data is flagged with a "Forced Error" code, signifying that the data at the revectoring location is suspect. The controller returns an error code whenever the block is re-read. Answer 'Yes' to the question to force a WRITE operation on the same block whenever a "Forced Error" flag is detected on a read. This is to avoid the same error code (the "Forced Error") being reported for the same block repeatedly. The re-write will, however, take place only if writes are enabled for the particular disk unit.
8. HALT ON BAD-BLOCK HARD ERRORS (#s 35, 38) (L) Y ?  
When the Exerciser is run with the DRS "Halt on Error" switch set (eg. START/FLAGS:HOE), the Exerciser halts on encountering ANY error. If it is desired that the testing continue on a bad-block error, even with the HOE switch set, answer No to the question.
9. HALT ON OTHER HARD ERRORS (#s 31-34, 36-37, 39-45) (L) Y ?  
This question is similar to question 8, but refers to non-bad block type of Hard Errors.

10. HALT ON SOFT ERRORS (#s 50-54) (L) N ?  
This question is similar to question 8, but refers to Soft Errors.
11. COUNT EACH RETRY AS A SEPARATE SOFT ERROR (L) N ?  
On encountering any error on a read/write, the controller retries the operation a number of times. If the operation is eventually successful, this is reported as a Soft Error. The error log packet contains the number of retries performed before the operation was successful. Normally, the whole sequence of retries is classified as one Soft Error. Answer Yes to the question if it is desired to count each internal retry attempt as a separate Soft Error.
12. RANDOM SEEK MODE (L) Y ?  
Answer YES to cause block numbers to be chosen randomly.  
Answer NO to cause block numbers to be selected sequentially.
13. UNITS TO BE SELECTED AT RANDOM (NO, IMPLIES SEQUENTIAL) (L) N ?  
This question is optionally asked if the answer to the previous question is N[o]. The selection of units for sequential operations is affected by the answer to this question. If the default answer is chosen (N[o]), then units shall be selected in a predetermined manner in accordance with the typical seek time margins for each drive. If the alternate answer is chosen (Y[es]), then the units will be chosen at random in accordance with the percentages specified in Software question 4.
14. READ-COMPARES PERFORMED AT THE CONTROLLER (L) Y ?  
Answering YES causes all read commands to include the "compare" modifier. This essentially forces the controller to perform two read operations on the same disk address, and to compare the results.  
The following message will appear after the operator has answered this question:  
THE REMAINING QUESTIONS ONLY APPLY TO UNPROTECTED DISK UNITS.
15. WRITE-COMPARES PERFORMED AT THE CONTROLLER (L) N ?  
Answering YES causes all write I/O requests to be changed to write-compare. After each write, the controller will read the data and compare it to data re-obtained from the host.

16. CHECK ALL WRITES AT HOST BY READING (L) Y ?
- This question will only be asked if the previous question was answered NO. Answering YES causes all writes to be checked by the host by reading the data immediately after the write operation. This option consumes extra CPU time, and doubles the amount of storage required for writes. Therefore, it is only recommended when drive write-compare operations are suspect.
17. USER-DEFINED DATA PATTERN (L) N ?
- An answer of YES allows the operator to define his/her own data pattern to be used in all write operations. A NO answer will allow the operator to select a pre-defined data pattern in the next question.
18. SELECT PRE-DEFINED DATA PATTERN (0 FOR SEQUENTIAL SELECTION) (D) 0 ?
- There are 21 pre-defined data patterns available, selected as 1 to 21 (see section 4.9). A zero answer will cause patterns 1 to 21 to be sequentially selected for each write. (Note that pattern 1 consists entirely of random numbers).
19. NUMBER OF WORDS IN DATA PATTERN (16 MAXIMUM) (D) 16 ?  
PATTERN VALUES (O) ?
- These questions will only be asked if the operator has decided to define his/her own data pattern. The actual bit patterns will be entered as octal (PDP-11).

3.0 ERROR TYPES  
-----

This program has four types of error classifications;  
system fatal, drive fatal, hard and soft.

SYSTEM FATAL ERRORS  
-----

System fatal errors are used to indicate that an error  
was detected by the Diagnostic Supervisor in relation  
to loading/controlling the diagnostic process.

The content of each error is such that it should be  
self explanatory. However, the messages utilize some  
terms that are specific to the disk subsystem, and may  
require some getting use to.

DRIVE FATAL ERRORS  
-----

Drive fatal errors are a result of:

an error that is considered fatal to the drive, but  
testing will continue.

HARD ERRORS  
-----

Hard errors are a result of:

1. retries of a soft error or \*
2. a non-recoverable error
3. a soft error if retries are not set.

\* Note: Retries are executed in the controller

SOFT ERRORS  
-----

Soft errors are media related errors. All soft errors  
will be retried by the controller.

Note: Soft errors are retrieved from the controller via  
the error log capabilities of MSCP.

3.1 ERROR INFORMATION  
-----

: C 0590 1  
: C 0591 1  
: C 0592 1  
: C 0593 1  
: C 0594 1

All general error messages will include the type of error (system-fatal, drive-fatal, hard, soft) and a unit number. If the error applies to a controller, then only the first unit number of the controller will be given. (The user will know the other unit numbers when subsequent "drop unit" messages are printed).

Basic error messages provide more details about the error. The Exerciser will print all basic error messages, along with the disk address, if applicable. In some cases where a drive-fatal error applies to a controller, the controller's IP address will be printed.

Extended error messages will be used to print the relevant fields of command and end message packets, status codes, SA register contents, and error log messages. All values will be in octal (PDP-11).

The error messages in this section do not include errors detected and printed by the Diagnostic Supervisor.

3.2 INITIALIZATION ERRORS  
-----

Two kinds of errors will be reported to the operator during the Initialization Test. The System-fatal error is too many units specified. A system-fatal error will cause the Exerciser to abort.

Drive-fatal errors only affect the unit(s) involved. Testing will continue on all other units. This class of errors includes, but is not limited to, the following:

1. Register Existence Test failure (no drive present)
2. Vector Test failure
3. BR Level Test failure
4. Initialization sequence failure
5. Online failed
6. Access failed

3.3 EXERCISER ERRORS  
-----

Most errors reported during this test will originate from MSCP end message packets. The status code field will be converted to text and printed as part of a basic error message. Any subcode value will follow if extended error messages are enabled.

The following list represents some of the error conditions reported via MSCP:

1. Disk unit went offline (a sub-code may follow detailing the reason)
2. Compare error
3. Data error (a sub-code may follow)
4. Drive error (a sub-code may follow)
5. Host buffer access error
6. Media format error (a sub-code may follow)

3.4 ERROR LOG MESSAGES  
-----

The contents of the error-log messages received from the controller are printed as received, and should be deciphered using the MSCP specs.

3.5 MSCP ERRORS  
-----

An MSCP error occurs when the host receives an Invalid Command End Message from the controller. In such cases, the host will print out the erroneous command followed by the reason for the error. If extended printouts are enabled, then the entire contents of the end message will be displayed in octal without interpretation of the data.

3.6 SAMPLE ERROR STATEMENT  
-----

The errors listed by the exerciser are usually very descriptive and are self explanatory. The following is an example error statement. This error statement is the extended error message.

(example)	(comments)
DISK XXX	!DISK UNIT NUMBER
INVALID COMMAND	!MAJOR STATUS CODE RECEIVED BACK
SUB-CODE XXXX	!SUB-CODE OF GIVEN COMMAND
COMMAND: READ	!COMMAND GIVEN TO DRIVE
LBN: XXXXX	!LOGICAL BLOCK NUMBER GIVEN
BYTE COUNT IN COMMAND XXXXX	!NUMBER OF BYTES WANTED TO READ
ACTUAL # OF BYTES TRANSFERRED XXXXX	!NUMBER OF BYTES ACTUALLY READ

The status code in an end messages is broken into two pieces. The first 5 bits represent the major status which is given by the "invalid command" message. The 11 remaining bits represent the sub-code, which tells in greater detail the error in the controller. The LBN is the logical block on the disk the controller was trying to read. The byte count refers to the number of bytes the controller was going to read off the LBN. The actual number of bytes transferred refers to the number of bytes read before the error.

## 5.0 TEST SUMMARY

-----

This exerciser consists of two parts: the initialization subtest, and the performance exerciser. The operator is not able to select which of these two parts he/she wishes to run; they both must be executed.

### 5.1 INITIALIZATION SUBTEST

-----

The purpose of this subtest is to verify the hardware configuration as specified by the operator, and to bring each unit online. The Initialization Subtest will always precede the execution of any other test.

First, the presence of each drive register will be verified, along with a check on the BR level specified by the operator. Then, an initialization will be issued to each controller configured for testing. When the initialization sequence has been completed, an attempt will be made to bring each unit online. If this succeeds, one or two MSCP reads will be issued to the inner-most LBN of each selected disk to ensure that each disk drive can seek and be read.

Any drive-fatal or hard errors encountered during this test will cause the appropriate unit(s) to be dropped. If basic error messages are enabled, then the program will print out the specific reason for dropping the unit(s). Henceforth, the failed unit(s) will not be tested unless the operator intervenes (adds unit(s) or restarts Exerciser).

Upon successful completion of the Initialization Subtest, the program will begin executing the Exerciser.

### 5.2 EXERCISER

-----

The purpose of this subtest is to exercise the disk drives in a manner similar to the typical usage under standard operating systems. Execution of this test should give an indication of the operating performance of the disk drive subunits. This test will utilize random disk addresses, random word counts, and data patterns, all subject to the limits and specifications made by the operator. All protected disks will be subject to read-only operations, while unprotected disks may be read or written, depending on the answers given to the software parameter questions. End-of-pass will be declared when the specified number of bytes have been transferred for all the disks taken as a whole.

: C 0757 1

 : C 0781 1  
 : C 0782 1  
 : C 0783 1  
 : C 0784 1  
 : C 0785 1

If a read/write error occurs during this test, then the controller will initiate an appropriate number of retries. If all retries fail, then a hard error will be reported to the host, an error message will be displayed on the console terminal and the error will be tallied for the summary report. The unit will be dropped if the hard error count has exceeded the specified limit.

### 5.3 DROP UNIT SUMMARY

-----

During the Initialization Subtest, individual units will be dropped from the test sequence if they are unable to be brought online or the operator specified drive does not match the hardware.

During the Exercise, the program will drop a unit for one of three reasons. The normal path is for each unit to complete the transfer of N megabytes, where N is specified by the operator during SW questioning and be soft-dropped. Otherwise, a unit will be hard-dropped if the number of hard errors encountered exceeds the operator-specified limit, or if a fatal error is detected. Units hard-dropped may later be added to the test cycle. However, statistics for the hard-added unit will be cleared to zero; if a transfer limit was specified, in which case the unit was soft-dropped, the statistics may or may not be cleared depending on the operators answer to Software question 12.

SYSTEM FATAL ERRORS  
-----

1 More than 4 units specified

DRIVE FATAL ERRORS  
-----

10 Controller couldn't be addressed at the address given. Wrong IP address selected

11 Controller didn't interrupt at the interrupt vector given. Wrong vector address selected.

12 Controller didn't interrupt at the BR level given. Wrong BR level selected.

13 Init sequence failed. Either one of the four initialization steps did not receive the correct response from the Controller, or one of the steps timed-out.

14 Fatal Controller error. The error bit (bit 15) in the SA register was set.

15 Failed to bring unit on-line. On-line response had an error code. (see also #s 22 and 23.)

16 Write protect conflict. The unit was hardware write protected and write operations were requested on the unit.

17 Access to either the inner or the outer track failed. Innermost or outermost track's header may be corrupted.

18 Unit went off-line. ---

19 Drive type not known. The version of the Exerciser being run does not support this disk type.

IF THE CURRENT RDRX IS ONLINE AND ITS CRING IS NOT FULL, THEN THIS ROUTINE "SENDS" A COMMAND TO THE RDRX BY LOADING THE PACKET DESCRIPTOR OF AN MSCP PACKET INTO THE COMMAND RING AND READING THE DEVICE'S IP REGISTER. IF THE CURRENT RDRX IS NOT ONLINE, THEN A FAILURE INDICATION IS RETURNED TO THE CALLER, AND NO ACTION IS TAKEN.

INPUTS:  
INDEX - INDEX OF MSCP PACKET CONTAINING THE COMMAND TO BE SENT

IMPLICIT INPUTS:  
CCTL - CURRENT CONTROLLER NUMBER  
DCT\_ADDR - ADDRESS OF CURRENT CONTROLLER'S DCT

! IF CRING IS NOT FULL AND  
! IF DEVICE IS ONLINE OR  
! IT IS A SET-CTRL-CHAR COMMAND

! LOOP TILL CREDIT BALANCE POSITIVE

!
! THIS ROUTINE IS CALLED BY QIO_GEN TO RANDOMLY SELECT ONE UNIT
! CONFIGURED UNDER THE CURRENT CONTROLLER (CCTL) TO BE USED FOR THE
! CURRENT QIO OR QIO PAIR. THE UNIT SELECTED IS BASED ON THE NUMBER OF
! UNITS ELIGIBLE TO RECEIVE AN I/O REQUEST (FROM 1 TO 4) AND THE FIRST
! RANDOM NUMBER IN THE RANDOM NUMBER TABLE (RANDOM).
!
! IMPLICIT INPUTS:
!   CST_ADDR - ADDRESS OF CURRENT CONTROLLER'S CST
!
! IMPLICIT OUTPUTS:
!   THE RD/RX DISK NUMBER (DISK ADDRESS) IS LOADED INTO THE
!   APPROPRIATE FIELD OF BOTH MSCP PACKETS.
!
! THE UNITS WILL BE SELECTED ON AN ADJUSTABLE RATIO, RD51/52 TO RX50,
! SELECTED VIA THE SOFTWARE PARAMETERS
!
! THIS MODE IS FOR SELECTING DEVICES ON THE FOLLOWING SCHEME:
! CHOOSE A DEVICE AND KEEP IT SELECTED FOR A CONSTANT TIME, THEN
! MOVE TO THE NEXT. THIS IS NON-RANDOM, FIXED SEQUENTIAL OPERATIONAL
! MODE
!
! if (not BIT_TST (SWP_FLAGS, SWF_RDM)) and           ! NOT RANDOM MODE
! (not BIT_TST (SWP_FLAGS, SWF_SEQ))                 ! NOT RANDOM SEQUENTIAL MODE
! then
!
!   if (.BST_CNT neq 0) and
!   (.CST_ADDR [.BST_DEV + OF_DATA, D_PRES] eq1 PRESENT) and
!   (.CST_ADDR [.BST_DEV + OF_DATA, D_STAT] eq1 ONLINE) and
!   (not .CST_ADDR [.BST_DEV + OF_DATA, D_FATAL])
!   then
!     begin

```

: 3594 1 GLOBAL routine QIO_FUNC : novalue =
: 3595 1
: 3596 1 !*
: 3597 1 ! THIS ROUTINE IS CALLED BY QIO_GEN TO SELECT THE I/O FUNCTION (OPCODE)
: 3598 1 ! TO BE USED FOR THE CURRENT QIO OR QIO PAIR. THE FUNCTION IS DETERMINED
: 3599 1 ! BY THE FOLLWING ALGORITHM:
: 3600 1 !
: 3601 1 !     IF THE CHOSEN UNIT IS PROTECTED
: 3602 1 !     THEN
: 3603 1 !         FUNCTION = READ
: 3604 1 !     ELSE (UNPROTECTED)
: 3605 1 !         FUNCTION (WRITE OR READ) IS BASED ON A RANDOM
: 3606 1 !         NUMBER
: 3607 1 !
: 3608 1 ! IN ADDITION, IF THE OPERATOR SELECTED THE OPTION OF PERFORMING WRITE-
: 3609 1 ! COMPARES AT THE HOST, AND IF A "WRITE" FUNCTION WAS CHOSEN ABOVE FOR
: 3610 1 ! THE FIRST QIO, THEN A "READ" OPCODE IS LOADED INTO THE SECOND MSCP
: 3611 1 ! PACKET. OTHERWISE, THE SECOND MSCP PACKET IS RETURNED TO THE POOL.
: 3612 1 !
: 3613 1 !
: 3614 1 ! PERIODIACLLY, THIS ROUTINE WILL CALL THE DUP ROUTINE BEFORE IT      ZZZ
: 3615 1 ! BEGINS ITS OWN TASK. IF THE OPERATOR HAS SELECTED, "ALSO RUN      ZZZ
: 3616 1 ! DUP EXERCISER," THEN DUP TESTING OF DBNS WILL BE INTERLEAVED      ZZZ
: 3617 1 ! WITH THE REGULAR MSCP TESTING OF THE LBNS.                          ZZZ
: 3618 1 !
: 3619 1 ! TO AVOID LONG, CUMULATIVE INIT TIMES, THE DUP CODE IS ONLY      ZZZ
: 3620 1 ! EXECUTED AFTER (25 TIMES 'DUPROUND') MSCP I/O'S HAVE BEEN DONE.    ZZZ
: 3621 1 ! THE DUMBER OF DUP I/O'S IS 'DUPROUND'. THIS GIVES US A 25 TO 1    ZZZ
: 3622 1 ! INTERLEAVE.                                                         ZZZ
: 3623 1 !
: 3624 1 ! THE DUP TESTING IS DONE BY EXECUTING CONTROLLER LOCAL PROGRAMS    ZZZ
: 3625 1 ! TO READ OR WRITE/READ DBNS. AFTER THE DUP TESTING, THE CON-      ZZZ
: 3626 1 ! TROLLER IS REINITIALIZED, AND QIO_FUNC ROUTINE CONTINUES FROM      ZZZ
: 3627 1 ! WHERE IT LEFT OFF.                                                 ZZZ

THIS ROUTINE SEARCHES THE CURRENT CONTROLLER'S RP_SAVE AREA FOR A
RETURN PACKET WHOSE COMMAND REFERENCE NUMBER (CRN) IS ONE LESS THAN THE
CRN OF THE CURRENT RETURN PACKET (I.E., SEARCHING FOR THE SAVED WRITE
OPERATION ASSOCIATED WITH THE CURRENT READ OPERATION). IF FOUND, THE
RP_SAVE ENTRY IS CLEARED (TO -1) AND THE RETPKT INDEX OF THE WRITE
OPERATION IS RETURNED TO THE CALLER.

IMPLICIT INPUTS:
    RP_ADDR - ADDRESS OF THE CURRENT RETURN PACKET

OUTPUTS:
    INDEX (VALUE OF THIS ROUTINE) - INDEX OF THE RETPKT CONTAINING
    A CRN WHICH IS ONE LESS THAN THE CURRENT

begin
