 4300                           SD
                                ;*********************************************************************
                                ;*DESCRIPTION
                                ;*-----------
                                ;*THIS TEST WILL INJECT DATA THROUGH THE READ PATH FIFO'S AND CLOCK THE
                                ;*SYSTEM UNTIL AN 'SCLK' APPEARS TO SIGNAL 18 BITS OF DATA READY FOR
                                ;*TRANSMISSION ACROSS THE MASSBUS. EACH 'SCLK' TIME WILL HAVE THE 'DDR'
                                ;*REGISTERS SETUP WITH THE ASSEMBLED DATA AS COMMANDED BY THE PACKING
                                ;*MODE SELECTED IN THE TEST. ALL PACKING MODES ARE TESTED (I.E. 11-NORM
                                ;*TO 10-HI DEN COMPAT) IN A READ FORWARD DATA TRANSFER. THE TEST WILL
                                ;*CLOCK THE SYSTEM ONLY UNTIL THE EXPECTED AMOUNT OF 'SCLK' DATA HAS
                                ;*BEEN TESTED TO VERIFY THAT THE SELECTED PACKING MODE IS WORKING AS
                                ;*EXPECTED. THE READ PATH WILL BE FILLED WITH 8 SUBGROUPS WORTH OF DATA
                                ;*REGUARDLESS OF THE AMOUNT OF EXPECTED DATA GROUPS TO BE TESTED (USUALLY
                                ;*4 SUBGROUPS OF DATA WILL BE SUFFICIENT TO TEST A PACKING MODE). THE EXTRA
                                ;*SUBGROUPS OF DATA INJECTED WILL ELIMINATE THE NECESSITY OF CALCULATING
                                ;*THE 'SPECIAL' CHARACTERS FROM THE TAPE IN GCR MODE (I.E. CRC, ACRC, &
                                ;*RESID CHARACTERS). EVERY 4 BYTES OF DATA TO BE INJECTED WILL BE TURNED
                                ;*INTO A 5 BYTE SUBGROUP TO SIMULATE DATA FROM THE 'TAPE'. THE 'ECC'
                                ;*WILL BE CALCULATED FOR EACH 7 BYTE OF DATA INJECTED AND ALSO INJECTED
                                ;*AT THE PROPER TIME INTO THE FIFO'S.

                                ;*-----------
                                ;*THIS TEST WILL INJECT DATA THROUGH THE READ PATH FIFO'S AND CLOCK THE
                                ;*SYSTEM UNTIL AN 'SCLK' APPEARS TO SIGNAL 18 BITS OF DATA READY FOR
                                ;*TRANSMISSION ACROSS THE MASSBUS. EACH 'SCLK' TIME WILL HAVE THE 'DDR'
                                ;*REGISTERS SETUP WITH THE ASSEMBLED DATA AS COMMANDED BY THE PACKING
                                ;*MODE SELECTED IN THE TEST. ALL PACKING MODES ARE TESTED (I.E. 11-NORM
                                ;*TO 10-HI DEN COMPAT) IN A READ REVERSE DATA TRANSFER. THE TEST WILL
                                ;*CLOCK THE SYSTEM ONLY UNTIL THE EXPECTED AMOUNT OF 'SCLK' DATA HAS
                                ;*BEEN TESTED TO VERIFY THAT THE SELECTED PACKING MODE IS WORKING AS
                                ;*EXPECTED. THE READ PATH WILL BE FILLED WITH 8 SUBGROUPS WORTH OF DATA
                                ;*REGUARDLESS OF THE AMOUNT OF EXPECTED DATA GROUPS TO BE TESTED (USUALLY
                                ;*4 SUBGROUPS OF DATA WILL BE SUFFICIENT TO TEST A PACKING MODE). THE
                                ;*FIRST TWO GROUPS OF DATA ARE SIMULATED 'CRC' DATA GROUP AND THE 'RESID'
                                ;*DATA GROUP. THE RESIDUAL DATA GROUP WILL CONTAIN NO DATA CHARACTERS,
                                ;*JUST THE 6 PAD CHARACTERS AND A FAKE ACRC & FAKE ECC CHARACTER (ALL 0'S).
                                ;*THE CRC GROUP WILL CONTAIN A RESIDUAL CHARACTER THAT INDICATED NO DATA
                                ;*BYTES IN THE RESIDUAL DATA GROUP. EVERY 4 CHARACTER BYTES INJECTED WILL
                                ;*BE TURNED INTO A 5 BYTE SUBGROUP TO SIMULATE DATA FROM THE 'TAPE'. THE 'ECC'
                                ;*WILL BE CALCULATED FOR EACH 7 BYTE OF DATA INJECTED AND ALSO INJECTED
                                ;*AT THE PROPER TIME INTO THE FIFO'S. ALL DATA INJECTED INTO THE FIFO'S
                                ;*WILL BE REVERSED TO SIMULATE A READ REVERSE DATA TRANSFER.
