TO REPLACE THE UNIT, FOLLOW INSTRUCTIONS IN REVERSE ORDER.
2. PRIMARY POWER CONN MUST BE DISCONNECTED TO REMOVE POWER SUPPLY COVER, SEE DETAIL D, SHEET 3.
3. FOAM FILTER ITEM 25, IS EASILY REMOVABLE FOR CLEANING OR REPLACING. MUST BE IN PLACE DURING OPERATION TO PREVENT DUST ACCUMULATION.
4. CONSOLE ASSY ( ITEM 3 ) INSTALLATION REQUIRES THAT FRONT TU BEZEL MATES CORRECTLY TO MOUTH OF FRONT DRIVE UNIT WITHOUT UNNECESSARY PRESSURE OR INTERFERENCE. CONSOLE ASSY MUST BE GUIDED INTO POSITION AND THEN (4) SCREWS, ITEM 40, SECURED. FOAM FILTER IS THEN INSERTED INTO POSITION.
5. BOTH POWER CORDS, 120V AND 240V ARE SUPPLIED WITH ALL CPU'S. PLEASE FOLLOW WARNING INSTRUCTIONS AND ALSO DISCARD UNUSED POWER CORD.

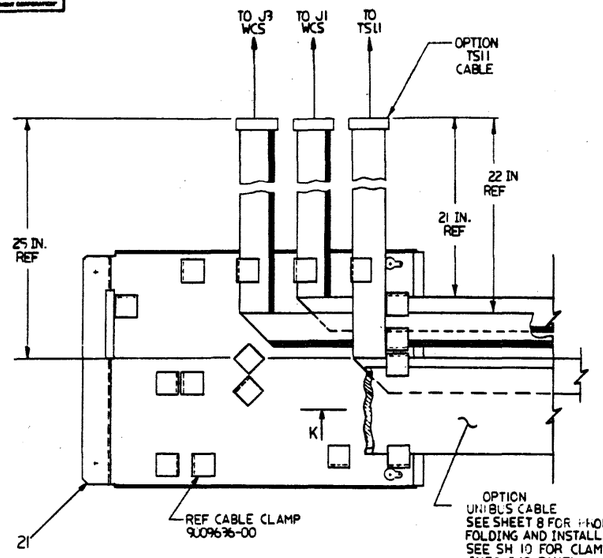
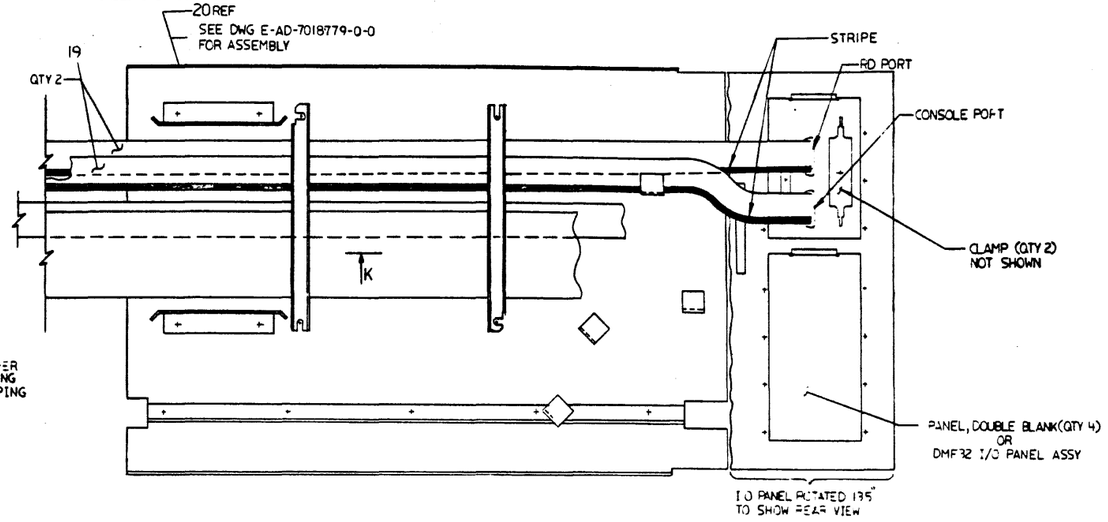
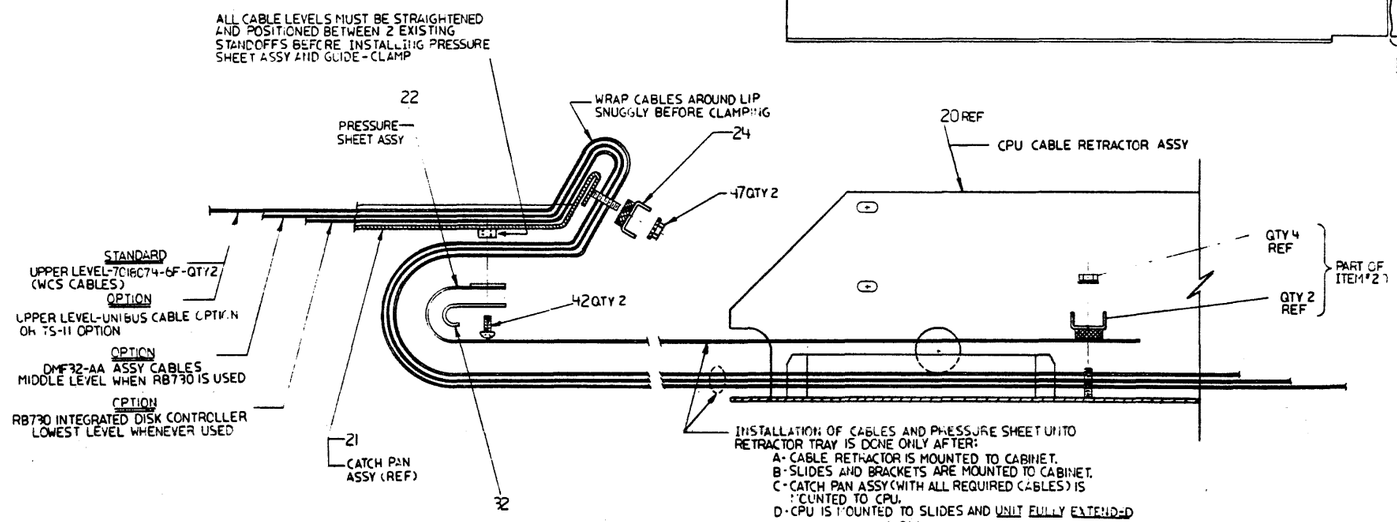
STANDARD O.E.M. CPU UNIT ASSY
BASIC UNIT, WITHOUT OPTIONS, WILL BE SUPPLIED WITH 2 EA 7018074-6F CABLE ASSY

NOTE

OEM CPU UNIT ASSY, WHEN IN SHIPPING PACKAGE WILL HAVE 2 WCS CABLES ALREADY INSTALLED FROM MODULE, THRU CATCH PAN ASSY, CAPTURED BY CLAMP (ITEM 24), AND TAPED TO UNDERSIDE OF CATCH PAN. ITEMS 22 & 32 MUST BE MOUNTED BEFORE CPU IS INSTALLED ON SLIDES IN CABINET. CABLING LAYOUT PROCEEDS AS SHOWN IN FIG. 3 & SECTION K-K.







INSTALLATION OF CABLES AND PRESSURE SHEET UNTO RETRACTOR TRAY IS DONE ONLY AFTER:
A - CABLE RETRACTOR IS MOUNTED TO CABINET.
B - SLIDES AND BRACKETS ARE MOUNTED TO CABINET.
C - CATCH PAN ASSY (WITH ALL REQUIRED CABLES) IS MOUNTED TO CPU.
D - CPU IS MOUNTED TO SLIDES AND UNIT FULLY EXTENDED

NOW
CABLES CAN BE POSITIONED ON TRAY AS SHOWN ON RESPECTIVE STANDARD OR OPTION VIEW (FROM SHEETS 6 AND 7). PULL CABLES AND PRESSURE SHEET GENTLY TO FORM TO GUIDE & CLAMP (ITEM 32) AND INSTALL CABLE CLAMPS.

### INSTALLATION INSTRUCTIONS

A. RETRACTOR ASSY IS INSTALLED FIRST.
B. SLIDES ARE SET UP, SIZED, AND INSTALLED SECOND.
C. CPU IS NEXT INSTALLED ON EXTENDED SLIDES.
D. CATCH PAN ASSY CABLING IS POSITIONED AND INSTALLED.
NOTE: CAN BE ON CPU BEFORE CPU IS INSTALLED.
E. POSITION AND/OR CONNECT ALL CABLING TO RETRACTOR ASSY.
F. POSITION AND MOUNT CABLE CARRIER ASSY.
G. CONNECT POWER CABLES AND OPTIONAL BBU CABLES.
H. MOUNT ALL COVERS SECURELY.
I POSITION MAGNETIC LATCH FOR PROPER CPU CLOSURE.
J INSTALL TETHER LINE CABLE CARRIER.

### NOTE

FOR OEM SHIPPING, ALL LOOSE HARDWARE REQUIRED, WILL BE KITTED AND BAGGED UNDER DEC P/N 11730-Z-3.

NOTES:

1. IF SLIDE MTG. BRACKETS ARE MOUNTED BEFORE SIZING TO REQUIRED LENGTH, ACCESS HOLES HAVE BEEN PROVIDED ON RETRACTOR ASSY FOR OPEN END OR BOX WRENCH.
2. FRONT MTG SLOTS ON SLIDE MTG BRKTS WILL PROVIDE ADJUSTMENT TO PREVENT SLIDES FROM BINDING DURING TRAVEL. SPACING ON EACH SIDE (CAB TO SLIDE) SHOULD BE ABOUT THE SAME.
3. OFFSET HOLES IN SLIDE MTG BRKTS PROVIDE PROPER CLEARANCE BETWEEN CPU AND RETR. TRAY. THESE BRKTS MUST BE MOUNTED AS SHOWN.

NOTES:

1. ITEM 3, 12V. DC FAN, WILL BE SUPPLIED BY VENDOR WITH 4 (FOUR) APPROPRIATE FAN MOUNTING CLIPS. USING BOSS MOUNTING CLIP (REF 9009165-00), THERE IS NO PROBLEM. USING U-CLIP TYPE (REF 9009282-00) ON CERTAIN FANS, POSITIONING OF CLIP PER SECTION D-D ON UPPER ROW OF CORNERS IS MANDATORY FOR INSTALLATION OF THIS ASSEMBLY INTO BA11-Z BOX ASSEMBLY.
2. INCORRECT POLARITY CONNECTIONS ON DC FAN IS PROTECTED BY THE FAN. FAN WILL NOT OPERATE IF IMPROPERLY CONNECTED.
3. TO PROPERLY INSTALL ITEM 11 ONTO ITEM 10, USE INSTALLATION TOOL 82-0-14719-11 (SOUTHCO) OR EQUIVALENT.
4. ITEM 12 RUBBER U CHANNEL IS TO BE CUT TO 1.25 ±.06 INCH LONG. THIS ITEM IS INSERTED UNTO ITEM 2 AND BUTTED AGAINST SENSOR BOARD.

CHAPTER 1
SCOPE

## 1.1 General Description - H7200 Series Power Supplies

This specification covers an off-line, high frequency switching power supply with a regulated 5 volt main output at 0 to 60 amps, memory and communications options outputs up to 400W total for all. It consists of a motherboard with supporting chassis and input- output connections. Size is approximately 15 x 50 cm. and 12 cm. high; weight is approximately 8 kilograms. Input power is 90-132 or 180-264 (internal select switch) at 48-63 Hz.

Outputs are divided into three groups: Main output (Channel 1): 5.1V main; Memory outputs (Channel 2): +5V at 15A for MOS memory, and DC Fan/TU58 power; Com Outputs (Channel 3): ±15V.

All outputs except fan/TU58 +12V feature overvoltage and overcurrent protection and are regulated independently of one another. Battery backup and AC standby are operable for the memory power channel (CH2).

Additionally, AC low and DC low signals are provided as well as AC line clock and boot enable. This power supply will be UL recognized, CSA certified and comply with DEC-STD-119 Rev B.

CHAPTER 2
ELECTRICAL SPECIFICATIONS (H7202B)

## 2.1 Input Specifications - AC Line

Note: Selection of low range or high range is accomplished through a tool operated slide switch located adjacent to the circuit breaker. A clear cover is also used to discourage casual operation.

### 2.1.1 Line Voltage

Note: Line impedance must be sufficiently low to assure less than 5% total harmonic distortion of the line AC waveform.

Low Range: (120V nominal) 90-132 (rms) single phase three wire.

High Range: (240V nominal) 180-264 (rms) single phase three wire.

### 2.1.2 Line Frequency

47-63 Hz for either voltage range.

### 2.1.3 Line Current

Peak and RMS currents vary proportionally with line voltage.

Low Voltage Range: 8.5 amperes (rms) max. and 25 amperes (peak) max. at a nominal 120 VRMS line.

High Voltage Range: 4.2 amperes (rms) max. and 12 amperes (peak) max. at a nominal 240 VRMS line.

### 2.1.4 Power Factor

The ratio of real power to apparent power shall be greater than 0.60 at full output load and nominal input voltage.

### 2.1.5 Inrush Current

At first application of input voltage to the power supply, the stated surge current may be reached for 1/2 cycle of the input line. Following that, there will be repetitive peaks of lower amplitude for up to 10 more cycles of the line.

Maximums: Low Voltage Range: 120 A (Peak)
High Voltage Range: 120 A (Peak)

### 2.1.6 Input Overload Protection

A two pole circuit breaker is provided to protect the input wire and components. This breaker is accessible and is a 15 Amp rating for both 120V and 240V settings.

### 2.1.7 Insulation/Hi-Pot

2.1.7.1 2120 V dc and 300 VAC, (rms) 50 Hz between input and frame and shields for 1 minute as specified in DEC-STD-119 Rev C, section 2, paragraph 2.

2.1.7.2 2500 VAC (rms) 50 Hz between input and output for 1 minute. In accordance with DEC-STD-119 Rev C. This excludes the line filter.

2.1.7.3 All isolation transformers shall have been high potential tested prior to assembly into a module or assembly. Devices without shields will have been tested to reinforced insulation levels (3750 VAC).

### 2.1.8 Input Power

The average input power shall be 650 watts max. with the outputs loaded to a total of 400 watts.

### 2.1.9 Grounding

The green/yellow bonding ground wire is connected to the metal case and to transformer shields. It is internally connected to the main 5V return.

### 2.1.10 Ride-Through Capability

All outputs are maintained within stated regulation limits for a minimum of 6 milliseconds after input power interruption at low line (either voltage range). AC low may be asserted at the interruption; DC Low will follow a minimum of 5 milliseconds after AC Low. (See power-down protocol Section 5.3.) The delay from power interruption to AC low increases with higher line voltage (either range) and lighter loads.

2.1.11 Efficiency

The ratio of output DC power at the power supply terminals to the input real power shall be 0.65 minimum taken at 5V/60A in either input voltage range. This ratio may degrade to .60 when other outputs are loaded.

2.1.12 Input Over/Under Voltage Conditions

Undervoltage: The power supply is capable of withstanding any undervoltage condition for any duration without damage or degradation.

Overvoltage: The power supply is capable of withstanding an input overvoltage of 150 VAC (RMS (low voltage range)) or 300 VAC (RMS) (high voltage range) for one second maximum without sustaining any internal damage or degradation. The outputs are protected from overvoltage (within crowbar range) under these conditions. Overvoltage in excess of this may be damaging to the power supply.

2.1.13 Input Line Noise Susceptibility

2.1.13.1 Transients

Note: A spike is defined as a voltage transient, of either polarity and of either common or differential mode, with a rise time (10% to 90%) of 0.1 micro-seconds or less and a fall time (to 10%) of 10 micro-seconds or more. The average power of spikes shall not exceed 0.5 watts. They may occur at any phase value of the input AC, adding to the instantaneous value.

2.1.13.1.1 Low Energy Transients

In accordance with DEC-STD-102.7 Rev C.

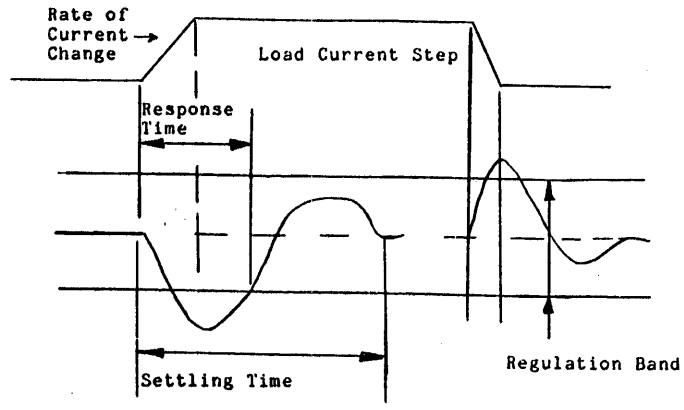
2.1.13.1.2 High Energy Transients

In accordance with DEC-STD 102.7 Rev C.

2.1.13.2 Conducted Noise

In accordance with DEC-STD-102.7 Rev C.

FIGURE 2.1 DYNAMIC RESPONSE TIME



2.1.13.2 Radiated Noise

In accordance with DEC-STD-102.7 REV C.

2.2 Output Specifications

This power supply has a fixed 5.1V output on the major board with remote sense capability. Other outputs are provided from the regulator cards. These outputs are regulated at the card. (See Table I.)

2.2.1 Output Voltages (Table I)

For all outputs, The "Total Tolerance" is the root-sum-squared of errors due to:

Initial Tolerance
Dynamic Voltage Limits
Line/Load Changes Over Specified Range
Long Term Stability (1000 hours)
Temperature Drift
Ripple

The "Total Static Tolerance" is the root-sum-squared of errors due to:

Initial Tolerance
Line/Load Changes Over Specified Range
Long Term Stability (1000 hours)
Temperature Drift

2.2.2 Output Current (Table I)

The minimum and maximum currents for each output are specified in Table I. Where minimum loads are given, it indicates a minimum loading level necessary to keep other outputs within that channel grouping within regulation.

2.2.3 Wattage

The maximum wattage from each output is the product of the max rated current and the sum of the rated voltage and the total tolerance. The maximum power obtainable from combining all output powers in any application must be limited to 400 watts.

2.2.4 Line/Load Regulation

Table I shows the maximum deviation of each output for gradual line and load changes. The line voltage range for this parameter is the full range specified in 2.1.1. The load current variation is from minimum load to maximum rated load as specified in Table I. Gradual change is defined for this purpose as covering the range in more than one second.

2.2.5 Noise

Table I shows the maximum peak to peak noise which is present on each output. Noise must be measured at the output terminals of the power supply. The noise voltage is superimposed on the ripple voltage. Noise is defined as repetitive disturbances at a frequency greater than 170 KHZ.

2.2.6 Ripple

Table I shows the maximum peak-to-peak ripple voltage present on each output at the specified measurement points. The output deviations classified as ripple are repetitive disturbances in the frequency range of 1 Hz to 170 KHZ.

2.2.7 Dynamic Response Time

Table I shows the dynamic response characteristics of each output channel. The load current change, the allowable overshoot/undershoot, the response time and the settling time are specified for each channel. Each channel is to be subjected to a maximum rate of load current change of 0.5 Amperes per microsecond (increasing or decreasing load). The load changes are to occur as a 50% duty cycle square wave at a frequency of 100 hertz max; within the min/max values specified in Table I. Figure 2.1 shows a typical output wave form and defines all the above mentioned terms.

2.2.8 Temperature Coefficient

The maximum temperature coefficient of each output of this supply is ±0.02%/oC maximum over the operating ambient temperature range specified in 7.1.1. The measurement of temperature coefficient is to be made at 50% load on all outputs, nominal line voltage and after ten minute warm-up period with proper cooling air flowing.

2.2.9 Short Term Stability

The changes in the voltage at each output during warm-up after the initial turn-on will be less than 0.2% of the output measured. This measurement is made from one second after the supply is turned on until component temperature stability is reached (no later than one hour after turn on). All other parameters and environmental conditions must remain constant during this test.

2.2.10 Long Term Stability

The long term stability of each output of the supply is 0.1%/1000 hours maximum when measured under constant line, load and environmental conditions. The conditions must be within the limits called out in this specification.

2.2.11 Output Overload Protection

Table I shows the type of current limiting scheme and initiating point (limits) for each output.

The description of each type is below:

| | |
|---|---|
| **Pulsing** | In this mode, the output is turned off for some fixed period of time after the initiation point is reached. Upon reactivation of the output, the output current builds; then, if the initiation point is reached again, the output turns off again. The average current in this mode is low, but with higher peaks. |
| **Constant Current** | At the initiation point, the output current is held constant and the voltage dropped to a level sufficient to maintain the fixed current level. |
| **Foldback** | In this mode, once the initiation point is reached, the voltage is lowered and the output current level also lowered. At a short circuit, the current is approximately 40% - 60% of the initiation point current. |

The current limit on all outputs is configured such that the output will automatically recover to normal operation upon the removal of the overload.

All outputs are capable of operating for indefinite periods of time with short circuits on the output without causing damage or degradation to any portion or component of the supply.

Note 1: The minimum load specified for the +5.1V output is required to maintain reg. on the +12.3V output. The 5.1V output will operate at no load but the +12.3V output will be below spec.

Note 2: Max continuous output current for +12.3V output is 3.0 amps. Intermittent currents of up to 6.0 amps may be drawn for several seconds if the duty cycle is kept below 2%. If continuous currents of greater than 3.0 amps are drawn a thermal protection switch will shut the supply down.

Note 3: The minimum load specified for the +12.3V output is required to maintain regulation. If the minimum load is below that specified the +12.3V output can be out of regulation on the high side. If the load falls below 0.75A the 12.3V output can rise sufficiently to cause an overvoltage condition and the module will shut down. See A-SP-H7213, paragraph 2.2.13.

2.2.12 Overvoltage Protection

All outputs except designator 2, table 1, have a crowbar protective device to prevent the voltage from exceeding the maximum fault voltage level indicated in Table I. The crowbars will be capable of discharging all internal and rated external capacitances. The maximum response time of the protection is 2 microseconds. The maximum voltage is not exceeded during the response time.

All overvoltage fault circuits (crowbars) are latching. The latched-off condition can be reset by removal of AC power for at least one minute or by removal of Power Request and Standby signals (console switch to "off").

2.2.13 Output Adjustment

All outputs are fixed with no means of adjustment. Channel 3 outputs are available for ±15V or ±12V. This selection is by choosing a variation of the module.

2.2.14 Output Sequencing

None.

2.2.15 Voltage Margins

There are no margin circuits or capability provided.

2.3 D. C. Input - Battery Backup Power

P1 is the inlet connector for Battery Backup Power. It is common with the bulk DC on the major board which is derived from line rectification. It is not isolated from the AC line. Proper cable mounting, shielding and insulation must be exercised when using this input to avoid circumventing the AC line filter and preserve signal integrity in adjacent cables. In systems that are high potential tested, this input is raised to the high voltage.

Note: This input is in common with the internal bulk DC voltage. There is no fusing or limiting provided. High surge and average currents are therefore possible from this interface, as with any 240V line connection.

There is internally stored energy available at this connection for several seconds after power removal following some internal failures. These two terminals must not be short-circuited together or to ground to discharge this energy.

This input is to be used only with isolated BBU units such as the H7240 series battery converters.

CHAPTER 3
ELECTROMAGNETIC INTERFERENCE

3.1 Limits of Equipment Generated Interference

AC Power Lines
Compliance with FCC A and VDE A limit is provided by the line filter within this power supply.

CHAPTER 4
APPLICATION SPECIFICATIONS

4.1 Input - Voltage Current and Cord Requirements

The input voltage range is selected with a screwdriver operated slide switch on the unit. The inlet connector is a three pin (IEC) connector. A 14 guage three wire cord is required. This cord is not supplied with the power supply. Removal of a small protective cover is required for operation of the line select switch.

4.2 Output Voltage, Current and Harness Requirements

The main 5 volt output is available at the connection blocks on the unit. A suitable bus bar or sufficient size wire is required to conduct the current used by the load and restrict the voltage drop to 100 mV between output terminals and remote voltage sense points for each lead, supply and return. Other voltages are available at the backplane connector on the distribution board (see D-IC-H7202). Voltage drops for these are determined by user requirements.

4.3 Load Duty Cycle

The power supply will operate within all specification limits continuously with any outputs loaded to full rated current, provided total DC output power does not exceed 400W.

4.4 Paralleling Requirements

Operation of this supply connected in parallel with any other power supply is not permissible.

4.5 Load Capacitance

The maximum external capacitance added in parallel at the load (for decoupling, etc.) for each output is:

| | | | |
|---|---|---|---|
| +5V | : 500 uf | +15V | : 270 uf |
| +12V | : 100 uf | -15V | : 270 uf |
| +5VB | : 500 uf | | |

These limits are necessary to insure system stability.

## 4.6 Load Connection Characteristics

The interconnection circuit from the output to the remote sense attachment points is restricted in inductance and capacitance to assure system stability as follows:

| | | | |
|---|---|---|---|
| maximum inductance | (Normal mode) | 50 | Microhenries |
| maximum capacitance | -- | 500 | Microfarads |
| maximum LC product | 250 X $10^{-12}$ | | FARAD-HENRIES |

## 4.7 Remote Sense

The main 5V output has remote sense capability. The maximum sense line length is one meter (each line). A capacitor of 0.1 uF is required at the sense line termination at the load. The sense lines are pin 6 (+) and 8 (-) in connector J2. The power supply output is protected from opening or shorting the sense lines. Crowbar is considered adequate protection for this purpose. Regulation limits are not guaranteed if the sense line resistance from the sense pins to the 5V output exceeds 0.5ohm (each line). In the event of an open sense line, regulation takes place at output assembly on the H7200 power module.

## 4.8 Battery Back-Up Requirements

This power supply is capable of operating from a battery back-up with a 200V output interfacing with the primary bus, such as the H7240 series units. The power supply is capable of operation in this mode for 30 seconds maximum at rated load and temperature without forced air cooling. External forced air is required for operation for longer periods in this mode.

This unit is internally programmed to back up Channel 2 outputs (memory regulator). These are also the "standby" outputs (See Table I and 5.2.2).

## 4.9 Return Wire Voltage Offsets

The return lines for each power channel must be connected together externally for normal, safe operation. This is normally done at the load. In such cases, the difference in return wire voltage drops due to distribution losses must be less than 350 mV for any combination of two of the three power channels. This is necessary to prevent shortening the life of the internal ground isolation resistors between the power channel control circuits.

# CHAPTER 5
# SIGNAL SPECIFICATIONS

## 5.1 Output Signals

### 5.1.1 DC Low

This signal when asserted (low state) indicates that the dc voltage at the input bus is not adequate to maintain regulation of the outputs, and that output DC power is about to drop. All outputs will remain in regulation for 1 millisecond minimum after this signal is asserted.

The output signal is provided on two lines leading to an ungrounded (floating) FET. On power turn-on this signal is asserted until regulation is reached.

Electrical Characteristics:

Asserted (low) - Capable of sinking 50 mA. at 0.4Vmax.

Un-asserted (high) - Output impedance of 100 K ohms min, 15V maximum applied voltage.

### 5.1.2 AC Low

This signal when asserted (low state) indicates that the dc voltage at the input bus is at or near the value necessary to guarantee the 5 mS. hold-up prior to DC low. This value is below the specified line voltage but above the minimum required for regulation. When un-asserted (high) this signal indicates adequate input voltage.

On power turn-on this signal is asserted until after DC low is de-asserted. On power turn-off this signal is asserted 5 milli-seconds minimum prior to DC low (See Figure 5.2, 5.3).

Electrical characteristics are the same as DC low (see 5.1.1). The return lead (FET source) is common with DC low.

### 5.1.3 Line Clock Signal

This signal is a timing reference at the frequency of and synchronous with the AC line. Its waveform is a square wave of approximately 50% duty cycle. Its source is an open-collector transistor sinking 20 mA. with 0.4V maximum in the low state and high impedance in the high state. High state maximum applied voltage is 15V, minimum impedance is 100 K ohms. The return lead is common with DC low (See Figure 5.1).

Note: This signal does not function when power is derived from battery back-up.

### 5.1.4 Battery Back-Up Enable

This signal when true (high state) asserts that a valid BBU condition exists in the power supply. This enables the BBU unit to assume the "ready" state which permits fast response to a power fail condition through the BBU request signal (para. 5.1.5).

When false, a non valid condition is indicated such as thermal shutdown or output failure. This allows the BBU unit to assume the "Off" state which does not allow fast response and permits minimum battery drain. A transition from True to False while BBU unit is supplying power, terminates the backup condition, removing power.

Electrical Characteristics:

True (high state): A voltage source of +12V (10.5 min, +14.5 max) at 10 mA. max current.

False (low state): High impedance source of greater than 100 K-ohms to +14.5V maximum.

### 5.1.5 Battery Back-Up Request

This is a momentary indication of a drop in the bulk DC power input to the power stages indicating input AC has dropped. This signal is asserted simultaneously with AC low but is de-asserted when the bulk DC is increased due to the input of battery derived power (See figure 5.4). The minimum assertion time is greater than 1 millisecond.

Electrical Characteristics are the same as Battery Back-up Enable (para. 5.1.4).

### 5.1.6 Boot Enable

This signal is valid on power up between de-assertion of DC low and AC low. When true (high state) it indicates that memory voltage(s) had been good and uninterrupted since assertion of DC low on power down. When false (low state) it indicates that memory voltages had been interrupted. Electrical characteristics are the same as DC low.

## 5.2 Input Signals

### 5.2.1 DEC Power Bus

The power supply responds to these two signals (Power Request and Total Shutdown) in accordance with DEC STD 123.

Power Request: All outputs are inhibited until this signal is pulled low externally, except for the Standby mode.

Total Shutdown: All outputs are inhibited whenever this signal is pulled low externally. This signal overrides all other signals.

Normal output signal and power output sequencing per section 5.3 occurs when these signals are used.

### 5.2.2 Standby (Console Signal)

This input enables the "Standby" outputs when pulled low externally. It overrides Power Request but not Total Shutdown. "Standby" is internally programmed to be the "Channel 2" outputs (memory regulator) (See Table I).

Low State (asserted): Less than 1.0V
Source Current is -1.0 mA. max.

High State (unasserted): Greater than 10V,
Sink current: 1 uA. max.

### 5.2.3 Module Enable

This signal when asserted (low state) indicates that primary power is coming from the battery converter. This signal forces a "standby" state by internally de-asserting power request. This shuts down the Channel 1 and 3 outputs. An AC Low - DC Low sequence precedes the fall in actual DC output. See figure 5.4.

Electrical Characteristics:

Low State (asserted): External low impedance to power supply return capable of sinking 3 mA. minimum with a max. voltage of 1 Volt.

High State (unasserted): High impedance, capable of blocking +15 V with 1 micro amp max. leakage.

### 5.2.4 $\overline{\text{AIR FAULT}}$:

This signal is a shutdown input with internal latch intended for use with external environmental sensors. It consists of a pull-up line and fault signal which must be connected together externally to permit normal operation (see Figure 5). When the AIR FAULT line is pulled low to P.S. return, all DC power is removed after an AC low - DC Low sequence. An internal latch is also set, holding this condition until Power Request and Standby inputs are de-asserted ("Key OFF"). Under default conditions with both lines open, the Power Supply will not operate.

The minimum fault assertion time to guarantee a latch is 100 microseconds.

Electrical Characteristics:

Asserted (low state): Low impedance to P.S. return capable of sinking 10 mA. with a maximum Voltage of 1 Volt.

Unasserted (high state): High impedance capable of blocking 15 VDC with a max. leakage of 1 Microamp.

Note: Electrical Characteristics apply when "pull-up" and "fault" are connected together.

## 5.3 Power-Up/Power-Down Sequencing

See Figure 5.2 for sequence of signals and events oon power-up and power-down.

## 5.4 Status Indicators

Three red light emitting diodes indicate the status of each of the three power channels. These are visible through the connection access cover and labeled. Each LED will be on when that channel is on and outputs are within normal range.

Labels are as follows:

|---|---|---|
| Main +5V | OK | (Channel 1) |
| Memory Power | OK | (Channel 2) |
| Com. Power | OK | (Channel 3) |

CHAPTER 6
MECHANICAL AND PHYSICAL SPECIFICATIONS

6.1 Size

The overall dimensions are 5 X 6.25 X 21 inches nominal, conforming to the dimensions shown in Figure 6.1.

6.2 Weight

The power supply with housing has a maximum weight of 8.2 kilograms (18lbs).

6.3 Mounting

Through threaded inserts comptaible with BA11-H and BA11-Z boxes .

6.4 Cooling

Externally supplied forced air at 400 linear feet per minute (20 m/s) is required to properly cool this unit when operating at full load and max. temperature. Volume requirement is approximately 80 cubic feet per minute. A suitable air filter is required to prevent dirt accumulation inside the unit. (See 7.6)

6.5 Thermal Protection

The power supply is self-protecting against the loss of adequate cooling air or excessive temperature by internal temperature switches which shut down the power supply. This sets an internal latch which is externally reset by de-asserting both power request and standby inputs (console key to OFF).

6.6 Accessibility

6.6.1 Connections:

All power and signal connections are available at the rear of the unit. A protective clear cover must be removed to access many of the power and signal connectors.

6.6.2 Service:

To access the working internal modules, the input power connector P2 must be disconnected to allow the top cover to be removed. This disconnects all HV power from the input harness. Channel 2 and 3 power modules may be removed at this point.

To remove the H7200 power module, the AC input panel must be removed, as well as the mounting screws on the bottom of the unit as well as the high current cables.

6.7 Identification Stickers

Special markings or compliance stickers are placed on the outside of the housing near the circuit breaker access, adjacent to the AC inlet connector and on the top cover.

6.8 Input/Output Connectors

6.8.1 Line Interfaces

Interfaces at AC Line potential (AC input line, battery back-up power) are through connectors in the chassis at the rear of the unit. AC line input is directly into the line filter.

6.8.2 Main Output

5V, 60A output is through screw and insert connections on the rear side corners. Interface to the load is then through flex-print (wire could also be used).

6.8.3 Other Interfaces

All other interfaces are from connectors on the distribution board under the rear protective cover. Interfaces included are:

(J2) Backplane (by flexprint) - includes DC power other than 5V/60A, and processor signals.

(J3) Fan: Power for DC fans and signals to and from air flow sensor.

(J7) Fan: Power for additional DC fan.

(J4) Battery Back-up: Signals to Battery Back-up unit.

(J6) DEC Power Bus.

(J1) Console - Control signals.

6.8.4 DEC Power Bus

These signals are carried out from the distribution board (J6) to the chassis where the standard 3 pin connector is accessible.

6.9 PACKAGING

2. APPLY CABLE CLAMPS (ITEM 14) TO EMBOSSED SQUARES IN METAL AS SHOWN. DOT ON METAL INDICATES CLOSED END OF CLAMPS.
3. MAGNET BRACKET (ITEM 6) SHOULD BE INSTALLED IN ITS INNERMOST ADJUSTABLE POSITION. THIS BRACKET MUST BE POSITIONED AT CPU INSTALLATION LEVEL.
4. ITEMS 7, 10 & 16 MUST BE LOCATED AT A RIGHT ANGLE (90°) TO ITS MOUNTING SURFACE AND LOWERED FLAT INTO POSITION. METAL INTERFERENCE IS BUILT IN TO REDUCE RFI EMISSION.
5. TWO OUTERMOST TABS ON ITEM 5 MUST MAKE CONTACT WITH ITEM 3 & 4. MYLAR OR SHIM STOCK TRIAL REQ'D
6. SLOTTED HOLES IN THE BRACKET ARE TO BE CENTERED ON STUDS ON BOTH TRAYS AT ASSY. ADJUSTMENT PROVIDED IN CASE REQUIRED.

PACKAGING INSTRUCTIONS 3700662-01

STEP PROCEDURE FIGURE 1 AND 2

1. CUT TWO (2) PIECES OF POLYESTER STRAPPING (9905734-02) SEVEN (7) FEET LONG AND LAY FLAT ON THE PALLET (9906199-00).

2. SET UP ONE (1) END OF THE DIE CUT TRAY (9906832-01) AND PLACE ON THE TWO (2) STRAPS.

3. SET UP THE DIE CUT SHEET (9906933-01).

4. PLACE RETRACTOR TRAY (7018779-00) ON DIE CUT SHEET SO THAT THE ANGLED CABLE CONNECTOR RESTS AGAINST THE CORRUGATED SQUARE.

5. WRAP THE SHEET AROUND THE RETRACTOR TRAY.

6. PLACE THE WRAPPED RETRACTOR TRAY INTO THE DIE CUT TRAY SO THAT THE CORRUGATED SQUARE ON THE SHEET RESTS AGAINST THE SET UP END OF THE DIE CUT TRAY.

7. TAPE ONE (1) PRESSURE SHEET ASSY (7018718-00) TO THE TOP OF THE CPU BOX USING FIFTEEN (15) INCHES OF GLASS FILAMENT TAPE (9009634-00).

8. PLACE A POLYETHYLENE BAG (9905128-23) OVER THE CPU UNIT ASSEMBLY.

9. PLACE THE CPU BOX INTO THE WRAPPED RETRACTOR TRAY SO THAT THE BEZEL OF THE CPU UNIT ASSEMBLY IS FACING THE OPEN END OF THE DIE CUT TRAY.

10. FOLD OVER THE OPEN END OF THE DIE CUT TRAY.

13. CLOSE AND SEAL THE FIVE PANEL FOLDER USING TWENTY-FOUR (24) INCHES OF CARTON SEALING TAPE (9905729-00).

14. PLACE THE SEALED FIVE PANEL FOLDER INTO THE HALF SLOTTED CARTON IN FRONT OF THE CPU BEZEL.
CPU 11730-ZA

15. PLACE ONE (1) TU58-K MEDIA CARTRIDGE (3615809-00) INTO A BUBBLELITE ENVELOPE (9905012-05) AND PLACE ON TOP OF THE FIVE PANEL FOLDER.

16. PLACE ONE (1) AC LINE CORD (1700083-21) AND ONE (1) AC LINE CORD 1700083-22) INTO THE HALF SLOTTED CARTON ON TOP OF THE FIVE PANEL FOLDER.

17. PLACE A HARDWARE KIT BAG (B-PL-11730-Z-5) INTO THE HALF SLOTTED CARTON ON TOP OF THE AC LINE CORDS.

18. PLACE TWO (2) SLIDES (1218166-00) AND HARDWARE KIT BAGS, ONE (1) ON EACH SIDE OF THE CPU UNIT ASSEMBLY BETWEEN THE INSIDE OF THE HALF SLOTTED CARTON AND THE WRAPPED RETRACTOR TRAY AS SHOWN IN FIGURE 1.

19. CLOSE THE FLAPS OF THE HALF SLOTTED CARTON.

20. SEAL THE CARTON BY CLAMPING THE TWO (2) STRAPS AROUND THE CARTON.

21. PALLETIZE PER FIGURE 2 USING FOUR (4) ANGLEBOARD (9906185-05) AND FOUR (4) PIECES OF STRAPPING (9905734-02).

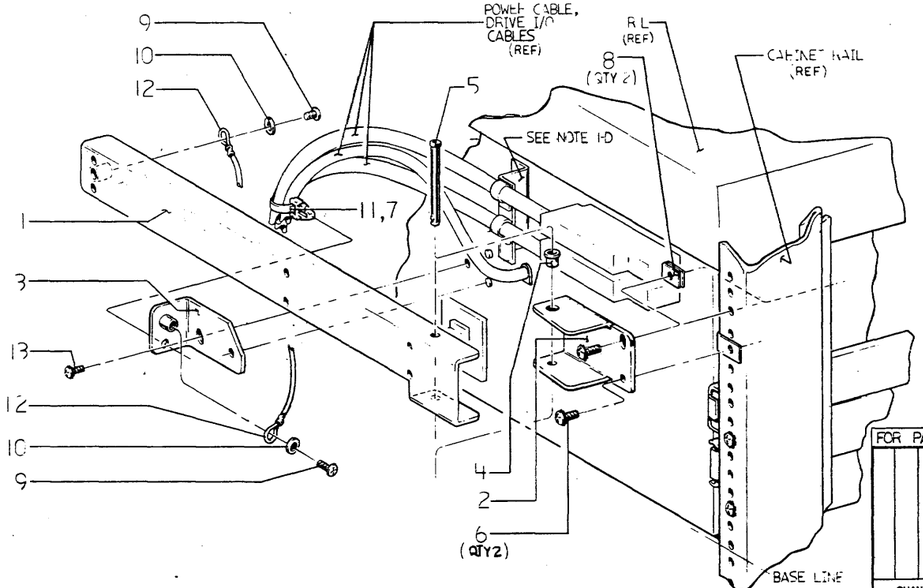
SCALE - 1:2



NOTES:

1. INSTALATION PROCEDURE:
   - A. MOUNT RETRACTOR MOUNTING BRACKET (ITEM 2) TO RAIL AS SHOWN.
   - B. INSTALL TETHER CABLE (ITEM 12) BETWEEN TETHER RELEASE (ITEM 3) AND RETRACTOR ARM (ITEM 1) AS SHOWN. POSITION PIECES AS SHOWN IN DETAIL A.
   - C. ATTACH RETRACTOR ARM (ITEM 1) TO MOUNTING BRACKET (ITEM 2) AS SHOWN. DON'T ATTACH TETHER RELEASE (ITEM 3) AT THIS TIME.
   - D. ATTACH I/O CABLE(S) TO REAR OF DRIVE MAKING SURE THE DRIVE'S CABLE CLAMPING BRACKET IS POSITIONED AS SHOWN.
   - E. SLIDE DRIVE OUT TO SERVICE POSITION. IF CABINET HAS STABILIZER(S), PLACE IN SERVICE POSITION.
   - F. PULL DRIVE CABLES (I/O AND POWER) GENTLY BACK TO RETRACTOR ARM (ITEM 1) AND CLAMP TO END HOLES AS SHOWN USING ITEMS 7, 11.
   - G. ATTACH TETHER RELEASE (ITEM 3) TO CABLES AS SHOWN IN "DETAIL A". MAKE SURE TETHER IS TAUT AND CABLES ARE SLIGHTLY SLACK BEFORE SECURING TO THE RELEASE BRACKET.
   - H. RETURN DRIVE TO THE CUSTOMER LOADING POSITION AND ATTACH RELEASE BRACKET (ITEM 3) TO DRIVE AS SHOWN.
   - I. RETURN DRIVE TO NORMAL OPERATING POSITION.
   - J. ROUTE CABLES TO THEIR DESTINATIONS, COIL ANY EXCESS I/O CABLE AND THEN INSTALL THE REMAINING CABLE TIES (ITEM 11) AND PUSHMOUNTS (ITEM 7) AS SHOWN IN CABLE LAYOUT.
2. I/O CABLE ROUTING TO DRIVE DIRECTLY ABOVE OR BELOW.
3. I/O CABLE ROUTING TO TRANSITION BRACKET OR ADDITIONAL DRIVE NOT MOUNTED DIRECTLY ABOVE OR BELOW. NOTE THE MINIMUM 8 RAIL HOLES BETWEEN THE RETRACTOR MOUNTING SCREW AND THE FIRST RAIL MOUNTED CABLE TIE.
4. THERE ARE THREE SPARE CABLE TIES AND PUSH MOUNTS (ITEMS 7, 11).
