## CHAPTER 1 GENERAL DESCRIPTION

### 1.1 Introduction

The M2247/48/49E disk drives are compact (mini-floppy size), inexpensive, and highly reliable fixed disk drives developed for random access files in small computers, word processors, and terminals.

The storage capacities (unformatted) for the models are: 181.5 MB for the M2247E, 285.3 MB for the M2248E, and 389.0 MB for the M2249E.

The drive interface is an Enhanced Small Disk Interface (ESDI), with high data integrity and intelligent diagnostics. It has superior freedom in sending selfrecognition data, and in structuring systems.

### 1.2 Features

(1) Compact size

Since the disks are 130 mm ( 5.12 in .) in outer diameter and are driven by a DC motor directly connected to the spindle, the drive is extremely compact in size:
$146 \mathrm{~mm}(5.7 \mathrm{in}).(\mathrm{W}) \times 83 \mathrm{~mm}(3.3 \mathrm{in}).(\mathrm{H}) \times 203 \mathrm{~mm}(8.0 \mathrm{in}$.) (D)
(2) High speed positioning

Using a rotary voice coil motor for head positioning results in high speed positioning.
(3) High reliability

The Whitney-type heads, disks, and positioners are completely sealed in the disk enclosure (DE), which has breather and recirculation filters to keep the air clean, thereby increasing reliability and preventing head crashes.
(4) No preventive maintenance
(5) DC power

The direct-drive DC motor requires no adjustment for line frequencies $(50 \mathrm{~Hz} / 60$ Hz ) or input power voltages ( $100 \mathrm{~V}, 115 \mathrm{~V}, 220 \mathrm{~V}$ or 240 V ).
(6) 5.25 -inch mini-floppy disk drive size compatibility

Because its physical size is the same as that of a mini-floppy disk drive, this drive can replace a mini-floppy disk drive without cabinet redesign.
(7) Vertical or horizontal installation

The drive may be installed in its cabinet either vertically or horizontally. (See Section 4.2).
(8) Low power consumption

The power consumption is 38 W (typical). This low power consumption enables the drive to be used in a wide environmental temperature range $\left(5^{\circ} \mathrm{C}\right.$ to $\left.45^{\circ} \mathrm{C}\right)$ without a cooling fan.
(9) Low noise

The drive's low noise output, approx. 45 dB (A-scale weighting) even during seeking, makes it ideal for office use.
(10) Low vibration

The drive has four rubber vibration isolators, which minimize the transfer of shock and vibration to the disk enclosure.
(11) LSI and microprocessor controlled

LSI integrated circuits and a microprocessor are used on the main printed circuit board to achieve high reliability.

## CHAPTER 2 SPECIFICATIONS

### 2.1 Functional Specifications

| Specification | M2247 | M2248 | M2249 |
| :---: | :---: | :---: | :---: |
| Total storage capacity Unformatted (MB) Formatted ${ }^{* 1}$ | $\begin{aligned} & 181.5 \\ & 142.5 \end{aligned}$ | $\begin{aligned} & 285.3 \\ & 224.0 \end{aligned}$ | $\begin{aligned} & 389.0 \\ & 305.5 \end{aligned}$ |
| Storage capacity/track Unformatted (B) Formatted* | 20,864 |  |  |
| Number of disks <br> Number of heads (R/W) <br> Number of cylinders <br> Number of tracks/cylinder | $\begin{array}{r} 4 \\ 7 \\ 1243 \\ 7 \end{array}$ | $\begin{array}{r} 6 \\ 11 \\ 1243 \\ 11 \end{array}$ | $\begin{array}{r} 8 \\ 15 \\ 1243 \\ 15 \\ \hline \end{array}$ |
| Number of sector  <br> Recording density (BPI) <br> Track density (TPI) <br> Transfer rate (KB/s) <br> Rotational speed (rpm) <br> Average latency time (ms) <br> Recording method  |  | ectable, 19,29 1,26 1,250 3,60 <br> RLL (1/7) |  |
| $\begin{array}{r} \text { Positioning time Min. } \\ \text { (ms) }{ }^{* 3} \\ \text { Avg. }(\mathrm{ms}) \\ \text { Max. }(\mathrm{ms}) \\ \hline \end{array}$ | $\begin{array}{r} 4 \\ 18 \\ 35 \end{array}$ |  |  |
| Input voltage*2 | $\begin{aligned} & +12 \mathrm{~V} \pm 5 \%, 2.5 \mathrm{~A}(\text { max. } 5.0 \mathrm{~A}) \\ & +5 \mathrm{~V} \pm 5 \%, 1.6 \mathrm{~A} \end{aligned}$ |  |  |
| Ripple* ${ }^{* 4}$ | $+5 \mathrm{~V} /+12 \mathrm{~V}, 50 \mathrm{mVp}-\mathrm{p}$ |  |  |
| External size <br> Width $\times$ height $\times$ depth $(\mathrm{mm})$ <br>   <br> Disk size $(\mathrm{mm})$ <br> Weight $(\mathrm{kg})$ | $\begin{aligned} & 146 \times 83 \times 203 \\ & (146 \times 83 \times 208 \text { with front protector } \\ & \text { installed }) \\ & (150 \times 86 \times 208 \text { with front panel } \\ & \text { installed }) \\ & \text { Outer diameter } 130, \\ & \text { Inner diameter } 40 \\ & \quad 3.5 \end{aligned}$ |  |  |

[^0]
### 2.1.1 Positioning time

### 2.1.2 Start and stop time

Start time (time from when power is turned on until the unit is ready) is 20 seconds or less, and stop time (time to completely stop when power is turned off) is 15 seconds or less using dynamic braking to prevent disk and head wear.

### 2.2 Environmental Conditions

| Temperature | Operating <br> Non-operating <br> Gradient | $5^{\circ} \mathrm{C}$ to $45^{\circ} \mathrm{C}$ <br> $-40^{\circ} \mathrm{C}$ to $60^{\circ} \mathrm{C}$ <br> $15^{\circ} \mathrm{C} / \mathrm{h}$ or less |
| :---: | :---: | :---: |
| Relative humidity | Operating Non-operating | $20 \%$ to $80 \%$ RH (max. wet bulb $29^{\circ} \mathrm{C}$ ) $5 \%$ to $95 \%$ RH (max. wet bulb $29^{\circ} \mathrm{C}$ ) Moisture must not condense. |
| Vibration | Operating | Less than $0.2 \mathrm{G}(3$ to 100 Hz$)$ $2 \mathrm{~min} \times 30$ cycles (sinusoidal waveform) |
|  | Non-operating (power-off state after installation) | Less than 0.4 G ( 3 to 100 Hz ) $2 \min \times 30$ cycles (sinusoidal waveform) |
| Shock | Operating Non-operating | Less than 2G (maximum 10 ms ) <br> Less than 20G (maximum 10 ms ) |
| Altitude above sea level | Operating <br> Non-operating time | $\begin{aligned} & 0 \mathrm{~m} \text { to } 3,000 \mathrm{~m} \\ & 0 \mathrm{~m} \text { to } 12,000 \mathrm{~m} \end{aligned}$ |

### 2.3 Power Requirements

(1) Power connector pin assignment

View from cable side of connector

| 1 | +12 V |
| :--- | :--- |
| 2 | +12 V RTN |
| 3 | +5 V RTN |
| 4 | +5 V |

(2) Input voltage tolerance and current

|  | Input voltage | Peak current | Average current |
| :---: | :---: | :---: | :---: |
| +12 V | $+12 \mathrm{~V} \pm 5 \%$ | 5.0 A | 2.5 A |
| +5 V | $+5 \mathrm{~V} \pm 5 \%$ | - | 1.6 A |

(3) Power consumption

Steady state 38 W
(4) Current waveforms
+12 V current waveform (for reference)

(5) Power on/off sequence

If the Write Gate signal from the controller is off before applying or removing power, the voltages $(+12 \mathrm{~V},+5 \mathrm{~V})$ to the drive need not be sequenced. That is, recorded data will not be destroyed nor will mechanical or electric problems occur. To maintain the Write Gate signal in the off state at the time of drive power-on or -off, the basic sequence between the power supply of the controller and drive is as follows:
a. Basic sequence

## Note:

The power supplies of the drive $(+12 \mathrm{~V},+5 \mathrm{~V})$ need not be sequenced in this case.
b. If the controller and the drive share a common supply and the Write Gate interface signal is determined only by +5 V , power sequencing is unnecessary. This is so because the +5 V level is monitored within the drive.
(6) Others

To eliminate AC line noise, a noise filter of the specifications given below should be incorporated in the AC input terminal of the drive power supply.

Attenuation characteristics: $\quad 40 \mathrm{~dB}$ or greater at 10 MHz
Circuit configuration: T type shown below is recommended.

### 2.4 Reliability

(1) Mean Time Between Failures (MTBF)

The estimated MTBF of the drive during its life time is $\mathbf{3 0 , 0 0 0}$ hours after an initial 3-month period.

Note:
The MTBF is defined as follows.
MTBF $=\frac{\text { Operating time (hours) }}{\text { The number of equipment failures from all field sites }}$
Operating time is the total time duration during which the power is ON.
Failure of the equipment means failure that requires repairs, adjustments, or replacement. Mishandling by the operator, failures due to bad environmental conditions, power trouble, controller trouble, cable failures, or other failures not caused by the equipment are not included.
(2) Mean Time To Repair (MTTR)

MTTR is the average time taken by a well trained service technician to diagnose and repair a drive malfunction. The drive is designed for a MTTR of 30 minutes or less.
(3) Service life

Overhaul of the drive is not required for the first five years.
(4) Power loss

Integrity of the data on the disk is guaranteed against all forms of abnormal DC power failure except a power failure during writing. Refer to Section 2.3.5.

### 2.5 Error Rate

Errors detected upon initialization and replaced by an alternate record are not included in the error rate.
(1) Recoverable error rate

A recoverable error which can be read correctly within 16 retries should not exceed 10 errors per $10^{11}$ bits read.
(2) Non-recoverable error rate

Errors which cannot be recovered within 16 retries should not exceed 10 errors per $10^{13}$ bits.
(3) Positioning error rate

The rate of positioning error recoverable by one retry is 10 or less per $10^{7}$ seeks.
(4) Media defects
a. Cylinder 0, Head 0 and 1 are defect free.

$$
\begin{array}{ll}
\text { M2247E } \ldots & 180 \text { or Less (48 per Surface) } \\
\text { M2248E } \ldots & 280 \text { or Less (48 per Surface) } \\
\text { M2249E } \ldots & 380 \text { or Less (48 per Surface) }
\end{array}
$$

c. The maximum defect length is 32 bytes.
d. All defects are recorded on a label and on the media per the ESDI specification. (See Section 2.7.)

### 2.6 Data Format

There are two types of data format-fixed length sector format and soft sector format. Recommended formats are given below.

### 2.6.1 Fixed length sector format

## Notes:

1. The above formats are for 64 sectors $/$ track.
2. The PLO sync field and Inter Sector Gap (ISG) byte numbers are given by the Request Configuration command.
3. All byte numbers other than for the address field are minimum numbers.

### 2.6.2 Soft sector format

## Notes:

1. The PLO sync field and ISG byte numbers are given by the Request Configuration command.
2. The data field is specified by the controller.
3. All byte numbers other than for the address field are minimum numbers.

### 2.6.3 Fixed length sector read/write timing

(1) Format Write

(2) Data Write

(3) Data Read

### 2.6.4 Soft sector read/write timing

(1) Address Mark Write

(2) Address Mark Read

$T_{1}: 24$ bit times minimum
${ }^{*}$ 1: Shows the last position of the address mark

### 2.7 Media Defect List Format

When the unit leaves the factory, a printed media defect list for each drive is sent with it. This information is also written into the media. Formats are described below.

### 2.7.1 Defect list (Hard copy)

The example below shows the printed format for a defect list attached to a drive.
*** MEDIA DEFECT LIST ***
DATA: 87/6/1 PAGE 1

Cylinder address; hexadecimal number (decimal number)

### 2.7.2 Defect list (written on the media)

The drive defect data is written in a specified position in the media in the format standardized by ESDI. The defect list format is different from that of the data area.
(1) Cylinder address

The same defect list is recorded on cylinders 1234 and 1242.
(2) Track format

Defect data for each surface is written into the respective defect list track. There are 64 sectors in one track, all containing the same information.
(3) Sector format

1. $\mathrm{CRC}=\mathrm{X}^{16}+\mathrm{X}^{12}+\mathrm{X}^{5}+1$ (includes sync byte; initial value $=00$ )
2. ID flag byte is 00 .
(4) Defect data format

Byte count from index to define start of defect (resolution is within 7 bit cells of start of flaw).

## Note:

The fields for Month, Day and Year are represented as unsigned binary values i.e. $01-12=01-0 \mathrm{C}, 01-31=01-1 \mathrm{~F}$.

## CHAPTER 3 CONFIGURATION

### 3.1 Mechanical Configuration

Figure 3.1 shows the outside view of the drive. The drive consists of disks, heads, spindle motor, actuator, cover, breather filter, recirculation filter, base, Read/Write preamplifier (PCB), and control (PCB).

Figure 3.1 Outside view

## (1) Disks

The Winchester-type disks have an outer diameter of 130 mm and inner diameter of 40 mm , and are coated with a special lubricating material. The M2247 uses four disks; the M2248, six; and the M2249, eight. The disks are good for at least 10,000 starts and stops.

## (2) Heads

The Whitney-type contact start/stop heads are in contact with the disks when the disks are not moving, but automatically float when the rotation reaches nominal speed. There are $7 \mathrm{read} / \mathrm{write}$ heads in the M2247, 11 in the M2248, and 15 in the M2249. The drive has a prewritten servo pattern for head seek control and for obtaining read/write control information.

Figure 3.2 Disk/head configuration
(3) Spindle motor

The disks are turned by a direct-drive DC motor. The motor attains a very precise rotational speed of $3600 \mathrm{rpm}, \pm 1 \%$. This precision is achieved through a feedback circuit which includes Hall-effect elements mounted within the motor assembly.
(4) Actuator

The actuator, which has a rotary voice coil motor (VCM) structure, consumes little power and generates little heat. The head assembly on the tip of the actuator arm is controlled by electrical feedback from servo information read out through the servo head. Servo information is used as a control signal activating the actuator. It is used as track crossing information in positioning, and track following information during data write/read.
(5) Air circulation

The heads, disks, and actuator are sealed inside a cover to keep out dust and other poliutants.

This head assembly has a closed-loop air recirculation system using the blower effect of the rotating disks to continuously cycle air through the recirculation filter. This filter traps any dust generated inside the enclosure. To prevent negative pressure in the vicinity of the spindle when the disks begin rotating, a breather filter is attached. This breather filter also equalizes the internal air pressure with the atmospheric pressure due to surrounding temperature changes.
(6) Read/write circuit

The read/write circuit uses LSIs and head ICs to prevent errors caused by external noise, and to increase data reliability.

Controller load is reduced and controller design made easier by the on-board VFO circuit and RLL data modulation circuits.
(7) Servo circuit

The positioning and speed of the voice coil motor is controlled by the closed loop servo method, which performs feedback control based on servo information recorded on the servo surface.
(8) Spindle motor driver circuit

This circuit controls the rotational speed by comparing the output frequency of the Hall elements from the motor with the standard frequency generated by the crystal oscillator, so the rotational variation is very low.

### 3.2 Cables

The recommended cable connector specifications are listed in Table 3.1.

Table 3.1 Cable connector specification

| Connector | Name | Spec. No. | Manufacture |
| :---: | :---: | :---: | :---: |
| A cable <br> (34P) | Cable connector | $\begin{aligned} & \text { FCN-767J034-AU/1 } \\ & \text { or 88373-3 } \\ & \text { or 3463-0001 } \end{aligned}$ | $\begin{aligned} & \text { FUJITSU } \\ & \text { AMP } \\ & \text { 3M } \end{aligned}$ |
|  | Drive card edge | - | - |
|  | Cable | $\begin{array}{\|r\|r\|} 455-248-34 \\ \text { or } 171-34 \end{array}$ | SPECTRA-STRIP ANSLEY |
| B cable <br> (20P) | Cable connector | FCN-767J020-AU/1 or $88373-6$ or $3461-0001$ | FUJITSU <br> AMP <br> 3M |
|  | Drive card edge | - | - |
|  | Cable | $\begin{array}{\|c\|} \hline 455-248-20 \\ \text { or } 171-20 \end{array}$ | SPECTRA-STRIP ANSLEY |
| Power cable | Cable connector | 1-480424-0 | AMP |

|  | Contact | 170121-4 | AMP |
|  | Cable | AWG 18 (+ 5V, RTN) <br> AWG 18 ( +12 V, RTN) | - |
| SG cable | Fasten receptacle for cable side | 62187-1 | AMP |
|  | Fasten tab for the drive | 61761-2 | AMP |
|  | cable | AWG 20 |  |

## CHAPTER 4 INSTALLATION

### 4.1 Outer Dimensions

Figure 4.1 shows the outer dimensions and mounting dimensions. All dimensions are in millimeters.

* Front panel is option.
* Different mounting dimensions may be specified for the front panel.

Figure 4.1 Outer dimensions

### 4.2 Notes on Installation

(1) Installation direction

There are three possible installation directions, and the mounting angle must be $\pm 5^{\circ}$ from the horizontal.
(2) Frame structure

The casting/HDA (signal ground) is electrically isolated from the mounting brackets (frame ground). If this isolation is to be maintained within the system, precautions must be taken. An embossed structure (or any other structure that does not touch the aluminum base) as shown below should be used to prevent the aluminum base from touching the frame ground (FG). The mounting screws should project no more than 4 mm from the outer wall of the drive mounting bracket.

(3) Ambient temperature

The operating temperature range of the drive is specified at a distance of 3 cm from the drive.
(4) Service area

### 4.3 Cable Connection

### 4.3.1 Drive connectors location

As shown in Figure 4.2, the A and B cable edge and power connectors are accessed at the bottom rear of the drive, and the SG connector at the bottom of the base.

Figure 4.2 Drive connectors

### 4.3.2 Connection

Connection of drives to a controller is shown in Figure 4.3. In serial mode, up to 7 drives can be connected. To connect drives, the A cable (control signals) must be connected in series and the $B$ cables ( $R / W$ signals) in parallel. The termination of control signals must be performed only at the last drive. The terminator must be removed from all but the last drive. See Figure 4.2 for terminator location.

Figure 4.3 Multi-drive connection

### 4.4 Driver/Receiver

The interface signals are terminated as in Figure 4.4. The total control cable length in a multi-drive configuration should not exceed the specification.

Figure 4.4 Driver/Receivers

### 4.5 DC Grounding

For DC ground, a fasten tab is provided as the SG connector (Figure 4.2).

### 4.6 Fault Lamps and Setting Plugs

### 4.6.1 Short circuits and fault lamp location

Figure 4.5 Location of check terminals and setting circuit

Short plugs are inserted as follows when shipped from the factory.
CNH7: Between 1 and 2, 7 and 8, 9 and 10, 11 and 12, and 15 and 16
CNH6: Between 1 and 2, and 15 and 16
CNH5: Between 15 and 16
CNH4: Between 11 and 12
The following settings are model specific.
$\begin{array}{lll}\text { CNH7: } & \text { Between 3 and 4: } & \text { M2249 } \\ & \text { Between 5 and 6: } & \text { M2248 } \\ & \text { No short plugs between 3 and 4, or 5 and 6: } & \text { M2247 }\end{array}$

### 4.6.2 Setting

(1) Drive select (drive number setting)

| Drive <br> Number | Location |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $1-2$ | $3-4$ | $5-6$ | $7-8$ | $9-10$ | $11-12$ | $13-14$ |  |  |  |  |  |  |  |  |
| 1 | Short | Open | Open | Open | Open | Open | Open |  |  |  |  |  |  |  |  |
| 2 | Open | Short | Open | Open | Open | Open | Open |  |  |  |  |  |  |  |  |
| 3 | Open | Open | Short | Open | Open | Open | Open |  |  |  |  |  |  |  |  |
| 4 | Open | Open | Open | Short | Open | Open | Open |  |  |  |  |  |  |  |  |
| 5 | Open | Open | Open | Open | Short | Open | Open |  |  |  |  |  |  |  |  |
| 6 | Open | Open | Open | Open | Open | Short | Open |  |  |  |  |  |  |  |  |
| 7 | Open | Open | Open | Open | Open | Open | Short |  |  |  |  |  |  |  |  |

(2) Radial option

When pins $15-16$ are shorted, the drive output signals (only A cable signals) are always enabled, regardless of Drive Select signal. Without a jumper here, the output signals are enabled only when the drive is selected.

| Signal gate or not <br> (Select signal) | CNH6 |
| :--- | :---: |
|  | $15-16$ |
| No gate (radial) | Short |
| Gate (daisy) | Open |

(3) Other settings

Setting values are valid when the power is on.
a.

| Location |  | Function |
| :--- | :---: | :---: |
|  |  | Function for motor start control from interface: |
| CNH7 | Open | Yes |
| $1-2$ | Short | No |

b.

| CNH7 |  | Device type selection |
| :---: | :---: | :---: |
| $3-4$ | $5-6$ |  |
| Open | Open | M2247 |
| Open | Short | M2248 |
| Short | Open | M2249 |

c.

| CNH7 | Sector mode setting |
| :---: | :--- |
| $13-14$ |  |
| Open | Drive hard sector (Sector) <br> Short |

d.

| CNH7 |  |  | Sector setting |  |
| :---: | :---: | :---: | :---: | :---: |
| $7-8$ | $9-10$ | $11-12$ | Sectors/Track | Bytes/Sector |
| Open | Open | Open | 16 | 1304 |
| Open | Open | Short | 18 | 1159 |
| Open | Short | Open | 19 | 1098 |
| Open | Short | Short | 32 | 652 |
| Short | Open | Open | 34 | 613 |
| Short | Open | Short | 35 | 596 |
| Short | Short | Open | 64 | 326 |
| Short | Short | Short | 36 | 579 |

## Note:

Valid only in hard sector mode
e.

| CNH7 | Power ON Reset Condition |
| :---: | :--- |
| $15-16$ |  |
| Open | ATTENTION signal and bit 8 of Status byte are set at the READY <br> state just after power-on. |
| Short | ATTENTION signal and bit 8 of status byte are not set <br> at the READY state just after power-on. |

f.

| CNH5 | READY LED lighting conditions |
| :---: | :--- |
| $15-16$ |  |
| Open | Drive select signal not gated <br> Short |
| Drive select signal gated |  |

g.

| CNH3 |  | Data Window Adjustment Early |

| Open | Open | 2 nS |
| Open | Short | 4 nS |
| Short | Open | 6 nS |
| Short | Short |  |

### 4.6.3 Fault lamps

Drive fault states are displayed by the fault lamps ( $0,1,2,3$ ).

| Item | Fault lamp |  |  | State |  |
| :---: | :---: | :---: | :---: | :---: | :--- |
| 1. | X | X | X | O | Spindle motor revolutions fewer than $90 \%$ of standard |
| 2. | X | X | O | X | VCM over current |
| 3. | X | X | O | O | Initial seek time out |
| 4. | X | O | X | X | Write command during Seek operation |
| 5. | X | O | X | O | +12 V/+5 V, less than 80\% of standard |
| 6. | X | O | O | X | Offtrack during Write operation |
| 7. | X | O | O | O | Write Echo check |
| 8. | O | X | X | X | Two or more head ICs selected during Write operation |
| 9. | O | X | X | O | Seek time out |
| 10. | O | X | O | X | Guard band detection during Seek operation |
| 11. | O | X | O | O | Guard band detection in the linear mode |
| 12. | O | O | X | X | Overshoot check |
| 13. | O | O | X | O | Seek command without ONTRACK signal true |
| 14. | O | O | O | X | Head load signal lost after READY |
| 15. | O | O | O | O | Read and Write commands simultaneously issued or |
|  |  |  |  |  | other miscellaneous faults |
| 16. | X | X | X | $\triangle$ | Invalid or unimplemented command fault |
| 17. | X | X | $\triangle$ | X | Interface time out fault |
| 18. | X | X | $\triangle$ | $\triangle$ | Command data parity fault |

$\mathrm{O}:$ On
$\mathrm{X}:$ Off
$\triangle:$ Blinking

Note:

1. Reset using Attention Reset command. Items 2 and 3 can only be cleared with power off.

## CHAPTER 5 INTERFACE

This chapter describes the physical and logical conditions of the signals transferred through the interface between the drive and the controller. The timing is specified at the driver/receiver location.

### 5.1 Signal Lines

## A Cable

$$
\text { Controller side } \quad \text { Drive side }
$$

B Cable
Controller side
Drive side
(1 pair) $\pm$ Write Data
(1 pair) $\pm$ Write Clock

| - Index |
| :--- |
| - Drive Selected |

${ }^{*} 1$ The signal line consists of sector, byte clock, or address mark found signals, selected at the drive. The above figures show sector signal being sent.

### 5.2 Input Signals

(1) Head Select 0 to 3

These signal lines are used to select the head address.
(2) Drive Select 1 to 3

These signal lines are used to validate the drive input/output signals. The signal line selects one of seven drives. The drive number is determined by the switch setting. When it matches the Drive Select (1 to 3) decoding signal, it indicates that the drive has been selected. The Drive Selected signal is sent on $\mathbf{B}$ cable. Drive number 0 does not exist.
(3) Transfer Request

When Command Data or Configuration/Status Data is transferred, this signal line is used with the Transfer Acknowledge signal as a handshake signal.
(4) Command Data

This signal line accepts commands controlling the drive. It is 16-bit sequential data with odd parity. This signal is transferred from the controller to the drive by the Transfer Request and Transfer Acknowledge signals. Transfer begins with the most significant bit.
(5) Read Gate

This signal line enables read data from the selected data head in the drive. Read data is valid $9.6 \mu \mathrm{~s}$ after the read gate is active.
(6) Write Gate

This signal line enables write current in the selected data head in the drive.
(7) Write Clock (balanced transmission)

This is a bit data cycle clock sent from the controller. The frequency is derived from the Read/Reference Clock from the drive.
(8) Write Data (balanced transmission)

This signal pair sends NRZ data to the disk from the controller, and is clocked by leading edge of the Write Clock in the drive.
(9) Address Mark Enable

This signal allows the address mark to be written when Write Gate is active, and is three bytes long. When neither the Write Gate nor the Read Gate are active, it searches for the address mark.

### 5.3 Output Signals

(1) Index

This negative pulse is produced once per revolution and indicates the beginning of the track.
(2) Ready

If Ready signal is active after the heads are on cylinder, the Read, Write, or Seek operations is possible on the selected drive. The Ready signal is sent on both $A$ and B Cables.
(3) Sector/Byte Clock/Address Mark Found

One index period is divided into 16 to 64 sectors, and sent as a sector pulse. However, the number of sectors depends on switch selection. When the byte clock is necessary for the controller to obtain the various sectors, or when an address mark is used, the pulse is sent as Byte Clock or Address Mark Found. The selection depends on the drive jumper setting.
(4) Attention

This signal sends a standard status request to the controller. The signal indicates that fault or status changes have occurred, and that the Write operation is inhibited. It is reset by the control command.
(5) Transfer Acknowledge

This signal is used in Command Data and Configuration/Status signal handshake transfers in conjunction with Transfer Request. See subsection 5.2.5.
(6) Configuration/Status Data

When commands are received from the controller, this signal sends each status to the controller. This signal is 16 -bit serial data with odd parity. It is transferred when a handshake occurs between the Transfer Request and Transfer Acknowledge signals. Transfer is performed beginning with the most significant bit.
(7) Drive Selected

This signal indicates that the drive number specified by the controller matches the drive number set in the drive. It indicates that the drive has been selected.
(8) Command Complete

This signal is sent even when the drive has not been selected. The gate is not enabled by the Drive Selected signal. This signal is active during the conditions given below.
a. After power-on until cylinder 0 is on track (until initial seek is complete)
b. From when Command Data is received to when the command is complete
(9) Read Data (balanced transmission)

Read Data is sent to the controller as an NRZ signal which becomes valid $9.6 \mu \mathrm{~s}$ after Read Gate. It is sent synchronized with the falling edge of Read Clock.
(10) Read/Reference Clock

This is a pulse at 1 -bit intervals. The Read/Reference Clock is synchronized with the servo clock during write, and with Read Data from the data head during Read.

### 5.4 Command Data Format

Command data format is 17 bits, 16 bits +1 parity, and is shown in the table below.

P: Parity (Odd)
(1) Function/Modifier/Parameter bit

| Function bit |  |  |  | Command function definition | Modifier bit 11 to 8 | Parameter bit 11 to 0 | Configuration/ Status Data |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 15 | 14 | 13 | 12 |  |  |  |  |
| 0 | 0 | 0 | 0 | Seek | No | Yes | No |
| 0 | 0 | 0 | 1 | Recalibrate | No | No | No |
| 0 | 0 | 1 | 0 | Request Status | Yes | No | Yes |
| 0 | 0 | 1 | 1 | Request Configuration | Yes | No | Yes |
| 0 | 1 | 0 | 0 | (Reserved) | - | - | - |
| 0 | 1 | 0 | 1 | Control | Yes | No | No |
| 0 | 1 | 1 | 0 | (Reserved) | - | - | - |
| 0 | 1 | 1 | 1 | Track Offset | Yes | No | No |
| 1 | 0 | 0 | 0 | Initiate Diagnostics | No | No | No |
| 1 | 0 | 0 | 1 | Set Bytes/Sector | No | Yes | No |
| 1 | 0 | 1 | 0 | (Reserved) | - | - | - |
| 1 | 0 | 1 | 1 | (Reserved) | - | - | - |
| 1 | 1 | 0 | 0 | (Reserved) | - | - | - |
| 1 | 1 | 0 | 1 | (Reserved) | - | - | - |
| 1 | 1 | 1 | 0 | (Reserved) | - | - | - |
| 1 | 1 | 1 | 1 | (Reserved) | - | - | - |

Notes:

1. All unused bits must be set to 0 .
2. When a reserved pattern is received, an Invalid command is sent in reply.
a. Seek ( 0000 )

Seek is performed to the cylinder specified by bits 0 to 11 .
b. Recalibrate (0001)

Seek (R.T.Z.) is performed to Cylinder 0. Track Offset is reset.
c. Request Status (0010)

This command is used when the controller requires the status held by the drive. Status defined by bits 11 to 8 is sent to the controller side as 16 -bit data with odd parity. In the condition shown in the following table, bits 11 to 8 are all zeros.

| Bit <br> Position | Function | Bit <br> details |
| :---: | :---: | :---: |
| 15 | (Reserved) | 0 |
| 14 | Removable Media Not Present | 0 |
| 13 | Write Protected (Removable Media) | 0 |
| 12 | Write Protected (Fixed Media) | $\mathbf{X}(0)$ |
| 11 | (Reserved) | 0 |
| 10 | (Reserved) | $\mathbf{0}$ |
| 9 | Spindle Motor Stopped | $\mathbf{X}(0)$ |
| 8 | Power On Reset Conditions Exist | $\mathbf{X}(0)$ |
| 7 | Command Data Parity Fault | $\mathbf{X}(0)$ |
| 6 | Interface Fault | $\mathbf{X}(0)$ |
| 5 | Invalid command Fault | $\mathbf{X}(0)$ |
| 4 | Seek Fault | $\mathbf{X}(0)$ |
| 3 | Write Gate with Track Offset Fault | $\mathbf{X}(0)$ |
| 2 | Vendor Unique Status Available | $\mathbf{0}(0)$ |
| 1 | Write Fault | $\mathbf{X}(0)$ |
| 0 | Removable Media Changed | $\mathbf{0}$ |

## Notes:

1. X varies according to the drive status. Numbers in parentheses show the normal status.
2. X varies according to the plug setting at the READY state just after power-on. (Refer to the item 4.6.2.e).
d. Request Configuration (0011)

Specified drive specifications are sent to the controller. Specifications are determined by combinations of bits 11 to 8 .

| Command modifier bit |  |  |  |  |
| :--- | :---: | :---: | :---: | :--- |
| 11 | 10 | 9 | 8 |  |
| 0 | 0 | 0 | 0 |  |
| 0 | General Configuration |  |  |  |
| 0 | 0 | 0 | 1 |  |
| Number of Cylinders (Fixed) |  |  |  |  |
| 0 | 0 | 1 | 0 |  |
| Number of Cylinders (Removable) |  |  |  |  |
| 0 | 0 | 1 | 1 | Number of Heads |
| 0 | 1 | 0 | 0 |  |
| 0 | 0 | Min. Unformatted Bytes/Track |  |  |
| 0 | 1 | 1 | 0 | Unformatted Bytes/Sector (Hard Sector) |
| 1 | 1 | 1 | 1 | Sectors/Track (Hard Sector) |
| 1 | 0 | 0 | 0 | Min. Bytes/ISG Field |
| 1 | 0 | 0 | 1 | Min. Bytes/PLO Sync Field |
| Number of words of vender unique status available |  |  |  |  |

| Bit <br> Position | 〈Function 〉 | Bit |
| :---: | :--- | :---: |
| 15 | Tape Drive | 0 |
| 14 | Format Speed Tolerance Gap Required | 0 |
| 13 | Track Offset Tolerance Gap Required | 1 |
| 12 | Data strobe Offset Option Available | 0 |
| 11 | Rotational Speed Tolerance $>0.5 \%$ | 0 |
| 10 | Transfer Rate $>10 \mathrm{MHz}$ | 0 |
| 9 | Transfer Rate $>5 \mathrm{MHz} \leqq 10 \mathrm{MHz}$ | 1 |
| 8 | Transfer Rate $\leqq 5 \mathrm{MHz}$ | 0 |
| 7 | Removable Catridge Drive | 0 |
| 6 | Fixed Drive | 1 |
| 5 | Spindle Motor Control Option Implemented | $\left({ }^{*} 1\right)$ |
| 4 | Head Switch Time $>15 \mu \mathrm{~m}$ | 0 |
| 3 | RLL Encoded (Note MFM) | 1 |
| 2 | Controller Soft Sectored (Address Mark) | $(* 2)$ |
| 1 | Drive Hard Sectored (Sector Pulses) | $(* 2)$ |
| 0 | Controller Hard Sectored (Byte Clock) | $(* 2)$ |

*1 Determined by the setting plug of the disk drive. If the plug is set to the spindle motor control option, bit 5 is set to 1 , otherwise it is set to 0 .
*2 Determined by the setting plug of the disk drive. Only the bit for the specified mode is set to 1 ; other bits are set to 0 .
e. Control (0101)

This command has the control functions shown in the table below.

| Command modifier bit |  |  |  | Function |
| :---: | :---: | :---: | :---: | :---: |
| 11 | 10 | 9 | 8 |  |
| 0 | 0 | 0 | 0 | Reset Interface Attention \& Standard Status |
| 0 | 0 | 0 | 1 | (Reserved) |
| 0 | 0 | 1 | 0 | Stop Spindle Motor* |
| 0 | 0 | 1 | 1 | Start Spindle Motor* |
| 0 | 1 | 0 | 0 | (Reserved) |
| 0 | 1 | 0 | 1 | (Reserved) |
| 0 | 1 | 1 | 0 | (Reserved) |
| 0 | 1 | 1 | 1 | (Reserved) |
| 1 | X | X | X | (Reserved) |

* This function is valid only when the drive is set to support spindle motor start/stop. When it is not set, rotation starts with power-on, and an invalid command is sent in reply.
f. Track Offset (0111)

This command sets offset during ontrack. The offset value and direction are selected by a combination of bits 11 to 8 . Offset is reset by the Seek or R.T.Z. command.

| Command modifier bit |  |  |  |  |  |  |  | Function |  |
| :--- | :---: | :---: | :---: | :--- | :--- | :---: | :---: | :---: | :---: |
| 11 | 10 | 9 | 8 |  | Track Offset |  |  |  |  |
| 0 | 0 | 0 | 0 | Restore offset to 0 |  |  |  |  |  |
| 0 | 0 | 0 | 1 | Restore offset to 0 |  |  |  |  |  |
| 0 | 0 | 1 | 0 | Positive offset 1 |  |  |  |  |  |
| 0 | 0 | 1 | 1 | Negative offset 1 |  |  |  |  |  |
| 0 | 1 | 0 | 0 | Positive offset 2 |  |  |  |  |  |
| 0 | 1 | 0 | 1 | Negative offset 2 |  |  |  |  |  |
| 0 | 1 | 1 | 0 | Positive offset 3 |  |  |  |  |  |
| 0 | 1 | 1 | 1 | Negative offset 3 |  |  |  |  |  |
| 1 | X | X | X | (Reserved) |  |  |  |  |  |

g. Initiate Diagnostics (1000)

This command performs drive diagnostics. Command Complete is sent when the diagnostics terminate normally, and Attention is sent with Command Complete after it terminates abnormally.
h. Set Unformatted Bytes;024Sector (1001)

This command indicates the number of unformatted bytes per sector by bits 11-0. It is effective only when the disk drive is in the hard sector mode; it is treated as an invalid command when the disk drive is in other modes. When this command is not used, the number of sectors and that of bytes specified by the drive setting plug are effective. Once the values are set, they are retained until this command is executed again or until the power is turned off.

| Sector | Bit position (bit 11-0) |  |  | Bytes/Sector | Remaining sector length |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 5 | 1111 | 1111 | 1111 | 4095 | 389 |
| 6 | 1101 | 1001 | 0101 | 3477 | 2 |
| 7 | 1011 | 1010 | 0100 | 2980 | 4 |
| 8 | 1010 | 0011 | 0000 | 2608 | 0 |
| 9 | 1001 | 0000 | 1110 | 2318 | 2 |
| 10 | 1000 | 0010 | 0110 | 2086 | 4 |
| 11 | 0111 | 0110 | 1000 | 1896 | 8 |
| 12 | 0110 | 1100 | 1010 | 1738 | 8 |
| 13 | 0110 | 0100 | 0100 | 1604 | 12 |
| 14 | 0101 | 1101 | 0010 | 1490 | 4 |

| 63 | 0001 | 0100 | 1011 | 342 |
| 64 | 0001 | 0100 | 0110 | 32 |
| 65 | 0001 | 0100 | 0000 | 336 |

The above table shows the Sector and Byte numbers.

## Notes:

1. If the number of Sectors specified is greater than 255 , the disk drive treats the Set Unformatted Bytes per Sector command as an invalid command.
2. Calculation formula:
$Y=\frac{20864}{X}$ Absolute value: Number of bytes per sector $\begin{aligned} & \text { N } \quad \text { Number of sectors per track) }\end{aligned}$
$Z=20864-$ (ABS.Y) X X Remaining sector length
i. (1010) to (1111) are reserved.

### 5.5 Timing Specifications

(1) Command Data

(2) Transfer Request

(3) Command and Configuration/Status Data

*1 When the controller does not need the response of Configuration/Status Data, Command Complete is sent when the command has been executed.
*2 Attention rises with Command Complete when an error occurs.
(4)

Index/Sector/Byte Clock

(5) Write/Read Data
a. Write Data, Write Clock

b. Read Data, Read/Reference Clock

### 5.6 Serial Mode Signal Lines Pin Assignment

(1) CNA signal lines pin assignment

| 2 | -Head Select $2^{3}$ | 1 | GND |
| ---: | :--- | ---: | :--- |
| 4 | -Head Select $2^{2}$ | 3 | GND |
| 6 | -Write Gate | 5 | GND |
| 8 | -Configuration/-Status Data | 7 | GND |
| 10 | -Transfer Acknowledge | 9 | GND |
| 12 | -Attention | 11 | GND |
| 14 | -head Select 2 |  |  |
| 16 | -SEC/-AMF | 13 | GND |
| 18 | -Head Select 2 | 15 | GND |
| 20 | -Index | 17 | GND |
| 22 | -Ready | 19 | GND |
| 24 | -Transfer Request | 21 | GND |
| 26 | -Drive Select 1 | 23 | GND |
| 28 | -Drive Select 2 | 25 | GND |
| 30 | -Drive Select 3 | 27 | GND |
| 32 | -Read Gate | 29 | GND |
| 34 | -Command Data | 31 | GND |

## Notes:

1. The key pin is between pin 4 and pin 6.
2. -SEC/-BYTE CL/-AMF: Sector/Byte Clock/Address Mark Found
(2) CNB signal lines arrangement

| 2 | -SEC/-AMF | 1 | -Drive Selected |
| ---: | :--- | ---: | :--- |
| 4 | -Address Mark Enable | 3 | -Command Complete |
| 6 | GND | 5 | -Reserved (Logical 0 level) |
| 8 | -Write Clock | 7 | +Write Clock |
| 10 | +Read/Reference Clock | 9 | Reserved (Logical 0 level) |
| 12 | GND | 11 | -Read/Reference Clock |
| 14 | -NRZ Write Data | 13 | +NRZ Write Data |
| 16 | GND | 15 | GND |
| 18 | -NRZ Read Data | 17 | +NRZ Read Data |
| 20 | -Index | 19 | GND |

## Notes:

1. The key pin is between pin 8 and pin 10 .
2. -SEC/-BYTE CL/-AMF: Sector/Byte Clock/Address Mark Found

## CHAPTER 6 DRIVE SPECIFICATIONS

Table 6.1 shows models and part numbers.

Table 6.1 Models and part numbers

| Item | Model | Part number | Mounting screw | Formatting |
| :---: | :---: | :--- | :--- | :--- |
| 1 | M2247E | B03B-4945-B001A | M4 | ESDI Format |
| 2 | M2248E | B03B-4945-B002A | M4 | ESDI Format |
| 3 | M2249E | B03B-4945-B003A | M4 | ESDI Format |
| 4 | M2247E | B03B-4945-B001A\#N | \#6-32UNC | ESDI Format |
| 5 | M2248E | B03B-4945-B002A\#N | \#6-32UNC | ESDI Format |
| 6 | M2249E | B03B-4945-B003A\#N | \#6-32UNC | ESDI Format |

## CHAPTER 7 SPARE PARTS

Table 7.1 shows spare parts and numbers.

Table 7.1 Spare parts

| Item | Part name | Number |
| :---: | :--- | :--- |
| 1 | Control PCB | B17B-0370-0060A |
| 2 | Read/write preamplifier PCB | B17B-0390-0060A |
