# LIST OF EFFECTIVE PAGES

The List of Effective Pages gives the date of the current edition, and lists the dates of all pages of that edition and all updates. Within the manual, any page changed since the last edition is indicated by printing the date the changes were made on the bottom of the page. Changes are marked with a vertical bar in the margin. If an update is incorporated when an edition is reprinted, these bars and dates remain. No information is incorporated into a reprinting unless it appears as a prior update.

Third Edition.....November 1982

Effective Pages

Date

ALL..... NOV 1982

# PRINTING HISTORY

New editions are complete revisions of the manual. Update packages, which are issued between editions, contain additional and replacement pages to be merged into the manual by the customer. The date on the title page and back cover of the manual changes only when a new edition is published. When an edition is reprinted, all the prior updates to the edition are incorporated. No information is incorporated into a reprinting unless it appears as a prior update. The edition does not change.

First Edition.....	JAN 1979
Second Edition.....	APR 1981
Update No. 1.....	OCT 1981
Third Edition.....	NOV 1982

# PREFACE

The information included in this manual is provided by Hewlett Packard to describe the internal organization of MPE. It is not intended to be a guide to the modification of MPE.

Any modification of the tables presented in this manual by HP 3000 users is strongly discouraged as serious damage to the operating system may result. Furthermore, Hewlett-Packard will not support, correct, or attend to any resulting modification of the MPE Operating System Software.

It is not the intention of Hewlett-Packard to update this manual on any scheduled basis. Hewlett-Packard is not responsible for problems arising from inaccuracies existing in this manual, nor is it responsible for the correction of any inaccuracies.

TABLE OF CONTENTS

CHAPTER 1 MEMORY LAYOUT

FIXED LOW MEMORY (SERIES II/III) . . . . . 1-1  
 FIXED LOW MEMORY (SERIES 30/33) . . . . . 1-2  
 FIXED LOW MEMORY (SERIES 44) . . . . . 1-25  
 SYSTEM GLOBAL AREA . . . . . 1-6  
 SYSGLOB EXTENSION . . . . . 1-17  
 SYSDB WORDS . . . . . 1-19  
 ALLOW MASK FORMAT . . . . . 1-20  
 LOGGING RELATED LOCATIONS . . . . . 1-21  
 FLAGX . . . . . 1-21  
 PROCESS STOP LIST GENERAL LAYOUT . . . . . 1-22  
     Entry Format . . . . . 1-22  
     Preassigned Entries . . . . . 1-22  
 INITIAL MEMORY ALLOCATION . . . . . 1-23  
     Initial Memory Layout . . . . . 1-25

CHAPTER 2 MEMORY MANAGEMENT TABLES

SEGMENT TABLE STRUCTURE . . . . . 2-1  
     Pointers and DST #'s of Segment Table . . . . . 2-2  
         Components  
         Standard Segment Identifier Format . . . . . 2-3  
         DST Entry Formats . . . . . 2-3  
             DST Entry 0 Format . . . . . 2-3  
             DST General Entry Format . . . . . 2-3  
         CST Entry Formats . . . . . 2-5  
             CST Entry 0 Format . . . . . 2-5  
             CST General Entry Format . . . . . 2-5  
         CST Entry Field Descriptions . . . . . 2-6  
         Table Format - CSTBLK . . . . . 2-6  
         Program Blocks and the CSTXMAP . . . . . 2-7  
             Entry Format - CST Extension Block . . . . . 2-7  
         Fixed DST Entry Assignments . . . . . 2-8  
 SWAP TABLES . . . . . 2-11  
     SWAPTAB . . . . . 2-11  
         SWAPTAB Entry 0 Format . . . . . 2-11  
         SWAPTAB Unassigned Entry Format . . . . . 2-11  
     Segment Locality Lists (SLL) . . . . . 2-12  
         SLL Header Format . . . . . 2-13  
         SLL Entry Format . . . . . 2-14  
         Special Request Table . . . . . 2-15  
 MAIN MEMORY REGION HEADERS AND TRAILERS . . . . . 2-16  
     Available Region Headers and Trailers . . . . . 2-17  
         Available Region Global Header Format . . . . . 2-17  
         Available Region Subregion Header . . . . . 2-17

Available Region Subregion Trailer . .	2-18
Available Region Global Trailer . . .	2-18
Reserved Region Headers and Trailers . .	2-19
Reserved Region Global Header Format	2-19
Reserved Region Subregion Header . . .	2-20
Reserved Region Subregion Trailer . .	2-20
Reserved Region Global Trailer . . . .	2-21
Assigned Region Headers and Trailers . .	2-22
Assigned Region Global Header Format	2-22
Assigned Region Subregion Header . .	2-22
Assigned Region Subregion Trailer . .	2-23
Region Header and Trailer Field	
Descriptions . . . . .	2-24
SPACE ALLOCATION STRUCTURES . . . . .	2-26
Available Region List (ARL) . . . . .	2-26
Available Region Size Bit Map (ARSBM)	2-27

CHAPTER 3     DISC LAYOUT  
-----

SYSTEM DISC LAYOUT . . . . .	3-1
DISC LABEL . . . . .	3-4
System Volume . . . . .	3-4
Serial Volume . . . . .	3-6
Master Volume . . . . .	3-8
Slave Volume . . . . .	3-10
DEFECTIVE TRACKS TABLE . . . . .	3-12
DEFECTIVE SECTOR TABLE . . . . .	3-14
RESERVED AREA BIT MAP . . . . .	3-15
DISC COLD LOAD INFORMATION TABLE . . . . .	3-16
INITIAL PROGRAM CST MAP . . . . .	3-20
VIRTUAL DISC SPACE MANAGEMENT STRUCTURES . .	3-22
Virtual Disc Space Management Table . . .	3-22
General Structure . . . . .	3-22
VDMSTAB Entry 0 Format . . . . .	3-23
VDMSTAB General Entry Format . . . . .	3-24
VOLUME TABLE . . . . .	3-25
Typical Private Volume Entry . . . . .	3-26
Typical System Volume Entry . . . . .	3-27

CHAPTER 4     DIRECTORY  
-----

OVERVIEW OF DIRECTORY . . . . .	4-2
DIRECTORY DATA SEGMENT . . . . .	4-3
DIRECTORY POINTER AREA . . . . .	4-5
DIRECTORY SPACE DATA SEGMENT . . . . .	4-6
DIRECTORY STRUCTURE . . . . .	4-7
DIRECTORY DEFINITIONS . . . . .	4-8

INDEX BLOCK PREFIX . . . . .	4-8
INDEX ENTRY . . . . .	4-9
ACCOUNT ENTRY . . . . .	4-9
GROUP ENTRY . . . . .	4-11
FILE ENTRY . . . . .	4-14
USER ENTRY . . . . .	4-14
USER ATTRIBUTES/CAPABILITY . . . . .	4-15
VOLUME SET DEFINITION ENTRY . . . . .	4-16
GVS LINKAGE, INFO, VOLFLAGS, VOLINFO . . . . .	4-17
VOLUME SET CLASS ENTRY . . . . .	4-18
GVC LINKAGE,INFO . . . . .	4-19
VOLUME MASK FORMAT . . . . .	4-19
VOLUME TABLE . . . . .	(SEE CHAPTER 3)

CHAPTER 5      LOCK RESOURCES  
-----

SIR ALLOCATION . . . . .	5-1
MULTIPLE SIR ALLOCATION . . . . .	5-2
SIR TABLE INFORMATION . . . . .	5-3
SIR ENTRY FORMATS . . . . .	5-4
RIN TABLE GENERAL LAYOUT . . . . .	5-5
ALLOCATION AND LOCKING OF LOCAL RINS . . . . .	5-6
ALLOCATION AND LOCKING OF FILE RINS . . . . .	5-7
ALLOCATION AND LOCKING OF GLOBAL RINS . . . . .	5-8

CHAPTER 6      FILE SYSTEM  
-----

FILE SYSTEM INTRODUCTION . . . . .	6-1
FILE SYSTEM OVERVIEW . . . . .	6-1
Buffers . . . . .	6-2
TABLE FORMATS . . . . .	6-3
File System Section of PCBX (PXFILE) . . . . .	6-3
Overhead . . . . .	6-4
PXFILE Control Block Table . . . . .	6-6
Available Block . . . . .	6-7
Active File Table (AFT) . . . . .	6-8
File Control Block Table (CBTAB) . . . . .	6-10
Overhead . . . . .	6-11
Vector Table . . . . .	6-13
Control Block Area . . . . .	6-16
Access Control Block (ACB) . . . . .	6-17
Logical Access Control Block (LACB) . . . . .	6-18
Physical Access Control Block (PACB) . . . . .	6-20
File Control Block . . . . .	6-36
File Label (FLAB) . . . . .	6-42
File Multi-Access Vector Table (FMAVT) . . . . .	6-50
Zero Entry Format . . . . .	6-50

Typical Entry Format . . . . .	6-51
System Global Area (SYSGLOB) . . . . .	6-52
SIRs, Locks, and Deadlocks . . . . .	6-53

CHAPTER 7      PROCESS TABLES  
-----

PROCESS TABLES INTRODUCTION . . . . .	7-1
PROCESS CONTROL BLOCK (PCB)	
TABLE STRUCTURE AND FORMAT . . . . .	7-1
Fixed Cells Related to PCB . . . . .	7-1
PCB Entry 0 Format . . . . .	7-2
Unassigned PCB Entry Format . . . . .	7-3
Assigned PCB Entry Format . . . . .	7-4
PCB Assigned Entry Field Descriptions . . . . .	7-5
PROCESS CONTROL BLOCK EXTENSION (PCBX)	
STRUCTURE AND FORMAT . . . . .	7-8
PCBX General Structure . . . . .	7-8
PXGLOB Format . . . . .	7-9
PXFIXED Assignments . . . . .	7-10
PXFIXED Expansion Bitmap . . . . .	7-14
File System Section of PCBX (PXFILE)	7-15
Overhead (PXFILE) . . . . .	7-16
Control Block Table (PXFILE) . . . . .	7-19
Available Block Area (PXFILE) . . . . .	7-21
Available File Table (AFT) (PXFILE) . . . . .	7-21
PCBX for Core Resident System Process	
Stacks . . . . .	7-24
PROCESS TO PROCESS COMMUNICATION TABLE . . . . .	7-25
SUB-SYSTEM RESERVED DL AREA . . . . .	7-26
FORTTRAN LOGICAL UNIT TABLE (FLMT) . . . . .	7-27

CHAPTER 8      JOB TABLES  
-----

JMAT STRUCTURE (JOB MASTER TABLE) . . . . .	8-1
JMAT ENTRY . . . . .	8-3
JOB STATES . . . . .	8-4
JPCNT - JOB PROCESS COUNT TABLE . . . . .	8-5
GLOBAL RIN FLAG TABLE . . . . .	8-5
JCUT - JOB CUTOFF TABLE . . . . .	8-6
JIT - JOB INFORMATION TABLE . . . . .	8-7
JDT - JOB DIRECTORY TABLE . . . . .	8-10
JOB DATA SEGMENT DIRECTORY ENTRY . . . . .	8-11
JOB TEMPORARY FILE ENTRY . . . . .	8-11
FILE EQUATION FILE ENTRY . . . . .	8-12
JOB LINE EQUATION ENTRY . . . . .	8-13
JOB CONTROL WORD TABLE . . . . .	8-14
AOPTIONS AND FOPTIONS WORD BREAKDOWN . . . . .	8-15

PMASK WORD BREAKDOWN . . . . .	8-16
UCOP REQUEST QUEUE (DST#9) . . . . .	8-17
UCOP ENTRY FORMAT . . . . .	8-18

CHAPTER 9      RELOCATABLE OBJECT CODE  
-----

USL FILES - GENERAL INFO . . . . .	9-1
RECORD 0 AND OVERALL USL FILE FORMAT . . . . .	9-1
Data Descriptors, Passed Parameters . . . . .	9-5
Entry Types 0,1 . . . . .	9-6
Entry Types 2,4-Notes for SPL and FORTRAN . . . . .	9-7
Entry Type 2 . . . . .	9-8
Entry Types 3,4 . . . . .	9-11
Entry Type 5 . . . . .	9-14
Entry Type 6 . . . . .	9-15
Entry Type 7 . . . . .	9-17
Entry Type 8 . . . . .	9-19
Entry Header Format . . . . .	9-21
Header Types 0,1 . . . . .	9-22
Header Types 2,3 . . . . .	9-23
Header Types 4,5 . . . . .	9-24
Header Types 6,7 . . . . .	9-25
Header Type 8 . . . . .	9-27
Header Type 9 . . . . .	9-28
Header Types 10,11 . . . . .	9-30
RL FILE FORMAT . . . . .	9-31
Storage Management . . . . .	9-32
Entry Point Directory . . . . .	9-33
Typical Directory Entry . . . . .	9-34
Procedure Info Block . . . . .	9-35
Headers . . . . .	9-36

CHAPTER 10      PREPARED OBJECT CODE  
-----

PROGRAM FILE FORMAT . . . . .	10-1
FLAGS . . . . .	10-3
FLAGS2 . . . . .	10-4
CST Remapping Array . . . . .	10-5
Segment Descriptor Array . . . . .	10-5
Global Area Format . . . . .	10-5
External List . . . . .	10-6
Entry Point List . . . . .	10-7
The Code Segment with Patch . . . . .	10-8
Patch Area . . . . .	10-8
PMAP Info . . . . .	10-9
PMAP Type Table . . . . .	10-9
PMAP Records . . . . .	10-10

Type 0 Segment PMAP Record . . . . .	10-10
Type 1 Procedure PMAP Record . . . . .	10-10
Type 2 Secondary Entry PMAP Record . . . . .	10-11
SL FILE FORMAT . . . . .	10-12
Storage Management . . . . .	10-14
Entry Point Directory . . . . .	10-14
Typical Directory Entry . . . . .	10-15
Code Segment Linkage Structure . . . . .	10-16
REFERENCE TABLE STRUCTURE . . . . .	10-18
Reference Table Entry . . . . .	10-19
The Code Segment With Patch Area . . . . .	10-20
Patch Area . . . . .	10-20
PMAP Info . . . . .	10-21
PMAP Type Table . . . . .	10-21
PMAP Records . . . . .	10-22
Type 0 Segment PMAP Record . . . . .	10-22
Type 1 Procedure PMAP Record . . . . .	10-22
Type 2 Secondary Entry PMAP Record . . . . .	10-23

CHAPTER 11      LOADER

-----

GENERAL INFORMATION . . . . .	11-1
LOADER SEGMENT ALLOCATION . . . . .	11-2
LOADER SEGMENT TABLE PRIMARY DB . . . . .	11-3
REFERENCE COUNT TABLE . . . . .	11-4
SEGMENT TRANSFORM TABLE . . . . .	11-4
ENTRY INDEX TABLE . . . . .	11-5
DIRECTORY . . . . .	11-5
ENTRY POINTER . . . . .	11-6
SBUFO . . . . .	11-7
DIRECTORY ENTRIES . . . . .	11-8
Definitions . . . . .	11-10
LOADER CACHE . . . . .	11-12
LOADER COMMUNICATION TABLE . . . . .	11-13

CHAPTER 12      PRIVATE VOLUMES/SERIAL DISC

-----

MOUNTED VOLUME TABLE . . . . .	12-1
PRIVATE VOLUME USER TABLE . . . . .	12-4
BIND NAMES DATA SEGMENT . . . . .	12-6
SERIAL DISC TABLES AND DATA STRUCTURES . . . . .	12-8
Data Record Format . . . . .	12-8
End of File Format . . . . .	12-9
Contiguous Block Format . . . . .	12-10
Hole Format . . . . .	12-10
Gap Table Format . . . . .	12-11
SDISC Extra Data Segment . . . . .	12-13

CHAPTER 13    I/O  
 -----    ---

I/O TABLE LINKAGE . . . . . 13-1

DEVICE REFERENCE TABLE (DRT) . . . . . 13-2

    Series II/III . . . . . 13-2

    Series 33/44 . . . . . 13-2

DRIVER LINKAGE TABLE (DLT) . . . . . 13-3

LOGICAL-PHYSICAL DEVICE TABLE (LPDT) . . . . . 13-4

    LPDT Entry . . . . . 13-6

OVERVIEW OF DEVICE TABLES IN DST %16 . . . . . 13-8

LOGICAL DEVICE TABLE . . . . . 13-9

    Zero Entry Format . . . . . 13-9

    Typical Entry Format . . . . . 13-9

DEVICE CLASS TABLE . . . . . 13-11

    Typical Entry Format . . . . . 13-11

LOGICAL DEVICE TABLE EXTENSION (LDTX) . . . . . 13-12

    Zero Entry . . . . . 13-12

    Typical Entry . . . . . 13-12

    Terminal Entry . . . . . 13-13

    Serial Disc Entry . . . . . 13-14

    CIPER Entry . . . . . 13-15

    System or Private Volume Disc Entry . . . . . 13-15

INTERRUPT LINKAGE TABLE (ILT) . . . . . 13-16

    ILT for Series II/III . . . . . 13-16

    ILT for Series 30/33/44 and  
         Series II/III (HP-IB) . . . . . 13-17

    ILT Terminology . . . . . 13-18

DEVICE INFORMATION TABLE (DIT) . . . . . 13-19

    DIT FOR SERIES II/III . . . . . 13-19

    DIT Terminology (Series II/III) . . . . . 13-20

    DIT for Series 30/33/44 . . . . . 13-21

    DIT Terminology (Series 30/33) . . . . . 13-22

    DIT for SIO Devices . . . . . 13-23

    DIT for Fixed Head Disc . . . . . 13-25

    DIT for 7900A and 2888A Moving Head Disc . . . . . 13-26

    DIT for 7905/7906/7920/7925 . . . . . 13-28

    DIT for CS 80 Disc . . . . . 13-30

    DIT for 7970/71 Magnetic Tape . . . . . 13-33

    DIT for 7976 Magnetic Tape . . . . . 13-36

    DIT for Series III Card Reader . . . . . 13-39

    DIT for HPIB Card Reader . . . . . 13-41

    Line Printer DIT (Series II/III) . . . . . 13-43

    2608 Line Printer DIT (HPIB Systems) . . . . . 13-47

    2608S (HIOCIPRO) Line Printer DIT . . . . . 13-50

    2631 or 2619A Line Printer DIT (for  
         HPIB Systems) . . . . . 13-53

    2680A DIT . . . . . 13-55

    I/O Status Block . . . . . 13-57

    30119 Card Reader/Punch DIT . . . . . 13-60

INP DIT . . . . .	13-62
DISC REQUEST TABLE AND DISC REQUESTS . . .	13-70
Disc Request Table . . . . .	13-71
Disc Request Element Format. . . . .	13-72
IOQ TABLE LAYOUT . . . . .	13-75
IOQ Element . . . . .	13-77
IO System Status Returns . . . . .	13-79
IOQ Element for 7976A Magnetic Tape . .	13-81
Series II/III Line Printer IOQ Element	13-83
2608 Line Printer IOQ Element - HPIB	
Systems . . . . .	13-86
2608S (CIPER) IOQ Element . . . . .	13-89
2619A and 2631 Line Printer IOQ	
Element - HPIB Systems . . . . .	13-92
Series III Card Reader IOQ . . . . .	13-96
IOQ Element for HPIB Card Reader . . .	13-99
CS 80 Disc IOQ Element . . . . .	13-101
CS 80 Integrated Cartridge Tape IOQ	
Element . . . . .	13-104
SBUF AND TBUF TABLE LAYOUT . . . . .	13-108
Table Element Allocation (TBUF and SBUF)	13-109
ICS GLOBAL . . . . .	13-111
ICS Global Cells, with Initial Values	13-113
CS80 Disc Interrupt Linkage Table (CILT)	13-114

CHAPTER 14 SPOOLING

INPUT DEVICE DIRECTORY/OUTPUT DEVICE	
DIRECTORY . . . . .	14-1
XDD Subentry Format . . . . .	14-1
SPOOK OUTPUT TAPE FORMAT . . . . .	14-5
Label Record . . . . .	14-5
File Directory . . . . .	14-6
Device and Class Directory . . . . .	14-6
Logical Device Entry . . . . .	14-6
Device Class Entry . . . . .	14-7
Spoolfile Format . . . . .	14-7
Spoolfile Block Format . . . . .	14-7
Spoolfile Record Format . . . . .	14-8
User Labels Information . . . . .	14-8

CHAPTER 15 UNIFIED COMMAND LANGUAGE

REPLY INFORMATION TABLE . . . . .	15-1

SYSDB WORDS

-----

ADDRESS	NAME	FUNCTION
DB+55	BUSY	- SYSDB relative pointer to BUSY TABLE for I/O resources
DB+56	HEAD	- SYSDB relative pointer to table containing head pointers to I/O resource queues
DB+57	TAIL	- SYSDB relative pointer to table containing head pointers to tail of I/O resource queues
DB+60	SIO COUNT	- Number of I/O Programs currently executing
DB+72	POWER FAIL	- 0-no power fail 1-system disc recovery 2-all other disc recovery 3-all other device recovery
DB+73	SYSUP	- System is up and operable
DB+74	CONSLDEVN	- System console logical device number

JOBSYNCH job synchronization via jobsynch (sysglob+121(8))

-----

(13:1) - JOBSREADY - set by DEVREC & MORGUE (via procedure STARTDEVICE) indicating a ready job. This prevents UCOP from going to a wait state when a job is just made ready.

(15:1) - DEVFREED - set by DEALLOCATE when device count goes to 0.

NOTE - Both bits above used for synchronization of job-made-ready or devicefreed when UCOP is running.

(14:1) - JOBSWAITING- set by UCOP just before waiting if any job is waiting for list device. Signals DEALLOCATE to awake UCOP when a device is freed.

## Initial Memory Allocation

-----

This section is a description of the method used by INITIAL to allocate memory for MPE tables and code segments in MPE IV. All memory allocated by INITIAL is permanently allocated. All non-core resident code and data is put on disc before exiting INITIAL.

At the most basic level INITIAL will try to build memory to look exactly as diagrammed below. There are, however, several ways in which to deviate from this structure. Before going into the sources of these deviations, it is necessary to point out which portions of memory are used by INITIAL during the restart and therefore cannot be used by MPE until INITIAL has finished. Before INITIAL begins to allocate any memory space, it relocates its core resident code, its code segment swapping area and its stack to the highest configured memory space. Additionally, it uses the last %240 words of bank 0 on a series III and the last %326 words of bank 0 on series 30, 33 and 44 for its I/O buffer area and temporary code segment table. After INITIAL has built all of core resident MPE (tables and code), it builds the disc resident MPE tables. Since some of the disc resident tables may be too large to be built in INITIAL's stack, these tables are built in unused memory space. Therefore, in addition to the memory space required for INITIAL's code, INITIAL's stack and core resident MPE, there must be enough space left in which to build the largest of the disc resident tables.

INITIAL will essentially build memory in the order shown below, however, there may be an unused fragment of memory between the DRT's and the system global area which INITIAL will fill with the smaller tables. Neither the tables marked with an asterisk nor the code segments will ever be put in this area.

Beginning with the B MIT, all bank 0 dependencies have been removed from core resident MPE code. If there is insufficient space in bank 0 for any core resident code segment, INITIAL will put it into bank 1. At the present time core resident MPE is not large enough to occupy more than all of bank 0 and part of bank 1. If the system being built by INITIAL is configured with 128K words or 160K words of memory then INITIAL's stack will be in bank 1 (the code also on a 128K word memory size). If INITIAL is occupying part of bank 1 and the space is needed for a core resident MPE code segment or to build a disc resident table then INITIAL will print the error message "ERROR #350 OUT OF MEMORY".

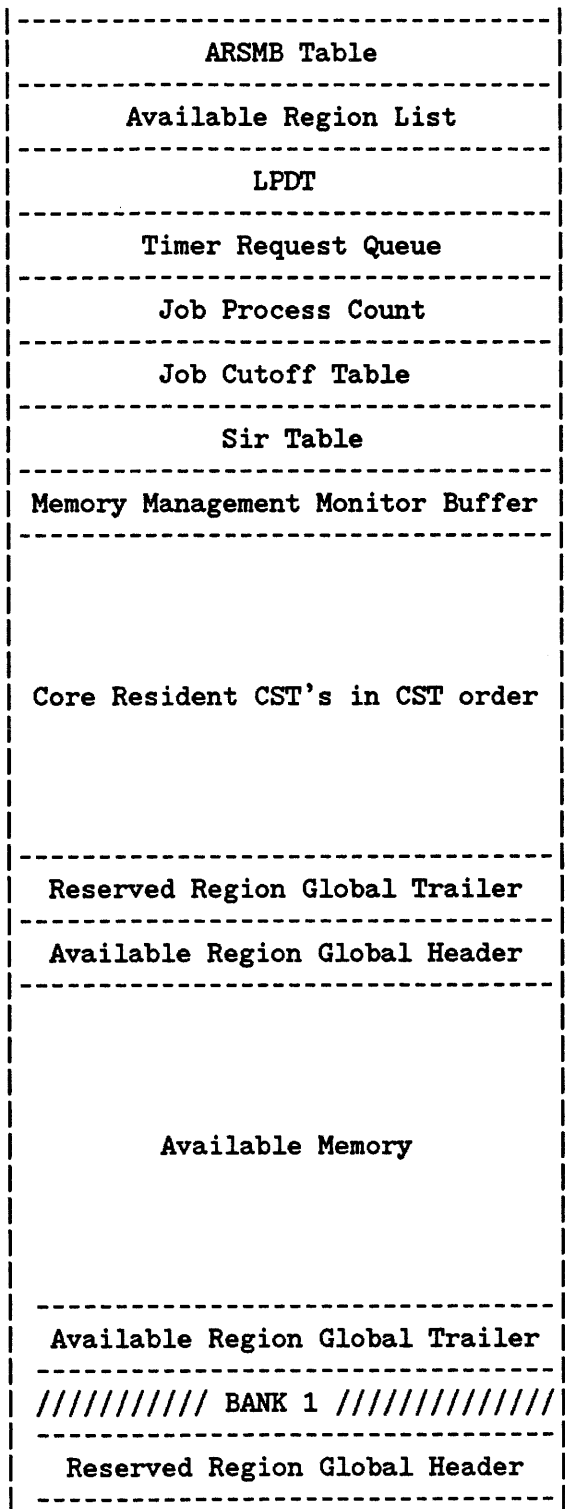

Except for the exceptions stated above, for every allocation of memory INITIAL will first try to allocate any remaining space between the DRT's and SYSDB. It will then try the next available space in bank 0, then the next available space in bank 1. If it were necessary it could continue searching until all all banks were checked for available space.

Immediately before exiting INITIAL, INITIAL lays down all the memory region headers and trailers as shown below. For any one bank of memory there will only be one block of core resident MPE, regardless of its contents. The only block of core resident MPE that does not have a re-

served region global header is in bank 0. It does have the reserved region global trailer though. Before placing any code outside bank 0 the first %23 words of every bank (except bank 0) is reserved for the region global header.

2.1 Segment Table Structure

The current location and state of each data segment and loaded code segment is maintained in the segment table. This table is partitioned into three parts, as shown in Figure 2-1. The partitions are based on the segment classes: a segment is a data segment, a segment is a system s1 segment, segment is part of a program. The structure and format of each partition is described in the following.

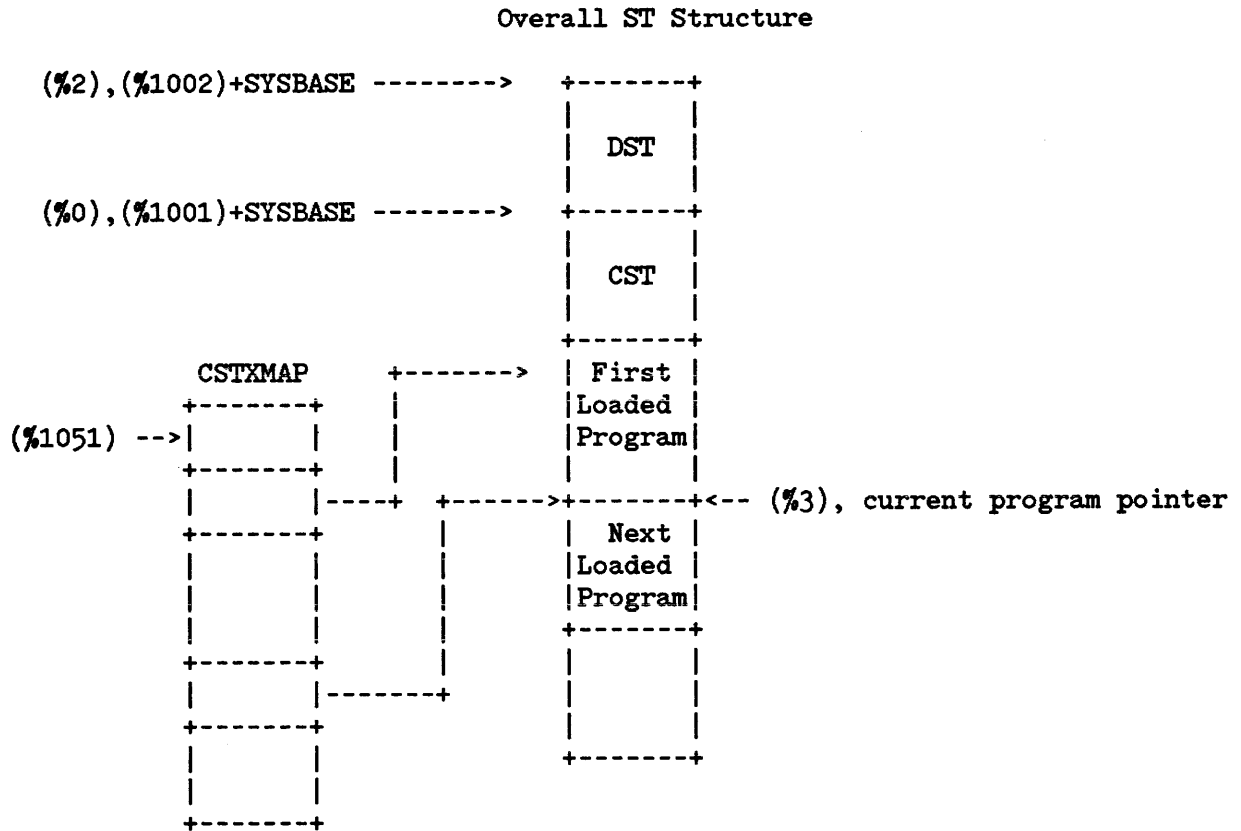

Figure 2-1

## 2.1.1 Pointers and DST #'s of Segment Table Components

- i. DST
  - % 2 absolute address of entry 0 of the DST
  - %1002 sysbase relative index of entry 0 of DST
  - DST# =2
  
- ii. CST
  - % 0 absolute address of entry 0 of system s1
  - %1001 sysbase relative index of entry 0 of system s1
  - %1032 displacement from DST base of entry 0 of system s1
  - DST# =1
  
- iii. CSTX
  - % 1 absolute address of entry 0 of current program
  - %1033 displacement from DST base to first CSTX entry s1
  - = @ CST (LAST) - @ DST (0) = DFS
  - DST# =4
  
- iv. CSTXMAP
  - %1051 sysbase relative index of entry 0 of CSTXMAP
  - DST# =43 (%71)

### 2.1.2 Standard Segment Identifier Format

```

SEGIDENTIFIER.(0:1) = 1 ==> SEG IS PART OF A PROGRAM
                        ==> (1:7) = PROGRAM INDEX INTO CSTXBLK,
                        (8:8) = LOGICAL SEG NUMBER (0-63)
SEGIDENTIFIER.(0:2) = 0 ==> SEG IS A DATA SEGMENT,
                        (2:14) = DST ENTRY NUMBER
SEGIDENTIFIER.(0:2) = 1 ==> SEG IS AN SL SEGMENT,
                        (2:14) = SL ENTRY NUMBER
EQUATE SEGIDDATATYPE=0,

```

*	*
* REMAINING CSTBLK TABLE ENTRIES	*
*	*
-----	-----

#### COMMENTS-

The table is initialized to minus one in each entry. When selected, the entry is replaced by a DST-relative index into the CST extension block.

## 2.1.8 Program Blocks and the CSTXMAP

Since programs can be dynamically loaded and unloaded, the segment table must be kept packed or fragmentation would occur. Thus, the block of ST entries for a program segment begins at an ST entry number that changes if a program which was loaded before it gets unloaded. To manage this dynamic structure, an auxiliary structure, the CSTXMAP is used. A program is identified by its index, CSTXEIX, into this map. The program's current beginning physical ST entry number is equal to CSTXMAP (CSTXEIX).

### ENTRY FORMAT-CST EXTENSION BLOCK

```
-----
CSTXMAP(CSTXEIX)-->-----
      0 * M = # OF CST'S IN BLOCK *
      -----
      1 * VALIDITY=%125252 *
      -----
      2 * # OF USERS SHARING BLOCK *
      -----
      3 *           0 *
      -----
%301 -----> * HAS CST ENTRY FORMAT *
      -----
%302 -----> * HAS CST ENTRY FORMAT *
      -----
      .
      .
      -----
%300+M -----> * HAS CST ENTRY FORMAT *
      -----
```

#### COMMENT

The value of CSTXEIX is established when a CST extension block is allocated. This index into the array CSTXMAP is maintained in the PCB of each process sharing the block.

## 2.2 Swap Tables

### 2.2.1 SWAPTAB

The Swaptab is a core resident memory management table used to keep track of the locality lists of the competing processes. ep

SWAPTAB DST# = 23 (%27)

%1025 Sysbase relative index of SWAPTAB entry 0.

#### SWAPTAB ENTRY 0 FORMAT

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
SWAPTAB00	# ENTRIES CONFIGURED															
SWAPTAB01	ENTRY SIZE (5)															
SWAPTAB02	# FREE ENTRIES															
SWAPTAB03	TABLE RELATIVE INDEX OF FIRST FREE ENTRY															
SWAPTAB04	0															

#### SWAPTAB UNASSIGNED ENTRY FORMAT

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
SWAPTAB00	%100000															
SWAPTAB01	TABLE RELATIVE INDEX OF NEXT FREE ENTRY															
SWAPTAB02	0															
SWAPTAB03	0															
SWAPTAB04	0															

An assigned entry in the swaptab is a process' SLL header or a member of a process' SLL. These formats are now described.

## 2.2.2 Segment Locality Lists (SLL)

The system maintains for each process a segment locality list (SLL) of the segments belonging to that process' current working set. The process' SLL consists of a header and a list of entries. The header and list entries are taken from the SWAPTAB.

A process' SLL is located via the process' pcbentry. PCB01 contains the sysbase relative index of the process' SLL header.

SLL HEADER FORMAT

### 2.3 Main Memory Region Headers and Trailers

---

Main memory is partitioned into regions. Each region is in one of three states: available, reserved, or assigned.

An available region is available for consumption by the free space allocation mechanism. An available region consists of neighboring subregions, each of which is either a hole or an overlay candidate. An available region is linked into the available region list of appropriate size.

A reserved region is a main memory region which is in the transition state from available to assigned. A reserved region has been cleaned, and there is a pending disc read of a segment into the region.

Assigned regions are occupied by present segments. Available and reserved regions consist of one or more adjacent subregions. Region headers and trailers are partitioned into global and local components. The global region header/trailer is only valid for the first/last subregion in regions consisting of more than one subregion.

The region headers and trailers of available, reserved, and assigned regions contain the state and control information pertaining to the current or planned contents of the region.

2.3.1 Available Region Headers and Trailers

## 2.3.4 Region Header and Trailer Field Descriptions

**RAS,**           Region Assignment State  
  .(0:1) Region Assigned Flag  
  .(1:1) Region Reserved Flag  
  .(2:1) Region Available Flag  
  .(3:1) Region Cleaned Flag  
  .(4:1) Size Change Pending Flag  
  .(5:1) Region Locked Flag  
  .(6:1) Region Frozen Flag  
  .(7:1) Region I/O Frozen Flag  
  .(8:7) Available  
  .(15:1) Blocked Lock Migration in Progress Flag

**IOCNT,**       On-Going I/O Count  
  = # of on-going I/O's in the region which must complete  
  before the initiation message can be processed.

**INITMSG,**     Initiation Message  
  .(0:1) Message Processed Toggle Switch  
  .(1:1) Message Externally Disabled Flag  
  .(2:1) Message On-going I/O Disabled Flag  
  .(3:1) Queue Segment Read Disc Request Flag  
  .(4:1) Incore Move Request Flag  
  .(5:1) Expansion Request Flag  
  .(6:1) Garbage Collection Flag  
  .(7:1) Message Aborted Flag  
  .(8:1) Release Residual Pages Flag  
  .(9:6) Available  
  .(15:1) Message Valid Flag

**INITINFO,**    Initiation Message Auxiliary Information  
  = Sysbase relative index of segment read disc request if  
  INITMSG, QREADREQ=1  
  or  
  = +/- Displacement to initiation message for moves and  
  expansions.

**COMPMSG,**    Completion Message  
  .(0:1) Message Processed Toggle Switch  
  .(1:1) Segment Modification Required  
  .(2:1) Block Lock Request  
  .(3:1) Send Scheduler A Message  
  .(4:1) Awaken A Device  
  .(5:1) Message Aborted  
  .(6:2) Available

MPQLINK,    Make Present Deferred Queue Link

            .(0:8) PIN Of First Process Waiting for this Segment  
            .(8:8) PIN of Last Process Waiting for this Segment

PAGECNT,    Release Page Count  
            =# of extra pages to release before processing initiation  
            message.

SPECREQTABPTR, points into special request table to the list of  
            devices queried on this segment.

SS,         Subregion Size

SD,         Subregion Displacement  
            .(0:1) Displacement Count Valid Flag  
            .(1:15) # Pages to Base of Region

WREQP,      Write Request Pointer  
            = Sysbase Relative Index of Disc Write Request when the  
            Data Segment in the Subregion is in Motion Out

SEGIDENT,   Segment Identifier- has standard segment identifier format

## Space Allocation Structures

Available regions in main memory are kept track of by multiple free lists. All available regions of the same size are linked into the same available region list (ARL). A bitmap is maintained to indicate which lists are non-empty (ARSBM). A sys-glob cell is maintained which contains the size of the largest currently available region. %1045 MAXAVAILREG, number of pages in largest currently available region.

### Available Region List (ARL)

%1044 SYSBASE index of base of ARL

ARL DST # = 55 (%67)

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
ARLD(0)																
								0								
								0								
ARLD(1)																
ARLD(2)																
.																
.																
.																
ARLD(N)																

Where N = maximum available region size  
=  $(2^{16}/2^{\text{pagepower}})$  pages

Available Region Size Bit Map (ARSBM)

%1004 SYSBASE index of base of ARSBM

ARSBM DST# = 41 (%51)

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
ARSBM(0)																
.																
.																
ARSBM(M)																

M = (# of available region sizes/16) +1

ARSBM (J) . (K:1) = 1 ==> the available region list of  
size J\*16+K Pages is non-empty.

177	LOGICAL DISC PACK SIZE (CYLINDERS)		127
	OR # OF TRACKS IF FH DISC		

DTC	(DEFECTIVE TRACK CODE)
0	suspect
1	suspect alternate
2	deleted
3	reassigned

NOTE: The situation where there are two entries for the same track, n, one having a DTC of 0 (suspect) and the other having a DTC 3 (reassigned) results from a situation where the disc driver could not "read" (unreadable) the address of the particular track.

DEFECTIVE SECTOR TABLE (DSCT -- sector 1 of disc)

(the DSCT exists on device type 3 (CS/80) discs)

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
0	number of entries in the table																0
%1	index to the first entry (6)																1
%2	entry size (2)																2
%3	maximum number of entries (61)																3
%4	0 (reserved)																4
%5	0 (reserved)																5
%6	first defective sector entry (double-word logical sector address)																6
%10	second entry																8
%12	third entry																10
	.																
	.																
	.																
%176	maximum defective sector entry																126
%177																	127

Unlike the DTT, entries in the DSCT are not permanent. Once a suspect sector is handled by INITIAL or VINIT, its entry is removed from the table. Thus this table contains only unprocessed suspect sectors.

RESERVED AREA BIT MAP (sector 4 of the system disc)

The first 400 sectors of the system disc are reserved for Initial's use. This area contains permanent data structures for the boot. It is also used as a temporary storage area for data during sparing. All other system volumes and private volumes reserve only the first 10 sectors of the disc. They do not have a reserved area bit map.

The bit map contains 1 bit per sector. A '1' means the sector is free.

## Virtual Disc Space Management Structures

Disc space for data segments is allocated from reserved regions of system volumes which have been assigned the virtual memory supporting (VMS) attribute. The data structure used for accounting and management of the virtual disc space of the various VMS volumes is the Virtual Disc Space Management Table (VDSMTAB). This structure consists of a circular list of entries, one for each VMS volume. Each entry contains the information defining the state of the virtual memory region on that volume.

### Virtual Disc Space Management Table

VDSMTAB DST# = 39 (%47)  
VDSMTABPTR= %1026

#### General Structure

VDSMTAB Entry 0 Format

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

Directory on disc consists of a contiguous area

SYSGLOB cells:

DIRBASE<-----absolute disk addr of base [SYSGLOB+%130 AND %131]

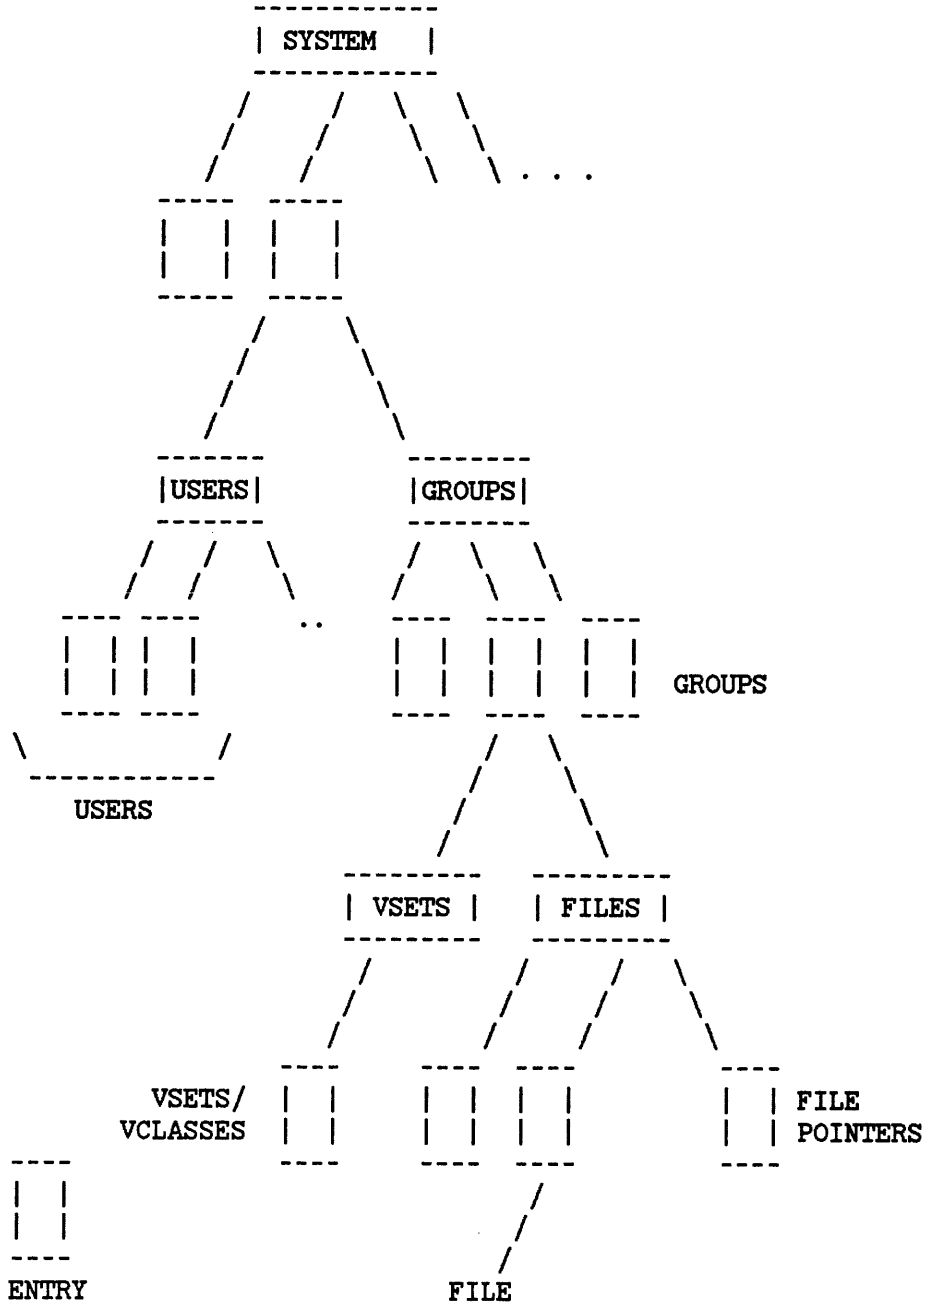

The capacities for accounts/groups/users/files are dependent on their block sizes, described in the directory data segment.

- \* SYSSAIBSIZE           System acct index block size (sectors)
- SYSAUIBSIZE           Acct. user index block size (sectors)
- SYSGIBSIZE            Acct. group index block size (sectors)
- SYSGFIBSIZE           Group file index block size (sectors)
- SYSGVSIBSIZE          Group volume set definition ind. blk. size(sectors)
- \* SYSAEBSIZE           Acct. entry block size (sectors)
- SYSEBSIZE             User entry block size (sectors)
- SYGEBSIZE             Group entry block size (sectors)
- SYFEBSIZE             File entry block size (sectors)
- SYSMAXBSIZE           Maximum of above. (used to initialize DDS.)
- SYSVSEBSIZE           Volume set definition entry block size (sectors)

\*These values are used once for the creation of the (root) system, account index or new systems. This root index is always at address DIRBASE+3.

DIRECTORY SPACE DATA SEGMENT (DIRSDS)

DST=21  
     10  
 SIR=8  
     10

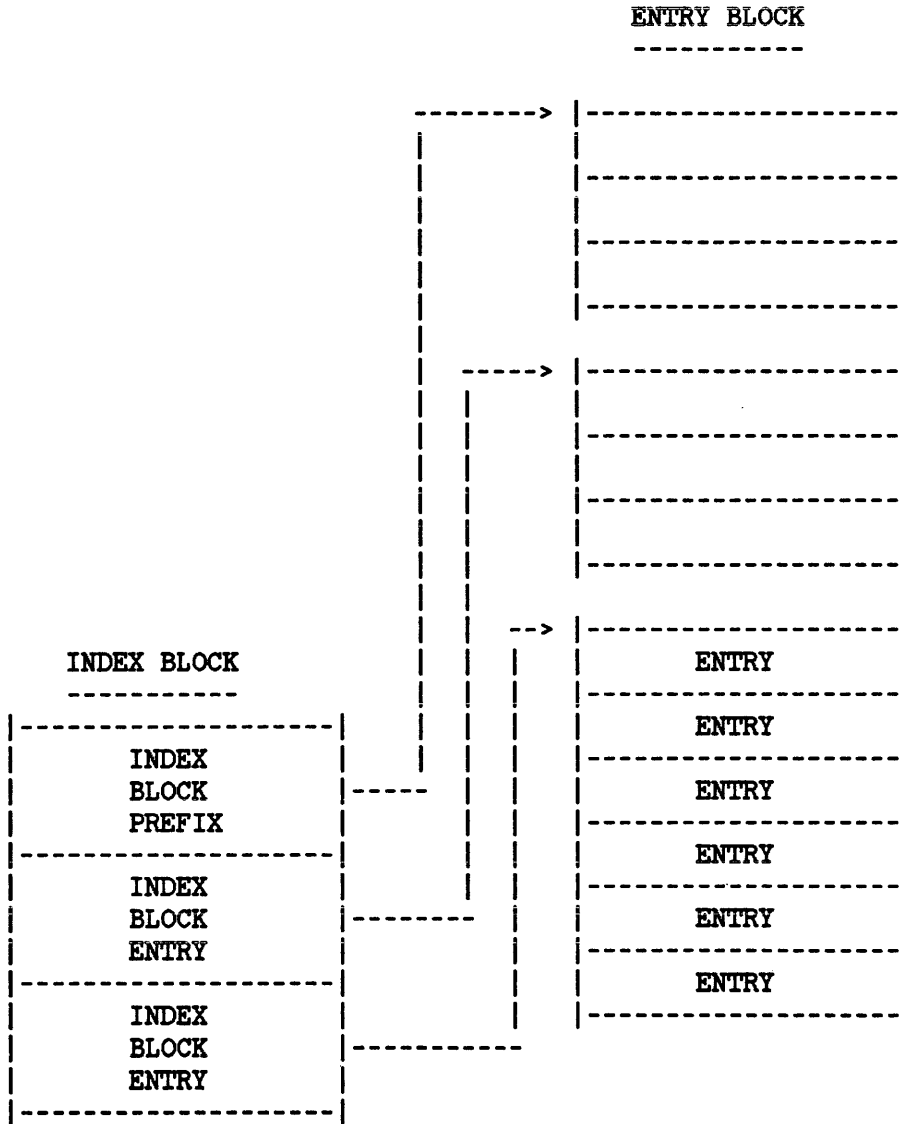

base address of parent directory

defines last word of bit map

defines next word to be examined

The bitmap defines the available/used sectors in the directory. Bit 0 word 0 corresponds to DIRBASE; bit 1 word 0 to DIRBASE+1 etc. 1=>available 0=>used. [NOTE: bitmap(0).(0:4)=0 always.]

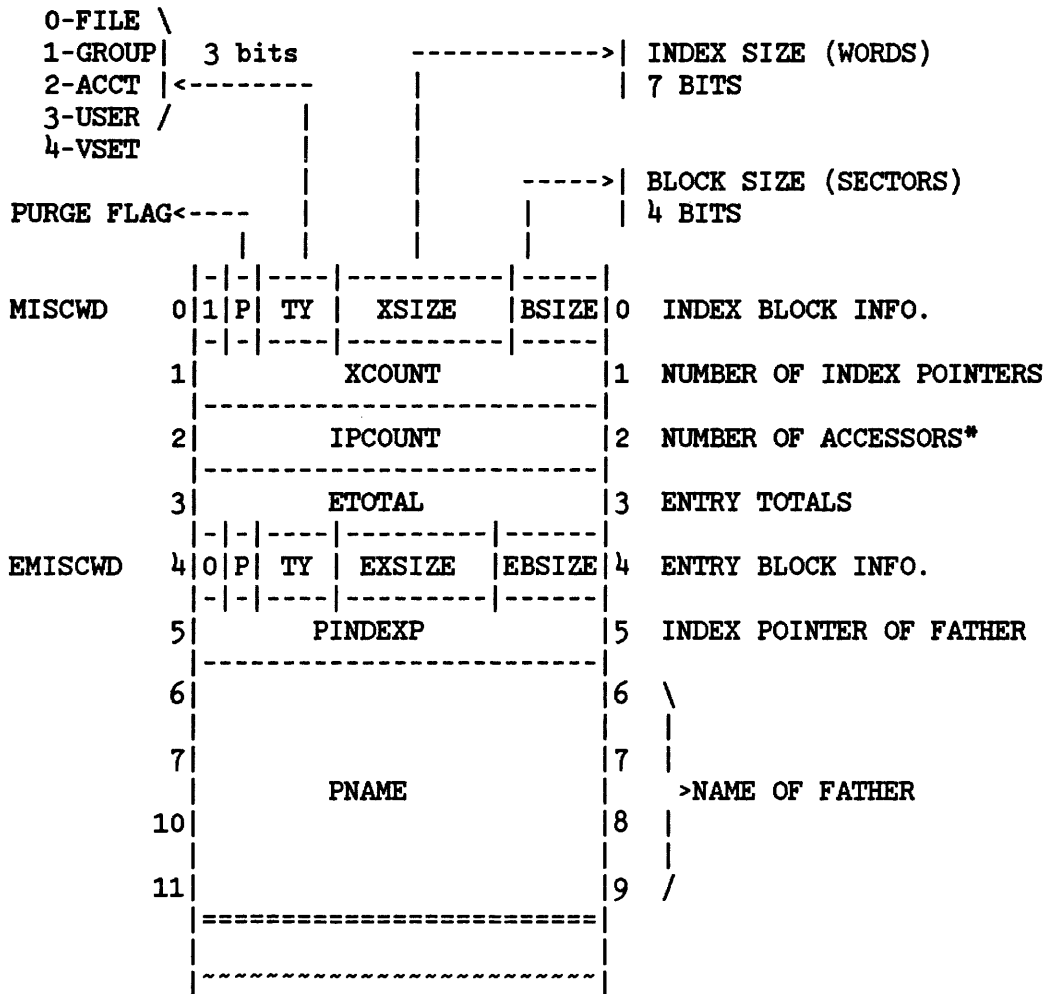

DIRECTORY STRUCTURE

### DIRECTORY DEFINITIONS

- >PAGE - smallest allocatable record ("phys.rec'd")-currently sector.
- >BLOCK - integral# of pages; contains contiguous indices or entries.
- >INDEX - pointer to entry block, containing name of 1st entry.
- >ENTRY - information-containing "object" may contain pointer to an index block.
- >POINTER - 15-bit positive relative page number (relative to directory base).
- >DDS - directory data segment.
- >ELEMENT - a generic name for index or entry.

#### INDEX BLOCK PREFIX (10 WORDS)

\*The count is incremented by each access that uses and relies upon a pointer to the index block, ie, it is guaranteed not to be purged while the count is not = 0.

MULTIPLE SIR ALLOCATION

-----

The five conventional chains used by MPE for SIR allocation and deallocation are:

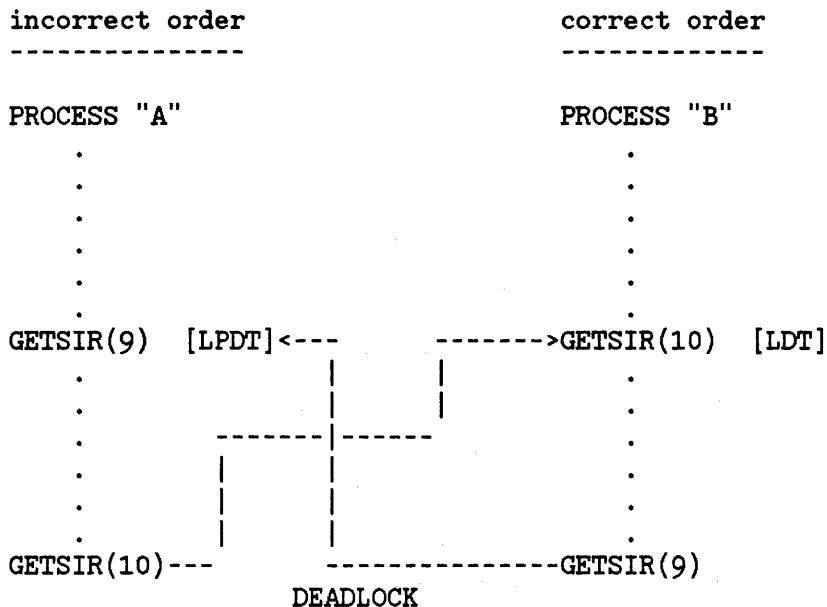

LOWER->LOGICAL RANK->HIGHER

- 1. LDT(10)->LPDT(9)->VDD(18)
- 2. JMATSIR(15)->LPDT(9)->JPCNT(13)
- 3. FMAVTSIR(16)->FILESIR(37)->DIRECT.(8)->DISC FREE SPACE TBLE(12)
- 4. FMAVTSIR(16)->FILESIR(37)->RINTABLE(38)
- \$ 5. SEGTABSIR (%21)-> BKPTSIR(%41)-> LOCKSIR(2)
- 6. JMATSIR(15)->LDT(10)->LPDT(9)->ODD(4)

Multiple SIR allocation requires care to avoid process deadlock situations. The rule that should be followed when working with the above SIRs is as follows:

Never attempt a GETSIR of lower rank then the SIR currently held (if any).

For example: suppose two processes, A and B, required the SIRs for the LDT and LPDT. Deadlock would result if done as below due to process A not following the convention order.

## SIR TABLE INFORMATION

-----

The system internal resource table is located in non-linked memory (resident table). The SIR table is used to protect critical system elements against access by more than one process, i.e., it provides a "lock out" mechanism. Each critical system resource (usually a table) is assigned a specific SIR number. Procedures are provided within MPE to lock (GETSIR) and unlock (RELSIR) the SIR. Processes attempting to obtain a SIR that is not available are impeded by the system. The SIR table entries form the head of a linked list in this case. If more than one process becomes impeded, word 8 of the PCB entry is used to add the "new" process to the growing list. The method of disimpeding the process depends on the SIR type.

A SIR does not respect process priority and operates in a FIFO manner. As processes become impeded on behalf of a SIR the new entries are entered at the tail of the impeded list. When the current holder of the SIR releases it, only the first process in the list (pointed at by the head pointer) is dis-impeded. The linked list head and all pointers are then updated and the newly dis-impeded process will obtain the SIR.

SIR ENTRY FORMATS

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15		
															0	0	free
															0	0	(not locked)
PIN of holder								0							0	SIR locked	
															0	0	(no impeded processes)
PIN of holder								SIR QUEUE LENGTH							0	SIR locked	
TAIL OF IMPEDED LIST(P)									HEAD OF IMPEDED LIST(P)							1	(impeded processes)

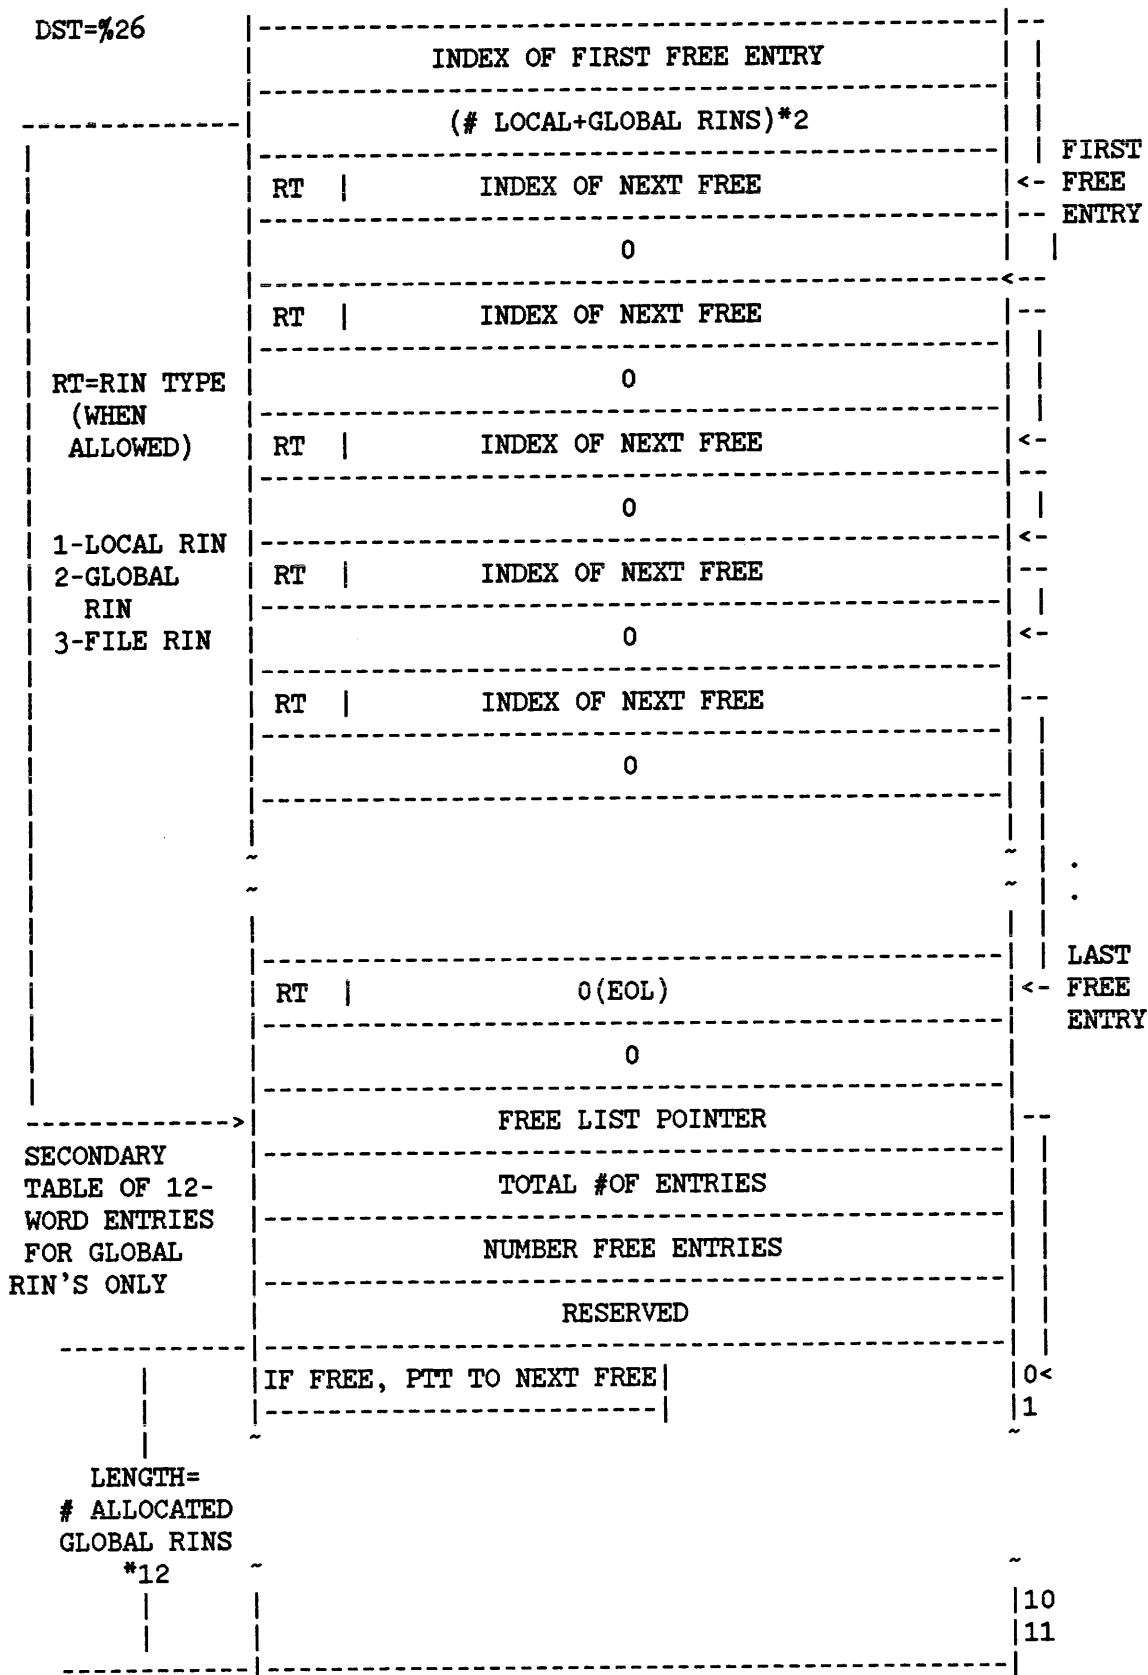

P = PIN#

PIN = PCB table entry number

SIR QUEUE LENGTH- number of processes queued for this SIR

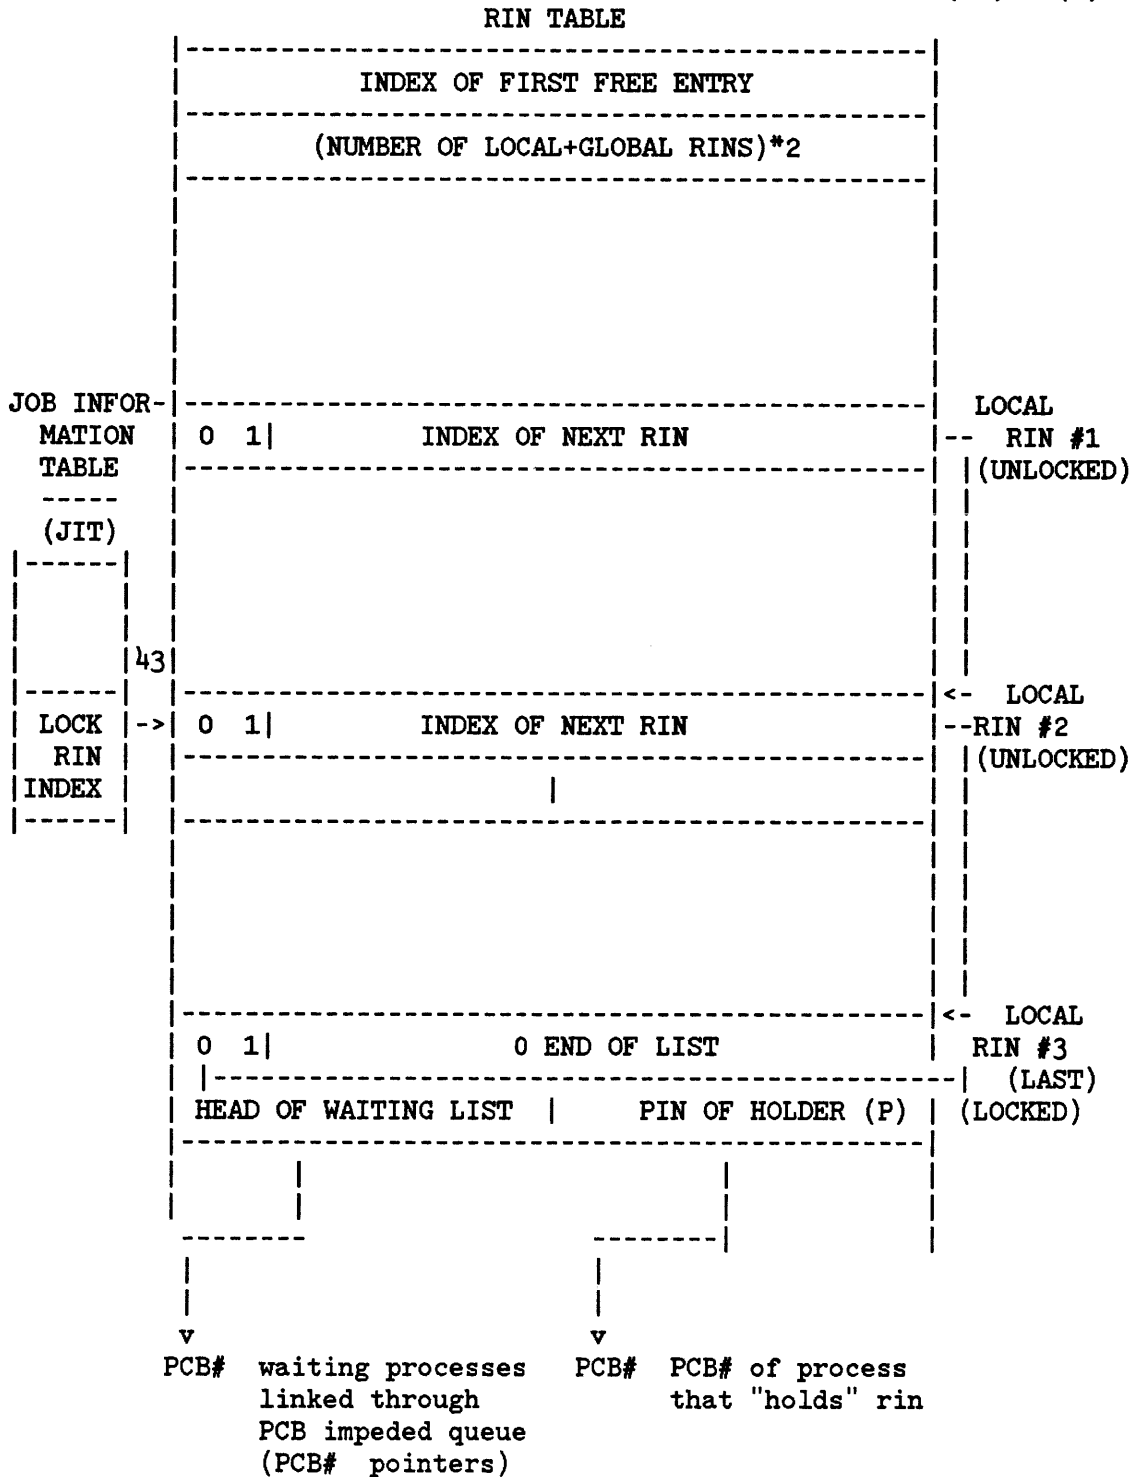

The SIR table is indexed by SIR#, each SIR# corresponding to a unique, preassigned system internal resource. Entry #0 is not used. Impeded lists are established by using the SIR table entry (1). (8:8) as the head of the list and PCB(8). (8:8) for elements. Pin numbers are always used as pointers, with 0 indicating end of list.

## 1.0 Introduction

---

This document describes the MPE-IV file system. Section 2 describes the basic concepts. Section 3 describes the table structures used.

## 2.0 File System Overview

---

I/O to files is done by reference to file numbers, which are assigned by calling the FOPEN intrinsic. This establishes an initial "point of attachment", which may be described as a connection between a program (i. e., process) and that particular point in a particular file at which the next FREAD or FWRITE would cause data to be transferred. A point of attachment is described by a control block, of which there are several different kinds (described later). Control blocks may exist in the process's own stack, in an extra data segment assigned by the file system, or (because of file sharing) in some other process' stack. In order to find control blocks quickly, a pointer scheme called vectors is used. A control block is uniquely described by a vector, which consists of one word with the low ten bits containing a segment number, and the upper six containing an index into a table (the "vector table") which describes the location of the control block within that segment. The entire assemblage, consisting of five overhead words, the vector table, and all of the control blocks to which it points, comprises a contiguous piece of storage called the "control block table". If it is in an extra data segment, the control block table comprises the entire segment; if in a stack, it occupies part of the PXFILE part of the PCBX, usually beginning at segment-relative location 106 octal.

The point of attachment is described by a "physical access control block", or PACB, which will exist as a result of an FOPEN to any file (except \$NULL). Any required I/O buffers are associated with the PACB; see section 2.1.

All FOPENs specifying "multi-access" for all processes running under a single job use a single PACB for references to a multi-access file. Although all these are attached to a single point in the file, the type of attachment (i. e., AOPTIONS) may be different. So, each FOPEN specifying a multi-access file establishes a "logical access control block", or LACB, which contains the point-of-attachment local values. The use of a single buffer (i. e., PACB) insures that references by various processes or against various FOPENs within one process are dealt with in strict sequential order. Note that references to a file by other jobs, or by other processes not specifying multi-access, will be through other PACBs, whose buffers will be read or written at the

pleasure of the file system; in order to insure any sort of coherence to such shared references, the jobs must use global RINS and FLOCK and FUNLOCK the file. \$STDIN, \$STDLIST, and spoolfiles are opened multi-access automatically.

In the case of disk files, there is another kind of control block: the file control block, or FCB. It contains copies of information read from the file label, such as the end-of-file pointer, the extent map, and the record and block structure. The EOF pointer is updated in the FCB as the file is written, and all changes made to the FCB are posted to the file label when the file is closed. An FCB is shared by all jobs in the system which reference the file.

The file number assigned by an FOPEN is an index into the Available File Table (AFT), a table of four-word entries which is at the end of the PXFILE part of the PCBX. Two of these words are vectors to the PACB and (if it exists) the LACB.

Because control blocks are shared among processes, it is necessary to have a scheme for coordinating access to them. A control block is "locked" by a process which requires exclusive access to it for a time. Other processes which attempt to lock the block will find it already locked, and will be impeded and queued. It may also be necessary to lock an entire control block table so that a process can create or destroy a control block in it, or lock or unlock an existing control block in the table.

Another table used by FOPEN is the File Multi-Access Vector Table (FMAVT). This table exists in a system extra data segment and is used by all jobs and processes in the system. When a file is being FOPENed with multi-access specified, the FMAVT is searched; if the file is already open, the FMAVT gives the PACB vector for the prior reference for each job.

## 2.1 Buffers

---

A bit in AOPTIONS specifies, when a file is opened, whether access is to be buffered or unbuffered. If unbuffered, data is transferred directly between the I/O device and the user's buffer (usually in his stack), which will be frozen in memory for the duration of the transfer. If buffered, the data is moved between the user's buffer and a file system buffer to which the I/O is actually done.

Buffers are associated with the PACB, attached to it as an appendage.

### 3.0 Table Formats

-----

This section gives a detailed discussion of the main tables constructed and used by the file system. The location and overall structure of each table is given, in addition to the table format and a discussion of each field in the table. Table indices at the right of the table are in octal. Index names apply to the entire word; if in parentheses, the names are defined in the file system listing but not explicitly used there.

### 3.1 File System Section of PCBX (PXFILE)

-----

The PXFILE area is a sub-section of the PCBX. It is a contiguous, expandable and contractable block of storage that is managed by the file system primarily for its own use. Other subsystems, namely CS and DS, also make use of the PXFILE section. In doing so they must conform to the conventions of the file system.

The overall structure of the PXFILE area is:

Overhead	66 (fixed)
Control block table	106 (variable)
Available	(variable)
Active File Table	(variable)
	DL-5

### 3.1.1 Overhead

The part labeled Overhead contains information that pertains to the entire section. It ordinarily begins at segment-relative location 66 octal, but is usually addressed via the pointer at DL-3.

0	1	7	8	15
PXFILE size in words				0 PXFSIZE
Last DOPEN error no.		Last COPEN error no.		1
N				2
Reserved for DS				3 (PXFDSINFO)
Last KOPEN error number		Last FOPEN error number		4
AFT size in words				5 PXAFTSIZE
CS Trace file info				6 (PXCTRINFO)
Last responding NO-WAIT I/O AFT entry number				7 PXFLEFTOFF
1st user (NOBUF) control block table DST number				10 PXFCBT1
2nd user (NOBUF) control block table DST number				11 (PXFCBT2)
3rd user (NOBUF) control block table DST number				12 (PXFCBT3)
4th user (NOBUF) control block table DST number				13 (PXFCBT4)
5th user (NOBUF) control block table DST number				14 (PXFCBT5)
6th user (NOBUF) control block table DST number				15 (PXFCBT6)
7th user (NOBUF) control block table DST number				16 (PXFCBT7)
8th user (NOBUF) control block table DST number				17 (PXFCBT8)

Partial word field identifiers are:

PXFDOPEN	= PXFILE(1).(0:8)#,	last DOPEN error code
PXFCOPEN	= PXFILE(1).(8:8)#,	last COPEN error code
PXFNOCB	= PXFILE(2).(0:1)#,	no CB's in PXFILE CBT?
PXFKOPEN	= PXFILE(4).(0:8)#,	last KOPEN error code
PXFFOPEN	= PXFILE(4).(8:8)#,	last FOPEN error code

Discussion:

PXAFTSIZE This is the size (in words) of the Active File Table (AFT). The size is in words to simplify calculating the size of the available block.

PXFCBT1-8            These are the DST numbers of the user (NOBUF) control block tables. A DST number of 0 indicates that no data segment is allocated.

PXFCOPEN            This contains the last COPEN error number. Not used by the file system.

PXFCTRINFO          This contains information pertinent to the CS trace file. Not used by the file system.

PXFDOPEN            This contains the last DOPEN error number. Not used by the file system.

PXFDSINFO           Reserved for DS. Not used by the file system.

PXFFOPEN            This contains the last FOPEN error number. If it is zero then the last FOPEN completed successfully; otherwise the last FOPEN was unsuccessful and the number is the file system error number.

PXFKOPEN            This contains the last KOPEN error number. KSAM is partly imbedded in the file system, and an FOPEN failure on a KSAM file can be caused by a failure to open either the key file or the data file. This error number is used in conjunction with PXFFOPEN to determine which file caused the KSAM open failure. This error number is not used by the file system.

PXFLEFTOFF          This is the AFT entry number of the last file/line that completed a no-wait I/O; if zero then no no-wait I/O has been completed. This cell is maintained solely by and for the IOWAIT intrinsic.

PXFNOCB             This bit signifies that control blocks are not to be created in the PXFILE control block table. This bit is set by the NOCB parameter to the CREATE intrinsic or the :RUN command. This feature permits the user to have as much stack space as possible; otherwise the file system will take several hundred words of stack for the PXFILE control block table.

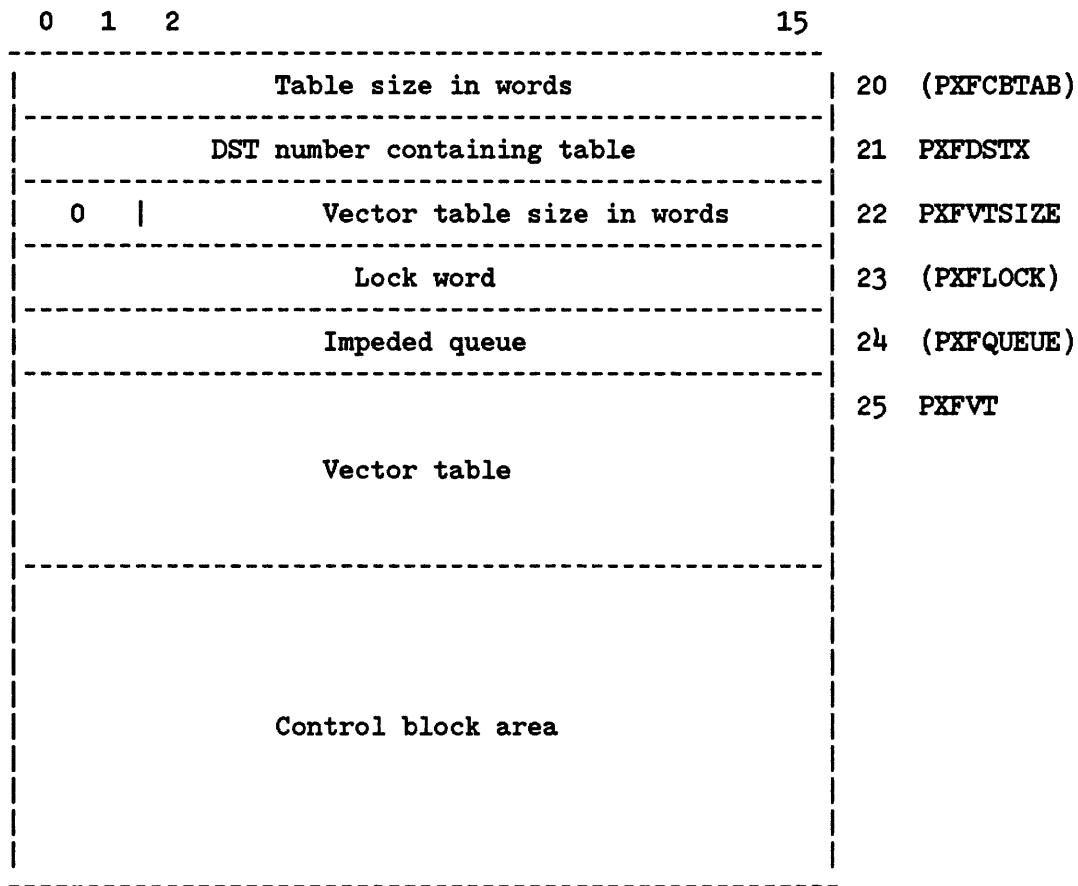

PXFSSIZE            This is the size (in words) of the complete PXFILE area. It is the sum of the overhead block, the control block table, the active file table and the available block.

### 3.1.2 PXFILE Control Block Table (PXFCBT)

Addressing within a PXFILE control block table is somewhat more complicated than addressing an extra data segment CBT since the table does not begin at DB+0. As a result all pointers within the table are table relative; the starting address of the table must be added to a pointer to generate a final DB-relative address. This addressing convention is consistently applied to all control block tables.

When the control block table is expanded, space is taken from the AVAILABLE area. If no space is available then the PXFILE area is expanded and the acquired space is added to the AVAILABLE area.

Refer to section 3.2 for a more detailed description of file control block tables.

The following identifier is also used:

PXFCBTSIZE = PXFILE(16)#, table size in words

Discussion:

PXFCBTAB            This is the first word of the control block table; it is used when referring to the entire table.

PXFCBTSIZE        This is the size in words of the control block table. It is used principally for calculating the size of the available block.

PXFDSTX            This is the DST number of the data segment that contains the control block table. This is the same as the DST number of the stack itself. The common convention of referring to the DST number of the stack as zero is not used, because the file system may refer to a PXFILE control block table in another stack, which would result in an ambiguity since that PXFILE control block table would also have a DST number of zero.

PXFLOCK            This is the lock word for the table and has the same format as the lock word for a control block in the table, i. e. lock bit, break bit, lock count, and locking PIN.

PXFQUEUE          This is the impeded queue for the table and has the same format as the impeded queue for a control block in the table.

PXFVT              This is the first word of the vector table. It is used when referring to the vector table in general.

PXFVTSIZE         This is the size, in words, of the vector table. This is the length of the table and does not reflect the number of entries used or unused.

### 3.1.3 Available Block

-----

The part labeled Available is used to provide space when the Control Block Table or the Active File Table is expanded. These two tables grow towards each other, and when more space is needed it is simply taken from the Available Block.

When the Available area is exhausted, the PXFILE area is expanded, the AFT is relocated and the new space is added to the Available Block.

Currently the PXFILE area is only expanded; it is never contracted.

### 3.1.4 Active File Table (AFT)

The part labeled Active File Table contains information used by the file system (or CS, DS, etc.) to grossly characterize the file access and, most importantly, to give the location of the control blocks.

The overall structure of the AFT is:

where  $N = \text{PXFAFTSIZE}/4$ .

The length of the AFT is specified by PXFAFTSIZE. Unused entries are all zeroes. When the table is full it is expanded by taking space from the Available block.

The AFT is negatively indexed by file number: the entry at DL-8 corresponds to file number 1, the entry at DL-12 corresponds to file number 2, etc.

The structure of a file system AFT entry is:

0	1	2	3	4	5	15	
Entry type   N						0	
Physical ACB Vector						1	AFTPACBV
Logical ACB Vector						2	AFTLACBV
NO-WAIT I/O IOQX						3	AFTIOQX

The entry format depends on the entry type; the file system uses entry type 0.

The following partial word field identifiers are used:

AFTTYPE	= AFT.(0:4)#,	entry type
AFTNULL	= AFT.(4:1)#,	\$NULL file

Discussion:

**AFTIOQX** This is the IOQ index of the pending no-wait I/O (if any). This is applicable iff the file was opened with the NOWAIT option specified. Also, CS and DS have the same capability and use this cell in a consistent manner. This is because the IOWAIT intrinsic services the file system as well as CS and DS, and is the principal user of this cell. In the case of a message file the accessor's reply port (file system basic IPC port) is stored in this cell. If this cell is zero there is no no-wait I/O pending.

**AFTLACBV** This is the vector of the Logical ACB (LACB) (if any). This is applicable iff the file was opened with the multi-access option specified.

**AFTNULL** This bit signifies that the file is \$NULL and that there are no control blocks.

**AFTPACBV** This is the vector of the Physical ACB (PACB). A PACB exists for all files except \$NULL.

**AFTTYPE** This is the AFT entry type number. At present the following entry types are defined:

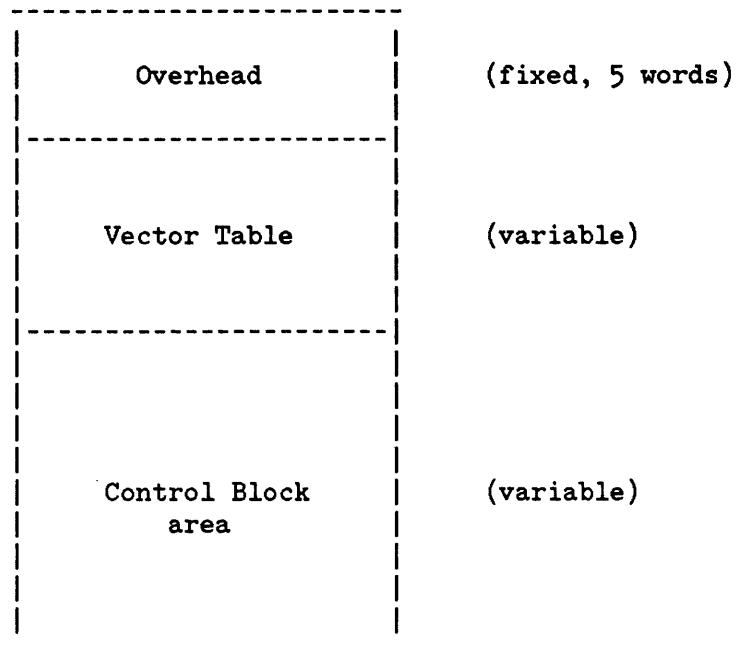

- 0 - file system
- 1 - remote file
- 2 - DS (no-wait I/O disallowed)
- 3 - DS (no-wait I/O allowed)
- 4 - CS
- 5 - CS
- 6 - KSAM
- 8 - Message File

### 3.2 File Control Block Table (CBTAB)

-----

A file control block table can be located in two places: (a) as a sub-part of the PXFILE area, as discussed in section 3.1.2; or (b) in a data segment. Although putting control block tables in PXFILE has the advantage of providing rapid access, it detracts from the space for the user's stack; so the larger control blocks (or optionally, all control blocks) are put into extra data segments. On the other hand, referencing extra data segments may result in an absence trap, which is slow. Extra data segment control block tables are of three kinds: expandable, non-expandable, and shared FCB. Non-expandable CBT's are used for a single PACB with buffers, i. e. where the control block is large, or where the control block can't be local to a single process, i. e., for multi-access. Expandable (or NOBUF) CBT's are used for small control blocks, to wit, LACB's, PACB's with no buffers, and FCB's which are local to a single process. A list of the expandable CBT's associated with a process is kept in the overhead area of PXFILE (cf. section 3.1.1). When a small control block is needed, these CBT's are checked in order to see if one of them has room. Shared FCB CBT's are like expandable CBT's except that they belong to the system rather than to a single process; the system keeps a list of DST's which it has assigned for this purpose.

The overall structure of a control block table is:

### 3.2.1 Overhead

The part labeled Overhead contains information pertaining to the entire table.

0	1	2	6	7	15
Table size in words					0 CBTSIZE
DST Number containing table					1 CBTDSTX
Type				Vector table size in words	
Lock word					3 CBTLOCK
Impeded queue					4 (CBTQUEUE)

Other identifiers used:

CBTTYPE = CBTAB(2).(0:2)#; control block table type  
CBTVTSIZE = CBTAB(2).(7:9)#; vector table size

Discussion:

**CBTDSTX** This is the DST number of the data segment that contains the control block table. If the table is contained in a stack, i.e. in the PXFILE area, then this is the DST number of the stack and not 0.

**CBTLOCK** This is the lock word for the table and has the same format as the lock word for a control block in the table, i. e. lock bit, break bit, lock count, and locking PIN. The table is locked, thus insuring exclusive access, whenever a control block is being created or destroyed. It isn't necessary to lock the table while locking a control block within it because control block locking is done pseudo-disabled.

**CBTQUEUE** This is the impeded queue for the table and has the same format as the impeded queue for a control block in the table. There is no second impeded queue because that facility is used exclusively for BREAK requests against the PACB for \$STDIN/\$STDLIST.

**CBTSIZE** This is the size in words of the table. It is initialized when the table is created and changed when the table is expanded. At present a table is never contracted, even though this is possible.

**CBTTYPE** This field is the type of the control block table.  
Possible values are:

- 0 - stack [PXFILE]
- 1 - NOBUF (expandable)
- 2 - System shared FCB
- 3 - Buffered (contains a single PACB)

**CBTVSIZE** This is the size, in words, of the vector table area in the control block table. It does not reflect the number of entries used or unused.

### 3.2.2 Vector Table

The part labeled Vector Table contains information used to locate and lock or unlock control blocks in the control block table.

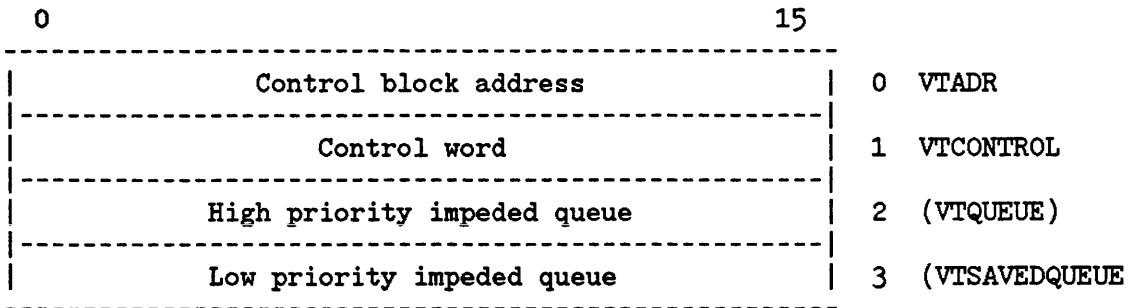

The overall structure of the vector table is:

where  $N = (CBTVTSIZE/4)-1$ . Since only six bits are available for a vector table index, the vector table can contain at most 64 entries.

An unused vector table entry will have zeroes in all the words of the entry. A used vector table entry will have a non-zero value in the first word of the entry (the control block address is necessarily non-zero).

The general structure of a vector table entry is:

#### Discussion:

VTADR Control block address is the table relative address of the control block associated with the vector table

entry. It is a word displacement from the beginning of the control block table.

**VTCONTROL** The control word is used to coordinate access to the control block. It contains a bit which indicates that the control block is being accessed, and therefore "locked", and a byte which contains the PIN of the process which has exclusive access to the control block. Other processes attempting to access the block will be impeded and queued.

**VTQUEUE** The high priority impeded queue is a byte pair of PINs that are the head and tail of the impeded queue of processes waiting for access to the control block. Processes are impeded and unimpeded by the file system using the normal mechanisms available under MPE.

**VTSAVEDQUEUE** The low priority impeded queue is a byte pair of PINs and has the same format as VTQUEUE. The only time this word is used is when the control block is in BREAK mode, which can only happen to an ACB corresponding to \$STDIN/\$STDLIST. It is used to save the current VTQUEUE when the control block goes into BREAK mode and to restore VTQUEUE when the control block goes back into non-BREAK mode.

The last three words of a vector table entry comprise a sub-block for the locking system that is used to coordinate access to a particular control block.

The structure of the vector table entry control sub-block is:

0	1	2	7	8	15	
L	B	Lock count		Lock PIN		0 CBLCONTROL
High priority tail PIN			High priority head PIN			1 CBLQUEUE
Low priority tail PIN			Low priority head PIN			2 CBLSAVEDQUEUE

The following partial word field identifiers are used:

CBLLOCK	= CBL.(0:1)#,	lock bit
CBLBREAK	= CBL.(1:1)#,	break bit
CBLCOUNT	= CBL.(2:6)#,	lock count
CBLPIN	= CBL.(8:8)#,	PIN holding lock
CBLTAIL	= CBL(1).(0:8)#,	high priority tail PIN
CBLHEAD	= CBL(1).(8:8)#,	high priority head PIN
CBLSAVEDTAIL	= CBL(2).(0:8)#,	low priority tail PIN

CBLSAVEDHEAD = CBL(2).(8:8)#; low priority head PIN

Discussion:

CBLBREAK This is the BREAK bit and is used only for the ACB corresponding to \$STDIN/\$SDTLIST.

CBLCONTROL This identifier is used when referring to the first word of the vector table control sub-block.

CBLCOUNT This is a count of the number of times that the control block is locked by CBLPIN. It is 0 if the control block is not locked and is greater than 0 if the control block is locked.

CBLHEAD This is the PIN of the process at the head of the high priority impeded queue.

CBLLOCK This is the lock bit for a control block; 1 denotes locked.

CBLPIN This is the PIN of the process which has locked the control block and has exclusive access to it. If the control block is not locked then this field is 0.

CBLQUEUE This is the high priority impeded queue.

CBLSAVEDHEAD This is the PIN of the process at the head of the low priority impeded queue.

CBLSAVEDQUEUE This is where CBLQUEUE is saved when creating a break queue.

CBLSAVEDTAIL This is the PIN of the process at the tail of the low priority impeded queue.

CBLTAIL This is the PIN of the process at the tail of the high priority impeded queue.

### 3.2.3 Control Block Area

The part labeled CONTROL BLOCK AREA contains the control blocks used by the file system.

To facilitate storage management, all control blocks have the same overall structure:

where  $N = \text{Size} - 1$ .

Partial word field identifiers are:

CBTYPE	= CB.(0:2)#,	control block type no.
CBSIZE	= CB.(2:14)#;	control block size

#### Discussion:

**CBDESCRIP** This is the first word of a control block; the format is common for all control blocks.

**CBSIZE** This is the size (in words) of the control block. The size includes the descriptor word.

**CBTYPE** This is the type number of the control block. There are four types of control blocks:

- 0 - Garbage
- 1 - FCB
- 2 - PACB
- 3 - LACB

When a control block table is created the initial control block area is completely allocated to a single control block of type garbage. When space is requested for a new control block the control block area is scanned (using a first fit algorithm) for a garbage control block that is as large as the size requested. The space for the new control block

is taken from this garbage control block and the space remaining becomes the new garbage control block size.

When space is returned it becomes a new garbage control block. To reduce fragmentation the new garbage control block is combined with either of the two neighboring control blocks if they are of type garbage.

If space is requested and no garbage control block is large enough to contain the new control block then the control block area and control block table are expanded by a sufficient amount. If expansion is not possible, some other control block table must be used.

### 3.2.4 Access Control Block (ACB)

-----

Virtually every file system intrinsic constructs an ACB as its first action. When using the multi-access option, each accessor shares a single PACB. However each accessor is permitted to view the shared file in a slightly different manner than the other accessors. For example, one accessor may access the file in a read-only mode while the other accessors may access the file in a read-write mode. To do this, each accessor must, during his access, have a slightly different ACB.

The PACB holds information that is global to all accessors of the file. The LACB holds information that is local to each accessor of the file. At the beginning of a particular access, an ACB is constructed by calling LOC'ACB, which copies information from both the LACB and the PACB. At the end of the access, the ACB is released by calling UNLOC'ACB; this updates the PACB and LACB from the ACB since some of the fields may have been modified due to the access. This scheme nearly eliminates EXCHANGEDB's to access the various data segments.

### 3.2.5 Logical Access Control Block (LACB)

All LACBs have the same structure:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15					
3			Complete LACB size												0					
								File number								1				
File name - 1st char.				File name - 2nd char.				File name - 3rd char.				File name - 4th char.				2				
File name - 5th char.				File name - 6th char.				File name - 7th char.				File name - 8th char.				3				
File name - 5th char.				File name - 6th char.				File name - 7th char.				File name - 8th char.				4				
File name - 7th char.				File name - 8th char.												5				
FOPTIONS															6					
AOPTIONS															7					
Record size in bytes															10					
Block size in words															11					
Reserved for PACBV															12					
Carriage control code															13					
EOF Pg		Ln		St		FK		TC		TB		8B		Car DB		EOF T		EOF M		14
								TE  IC  Q     Terminal stop character								15				
Error code															16					
Last I/O transmission log															17					

Partial word field identifiers are:

LACBSIZE = LACB.(2:14)#, size in words  
 LACBSTOPCHAR = LACB(2).(0:8)#, terminal stop character

Discussion:

LACBAOPTIONS See ACBAOPTIONS.

LACBBSIZE See ACBBSIZE.

LACBCTL	See ACBCTL.
LACBERROR	See ACBERROR.
LACBFNUM	See ACBFNUM.
LACBFOPTIONS	See ACBFOPTIONS.
LACBMODE	See ACBMODE.
LACBNAME1-8	See ACBNAME.
LACBPACB	This is the vector of the Physical ACB (PACB) for the file.
LACBRSIZE	See ACBRSIZE.
LACBSIZE	This is the size, in words, of the LACB. All LACBs are sixteen (decimal) words long.
LACBSTATE	See ACBLSTATE.
LACBSTOPCHAR	See ACBSTOPCHAR.
LACBTLOG	See ACBTLOG.

### 3.2.6 Physical Access Control Block (PACB)

---

The overall structure of the PACB is:

The buffering extension is optional; it is present if and only if the file is accessed with buffering. There are thus two possible formats for an ACB:

1. No buffers; the buffering extension is not present.
2. PACB buffers; the buffering extension is present and the buffers are in the buffering extension.

If multiple PACB buffers exist, there will be a buffering extension for each, immediately preceding the buffer. The basic PACB (or NOBUF PACB) is copied into the the ACB as words 0 thru 57 octal; an ACB "extension" is then generated in words 60 thru 67. The resulting ACB thus has the following format:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
0	2		Complete ACB size													0	
1									File number								1
2	File name - 1st char.								File name - 2nd char.								2
3	File name - 3rd char.								File name - 4th char.								3
4	File name - 5th char.								File name - 6th char.								4
5	File name - 7th char.								File name - 8th char.								5
6	FOPTIONS																6
7	AOPTIONS																7
8	Record size in bytes																10
9	Block size in words																11
10	(Reserved for PACBV, if multi-access)																12
11	Carriage control code																13
12	EOF Pg	Ln	St	FK	TC	TB	8B	Car	DB	EOF T	EOF M						14
13	TE IC Q								Terminal stop character								15
14	Error code																16
15	Last I/O transmission log																17
16	File pointer																20
17																	21
18	Current variable block number																22
19																	23
20	Record transfer count																24
21																	25
22	Block transfer count																26
23																	27
24	Highest block number started																30
25																	31
26	FCB Vector																32

27	Spare			33
28	No. input LACB'S		Total no. LACB'S	34
29	Bk	Device type	Last logical I/O status	35
30	AE  RW  ABR NE	SEOFS	EOFS   Blocking factor	36
31	PF  Hit	Current buffer	Tape Displace.  No. buffers	37
32	Current record word index			40
33	Buffer size			41
34	Spare			42
35	FMAVT index			43
36	Volume table index			44
37	Name type		File disposition	45
38	Access bit map		Logical device number	46
39	S   M   Q   R   D		Virtual logical device no.	47
40	Spooled device type		Spooled device record size	50
41	Spooled device FOPTIONS			51
42	Spooled device AOPTIONS			52
43	IDD or ODD Index			53
44	No-Wait disk address			54
45				55
46	Spare			56
47	Spare			57

The above words, 0-%57, are physically located in the PACB of the file. Below, words %60-%67, are used by file system intrinsics and are placed onto the stack by the procedure LOC'ACB when locking the ACB. Therefore, the buffering extention, if present, will immediately follow word %57 of the actual ACB in the Control Block Table of the file.

48	PACB DST nr.			60
49	PACB offset (DST-rel.)			61

50	LACB DST nr.	62
51	LACB offset (DST-rel.)	63
52	ACB offset (Stack-DST-rel.)	64
53	DB offset (Stack-DST-rel.)	65
54	Stack-DST-rel location of PXFILE CBTAB	66
55	CBTAB-rel vector table entry address	67

The following identifiers are used when referring to an ACB:

(ACBSIZE)	= ACB.(2:14)#,	size in words
ACBFNUM	= ACB(1).(8:8)#,	file number
ACBNAME	= ACB(2)#,	file name
ACBNAME1	= ACBDBL(1)#,	file name - first half
ACBNAME2	= ACBDBL(2)#,	file name - second half
ACBFOPTIONS	= ACB(6)#,	FOPTIONS
ACBAOPTIONS	= ACB(7)#,	AOPTIONS
ACBRSIZE	= ACB(8)#,	record size (bytes)
ACBBSIZE	= ACB(9)#,	block size (words)
ACBCTL	= ACB(11)#,	carriage control word
ACBLSTATE	= ACB(12)#,	local state flags
ACBEOF	= ACBLSTATE.(1:1)#,	end of file sensed
ACBLPCTL	= ACBLSTATE.(2:2)#,	page and line control
ACBPAGECTL	= ACBLSTATE.(2:1)#,	page control
ACBLINECTL	= ACBLSTATE.(3:1)#,	line control
ACBSTREAM	= ACBLSTATE.(4:1)#,	stream I/O
ACBFKEYS	= ACBLSTATE.(5:1)#,	restore function keys
ACBXMITCRLF	= ACBLSTATE.(6:1)#,	transmit CR,LF to user
ACBTBLOCK	= ACBLSTATE.(7:1)#,	disable block mode
ACBBINARYIO	= ACBLSTATE.(8:1)#,	8-bit terminal transfers
ACBCARRIAGE	= ACBLSTATE.(9:1)#,	carriage control flag
(ACBDEFBLOCK)	= ACBLSTATE.(10:1)#,	default blocking
ACBREADCODE	= ACBLSTATE.(11:4)#,	input EOF check
ACBREADTYPE	= ACBLSTATE.(11:2)#,	input EOF type
ACBREADMODE	= ACBLSTATE.(13:2)#;	input EOF mode
ACBMODW	= ACB(13)#,	mode word
ACBMODE	= ACBMODW.(0:8)#,	mode setting
ACBTAPEERROR	= ACBMODW.(4:1)#,	report recovered tape error
ACBINHIBCRLF	= ACBMODW.(5:1)#,	inhibit terminal CR/LF
ACBQUIESCE	= ACBMODW.(6:1)#,	critical output verify

Discussion:

**ACBABORTREAD**       This flag is used to abort a broken terminal re-read. The flag is set via the ABORT parameter to FUNBREAK. If the flag is set then the READ PENDING message will be aborted along with the re-read. This feature is needed to handle the BREAK...:ABORT, etc. situation.

**ACBACCCL**            This is the access class part of the device type number. The following are legal values:

- 0 - direct (e.g. disc)
- 1 - serial input (e.g. card reader)
- 2 - parallel input/output (e.g. terminal)
- 3 - serial input/output (e.g. mag tape)
- 4 - serial output (e.g. line printer)

**ACBACCESS**         This is the access bit map for the file. The following are the bit definitions of this eight-bit field:

- (0:1) - unused
- (1:1) - unused
- (2:1) - read
- (3:1) - append
- (4:1) - write
- (5:1) - lock
- (6:1) - execute
- (7:1) - save

This access security is determined by the ACCCHECK intrinsic and enforced by the file system.

**ACBAOPTIONS**       This is the AOPTIONS in effect for this file access.

**ACBBINARYIO**       This bit controls full eight bit transfers on the 2644 page mode terminal. It is adjusted by FCONTROL(26) and FCONTROL(27).

**ACBBLK**             This is the block number of the current variable record format block. Applicable iff the record format is variable.

**ACBBLKFACT**        This is the blocking factor for the file. It is the number of records in a block. Legal values range from 1 to 255.

**ACBBREAK**          This is the break mode flag. It is applicable iff the ACB is for \$STDIN or \$STDLIST. If set it means that the BREAK key has been hit and that the CI should have high priority access to the ACB. The flag will be

cleared when a RESUME or ABORT is issued.

ACBBSIZE This is the block size, in words, of the file.

ACBBTFRCT This is the total number of blocks transferred to and from the file. The initial value is 0D.

ACBBUFUSED This is the word index, relative to the base of the block, for the selected record within the block. This is applicable iff the file access is buffered.

ACBCARRIAGE This bit signifies that the file has carriage control. It is the same as the carriage control bit in ACBFOPTIONS if the file is spooled. If not spooled, the bit is zero, and IOMOVE will pass the FWRITE carriage control parameter directly to the driver rather than imbedding it as the first character of the output record.

ACBCTL This is the CONTROL parameter from the last FWRITE. This value is pertinent iff the file was opened with carriage control.

ACBCURRBUF This is the buffer number (0-relative) containing the most recently referenced record. Applicable iff the file access is buffered.

ACBDADDR This is the logical device number of the file. For a disc file this is the logical device number of the first extent.

ACBDEFBLOCK This bit signifies that the file is to be accessed with default blocking. The bit is initialized from the FOPEN stateword STATE. It does not need to be in the ACB; it is mentioned here only to signify that the bit is effectively used due to the way ACBLSTATE is initialized from STATE.

ACBDISP This is the file close disposition derived from the FOPEN call. The only way this can be specified is via a file equation. The legal values are the same as those for FCLOSE.

ACBDNTYPE This is the file reference format type number and is derived from the FOPEN call. The following are legal values:

- 0 - full name
- 1 - account name absent
- 2 - group and account name absent
- 3 - null name

This information is needed by FRENAME.

ACBDTYPE This is the device type number of the file. The following are legal values (octal):

- 0 - moving head disc
- 1 - fixed head disc
- 7 - foreign disc
- 10 - card reader
- 11 - paper tape reader
- 20 - terminal
- 24 - card reader/interpreter/punch
- 26 - SSLC
- 27 - programmable controller
- 30 - magnetic tape
- 31 - serial disc
- 40 - line printer
- 41 - card punch
- 42 - paper tape punch
- 43 - CALCOMP 500 plotter
- 44 - CALCOMP 600 plotter
- 45 - CALCOMP 700 plotter

**ACBEOF** This bit is set when EOF has been sensed.

**ACBEOFS** This is the type of EOF detected on \$STDIN(X). This field consists of two bits:

- (0:1) - super colon (i.e. EOF for \$STDINX)
- (1:1) - regular colon (i.e. EOF for \$STDIN)

Applicable for multi-access to \$STDIN(X) only.

**ACBERROR** This is the error number for the file. It is used by all intrinsics except FOPEN. When an error is detected the error number is placed in this cell. The error number is cleared at the beginning of each callable intrinsic except FCHECK (which reads it).

**ACBFCB** This is the FCB vector for the file. Applicable only to disc files.

**ACBFKEYS** This bit controls the definition of the f1 and f2 function keys on the 2644 page mode terminal; it is adjusted by FCONTROL(32) and FCONTROL(33). (Obsolete function)

**ACBFNUM** File number, range from 1 to 255. Used mostly for calling routines that access things such as labels by file number.

**ACBFOPTIONS** This is the FOPTIONS in effect for this file access.

**ACBFPTR** This is the sequential access record pointer; it contains the next sequential record number. The initial value is 0D. This value is used only by the FREAD, FWRITE and FUPDATE intrinsics. However the value is maintained by all data transferring file system intrinsics.

ACBFMAVTX This is the entry index into the file multi-access vector table (FMAVT). This is valid iff the file access is multi-access.

ACBGSTATE These are miscellaneous state flags. These are "global" in nature in that they are the same for all accessors in a multi-access environment. The constituent bits are described individually.

ACBGSTATUS This is the general part of the last I/O status for the file. The following are the legal values:

- 0 - pending
- 1 - successful
- 2 - end of file
- 3 - unusual condition
- 4 - irrecoverable error

ACBHIBLK This is the highest block number for which an anticipatory read has been issued, and is applicable iff the file access is buffered. The initial value is -1D.

ACBHIT This is the buffer hit flag. If set it indicates that the last read or write request was serviced without any physical I/O required. This flag is used only for performance measurement. The code which manipulates it is optional to the file system, and is controlled by compiler toggle X3.

ACBINHIBCRLF This bit controls the termination of lines written to the terminal. If not set then each line is terminated with a CR and LF; if set then no line termination characters are used. This bit is valid iff the file is a terminal file; it is adjusted by FSETMODE.

ACBLINECTL This is the line control bit. If not set then each line is post-spaced; if set then each line is pre-spaced. This bit is used by line printers and terminals only. It is adjusted by FCONTROL(1) and FWRITE with the appropriate carriage control.

ACBLPCTL This are the line and page control bits, which are described separately.

ACBLSTATE These are miscellaneous state flags. They are "local" in nature in that they may be different for each accessor in a multi-access environment. Bits (9:6) are initialized from the stateword local variable called STATE in FOPEN; the ten remaining bits are initialized individually. The constituent bits are described individually.

ACBMODE            These are miscellaneous mode flags. The constituent bits are described individually.

ACBNAME            This is the local file name. The name is eight bytes in length with trailing blanks added.

ACBNEWEOF         This flag when set indicates that a new tape mark should be written before the tape is rewound or backspaced. Applicable only to mag tape files.

ACBNOWAITEOF      This bit is used to save the value of the local EOF advanced flag NEWEOF in IOMOVE between the I/O initiation and I/O completion calls. This flag is applicable iff the file is accessed in no-wait I/O mode.

ACBNOWAITMODE     This cell is used to save the I/O mode between no-wait I/O initiation and completion calls. If the bit is set then the last I/O request was a write; otherwise it was a read. This cell is pertinent iff the file is accessed in no-wait I/O mode.

ACBNUMBUFS        This is the number of buffers, less one, used for the file access. Applicable iff the file access is buffered.

ACBPAGECTL        This is the page control bit. If not set then a page is assumed to consist of 60 lines (auto page eject); if set then a page is assumed to consist of 66 lines (no auto page eject). This is used primarily for line printers but is also valid for terminals; these are the only devices for which this is valid. This bit is adjusted by FCONTROL(1) and FWRITE with the appropriate carriage control.

ACBPRIV            This flag when set indicates that the file is privileged in that it has a negative file code; the user must be in privileged mode to access it.

ACBQSTATUS        This is the qualifying part of the last I/O status for the file. The values are unique for each general status part. See I/O System IMS for all legal values.

ACBQUIESCE        This bit controls critical output verification. If set, buffered output is guaranteed to have been written to the device when control is returned to the user. This bit is adjusted by FSETMODE.

ACBREADCODE        This field consists of the input EOF checking type and mode, and is used to generate the P1 parameter to ATTACHIO. These fields are described individually.

ACBREADMODE        This field controls the input EOF checking mode. It is 00 for reading \$STDIN, 01 for reading \$STDINX, and 10 for the command interpreter.

ACBREADTYPE This field controls the input EOF checking type. It is 01 for JOBS, 10 for SESSIONS, and 00 for DATA.

ACBRSIZE This is the file's record size in positive bytes.

ACBRTFRCT This is the total number of records transferred to and from the file. The initial value is 0D.

ACBSAVEEOFS This field is used to save the contents of ACBEOFS during BREAK mode processing.

ACBSHCNT This is the total number of LACBs that exist for this PACB. Valid iff the file access is multi-access.

ACBSHCNTIN This is the total number of input-only LACBs that exist for this PACB. Valid iff the file access is multi-access.

ACBSHCNTS This is the total LACB and total input-only LACB counts, each of which is described separately.

ACBSIZE This is the size, in words, of the complete ACB. It includes the buffering extension, if present.

ACBSPAOPT This is the AOPTIONS for the spooled device. Applicable iff the file access is to a spooled device.

ACBSPFOPT This is the FOPTIONS for the spooled device. Applicable iff the file access is to a spooled device.

ACBSPOOLED This is the spooled device flag. If set then the file access is to a spooled device.

ACBSPOOLIO This field is a combination of the spooled device flag and the input/output mode of the spooled device. Legal values are:

00 - not spooled  
01 - illegal  
10 - input spooling  
11 - output spooling

ACBSPREC This is the record size, in bytes, of the spooled device. Applicable iff the file access is to a spooled device.

ACBSPTYPE This is the device type (from the LDT) of the spooled device. Applicable iff the file access is to a spooled device.

ACBSPTYRC This cell contains the spooled device type and record size, which are described separately.

ACBSPVDEV This is the logical device number of the spooled device. Applicable iff the file access is to a spooled

device.

ACBSPXDDX This is the index into the IDD or ODD for a spoolfile. Applicable iff the file access is to either a spooled device or a spoolfile.

ACBSTATUS This is the last I/O status for the file. It comes from the I/O status part of the IOCB returned by ATTACHIO. Not all ATTACHIO calls update this cell.

ACBSTOPCHAR This is the record termination character used for terminal reads. This character can be changed via FCONTROL(25).

ACBSTREAM This bit signifies inter-block garbage for disc files. If set, the block size is a multiple of 128 words and therefore there is no garbage data between blocks. This fact is used to improve multi-record I/O by mapping the request into as few ATTACHIOs as possible.

ACBSUBCL This is the sub-class part of the device type number. The sub-class is unique for each access class. The following are the legal sub-class values for each device class:

- 0 - direct
  - 0 - moving head disc
  - 1 - fixed head disc
  - 7 - foreign disc
- 1 - serial input
  - 0 - card reader
  - 1 - paper tape reader
- 2 - parallel input/output
  - 0 - terminal
  - 4 - card reader/punch
  - 6 - SSLC
  - 7 - programmable controller
- 3 - serial input/output
  - 0 - mag tape
  - 7 - serial disc
- 4 - serial output
  - 0 - line printer
  - 1 - card punch
  - 2 - paper tape punch
  - 3 - CALCOMP 500 plotter
  - 4 - CALCOMP 600 plotter
  - 5 - CALCOMP 700 plotter

ACBTAPEDISP This number is used to keep track of the difference or displacement between the physical and logical tape locations. The tape could be mispositioned due to pre-reads and this variable is used to properly backspace the tape before an FWRITE, FSPACE, FCONTROL(6) or FCLOSE(DISP=3).

ACBTAPEERROR This bit controls the reporting of recovered mag tape errors. If not set the recovered errors are not reported to the user; if set then recovered errors are reported to the user by returning CCL and error number 39. Valid iff the file is a mag tape file. This bit is adjusted by FSETMODE.

ACBTBLOCK This bit controls block mode transfers on the 2644 page mode terminal. This bit is adjusted by FCONTROL(28) and FCONTROL(29).

ACBTLOG This is the last I/O transmission log for the file. It comes from the I/O transmission log part of the IOCB returned by ATTACHIO. Not all ATTACHIO calls update this cell.

ACBVDADDR This is the volume table index for the file. Applicable iff the file is a disc file.

ACBXMITCRLF This bit controls CR and LF insertion into the user buffer on the 2644 page mode terminal. This bit is adjusted by FCONTROL(30) and FCONTROL(31).

If present, the PACB buffering extension contains from one to sixteen block buffers each having the following format:

0	7	10	11	12	13	14	15	
IOQ entry index								0 BLKIOQX
U   R   D   W   M   P								1 BLKFLAGW
IOCB - Status								2 BLKLSTAT
IOCB - Transmission log								3 BLKTLOG
Block number								4 BLKBLOCK
								5
Block log. device no.								6 BLKDADDR
Block sector number								7
Block Extent Base								8 BLKEXTBASE
								9
Block Extent Size								10 BLKEXTSIZE
Not Used								11
								12 BLKBUFFER
Buffer								

Other identifiers used:

BLKIOCB	= BLKDBL(1)#,	IOCB
(BLKLDEV)	= BLK(6).(0:8)#,	block logical device number
BLKFLAGS	= BLK(1).( 8:8)#,	block I/O flags
BLKUNALLOEXT	= BLK(1).(10:1)#,	block from un-allocated extent
BLKREVERSE	= BLK(1).(11:1)#,	block for tape FREADBACKWARDS
BLKDONTWAIT	= BLK(1).(12:1)#,	I/O status not checked.
BLKIOOUT	= BLK(1).(13:1)#,	last I/O was write?
BLKDIRTY	= BLK(1).(14:1)#,	buffer modified?
BLKIOPEND	= BLK(1).(15:1)#,	I/O in progress?
BLKIOCOMP	= BLK(1).(14:2)#,	I/O complete - not dirty

Discussion:

BLKBLOCK	This is the block number of the data contained in the buffer. A value of -1D indicates that the buffer is empty.
BLKBUFFER	If ACB buffering is used, this is the buffer location. When system buffers were used, the buffer location was given by BLKSYSBUF <sub>X</sub> and BLKSYSBUFDISP.
BLKDADDR	This is the block's logical device and sector number.
BLKDIRTY	This flag is set if the contents of the buffer has been modified. When the block buffer is reused this flag is checked to see if the block needs to be written to the device.
BLKDONTWAIT	This bit is on if the buffer's I/O was completed and the BLKIOQ <sub>X</sub> and pending bits cleared, but the status of the I/O was not checked. This is done to free valuable DRQ entries. If the bit is on, then BLKLSTAT must be checked before using the block.
BLKEXTBASE	This is the sector address of the base of the extents in which the block resides. It is used for I/O disk caching.
BLKEXTSIZE	This is the size, in sectors, of the extent in which the block resides. Also used for I/O disk caching.
BLKFLAGS	These are the miscellaneous flags associated with the block, which are described separately.
BLKIOCB	This is the IOCB returned by the I/O system when the block I/O has completed. On a blocked I/O request this is obtained from the ATTACHIO call; on an unblocked I/O request this is obtained from WAITFORIO.
BLKIOCOMP	This is the buffer modified flag (BLKDIRTY) and the I/O in progress flag (BLKIOPEND), which are described separately. This field is usually interrogated to see if it contains the value 2, which means that the buffer has been modified but not yet written to the device.
BLKIOOUT	This is the mode of the I/O operation for the block. It is set by a write and cleared by a read.
BLKIOPEND	This is the I/O in progress flag. It is set if the I/O is pending; it is cleared when the I/O has completed.
BLKIOQ <sub>X</sub>	This is the IOQ index of the unblocked I/O request for the block. It is used as the argument to WAITFORIO, which insures the completion of the I/O request.
BLKLDEV	This is the logical device number of the block.

BLKLSTAT           The I/O status part of the IOCB consists of the PCB number and the error code for the completed I/O request.

BLKREVERSE         This bit is not currently used but has been reserved if FREADBACKWARDS (reading a tape backwards) to a buffered file which is not currently supported.

BLKTLOG            The transmission log part of the IOCB is the number of words or bytes transferred by the the I/O request.

BLKUNALLOCEXT     This bit is on if the block in this buffer was read from unallocated extent. In this case, the extent was not allocated and the buffer was simply flushed with fill characters. The block must be allocated before writing to it.

### 3.2.7 File Control Block (FCB)

The FCB coordinates access to a file on a sharable device. At present the only sharable device is a disc, so only disc files have FCBs.

The information contained in an FCB is derived from the file label. The FCB is used to hold this information, rather than the file label, since it can be accessed more quickly.

The FCB can be contained in a stack when first created. If another process opens the file, the FCB will be moved to a system data segment (which will be created if it doesn't already exist) so that the first process' entire stack need not be present when the second process is dealing with the file. The number of a data segment containing a list of numbers of shared file system data segments is kept in system global location 1076 octal. The size of the FCB depends on the maximum number of extents specified at FOPEN; there are 44 (octal) words plus two per extent. There will be at least one extent, since the file label always exists in the first extent. The FCB extent map is in terms of logical device and sector number. The extent map in the file label is in terms of volume rather than logical device; the map is converted by VTABTOLDEV when the label is read, and converted back by LDEVTOVTAB when the label is written to disk.

The FCB has the following format:

	0	1	2	3	7	8	12	13	14	15	
0	1	Complete FCB size									0
1	New FCB vector										1 FCBNEWFCBV
2	FOPTIONS										2 FCBFOP- TIONS
3	Device specification										3 FCBDEVICE
4	Prev. lock	Dev. type	C	Device subtype							4
5	No. opens for output					No. opens for any mode					5
6	Creator ACB vector										6 FCBACB
7	RIN number										7 FCBRIN
8	Exclusive status										10 FCBEXC- STAT
9	Private volume information										11 FCBPVINFO
10	File limit										12 FCBFLIM
11											13

12	Reserved for IMAGE	14	FCBIMAGE
13		15	
14	End of data pointer	16	FCBEOF
15		17	
16	No. user labels written   No. user labels avail.	20	FCBUSERLBL
17	Extent size in sectors	21	FCBEXTSIZE
18	Blocking factor   Sectors per block	22	
19	Sector offset to data   Disp   No. extents - 1	23	
20	Last extent size in sectors	24	FCBLAST- EXTSIZE
21	No. opens input mode	25	
22	Group name - 1st char.   Group name - 2nd char.	26	FCBGN
23	Group name - 3rd char.   Group name - 4th char.	27	
24	Group name - 5th char.   Group name - 6th char.	30

Logical device number
Last extent sector number

Other identifiers used:

FCBSIZE	= FCB(2:14)#,	size in words
FCBLKST	= FCB(4).(0:2)#,	previous lock state
FCBDTYPE	= FCB(4).(2:6)#,	device type
FCBCRUNCH	= FCB(4).(8:1)#,	pending crunch disposition
FCBSUBTYPE	= FCB(4).(12:4)#,	device subtype
FCBOCNTOUT	= FCB(5).(0:8)#,	no. accessors - output
FCBOCNT	= FCB(5).(8:8)#,	no. accessors
FCBLEOF	= FCB(16).(0:8)#,	no. labels written
FCBLBL	= FCB(16).(8:8)#,	no. labels available
FCBBLKFACT	= FCB(18).(0:8)#,	blocking factor
FCBSECTPBLK	= FCB(18).(8:8)#,	sectors per block
FCBSECTOFF	= FCB(19).(0:8)#,	sector offset to data
FCBDISP	= FCB(19).(8:3)#,	pending disposition
FCBNUMEXTS	= FCB(19).(11:5)#,	no. extents less 1
FCBOCNTIN	= FCB(21).(8:8)#,	no. accessors - input
FCBLABEL	= FCDBL(18)#,	label LDEV and sector
FCBLDEV	= FCB(36).(0:8)#,	label LDEV

Discussion:

FCBACB	This is the vector of the ACB that was created at the same time as the FCB. This is used in conjunction with FCBNEWFCBV when relocating the FCB.
FCBAN	This is the account name of the file. It is eight bytes in length with trailing blanks added.
FCBBLKFACT	This is the blocking factor of the file. It is the number of logical records in a physical block. Legal values range from 1 to 255.
FCBDEVICE	This specifies the device on which the file resides. If it is positive then it represents a logical device number; if negative it represents a (negative) device class index.
FCBDISP	This is the pending FCLOSE disposition for the file. Legal values are:

- 0 - no change
- 1 - save permanent
- 2 - save temporary and rewind
- 3 - save temporary but do not rewind
- 4 - release

7 - invalid file (file label access error)

**FCBCRUNCH** This bit governs if space will be returned beyond the EOF up the last FCLOSE of the file.

0 - no change  
1 - return space beyond EOF

**FCBDTYPE** This is the device type number of the first extent of the file. See ACBDTYPE for a list of legal values.

**FCBEND** Block number of the file's EOF, relative to FCBSTART.

**FCBEOF** This is the end-of-file pointer for the file. It is a double integer representing the number of records in the file. It can also be viewed as the record number of the next record past EOF.

**FCBEXCLSTAT** This is the exclusive status of the file access. If -1 then the file is being accessed exclusively; otherwise it is the number of semi-exclusive accessors.

**FCBEXTMAP** This is the extent map of the file. The number of extents is specified by FCBNUMEXTS; a 0D extent descriptor indicates that the extent has not been allocated.

**FCBEXTSIZE** This is the extent size, in sectors, of the file. All extents in the file except possibly the last have this size. This is a logical value, and legal values range from 1 to 65535 sectors. This restricts the maximum file size to 2097120 sectors (268,431,360 words).

**FCBFLIM** This is the end-of-space pointer for the file. It is a double word integer representing the maximum number of records (fixed length record format) or blocks (undefined or variable length record format) in the file.

**FCBFOPTIONS** This is the FOPTIONS in effect for the file.

**FCBGN** This is the group name of the file. It is eight bytes long with trailing blanks added.

**FCBLABEL** This is the logical device and sector number of the file label, which is the same as the first extent descriptor.

**FCBLASTEXTSIZE** This is the size, in sectors, of the last extent in the file. If the file has one extent then this is the same as FCBEXTSIZE; otherwise this value may be different from FCBEXTSIZE. This is the size of the last physical extent for the file; it is not the size of the last allocated extent.

FCBLBL This is the number of user labels allocated for the file. Since each label is a sector long, this is also the number of sectors allocated for user labels.

FCBABLEOF This is the end-of-data pointer for the user labels. It is analogous to FCBEOF in that it represents the number of labels written. The initial value is 0.

FCBLDEV This is the logical device number of the first extent of the file.

FCBLKST This is the previous lock state of the file and is derived from the file label. Legal values are:

- 0 - no accessors
- 1 - read
- 2 - write
- 3 - read/write

FCBNEWFCBV This is the vector of the new FCB for the file. It is used in conjunction with FCBACB to move the FCB to a system (shared FCB) control block table when the second accessor is established. If this value is zero then there is no new FCB; if non-zero then a new FCB has been created.

FCBNUMEXTS This is the maximum number of extents, less one, allowed for the file. It is not the number of extents presently allocated, which is always determined by counting non-zero entries in the extent map.

FCBNUMOPENCLSREC Number of open and close records in the message file.

FCBOCNT This is the number of accessors for the file. Alternatively it can be viewed as the number of PACBs created for the file.

FCBOCNTIN This is the number of file accessors having input access.

FCBOCNTOUT This is the number of file accessors having output access.

FCBRIN This is the RIN number used to support dynamic locking (i.e. FLOCK and FUNLOCK) for the file. If there is no dynamic locking then this number is zero.

FCBSECTOFF This is the sector offset from the file label to the first block of the file. This is not necessarily equal to FCBLBL+1 since an integral number of blocks are allocated for the file and user labels.

FCBSECTPBLK	This is the number of sectors in a block for the file.
FCBSIZE	This is the size, in words, of the complete FCB. It includes the extent map.
FCBSTART	Block number of the file's start, excluding the file label block.
FCBSUBTYPE	This is the device sub-type number of the first extent.
FCBUSERLBL	This field describes the user labels for the file. It consists of FCBLBL and FCBLBLEOF, described separately.

### 3.3 File Label (FLAB)

The file label has the following format:

0	1	2	3	7	8	12	13	14	15		
File name - 1st char.				File name - 2nd char.				0	FLLOCNAME		
File name - 3rd char.				File name - 4th char.				1			
File name - 5th char.				File name - 6th char.				2			
File name - 7th char.				File name - 8th char.				3			
Group name - 1st char.				Group name - 2nd char.				4	FLGRPNAME		
Group name - 3rd char.				Group name - 4th char.				5			
Group name - 5th char.				Group name - 6th char.				6			
Group name - 7th char.				Group name - 8th char.				7			
Acct name - 1st char.				Acct name - 2nd char.				10	FLACCTNAME		
Acct name - 3rd char.				Acct name - 4th char.				11			
Acct name - 5th char.				Acct name - 6th char.				12			
Acct name - 7th char.				Acct name - 8th char.				13			
Creator name - 1st char.				Creator name - 2nd char.				14	FLUSERID		
Creator name - 3rd char.				Creator name - 4th char.				15			
Creator name - 5th char.				Creator name - 6th char.				16			
Creator name - 7th char.				Creator name - 8th char.				17			
Lockword - 1st char.				Lockword - 2nd char.				20	FLLOCKWORD		
Lockword - 3rd char.				Lockword - 4th char.				21			
Lockword - 5th char.				Lockword - 6th char.				22			
Lockword - 7th char.				Lockword - 8th char.				23

Other identifiers used:

FLSECURE	= FLAB(22).(15:1)#,	file secure bit
(FLSRRELEASE)	= FLAB(22).(14:1)#,	STORE/RESTORE released bit
(FLSTORE)	= FLAB(28).(0:1)#,	file being stored
FLRESTORE	= FLAB(28).(1:1)#,	file being restored
(FLLOAD)	= FLAB(28).(2:1)#,	file loaded
FLEXCL	= FLAB(28).(3:1)#,	exclusive access
FLSR	= FLAB(28).(0:2)#,	S & R bits
FLSRL	= FLAB(28).(0:3)#,	S, R, & L bits
(FLSRLX)	= FLAB(28).(0:4)#,	S, R, L, & X bits
FLSUBTYPE	= FLAB(28).(4:4)#,	device sub-type
FLDTYPE	= FLAB(28).(8:6)#,	device type
FLSTATUS	= FLAB(28).(14:2)#,	write/read status
(FLLBLEOF)	= FLAB(29).(0:8)#,	no. labels written
(FLLBL)	= FLAB(29).(8:8)#,	no. labels available
FLSECTOFF	= FLAB(39).(0:8)#,	sector offset to data
FLNUMEXTS	= FLAB(39).(11:5)#,	no. extents less 1
FLLABEL	= FLABDBL(22)#,	label VTAB and sector
FLVTAB	= FLAB(44).(0:8)#,	label VTAB index

**Discussion:**

**FLACCTNAME** This is the account name of the file. It is eight bytes in length with trailing blanks added.

**FLALLOCDATE** Date that the file was allocated on this system.

**FLALLOCTIME** Doubleword containing the time that the file was allocated on this system.

**FLBLKSIZE** This is the block size, in sectors, of the file.

**FLCHECKSUM** This is the exclusive-OR checksum of the file label (excluding words 34, 42, and 43 octal) and is used for error detection. Each time the file label is read from disc the check sum is calculated and compared against the value recorded in the file label. Similarly, each time the file label is written to the disc the check sum is calculated and inserted into the file label.

**FLCLID** This is the cold load number in effect the last time that the file was accessed. This should always be the current cold load number. If it is not it means that the system crashed while the file was open and that the data in the file label should be "reset" (principally the FCB vector FLFCBVECT).

**FLCREATE** This is the creation date of the file. It is in the format defined by the intrinsic CALENDAR.

**FLDEVNAME** This is the FOPEN device specification that was used when the file was created. This information is needed when new extents are allocated.

**FLDTYPE** This is the device type number of the first extent of the file; see ACBDTYPE for a list of legal values. This value is determined by configuration.

**FLEND** Number of current data blocks (that is, the end of file block number relative to the start of file).

**FLEOF** This is the end-of-file pointer for the file. It is a double word integer representing the number of records in the file. It can also be viewed as the record number of the next record past EOF.

**FLEXCL** This is the exclusive access flag for the file. If set it means that the file has been opened exclusively by a single accessor. If not set then the file is potentially accessible by others.

**FLEXTMAP** This is the extent map of the file. The number of extents is specified by FLNUMEXTS; a 0D extent descriptor indicates that the extent has not been allocated.

**FLEXTSIZE** This is the extent size, in sectors, of the file. All extents in the file, except the last, have this extent size. This is a logical value, and legal values range from 1 to 65535 sectors. This limits the maximum file size to 2097120 sectors.

**FLFCBVECT** If non-zero, this is the vector of the FCB for the file. If zero, the file is not being accessed.

**FLFILECODE** This is the file code of the file. Known values are:

- 401 IMAGE data set
- 400 IMAGE root file
- 1024 USL file
- 1025 BASIC data file
- 1026 BASIC program file
- 1027 BASIC fast program file
- 1028 RL file
- 1029 Program file
- 1030 STAR file
- 1031 SL file
- 1040 Cross Loader ASCII file (SAVE)
- 1041 Cross Loader relocatable binary file
- 1042 Cross Loader ASCII file (DISPLAY)
- 1050 EDITOR KEEPQ file (non-COBOL)
- 1051 EDITOR KEEPQ file (COBOL)
- 1060 RJE punch file
- 1069 RSAM (Bob Strand's ISAM) file
- 1070 QUERY procedure file
- 1071 QUERY work file
- 1072 QUERY work file
- 1080 KSAM key file
- 1081
- to Reserved for KSAM
- 1089
- 8000
- to Reserved for APL
- 8099

**FLFLIM** This is the end-of-space pointer for the file. It is a double integer representing the maximum number of records (fixed length record format) or blocks (undefined or variable length record format) in the file.

**FLFOPTIONS** This is the FOPTIONS of the file.

**FLGRPNAME** This is the group name of the file. It is eight bytes long with trailing blanks added.

**FLLABEL** This is the volume table index and sector number of the file label, which is the same as the first extent descriptor.

**FLLASTACC** This is the last access date of the file. It is in the format defined by the intrinsic CALENDAR.

**FLLASTMOD** This is the last modification date of the file. It is in the format defined by the intrinsic CALENDAR.

**FLLASTTEXTSIZE** This is the size, in sectors, of the last extent in the file. If the file has one extent then this is the same as FLEXTSIZE; if the file has more than one extent then this value may be different from FLEXTSIZE. This is the size of the last physical extent for the file; it is not the size of the last allocated extent.

**FLLBL** This is the number of user labels allocated for the file. Since each label is a sector long, this is also the number of sectors allocated for user labels.

**FLBLEOF** This is the end-of-data pointer for the user labels. It is analogous to FLEOF in that it represents the number of labels written.

**FLLOAD** This is the LOADED flag for the file. If set it means that the file is a loaded program or SL file and cannot be modified except by a privileged accessor. This flag is set and cleared by the loader, not the file system.

**FLLOCK** This identifies the word containing the lock bits, which are described separately.

**FLLOCKWORD** This is the lock word of the file. It is eight bytes long with trailing blanks added. If it is all blanks then the file does not have a lockword.

**FLLOCNAME** This is the local name of the file. It is eight bytes long with trailing blanks added.

**FLNUMEXTS** This is the number of extents, less one, allowed for the file. It is not the number of extents allocated. Legal values range from 0 to 31, i. e., 1 to 32 extents.

**FLNUMOPENCLSREC** Number of open and close records in the message file.

**FLRECSIZE** This is the record size of the file in negative bytes.

**FLRESTORE** This is the RESTORE flag for the file. If set it means that the file is being RESTORED and cannot be accessed. RESTORE also sets the STORE bit for the file (FLSTORE); see FLSR for a full description of the use of these bits. This flag is set and cleared by STORE/RESTORE, not the file system.

**FLSECMX** This is the security matrix of the file. The bits are organized into five groups of six bits each. (Bits 0:2 are not used.) The groups correspond to the access types: READ, APPEND, WRITE, LOCK, and EXECUTE. Within each group, each bit specifies who may have the access: ANY, ACCOUNT MGR, ACCOUNT LIB-

RARIAN, GROUP, GROUP LIBRARIAN, CREATOR.

**FLSECTOFF** This is the sector offset from the file label to the first block of the file. This is not necessarily equal to FLLBL+1 since an integral number of blocks are allocated for the file and user labels.

**FLSECURE** This is the file security enforcement flag for the file. If not set then the file has been RELEASED and the security matrix FLSECMX should be ignored. If set then secured as specified by the security matrix.

**FLSR** This is the STORE and RESTORE flags for the file, which are described separately. STORE and RESTORE decode the two-bit field to indicate their operation. Legal values are:

- 0 - file not in use by either STORE or RESTORE
- 1 - illegal value
- 2 - file being STORED
- 3 - file being RESTORED

The file system interprets the leftmost bit as indicating that the file is being accessed by either STORE or RESTORE. The rightmost bit is interpreted as indicating what access should be permitted: 0 (file being STORED) allows read access; 1 (file being RESTORED) allows no access. This field is set and reset by STORE/RESTORE, not the file system.

**FLSRL** This is the STORE, RESTORE and LOADED flags for the file, which are described separately.

**FLSRLX** This is the STORE, RESTORE, LOADED and exclusive flags for the file, which are described separately.

**FLSRRELEASE** This flag is used by STORE/RESTORE. If a file is STORED with the ";RELEASE" keyword, STORE will set this flag in the tape copy of the file label. RESTORE will allow any user to access such files, regardless of the file's normal security. If this bit is off in the tape copy of the file label, RESTORE applies normal security checks (as defined by the information in FLSECMX and FLSECURE). This bit is zero for files on disc.

**FLSTART** Block number of the file's start, excluding the file label block.

**FLSTATUS** This is the read/write status of the file. Legal values are:

- 0 - no accessors
- 1 - read
- 2 - write
- 3 - read/write

**FLSTORE** This is the STORE/RESTORE flag for the file. If set it means that the file is being either STOREd or RESTOREd. The RESTORE bit (FLRESTORE) must be interrogated to determine which operation is taking place; see FLSR for a full description of the use of these bits. This flag is set and cleared by STORE/RESTORE, not the file system.

**FLSUBTYPE** This is the device sub-type number of the first extent of the file. This value is determined by configuration.

**FLUSERID** This is the creating user name of the file. It is eight bytes long with trailing blanks added.

**FLUSERLBL** This field describes the user labels of the file. It consists of FLLBL and FLLBLEOF, which are described separately.

**FLVTAB** This is the volume table index of the first extent of the file.

### 3.4 File Multi-Access Vector Table (FMAVT) DST(%54)

-----

The FMAVT is used to locate shared PACB's for files opened multi-access. When an old disc file has been opened multi-access, the FMAVT is searched to determine if the file has previously been opened. The JITDST and the DADDR found in the FMAVT are compared to the JITDST of the job and the DADDR of the device or disc file being opened multi-access. If an entry exists for the file, then the PACB can be easily located for that file. If this is the first process opening the file then an entry is created and inserted into the FMAVT for the file.

Spoolfiles are opened multi-access, therefore, they will have entries in the FMAVT. \$STDIN and \$STDLIST also have entries in the FMAVT since they too are opened multi-access.

#### Zero Entry Format

Current Table Size	0 FM'CURRE'SIZE
Entry Size = 4	1 FM'ENTRY'SIZE
Maximum Table Size	2 FM'MAX'SIZE
0	3

#### Descriptions:

**FM'CURRE'SIZE** The current size of the FMAVT in words. This value increases in increments of %200 words until FM'MAX'SIZE is reached.

**FM'MAX'SIZE** The maximum allowable size in words that the FM'CURRE'SIZE can get. The current value of this is %4000. FM'MAX'SIZE can be changed only by changing the code in Initial. The FOPEN fails when the maximum is reached.

**FM'ENTRY'SIZE** Size in words of an FMAVT entry, 4 words at present.

Typical Entry Format

0	1	2	3	6	7	8	12	13	14	15	
1	G	D					JIT DST				0
Logical Device											1 FM'DADDR
						Disk Address				2	
						PACB Vector				3 FM'PACBV	

FM'DEVICE = FMAVT(0).(2:1)#, Device bit  
 FM'GLOBAL = FMAVT(0).(1:1)#, Global multi-access bit  
 FM'JITDST = FMAVT(0).(6:10)#, JIT DST number of job opening file  
 FM'LDEV = FM'DADDR(0).(0:8)#, Logical device number of file

Descriptions:

FM'DADDR The disc address of the file label for disc files. For device files, the disc address is zero.

FM'DEVICE This bit is 1 for device files and 0 for disc files.

FM'LDEV Logical device number of device files or the LDEV of the disc containing the file label for disc files.

FM'JITDST The DST number of the JIT for the job that has the file open. If this field is non-zero, than only processes in the family tree of this particular job can open the file. This field is zero if the file was open global multi-access.

FM'GLOBAL This bit is 1 if the file was opened global multiaccess, this allows multi-access to the file between jobs.

FM'PACBV The PACB vector for this multi-access file. Used to easily find the Physical Access Control Block for files opened multi-access.

### 3.5 System Global Area (SYSGLOB)

-----

The file system uses several words in the system global area for its own use.

SHFCBDST	= SYSDB+%76,	shared FCB DST no.
MONITOR	= SYSDB+%77,	monitoring flag word
MAXSSECT	= SYSDB+%100,	max # spoolfile sectors
NUMSSECT	= SYSDB+%102,	current # spoolfile sectors
EXTSSECT	= SYSDB+%104,	# sectors/spoolfile extent
SPOOLINDEX	= SYSDB+%132,	class spool index
CSIOWAIT	= SYSDB+%135,	CSIOWAIT PLABEL
CCLOSEPLABL	= SYSDB+%140,	CS CCLOSE PLABEL - FPROCTERM
DSCHKPLABL	= SYSDB+%335,	DSCHECK PLABEL
DSOPENPLABL	= SYSDB+%336,	DSOPEN PLABEL
DSCLOSEPLABL	= SYSDB+%337,	DSCLOSE PLABEL
SDSLDEVLABEL	= SYSDB+%323,	PLABEL for SDSLDEV
MANWCPLABL	= SYSDB+%340;	MANAGEWRITECONV PLABEL

### 3.6 SIRs, Locks, and Deadlocks

---

The file system uses two SIRs: the File SIR, which is intended to protect file label integrity, and the FMAVT SIR, which is to guarantee the integrity of the FMAVT. Since the file system locks these resources, and also locks control blocks, deadlocks can occur if locking is done in the wrong order. Not only must the file system handle locking correctly, but the entire ensemble of the file system, its callers, and its callees must do so also. These include KSAM, which has a SIR of its own, and SYSDUMP and STORE, which lock the File SIR because they tweak bits in file labels. The presently accepted order is:

Get FMAVT SIR  
Lock ACB  
Get File SIR  
Lock FCB

It may not be necessary to do all of these things in any particular procedure. In modifying a procedure, you should be sure that any of these locks which you change are consistent not only within your own code, but also with its callers and callees.

## 7.1 Introduction

The operating system maintains state, control, and accounting information on each process. The data structures for this purpose are the process control block table (PCB; core resident, 1 entry per process) and the process control block extension (PCBX; contained in the process' stack below DL). Process related information which must be accessible even when the process stack is not present in main memory is maintained in the process' PCB entry. All other process related information is maintained in the process' PCBX.

A process is identified in the system by its PCB entry number, referred to as its PIN (process identification number), or by its PCBPT=(PIN)\*(PCB entry size).

The structure of the PCB table, PCB entry format, PCBX structure, and PCBX format are specified in this chapter.

## 7.2 Process Control Block Table Structure and Format

### 7.2.1 Fixed Cells Related to PCB

- 3 Absolute address of base of PCB table
- 4 Absolute address of current process' PCB entry

## 7.2.4 PCB Assigned Entry Field Descriptions

PCB00 .(0:1) SAR ==> scheduling attention required  
.(1:1) Bounds Flag -- Priv mode bounds check  
.(2:1) CRIT ==> process is critical  
.(3:1) HSIR ==> process has a sir  
.(4:1) PIOVR ==> pending PI, process critical  
.(5:1) HSPRI ==> hold sir priority  
.(6:1) IPEXP ==> incore protect expired  
.(7:1) PC ==> preempt capability  
.(8:1) DSOFT ==> Delayed soft int processing. A pending  
soft int cannot be processed because of sir  
or critical state. PSEUDOINT will be invoked  
when these condition(s) go away.  
.(9:1) LW ==> long wait  
.(10:1) SW ==> short wait  
.(11:1) TRW ==> terminal read wait  
.(12:1) USEDQ ==> used a quantum since transaction began  
.(13:1) HIPRI ==> hold impeded priority  
.(14:1) STOVA ==> processing abort due to stack overflow.  
.(15:1) RITBK

PCB01 .(0:16) SLLPTR, SYSBASE relative index to process' segment  
locality list

PCB02 .(0:1) ADB, set if db pointing to an absolute address  
.(1:10) XDS, DST entry number of extra data seg. to which  
DB is set; zero if none.  
.(11:4) Reserved for expansion of DST entry number field

PCB03 .(0:1) STOVRALL FLAG ==> stack overflow is already allocated  
.(1:10) DST entry number of process' stack  
.(11:1) SC, set if executing system code  
.(12:3) Reserved

PCB04 .(0:1) M, mourning wait.  
.(1:1) RG, global RIN wait.  
.(2:1) RL, local RIN wait.  
.(3:1) MA, mail wait.  
.(4:1) BIO, blocked I/O wait.  
.(5:1) IO, I/O wait.  
.(6:1) UCP, UCOP wait and RIT wait.  
.(7:1) JNK, junk wait.  
.(8:1) TIM, timer wait.  
.(9:1) MSG, file system basic ipc message wait.  
.(10:1) SON, son wait.  
.(11:1) FA, father wait.  
.(12:1) IMP, process waiting to be unimpeded.  
.(13:1) SIR, process waiting for a sir.  
.(14:1) TIM, process waiting for a time out.  
.(15:1) MEM, process waiting for memory.

PCB05 .(0:8) FPIN, father's PCB entry number  
.(8:8) SPIN, son's PCB entry number

PCB06 .(0:8) BPIN, brother's PCB entry number  
.(8:8) BLKIDX (reserved)

PCB07 .(0:8) PIMPPIN, previous impeded pin.  
.(8:8) BPTLINK, breakpoint link for process.

PCB08 .(0:3) PSIM, pseudo - interrupt mode  
1: hard kill  
2: soft kill  
3: stop  
4: hibernate  
5: escape  
6: break  
7: normal

.(3:1) ASOFT, OK for soft int to wake process !  
even though it is waiting on another event. !

.(4:2) OA  
0: other source  
1: father  
2: son  
3: reply done on RIT wait

.(6:1) DEAD, set during expiration.

.(7:1) FAC, if set, the father is to be activated on process  
termination.

.(8:8) NIMPPIN, next impeded process' pin

PCB09 .(0:1) LIVE, set if process is alive.

.(1:2) BMS, block mail, valid if MA set  
0: sent to father  
1: rec from father  
2: send to son  
3: rec from son

.(3:2) PPC, process to process communication, set with  
respect to son.  
0: null  
1: son to father  
2: father to son  
3: blocked

.(5:1) STOV, stack overflow bit

.(6:3) PTYPE, process type  
0: user  
1: user, son of main  
2: user, main  
3: user, main, task  
4: system  
5:  
6: system, UCOP  
7:

.(9:1) SI, set when the Dispatcher (and PSEUDOINT) !  
should be aware of a pending soft interrupt. !

.(10:1) HK, hard kill pseudo interrupt

.(11:1) SK, soft kill pseudo interrupt

.(12:1) ST, stop pseudo interrupt  
 .(13:1) HB, hibernate pseudo interrupt  
 .(14:1) CY, control-y pseudo interrupt  
 .(15:1) BK, break pseudo interrupt

PCB10 .(0:15) EVENTFLAGS, one for each wait class in PCB04  
 .(15:1) WS, wake up waiting switch set if an awake is missing.

PCB11 .(0:16) LASTREFSWAPSEG, segment identifier of last referenced swappable code segment.

PCB12 .(0:16) PBX, CSTX block map index of process' program.

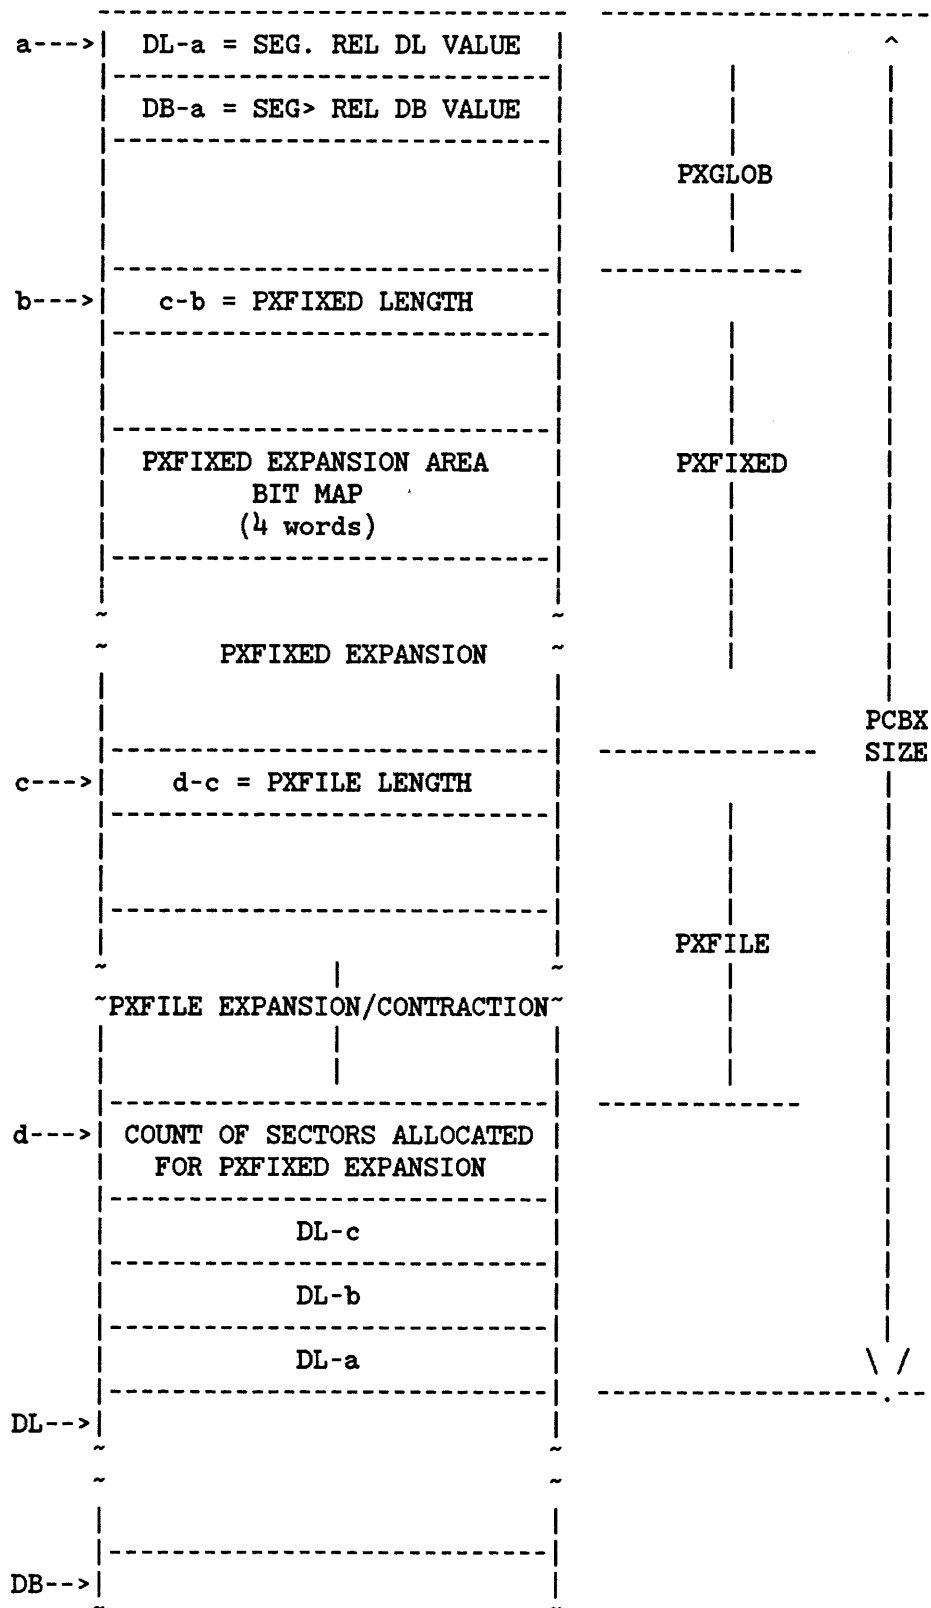

PCB13 (QUEUEING INFO)  
 .(0:1) DISPQ ==> on dispatching queue  
 .(1:1) L scheduling class  
 .(2:1) C scheduling class  
 .(3:1) D scheduling class  
 .(4:1) E scheduling class  
 .(5:1) INTER ==> process is interactive  
 .(6:1) CORER ==> process is core resident  
 .(7:1) ASOFT, Allow soft interrupt. A value of 1 implies that user soft interrupts will be processed. A zero value inhibits user soft ints (they are queued). This bit is managed by FINSTATE and FINTEXTIT intrinsics.  
 .(8:8) Process' scheduling priority

PCB14 .(0:16) NQPTR, sysbase index of PCB entry of next process in scheduling queue

PCB15 .(0:16) PQPTR, sysbase index of PCB entry of previos process in scheduling queue

### 7.3 PCBX Structure and Format

#### 7.3.1 PCBX General Structure

### 7.3.2 PXGLOB FORMAT

The PXGLOB portion of the pcbx is for job information, and contains the same job related information for all processes belonging to the same job.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

DCY                   A DELAYED CONTROL Y IS PENDING (THIS BIT IS CHECKED BY ININ ON BOUNDS VIOLATION TO DETERMINE IF GOT: 1) TRUE BOUNDS VIOLATION OR 2) AN INDUCED BOUNDS VIO THAT INDICATES THAT THE CONTROL Y TRAP PROCEDURE MAY NOW BE ENTERED).

OSI                   STATE OF THE "ASOFT" PCB BIT WHEN CONTROL Y TRAP WAS ENTERED. ASOFT = 1 ALLOWS USER SOFT INTERRUPTS AGAINST THE PROCESS. IT IS SET TO ZERO WHEN THE CONTROL Y HANDLER IS ENTERED. IT IS SET TO ITS PRIOR STATE WHEN THE USER CALLS RESETCONTROL.

\* SET TO COMMAND RECORD LENGTH WHEN COMMAND PENDING (I.E. COMMAND ENTERED DURING BREAK OR ENCOUNTERED DURING FLUSHING).

\*\* CONTINUE FLAG VALUES

0 = NO CONTINUE IN EFFECT  
1 = CONTINUE JUST ENCOUNTERED  
2 = CONTINUE IN EFFECT FOR THIS COMMAND

CY FLAG

PCBXFIXED(61).(1:1)           = SET BY PSEUDOINT WHEN THERE IS A PENDING CONTROL Y WHICH CANNOT BE PROCESSED BECAUSE OF SYSTEM CODE OR PRIVILEGED CODE. ININ CHECKS THIS BIT ON BOUNDS VIOLATION OR TRACE TRAP.

SI FLAG

PCBXFIXED(61).(3:1)           = SPECIFIES THE STATE OF THE USER INTERRUPT FLAG WHEN THE CURRENT CONTROL Y WAS PROCESSEI

### 7.3.4 PXFIXED EXPANSION BITMAP

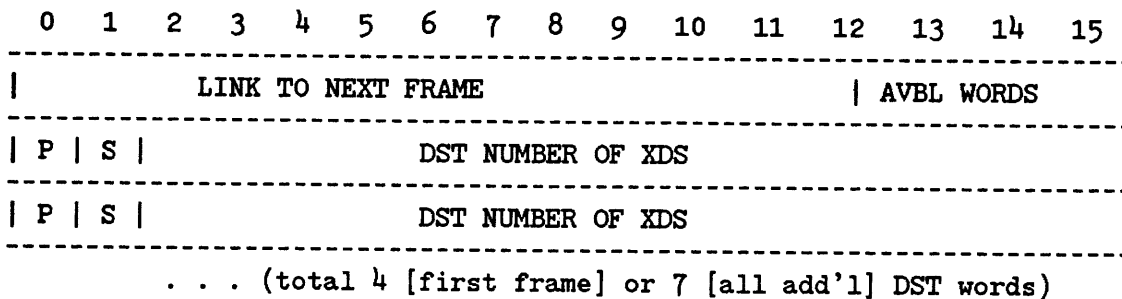

The PXFIXED bitmap and expansion area is for use in accounting for extra data segments acquired by the process.

The names of extra data segments allocated by and belonging to a process are kept in the PXFIXED part of the PCBX. Up to four such names (DST numbers) can be kept in cells that are permanently allocated for this purpose at PXFIXED locations 8 through 11. If more than four extra data segments are allocated, an expansion of PXFIXED occurs in which it is enlarged by one sector (128 words). Up to three such sectors can be allocated.

The expansion area is managed by a cumbersome scheme in which each sector is divided up into "frames" of eight words. The first word of each frame contains the frame size in the low 4 bits, and a pointer to the next frame (or zero, if none) in the upper 12 bits. The frames are allocated by a bitmap; one bitmap word is needed for each expansion sector, and the words are stored at locations 76,77, and 78 in PXFIXED. Although a procedure exists to de-allocate a frame, it is never called. The original intent presumably was to permit use of frame space by activities other than DST management, but nothing of this sort has been done.

In order to permit the four PXFIXED words to be managed as a frame, they are preceded by a word at PXFIXED(7) which is in the frame header format described above; initially, the frame size field is 4 and the pointer is 0.

Pictorially, a frame looks like this:

P=0 if DST is privileged; i.e., creator was in privileged mode.  
Non-privileged DSTs are subject to a SYSGLOB limit on the number of such DSTs per process. Also, non-privileged users of the extra data segment intrinsics see only a "logical" index which is basically the negative ordinal position of the PXFIXED slot containing the DST number, but with the sign bit cleared. Privileged callers get the actual DST number to use, so they can do privileged instructions such as MFDS.

S=0 if DST is specified as sharable between processes within the job.  
There is a list of shared DSTs in the JDT.

## File System Section of PCBX (PXFILE)

-----

The PXFILE area is a sub-section of the PCBX. It is a contiguous, expandable and contractable block of storage that is managed by the file system primarily for its own use. Other sybsystems, namely CS and DS, also make use of the PXFILE section. In doing so they must conform to the conventions of the file system.

The overall structure of the PXFILE area is:

OVERHEAD	(fixed)
CONTROL BLOCK TABLE	(variable)
AVAILABLE	(variable)
AVAILABLE FILE TABLE	(variable)

### VECTOR FORMAT

-----

0	5 6	15
ENTRY		DST NUMBER

Overhead (PXFILE)

The part labeled OVERHEAD contains information that is pertinent to the entire table.

0	1	7	8	15	
PXFILE SIZE IN WORDS				0	
LAST DOPEN ERROR NUMBER			LAST COPEN ERROR NUMBER		1
N				2	
LAST DF AFT			SLAVE AFT NUMBER		3
LAST KOPEN ERROR NUMBER			LAST FOPEN ERROR NUMBER		4
AFT SIZE IN WORDS				5	
CS TRACE FILE INFO				6	
LAST RESPONDING NO-WAIT I/O AFT ENTRY NUMBER				7	
1st USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				8	
2nd USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				9	
3rd USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				10	
4th USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				11	
5th USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				12	
6th USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				13	
7th USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				14	
8th USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				15	

In general the following identifiers are used when referring to this part of the PXFILE area:

```

DEFINE
PXFSIZE           = PXFILE#,          <<PXFILE SIZE>>
PXDSOPENERR      = PXFILE(1).(0:8)#, <<LAST DOPEN ERROR CODE>>
PXCOPENER        = PXFILE(1).(8:8)#, <<LAST COPEN ERROR CODE>>
PXFNOCB          = PXFILE(2).(0:1)#, <<NO CB'S IN PXFILE CBT?>>
PXLASTDSAFT      = PXFILE(3).(0:8)#, <<DSNUM OF LAST DS OPEN>>
PXSLAVEAFT       = PXFILE(3).(8:8)#, <<DSNUM OF SLAVE PTOPTOP DSOPEN>>
PXFKOPEN         = PXFILE(4).(0:8)#, <<LAST KOPEN ERROR CODE>>
PXFFOPEN        = PXFILE(4).(8:8)#, <<LAST FOPEN ERROR CODE>>
PXFAFTSIZE       = PXFILE(5)#,       <<AFT SIZE IN WORDS>>
PXFCRINFO        = PXFILE(6)#,       <<CS TRACE FILE INFO>>
OVERHEAD (CONT.)

```

```

-----
PXLEFTTOFF      = PXFILE(7)#,      <<LAST RESPONDING AFT NR.>>
PXFCBT1         = PXFILE(8)#,      <<1ST USER CBT DST NR.>>
PXFCBT2         = PXFILE(9)#,      <<2ND USER CBT DST NR.>>
PXFCBT3         = PXFILE(10)#,     <<3RD USER CBT DST NR.>>
PXFCBT4         = PXFILE(11)#,     <<4TH USER CBT DST NR.>>
PXFCBT5         = PXFILE(12)#,     <<5TH USER CBT DST NR.>>
PXFCBT6         = PXFILE(13)#,     <<6TH USER CBT DST NR.>>
PXFCBT7         = PXFILE(14)#,     <<7TH USER CBT DST NR.>>
PXFCBT8         = PXFILE(15)#;     <<8TH USER CBT DST NR.>>

```

The following is an alphabetized list of the above identifiers along with a discussion of their meaning.

#### PXFAFTSIZE

This is the size (in words) of the Available File Table. Note that the size is in words and not in terms of number of entries. The reason for this is that it simplifies the calculation for the size of the available block.

#### PXFCBT1-8

These are the DST numbers of the user (NOBUF) control block tables. A DST number of 0 indicates that no data segment is allocated. Note that a DST number is representable with ten bits; a full word is used to simplify the code.

#### PXFCOPEN

This contains the last COPEN error number. It is not used by the file system; it is included here for completeness only.

#### PXFCTRINFO

This contains information pertinent to the CS trace file. It is not used by the file system; it is included here for completeness only.

#### PXFDOPEN

This contains the last DOPEN error number. It is not used by the file system; it is included here for completeness only.

#### PXFDSINFO

This cell is reserved for DS. It is not used by the file system; it is included here for completeness only.

#### PXFFOPEN

This contains the last FOPEN error number. If it is zero then the last FOPEN completed successfully; if it is non-zero then the last FOPEN completed unsuccessfully and the number represents the file system error number. Note that only eight bits are needed to hold the error number; a full word is used to simplify the code.

-----

PXFKOPEN

This contains the last "KOPEN" error number. Since KSAM is imbedded in the file system, an FOPEN failure on a KSAM file can be caused by a failure to open either the key file or the data file. This error number is used in conjunction with PXFFOPEN to determine which file caused the KSAM open failure. Note that this error number is not used by the file system; it is included here for completeness only.

PXFLEFTOFF

This is the AFT entry number of the last file/line that completed a no-wait I/O; if zero then no no-wait I/O has been completed. This cell is maintained solely by and for the IOWAIT intrinsic.

PXFNOCB

This bit is used to signify that no control blocks are to be created in the PXFILE control block table. This bit is set by the NOCB parameter to the CREATE intrinsic or the :RUN command. The reason for this feature is to permit the 3000/20 user to have as much stack space as possible; otherwise the MPE/30 file system will take away several hundred words of stack for the PXFILE control block table.

PXFSIZE

This is the size (in words) of the complete PXFILE area. It is the sum of the overhead block, the control block table, the available file table and the available block.

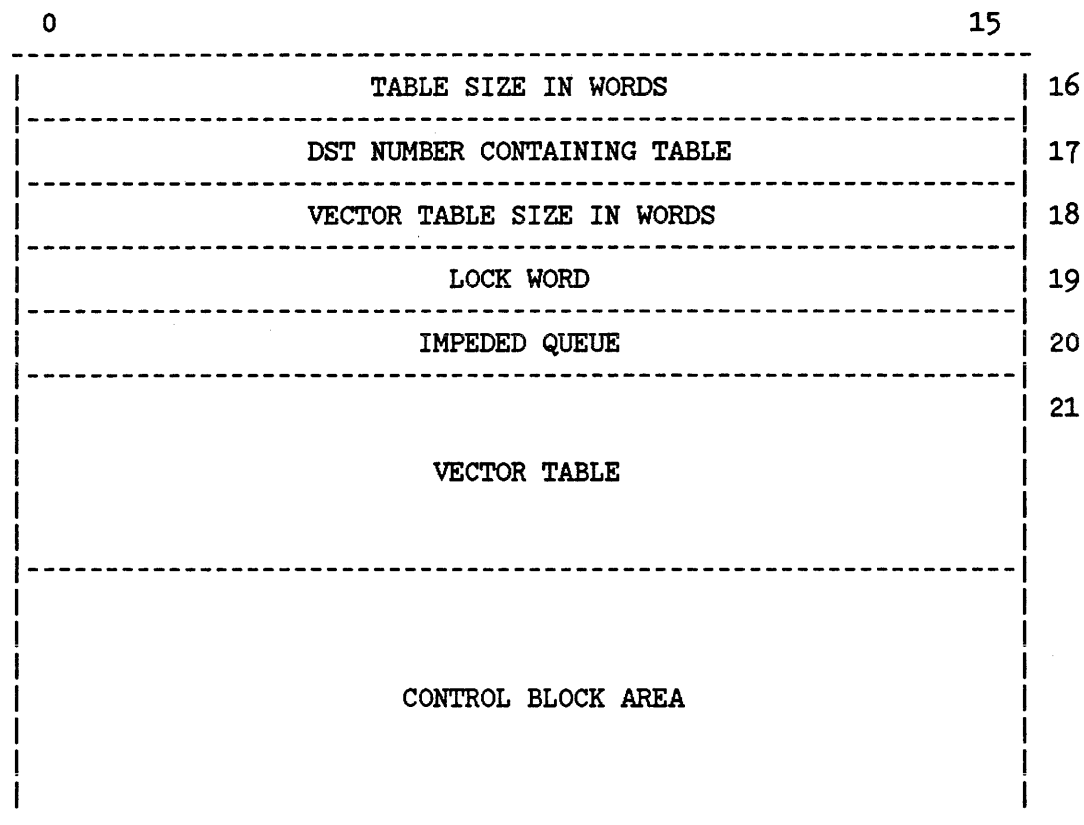

Control Block Table (PXFILE)

The part labeled CONTROL BLOCK TABLE contains a file control block table. This is a new feature with MPE/30; it is not present under MPE/20.

The format of the control block table is the same as any other file control block table. The only difference is that addressing is slightly more complicated since the table does not begin at DB+0. As a result all pointers within the table are table relative; the starting address of the table must be added to a pointer to generate a final DB-relative address. This addressing convention is consistently applied to all file control block tables. When the control block table is expanded, space is taken from

the AVAILABLE area. If no space is available then the PXFILE area is expanded and the acquired space is added to the AVAILABLE area.

The interested reader is referred to section 3.2 for a more detailed description of file control block tables.

In general the following identifiers are used when referring to this part of the PXFILE area:

```

DEFINE
PXFCBTAB      = PXFILE(16)#,    <<CONTROL BLOCK TABLE>>
PXFCBTSIZE   = PXFILE(16)#,    <<TABLE SIZE IN WORDS>>
CONTROL BLOCK TABLE (CONT.)

```

-----  
PXFDSTX           = PXFILE(17)#,       <<TABLE DST NUMBER>>  
PXFVTSIZE         = PXFILE(18)#,   <<VECTOR TABLE SIZE IN WORDS>>  
PXFLOCK           = PXFILE(19)#,   <<TABLE LOCK WORD>>  
PXFQUEUE          = PXFILE(20)#, <<TABLE IMPEDED QUEUE>>  
PXFVT             = PXFILE(21)#; <<VECTOR TABLE>>

The following is an alphabetized list of the above identifiers along with a discussion of their meaning.

#### PXFCBTAB

This is the first word of the control block table. In general this is used only when referring to the entire control block table.

#### PXFCBTSIZE

This is the size in words of the control block table. In general this is used only when calculating the size of the available block.

#### PXFDSTX

This is the DST number of the data segment that contains the control block table. This is the same as the DST number of the stack. Note that the convention of referring to the DST number of the stack as zero is not used. The reason for this is that the file system may refer to a PXFILE control block table in another stack. This would result in an ambiguity since that PXFILE control block table would also have a DST number of zero.

#### PXFLOCK

This is the lock word for the table and has the same format as the lock word for a control block in the table.

#### PXFQUEUE

This is the impeded queue for the table and has the same format as the impeded queue for a control block in the table.

#### PXFVT

This is the first word of the vector table. It is used when referring to the vector table in general.

#### PXFVTSIZE

This is the size, in words, of the vector table. Note that this is the length of the table and does not reflect the number of entries used or unused.

Available Block Area (PXFILE)

-----

The part labeled AVAILABLE BLOCK is used to provide space when the Control Block Table or the Available File Table is expanded. These two tables grow towards each other, and when more space is needed it is simply taken from the Available Block.

When the Available Block is exhausted, the PXFILE area is expanded, the AFT is relocated and the new space is added to the Available Block.

Note that currently the PXFILE area is only expanded; it is never contracted.

Available File Table, AFT (PXFILE)

-----

The part labeled AVAILABLE FILE TABLE contains information used by the file system (or CS, DS, etc.) to grossly characterize the file access and, most importantly, to give the location of the control blocks.

The overall structure of the AFT is:

where  $N = \text{PXFAFTSIZE}/4$ .

The AFT is as long as specified by PXFAFTSIZE. Unused entries are all zero's. When the table is full it is expanded by taking space from the AVAILABLE block.

The AFT is negatively indexed by file number: the entry at DL-8 corresponds to file number 1, the entry at DL-12 corresponds to file number 2, etc.

AFT (CONT.)

---

The structure of an AFT entry is:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
ENTRY TYPE				N												0
PHYSICAL ACB VECTOR															1	
LOGICAL ACB VECTOR															2	
NO-WAIT I/O IOQX															3	

Note that the entry format is dependent on the entry type. The one shown above is the one used by the file system.

In general the following identifiers are used when referring to an AFT entry:

```

DEFINE
AFTTYPE          = AFT.(0:4)#,      <<ENTRY TYPE>>
AFTNULL          = AFT.(4:1)#,      <<$NULL FILE>>
AFTPACBV         = AFT(1)#,         <<PACB VECTOR>>
AFTLACBV         = AFT(2)#,         <<LACB VECTOR>>
AFTIOQX          = AFT(3)#;         <<NO-WAIT I/O IOQX>>
    
```

AFT (CONT.)

---

The following is an alphabetized list of the above identifiers along with a discussion of their meaning.

AFTIOQX

This is the IOQ index of the pending no-wait I/O (if any). Note that this is applicable iff the file was opened with the NOWAIT option specified. Also, CS and DS have the same capability and use this cell in a consistent manner. The reason for this is that the IOWAIT intrinsic services the file system as well as CS and DS, and is the principal user of this cell. If the cell is zero then there is no I/O pending; otherwise the cell contains the IOQ index corresponding to the pending I/O.

Exception: a nonzero value for message files specifies the accessors reply port (instead of an IOQ entry).

AFTLACBV

This is the vector of the Logical ACB (LACB) (if any). Note that this is applicable iff the file was opened with the multi-access option specified.

AFTNULL

This bit signifies that the file is \$NULL and that there are no control blocks.

AFTPACBV

This is the vector of the Physical ACB (PACB). Note that a PACB exists for all files except \$NULL.

AFTTYPE

This is the AFT entry type number. At present the following entry types are defined:

- 0 - file system
- 1 - remote file
- 2 - DS (no-wait I/O disallowed)
- 3 - DS (no-wait I/O allowed)
- 4 - CS
- 5 - CS (AUTO DIAL)
- 6 - KSAM
- 8 - message file

PCBX FOR CORE RESIDENT SYSTEM PROCESS STACKS

0	DL-a (Seq Rel DL Value)	0		
1	DB-a (Seq Rel DB Value)	1		
2	USER ATTRIBUTES (always -1)	2		
3	0   INPUT DEV LDEV	3	PXGLOB	
4	0   OUTPUT DEV LDEV	4		
5	0	5		
6	0   D   I   0	6		
7	0	7		
10	PXFIXED SIZE (c-b)	8		PXFIXED
11	RELATIVE S (S-DB)	9		
12	RELATIVE Z (Z-DB)	10		
13	INITIAL Q (Q-DB)	11		
14	RELATIVE DL (DB-DL)	12		
15	GENERAL RESOURCE CAPABILITY(-1)	13		
16	RESERVED	14		
17	0	15		
20	DL-c	16		
21	DL-b	17		
22	DL-a	18		

- NOTES: 1. there is no PXFILE area.  
 2. the PXFIXED area is much smaller than a normal PCBX.

PROCESS TO PROCESS COMMUNICATION TABLE

-----

This table is used as the communication link by which father and son processes communicate with one another via the mailbox scheme. This table contains two words per entry and is indexed by PCB# (entry index 0 is meaningless). Each two word entry of index N essentially relates where, as well as how much, mail may be found for a process N with respect to communications between N and his father process.

ENTRY FORMAT

-----

word 0		-----
		WORD COUNT
		-----
word 1		MAIL WORD OR DST#
		-----

where word 0 = the # of mail words to be transferred.  
word 1 = the only word of mail itself if word 0 = 1  
          otherwise  
          it contains the DST# of the extra data segment where "word count" words of mail exist.

NOTE: Assume process S is the son of process F. Then the process to process communication table index which will be used for mailbox communication between son S and father F will be that of the son (i.e. S).

DB AREA

FORTRAN LOGICAL UNIT TABLE (FLUT)

-----

The segmenter is responsible for the preparation and initialization of a Fortran logical unit table. This is done when a program is prepared if that program contains at least one program unit that references a logical unit. The location of the FLUT is in the secondary DB area and the address of this location is contained in DB-1.

The FLUT is formatted as per the following example:

DB-1	X												
DB+X	<table style="border-collapse: collapse; width: 100%;"> <tr> <td style="border-right: 1px dashed black; padding: 2px 5px;">3</td> <td style="padding: 2px 5px;">0</td> </tr> <tr> <td style="border-right: 1px dashed black; padding: 2px 5px;">4</td> <td style="padding: 2px 5px;">0</td> </tr> <tr> <td style="border-right: 1px dashed black; padding: 2px 5px;">5</td> <td style="padding: 2px 5px;">0</td> </tr> <tr> <td style="border-right: 1px dashed black; padding: 2px 5px;">7</td> <td style="padding: 2px 5px;">0</td> </tr> <tr> <td style="border-right: 1px dashed black; padding: 2px 5px;">10</td> <td style="padding: 2px 5px;">0</td> </tr> <tr> <td style="border-right: 1px dashed black; padding: 2px 5px;">255</td> <td style="padding: 2px 5px;">///</td> </tr> </table>	3	0	4	0	5	0	7	0	10	0	255	///
3	0												
4	0												
5	0												
7	0												
10	0												
255	///												

<p>----- -----</p> <p style="text-align: center;"> </p> <p style="text-align: center;">1st BYTE</p> <p>List of the logical unit numbers referred to in this Fortran-produced program. (255 terminates).</p>	<p>----- -----</p> <p style="text-align: center;"> </p> <p style="text-align: center;">2nd BYTE</p> <p>The MPE file number (as returned by FOPEN) used in accessing the file. Zero if file not open. Filled in by formatter as each l.u. is initially referenced.</p>

JOB STATES  
-----

JOB STATES - JMAT ENTRY WORD 0.(0:6)

SHOWJOB - Displays job states by scanning JMAT DST (%31)

LOGON USES ALL STATES EXCEPT "SUSPEND"

STATE NO.	STATE NAME	PROCESS	SEGMENT	PROCEDURE(S)
1	INTRO	DEVREC JSMP SPOOLER	NURSERY	STARTDEVICE ->PUTJMAT ->ALLOCENTRY IN SEGMENT ALLOCTIL
%40	WAIT	DEVREC JSMP SPOOLER	NURSERY \ SPOOLING /	STARTDEVICE ->SCHEDULEJOB SPOOLSTUFFIN ->SCHEDULEJOB
%60	INIT- IALIZAT- ION	UCOP	UCOP	LAUNCHJOB
2	EXEC	JSMP	NURSERY	INITJSMP
3	TERMIN- ATING	JSMP	MORQUE	TERMINATE ->EXPIRE -> CLEANUPJOB
0	FREE ENTRY	JSMP	MORQUE	TERMINATE ->EXPIRE -> CLEANUPJOB ->DEALLOCENTRY IN ALLOCTIL
4	SUSP	JSMP	OPLOW	CXBREAKJOB

For states INTRO and WAIT,

DEVREC => logon command originated on terminal or other unspooled device.

SPOOLER => logon command originated on spooled device.

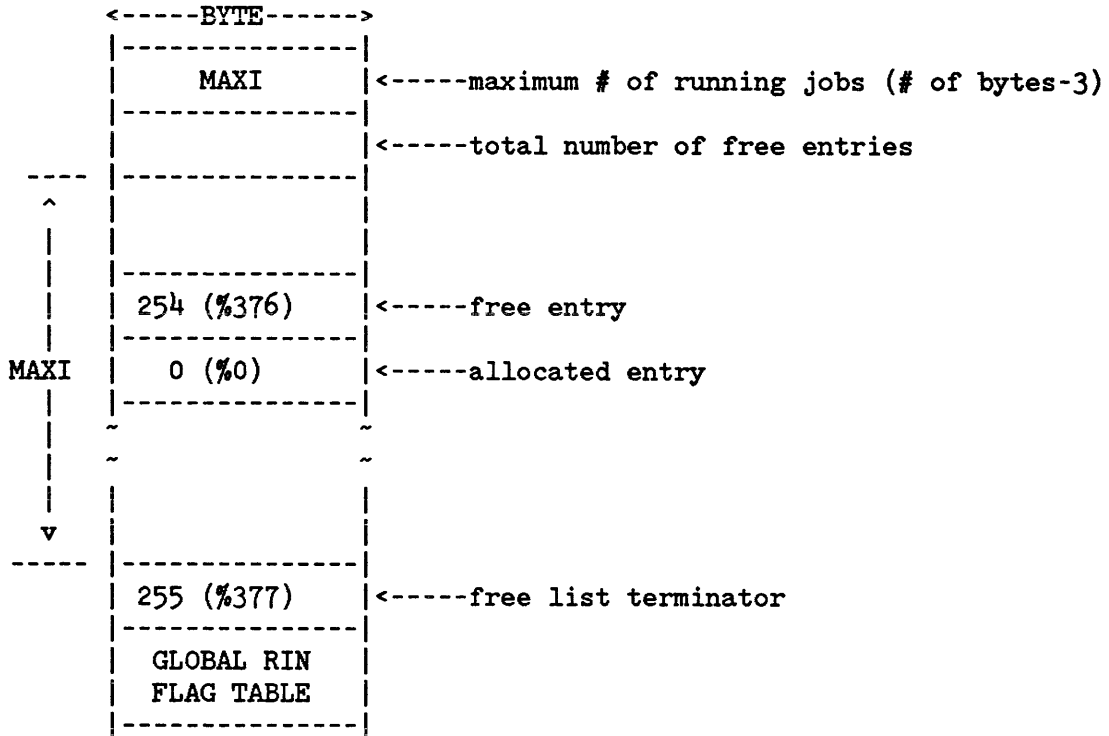

JSMP => logon command is the result of the execution of a :STREAM command. (This also includes USER processes which have done programmatic :STREAMs.)

JPCNT - JOB PROCESS COUNT TABLE

(1 Entry/Running Job)

CORE RESIDENT

SYSGLOB BASE = DB+13(%15)  
 DST = 24(10)  
 SIR = 13(10)

A JPCNT entry must be allocated before the main process can be procreated.

The job SIR (PXGJSIR) = some base+JPCNT index.

NOTE: This table is completely byte oriented with each entry consisting of one byte. Entries are taken from available pool on a "first found" basis. 254 (376 octal) in a byte denotes a free entry. 255 (377 octal) denotes the end of table.

GLOBAL RIN FLAG TABLE

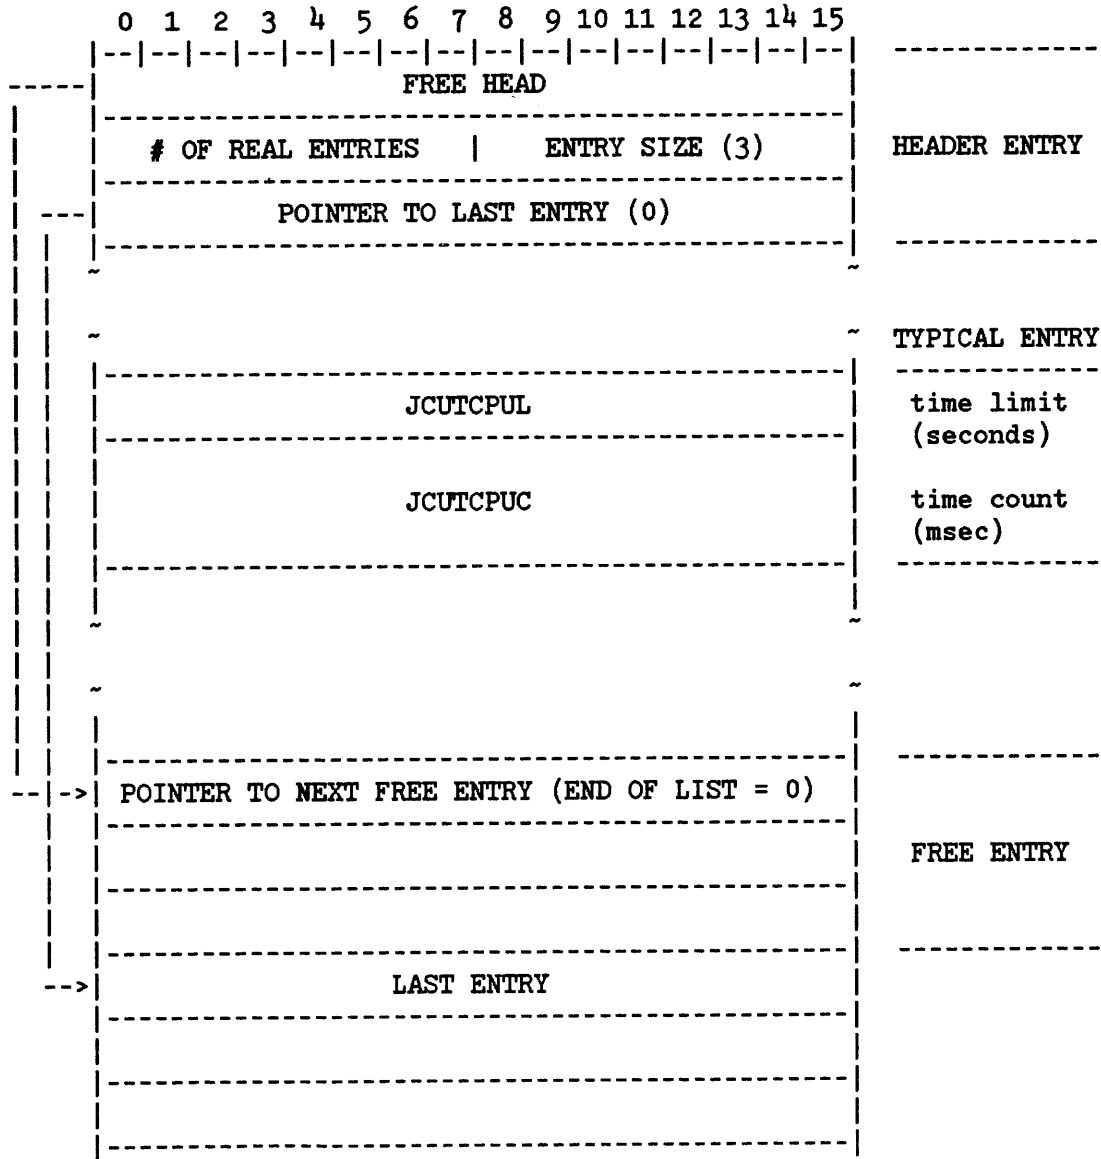

This table is a bit table which immediately follows the "free list terminator" byte. It is initialized to 0 and is indexed by JPCNT index for each job. When any process in a job/session locks a global rin, the appropriate bit is turned on.

JCUT - JOB CUTOFF TABLE

1 Entry/ CPU-limited Job

CORE RESIDENT

-----  
 SYSGLOB BASE = DB+11(%13)  
 DST = 36(10)

 WITH RESPECT TO SPL AND FORTRAN  
 -----

*ENTRY TYPE 2 SPL O.B.	**ENTRY TYPE 4 SPL PROC	*ENTRY TYPE 2 FORTRAN MAIN	**ENTRY TYPE 4 FORTRAN SUB.
TPDB	0	0	0
1,5 TSDB	1 TSDB	1,2,3,4 TSDB	1,2,3,4 TSDB
NWPUST	NWPUST	NWPUST	NWPUST
5 NWSDB	NWO	NWD	NWD

WHERE: TPDB = Total primary DB length in words  
 TSDB = Total secondary DB length in words  
 NWPUST = Number of words in "TRACE" array  
 NWSDB = Number of words in secondary DB array  
 NWO = Number of words in own array  
 NWD = Number of words in data array

- Notes: 1. Does not include the length of the STLT  
 2. Does not include the length of the FLUT  
 3. Does not include the length of any common array  
 4. Includes the length of any DB-allocated format array array  
 5. Are not necessarily equal

In general TPDB and TSDB are summations of storage allocated in the global area of the program's data segment. They are not, however, complete since the compilers are not aware of all storage actually allocated! The STLT and FLUT are examples of this since these tables are constructed by the segmenter. Common arrays also present a problem since their inclusion in TPDB and TSDB might cause their storage requirements to be counted more than once.

NW - Number of words in entry block.

HL - Hash link - points to next entry with same hash code.

A - Activity bit. 0 if active, 1 if inactive outer block.

C - Callability bit set if entry point is uncallable.

I - Priv mode bit - set if program unit is to be executed in priv mode..

NC - Number of characters in name. Max is 16.

CHAR. 1 - First character in variable field.

CHAR. NC - Last character in variable field.

L - Last entry in list.

0 if not last

1 if last

ENTRY TYPE 2 (CONT.)

-----

SUBL - Subprogram link - points to next entry  
Entry having the same segment name.

SECL - Secondary entry point list link.

SSA - Program unit starting PB address.

SAC - Starting 8FILE9 address of code  
module

F - Set if fatal error

W - Set if non-fatal error

NWC - Number of words in code module.

SE - Stack size estimate

TPDB - Total number of words of primary  
DB to be allocated

TSDB - Total number of words of secondary  
DB to be allocated.

NWPUST - Number of words in trace array  
(PUST)

NWD - Number of words in data array  
(FORTRAN)

NWSDB - Number of words in secondary  
DB array (SPL)

T - Terminating bit - set if last set of  
headers in entry

NH - Number of headers

SAH - Starting address of header (relative  
to SAI)

HDW - Header (pointer)

CN - CHARACTER COUNT OF PARMS

TN - PROCEDURE TYPE

ENTRY HEADER FORMAT

EACH ENTRY (EXCEPT SECONDARY ENTRY POINT ENTRIES) MAY DESCRIBE  $N > 0$  SETS OF HEADERS. THE HEADERS IN EACH SET MUST BE CONTINUOUS AND IN THE SAME ORDER AS THE HOW LIST DESCRIBING THE SET.

THE CODE MODULE MAY BE PLACED IN ANY POSITION IN A HEADER SET. NOTE THAT IF THE CODE MODULE IS AT THE BEGINNING OF A SET,  $SAC = SAH$ .

IF THE ENTRY HAS NO HEADER SET, THEN NH, SAH SEQUENCE IS ABSENT.

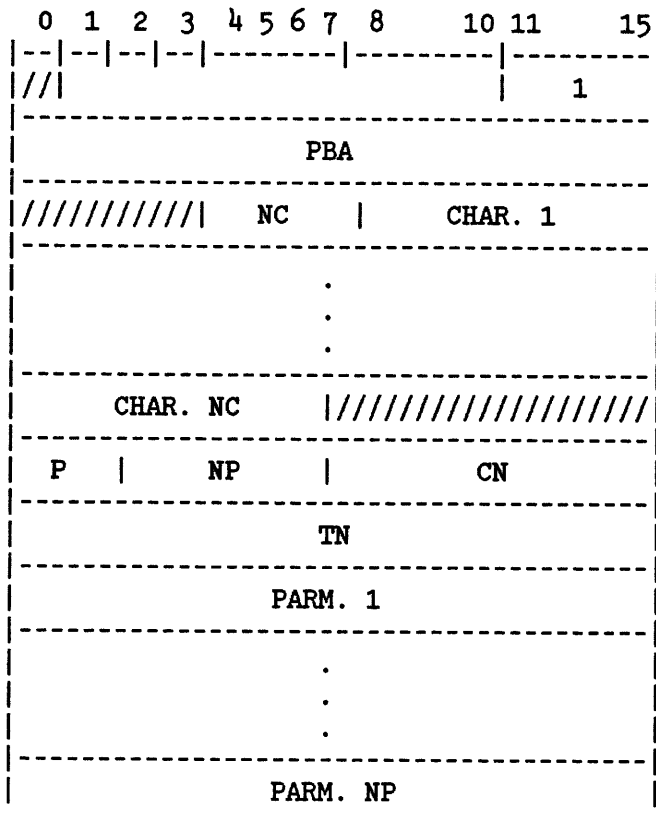

HEADER TYPE 0  
-----

GARBAGE

PCALs

HEADER TYPE 1  
-----

PBA - PB' ADDRESS OF LINKED LIST OF PCAL INSTRUCTIONS TO BE REPAIRED - LOWER 14 BITS USED AS NEGATIVE DISP. - BIT 0 SET MEANS THAT WORD IS NOT A PCAL INSTRUCTION BUT A POINTER TO A SST LABEL OF 'EXTERNAL' FORMAT - A LINK OF 0 TERMINATES THE LIST - BIT 1 SET MEANS THAT THE WORD IS TO BE INITIALIZED WITH THE PB ADDRESS OF THE PROCEDURE.

HEADER TYPE 2

PB ADDRESSES

0	1	10	11	15
///	NW			2
PBA				
.				
.				
PBA				

PBA - PB' ADDRESS OF PB ADDRESS  
TO BE CORRECTED

HEADER TYPE 3

OWN/DATA VARIABLES

0	1	10	11	15
///	W			3
B	PBA			
.				
.				
B	PBA			

PBA - PB' ADDRESS OF OWN VARIABLE  
POINTER TO BE CORRECTED

HEADER TYPE 4

DSDB/OWN/DATA/VALUES

0	1	10	11	15
///		NW		4
LD				
B		IN		
INITIAL VALUES				

- LD - LOGICAL WORD DISPLACEMENT  
 IN OWN ARRAY FOR INITIAL VALUES
- B - BYTE BIT-SET IMPLIES THAT LD IS  
 TYPE BYTE AND THAT THE FIRST  
 WORD OF THE INITIAL VALUE BLOCK  
 IS A COUNT OF THE NUMBER OF BYTES  
 IN THE INITIAL VALUE BLOCK
- IN - INTERATION NUMBER - NUMBER OF  
 TIMES THE BLOCK OF INITIAL VALUE  
 IS TO APPEAR IN THE SECONDARY BD -  
 1->NO DUPLICATION,  
 2->DUPLICATION, ETC

HEADER TYPE 5

PUST

0	1	10	11	15
///		NW		5
PBA				
INITIAL VALUES				

- PBA - PB' ADDRESS OF LINKED LIST OF  
 POINTERS TO BE INITIALIZED WITH  
 DB ADDRESS OF PUST (SAME LIST  
 FORMAT AS FOR FORMAT STRINGS)  
 A PBA of -1 INDICATES NO FIX-UPS.

NOTE: ALL REFERENCES TO THE PUST INCLUDE THE FOUR-WORD HEADER THAT IS  
 APPENDED BY THE SEGMENTER. THESE WORDS ARE NOT PRESENT IN THE  
 HEADER; THEY ARE AUTOMATICALLY ALLOCATED AND INITIALIZED BY THE  
 SEGMENTER.

HEADER TYPE 6

GLOBAL VARIABLES

HEADER TYPE 9 (CONT.)

-----

NWC - NUMBER OF WORDS IN COMMON ARRAY

NC - NUMBER OF CHARACTERS IN COMMON  
NAME- IF BLANK COMMON 4 COM'

DA - LOGICAL WORD DISP. IN PUST - LOWER  
8 BITS OF WORD WILL BE INIT. WITH  
PRIM. DB ADDRESS OF VARIABLE - NOTE  
DA IS PRESENT IF M = 1

B - BYTE BIT  
0 IF THE PRIMARY DB POINTER TO BE  
ALLOCATED AND INITIALIZED AND LD  
ARE OF TYPE WORD  
1 IF TYPE BYTE

M - MONITORED VARIABLE BIT - SET IF  
VARIABLE IS BEING MONITORED BY  
DEBUG

NL - NUMBER OF ADDRESS LISTS FOR  
VARIABLE

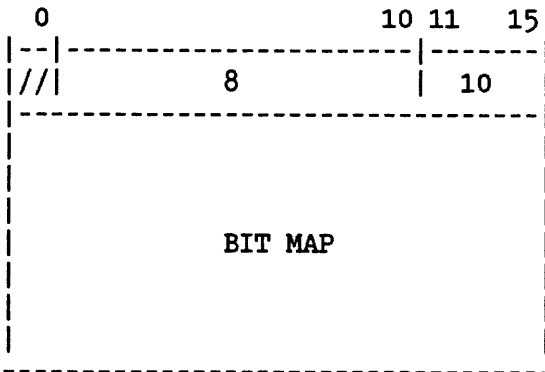

LD - LOGICAL DISPLACEMENT OF VARIABLE  
IN COMMON ARRAY

PBA - PB' ADDRESS OF LINKED LISTS OF  
INSTRUCTIONS TO BE REPAIRED  
LOWER 8 BITS USED AS NEGATIVE  
DISPLACEMENT TO NEXT INSTRUCTION  
A LINK OF 0 TERMINATES THE  
LIST

PBA = -1 INDICATES NO FIX-UPS

HEADER TYPE 10

LOGICAL UNITS

BIT MAP - BIT MAP OF LOGICAL UNITS REFERENCED; BIT 0 CORRESPONDS TO LU 0, ETC. (1 LESS THAN OR EQUAL TO LU LESS THAN OR EQUAL TO 99)

HEADER TYPE 11

FORMAT STRING

PBA - PB' ADDRESS OF LINKED LIST OF POINTERS TO BE INITIALIZED LOWER 14 BITS OF WORD USED AS NEGATIVE DISPLACEMENT TO NEXT POINTER - BIT 0 SET MEANS THAT THE POINTER IS TO BE TYPE BYTE - A LINK OF 0 TERMINATES THE LIST.

RL FILE FORMAT

0	LID	0	LOADER ID	0	
1	FL	1	FILE LENGTH (IN RECORDS)		RECORD 0
2	NS	2	NR. SECTIONS		
3		3			
4	SAXL	4	S.A. EXTERNAL SET LIST		
5		5			
6		6		1	FREE MAP 0
7		7

11		9			
12		10			
				NS	FREE MAP NS-1
				NS+1	AVAILABLE
41	HL 0	33	S.A. HASH LIST 0		
	.				
	.				
177	HL 94	127	S.A. HASH LIST 94		

NOTE: UNINITIALIZED FIELDS ARE RESERVED FOR FUTURE USE AND SHOULD BE ZERO.

STORAGE MANAGEMENT

-----

FILE SPACE IS MANAGED IN TERMS OF 32 WORDS BLOCKS (4 BLOCKS PER 128 WORD RECORD).

FREE SPACE (BLOCKS) IS ACCOUNTED FOR IN A BIT MAP, WHICH IS PARTITIONED INTO RECORDS (2K BLOCKS PER SECTION). A 0 INDICATES THAT A BLOCK IS USED, A 1 INDICATES THAT IT IS FREE.

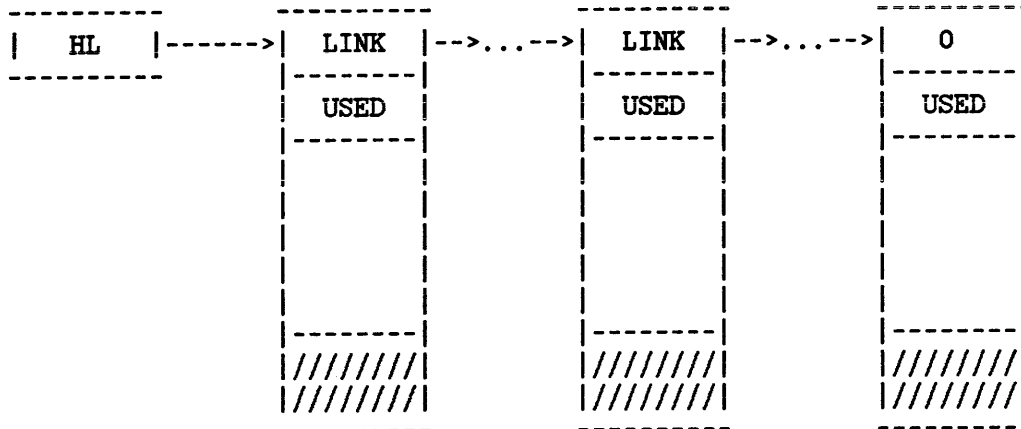

FILE SPACE IS ALSO PARTITIONED INTO 512 RECORD SECTIONS (64 MAX. SECTIONS, 2K BLOCKS PER SECTION, 1 MAP PER SECTION). THE NUMBER OF SECTIONS IN A FILE IS  $NS=(FL+511) \& LSR(9)$ . THE FIRST NS RECORDS FOLLOWING RECORD 0 (RECORDS 1 TO NS) ARE RESERVED FOR THE SECTION MAPS.

A COMPLETE FILE ADDRESS WOULD HAVE THE FOLLOWING CONFIGURATION:

FILE (WORD) ADDRESS  
DOUBLE WORD

ENTRY POINT DIRECTORY

THE DIRECTORY IS PARTITIONED INTO 95 HASH LISTS (SAME HASH FUNCTION AS USL); EACH HASH LIST IS A LINKED LIST OF RECORDS.

EACH RECORD CONTAINS A SUCCESSOR LINK (RECORD #) AND A USED SPACE COUNT. A LINK OF 0 TERMINATES A LIST. WHEN A RECORD IS VOID OF ENTRIES (USED=2), ITS SPACE IS RETURNED TO THE FREE STORAGE AREA.

TYPICAL DIRECTORY ENTRY

0 1 2 3 4567 8 15

## CST REMAPPING ARRAY

-----

CONTAINS THE LAST CST NUMBERS ASSIGNED TO THE SEGMENTS;  
INDEXED BY SEGMENT NUMBER. WHEN A PROGRAM FILE IS  
PREPARED, THE ARRAY IS INITIALIZED TO 0, 1...,N.  
THIS ARRAY IS USED TO RE-ESTABLISH INTRA-PROGRAM  
LINKAGE WHEN THE PROGRAM IS LOADED.

## SEGMENT DESCRIPTER ARRAY

-----

CONTAINS THE SEGMENT LENGTH AND A FLAG INDICATING IF THE  
SEGMENT IS TO BE LOADED IN PRIV. MODE. INDEXED BY  
SEGMENT NUMBER. ALL SEGMENTS BEGIN ON A RECORD BOUNDARY.  
THE NUMBER OF RECORDS FOR A GIVEN SEGMENT IS (SL + 127)  
& LSR(7). THE RECORD NUMBER, SAS, OF SEGMENT N IS

```
SAS:=0
FOR I=0 TO N-1
  BEGIN
  SAS:=SAS + (SL(I) + 127)&LSR(7)
  END
```

## GLOBAL AREA FORMAT

-----

A SET OF RECORDS CONTAINING THE INITIAL VALUES FOR THE  
GLOBAL AREA OF THE DATA SEGMENT. THIS SET BEGINS AT  
RECORD SAG (WORD 3) AND CONSISTS OF (GS + 127) & LSR(7)  
RECORDS.

SL FILE FORMAT (CONT.)

STORAGE MANAGEMENT

FILE SPACE IS MANAGED IN TERMS OF 128 WORD BLOCKS (1 BLOCK PER 128 WORD RECORD).

FREE SPACE (BLOCKS) IS ACCOUNTED FOR IN A BIT MAP, WHICH IS PARTITIONED INTO RECORDS (2K BLOCKS PER SECTION). A 0 INDICATES THAT A BLOCK IS USED; A 1 INDICATES THAT IT IS FREE.

FILE SPACE IS ALSO PARTITIONED INTO 2048 RECORD SECTIONS (16 MAX. SECTIONS, 2K BLOCKS PER SECTION 1 MAP PER SECTION). THE NUMBER OF SECTIONS IN A FILE IS NS=(FL + 2047) & LSR(7). THE FIRST NS RECORDS FOLLOWING RECORDS 0, 1 (RECORDS 2 TO NS+1) ARE RESERVED FOR THE SECTION MAPS.

IF THE SECTION MAPS SPECIFY MORE SPACE THAN IS POTENTIALLY AVAILABLE, THOSE RECORDS BEYOND FLIMIT ARE MARKED AS "USED".

ENTRY POINT DIRECTORY

THE DIRECTORY IS PARTITIONED INTO 95 HASH LISTS (SAME HASH FUNCTION AS USL); EACH HASH LIST IS A LINKED LIST OF RECORDS.

EACH RECORD CONTAINS A SUCCESSOR LINK (RECORD #) AND A USED SPACE COUNT. A LINK OF 0 TERMINATES A LIST. WHEN A RECORD IS VOID OF ENTRIES (USED=2), ITS SPACE IS RETURNED TO THE FREE STORAGE AREA.

THE HASH LIST HEAD POINTERS (HL IN THE DIAGRAM ABOVE) ARE IN RECORD 0 WORDS %41 TO %177.

TYPICAL DIRECTORY ENTRY

NP is (2:6) is # parameters

P - 0= Not permanently allocated  
 1= Permanently allocated

U - Uncallable bit - set if entry point is uncallable.

## CODE SEGMENT LINKAGE STRUCTURE

---

EACH CODE SEGMENT OCCUPIES AN INTEGRAL NUMBER OF RECORDS. THIS BLOCK OF INFORMATION CAN BE SUB-DIVIDED INTO THREE TABLES: THE CODE SEGMENT PROPER, AN STT SEGMENT MAP ARRAY, AND AN EXTERNAL LIST.

### STT MAP ARRAY

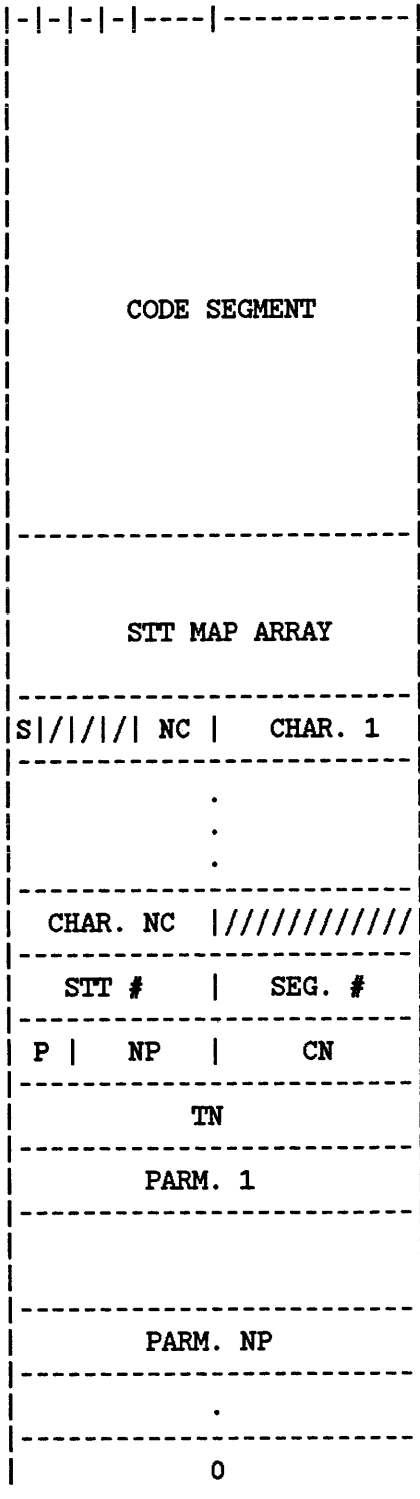

A 1 BYTE X 256 BYTE ARRAY. IT IS INDEXED BY STT NUMBER AND RETURNS (IF THE STT CORRESPONDS TO AN EXTERNAL OF THE SEGMENT) THE SEGMENT NUMBER OF THE EXTERNAL AND 255 OTHERWISE. THIS ARRAY IS USED WHENEVER THE SEGMENT IS LOADED AND IS UPDATED WHENEVER THE SL IS BOUND BY THE SEGMENTER.

### EXTERNAL LIST

A SYMBOLIC LIST OF THE EXTERNALS OF THE SEGMENT. EACH ENTRY CONTAINS INFORMATION ABOUT THE EXTERNAL: PARAMETER CHECKING LEVEL AND PARAMETER MATCHING INFORMATION, AND THE SEGMENT NUMBER AND STT NUMBER IF THE EXTERNAL IS SATISFIED WITHIN THE SL.

CODE SEGMENT LINKAGE STRUCTURE (CONT.)

0 1 2 3 4 5 6 7 8 15

S - SATISFIED BIT - SET IF EXTERNAL IS SATISFIED WITHIN SL

EXTERNAL LIST TERMINATOR

## REFERENCE TABLE STRUCTURE

-----

FOR EACH SEGMENT THERE IS A REFERENCE TABLE ENTRY OF 32 WORDS. THE REFERENCE TABLE ENTRIES ARE PACKED FOUR TO A RECORD. THE RECORDS CONTAINING THE REFERENCE TABLE ENTRIES ARE LISTED IN RECORD 1. THE RECORD CONTAINING REFERENCE TABLE ENTRY N IS REC 1 (N.(0 : 14)); THE FIRST WORD OF THE ENTRY IS REFTAB (N.(14 : 2) & LSL (5)).

WHEN A SEGMENT IS DELETED, THE REFERENCE TABLE ENTRY CORRESPONDING TO THE SEGMENT IS RELEASED. THESE FREE ENTRIES ARE LINKED TOGETHER IN A LIST; THE SEGMENT # IS USED AS A LINK AND IS PLACED IN THE FIRST WORD OF THE ENTRY.

WHEN A SEGMENT IS ADDED IT IS ASSIGNED A SEGMENT NUMBER (0 LESS THAN/EQUAL TO N LESS THAN/EQUAL TO 254); THE NUMBER IS THAT OF THE FIRST FREE REFERENCE TABLE ENTRY, OR, IF NONE ARE FREE, THE NEXT AVAILABLE REFERENCE TABLE ENTRY (CAUSING SPACE ALLOCATION FOR THE ENTRY).

-----  
GENERAL INFORMATION  
-----

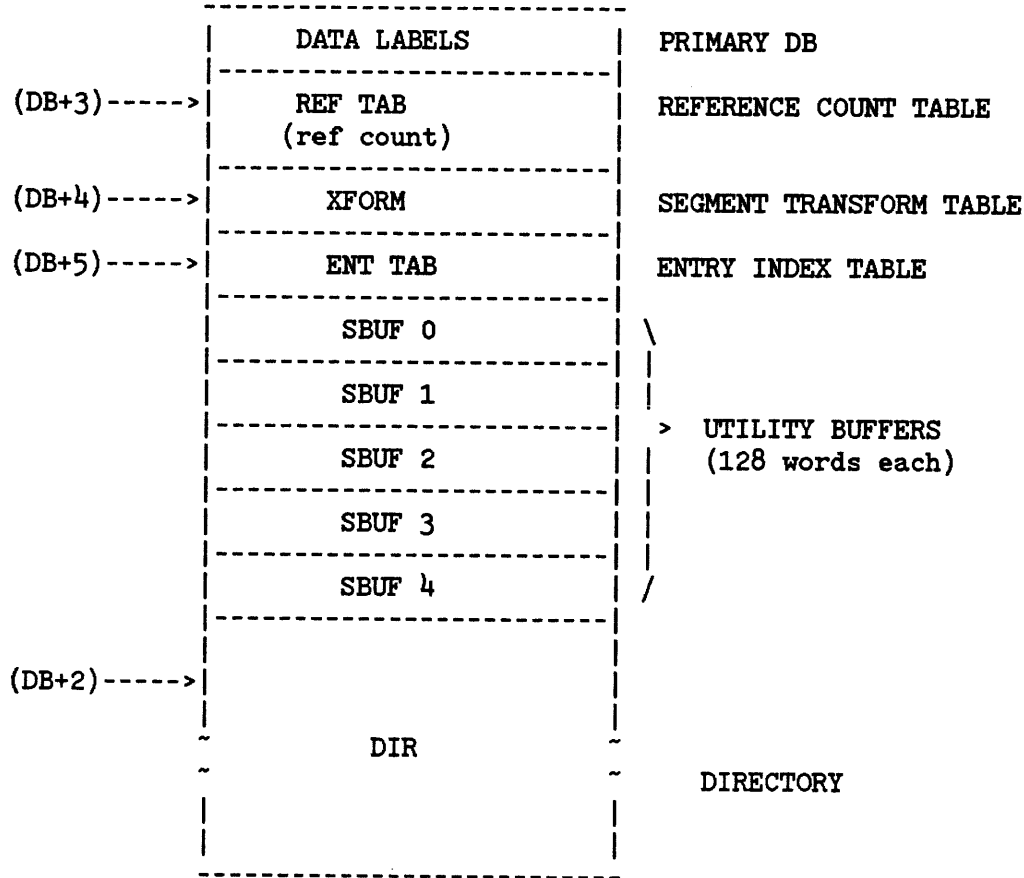

The first area of the CST, pointed to by absolute 0, contains system and library segments. Its size is configurable but it may not contain more than 191 entries. This area is assigned CST numbers 1-%277. The second area is used for programs. The total number of entries in this area is not hardware limited. This area is allocated a block at a time with one program per block. A block may contain from 1 to 63 segments, which will be assigned CST entry numbers %301-%377. The maximum number of segments in a program file is 63 and segments of different programs will have the same CST number. Thus both a block number and a CST# are required to uniquely identify a program segment. A fallout of this is that logical segment=physical CST-%301.

The loader is a system process which will do loads sequentially. If a process needs code to be loaded, it will get the load process' SIR, fill a communication data segment and then awake the loader. Upon completion, the loader will return its status through the communication data segment and then activate the waiting process.

LOADER SEGMENT ALLOCATION

-----

The order in which storage is allocated for arrays is arbitrary, with one exception: The storage for array DIR must be last in the data segment. This allows the data segment expansion/contraction intrinsics to be applied so that DIR storage may be dynamically allocated.

 X-System (MPE) Segment (1/0)

ENTRY INDEX TABLE

-----  
(DB + 5)

Indexed by CST number; contains the directory index of the file entry corresponding to the CST number.

DIRECTORY

-----  
(DB + 2)

Accessed by entry key - contains variable length entries, each entry describing a set of CST numbers.

The directory is completely filled with variable length entries. The empty state is represented by a single garbage entry. It is accessed by a sequential search using a double word entry key, or by direct indexing using ENTTAB.

The first word of each entry has the same format and includes an entry type number. In addition, most entries (all entries except type garbage) have an implicit double word entry key. Those entries that have an explicit single word key have an additional word that is implicitly 0. The entry key immediately follows the entry descriptor (first) word.

For file entries, the key is the double word sector number of the file label with the first byte of the double word replaced with the logical device number. For process entries, the key is the single word PIN with the first byte of the single word replaced with the extension number (LOADPROC id number).

DIRECTORY ENTRIES (CONT.)

DEFINITIONS

NWG - #words in garbage entry.

FID - file ID.

- word 1-(0:8)=log dev#
- word 1-(8:8)=msb of disc address
- word 2-=lsb of disc address

LIB - 0=SSL, 1=PSL, 2=GSL.

F - CST array format (0=list, 1=bit map)

M - executing mode. indicates whether the segments for the file  
 - have been copied onto the system disc (1=fast) or not (slow).

DEFINITIONS (CONT.)

T - entry type

- 0 GARBAGE self explanatory
- 1 SL indicates which CST's are being used for segments of the file. Currently F=1 and M=0 for all SL entries.
- 2 PROGRAM indicates which CST's are being used for segments of the file and all its externals. Currently M=0 for all program entries.
- 3 LOADING indicates that a program file (FID) is being loaded on behalf of a process (PIN).
- 4 WAITING indicates that a process (PIN) is waiting for a program file (FID) to be loaded.
- 5 LOADED transformed entry of type 4 that is used to return status of load.
- 6 SHARER indicates that a process (PIN) is currently running a program file (FID).
- 7 EXTENSION indicates that a process (PIN) has LOADPROCed a procedure (1<=EXT<=225).

P - program mode bit=0 (normal) everything that should be in priv is in priv mode and likewise for non-  
=1 (NOPRIV) everything in non-priv mode.

## Serial Disc Tables and Data Structures

### Data Record format

The primary purpose of the Serial Disc Interface (SDISC) is to adapt the undefined length transfers characteristic of mag tape to the fixed length environment of a disc or integrated cartridge tape (ICT). To accomplish this, data is buffered within SDISC. The buffer is an integral number of sectors (blocks for the ICT) long. Files always start on a sector boundary, but data records within files may start anywhere and straddle sector boundaries. A record in the buffer is structured as follows:

The record length is always a one-word positive byte count which includes only the data portion of the record, not the length words themselves. Records within a file might be stored on the disc as follows:

The reason for the trailing byte count is to implement an easy way to back-space records.

End of File format

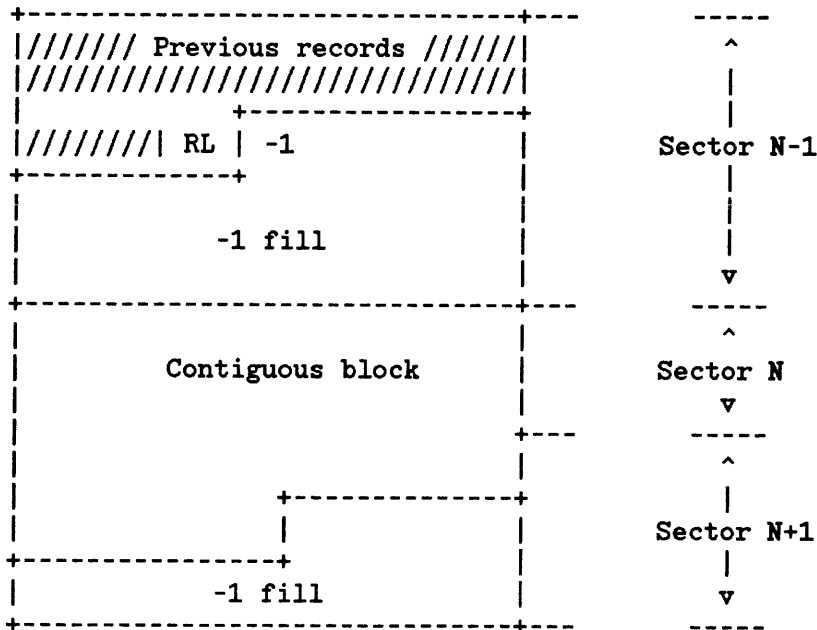

Since files always start on a sector boundary, it follows that they also end on one. End of files consist of a 0 record length and 0-fill to the end of the current sector as follows:

In addition, an End-of-File entry is made in the Gap Table, so that files may be skipped by scanning Gap Table entries instead of serially scanning the data area. The Gap Table is described a few pages from now.

### Contiguous Block format

A serial disc, if it can do everything a mag tape can do, must also be a cold-load device. This means that machine microcode must be able to read a bootstrap channel program and the resident segments of INITIAL from the disc into memory. The microcode and channel programs cannot deal with the record length words which surround standard data records, so for them we have a structure, called a CONTIGUOUS BLOCK, which has the data without the length words. Information as to the length of each contiguous block must therefore be kept elsewhere, so there are Gap Table entries which hold the beginning and ending sector addresses of each contiguous block. This implies that each block must begin and end on a sector boundary. In this way they are similar to data files. To set contiguous blocks off from normal data, and to reach a sector boundary, a record length and fill character = %177777 is used, as follows:

### Hole format

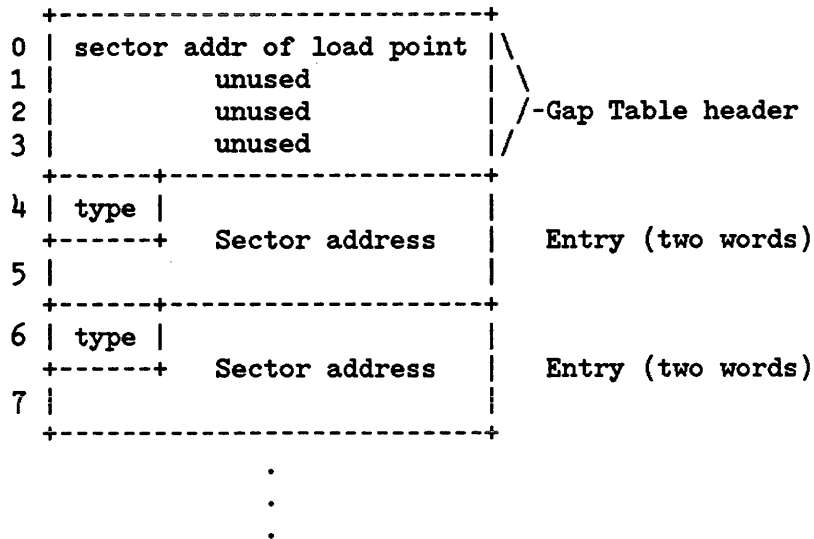

Holes on the serial disc have the same format as contiguous blocks (that is, they start and end on sector boundaries with -1 fill characters as required). They are generated during write error processing on the HP7920 or HP7925 large discs, or the HP7902 or HP9895 floppy discs. They are at least one track long. Write errors rarely occur in actual use, so holes are similarly rare. Further details may be found in the Serial Disc IMS.

## Gap Table format

The Gap Table is a four-word header followed by a series of two-word device address entries. A permanent copy lives on the device, starting in sector 4, while a working copy lives in main memory. The copy in memory is posted to the disc only when a backspace or rewind operation occurs after writing (in other words, when the copy in main memory has changed). The length of the Gap Table is device-dependent according to the table below:

<u>Device</u>	<u>Number of sectors (or ICT blocks)</u>
HP7920	44
HP7925	106
HP7935	219
HP7902/9895	26
ICT	4 blocks ("S" cartridge) 5 blocks ("L" cartridge)

The Gap Table looks like this:

The type field is bits 0, 1 and 2 of the first word. The eight possible types are:

0. End of File. The associated sector address contains one or more end of file fill characters (0) to fill out that sector. In the worst case (the previous record ended exactly at the end of the previous sector), the end of file sector contains all zeros.
1. End of data. The associated sector address is the last address of valid data plus 1, in other words, the next available address. In practice, such an entry is usually preceded by an end-of-file entry, since the EOD entry is written when you stop writing, and the file system will not let you backspace or rewind after writing without sending a Write End of File. An EOD entry is also written at the beginning of the Gap Table when new (unwritten) media is inserted. This prevents erroneous reading of blank media.

2. Beginning of Hole. The starting address of a "defective" area of the disc. Usually on a track boundary, but may be in mid-track if a contiguous block was being written when the "defect" was encountered.
3. End of Hole. The corresponding ending address of the "defective" area. Always at a track boundary.
4. Beginning of (contiguous) Block. The starting address of a contiguous block, exclusive of the -1 fill characters which may have been required to get us to a sector boundary. Unlike the End of File fill characters, there need not be any -1 characters if the previous record or contiguous block (with or without the trailing length word) ended exactly on a sector boundary.
5. End of (contiguous) Block. The address of the last sector containing contiguous block data. The sector may also contain -1 fill characters to get us to a sector boundary, but as with the beginning of block they are not required if the contiguous block ends exactly on a sector boundary.
6. End of Tape mark. The sector address of the simulated End of Tape reflector. This type is now written only to floppy discs for use by INITIAL's serial disc interface. When read by MPE's SDISC, it will be skipped no matter what device it is found on. This ensures compatibility with older serial discs.
7. End of Gap Table. No associated sector address. If you hit this while scanning the Gap Table, you've gone too far. In practice, this type is created whenever the Gap Table is cleared, by the simple device of initializing the table to -1.

SDISC Extra Data Segment

With insignificant exceptions, SDISC operates entirely in split-stack mode, that is, using an extra data segment for its working storage. Since SDISC runs on the user's stack (under the File System and ATTACHIO), it really wouldn't do to have the user support a 16K RECBUFF (for an ICT) or a 13.6K Gap Table (for a 7925) on his stack.

The extra data segment (XDS) is usually acquired by the external procedure ALLOCATE when the serial disc device is first assigned to a user as part of a FOPEN. The external procedure DEALLOCATE makes the XDS go away as part of its processing of the final FCLOSE against the device. The system program PVPROC may also acquire and release an XDS so that the tape label routines in LABSEC may also use SDISC for their work when DEVREC processes a device on-line interrupt.

In addition to the Gap Table already described, the XDS contains a data buffer (RECBUFF), SDISC's global storage area and a small buffer (called WORKTABLE) used to hold data while moving it from a "defective" disc area to its new location as part of the process of creating a hole. WORKTABLE also holds the contents of the Serial Disc label sector when SDISC reads it in as part of its self-configuration.

The three arrays in the XDS (WORKTABLE, RECBUFF and GPT (Gap Table)) are all dynamically configured by SDISC as vanilla indirect arrays, such as might have been constructed by SPL. This is done by declaring the array names as pointers, then inserting appropriately computed element-0 addresses in them.

The extra data segment is organized as follows:

0	WORDSPERSECTR	These twelve words are reserved for use by ALLOCATE when the data segment is created. However, ALLOCATE only stuffs the last five of them. We fill the first seven ourselves with information we get from the label sector.	
1	SECTORSPEPTRAK		
2	STARTADDRESS (BOT)		
3	EOTSECTR (disc address of simulated end of tape)		
4	EODSECTR (last sector of disc)		Simulates tape runoff.
5			
6			
7	JUSTALLOCATED		Tells us to initialize SDISC parameters to BOT if true.
8	WRITERING		Simulation of tape write ring.
9	FATALERROR		Disables SDISC when true.
10	LPERRORLOG		Dumps XDS and user stack to LP if true and FATALERROR occurs. Currently may be set only in DEBUG.

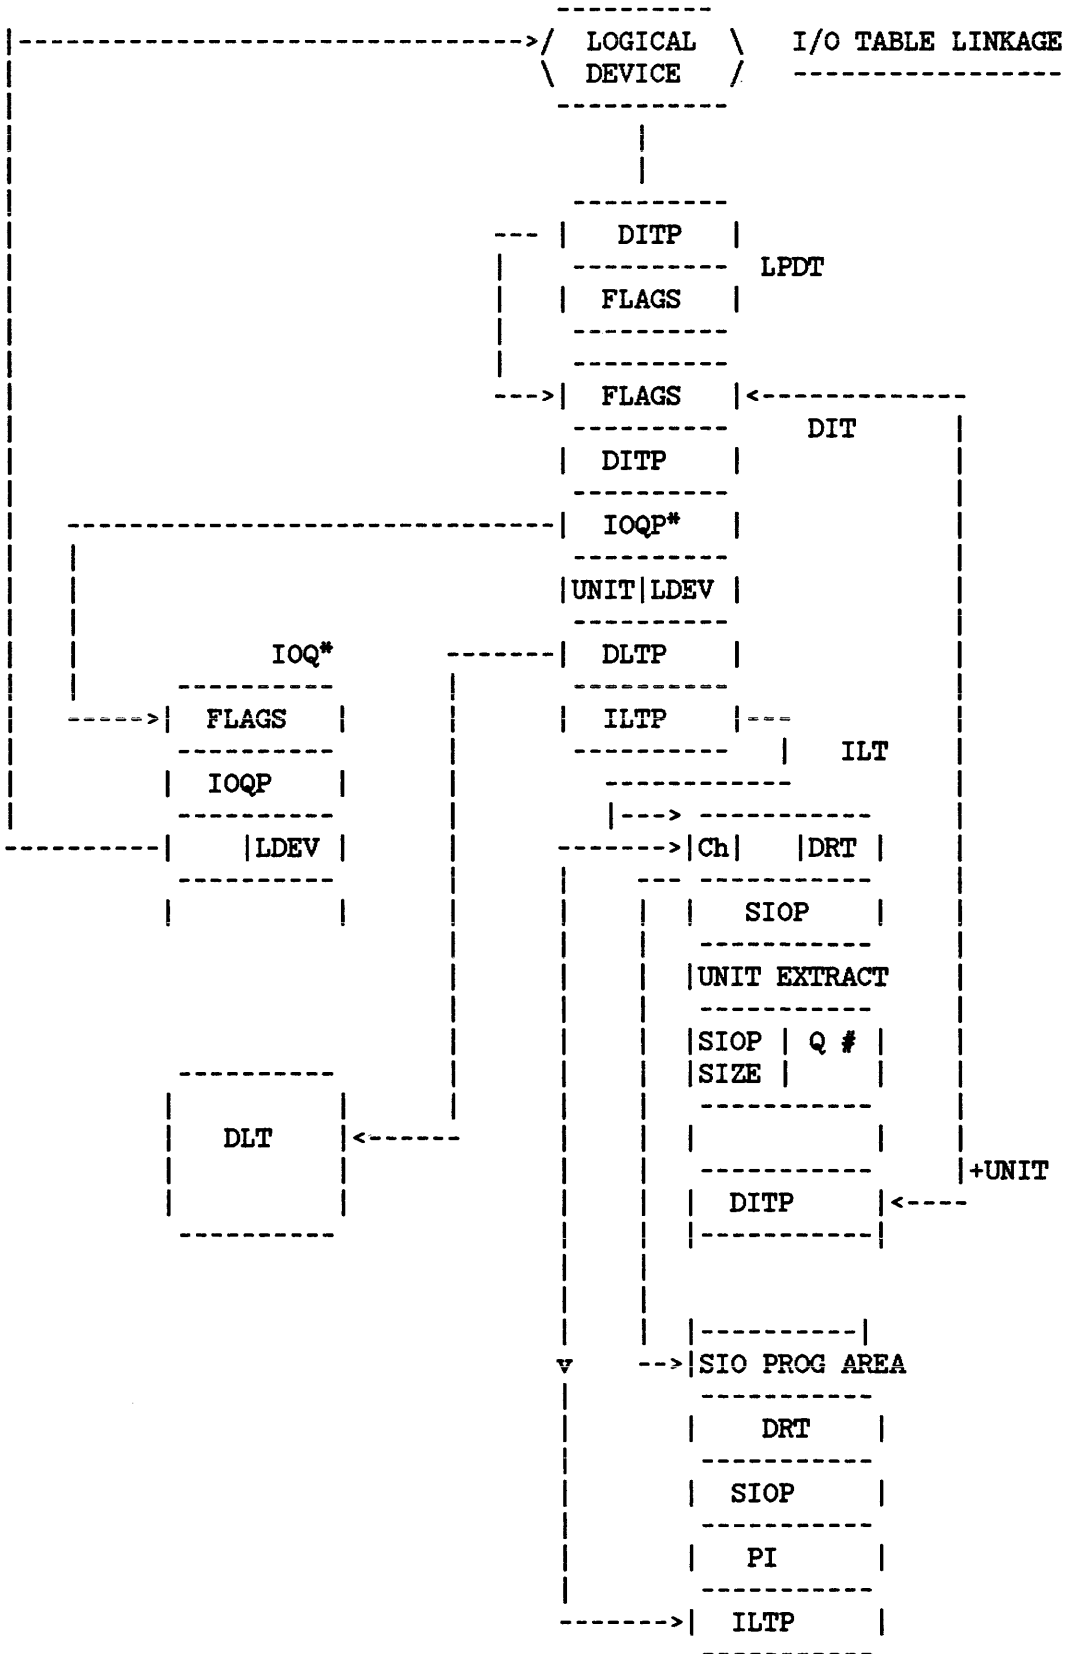

11	<pre> . . . . . MAX'DSEG'SIZE </pre>	<p>Max size of our XDS, so we can check that it's big enough.</p>
	<pre> SDISC global variables, including array pointers. </pre>	
	<pre> W  O   R    K     T      A       B        L         E </pre>	<p>Length is WORDSPERSECTR.</p>
	<pre> R  E   C    B     U      F       F </pre>	<p>Length is calculated as 32 * WORDSPERSECTR.</p>
	<pre> G  A   P    T     A      B       L        E </pre>	<p>Length varies with device, and is calculated by SDISC as part of its self-configuration.</p>

Serial disc organization

The disc is organized as follows:

Label sector	0	See expanded view in Chapter 3.
Defective Trk Tbl	1	Maintained by disc driver, not used by SDISC.
Cold load	2	HP-IB cold load channel prog.
Soft dump	3	SOFTDUMP channel program.
Gap Table	4	to STARTADDRESS - 1.
.		
.		
Data	STARTADDRESS	
.	.

DRIVER LINKAGE TABLE (DLT)

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
0	QUEUE NUMBER								DF	MC	CR	0		MTYP	(SEE BELOW)		DPROC
1	MONITOR PLABEL															DMNTR	
2	INITIATOR PLABEL															DINIT	
3	COMPLETOR PLABEL															DCOMP	
4	INTERRUPT PLABEL															DINTP	
5	DIT SIZE							DEVICE TYPE							DTYPE		
6	CS DRIVER EDITOR PLABEL																
7	INITIALIZATION PLABEL																

There is one DLT for each type of driver. A pointer in the DIT allows different devices on a controller to have different drivers and interrupt handlers.

- DPROC.QNUMB - This field contains the I/O process request queue number for type 2 drivers. Zero for all other types.
- .(8:1).DRVFRZ (DF) - Driver code frozen. Set by MAM when the driver code segment has been made present and frozen from a request from SIODM.
- .(9:1).MAMERR (MC) - MAM Error on Code Makepresent
- .(10:1).CORERES (CR) - If set both initiator and completor code are core resident.
- .(14:2).DRVRTYPE (MTYP) - DRIVER/MONITOR TYPE
  - 0 - not used
  - 1 - driver can be executed on any stack
  - 2 - driver can be executed in the user process or in the I/O process identified by IDNUMB
  - 3 - run only in process whose PCB number is in IDNUMB

DMNTR - I/O Monitor Plabel.

DINIT - Driver Initiator Procedure Plabel.

DCOMP - Driver Completor Procedure Plabel.

DINTP - Special interrupt hanler Plabel. This procedure is called by GIP if ISPEC is set DFLAG. No other action is taken by GIP except to set the Interupt Status in DSTAT.

DTYPE.DITSIZE - The length of the DIT in words for this driver.

## LOGICAL-PHYSICAL DEVICE TABLE (LPDT)

-----

The system uses the Logical-Physical Device Table (LPDT) for many purposes. For every physical device on the system, there is an entry which is used to communicate to the system the various states the device may be in. Included in the entry is the DRSTATE (device recognition state) used by DEVREC and the I/O drivers for the handling of unexpected interrupts (e.g., a tape mount, a carriage return on an available terminal). Also in the LPDT is an entry for every open spoolfile, which allows a large part of the operating system to treat open spoolfiles in much the same way as physical devices are treated.

Much of the low-level operating system software accesses the LPDT. Specifically, DEVREC (the device recognition system process) and many I/O drivers modify both the LPDT header and the DRSTATE for specific devices. Although there is an LPDT SIR, these low-level modules don't use it: we do not wish an I/O driver to impede while waiting for a SIR. Thus, whenever either the LPDT header or the second word of an LPDT entry are modified, the modifying software first DISABLEs in order to lock the LPDT. Software that accesses the spooling information in the LPDT typically uses the SIR mechanism to lock the table.

Although it would seem that SIR locking is the proper method for locking the LPDT, not all software that modifies the LPDT uses it. As a result, improper LPDT locking could lead to incorrect information in the LPDT header. Included in the header is the service request count for DEVREC. Occasionally, this count is decremented once too often; thus, the highest numbered logical real device requesting DEVREC service will never get serviced.

In summary, if you are modifying the LPDT for a real device, you must first DISABLE, do all your modifications, and then ENABLE. This is also the case if you want to be sure of the LPDT data you are reading.

If you are modifying the LPDT for a virtual device (an open spoolfile), you must lock the LPDT SIR before the table can be safely modified.

It is easy to determine that the LPDT was improperly locked after the fact, but it is impossible to determine who was improperly locking the table. To avoid improper LPDT locking, it is imperative that you eye-check all code for improper locking.

----

		LPDT ENTRY															
		0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	V FLAG	DITP/VIRTUAL DEVICE INFORMATION															
1	DRSTATE	JOBS	DATA	BOT	NSD	CY	DUP	M	INTR	RV	EOF	BR	LG	DR	SUBTYPE	SF	FS

There is one two-word entry in the LPDT for each Logical Device.

The base of the entry for a given Logical Device is equal to the Logical Device number multiplied by the entry size (word 0.(8:8)), currently two. The physical device characteristics are maintained in the DIT and ILT.

The field definitions for each entry are:

WORD 0 --

- VFLAG - Virtual device flag
- DITP - When VFLAG = 0, SYSDB relative pointer to the DIT  
1, Virtual device information

WORD 1 --

The following fields are defined for all devices:

- DRSTATE - Device Recognition State
  - 0-Not owned
  - 1-Owned or recognized
  - 2-Service requested - set by driver upon unexpected interrupt and awake DEVREC
  - 3-Service granted - set by DEVREC (sequence for logon:0-2-3-1)
- JOBS - Accepting Jobs or Sessions
- DATA - Accepting Data
- EOF - End of File condition
  - 0-No EOF
  - 1-HARDWARE EOF
  - 2-:DATA
  - 3-:EOD
  - 4-:HELLO
  - 5-:BYE
  - 6-:JOB
  - 7-:EOJ

LPDT (CONT.)

-----

SUBTYPE - Device subtype. For tapes, the SUBTYPE is divided into two subfields as follows:

WORD1.(13:3) - actual device subtype  
WORD1.(12:1) - 0 = operator allocation  
                  1 = automatic allocation

The definitions for bits 4,5,6,10, and 11 in word 1 are device dependent.

For terminal-like devices only,

CY - Control Y is allowed and has been detected  
BR - Break detected or ignore break if main running  
LG - The terminal is logging on. This bit is set by PROGEN and DEVREC when the logon sequence starts. If the bit is off when polled by INITJSMP, the terminal has disconnected. For now, only IOTERMO and HIOTERMO support the use of this bit. MULTIPOINT and DS pseudo-terminals do not.

For tape drives only,

BOT - Tape is at load point or no tape mounted  
DR - DEVREC is performing Automatic Volume Recognition (AVR) on tape drive or suppress AVR on job/data-accepting tapes

For all devices except disc drives,

DUP - Duplicative  
INTR - Interactive

For disc drives only,

NSD - The disc is a non-system domain disc drive

For non-system domain disc drives (NSD=1) only,

M - Mounted private volume  
RV - Reserved volume for multiple pack mount requirement  
SF - Serial or foreign disc physically and logically mounted ←  
FS - If SF = 1, then: FS = 0, Serial disc  
                  FS = 1, Foreign disc

----

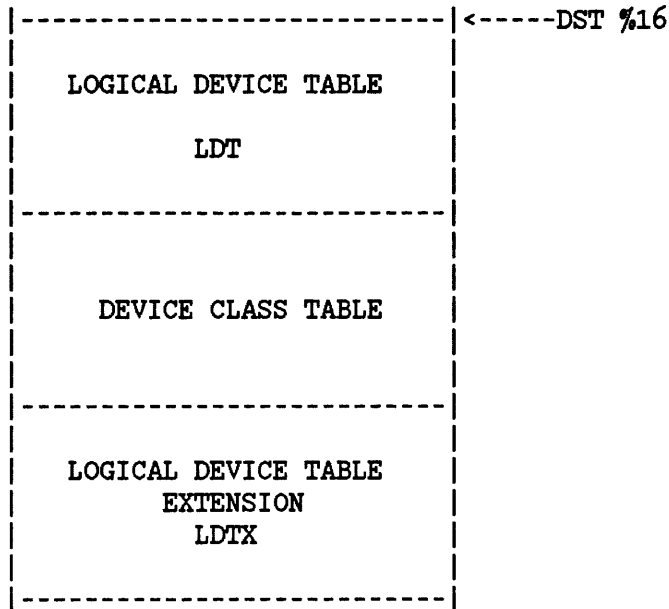

The first word of each entry in the LPDT has changed to reflect the addition of Virtual Devices.

A "real" logical device (ie. one on which an ATTACHIO call may be performed) has the sign bit set to "zero".

A "virtual" logical device has the sign bit set to "one". Thus anyone who loads the DIT pointer for use must check this sign bit.

## ILT TERMINOLOGY

- 
- IPCVA - These four words comprise the channel program variable area where information is stored concerning a channel program Interrupt instruction or abort. CPVA0 should be used only for channel program aborts.
  - ICPVA<sup>4</sup> - Words 4 and 5 contain DMA address, when channel program aborts during DMA transfer.
  - ISRQL - Serial poll request queue length. Series 33 currently does not support any serial poll devices. This should always be zero.
  - ICPGM - This is the SYSDB relative address of the channel program to be started for this device after receiving a HIOP interrupt in GIP. GIP will call STARTIO when the flags word indicates "ignore halt interrupt" and "start channel program" bits are set.
  - ICNTRL - Contains controller information.
    - .M If set, the controller is sharing a software channel resource in order to limit bandwidth.
    - .CHNQ The software channel resource number.
    - .DRTN The DRT number for a Series 33 device is equivalent to:
      - .CHAN - channel number (4 most significant bits of DRTN)
      - .DEV - device number (3 least significant bits of DRTN)
  - IFLAG - Used for controller flags.
    - .RW Runwait flag. An idle channel program should be started when there are no active requests to process.
    - .WP Waitprog flag. An idle channel program has been started for this controller. This bit is reset by an interrupt.
    - .IG Ignorehi flag. An HIOP instruction has been issued against this controller, but the channel program was not in a wait statement. Therefore, ignore the interrupt generated by the channel code when this program halts.
    - .SC Start channel program flag. When set along with the IG flag, GIP will start a previously attempted SIOP on this device.
    - .SQ Start channel program "queued" flag. When bit SC is set, this bit will determine if the call to START'HPID will have logical parameter QUEUED true or false.
  - .HCUNIT Highest configured unit number for this controller.

DEVICE INFORMATION TABLE (DIT)

-----

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the I/O queue element. Although details of DIT's vary with device, the following structure is common to all:

DIT for Series II/III

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
0	T	D	AC	RQ	CE	MU	SP	IO	IA	NO	ST	NS	STATE			DFLAG	
1	SYSDB relative pointer to the DIT for the next device requesting this resource or service															DLINK	
2	SYSDB relative pointer to the first IOQ in request list for this device															DIOQP	
3	IOT		Phys. unit #				Logical device number					DLDEV					
4	SYSDB relative pointer to Driver Linkage Table															DDLTP	
5	SYSDB relative pntr to Interrupt Linkage Table															DILTP	
6	Controller hardware status															DSTAT	
7	Hardware error status. Set when the driver detects an error. Whenever <>0, the driver monitor logs an I/O error and clears this word															DSERR	
	Device Dependent Area															(DTIME)

DFLAG - DEVICE RELATIVE FLAGS

- T SET IF DEVICE IS A TERMINAL.
- D SET IF DEVICE IS A DISC.
- AC ACTIVE BIT. 1 IMPLIES A MONITOR CURRENTLY SERVICING THIS DEVICE.
- RQ REQUEST BIT. 1 IMPLIES SERVICE REQUESTED WHILE MONITOR IS ACTIVE.
- MU IF SET, MULTIPLE UNIT CONTROLLER.
- IO IF SET, THEN A CHANNEL PROGRAM IS CURRENTLY EXECUTING.
- IA IF SET, AN INTERRUPT OR RESPONSE HAS OCCURRED.
- NO IF SET, DEVICE IS IN A NOT READY OR OPERATOR WAIT.
- ST IF SET, AN IDLE CHANNEL PROGRAM SHOULD BE STARTED FOR THIS DEVICE.
- CE CACHING ENABLED ON THIS DEVICE (MASS STORAGE ONLY)
- NS DO NOT SHORT WAIT THIS DISC
- STATE CURRENT DRIVER STATE AS DEFINED BY THE MONITOR.

ALLOWABLE STATES ARE:

- 0 - START REQUEST
- 1 - NOT USED (BUT RESERVED)
- 2 - CALL DRIVER INITIATOR
- 3 - CALL DRIVER COMPLETOR
- 4 - NOT USED (BUT RESERVED)
- 5 - COMPLETE REQUEST
- 6 - UNEXPECTED INTERRUPT OCCURED
- 7 - START OPERATOR INTERVENTION WAIT
- %10 - WAITING (ON OPERATOR). RESTART AT 0
- %11 - WAITING (DATA MAKEPRESENT/FREEZING)
- %12 - WAITING (INITIATOR CODE MAKEPRESENT/FREEZE)
- %13 - WAITING (FOR COMPLETION INTERRUPT)
- %14 - WAITING (FOR DEVICE CONTROLLER AVAILABILITY)
- %15 - NOT USED (BUT RESERVED)
- %16 - WAITING (INITIATOR CODE MAKEPRESENT)
- %17 - WAITING (COMPLETOR CODE MAKEPRESENT)

- IOT - I/O System type 0-Series II/III I/O System
- 1-HP-IB
- 2-unused
- 3-unused

DIT for SIO Devices  
-----

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
0	TERM	DISC	ACT	REQ	CE	M	SIO	IO	IAK	M	NT			STATE			DFLAG
						UNIT	PREMP	PROG		HEAD	RY						
1	NEXT DITP															DLINK	
2	IOQP															DIOQP	
3	IOT			UNIT										LDEVN			DLDEV
4	DLTP															DLTP	
5	ILTP															DILTP	
6	Controller Hardware Status															DSTAT	
7	Hardware Error Status															DSERR	
8	DRIVER DEPENDENT DIT AREA															DTRQX	

- 
- DFLAG.TERMINAL - Device is a terminal  
 .DISC - Device is a Disc (Bit 0 = 0)  
 .ACTIVE - A monitor is currently servicing this device  
 .REQUEST - Service requested while monitor was active
- .MUNIT - device controller servicing multiple units  
 .SIOPREMP - If set then a preemptive request has been queued for this device. Preempt code is set in IOQ.  
 .IOPROG - I/O program in progress. Decrement SIOCOUNT and check for multi-channel when complete  
 .IAK - Interrupt or Response has occurred.  
 .M HEAD -Moving head disc  
 .NT RDY -Not ready for SIO. SIODM holds off next SIO until ALLOWPOLL is done.  
 .CE - Caching is enabled on this device (mass storage only)
- DTRQX - Used by some device drivers, it denotes timer request index.

DIT FOR SIO DEVICES (CONT.)

- 
- DFLAG.STATE - this quantity specifies the next action to be taken in servicing the request.
- 0-new - start request.
  - 1-not used.
  - 2-call Driver Initiator Procedure
  - 3-call Driver Completor Procedure
  - 5-complete request
  - 6-device recognition
  - 7-start operator intervention wait (%10)
  - %10-restart request on interrupt
  - %11-wait for data to be frozen then state 2
  - %12-wait for driver code to be frozen then state 2
  - %13-call completor on interrupt
  - %14-wait for device controller
  - %15-not used
  - %16-wait for initiator make present then state 2
  - %17-wait for completor make present then state 3
- DLINK - SYSDB relative pointer to the DIT for the next device requesting this resource or service.
- DIOQP - SYSDB relative pointer to the first IOQ in the request list for this device
- DLDEV.LDEVN - Logical Device Number
- .UNIT - unit number of the physical device.
- .IOT - IO type 0=> Series III I/O, 1=> HPIB I/O
- DDLTP - SYSDB relative pointer to the DLT.
- DILTP - SYSDB relative pointer to the ILT.
- DSTAT - interrupt status for this device. Set each time the device interrupts.
- DSERR - Hardware Device Controller Status. Set when the driver detects an error. whenever not zero SIODB logges an I/O error and clears this word.
- DTIME - time out completed flags. If a timeout occurs in response to a timer request type %20 (I/O request), the sign bit is set in this word. The IA bit in DFLAG is also set, and the monitor for this device is awakened. (Only used if timer services are requested. Must be word #8 if timer services are requested.)

 W - writing track map  
 C - issued a recalibration

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IOQ element. For the CS'80 disc controller, there will only be one device. The following diagram shows the DIT used by the CS'80 disc driver.

NOTE: Integrated Cartridge Tape's DIT has the same format.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
0	TM	DS	AC	RQ	CE	0	0	IO	IA	NO	ST	0	STATE			DFLAG
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
1	SYSDB relative pointer to the DIT for the next device requesting this resource or service														DLINK	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
2	Current request sysbase index														DCURREQP	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
3	IOT	Phys. unit #					Logical device number					DLDEV				
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
4	SYSDB relative pointer to Driver Linkage Table														DDLTP	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
5	SYSDB relative pointer to Intrp Linkage Table														DILTP

.																
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
.																
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																

DFLAG - Flags and request state

- TM TERM - Set if device is a terminal.
  - DS DISC - If TM = 0 and this bit is set then the device is a disc, otherwise device dependent.
  - CE - Caching is enabled.
  - AC ACTIVE - A monitor is currently servicing this device.
  - RQ REQUEST - A service request is pending while the monitor is active.
  - IO IOPROG - An I/O Channel Program is running for this device.
  - IA IAK - An interrupt or response has occurred for this device.
  - NO NOTRDY - Go to state %10 after Idle Channel Program is started.
  - ST STWAIT - The device monitor is starting an Idle Channel Program for this device. There is no IOQ associated with this type of request.
- STATE - State of the device monitor. Specifies the next action to be taken in SIODM in servicing the request:
- 0 - start new request
  - 1 - not used
  - 2 - call driver initiator procedure
  - 3 - call driver completor procedure
  - 4 - not used
  - 5 - process request completed
  - 6 - initiate device recognition sequence
  - 7 - start operator intervention wait
  - %10 - wait for interrupt (operator intervention) restart at state 0
  - %11 - wait for data segment freeze, then state 2
  - %12 - wait for driver initiator to be frozen, then allocate controller (state 2)
  - %13 - wait for I/O completion interrupt, then state 3
  - %14 - wait for controller, then call driver initiator
  - %15 - not used
  - %16 - wait for initiator make present, then state 2
  - %17 - wait for completor make present, then state 3

DLINK - A SYSDB relative pointer to the next DIT requesting this resource or service.

DCURREQP - A current request sysbase index.

DLDEV.(0:2) - I/O system type

- 0 - HP3000 Series 2/3
- 1 - HP3000 Series 33 (HPIB)
- 2 - Unused
- 3 - Unused

DLDEV.(2:6) - Unit number of this device. Zero if a single unit.

DLDEV.(8:8) - Logical device number of this device.

DSTAT - Set to a -1 when a system powerfail has occurred.

DSERR - Pointer to status to be logged.

Bits(0:7) - Number of words to be logged.

Bits(8:15) - Offset relative to DITP(0).

DMISC - Device dependent processing flags

LOCK'FLG - Lock flag denoting unload status of the disc volume.

0 - Allow operator unload to the volume.

1 - Deny operator unload to the volume.

IGNORE'INT'FLG - Ignore unexpected interrupt flag.

SUBSTATE - Indicates state of the idle channel program:

0 - Normal idle channel program wait

1 - Idle request being serviced wait

DSBUFADDR - SYSDB relative pointer to the system buffer element used to read the DSCT. Zero, if no element gotten.

DBADBLK1 - High order logical sector address of the bad block for the Defective Sector Table (DSCT) entry.

DBADBLK2 - Low order logical sector address of the bad block for the DSCT entry.

DBADXFER - Byte transfer left when bad block occurred.

DLOGERROR - CPVA(0) logged on hardware error status.

DSIOPSTOP - Stopped channel program relative offset location due to an error in CPVA(0).

DSTATUS - 20 bytes disc status logged on status error.  
(See CS'80 Disc Drive Status).

Caution: \* Since the "C" MIT, word %10 and %11 of the DIT for disc devices have been used for DQHEAD and DQTAIL pointers for disc request queues. Word %10 is also used by the timer procedure to hold a timer request index (DTRLX). Unless word %10 of the DIT is freed up in a future MIT, timers cannot be implemented on any disc drivers.

Device Information Table (DIT)

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC
0	0	0	0	AC	RQ	0	MU	0	IO	IA	0	0	0	STATE			DFLAG
1	SYSDB relative pointer to the DIT for the next device requesting this resource or service															DLINK	
2	SYSDB relative pointer to the first IOQ in request list for this device															DIOQP	
3	IOT		Phys. unit #			Logical device number										DLDEV	
4	SYSDB relative pointer to Device Linkage Table															DDLTP	
5	SYSDB relative pntr to Interrupt Linkage Table															DILTP	
6	RW	RU	SH	CE	BO											AA	DSAVE
7	Hardware error pointer. Set when the driver detects an error. Whenever <>0, the driver monitor logs an I/O error and clears this word															DSERR	
%10	Bit 0 is set at completion of timer															DTIME	
%11	Interrupt status for this unit. Set by the driver each time it processes an interrupt.															DSTAT	
%12	Holds the time out request entry index while a timer is active.															DRQST	
%13	Hardware logged error status															DLOGERROR	

DFLAG - Flags and request state

- AC ACTIVE - A monitor is currently servicing this device.
- RQ REQUEST - A service request is pending while the monitor is active.
- MU MUNIT - This device is on a multi-unit controller.
- IO IOPROG - An I/O Channel Program is running for this device.
- IA IAK - An interrupt or response has occurred for this device.
- NO NOTRDY - Go to state %10 after Idle Channel Program is started.
- ST STWAIT - The device monitor is starting an Idle Channel Program for this device. There is no IOQ associated with this type of request.

STATE - State of the device monitor. Specifies the next action to be taken in SIODM in servicing the request:

- 0 - start new request
- 1 - not used
- 2 - call driver initiator procedure
- 3 - call driver completor procedure
- 4 - not used
- 5 - process request completed
- 6 - initiate device recognition sequence
- 7 - start operator intervention wait
- %10 - wait for interrupt (operator intervention) restart at state 0
- %11 - wait for data segment freeze, then state 2
- %12 - wait for driver initiator to be frozen, then allocate controller (state 2)
- %13 - wait for I/O completion interrupt, then state 3
- %14 - wait for controller, then call driver initiator
- %15 - not used
- %16 - wait for initiator make present, then state 2
- %17 - wait for completor make present, then state 3

DLDEV - I/O system type, unit and logical device number

IOT I/O TYPE- Type of I/O system

- 0 - HP3000 Series II/III
- 1 - HP3000 Series 33 (HP-IB)
- 2 - unused
- 3 - unused

DSAVE - Device processing flags

RW RWBIT - Indicates tape has been rewind.

RU RWUNLD - Indicates that a rewind/unload was performed to allow a write-ring mount.

SH SHORT - A short read is in progress. After completion of read, EOF is checked for and if not present, the requested bytes are transferred from the short-read buffer to the user's buffer.

CE CESTAT - Channel parity error processing is in progress.

BO BODEOF - Backspace record due to a data EOF processing is in progress.

AA AB'ACK - Abort Channel Program is executing.

\$PAGE

DSTAT - Mag tape controller status

%10	Bit 0 is set at completion of timer														DTIME	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
%11	Interrupt status for this unit. Set by the driver each time it processes an interrupt.														DSTAT	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
%12	Holds the time out request entry index while a timer is active.														DRQST	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
%13	Error log. Contains 5 valid bytes of status														DLOGERROR	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																

DFLAG - Flags and request state

- AC ACTIVE - A monitor is currently servicing this device.
- RQ REQUEST - A service request is pending while the monitor is active.
- MU MUNIT - This device is on a multi-unit controller.
- IO IOPROG - An I/O Channel Program is running for this device.
- IA IAK - An interrupt or response has occurred for this device.
- NO NOTRDY - Go to state %10 after Idle Channel Program is started.
- ST STWAIT - The device monitor is starting an Idle Channel Program for this device. There is no IOQ associated with this type of request.

STATE - State of the device monitor. Specifies the next action to be taken in SIODM in servicing the request:

- 0 - start new request
- 1 - not used
- 2 - call driver initiator procedure
- 3 - call driver completor procedure
- 4 - not used
- 5 - process request completed
- 6 - initiate device recognition sequence
- 7 - start operator intervention wait
- %10 - wait for interrupt (operator intervention) restart at state 0
- %11 - wait for data segment freeze, then state 2
- %12 - wait for driver initiator to be frozen, then allocate controller (state 2)
- %13 - wait for I/O completion interrupt, then state 3
- %14 - wait for controller, then call driver initiator
- %15 - not used
- %16 - wait for initiator make present, then state 2
- %17 - wait for completor make present, then state 3

DSAVE - Device processing flags

RW RWBIT - Indicates tape has been rewound.  
 RU RWUNLD - Indicates that a rewind/unload was performed to allow a write-ring mount.  
 SH SHORT - A short read is in progress. After completion of read, EOF is checked for and if not present, the requested bytes are transferred from the short-read buffer to the user's buffer.  
 DC DSFLAG - Transfer used data chaining - used for computing the transmission log.  
 PF POWER - Device power up indication.

DSTAT - Mag tape controller status

CARD READER DIT FIELD DEFINITIONS

-----

DFLAG - Flags and device state

ACTIVE Monitor is currently active servicing this device.

REQUEST Service for this device was requested while the monitor was active.

IOPROG SIO program in progress.

IAK Interrupt occurred or request aborted or preempted.

READDONE Previous read resulted in an EOF with a backup save requested. The data has been saved in an auxiliary buffer and will be passed back on the next read request.

NRMESSAGE Set when a not ready message has been issued, and cleared when the reader is found ready. Used to prevent multiple Not Ready messages when power is turned on.

MSTATE Monitor State. See SIODM specifications for details.

DLINK - SYSDB relative pointer to the DIT for the next device requesting service for this resource.

DIOQP - SYSDB relative pointer to the first IOQ element in the request list for this device.

DLDEV - Logical device number and unit number.

UNIT Unit number of device.

LDEVN Logical device number.

DDLTP - SYSDB relative pointer to driver linkage table (DLT).

DILTP - SYSDB relative pointer to interrupt linkage table (ILT).

DSTAT - Device interrupt status. Contains the device interrupt status at the last interrupt. See hardware ERS for details.

DSERR - Device interrupt error status. If not zero, then holds the device interrupt status from an operation with an erroneous completion status. Causes SIODM to log an error.

DWCNT - Holds the requested transfer count in words.

DIT for HPIB Card Reader

-----

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IOQ element. The following diagram shows the DIT used for the card reader driver.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC
0	0	0	AC	RQ	0	MU	0	IO	IA	NO	ST	0	STATE			DFLAG
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
1	SYSDB relative pointer to the DIT for the next device requesting this resource or service														DLINK	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
2	SYSDB relative pointer to the first IOQ in request list for this device														DIOQP	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
3	IOT		Phys. unit #			Logical device number						DLDEV				
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
4	SYSDB relative pointer to Driver Linkage Table														DDLTP	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
5	SYSDB relative pntr to Interrupt Linkage Table														DILTP

%11	Request word count														DWCNT	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
%12	Device Status. Read from device during each execution of the channel program.														DSTAT	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																
%13	Logging will be done from here.														DLOGERROR	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																

DFLAG - Flags and request state

- AC ACTIVE - A monitor is currently servicing this device.
- RQ REQUEST - A service request is pending while the monitor is active.
- MU MUNIT - This device is on a multi-unit controller.
- IO IOPROG - An I/O Channel Program is running for this device.
- IA IAK - An interrupt or response has occurred for this device.
- NO NOTRDY - Go to state %10 after Idle Channel Program is started.
- ST STWAIT - The device monitor is starting an Idle Channel Program for this device. There is no IOQ associated with this type of request.

STATE - State of the device monitor. Specifies the next action to be taken in SIODM in servicing the request:

- 0 - start new request
- 1 - not used
- 2 - call driver initiator procedure
- 3 - call driver completor procedure
- 4 - not used
- 5 - process request completed
- 6 - initiate device recognition sequence
- 7 - start operator intervention wait
- %10 - wait for interrupt (operator intervention) restart at state 0
- %11 - wait for data segment freeze, then state 2
- %12 - wait for driver initiator to be frozen, then allocate controller (state 2)
- %13 - wait for I/O completion interrupt, then state 3
- %14 - wait for controller, then call driver initiator
- %15 - not used
- %16 - wait for initiator make present, then state 2
- %17 - wait for completor make present, then state 3

DLDEV - Device logical device number

IOT I/O TYPE - I/O System type

- 0 = Series II / III I/O system
- 1 = HP-IB
- 2 = unused
- 3 = unused

DSAVE - Device processing flags

RD READDONE - A card has already been read.

AF ABORTFLAG - A device clear has already been sent for this series of aborted IOQs. |

LINE PRINTER DIT (SERIES II/III)

-----

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IOQ element. The following diagram shows the DIT used for IOLPRT0.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC		
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
0	0	0	AC	RQ	0	0	0	IO	AK	PS	NE	TF	STATE			DFLAG		
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
1	SYSDB relative pointer to the DIT for the next device requesting this resource or service														DLINK			
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
2	SYSDB relative pointer to the first IOQ in request list for this device														DIOQP			
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
3				Phys unit #			Logical device number									DLDEV		
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
4	SYSDB relative pointer to Driver Linkage Table														DDLTP			
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
5	SYSDB relative ptr to Interrupt Linkage Table														DILTP			
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
6	Controller interrupt status. Set by GIP each time it processes an interrupt for this DIT. See individual field descriptions on next page.														DSTAT			
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
7	Hardware error pointer. Set when the driver detects an error. Whenever <> 0, the driver monitor logs an I/O error and clears this word														DSERR			
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
%10	Bit 0 is set at completion of 2-second timer.														DTIME			
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
%11	Timer Request List Index. Not used except to clear the request after timing out.														DTRLX			
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
%12												Last byte if odd bytcnt		Data byte for VFC or left margin download		DLAST		
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
%13	VF	PF	BT	TL	Left margin			Vertical Format Code									DVFC1	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
%14	Lines left to skip (subtypes 1, 2, >15 line slew request)						%202 (2608) or %102. Skip to channel 3 pre- to postspace print.									DVFC2		
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
%15	HARDWARE ERROR LOGGING STATUS														DLOGERROR			
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		
%16	DVR DEPENDENT FLAGS =>								PS			NE			TF			DDF
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																		

- DFLAG.AC - Active. A monitor is currently servicing this device. \*
- DFLAG.RQ - Request. A service request is pending while the monitor is active. \*
- DFLAG.IO - An I/O channel program is in progress. Decrement SIOCOUNT and check for multiple channels when complete. \*
- DFLAG.AK - Interrupt Acknowledge. An interrupt has occurred. \*
- DDF .PS - Prespace. The last request was a prespace (space then fill buffer) operation.
- DDF .NE - Not Empty. The print buffer is not empty. Causes a print when changing from pre- to postspace or before ejecting a page for a File Open, File Close or Device Close.
- DDF .TF - Top of Form. The last request ended with a skip to channel 1 (page eject).

\* Not examined or modified by IOLPRT0.

DFLAG.STATE - State of the device monitor. Specifies the next action to be taken by SIODM in servicing the request. Not used within IOLPRT0.

- DSTAT.(0:1) - SIO OK. Set when no SIO channel program is in progress, that is, it is OK to start one.
- .(1:1) - WIO OK. Set when it is OK to execute a WIO instruction or a doubleword WRITE channel order. If clear, indicates that a one word transfer is in progress.
- .(2:1) - Interrupt Pending. If set, indicates one or more bits of the Interrupt Status Byte (DSTAT.(8:8) are set.
- .(3:2) - U.I. Transfer State. Used mostly for hardware maintenance. See U.I. card manual (30051-90001) for details.
- .(5:1) - Device Flag. Indicates a print-and-advance-paper sequence in progress. Since the 2608 buffers such commands, this signal may be shorter than with other printers.
- .(6:1) - Always 0. DSTAT.(8:8) always contains the Interrupt Status Byte.
- .(7:1) - Not used. Always 0.
- .(8:3) - Varies among HP-supported line printers according to the table below:

SUBTYPE	MODEL(S)	BIT 8	BIT 9	BIT 10
-----	-----	-----	-----	-----
0	2610, 2614	LINE PRINTED	READY	NOT READY
1	2607	Not used	READY	NOT READY
2	2613, 2617, 2618, 2619	Not used	READY	NOT READY
3	2617J (KATAKANA)	Not used	READY	NOT READY
4	2608	ON LINE	NOT READY	VFC CHAN 9

- .(11:1) - Data Transfer Interrupt bit. Always 0.
  - .(12:1) - Not used. Always 0.
  - .(13:1) - Programmed Interrupt bit. True if interrupt request was generated by:
    - a) SIN machine instruction,
    - b) INTERRUPT channel order, or
    - c) END-WITH-INTERRUPT channel order.
  - .(14:1) - Transfer Error Interrupt bit. True if interrupt was generated by:
    - a) an illegal memory address,
    - b) a memory parity error, or
    - c) a multiplexer parity error during data xfr to U.I.
  - .(15:1) - Time-out Interrupt bit. Set if 5-second timer on U.I. card is enabled, then times out without being cleared.
- 
- DLAST.(8:8) - Request dependent. If a print request has an odd number of bytes, this word holds the final byte. For VFC downloads, contains the associated data byte (6 or 8 lines per inch and number of lines in VFC). For left margin downloads, also contains the associated data byte (the number of columns to offset).
  - DVFC1.(0:1) - VFC Modified. 2608 only. Indicates that an external VFC has been downloaded into the 2608.
  - DVFC1.(1:1) - Power Fail/Reset. 2608 only. The 2608 has suffered a Power Failure or someone has pressed the front panel Reset button. In either case, the printer's operating environment has been destroyed, and must be reloaded by the operator.
  - DVFC1.(2:1) - Between Jobs. Set when a Device Close is executed, cleared when an FOPEN is performed. 2608 Power Fail/Master Reset's will be cleared but not reported while this bit is set (thus avoiding an extraneous console message when the printer is powered up).
  - DVFC1.(3:1) - TALLY'NOT'READY. Set when an off-line condition is detected on a 2607. Causes a three-second delay when the 2607 comes back on-line.
  - DVFC1.(4:4) - Left margin offset (2608 only). Stored during each :DOWNLOAD which specifies a left margin and restored to printer following a 2608 power fail or reset. Set to 0 when system is initialized.
  - DVFC1.(8:8) - Request dependent. Contains the carriage control byte sent to the printer during a print request.

DVFC2.(0:8) - LINES'LEFT'OVER. Has two functions:

- 1) The 2607/13/17/18/19 can only slew (skip) a maximum of 15 lines per print command (not counting VFC skips, which can be of any length). Slew requests > 15 lines must be broken up. This byte holds the number of lines (greater than 15) which remain to be slewed at any point of a request to such a printer, or 0 if the number of lines to skip is <= 15. This mechanism is not needed (and this field is therefore 0) for CDC and 2608 line printers, which can slew up to 63 lines at a time.
- 2) The carriage control characters "0" and "-" specify double and triple spacing, respectively. But if you use the equivalent channel skip, you get skips to the next odd and third lines, respectively, which is not the same as double and triple spacing. If you slew (advance paper) 2 or 3 lines, you can easily print over the paper perforations unless your program watches out for such things. We avoid this by examining the NO'AUTO'PAGE eject bit (IOQ(QPAR2).(14:1)). If it is set, then the request is treated like a normal slew and LINES'LEFT'OVER is not used. If it is clear (auto eject desired), then we simulate the multiple line skip by doing two ("0") or three ("-") skips to channel 3 (single spaces with auto page eject for the standard VFC). In this case, LINES'LEFT'OVER holds the number of such single spaces remaining in the request.

a 1990

DVFC2.(8:8) - %202 for 2608, %102 otherwise. Causes skip to channel 3 (single space with auto page eject). Used when last request left data in print buffer (prespace) and current operation is postspace. Buffer is dumped first, using this byte as carriage control.

2608 LINE PRINTER DIT (HPIB SYSTEMS)

-----

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IOQ element (however, there is only one device per 2608 controller.) The following diagram shows the DIT used for the 2608 line printer driver.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC

%12	Hardware logged error status														DLOGERROR		
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																	

DFLAG - Flags and request state

- AC ACTIVE - A monitor is currently servicing this device.
- RQ REQUEST - A service request is pending while the monitor is active.
- IO IOPROG - An I/O Channel Program is running for this device.
- IA IAK - An interrupt or response has occurred for this device.
- NO NOTRDY - Go to state %10 after Idle Channel Program is started.
- ST STWAIT - The device monitor is starting an Idle Channel Program for this device. There is no IOQ associated with this type of request.

- STATE - State of the device monitor. Specifies the next action to be taken in SIODM in servicing the request:
- 0 - start new request
  - 1 - not used
  - 2 - call driver initiator procedure
  - 3 - call driver completor procedure
  - 4 - not used
  - 5 - process request completed
  - 6 - initiate device recognition sequence
  - 7 - start operator intervention wait
  - %10 - wait for interrupt (operator intervention)  
restart at state 0
  - %11 - wait for data segment freeze, then state 2
  - %12 - wait for driver initiator to be frozen, then  
allocate controller (state 2)
  - %13 - wait for I/O completion interrupt, then state 3
  - %14 - wait for controller, then call driver initiator
  - %15 - not used
  - %16 - wait for initiator make present, then state 2
  - %17 - wait for completor make present, then state 3

DLDEV - I/O system type, unit and logical device number

- IOT I/O TYPE- Type of I/O system
- 0 - HP3000 Series II/III
  - 1 - HP3000 Series 33 (HP-IB)
  - 2 - unused
  - 3 - unused

DSAVE - Device processing flags

- VM VFCMOD - VFC has been modified.
- TAB TABDEFAULT - System tab default.
- PS PRESPACE - Last request used prespacing.
- FL FULL - Line printer buffer is full.
- TP TOP - Printer is at top of form

## 2608 Line Printer Status

HIOCIPRO DIT (HP2608S)

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IOQ element (however, this driver only supports one device per controller.) The following diagram shows the DIT used for the HP-IB CIPER physical driver.

Word #	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC	
0	0	0	AC	RQ	0	0	0	IO	IA	NO	ST	0						
1	SYSDB relative pointer to the DIT for the next device requesting this resource or service																DLINK	
2	SYSDB relative pointer to the first IOQ in request list for this device																DIOQP	
3	IOT		Phys. unit #				Logical device number											DLDEV
4	SYSDB relative pointer to Driver Linkage Table																DDLTP	
5	SYSDB relative pointer to Intrp Linkage Table																DILTP	
6	VS	AB	RE	TP	NR	NR CNT		DEVICE STATUS										
7	Hardware error status. Set when the driver detects an error. Whenever <0, the driver monitor logs an I/O error and clears this word																DSERR	
8	Bit 0 is set at completion of timer																DTIME	
9	Holds the time out request entry index while a timer is active.																DRQST	
10	RF	UE	DE	TO	UNIT CNT		DATA CNT		TO CNT		PRTY CNT							
11	Error logging location #1																DLOGERROR	
12	Error logging location #2																DLOGCOUNT	

DFLAG - Flags and request state

AC ACTIVE - A monitor is currently servicing this device.

RQ REQUEST - A service request is pending while the monitor is active.

IO IOPROG - An I/O Channel Program is running for this device.

IA IAK - An interrupt or response has occurred for this device.

NO NOTRDY - Go to state %10 after Idle Channel Program is started.

ST STWAIT - The device monitor is starting an Idle Channel Program for this device. There is no IOQ associated with this type of request.

STATE - State of the device monitor. Specifies the next action to be taken in SIODM in servicing the request:

- 0 - start new request
- 1 - not used
- 2 - call driver initiator procedure
- 3 - call driver completor procedure
- 4 - not used
- 5 - process request completed
- 6 - initiate device recognition sequence
- 7 - start operator intervention wait
- %10 - wait for interrupt (operator intervention)  
restart at state 0
- %11 - wait for data segment freeze, then state 2
- %12 - wait for driver initiator to be frozen, then  
allocate controller (state 2)
- %13 - wait for I/O completion interrupt, then state 3
- %14 - wait for controller, then call driver initiator
- %15 - not used
- %16 - wait for initiator make present, then state 2
- %17 - wait for completor make present, then state 3

DLDEV - I/O system type, unit and logical device number

- 0 - HP3000 Series 2/3
- 1 - HP3000 Series 33 (HPIB)
- 2 - Unused
- 3 - Unused

DSAVE - Device processing flags

VS - VALID STATUS - Set to indicate Device Status has been updated.

AB - DVRABFLAG - Sequence Abort in progress due to ABORT request.

RE - RETRYFLAG - Sequence Abort in progress due to an error.

TP - TIMERPOPPED - Current error is due to software timer popping.

NR - NOTRDYFLAG - Not Ready Wait in progress.

NR CNT - Number of Not Ready Waits during this request.

DEVICE STATUS - Device status returned during a Sequence Abort.

- BIT 8 - CRC available and enabled.
- BIT 9 - Reserved.
- BIT 10 - Reserved.
- BIT 11 - Reserved.
- BIT 12 - Power fail or reset has occurred.
- BIT 13 - A protocol error has been detected.
- BIT 14 - A parity error has been detected.
- BIT 15 - The peripheral has data to send.

DSERR - Pointer to status to be logged.

- Bits.(0:8) - Number of words to be logged.
- Bits.(8:8) - Offset relative to DITP(0).

DCOUNTS - Error flags and error counts (4).

- RF - REQ FAILED - An error has forced this request to be aborted.
- UE - UNIT ERROR - The current error is a Unit Error.
- DE - DATA ERROR - The current error is a Data Error.
- TO - TIME OUT - The current error is a GIC Time Out Error.
- UNIT CNT - Number of Unit Errors during this request.
- DATA CNT - Number of Data Errors during this request.
- TO CNT - Number of GIC Time Outs during this request.
- PRTY CNT - Number of HP-IB Parity Errors during this request.

2631 OR 2619A LINE PRINTER DIT (FOR HPIB SYSTEMS)

-----

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IOQ element (however, there is only one device per 2631 controller.) The following diagram shows the DIT used for the 2631 line printer driver.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																	
0	0	0	AC	RQ	0	0	0	IO	IA	NO	ST	0	STATE			DFLAG	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																	
1	SYSDB relative pointer to the DIT for the next device requesting this resource or service														DLINK		
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																	
2	SYSDB relative pointer to the first IOQ in request list for this device														DIOQP		
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+

+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																	
7	Hardware error status. Set when the driver detects an error. Whenever <>0, the driver monitor logs an I/O error and clears this word														DSERR		
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																	
%10	Bit 0 is set at completion of timer														DTIME		
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																	
%11	Holds the time out request entry index while a timer is active.														DRQST		
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																	
%12	Hardware logged error status														DLOGERROR		
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																	

DFLAG - Flags and request state

- AC ACTIVE - A monitor is currently servicing this device.
- RQ REQUEST - A service request is pending while the monitor is active.
- IO IOPROG - An I/O Channel Program is running for this device.
- IA IAK - An interrupt or response has occurred for this device.
- NO NOTRDY - Go to state %10 after Idle Channel Program is started.
- ST STWAIT - The device monitor is starting an Idle Channel Program for this device. There is no IOQ associated with this type of request.

STATE - State of the device monitor. Specifies the next action to be taken in SIODM in servicing the request:

- 0 - start new request
- 1 - not used
- 2 - call driver initiator procedure
- 3 - call driver completor procedure
- 4 - not used
- 5 - process request completed
- 6 - initiate device recognition sequence
- 7 - start operator intervention wait
- %10 - wait for interrupt (operator intervention) restart at state 0
- %11 - wait for data segment freeze, then state 2
- %12 - wait for driver initiator to be frozen, then allocate controller (state 2)
- %13 - wait for I/O completion interrupt, then state 3
- %14 - wait for controller, then call driver initiator
- %15 - not used
- %16 - wait for initiator make present, then state 2
- %17 - wait for completor make present, then state 3

DLDEV - I/O system type, unit and logical device number

IOT I/O TYPE - Type of I/O system

- 0 - HP3000 Series 2/3
- 1 - HP3000 Series 33 (HPIB)
- 2 - Unused
- 3 - Unused

DSAVE - Device processing flags

BJ BETJOB - Between jobs flag. If set, suppress Powerfail message.

AB ABORT - Abort (caused by Powerfail or Operator) has occurred.

PS PRESPEC - Last request used prespacing.

FL FULL - Line printer buffer is full.

TP TOP - Printer is at top of form

DFLAG - DEVICE RELATIVE FLAGS.

AC ACTIVE BIT. 1 IMPLIES A MONITOR CURRENTLY SERVICING THIS DEVICE.

RQ REQUEST BIT. 1 IMPLIES SERVICE REQUESTED WHILE MONITOR IS ACTIVE.

SP SIO PREEMPTION. IF SET THEN A PREEMPTIVE REQUEST HAS BEEN QUEUED FOR THIS DEVICE. PREEMPT CODE IS SET IN IOQ ELEMENT.

CP CHANNEL PROGRAM IN PROGRESS. IF SET, THEN A CHANNEL PROGRAM IS CURRENTLY EXECUTING.

IA IF SET, AN INTERRUPT OR RESPONSE HAS OCCURED.

NR IF SET, DEVICE IS IN A NOT READY OR OPERATOR WAIT.

SW IF SET, AN IDLE CHANNEL PROGRAM SHOULD BE STARTED FOR THIS DEVICE.

MSTATE CURRENT DRIVER STATE AS DEFINED BY THE MONITOR.  
ALLOWABLE STATES ARE:

- 0 - START REQUEST
- 1 - NOT USED(BUT RESERVED)
- 2 - CALL DRIVER INITIATOR
- 3 - CALL DRIVER COMPLETOR
- 4 - UNUSED(BUT RESERVED)
- 5 - COMPLETE REQUEST. PERHAPS RETURN TO USER.
- 6 - UNEXPECTED INTERRUPT OCCURRED.
- 7 - START OPERATOR INTERVENTION WAIT.
- %10 - WAITING (ON OPERATOR). RESTART AT 0.
- 11 - WAITING (DATA MAKEPRESENT/FREEZING)
- 12 - WAITING (INITIATOR CODE MAKEPRESENT/FREEZE)
- 13 - WAITING (FOR COMPLETION INTERRUPT)
- 14 - WAITING (FOR DEVICE CONTROLLER AVAILABILITY)
- 15 - UNUSED(BUT RESERVED)
- 16 - WAITING (INITIATOR CODE MAKEPRESENT)
- 17 - WAITING (COMPLETOR CODE MAKEPRESENT)

DLDEV - I/O SYSTEM TYPE, UNIT AND LOGICAL DEVICE NUMBER.

IOT I/O SYSTEM TYPE.

- 0 - HP3000 SERIES II/III (SIO/DIO)
- 1 - HP-IB
- 2 - RESERVED
- 3 - RESERVED

DCBCNT - CURRENT BYTE COUNT TO BE TRANSFERRED.

DCWCNT - CURRENT WORD COUNT TO BE TRANSFERRED.

DRCNT - REMAINING WORD COUNT TO TRANSFER.

DOFFSET - OFFSET IN BUFFER OF NEXT # WORDS TO TRANSFER.

DDEBUG - IF BIT 15=1 THEN DEBUGGING INFO WILL BE SENT TO CONSOLE

DLOGBUFFER - STATUS WORDS 1 & 3 ARE MOVED HERE TO BE LOGGED  
IF THEY WERE LOGGED FROM THE I/O STATUS BLOCK  
THEIR CONTENTS MIGHT BE CHANGED BEFORE THEY  
WERE LOGGED.

DIOSSTAT - I/O STATUS AREA 16 WORDS, SEE I/O STATUS BLOCK DEFINITION.

I/O STATUS BLOCK

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
0	!0!--THE "OR" OF WORDS 1/15 IS LOCATED HERE----															DIT 17

14	!	SHEET NUMBER OF ERROR IF WORD 4 TO 6 <> 0														!	31
	---	OR														---	
15	!	LAST SHEET TRANSFERRED IF "JOB" & POWER-ON														!	32

WORD 0 - EACH BIT IS THE 'OR' OF ONE WORD IN THE TABLE (EXCEPT BIT 0 WHICH IS NOT USED). THEREFORE, BIT .(1:1) IS SET IF WORD 1 IN THE TABLE IS NON-ZERO.

WORD 1 - BIT= 0 - (OF) ONLINE/OFFLINE BIT.  
 1 - (MS) MESSAGE BEING DISPLAYED ON THE 2680A CONSOLE.  
 2 - (PW) POWER UP COMPLETED SINCE LAST I/O STATUS READ.  
 3 - (PE) PARITY ERROR DETECTED ON PHI COMMAND.  
 4 - (TE) TRANSMISSION ERROR DETECTED IN THE PRINTER.  
 5/15 - RESERVED. UNUSED.

WORD 2 - NOT USED. RESERVED.

WORD 3 - MCS FAULT NUMBER. CONTAINS AN INTEGER DESCRIBING THE LAST FAULT TO OCCUR SINCE THE LAST TIME THE I/O STATUS WAS READ OR THE HP2680A WAS POWERED DOWN. IF THE WORD IS ZERO THERE IS NO MCS FAULT. SEE DCS ERS FOR A DESCRIPTION OF THE MCS FAULT NUMBERS.

- WORD 4 - BIT= 0 - (CL) NO ROOM FOR ATTEMPTED CHARACTER SET LOAD.  
1 - (FL) NO ROOM FOR ATTEMPTED FORM LOAD.  
2 - (VL) NO ROOM FOR ATTEMPTED VFC LOAD.  
3 - (CU) ATTEMPT TO PRINT DATA AND THERE IS NO CURRENTLY  
SELECTED CHARACTER SET.  
4 - (FU) ATTEMPT TO SELECT AN UNDEFINED FORM SET.  
5 - (VU) ATTEMPT TO PRINT DATA AND THERE IS NO CURRENTLY  
SELECTED VFC SET.  
6 - (IL) ATTEMPT TO PRINT DATA AND THERE IS NO CURRENTLY  
SELECTED LOGICAL PAGE TABLE (LPT) ENTRY.  
7 - (IP) ATTEMPT TO MOVE PEN OFF THE LOGICAL PAGE.  
8 - (ST) THE 2680A COULD NOT PROCESS ALL OF THE DATA  
BEFORE IT WAS SUPPOSED TO BE TRANSFERRED TO THE  
DRUM/PAPER. DATA WAS LOST!  
9 - (SB) SPOOLER BLOCK CONTAINS FORMAT ERROR.  
10 - (IR) INVALID RECOVERY BLOCK RECEIVED FROM SPOOLER.  
11 - (MP) MAXIMUM NUMBER OF COPIES PER PHYSICAL PAGE  
HAS BEEN EXCEEDED. THIS IS A RESULT OF THE  
SPOOLER PROCESS SETTING THE MAXIMUM COPIES PER  
PAGE WITH FUNCTION CODE 132.  
12 - (NJ) A COMMAND OR FUNCTION CODE WAS RECEIVED WHEN NO  
"JOB" WAS IN PROGRESS. THE COMMAND OR FUNCTION WAS  
IGNORED BY THE DCS.  
13 - (NM) NO MEMORY. 2680A DYNAMIC MEMORY ALLOCATION HAS  
DETECTED THAT MAIN MEMORY IS COMPLETELY OCCUPIED WITH  
CHARACTER SETS, VFC'S, FORMS AND DATA SUCH THAT THE  
2680A CANNOT PROCESS THE CURRENT INPUT DATA. DATA  
WILL BE LOST!  
14 - (TL) ATTEMPT TO PRINT DATA AND THERE ARE MORE THAN  
THE MAXIMUM ALLOWABLE LOGICAL PAGE TABLE (LPT)  
ENTRIES SELECTED.  
15 - (NC) A NON-EXISTENT VFC CHANNEL WAS SKIPPED TO.

- WORD 5 - BIT= 0 - (LP) LOGICAL PAGE TRUNCATED TO FIT PHYSICAL PAGE.  
1 - (PF) PAGE SIZE PEQUIRED BY PROGRAMMER DID NOT  
MATCH PAGE SIZE SET BY OPERATOR. OPERATOR PAGE  
SIZE PREVAILS.

- 2 - (NC) NO CHARACTER SET SELECTED.  
WORD 6 - BIT= 0 - (PL) NOT ENOUGH MEMORY FOR PICTURE DOWNLOAD.  
1 - (OP) ATTEMPT TO PRINT MORE THAN 64 PICTURES ON A  
PHYSICAL PAGE.  
2 - (IP) ATTEMPT TO PRINT A PICTURE WHICH IS NOT PRESENT.

WORDS 7/11 NOT USED. RESERVED FOR FUTURE USE.

WORDS 12/13 - THE RECORD NUMBER WHICH CONTAINS THE OFFENDING ERROR  
AS DEFINED BY WORD FOUR. IF A POWER FAIL OCCURS DURING  
A "JOB", THE POWER FAIL BIT IS SET AND A SHEET NUMBER IS  
MADE AVAILABLE IN WORDS FOURTEEN AND FIFTEEN. HOWEVER,  
THE RECORD NUMBER IS LOST AND CANNOT BE REPORTED. THESE  
WORDS OCCUR IN A "JOB" ONLY.

WORDS 14/15 - THE SHEET NUMBER ON WHICH THE ERROR OCCURED AS DEFINED BY WORD FOUR. IF AN ERROR OCCURS IN THE ENVIRONMENT FILE AT THE START OF A "JOB", THEN THIS NUMBER WILL BE ZERO. IN ADDITION, WHEN A POWER FAIL OCCURS DURING A "JOB", THE POWER ON BIT IS SET IN WORD ONE AND THE SHEET NUMBER OF THE LAST SUCCESSFULLY TRANSFERRED PAGE IS PLACED HERE. THIS INFORMATION IS FOR USE BY THE SPOOLER SHOULD A RECOVERY OF A "JOB" BE DETERMINED. THESE WORDS OCCUR IN "JOB" ONLY.

ALL WORDS OF THE I/O STATUS ARE CLEARED WHENEVER THE STATUS BLOCK IS RETURNED TO THE HOST. IT IS UP TO THE HOST CPU TO RETAIN ANY ON-GOING STATUS BITS REQUIRED.

QMISC -

```

      0  1  2  3  4  5  6  7  8  9 10 11 12 13 14 15
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
IOQ3 !MB!RB!AB!IO!TO!           ! XFER ! PARITY ! ! QMISC
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+

```

WHERE:

- .(0:1) - MB            USER REQUESTED TRANSFER IN EXCESS OF 4096 WORDS. THE DRIVER CAN WRITE UP TO 4096 WORDS TO THE 2680A. IN ORDER TO HANDLE UP TO 32K WORDS, MULTIPLE WRITES ARE USED WITHOUT A RETURN TO THE USER WHO CALLED THE DRIVER. THIS BIT INDICATES THAT MULTIPLE WRITES ARE BEING DONE TO THE 2680A.
- .(1:1) - RB            THE CURRENT WRITE BLOCK MUST BE RETRIED.
- .(2:1) - AB            USER REQUESTED ABORT IN PROGRESS FLAG.
- .(3:1) - IO            I/O STATUS HAS BEEN READ AND IS AVAILABLE.
- .(4:1) - TO            GENERAL I/O CONTROLLER TIMED OUT.
- .(5:4) - RESERVED    NOT CURRENTLY USED.
- .(9:3) - XFER          2680A TRANSFER ERROR COUNTER.
- .(12:3)- PARITY        CHANNEL PROGRAM COMMAND PARITY ERROR COUNTER.
- .(15:1)- RESERVED    NOT CURRENTLY USED.

**\*\*NOTE\*\*** IN THE ABOVE, SINGLE BIT FIELDS ARE AS DEFINED WHEN THE BIT IS A LOGIC "1".

30119 CARD READER/PUNCH DIT

Everything is the same as the SIO DIT  
and standard IOQ except as noted below:

1. DIT (9)

	0	1	2	3	4	5	6	7	8	9	10	11	12,13	14	15	
%11	C	S	S	H	I	E	I	P	P	S	E	S	M	C	T	DACCP
	B				I	O				P			O	O		
	F	C	S	S	F	F	B	R	N	D	C	m	D	N	R	

- DIT(9).(0:1)            CBF        Clear Buffer Full - 0= the next card leaving the hopper will be read by the device. 1= the read buffer will be cleared when next card leaves the hopper.
- DIT(9).(1:1)            SC        Stacker Control - 0=all cards are stacked in right hopper until device goes not ready. 1= cards are stacked per bit 2.
- DIT(9).(2:1)            SS        Stacker Select - 0=Right stacker (stacker 1) 1= Left Stackers (stacker 2).
- DIT(9).(3:1)            HS        Hopper Select - 0= Pick from rear hopper (primary hopper). 1= Pick from front hopper (secondary hopper).
- DIT(9).(4:1)            IIF        Inhibit Input Feed - Inhibit picking a card when card currently in wait station is eject to a hopper.
- DIT(9).(5:1)            EOF        End Of File has been detected on a read oper
- DIT(9).(6:1)            IB        Internal Buffer -An internal buffer is being used. The buffer is the SIO area in the ILT.
- DIT(9).(7:1)            PR        Print - Print on the next card to pass the print station.
- DIT(9).(8:1)            PN        Punch - Punch 80 columns of data on the next card to pass the punch station.
- DIT(9).(9:1)            SPD        Separate Print Data - Print data other than that being punched on the next card to pass the punch and print station.
- DIT(9).(10:1)           EC        Eject Card - Eject on a write after a read. Used when reading one card then punching one card (last card was read).

30119 CARD READER/PUNCH (CONT.)

```

-----
DIT(9).(11:1)      Sm      Stacker Mode -Saved staker mode on last read
DIT(9).(12:2)      MODE     Access Mode -
                        0= File opened for Read only
                        1= File opened for Write only
                        2= File opened for Read/Write
DIT(9).(14:1)      CON      Control - 0= no FCONTROL has occurred for this
                        file (use default settings). 1= FCONTROL has
                        been done on this file (use settings in this
                        DIT word for controlling this device).
DIT(9).(15:1)      TR       Timer Request - A timer request is pending.
                        Timer request index is in word %12.

```

2. DIT(10) Timer request index (see DIT(9).(15:1)).

3. QMISC{IOQ(4)}

DFLAG - Flags, IOSTATE and MAMSTATE

- ACTIVE - If set, the Driver is active servicing this device
- REQUEST - If set, service for this device was requested while the Driver was active. The Driver is run again to insure servicing of the condition which caused REQUEST to be set.
- DO'TIMING - If set, the hardware and software timers are started in the normal manner when performing an operation. If clear, no timing is done.
- SIOPREEMPT- Preemptive request queued by ATTACHIO. Not used by this Driver.
- IOPROG - If set, an I/O program is in progress. Set by STARTIO and cleared by GIP. Not used by the Driver.
- IAK - Interrupt Acknowledge If set, an interrupt has occurred or a software timeout has completed.
- SIMULATOR - If set, all I/O is to be simulated. The Driver will set flags in the DRT instead of calling STARTIO.
- MAMSTATE - Memory Manager State
  - 0 - Null, no Memory Management requests or condition
  - 1 - Not used
  - 2 - Data segment associated with the first request in the Active Queue is being made present and frozen.
  - 3 - Data segment associated with the first request in the Active Queue is frozen in memory.
  - 4 - Data segment associated with the second request in the Active Queue is being made present and frozen. Implies the data segment associated with the first request is frozen.
  - 5 - Data segments associated with the first and second requests on the Active Queue are frozen in memory.
  - 6 - Not used
  - 7 - Not used

INP DIT (cont)

-----

- IOSTATE - Current I/O program operation being performed
- 0 - Inactive No I/O in progress
  - 1 - Idle Read The Idle Read I/O program has been started.
  - 2 - Sending message An I/O program which sends a message without data and then goes to the Idle Read section of the I/O program has been started.
  - 3 - Sending data An I/O program which sends a message and data and then goes to the Idle Read section has been started.
  - 4 - Send message and interrupt An I/O program which sends a message without data then interrupts and halts when the message is sent has been started.
  - 5 - Send data and interrupt An I/O program which sends a message with data then interrupts and halts has been started.
  - 6 - Receive data An I/O program which sends a message and receives data then interrupts and halts has been started.
  - 7 - Do not start I/O Used to hold off requesting any I/O activity during a power on reset or when an error occurs.
- DLINK - Link word for the linked list of devices waiting to be serviced by the I/O process associated with this device
- DIOQP - System DB relative pointer to the first element in the requests to be processed list for this device The requests are queued to this list by ATTACHIO but in processing, the are moved to other queues depending of the state of the request The Driver always attempts to keep this list empty.
- DLDEV - Logical Device Number of this device
- DDLTP - System DB relative pointer to the Driver Linkage Table. (DLT)
- DILTP - System DB relative pointer to the Interrupt Linkage Table. (ILT)
- DSTATUS - Controller hardware status Set by GIP on interrupt and the Physical Driver during certain service operations See INP ERS for description. For the Toothpick version, this word contains the software timeout flags as described for the word DTIME below.

INP DIT (CONT)

-----

- DTRLX - Timer request index for software timeouts as returned by the MPE procedure TIMEREQ
- DTIME - Timed out flags and type 3 driver process PCB Number
- TIMED - If set, a software timeout has completed
- READYQ - System DB relative pointer to the IOQ for the first request in the Ready Queue. If zero, the Ready Queue is empty.
- READYQTL - System DB relative pointer to the last IOQ in the Ready Queue. When the queue is empty, this word points to the word preceding the queue head pointer in the DIT.
- ACTIVEQ - System DB relative pointer to the IOQ for the first request in the Active Queue. If zero, the Active Queue is empty.
- ACTIVEQTL - System DB relative pointer to the last IOQ in the Active Queue. When the queue is empty, this word points to the word preceding then queue head pointer in the DIT.
- WAITEDQ - System DB relative pointer to the IOQ for the first request in the Waited Queue. If zero, the Waited Queue is empty.
- WAITEDQTL - System DB relative pointer to the last IOQ in the Waited Queue. When the queue is empty, this word points to the word preceding then queue head pointer in the DIT.
- DSTATE - Driver state and control flags
- ERRORONLY - If set, the Driver trace record is to be returned to the Trace Process only when an error occurs.
- WRAP - If set, the Driver will overlay the oldest trace entry when a trace record overflow occurs. If clear, entries are lost when an overflow occurs.
- TRACEON - If set the Driver trace facility is enabled and the Driver generates trace entries for most of its local

INF DIT (CONT)

-----

subroutine calls.

- PFSTATE - Power failure recovery state
- 0 - No power failure recovery in progress
  - 1 - Power failure detected on the mainframe before INP indication. Check for completion of any pending I/O and then wait in PFSTATE 2 for INP to pfail.
  - 2 - Power failure detected on the Mainframe before INP has indicated a power failure. Wait for INP to indicate a power failure.
  - 3 - Power failure indicated by INP before being informed by the Mainframe power failure routines. Wait for the Mainframe power failed request.
  - 4 - Power failure indicated both on the Mainframe and by INP. Power failure recovery may be started.
  - 5 - Send Redo The Mainframe receive count was less than INP's send count so the dialogue must be restarted. The Driver is sending the Redo message.
  - 6 - Send Ignore The Mainframe send count was greater than INP's receive count so any part of a dialogue so far received is to be ignored and the entire dialogue will retransmitted. The Driver is sending Ignore message.
  - 7 - Recovered. The Mainframe and INP dialogue counters agree or mainframe not sending, so no recovery is necessary. The Driver is sending the recovered message informing INP to go back to its normal mode.
- UNFRZ - If set, the source data segment is to be unfrozen when the data has been transmitted to the INP. If clear, the source data segment remains frozen until a request complete indication is returned by the INP.
- PASSREADS - If set, then read requests are to be passed around other requests which have been impeded because no buffers are available on the INP.
- NOTRDYWAIT- If set, then a request has been impeded because no buffers were available on the INP.
- SENDING - If set, an I/O program which send sends a message, with or without associated data has been started but not completed.
- OPENSTATE - Operational state of the Driver and INP
- 0 - Not opened or closed

INP DIT (CONT)

-----

- 1 - In ROM The device has been opened but the RAM Operating System has not been entered
- 2 - Crashed Some catastrophic error has occurred
- 3 - In RAM. The device has been opened, down loaded and is in the RAM Operating System.

ABORT - If set one or more requests have been aborted but the abort was not done because the aborted request was in the process of doing a Memory Management function or I/O when when request to abort was processed. The actual abort will take place when the Memory Management function completes.

The following five words hold the message block which is sent to INP when the Physical Driver is called to send a message with or without associated data. The Logical Driver sets the message contents into this area and calls the Physical Driver to send the message.

DOUTMSG - Message type code for messages sent to INP

DOUTID - Request identifier associated with the message being sent.

DOUTP1 - Parameter one of the message being sent to INP

DOUTCNT - Count parameter of the message being sent to INP

DOUTP2 - Parameter two of the message being sent to INP

DSEND - Messages sent counter. This word contains the number of messages sent since the RAM Operating System was entered. It is used for power failure recovery.

DRECV - Messages received counter. This word contains the number of messages received from INP since the RAM Operating System was entered. It is used for power failure recovery.

DEOT - End of dialogue flag. When a message has been sent and the EOT indicating INP has received the message is transmitted, it is received into this word. This flag is used to indicate to the Logical Driver that a transmission has been completed and that the Physical Driver should be called to check the completion status and update the IOSTATE.

INP DIT (CONT)

-----

The following six words are the data area into which messages from INP are received. The Physical Driver constructs I/O programs which reference this area.

- DINMSG - Message type code of message from INP
- DINID - Request Identifier associated with message from INP
- DRSTATUS - Request Completion status
- DINCNT - Number of bytes of data to be received associated with the completion of a request which results in data being sent from INP.
- DXLOG - Transmission log to be returned when the request identified by DINID is completed.
- DINPARM - Parameter associated with the completion of this request. This word is return in the X register by IOSTATUSX.
  
- DTRCNT - Trace ready pending count. This word contains the number of Trace Ready messages recieved but not satisfied by Trace Read requests.
  
- DDSTN - If not zero then internal Driver extra data segment tracing is enabled and this is the data segment number into which the trace entries are to be set.
  
- DERROR - Driver Error block. The following sixteen words are used to store information describing the current operations being performed when a catastrophic Driver error occurred. A catastrophic error occurs on illogical Driver control data, MPE errors or when INP does not respond in an expected manner. The first five word block is used to hold the current or last message transmitted to INP when a catastrophic error condition was detected. It contains the data in the same format as message to INP block.
  
- DCSERR - CS Error Code associated with a catastrophic Driver error
  
- DSAVE - Request Identifier of the request being processed when a catastrophic Driver error was detected

INP DIT (CONT)

-----

- DVERSION - Version numbers of the Physical and Logical Drivers
- TP - If set, the Physical Driver is for the Toothpick System
- PVERSION - Physical Driver version number
- LVERSION - Logical Driver version number
- DERROR1 - The six word block beginning here is used to hold the last message received from INP before a catastrophic Driver error was detected. It contains the data in the same format as the message from INP block.
- DDRVREERR - Holds the code specifying the catastrophic error detected by the Physical Driver. See ERRORS under the PHYSICAL DRIVER INTERNAL SPECIFICATIONS for the definition.
- DMNTRERR - Holds the code specifying the catastrophic error detected by the Logical Driver. See ERRORS under the LOGICAL DRIVER INTERNAL SPECIFICATIONS for the definition.
- DSERR - Hardware Controller status when a catastrophic Driver error was detected.
- HSTATUS - Left byte of the DSTATUS word at time of error
- SIOFX - SIO program area relative index to the last order executed or current order being executed at time of error.
- DTP'ERROR - Toothpick hardware error status. To be defined.
- DTR'IOQP - If not zero then an IOQP pointer to the Trace Read request which is supplying the locked and frozen buffer into which the Driver places trace entries to generate a trace record.
- DLOGX - Driver local trace buffer index. This is the index relative to the Driver local trace buffer to place the next trace entry.
- DLOGBUF - Driver local trace buffer. This buffer extends from here to the end of the DIT.

# DISC REQUEST TABLE AND DISC REQUESTS

Requests for disc transfers are effected by acquiring an entry from the Disc Request Table (DISCREQTAB), filling the proper information, and calling the DISCQMANAGER to link the request into the device's doubly linked request queue. The head and tail of a device's request queue are contained in the device's DIT.

DISC REQUEST TABLE

DISCREQTAB DST ENTRY# = 56 (%70)

Note: Upon return to free list, word (#1) becomes index of next EE free entry.

Word 0 - QFLAG - Request dependent flags

Bit 0     .ABORT           Request has been aborted externally.

Bit 1     .MMREQ           Request is for a segment transfer.

Bit 2     .DIAG            Diagnostic request (not used).

Bit 3     .SBUF            System Buffer. Target is a system buffer whose index is relative to the start of the SBUF table.

Bit 4     .IOWAKE          Wake caller on completion of request.

Bit 5     .BLOCKED         Blocked I/O. Caller is waited in ATTACHIO until request is completed.

Bit 6     .COMPLETED      Request has been completed and caller woken if he had specified.

Bit 7     .DATAFRZN        Data segment has been made present and is frozen.

Bit 8     .MAMERRORD       MAM error on data segment make present.

Bit 9     .PREQQUEUED      Request is queued into disc's req queue

Bit 10    .SFAIL           Start SIO failure in GIP.

Bit 11    .PFAIL           The I/O has been aborted because of a powerfail.

Bit 12    .CURREQ         Request is device's current request.

Bit 13    .DISABLED        Request is disabled.

Bit 14    .DISATMPT        Attempted to disable this request.

Bit 15    .MSGDONE         A message request reply has completed.

Word 2 - QLDEV.QLDEVN - Logical Device Number

Word 3 - QMISC - Device dependent.

Word 4

QDSTN - If SYSBUFRs is clear then this is the DST number of the target data segment. If bit 0 is set then buffer address is a DB offset value instead of segment relative offset (implemented for NOWAIT IO and NOBUFF).

Word 5

QADDR - Offset in data segment or sys buff table to target data buffer.

Word 6

QFUNC.FUNC - Function code and qualifiers as specified by driver.

Word 7

QXFERCNT-On initiation specifies the word count if positive or byte count if negative. At completion of the request this location contains the actual transmission count in the same units as the call. Certain control requests return data through this location.

Word 8

QPAR1 - Parameter one, defined by driver

Word 9

QPAR2 - Parameter two, defined by driver

QMISC - Miscellaneous request dependent storage available to driver.

Word 10

QSTAT.PCBN - PCB Number of process which made this request. Zero if not associated with any process and IOQ is to be returned by the system.

.QUALIFIER - A code which further defines or qualifies the general status. Defined by driver.

.STATUS - General Status. Indicates current and result state of the request according to the following codes.

0 - not started or awaiting completion.

1 - successful completion.

2 - end of file detected.

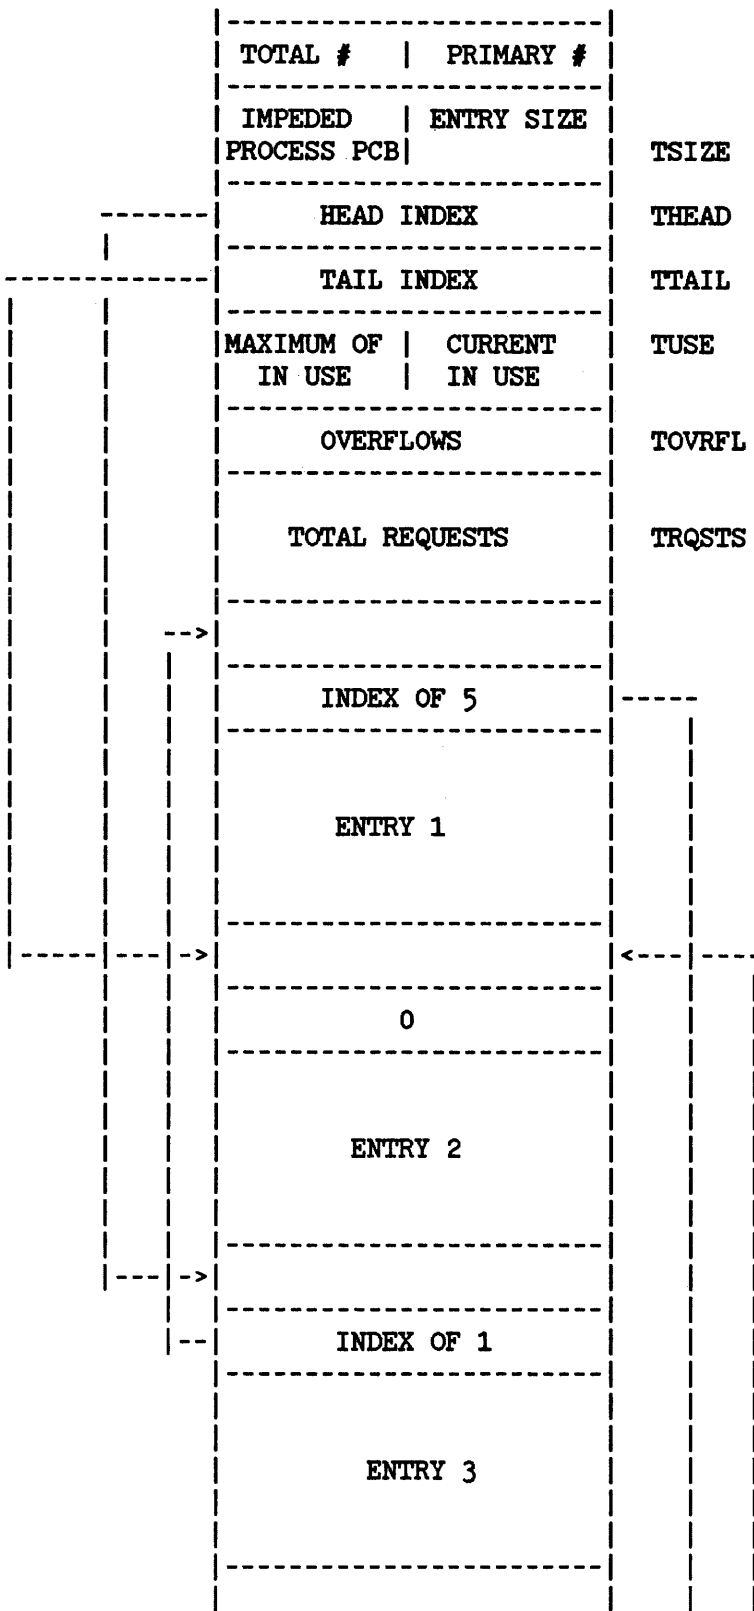

3 - unusual condition.

4 - irrecoverable error.

NOTE: See I/O System Status Returns.

IOQ TABLE LAYOUT

10	PCBN										QUALIFIER						STATUS	QSTAT

QFLAG - Request dependent flags

- Bit 0     .ABORT           Request has been aborted externally.
- Bit 1     .SPECIAL        Special handling is to be applied to this request. For disc, indicates a memory management request.
- Bit 2     .DIAG           Diagnostic request (not used).
- Bit 3     .SBUF            System Buffer. Target is a system buffer whose index is relative to the start of the SBUF table.
- Bit 4     .IOWAKE         Wake caller on completion of request.
- Bit 5     .BLOCKED        Blocked I/O. Caller is waited in ATTACHIO until request is completed.
- Bit 6     .COMPLETED     Request has been completed and caller woken if he had specified.

IOQ ELEMENT (CONT.)

-----

Bit 7      .DATAFRZN      Data segment has been made present and is frozen.

Bit 8      .MAMERRORD      MAM error on data segment make present.

Bit 9      .PREQ            This request has been started but was preempted by a MAM request.

Bit 10     .SFAIL         Start SIO failure in GIP.

Bit 11     .PFAIL         The I/O has been aborted because of a powerfail.

Bits12-13 .PREMPT        Preemptive type code: 1-soft, 2-hard.

Bit 15     .MSGDONE        A message request reply has completed.

QLINK - SYSDB relative pointer to next IOQ element. Points to first word of element.

QLDEV.QLDEVN - Logical Device Number

QMISC - Device dependent.

QDSTN - If SYSBUFRRs is clear then this is the DST number of the target data segment.If bit 0 is set then buffer address is a DB offset value instead of segment relative offset (implemented for NOWAIT IO and NOBUFF).

QADDR - Offset in data segment or sys buff table to target data buffer.

QFUNC.FUNC - Function code and qualifiers as specified by driver.

QWBCT - On initiation specifies the word count if positive or byte count if negative. At completion of the request this location contains the actual transmission count in the same units as the call. Certain control requests return data through this location.

QPAR1 - Parameter one, defined by driver

QPAR2 - Parameter two, defined by driver

QMISC - Miscellaneous request dependent storage available to driver.

QSTAT.PCBN - PCB Number of process which made this request. Zero if not associated with any process and IOQ is to be returned by the system.

.QUALIFIER - A code which further defies or qualifies the general status. Defined by driver.

.STATUS - General Status. Indicates current and result state of the request according to the following codes.

0 - not started or awaiting completion.

1 - successful completion.

2 - end of file detected.

3 - unusual condition.

4 - irrecoverable error.

I/O SYSTEM STATUS RETURNS

QFLAG - Request dependent flags

- Bit 0 ABORT - Abort this request and return an error indication to the caller.
- Bit 1 SPECIAL - Apply special handling to this request. (Not used)
- Bit 2 DIAG - This is a request from the diagnostic subsystem. (Not used)
- Bit 3 SYSBUFF - Target is an index relative to the SBUF Table of the data buffer.
- Bit 4 IOWAKE - Wake caller on completion of request.
- Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACHIO until the request is completed. Implies IOWAKE.
- Bit 6 COMPLETED - The request has been completed and the caller

awakened if he had requested (with IOWAKE).

- Bit 7 DATAFRZN - Set by the memory management routines (MAM) when a MAKEPRESENT request is successfully completed and indicates the data segment is frozen in memory.
- Bit 8 MAMERRORD - An error has occurred while MAM was trying to make the target data segment present and freeze it in memory.
- Bit 9 PREQ - (Not used)
- Bit 10 SFAIL - Delayed failure of SIO instruction. If a call to START'HPIB resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
- Bit 11 PFAIL - The request was aborted because of a system power failure.

QMISC - Driver request dependent flags and counters. Used mostly for error retries.

- RETRY - Indicates an error retry is in progress.
- BACK - Backspace record processing for an error retry is in progress.
- FORWARD - Forward space record processing for an error retry is in progress.
- GAP - Gap processing for an error retry is in progress.
- BODEOF - Backspace record due to a data EOF processing is in progress.
- TOUTCNTR - GIC timed-out counter.
- FSCNTR - Forward space record counter.
- BSCNTR - Backspace record counter.
- RTCNTR - Error retry counter.

QSTAT - PCB number and request completion status.

- PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.
- STATUS - General status indicating the final state of the request. The following codes are used:
  - 0 - Not started or awaiting completion.
  - 1 - Successful completion.
  - 2 - End-of-file detected.
  - 3 - Unusual, but recoverable, condition detected.
  - 4 - Irrecoverable error has occurred.
- QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

QFLAG - Request dependent flags

- Bit 0 .ABORT - Request has been aborted externally, either by the operator or a system intrinsic.
- Bit 1 .SPECIAL - Not used.
- Bit 2 .DIAG - Not used.
- Bit 3 .SYSBUFERS - Target is a system-buffer-relative index to the data buffer. \*
- Bit 4 .IOWAKE - Wake caller on completion of request. \*
- Bit 5 .BLOCKED - Blocked I/O. The caller is waited in ATTACHIO until the request is completed. Implies IOWAKE. \*
- Bit 6 .COMPLETED - Request has been completed, and the caller awakened if s/he had requested (with IOWAKE). \*

- Bit 7 .DATAFRZN - If set, then the data segment has been made present and frozen in memory. Set by the memory management routines (MAM) when a MAKEPRESENT request is successfully completed. \*
- Bit 8 .MAMERRORD - An error has occurred while MAM was trying to make the target data segment present and freeze it in memory. \*
- Bit 9 .PREQ - Not used.
- Bit 10 .SFAIL - Delayed failure of SIO instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
- Bit 11 .PFAIL - The request was aborted because of a system power failure.
- Bits12-13 .PREMPT - Not used.
- Bit 14 . - Not used.
- Bit 15 .MSGDONE - Not used.
- QMISC.WAITFLD - This field contains a code describing the current idle state of the driver. The driver orients itself at each entry, based on the state of this field.
- 0 - The current entry is the start of a new request.
  - 1 - The normal state while waiting for a completion interrupt of a print, fill or control operation.
  - 2 - An SIO channel program was in progress when an asynchronous interrupt (usually an external abort) occurred, or a 2607 printer was placed on-line after going off-line while printing. The driver enters this state and waits for three seconds for the channel program or 2607 printer to complete, so as not to pose control conflicts to the U.I. card between the driver and the program.
  - 3 - A Not Ready, Off Line or Paper Out (or Jammed) condition has been detected. The request will be continued or retried when the operator has corrected the condition and placed the printer on line.
  - 4 - A 2607 (Tally) printer has come on-line after going off-line while printing. One line of data is buffered in the printer. This state causes the driver to shift to state 2 to allow the 2607 to print and space the buffered line before sending it the next line.
- QMISC.(12:1) - RETRY (RT). Kludge to catch an LDEV configured as a 2608 when the physical device is a different subtype. Prevents Master Clear'ing and retrying a request more than once when the Power Fail/Reset device status bit is "set" by a non-2608.
- QMISC.(13:1) - MASTER' CLEAR (MC). Set when a 2608 Master Reset, required because of a printer Power Fail/Reset, is configured and executed.
- QMISC.(14:1) - PRESPEACE (PS). The current operation is a pre-

- space (space then print) request. This bit alerts the continuation section to fill the print buffer after spacing.
- QMISC.(15:1) - PRE'TO'POST (PP). The previous request was a prespace operation while the current operation is a postspace.
- QSTAT.PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process, and the IOQ element is to be returned by the system when the request has completed. \*
- QSTAT.STATUS - General status. Indicates the final state of the request. The following codes are used:
- 0 - Not started, or awaiting completion.
  - 1 - Successful completion.
  - 2 - Not used.
  - 3 - Unusual, but recoverable, condition (such as Request Aborted Externally).
  - 4 - Irrecoverable error (such as SIO failure, memory parity error, etc.).
- QSTAT.QUALIFIER - A code which further defines or qualifies the general status.

2608 LINE PRINTER IOQ ELEMENT -- HP1B SYSTEMS

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC
0   Request dependent flags (see below)															QFLAG	
1   SYSDB relative pointer to next IOQ element.															QLINK	
Points to first word of element.																
2     Logical device number															QLDEV	
3   PP   PE   MC   TOUTCNTR     WAITCODE															QMISC	
4   S   If QFLAG.(3:1) is clear then this is the															QDSTN	
DST number of the target data segment. If																
S is set, QADDR is DB relative.																
5   Offset in the data segment or system buffer															QADDR	
table to the target data buffer.																
6     Function code for															QFUNC	
this request. (See																
next section.)																
7   On initiation, specifies the word count (>0)															QWBCT	
or byte count (<0). At completion of the																
request this location contains the actual																
transmission count in the same units (bytes																
or words) as in the request.																
%10   Parameter 1. Vertical Format specification.															QPAR1	
(See next section for detail.)																
%11   Parameter 2. Space Mode Flags. (See next															QPAR2	
section for details.)																
%12   PCBN   QUALIFIER   STATUS															QSTAT	

QFLAG - Request dependent flags

- Bit 0 ABORT - Abort this request and return an error indication to the caller.
- Bit 1 SPECIAL - Apply special handling to this request. (Not used)
- Bit 2 DIAG - This is a request from the diagnostic subsystem. (Not used)
- Bit 3 SYSBUFF - Target is an index relative to the SBUF Table of the data buffer.
- Bit 4 IOWAKE - Wake caller on completion of request.
- Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACHIO until the request is completed. Implies IOWAKE.
- Bit 6 COMPLETED - The request has been completed and the caller

- awakened if he had requested (with IOWAKE).
- Bit 7 DATAFRZN - Set by the memory management routines (MAM) when a MAKEPRESENT request is successfully completed and indicates the data segment is frozen in memory.
- Bit 8 MAMERRORD - An error has occurred while MAM was trying to make the target data segment present and freeze it in memory.
- Bit 9 PREQ - (Not used)
- Bit 10 SFAIL - Delayed failure of SIO instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
- Bit 11 PFAIL - The request was aborted because of a system power failure.

QMISC - Driver request dependent flags and counters.

- PRE'TO'POST - Pre to post spacing change flag.
- PEJECT - Last operation was a page eject.
- MASTERCLR - Master clear done to clear powerfail bit in status.  
Master clear needs to be done from not ready conditon.
- TOUTCNTR - Channel time-out retry counter.
- WAITCODE - Indicates type of wait:
  - 0 - new request
  - 1 - completion wait
  - 2 - not ready wait

QSTAT - PCB number and request completion status.

- PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.
- STATUS - General status indicating the final state of the request.  
The following codes are used:
  - 0 - Not started or awaiting completion.
  - 1 - Successful completion.
  - 2 - End-of-file detected.
  - 3 - Unusual, but recoverable, condition detected.
  - 4 - Irrecoverable error has occurred.
- QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

3																QMISC	
4	S	If QFLAG.(3:1) is clear then this is the DST number of the target data segment. If S is set, QADDR is DB relative.														QDSTN	
5	Offset in the data segment or system buffer table to the target data buffer.															QADDR	
6	Used by the new Disc routines for special status returns.							Function code for this request. (See next section.)								QFUNC	
7	On initiation, specifies the word count (0) or byte count (<0). At completion of the request this location contains the actual transmission count in the same units (bytes or words) as in the request.															QWBCT	
8	Parameter 1.															QPAR1	
9	Parameter 2.															QPAR2	
10	PCBN					QUALIFIER					RSTATUS					QSTAT	

**QFLAG - Request dependent flags**

- Bit 0 ABORT - Abort this request and return an error indication to the caller.
- Bit 1 SPECIAL - Apply special handling to this request. (Not used)
- Bit 2 DIAG - This is a request from the diagnostic subsystem.
- Bit 3 SYSBUFF - Target is an index relative to the SBUF Table of the data buffer.
- Bit 4 IOWAKE - Wake caller on completion of request.
- Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACHIO until the request is completed. Implies IOWAKE.

- Bit 6 COMPLETED - The request has been completed and the caller awakened if he had requested (with IOWAKE).
- Bit 7 DATAFRZN - Set by the memory management routines (MAM) when a MAKEPRESENT request is successfully completed and indicates the data segment is frozen in memory.
- Bit 8 MAMERRORD - An error has occurred while MAM was trying to make the target data segment present and freeze it in memory.
- Bit 9 PREQ - (Not used)
- Bit 10 SFAIL - Delayed failure of SIO instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
- Bit 11 PFAIL - The request was aborted because of a system power failure.

QSTAT - PCB number and request completion status.

PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.

RSTATUS - General status indicating the final state of the request. The following codes are used:

- 0 - Not started or awaiting completion.
- 1 - Successful completion.
- 2 - End-of-file detected.
- 3 - Unusual, but recoverable, condition detected.
- 4 - Irrecoverable error has occurred.

QUALIFIER - A code which further defines or qualifies the general status.

General Status (13:3)	Qualifying Status (8:5)	Overall (8:8)
0 - Pending	1 - Waiting For Completion	%10
	3 - Not Ready Wait	%30
1 - Successful	0 - No Errors	%1

QFLAG - Request dependent flags

- Bit 0 ABORT - Abort this request and return an error indication to the caller.
- Bit 1 SPECIAL - Apply special handling to this request. (Not used)
- Bit 2 DIAG - This is a request from the diagnostic subsystem. (Not used)
- Bit 3 SYSBUFF - Target is an index relative to the SBUF Table of the data buffer.
- Bit 4 IOWAKE - Wake caller on completion of request.
- Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACHIO until the request is completed. Implies IOWAKE.
- Bit 6 COMPLETED - The request has been completed and the caller

- awakened if he had requested (with IOWAKE).
- Bit 7 DATAFRZN - Set by the memory management routines (MAM) when a MAKEPRESENT request is successfully completed and indicates the data segment is frozen in memory.
  - Bit 8 MAMERRORD - An error has occurred while MAM was trying to make the target data segment present and freeze it in memory.
  - Bit 9 PREQ - (Not used)
  - Bit 10 SFAIL - Delayed failure of SIO instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
  - Bit 11 PFAIL - The request was aborted because of a system power failure.

QMISC - Driver request dependent flags and counters for 2631.

- PRE'TO'POST - Pre to post spacing change flag.
- PEJECT - Last operation was a page eject.
- TOUTCNTR - Channel time-out retry counter.
- POWERFAIL - Power fail flag indicates power fail occurred.
- WAITCODE - Indicates type of wait:
  - 0 - new request
  - 1 - completion wait
  - 2 - not ready wait

Format for 2619A

0	1	2	3	4		12	15
-----						-----	
PP PE PF TO BF						WAITCODE	
-----						-----	

- TOUT - Channel timed out flag
- BUF'FILL - Buffer fill operation in progress

QSTAT - PCB number and request completion status.

- PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.
- STATUS - General status indicating the final state of the request. The following codes are used:
  - 0 - Not started or awaiting completion.
  - 1 - Successful completion.
  - 2 - End-of-file detected.
  - 3 - Unusual, but recoverable, condition detected.
  - 4 - Irrecoverable error has occurred.
- QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

2619 Line Printer Request Codes

Operation	Function	Parameters
WRITE	1	<p>P1 - Vertical Format Specification</p> <p>1 - Use 1st data char as format specification.</p> <p>%53 - "+", print and suppress spacing</p> <p>%55 - "-", print and triple space</p> <p>%60 - "0", print and double space</p> <p>%61 - "1", print and top of form</p> <p>%200-%277, print and space N-%200 lines</p> <p>%300-%312, print with channel N-%277</p> <p>%320 - Fill Line Printer Buffer Only</p> <p>All others, print and single space.</p> <p>P2 - Space Mode Flags</p> <p>(15:1) - Prespace flag</p> <p>if set, print then fill buffer</p> <p>if clear, fill buffer then print</p> <p>(14:1) - No page stepover flag</p> <p>if set, single and double space without stepover (66 lines/page)</p> <p>if clear, single and double space with stepover (60 lines/page)</p>
FILE OPEN	2	Page eject if not at top of form
FILE CLOSE	3	Page eject if not at top of form
DEVICE CLOSE	4	Page eject if not at top of form
READ STATUS	%17	Read I/O status Count - buffer size
*IDENTIFY	%110	Return ID value in Bank & Buffaddr
*SELF TEST:		
INITIATE	%111	Subtest number to execute in Bank and Buffaddr (subtest number ranges from 0 to 7)
STATUS	%112	Subtest result returned in Bank & Buffaddr
*LOOPBACK TEST:		
WRT DATA	%113	Data to LP in Bank & Buffaddr [PING]
READ DATA	%114	Data from LP read into Bank & Buffaddr [PONG] Count - Buffer Size (256 bytes max)

- BIT6 COMPLETED
- BIT7 DATA FREEZE
- BIT8 MAM ERROR
- BIT9 0
- BIT10 SFAIL
- BIT11 PFAIL

CARD READER IOQ (CONT.)

-----

QFLAG - Flags and request state.

ABORT            Abort this request and return an error indication to the caller.

SPECIAL         Special handling is to be applied to this request. Has no meaning for card reader requests.

DIAGNOSTIC     This is a request from a diagnostic subsystem. Not used by card reader driver.

SYSEBUFRS      Target is an index relative to the SBUF table of the data buffer.

IOWAKE         Wake caller on completion of request.

BLOCKED        Blocked I/O. The caller is waited in ATTACHIO until the request is completed. Implies wake.

COMPLETED     Request has been completed and caller woken if requested.

DATAFRZN       If set then the data segment has been frozen in memory. Set by MAM when a MAKEPRESENT request is successfully completed.

MAMERRD        An error has occurred in trying to make the target data segment present and freeze it in core.

SFAIL          SIO program failed to start because a) device didn't respond, or b) request has queued because device was busy.

PFAIL          This request has been aborted because of a power failure.

QLINK - SYSDB relative pointer to the next IOQ element. Points to the first word of the next element.

QLDEV - Logical device number.

QLDEVN         Logical device number.

QMISC - Auxiliary buffer flag. When odd. Data is being read into an auxiliary buffer because the requested count is less than 40 words.

QDSTN - Contains the data segment number of the target data area.

QADDR - Offset to the target data area in the data segment or bank.

CARD READER IOQ (CONT.)

-----  
QFUNC - Function code. See ATTACHIO description for details.

FUNC           Function code field.  
    0 - read  
    2 - file open           (no operation)  
    3 - file close         (no operation)  
    4 - device close       (clear EOF field in LPDT)

QWBCT - Word or byte count and control returns. On initiation specifies a word count if positive or a byte count if negative. At completion of the request this location contains the actual transmission count in the same units as the call specified. Odd counts are rounded up to produce reads of an even number of bytes. All counts are truncated to produce maximum reads of 40 words for ASCII or 80 words for column binary.

QPAR1 - End of file specification. See EOFCHECK write up for details.

QPAR2 - Binary/ASCII specification.

BINARY         If 0 then ASCII code conversion; 40 words maximum read.  
               If not 0 then column binary read; 80 words maximum read.

QSTAT - Request completion status and PCB number associated with this request.

PCBN           PCB number associated with request. If zero this IOQ element is returned by the system when the request is completed.

STATUS         General Status. See general IOQ entry for specifications.

QUALIFIER      Driver specific status. See general IOQ entry.

IOQ ELEMENT FOR HPIB CARD READER

QFLAG - Request dependent flags

- Bit 0 ABORT - Abort this request and return an error indication to the caller.
- Bit 1 SPECIAL - Apply special handling to this request. (Not used)
- Bit 2 DIAG - This is a request from the diagnostic subsystem.
- Bit 3 SYSBUFF - Target is an index relative to the SBUF Table of the data buffer.
- Bit 4 IOWAKE - Wake caller on completion of request.
- Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACHIO until the request is completed. Implies IOWAKE.
- Bit 6 COMPLETED - The request has been completed and the caller awakened if he had requested (with IOWAKE).

- Bit 7 DATAFRZN - Set by the memory management routines (MAM) when a MAKEPRESENT request is successfully completed and indicates the data segment is frozen in memory.
- Bit 8 MAMERRORD - An error has occurred while MAM was trying to make the target data segment present and freeze it in memory.
- Bit 9 PREQ - (Not used)
- Bit 10 SFAIL - Delayed failure of SIO instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
- Bit 11 PFAIL - The request was aborted because of a system power failure.

QMISC - Auxillary buffer flag used to indicated a read into the driver's buffer and not the user's buffer.

QSTAT - PCB number and request completion status.

- PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.
- STATUS - General status indicating the final state of the request. The following codes are used:
  - 0 - Not started or awaiting completion.
  - 1 - Successful completion.
  - 2 - End-of-file detected.
  - 3 - Unusual, but recoverable, condition detected.
  - 4 - Irrecoverable error has occurred.
- QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

## QFLAG - Request dependent flags

- Bit 0 ABORT - Request has been aborted externally.
- Bit 1 MMREQ - Request is for a segment transfer.
- Bit 2 DIAG - This is a request from the diagnostic subsystem.
- Bit 3 SBUF - Target is an index relative to the SBUF Table of the data buffer.
  
- Bit 4 IOWAKE - Wake caller on completion of request.
- Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACHIO until the request is completed. Implies IOWAKE.
  
- Bit 6 COMPLETED - The request has been completed and the caller awakened if he had requested (with IOWAKE).
  
- Bit 7 DATAFRZN - Data segment has been present and is frozen.
- Bit 8 MAMERRORD - An error has occurred while MAM was trying to make the target data segment present and freeze it in memory.
  
- Bit 9 PREQUEUED - Request is queued into disc's request queue
- Bit 10 SFAIL - Delayed failure of SIO instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
  
- Bit 11 PFAIL - The request was aborted because of a system power failure.
  
- Bit 12 CURREQ - Request is device's current request.
- Bit 13 DISABLED - Request is disabled.
- Bit 14 DISATMPT - Attempt to disable this request.
- Bit 15 MSGDONE - A message request reply has completed.

## QLDEV.QLDEVN - Logical Device Number

## QMISC - Driver request dependent flags and counters.

- CHAN'ERR'FLG - Channel error retry flag.
- RSTAT'FAIL'FLG - Request status failed flag.
- OPER'REQ'FLG - Operator requested release flag.
- IM'FAULT'FLG - Internal maintenance fault flag.
- STAT'RTRY'FLG - Status error single retry flag.
- RTRANS'FLG - Retransmit required flag.
- LOAD'FLG - Media load flag.
- SYS'PFAIL'FLG - System powerfail flag.

## WAITCODE - Indicates type of wait:

- 0 - new request
- 1 - completion wait
- 2 - not ready wait
- 3 - release/release deny wait
- 4 - IOQ defer wait
- 5 - DSCT read wait
- 6 - DSCT write wait
- 7 - synchronization wait

- QDSTN - If system buffer is clear then this is the DST number of the target data segment. If bit 0 is set then buffer address is a DB offset value instead of segment relative offset (implemented for NOWAIT I/O and NOBUFF).
- QADDR - Offset in data segment or system buffer table to target data buffer.
- QFUNC - Function code and qualifiers as specified by driver.
- QSTAT - PCB number and request completion status.
- PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.
- STATUS - General status indicating the final state of the request.
- 0 - Not started or awaiting completion.
  - 1 - Successful completion.
  - 2 - End-of-file detected.
  - 3 - Unusual, but recoverable, condition detected.
  - 4 - Irrecoverable error has occurred.
- QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

## QFLAG - Request dependent flags

- Bit 0 ABORT - Request has been aborted externally.
- Bit 1 MMREQ - Request is for a segment transfer.
- Bit 2 DIAG - This is a request from the diagnostic subsystem.
- Bit 3 SBUF - Target is an index relative to the SBUF Table of the data buffer.
- Bit 4 IOWAKE - Wake caller on completion of request.
- Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACHIO until the request is completed. Implies IOWAKE.
- Bit 6 COMPLETED - The request has been completed and the caller awakened if he had requested (with IOWAKE).
- Bit 7 DATAFRZN - Data segment has been present and is frozen.
- Bit 8 MAMERRORD - An error has occurred while MAM was trying to make the target data segment present and freeze it in memory.
- Bit 9 PREQUEUED - Request is queued into disc's request queue
- Bit 10 SFAIL - Delayed failure of SIO instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
- Bit 11 PFAIL - The request was aborted because of a system power failure.
- Bit 12 CURREQ - Request is device's current request.
- Bit 13 DISABLED - Request is disabled.
- Bit 14 DISATMPT - Attempt to disable this request.
- Bit 15 MSGDONE - A message request reply has completed.

## QLDEV.QLDEVN - Logical Device Number

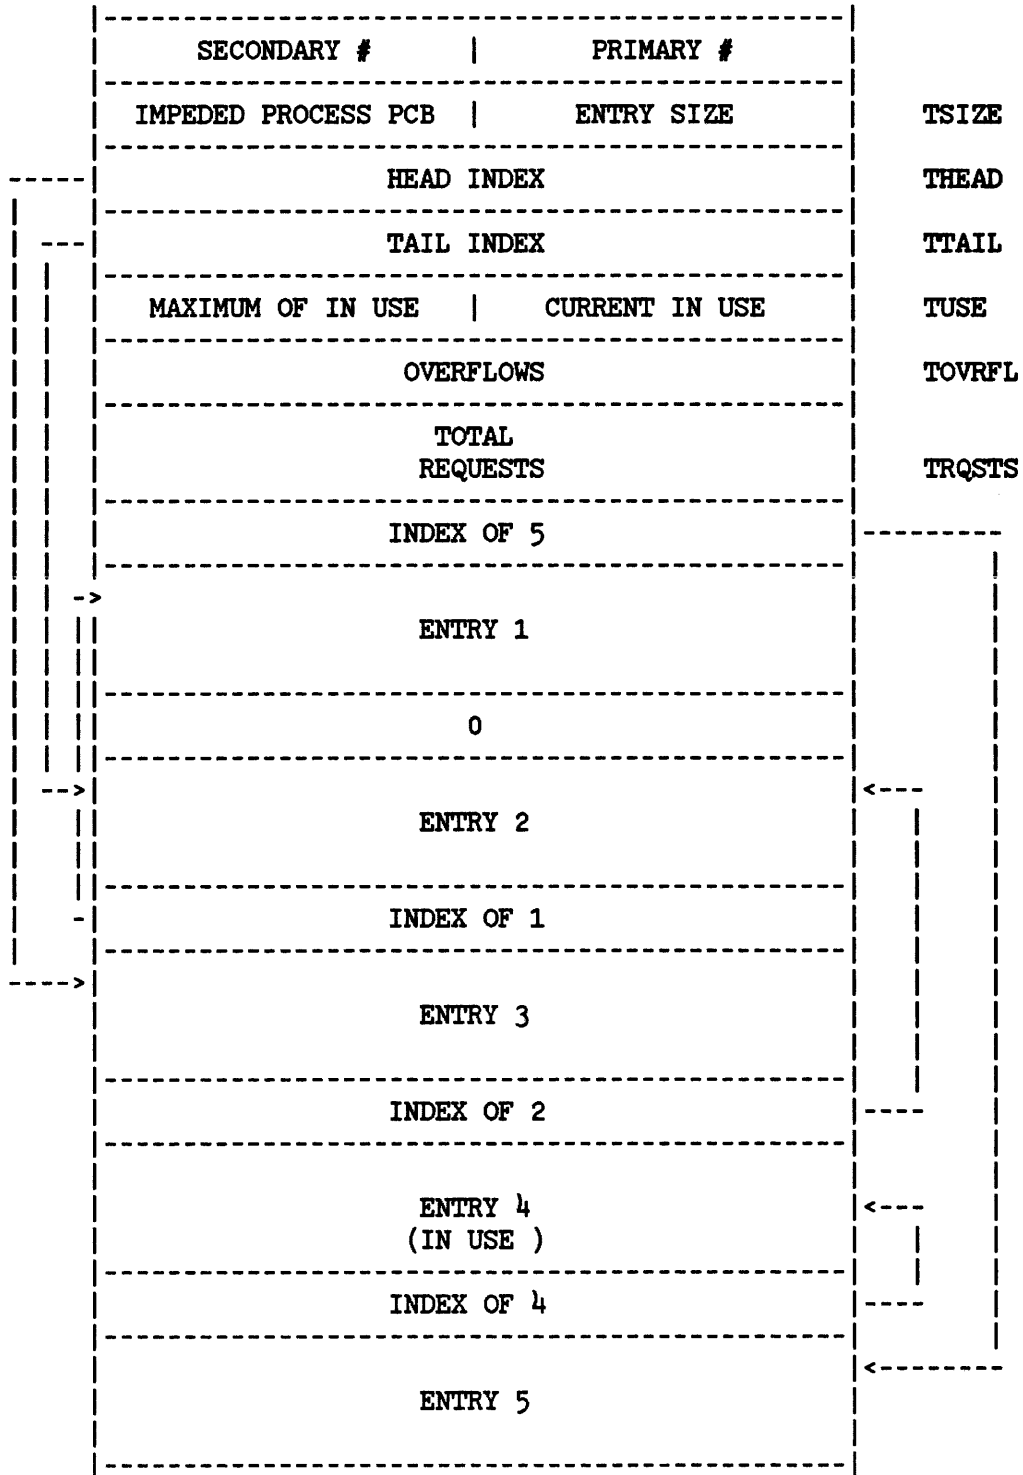

## QMISC - Driver request dependent flags and counters.

- CHAN'ERR'FLG - Channel error retry flag.
- RSTAT'FAIL'FLG - Request status failed flag.
- OPER'REQ'FLG - Operator requested release flag.
- IM'FAULT'FLG - Internal maintenance fault flag.
- RETRY'COUNT - Retry count area.
- LOAD'FLG - Media load flag.
- SYS'PFAIL'FLG - System powerfail flag.

- WAITCODE - Indicates type of wait:
- 0 - new request
  - 1 - completion wait
  - 2 - not ready wait
  - 3 - release/release deny wait
  - 4 - IOQ defer wait
  - 5 - DSCT read wait
  - 6 - DSCT write wait
  - 7 - synchronization wait

- QDSTN** - If system buffer is clear then this is the DST number of the target data segment. If bit 0 is set then buffer address is a DB offset value instead of segment relative offset (implemented for NOWAIT I/O and NOBUFF).
- QADDR** - Offset in data segment or system buffer table to target data buffer.
- QFUNC** - Function code and qualifiers as specified by driver.
- QSTAT** - PCB number and request completion status.
- PCBN** - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.
- STATUS** - General status indicating the final state of the request.
- 0 - Not started or awaiting completion.
  - 1 - Successful completion.
  - 2 - End-of-file detected.
  - 3 - Unusual, but recoverable, condition detected.
  - 4 - Irrecoverable error has occurred.
- QUALIFIER** - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

SBUF AND TBUF TABLE LAYOUT

3 - 1 - 5 - 4 - 2

## TABLE ELEMENT ALLOCATION (TBUF AND SBUF)

-----

The allocation of the elements in the IOQ terminal buffer (TBUF) and system buffer (SBUF) tables is of concern to the I/O system.

### FREE LIST OF TABLE ELEMENTS

These tables are in the form of a free-linked list of the free elements. For the SBUF's the -1 word of entry is the link to the next element. For the TBUF's, word zero is the link and word 1 is the link for the IOQ elements.

Each word has an 8-word header beginning at the base of the table. The first four words of the header are for managing the table and the second four are for monitoring table activity.

The entries follow the header at word eight.

### ELEMENT ALLOCATION

Elements are obtained from the beginning of the free list, pointed to by the head and returned to the end of the free list pointed by the tail.

When the free list is empty, the head index is zero and the tail index is set to point at the head index.

The tables are divided into two areas: a primary and a secondary area. Most requests are obtained from the primary area. The secondary area is used only for critical requirements when the primary area is exhausted. These areas are logical areas determined by parameters in the header.

The utility of the core resident tables is seriously reduced if their use is not restricted to dynamic situations.

One of three responses must be specified to the routines which allocate elements from the I/O system tables.

1. Impede caller if primary is empty.
2. Get from primary area only.
3. Get from secondary area if primary area is empty.

TABLE ELEMENT ALLOCATION (CONT.)

Request types 2 and 3 return an indication to the caller if the request could not be satisfied. The following table specifies the types of calls for element allocation and the action if an element is not activated.

BUFFER USER	CALL TYPE	FINAL ACTION
<b>SBUF's</b>		
File system	Impede	---
Ptape	Impede	---
Bad track	Primary	Forget request
<b>TBUF's</b>		
Terminal write (impedable)	Impede	---
Terminal write (not impedable)	Primary	I/O error
Terminal read on ICS	Secondary	I/O error
Log error	Primary	Forget request
<b>IOQ's</b>		
ATTACHIO (not impedable)	Primary	Return IOQX-0
ATTACHIO (impedable)	Impede	---
SIODM (memory management)	Secondary	Sudden death
IOMESSAGE	Secondary	I/O error

HEADER DEFINITION

Primary #	- Number of elements in the primary area.
Total #	- Total number of elements in the table.
Size	- Size in words of each element.
Impeded PCB	- If not zero then contains the PCB number of the first process waiting for an element in this table.
Head index	- Index of first free element.
Tail index	- Index of last free element.
In use	- Current number not in free list.
Overflows	- Number of requests made for an element.
Total requests	- Total number of elements requested.

ICS GLOBAL CELLS, with initial values  
-----

STDB - absolute address of the currently running process's stack.  
SBANK - bank address for process' stack.  
S - stack DB relative S  
DL - stack DB relative DL  
Z - stack DB relative Z  
PCBX - absolute stack address  
XP - PCB table relative pointer to word 0 of the running process'  
PCB.

The above cells are to be initialized for the PROGENITOR.

CPCB - absolute 4, is an absolute version of XP. If CPCB is zero,  
then the above cells are invalid. This will never be the  
case in a process. CPCB should also be set by INITIAL.  
SDST - DST# for running process' stack.  
JCUT - the bank zero absolute address of the JCUT table.  
PADDR - PB relative address for the procedure PSEUDOINT.  
PSTA - status value for PSEUDOINT, %140000+CST#.  
DISAP - PSDB counter, initially 0.

INITIAL sets the above as described.

CS 80 DISC Interrupt Linkage Table (ILT)

-----

There is one ILT for each device controller configured on the system.  
 A controller may support more than one unit, however the CS'80 disc driver will only concern itself with the single unit controller.

## ICPVA0 - Channel Program Variable Area

The first word is used by the channel program processor to store status information after I/O channel aborts. The next word is used by the driver to indicate if status should be examined for special conditions or errors. The other two words are not used.

## ICPVA4 - DMA abort address

If a DMA abort occurs, the absolute address where the abort occurred is stored in this area.

## ICNTRL - Contains controller information

LIM - If this bit is set, the controller is sharing a software channel resource in order to limit bandwidth.  
CHANQUE - The software channel resource number.  
CHAN - Channel number (four most significant bits of DRTN).  
DEV - Device number (three least significant bits of DRTN).

## IQUEUE -

SIOPSIZE - (number of words + 1)/2 in the channel program area.  
CQUEN - For a multi-unit controller this field contains the software controller resource number.

## IFLAG - Controller and Channel Program state flags

RUNWAIT - An Idle Channel Program should be started when there are no active requests to process.  
WAITPROG - An Idle Channel Program has been started for this controller. This bit is reset by an interrupt.  
IGNOREHI - An HIOP instruction has been issued against this controller but the channel program was not in a wait statement. Therefore ignore the interrupt generated by the channel code when this program halts.  
HCUNIT - Highest configured unit number for this controller.

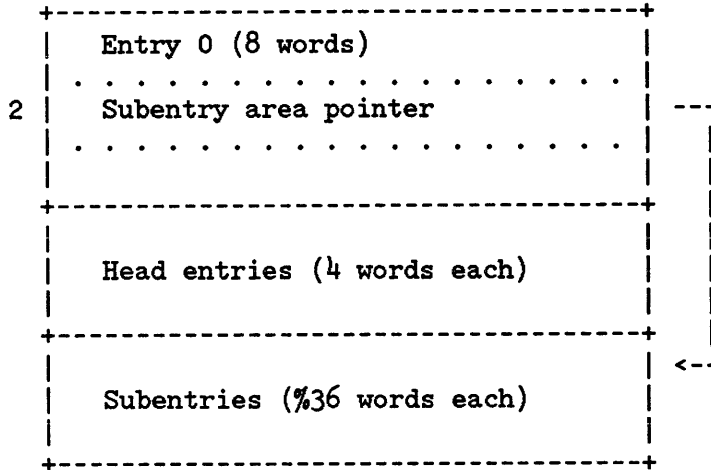

ISTAT - 20 bytes of status from the idle channel program.

INPUT DEVICE DIRECTORY/OUTPUT DEVICE DIRECTORY

IDD/ODD (Common attributes referred to as XDD)

IDD: DST = 45 (= %55)                    ODD: DST = 46 (= %56)  
       SIR = 3                                SIR = 4

Overview of table structure

Entry 0 (overall table definitions)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Maximum size								Current size							0 (sectors)
Head entry size = 4								Subentry size = %36							1 ( words )
Subentry area pointer (segment relative)															2
3 DD	Next avail device file ID (DFID)													3	
////////////////////////////////////															4
////////////////////////////////////															5
////////////////////////////////////															6
////////////////////////////////////															7

DD:     0 ==> This is the IDD,  
       1 ==> This is the ODD.

Fence: For spooled output devices (ODD), the system-wide out-  
       fence. For spooled input devices (IDD), the jobfence.

Typical head entry (4 words)

There are two types of head entry, a class entry and a logical device entry. There is only one class entry, if it exists at all, and it is the first head entry in the XDD. All spoolfiles opened by class (e.g., LP, SLOWLP, EPOC, PP, etc.) are linked to this entry. There is one logical device entry for each real (physical, as opposed to virtual) device on the system. Output devices appear in the ODD, input devices in the IDD. AC/DC devices such as terminals appear in both directories.

Each head entry is linked to 0 or more subentries (a typical subentry is shown in the next table). A null chain (0 subentries) consists of head pointer = 0 and tail pointer = segment-relative address of the associated head pointer. If one or more subentries exists, the pointers are segment-relative addresses of the first word of the first and last subentries of the chain. Any intermediate subentries are linked through the subentries. The tail subentry always contains a 0-link.

The Device Outfence and LDEV# fields are meaningless for the class entry. For logical device entries (non-0 Logical Device field), a non-0 Device Outfence means that this outfence overrides the system-wide outfence in word 4 of entry 0, but only for this device.

Typical subentry (%36 words)

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	TL	State	Outpri									Device

31	Segment-relative link to next subentry,															
32	Number of records in spoofer (doubleword)															
33																
34	Time (CLOCK intrinsic format) at which															
35	spoofer was made READY, or OD if not closed															
	properly (say, because of a system failure)															

NOT ~~CL~~ ( )  
MPE ~~V~~ V

MPE V : 3:13  
slightly diff in MPE

Word 0: TL -- A bit reserved for tape labels.  
 State -- State of subentry:  
           0 ==> Active  
           1 ==> Ready  
           2 ==> Open  
           3 ==> Locked

CL -- 1 ==> DEVICE field is a class index into  
       the Device Class Table.  
       0 ==> DEVICE field is an LDEV number.

Word 1: Type -- Describes which environment created the  
 subentry:  
           0 ==> Session' (SPOOK)  
           1 ==> Session  
           2 ==> Job  
           3 ==> Job' (SPOOK)

Word %22: IO -- 1 ==> Output DFID  
               0 ==> Input DFID

Word %23: FS -- There are one or more forms message re-  
 quests in the spoolfile.  
 DA -- The spoolfile was created via a :DATA record  
 (input spooling only).

Word %24: LDEV -- The logical device in class SPOOL where  
 the file label (first extent) of the spool-  
 file lives.

Word %26: LDEV -- LPDT index of virtual device LDEV. Simulates the  
 properties of a real LDEV to the process which  
 FOPENs a new (previously non-existing) spool  
 file (State field (XDD(0).(1:2)) = 2 (Open)).

Word %30: SQ -- 1 ==> Squeeze (purge) spoolfile extents as  
 the final copy is printed.  
               0 ==> Purge only when final copy printed.

RS -- 1 ==> Restart job when warmstarting (input  
 spooling only).

FD -- 1 ==> There are non-standard forms on the  
 device.

SO -- Spaced Out bit. File System could not ac-  
 quire a new extent when creating spoolfile.

AB -- This is the \$STDLIST of an aborted job.

Head index: The (segment-relative address)/4 of the head en-  
 try with which this subentry is linked. Since  
 head entries are four words long, this can be  
 thought of as an index into the head entry por-  
 tion of the XDD -- if you disallow values of 0  
 and 1. Cute, huh?

## SPOOK Output Tape Format

The overall format of output tapes produced by the SPOOK "OUTPUT" command is shown below. The various components of the tape are then described in detail. The format described here is subject to change as MPE evolves. Also, there may be errors in SPOOK which would cause the actual tape format to differ from the one described here in some cases. All numeric information is in integer format unless otherwise specified.

EOF

EOF

Label Record

EOF

File Directory Records

Device and Class Directory Record

EOF

Spoolfile

EOF

Spoolfile

EOF

.....

Mechanisms for End-of-tape and tape switching are the same as for STORE/RESTORE tapes.

### Label Record

Words 0-13: "SPOOLFILETAPE LABEL-HP3000."

Word 23: reel number (first reel is number 1)

Word 24: date (from CALENDAR intrinsic)

Words 25&26: time (from CLOCK intrinsic)

30+31 "MPE V" if from MPE V

All other words are zero.

### File Directory

The File Directory has one entry for each spoolfile on the tape. Each entry is 12 words, and entries are packed into as many 1020-word records as needed. The last record will be padded with zeros if necessary. The entry format is:

Word 0: Device file id number (bit 0 is on to indicate that the file is an output spoolfile)

Words 1-3: zero

Words 4-7: User name

Words 8-11: Account Name

### Device and Class Directory

The Device and Class Directory is contained in one 1024-word record. There is no EOF separating this record from the File Directory. This directory contains one entry for each logical device or device class linked to the spoolfiles on the tape. Also, there is an entry for each logical device in each class in the directory, whether or not that logical device was directly referenced by a spoolfile. The entries are packed into the tape record one after another in no particular order. The entry formats are shown below.

#### Logical Device Entry

Word 0: logical device number

Word 1: Bits 0:8 : device subtype  
Bits 8:8 : 3 (=length of this entry in words)

Word 2: device type

### Device Class Entry

- Word 0: Device class number (negated). This is the number of the entry of this device class in the system's Device Class Table.
- Word 1: Total number of words in this entry.
- Words 2 on: The entire contents of the Device Class Table entry for this device class.

There is one known bug in the Device and Class Directory. The last logical device in each class will be skipped when generating device entries for the members of the class. Unless that logical device is entered into the directory for some other reason, it will not be present.

apparentl.  
Fixed  
in  
MPE V

### Spoolfile Format

← 32 in MPE V  
ODD entry (30-word tape record)

Spoolfile block ---> Two spoolfile blocks packed into one  
Spoolfile block 1024-word tape record.

Two spoolfile blocks

Two spoolfile blocks

.....

The first few spoolfile blocks have been modified to contain user label information from the spoolfile. This is explained later.

### Spoolfile Block Format

A spoolfile block is a 512-word block that contains variable length records in spooler format. The 2680 is intimately familiar with this structure. Any effort to change this format should be cleared with the 2680 project in Boise first! Spoolfile records start at the first word of the block. The last record is followed by a -1 to indicate that no more records follow. The last two words of the block contain a doubleword which is the record number of the first record in the block.

## Spoolfile Record Format

Word 0: Byte count of record - 2

Word 1: Byte count of data portion of record. Note that this count includes trailing blanks. However, trailing blanks are truncated in the actual record, so this count may be more than the number of bytes actually present in the data portion.

Word 2: Function Code: 1=Fwrite  
2=Fcontrol  
3=Fopen  
4=Fclose  
%200 and beyond=Fdevicecontrol

Word 3: P1 -- ATTACHIO parameter

Word 4: P2 -- ATTACHIO parameter

Words 5 on: Data Portion of Record

## User Labels Information

In the C-Mit and newer MPE versions, spoolfiles have a number of user labels with several kinds of information. These are:

1. Master: user label 0.
2. FOPEN entry catalog: user labels 1-10.
3. Circular queue for restart checkpointing: user labels 11-27.

Since older versions of MPE did not use user labels, a way was needed to incorporate them into the SPOOK tape format without losing forward and backward compatibility. The method used is to add several special spoolfile blocks to the beginning of the spoolfile on tape. Each of these blocks has exactly one FOPEN record at its beginning. This record is followed by a -1. Thus old versions of MPE will assume that the rest of the block is garbage. However, the rest of the block is actually used to contain user label information. The first two spoolfile blocks (i.e. the first tape record of the spoolfile proper) contain only the FOPEN records. The next 5 tape records actually contain user labels in addition to the FOPEN records. The user labels are packed 3 to a spoolfile block, 6 to a tape record. Each spoolfile block of 512 words has the following format:

Words	0-4:	FOPEN record
Word	5:	-1 (to "terminate" the block)
Words	%200-%377:	user label
Words	%400-%577:	user label
Words	%600-%777:	user label

Following this special group of blocks, the spoolfile resumes a normal format. The special FOPEN records all have the number of user labels in P2.

It is often the case that some of the 27 user labels have not been initialized before the tape is written. In that case, their places will be filled with garbage. There is no easy way of detecting this except by careful inspection.

Since user labels are written 6 to a tape record and there are 28 user labels, the last %400 words of the final user label tape record are always uninitialized.

MAX # OF QUEUED ENTRIES = 52

The message system consists of the following parts:

- Callable intrinsic GENMESSAGE.
- Uncallable procedure GENMSG which is used by MPE.
- System message catalog (CATALOG.PUB.SYS) and any number of user catalogs.
- Program MAKECAT which builds message catalogs.
- MESSAGE SIR %24
- MESSAGE SYSGLOB CELLS %371-373
- MESSAGE DATA SEGMENT

The message system is used by calling GENMESSAGE (or GENMSG) with a message number. The message system fetches the message from a message catalog, inserts parameters, then routes the message to a file or returns the message in a buffer to the caller.

A message catalog is a numbered editor-type file containing sets of messages. The sets serve to break a catalog into manageable portions. A message system user may call GENMESSAGE using either his own message catalog or using MPE's catalog (CATALOG.PUB.SYS).

After creating a message file, run the program MAKECAT in order to build a catalog that is readable by the message system. This file is still readable by the editor (it can be "texted") but it contains a directory (written as a userlabel).

In order to use the message catalog, the program must first open the message catalog, then call GENMESSAGE with the file number, set number and message number. (MPE users don't need to open the catalog, GENMSG automatically uses CATALOG.PUB.SYS.) The file must be opened with the aoptions "NOBUF" and "MULTI" -record access.

#### MESSAGE CATALOG

Messages in the catalog can be of any length and can contain up to five parameters. Continuation of a message is indicated by "%" or "&" at the end of a line. The "%" symbol indicates that the message is continued and that a carriage return, line feed be issued the terminal. The "&" symbol indicates that the message is continued on the same line with no carriage return, line feed.

Parameters may be inserted into the message fetched from the catalog. The parameters are passed in the GENMESSAGE (or GENMSG) call and inserted wherever a "!" is found. Message sets are indicated by "\$SET n" starting in column 1 (the rest of the line is treated as a comment). Maximum value for n is 63. Comments can be inserted in the catalog by placing "\$" in column 1. Message numbers are positive integers, need not be contiguous, but must be in ascending order. After processing by the program MAKECAT, the catalog file contains records of 80 bytes, blocked 16, in 32 extents. (The system message catalog is only one extent, however). The format of the message catalog is as follows:

MESSAGE SYSTEM (CONT.)

-----  
\$SET 1 SYSTEM MESSAGES

204 FILE COMMAND REQUIRES AT LEAST TWO PARAMETERS, INCLUDING  
THE

FORMAL NAME OF THE FILE (CIERR 204)

.

.

MAKECAT PROGRAM

-----  
The program MAKECAT.PUB.SYS is used to build message catalogs  
(and also HELP catalogs). The program's input file has the  
formal designator INPUT, which must be used for all entry points.  
The program has the following entry points:

(no entry - Reads from input file and builds a temporary file  
point) (formal designator CATALOG). Also renames any old  
temporary CATALOG, CATnn, using an archival  
numbering scheme (i.e., CAT1, CAT2, etc.).

BUILD - (Must log on under MANAGER.SYS.) Reads from input  
file, build the system message catalog (formal-  
designator CATALOG), and installs the message  
system. Existing catalog is renamed CATnnnn  
according to the same scheme as for no entry  
point (above). Installation of the message  
system means moving the directory contained in  
the userlabel of the catalog into a data segment.  
The DST number and the disc address of CATALOG  
are placed in system global area. The message  
system may be installed while the system is  
running.

MESSAGE SYSTEM (CONT.)

- 
- DIR - (Must have PM or OP capability.) Installs the system message catalog (does not build a new one). Opens input file, moves the directory in the CATALOG into a data segment, and places the DST number and disc address of CATALOG in system global area. This may be done when the message system seems to be "broken", but the catalog is intact. (MPE is issuing "MISSING MSG. SET=mm. MSG=nn" at terminals and at the console.) This may be done while the system is running.
  
  - HELP - Used to build the HELP catalog. Reads input file and builds a HELP catalog (formaldesignator HELPCAT).

-----

## Field Definitions

BCOMIMAGE: Byte pointer to COMIMAGE (sometimes called WCOMIMAGE) in the CI stack.

COMMAND IMAGE: Command character string currently being executed.

LINELENSTACK: A CI command can span up to 30 input lines. This stack holds the length of each input line.

NEXTMSG: Used to be used to link messages together. No longer being used.

THIS IS SPARE: Not used.

UDC0: Holds the DST number of the UDC definitions.

UDC1: Holds the old S register value for UDCs.

UDC2: (0:1)--FLUSHUDC, used by :SETCATALOG

UDC3: UDC options for current UDC.

UDC4: (0:1)--UDC Fatal Ci Error  
(1:1)--UDC EXITBREAK  
(2:1)--UDC BREAKDETECTED  
(3:1)--UDC NOPRINT  
(4:1)--UDC IMAGEADJUST  
(10:6)--UDC NESTLEVEL

IFNESTING: Level of nesting of :IF commands.

IFSKIP: Whether the current commands are being skipped as the false part of a :IF command.

ELSESEEN: Level of the :ELSE commands.

CIFLAGS: (13:1)--Sequenced: line numbers at rear.  
(15:1)--Not REDOable (last command).

CONTINUE STATE STACK: History of the :CONTINUE commands.  
= 0--no :CONTINUE  
= 1--just seen  
= 2--in effect.

PENDINGCOMLEN: If <> 0, command is already in stack and this word is the command string length.

BLASTCOMIMAGE: Byte pointer to last command image.

LAST COMMAND IMAGE: When a command completes execution, the command string is copied here for use by the :REDO command.

LABELED TAPE SUBSYSTEM

The MPE labeled tape subsystem permits convenient access to tapes labeled to either ANSI or IBM standards. It operates as a set of subprocedures to the file system.

A labeled tape consists of one or more logical files. Each logical file consists of three physical files, i. e. tape areas delimited by tapemarks. The first physical file contains header labels, the second contains the data, and the third contains trailer labels which are (except for minor differences) copies of the header labels. The tape mark following trailer labels will be followed either by header labels for the next file, or by another tapemark if there is no next file.

Format of MPE Tape Labels

Labels are 80 bytes long, and conventionally are identified by their first four characters (three letters and a digit) and contain information as follows (CP := character position; L:= length):

VOL1: Present only on the first file of a volume, the volume label contains the volume identifier, which is usually the number on the tape strap, and is thus not expected to be changed.

CP	Field Name	L	Content
1/3	Label identifier	3	"VOL"
4	Label Number	1	"1"
5/10	Volume Identifier	6	Vol ID
11	Accessibility	1	"0" if IBM, else " "
12/79	Not used	62	Blanks
80	Label-Standard Version	1	"1" if H-P ANSI else " "

UVLn: User volume labels. May be present on tapes from foreign shops, but are not written by MPE. If encountered, they are ignored.

HDR1: First header label. Required for each file. Specifies:

CP	Field Name	L	Content
1/3	Label identifier	3	"HDR"
4	Label Number	1	"1"
5/21	File Identifier	17	File name, if tape was not written by MPE, only the first eight are significant.
22/27	Volume Set Identifier	6	Names the volume on which the set of files begins
28/31	Reel Number	4	Counts the reels that contain this file (1 starts)
32/35	File sequence number	4	Counts the files in the set of files (1 starts)
36/41	Not Used	6	MPE writes blanks
42/47	Creation Date	6	Year and day within year when the file was written.
48/53	Expiration Date	6	Year and day within year when the file may be overwritten without permission.
54	Accessibility	1	%230 if Lockword, "0" if IBM
55/60	Block count	6	Number of blocks if IBM.
61/73	System Code	13	"HP MPE 3000 "
74/80	Not Used	7	Blanks

HDR2: Second header label. Although defined by the standard, may be missing on foreign tapes. Contains:

CP	Field Name	L	Content
1/3	Label identifier	3	"HDR"
4	Label Number	1	"2"
5	Record Format	1	"F" = Fixed "V" = Variable "U" = Undefined Others treated as Undefined
6/10	Block Length	5	Block length (in character format).
11/15	Record Length	5	Record length (adhering to MPE rules) in characters.
16/23	Lockword	8	MPE File Lockword.
24/36	Not Used	13	MPE writes blanks
37	Record Type	1	"A" = ASCII "B" = Binary.
38	Carriage Control	1	"C" = control " " = no control.
39/80	Not Used	42	Blanks

IBM: IBM has a slightly different format. It is:

CP	Field Name	L	Content
1/3	Label identifier	3	"HDR"
4	Label Number	1	"2"
5	Record Format	1	"F" = Fixed "V" = Variable "U" = Undefined Others treated as Undefined
6/10	Block Length	5	Block length (in character format).
11/15	Record Length	5	Record length (adhering to MPE rules) in characters.
16	Not Used	1	Blank.
17	IBM Position	1	"0" = no volume switch "1" = a switch has occurred.
18/38	Not Used	11	Blanks.
39	IBM Block Attribute.	1	"B" = Blocked records. "S" = Spanned records. "R" = Blocked and Spanned. " " = No blocked or spanned.
40/80	Not Used	41	Blanks

User header labels: optional. Standard prescribes UHLn in the first four characters, but MPE doesn't care.

EOV1: End of Volume; used as first trailer label. Required if the logical file is continued onto another reel. Identical to HDR1, except contains the number of physical blocks of data in the data area.

CP	Field Name	L	Content
1/3	Label identifier	3	"EOV"
4	Label Number	1	"1"
5/54	Same as HDR1	50	
55/60	Block Count	6	Number of data blocks since last beginning of file section label group.
61/80	Same as HDR1	20	

EOV2: Defined by the standard, but may be missing on foreign tapes. Follows EOV1; format same as HDR2.

EOF1: End of File; used as first trailer label. Required if this is the end of the logical file. Format same as EOV1.

EOF2: Same as EOV2 except used after EOF1.

User trailer labels: optional. Standard prescribes UTLn in the first four characters, but MPE again doesn't care.

TAPE LABEL TABLE

The tape label table is the private playground of the tape label subsystem. It consists of two parts: LDEV Control Blocks (LCBs) and Volume Control Blocks (VCBs). The LDEV area is set up at system initialization and contains one entry for each magnetic tape LDEV and serial disc device in the system. As is common in MPE, the first entry is a dummy which tells where the other things in the table are. The volume area contains one entry for each labeled tape volume requested or active on the system.

Although table entries are stored in an extra data segment, they are generally manipulated via local copies on the stack. The procedures GETLDEV and GETFNUM look for LDEV and volume entries as specified; they copy them to stack buffers and return the DST address for use in copying them back. POSTVTENT copies the entries back, and in the case of a new volume entry, allocates space for it in the volume section of the tape label table.

Tape Label Table Header Entry

During PROGEN, SETUP'TAPES is called to initialize the table. The overall structure of the initialized TLT is:

TLTDST -- %32,#26																TLTSIR -- %47,#39															
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Table initialization word (=1 when initialized)																0															
Entry size (ESIZE) = %32,#26																1															
Table relative pointer to base of LCB entries (LTBASE) (1)																2															
Table relative pointer to base of VCB entries (VTBASE) (2)																3															
Table relative pointer to top of Volume table (VITOP) (3)																4															
Size of Tape Label Table, in words (VIMAX)																5															
not used																6															
																7															
																10															
																30															
not used																31															

Uninitialized Table (INITIAL)

INITIAL will build the "uninitialized" TLT as follows:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Size of the table, in words (always > 1)															0
Number of LDEVS in the table = X															1
LDEV#                                 T															2
Total of LDEVS (X) entries of above															
LDEV#                                 T															X+2
Expansion area during SETUP'TAPES															

T: 1 if Tape drive  
0 if not Tape drive (ie. serial disc)

LCB Entry Format

The LCB entries have the following structure:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
Type   T   L   B   HP																0
Logical device number																1
VCB address																2
Reel number																3
File sequence number																4
Creation date																5
Expiration date																6
File name																7
																10
																16
																17
(not used)																20
																21
																22
																23
Volume set identifier																24
																25
																26
																27
Volume identifier																30
																31

Type: 00 = no tape mounted

01 = unlabelled

10 = ANSI

11 = IBM

L: 1 if file has lockword.

T: 1 if device is a tape drive.

B: 1 if tape is from Burroughs, which has incorrect block/record size  
in the HDR2 label. Code can be patched to correct the size.

HP: 1 if tape is Hewlett-Packard ANSI format.

VCB address: Pointer to VCB entry describing volume mounted on  
tape drive, only if linked. Otherwise, 0.

VCB Entry Format

The VCB format is:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

BREAK POINT TABLE

DST = 30(10) = %36

The break point table is divided into 2 sections:

- 1) PCB BREAKPOINT EXTENSION TABLE (PCB'BKPT'EXT)  
This table contains the heads of the breakpoint chains
- 2) BREAKPOINT ENTRY TABLE (BKPT'ENTRY'TAB)  
This table contains the actual entries

General Layout

PCB BREAKPOINT EXTENSION TABLE

TIMER REQUEST LIST (TRL)

The system clock interrupts every 100 ms, with the CR being automatically cleared. An exception is the Shared Clock Interface measurement service which allows rates as fast as 5 ms. The interrupt handler is the procedure TICK. On entry, DB is pointing to the base of timer request list. Besides timeout requests, the clock also controls time slicing.

	/ 0	FREE LIST PTR	
ENT0	1	NR ENTRIES   ENTRY SIZE(4)

%5/%6	*DTIME	For Series 30/33, DTIME is # of TICS (0.091457 ms) since last midnight.

MPE USER LOGGING enables users and subsystems to log changes to data sets on disc or serial files. This "change" file can later be used to recover data lost due to a system or program failure. The log file can itself be used for auditing purposes.

I. GENERAL DESIGN OVERVIEW

A. Hardware Environment

No special hardware is required to operate the system. However, if logging to a tape file is desired, the hardware configuration must include a tape drive.

If there is no tape drive, then may log to a serial disc class device.

B. Software Environment

MPE USER LOGGING is an integral part of MPE. No other special software is required.

C. Design Narrative

User Logging enables users and subsystems to journalize additions and modifications to MPE and subsystem files. The journal can reside on either disc or serial logfiles.

User Logging consists of a logging process, a memory buffer, a disc resident logging buffer (for serial logging) and a user defined destination log file on disc or serial media.

The logging process has two functions depending on whether the destination file resides on disc or serial media. If the destination file is serial, the logging process performs all output to the destination file. If the destination file is on disc, the logging process allocates additional space (extents) as it is required by the user.

The logging buffer is divided into communication and buffer areas. The communication area is used to pass information among the users and the logging process. This information includes status of the logging process and logging file, space remaining in the logging file and error information important to users or the logging process. The buffer portion of the logging data segment blocks inputs into the logging file before the data is actually posted. The buffer is flushed any time a user requests to close a log file or when a logging process

is terminated. (The buffer is also flushed by the begin/end transaction or buffer flush requests).

#### D. Error Recovery Description

The error recovery mechanisms provided by User Logging are: power fail recovery and recovery from system failure.

Power failure recovery applies only to tape log files since MPE provides adequate recovery for disc files during power fail. When a power failure is detected, a message will be printed on the console asking the operator to place the tape drive back on-line. (If the operator places the tape on-line before the message valid data may be overwritten). (To reset the tape drive the operator must hit the load button until the tension returns to the drive. Then hit the reset button followed by placing the tape drive back on-line).

At this time the log process will recover the file by rewinding to the load point and then forward spacing to the point where the power fail occurred. Writing to the log file will continue at that point.

In the event of a system failure, the warm start load option initiates recovery of User Logging files. In the case of a serial file, the file is read and compared to the disc logging buffer. All records found in the disc buffer that are not on the serial log file are posted and a proper end of file written. If the destination file is a disc file, all records are read and verified and an end of file posted to the file. In order to continue logging to a User Logging file that has been recovered in this manner, the logging process for the file must be restarted using the console command :LOG.

#### NOTE:

Any records in the buffer area of the logging buffer will be lost.

User logging has been enhanced to work with labeled serial discs. Internally the log process handles serial disc (or cartridge tape) log files the same as for tape files.

II. DESIGN STRUCTURES

A. USER LOGGING TABLE

ENTRY SIZE = #38 words  
 DST %33

Table containing an entry for each activated user logging process. Each entry is created when the process is started, and deleted when the process terminates. (Via :LOG command). The information is extracted from the Logging Identifier Table (LIDTAB).

#	ENTRY 0	%
0	NUMBER OF ENTRIES	0
1	FREE ENTRY HEAD PT.	1
2	INUSE ENTRY HEAD PT.	2
3	NEXT BUFFER NUMBER	3
4	MAX # PROCESSES	4
5	MAX # USERS/PROCESS	5
6		6
7	ENTRY SIZE	7
	.	
	.	
37	.	45

WORD ENTRIES

NUMENTRIES	=	LOGTAB
FREE	=	LOGTAB(1)
INUSE	=	LOGTAB(2)
BUFNUM	=	LOGTAB(3)
MAXLOGPROC	=	LOGTAB(4)
MAX'USR'PROC	=	LOGTAB(5)
LOGTAB'ESIZE	=	LOGTAB(7)

**NUMENTRIES**

The number of entries in the logging table.

**FREE**

A table relative pointer to the first free entry in the logging table. (-1 = table full).

**INUSE**

A table relative pointer to the first entry in the logging table that is being used (-1 = no entries in use).

**BUFNUM**

The number of the buffer associated with this logging process. Used to create the name of buffer file if serial logfile. (i.e. ULOGxxxx.PUB.SYS).

**MAXLOGPROC**

The maximum number of user logging processes allowed.

**MAX'USR'PROC**

The maximum number of users per logging process.

**LOGTAB'ESIZE**

The size (in words) of each entry in the table.

TYPICAL ENTRY

#		%

34	SIZE OF LOGGING BUFFER	42
36	FWRD ENTRY PT	44
37	BWRD ENTRY PT	45

TABINDEX = WORD INDEX TO CURRENT ENTRY  
BTABINDEX = BYTE INDEX TO CURRENT ENTRY  
DTABINDEX = DOUBLE INDEX TO CURRENT ENTRY

LGNAME = BTABINDEX  
BNAME = BTABINDEX+8  
LFNAME = BTABINDEX+16  
LFLOCKW = BTABINDEX+24  
LFGROUP = BTABINDEX+32  
LFACCT = BTABINDEX+40

NUMUSERS = TABINDEX+24  
DST = TABINDEX+25  
STATUS = TABINDEX+26  
LGAUTO = TABINDEX+27.(0:8)  
LGTYPE = TABINDEX+27.(8:8)  
LGDEV = TABINDEX+28  
PIN = TABINDEX+29  
LGSWITCH = TABINDEX+30  
LGNEWAUTO = TABINDEX+31.(0:8)  
LGNEWTYPE = TABINDEX+31.(8:8)

LGADDR = DTABINDEX+16  
BSIZE = DTABINDEX+17

NEXT = TABINDEX+36  
PREV = TABINDEX+37

**LGNAME**

The name of the logging process (logging identifier).

**BNAME**

The name of the disc buffer used if the logging process destination file is a serial file. This is a file that resides in PUB.SYS. The format of the name is ULOGxxxx where xxxx is the buffer number padded on the left with zeroes.

If the switch flag is true, the following will be the fully qualified file name of the new log file.

**LFNAME**

The name of the logging file.

**LFLOCKW**

The lockword of the disc logging file.

**LFGROUP**

The group that the destination logging file resides in if the file is a disc file.

**LFACCT**

The account that the destination logging file resides in if the file is a disc file.

**NUMUSERS**

The number of users currently accessing the logging file.

**DST**

The dst number of the logging data segment (LOGBUFF).  
(-1 = LOGBUFF not created yet)

**STATUS**

The status of the logging process.

ACT = 1, INACT = 0, RECOVERING = 2, INITIALIZING = -1.

**LGAUTO**

True if the automatic changelog facility was enabled.

**LGTYPE**

The type of destination file of the logging process.

DISC = 0, TAPE = 1, SDISC = 2, CTAPE = 3

**LGDEV**

The logical device number of the disc logging file or the disc logging buffer.

**PIN**

The PCB number for the logging process.

**LGSWITCH**

Flag indicating a CHANGELOG is pending (if true).

**LGNEWAUTO**

True if the automatic changelog facility was requested for the new log file.

**LGNEWTTYPE**

If a switch is pending, this will be the type of the new log process.  
(-1 = no switch pending)

**LGADDR**

Sector number of the current extent in the disc logging file or the disc buffer file. (Disc buffer file has only 1 extent)

**BSIZE**

The number of records in the current extent (for disc logging) or the number available in the disc logging buffer.

**NEXT**

A table relative pointer to the next entry in the logging table.  
(-1 = this is last entry)

**PREV**

A table relative pointer to the previous entry in the logging table. (-1 = this is first entry)

## B. USER LOGGING BUFFER

There will be one of these tables around for the life of any active user logging process. The table consists of three parts:

- COMMUNICATIONS AREA - Info about status of the process, etc. that is common to all users of the process. Also the cells for messages to/from the process.
- USER ENTRIES - Info for a specific user of the process. One of these for every user of a process (Setup by OPENLOG, released by CLOSELOG).
- BUFFER AREA - Buffer used to hold logging records from all users before writing to the log file.

EXTENT	=	LOGBUFF(35)
RESOURCE	=	DLOGBUFF(18)
UHEAD	=	LOGBUFF(48)
FHEAD	=	LOGBUFF(49)

LOGID

The name of the logging process.

SWITCH'

True if log file switch is pending.

NEWAUTO

True if the automatic changelog option has been specified for the new log file.

NEWTYPE

If a switch was requested, this will be the type of the new logging file. (-1 = no switch pending)

AUTO

True if the automatic changelog option was specified for the current log file.

LOGTYPE

The type of destination file for the logging process.  
DISC = 0, TAPE = 1, SDISC = 2, CTAPE = 3

BDST

The data segment number of this table.

LOGPIN

This is the PCB number for the logging process (PIN\*16).

NUMUSER

The number of users currently accessing the logging file.

MAXUSER'

The maximum number of users allowed to access the logging file.

USERNO

The next sequential number to be assigned users accessing the system. It will get incremented for every unique OPENLOG - used as the log # in the logging record format.

SLPCT

The number of users currently waiting for activation by the logging process.

STATE

The state of the user logging process.  
ACTIVE = 1, INACTIVE = 0.

MSG

An internal message word used to indicate an error or operator request.

- 6 - Continue processing, all o.k.
- 2 - Suspend - error reading buffer file or writing to serial file
- 3 - Stop - set when issue :LOG logid,STOP or when an EOF condition is found on the disc log file.

#### LOGMSG

A messages from the logging process.

- 6 - Continue processing, all O.K.
- 15 - EOF - if there are no more extents available to be allocated.
- 12 - Disc space - could not allocate the new extent because no space left in the group.
- 9 - Write error - error occurred while writing to log file

#### USERMSG

A messages from the user process.

- 6 - Continue processing, all O.K.
- 12 - Disc space - user process needs another extent allocated for disc logging.

#### LOGERR

Last error found.

After changelog:

- +N - File System error number encountered
- 0 - No error
- 1 - New disc log file was not empty
- 2 - New disc log file did not have file code LOG
- 3 - New disc file is too small

#### LOGDEV

The logical device number of the current extent of the disc log file or the disc buffer file (buffer file has only 1 extent).

#### BSPACE

The amount of space, in records, that are currently available to the users. On the last block of the last extent, one record will be saved by the logging process so that the proper close information can be posted to the file - either the trailer record (if the log logging process is stoppped) or the change'to'new record because of an EOF condition (and the AUTO option had been specified).

#### BUFUSED

The number of records currently in the buffer. On all extents, except the last extent  $BUFSPACE+BUFUSED = 32$  (number of records in a complete block). However, on the last block of the last extent this will NOT be true since one record is always held in reserve by the logging process.

#### VSETNO

This shows the order in the log file "set" of the currently opened log file.

#### LOGADDR

The disc address of the current extent of the disc log file. If it's a serial file, this is the disc address of the disc buffer for the file.

#### INBUFREC

The record number of the next block to be written to the logging destination file or the disc logging buffer for serial files. (Used as an offset into the current extent for the writes - since

each record is one sector in length).

**FSPACE**

The current extent size of the logging destination file or disc logging buffer file for serial destination files.  
(on the last extent this will be the last extent size minus 1).

**FSPACE'**

The space in records that remains in the current extent of the disc logging destination file or disc buffer for tape destination files. (On the last extent of the disc log file, this is the amount of space minus 1).

**TRECS**

The total number of records written to the logging destination file (including those records currently in the buffer).

**MAXFSPACE**

The total file size, in records, minus 1. (Need that last record to post close information).

**LASTEXT'**

The extent number of the final extent in the disc logging file or disc buffer file.

**EXTENT**

The current extent number of the disc logging file or disc logging buffer.

**RESOURCE**

Used for resource management (i.e. locking the LOGBUFF).

Format is:

RESOURCE.(0:8) = Owner's pin, RESOURCE.(8:8) = Queue length,  
RESOURCE1.(0:8) = Q tail pin, RESOURCE1.(8:8) = Q head pin.

**UHEAD**

A table relative pointer to the first entry into the logging data segment. (-1 = no entries currently in use)

**FHEAD**

A table relative pointer to the first free entry in the logging data segment. (-1 = no free entries)

TYPICAL LOGBUFF ENTRY

PENTRY	=	INDEX+24

**USER**

The name of the user who opened the logging file through this entry.

**GROUP**

The group of the user who opened the logging file.

**ACCT**

The account of the user who opened the logging file.

**UPIN**

The process identification number for the user's process.

**OPENCNT**

Counter of how many times this user called OPENLOG. (Incremented for every OPENLOG, decremented for every CLOSELOG).

**WSTATE**

The wait status of the users process.

ACTIVE = 1, INACTIVE = 0.

**ERROR**

Used to hold error information for this user.

0 = O.K.            -1 = no room in disc (or disc buffer) and NOWAIT.

**LGNUM**

The logging number assigned to the user.

(From USERNO in global area to be used as log # in the log record).

**SCODE**

The subsystem code for the caller. This applies only to privileged callers.

**RECS**

The number of records written by this user.

**NENTRY**

A table relative pointer to the next entry in the logging data segment. (-1 = this is the last entry)

**PENTRY**

A table relative pointer to the previous entry in the logging data segment. (-1 = this is the first entry)

**C. LOGGING IDENTIFIER TABLE**

ENTRY SIZE = #33 words  
DST %41

Table containing an entry for each potential logging process. Entries are added via :GETLOG and released via :RELLOG.

LID

The logging identifier name. This is a maximum of eight characters long.

PW

The pass word for the logging identifier. This is a maximum of eight characters long.

The following is the fully qualified file name of the current log file.

FNAME'

The name of the destination file.

LW

The lock word on the destination file if the file is on disc.

FGROUP

The group that the file resides in.

**FACCT**

The account that the destination file resides in.

**UNAME**

The name of the user who created the logging identifier.

**UACCT**

The account of the user who created the logging identifier.

**TYP**

The status of the entry. -1 = null entry  
0 = disc logging file  
1 = tape logging file  
2 = serial disc logging file  
3 = cartridge tape logging file

D. LOGGING RECORD FORMAT

RECORD SIZE = 128 words  
 USER AREA = 119 words

LOG RECORD AT OPENLOG

0    2    3    4    6    7    11 12            24 25            127

rec#	cksum	code	time	date	logid	log#	creator	pcb	
------	-------	------	------	------	-------	------	---------	-----	--

USER OR SUBSYSTEM/CONTINUATION LOG RECORD (from WRITELOG)

0    2    3    4    6    7    8 9            127

rec#	cksum	code	time	date	log#	len	user area
------	-------	------	------	------	------	-----	-----------

LOG RECORD AT CLOSELOG

0    2    3    4    6    7    11 12            24 25            127 128

rec#	cksum	code	time	date	logid	log#	creator	pcb	
------	-------	------	------	------	-------	------	---------	-----	--

CRASH MARKER

0    2    3    4    6    7            127 128

rec#	cksum	code	time	date	
------	-------	------	------	------	--

HEADER RECORD (START/RESTART)

0    2    3    4    6    7    11            127

rec#	cksum	code	time	date	logid	
------	-------	------	------	------	-------	--

TRAILER RECORD (STOP)

0 2 3 4 6 7 11 127

rec#	cksum	code	time	date	logid	
------	-------	------	------	------	-------	--

NULL RECORD

0 2 3 4 6 7 127 128

rec#	cksum	code	time	date	
------	-------	------	------	------	--

BEGIN TRANSACTION MARKER

0 2 3 4 6 7 8 9 127

rec#	cksum	code	time	date	log#	len	user area
------	-------	------	------	------	------	-----	-----------

END TRANSACTION MARKER

0 2 3 4 6 7 8 9 127

rec#	cksum	code	time	date	log#	len	user area
------	-------	------	------	------	------	-----	-----------

CODE DEFINITION

- CODE.(8:8) =
- 1 Open log record
  - 2 User/subsystem record (writelog)
  - 3 Close log record
  - 4 Header record
  - 5 Trailer record
  - 6 Restart record
  - 7 Continuation of a user or subsystem record
  - 9 Crash marker
  - 10 End transaction record
  - 11 Begin transaction record
  - SPACE NULL record

## DATA FIELDS OF LOG RECORDS

REC#	=	DOUBLE INTEGER
CKSUM	=	INTEGER
CODE	=	INTEGER
TIME	=	DOUBLE (from intrinsic CLOCK)
DATE	=	INTEGER (from intrinsic CALENDAR)
LOGID	=	ASCII
LOG#	=	INTEGER
LEN	=	INTEGER
USERAREA	=	ASCII
CREATOR	=	ASCII
PCB	=	INTEGER

### NOTE:

1. The checksum algorithm uses the exclusive or (XOR) function against a base of negative one.
2. Null record is used for filler.
3. The code word of the logging record can contain a subsystem code defined by the user in the first half of the word (0:8). User logging allows privileged users to pass this code in the index parameter of the Openlog intrinsic.
4. The "len" field will contain the entire length of the data in the transaction (i.e. the length passed to WRITELOG, BEGINLOG, ENDLOG). If a continuation record is part of the transaction, it will also contain the entire length of the data. For example, a length of 140 was passed to the intrinsic. The "len" field of the first record will be 140, the "len" field of its continuation record will also be 140 - even though the actual amount of data found in the first record will be 119 and the data found in the continuation record will be 21.  
(Positive length = # words, negative length = # bytes)

This chapter contains the data structures necessary to support message files. The first section details the message file's version of the familiar file system data structure; ie, the file label, file control block, access control block, etc..

The second section show the tables used by the basic ipc mechanism which is a set of internal, MPE procedures designed to support the "boundary conditions" of ipc files. For example, signalling a no wait reader that its record has arrived. See the section's introduction for a detailed description.

{File Structure}

{File label/FCB extent map}

	End of file block	Start of file block
: Disc addr of extent 0	:	.
: .....	:	.
: Disc addr of extent 1	:	v
: .....	:	-
: Disc addr of extent 2	:	.
: .....	:	.
: Disc addr of extent 3	:	.
: .....	:	.
z	z	.
: .....	:	.
: Disc addr of extent n-1	:	v
: .....	:	-
: Disc addr of extent n	:	.
: .....	:	.

The EOF and SOF are examples only, meant to show that 1) the start of file moves into the extent map as records are read and 2) that the file can wrap around and, hence, cause the SOF to be greater than the EOF.

When a file becomes empty the SOF and EOF are reset to the first block of extent zero.

Each extent is composed of a number of blocks. Extents all have the same number of blocks. Extent zero also contains space for the file label and user labels in the exact same format as standard files. Starting with block zero, sufficient blocks are allocated to the file label/user labels to satisfy their space requirements.

Extents outside of the SOF/EOF range may not exist. They are deleted at close time when there are no more writers accessing the file.

{Block Structure}

```
..... *****
: First data record      :
:.....: Exact same format as standard
: Second data record    : variable length blocks.
:.....:
z           z
:.....:
: Last data record      :
:.....:
: Record delimiter (-1) :
:.....: *****
:
: Empty space (next record :
: would not fit)        :
:
:.....:
: Header delimiter (%77) :
:.....:
: Last header record    :
:.....:
z           z
:.....:
: Second header record  :
:.....:
: First header record   :
:.....:
```

Separating the data portion of the records from their header enables the standard file system access procedures to read the records with no knowledge that they are msg file records.

{Record Format}

```
.....  
: Number of bytes in record :  
:.....  
: First data word of record :  
:.....  
z                               z  
:.....  
: Last data word of record :  
:.....
```

Length word's value does not include itself.

{Header Format}

```
.....  
: C:LC:      : Header Type: 0  
:.....  
: Writer's ID      : -1  
:.....
```

C (0:1) - Set on if this was the last record written before the system crashed. This bit is set on by the first open on the file after the crash.

LC (1:1)- Valid only for close headers. Set to one if this is the last writer to close the file.

Type(8:8)- 0 data  
1 open  
2 close

{Message Access Control Block}

Notes:

1. Words/fields that do not pertain to message files are left blank.
2. This diagram shows the "combined" ACB as it appears to the message access procedures (the procedures in IPC). Thus it is a combination of the LACB and the PACB.

```

.....
0 :      : Size of the ACB including buffers (words)      : 0
.....
1 :      : File number                                     : 1 *

\* Value is private to a particular accessor.

Word	Field	Description
66		Accessor's local flags.
	(0:1)	O 1 - have not yet issued an FREAD/FWRITE against the file.
	(1:1)	ex 1 - extended wait mode.
	(2:1)	nd 1 - do not destroy the next record read.
	(3:1)	vr 1 - writer has not yet written his first record (ie., he is a virgin).
	(4:1)	bt 0 - transmission log should be expressed in words. 1 - " " " " " " bytes.
	(5:1)	cls Not currently used (reserved for group IPC standard).
	(6:1)	C No wait completion message is in LACB area.
	(8:8)	car ctl carriage control character to be used for the writer's record (a value of one indicates no carriage control character).

Word	Field	Description
39		File's global flags.
	(9:1)	er 1 - extended read
	(10:1)	qw 1 - one or more writers has been queued on the wait queue.
	(11:1)	m 1 - wait msg is located in the ACB
	(12:1)	c 1 - completion msg is located in the ACB
	(13:1)	d 1 - the current write buffer has dirty bit set
	(14:1)	s 1 - the start of file is block zero
	(15:1)	f 0 - the ACB buffers have not been filled

{MMSTAT Definitions}

Octal Value	Event Type	Parameter 1	Parameter 2
72/0	Read init	# free rec	
72/1	Read compl	(0:8) error, (8:8) ID	Number of records
72/2	Write init	(0:8) # rec, (8:8) ID	Number of free records
72/3	Write compl	(0:8) error, (8:8) ID	Number of free records
72/4	Control	(0:8) error, (8:8) ID	(0:4) func, (4:12) parm
72/5	EOF	(0:8) error, (8:8) ID	Number of records
72/6	Open	(0:8) error, (8:8) ID	Number of records
72/7	Close	(8:8) #free, (8:8) ID	Number of records
72/10	Initiation	0	(0:8) fix, (8:8) update
73/0	Put record	(0:8) error, (8:8) ID	(0:3) rec type, (3:13) number of records
73/1	Delete rec	(0:8) error, (8:8) ID	(0:3) rec type (3:13) number of records
73/2	Delete blk	Start of file block #	End of file block #

Notes:

1. The aa/bb notation in the "octal value" column denotes type/subtype. Type is the actual MMSTAT event number. Subtype is (0:4) of parameter 0.

2. Several items can possibly exceed their fields, in that case the bits beyond the field are lost. These items are number of records, number of free records, start of file, and end of file.
3. Parameter word zero has a common format for all the MMSTAT events.

Field	Description
(0:4)	Event's subtype.
(4:2)	File's state 0 - empty 1 - partially full 2 - only a fraction of a free record is left 3 - completely full
(6:1)	Nonzero indicates that there is one or more waiting readers.
(7:1)	Nonzero indicates that there is one or more waiting writers.
(11:1)	Nonzero indicates that the write has a carriage control character.
(12:4)	Flags local to the accessor. (12:1) - the accessor has done no FREADs/FWRITEs (13:1) - extended wait (14:1) - nondestructive read (15:1) - writer has not written any records

{File System Basic IPC Definitions}

The objective of this set of uncallable procedures is to provide a simple ipc mechanism to support the ipc file access procedures. It enables one process to send short, control messages to another process.

{General behavior}

{FCPORTOPEN procedure}

The heart of this mechanism is the port. A process desiring to receive messages would first open (create) a port. This process is termed the "port manager." When the port is created, a port number is returned to the opener. Since the port number value cannot be known in advance, potential senders need some method of obtaining the port number from the port manager.

Both the ports and the messages are contained in a single disc resident data segment. There can be a total of over thirty-five hundred open ports and outstanding messages. Thus neither ports nor message blocks are scarce resources.

{FCPORTSEND procedure}

This procedure sends a 0 to 5 word message to a port. Optionally a timeout value may be specified which will limit the duration the message will remain attached to the port. Expiration of the timeout causes the message to be deleted from the target port's queue and placed on the sender's reply port (specified by the sender in the FCPORTSEND procedure call).

{FCPORTRECEIVE}

Reads and deletes the head message from a port. The sender's return port number is also given to the receiver, enabling him to send a reply message.

{FCPORTCLOSE}

Demolishes the port.

{IPC File's Use of the IPC Mechanism}

All open message files have two ports open for the file (read wait queue and write wait queue), plus one port per accessor (reply port). Their use is described in the following.

{Reader and writer wait queues}

When an empty message file is accessed by more than one reader (share), then there must be a way of having the readers' FREADs satisfied in the same order that they were issued. That is, there must be queue of waiting readers. The ipc access procedures accomplish this by dedicating a basic ipc port as a "read wait queue." Whenever a reader's request is stalled because the file is empty, a message is sent to the read wait queue. Subsequent FREADs by other processes will queue up behind the first reader in a FIFO manner. An FWRITE will take the first entry from the wait queue and send a "read may be done" message to the reader's reply port.

In a like manner multiple writers will queue on the write wait queue when the file is full.

{Completion notification for nowait I/O}

The IOWAIT intrinsic waits for a message to be sent to the reply port (s) of the specified user files.

{Timeouts}

When an accessor encounters a boundary condition (ex, a reader accesses an empty file), it may specify that the condition must be satisfied in x seconds (FCONTROL 4). To this end the ipc access procedures merely issue the FCPORTSEND to the wait queue with the user's timeout value specified. The timeout will tear the message from the wait queue and place it on the accessor's reply port.

## I. Overview

The memory resident message facility of MPE IV addresses the need for an efficient, simple, and uniform method for system code to send short status-type messages to processes.

Each process is created with a message harbor which supports a set of message ports which are private to that process. There is a maximum of four ports per harbor in the initial implementation. This limit can be easily extended when new ports are required.

Any system code, even code running on the ICS, can send a message to any port of any process. The destination process' PIN must be known, and a priori conventions on portnumber and message formats must be established. The caller of SENDMSG may optionally specify that the destination process be awakened from a message wait.

The caller of SENDMSG specifies whether the message is to be buffered in the primary message table or the secondary message table. When the secondary table is specified, if the pool of secondary message entries is exhausted, the calling process is queued for a message table entry and blocked until one becomes available. Use of the primary message table is reserved for code running on the ICS or during critical sections (Pdisabled or Disabled intervals) in which it is not possible to release control of the processor to queue for a free message table entry. If the primary table is specified and no free entries are available, the SENDMSG crashes the system.

Messages can be of any length up to the configured maximum. Message length is specified in the call to SENDMSG and RECEIVMSG. In the initial implementation, messages are limited to 4 words in length. This maximum can be easily increased if the need arises.

By calling PORTSTATUS, a process may at any time determine whether a specified port is non-empty or obtain the portnumber of his most urgent non-empty port (lowest numerical port number =most urgent port).

By calling RECEIVMSG, a process may receive the message at the head of his specified message port. This receive is optionally non-destructive.

A process can wait on a message wait, or on a combination of message wait and other wait types.

## II. Message Intrinsic

- A. Procedure SENDMSG(Destpin, Destport, Msglength, Flags);  
Value Destpin, Destport, Msglength, Flags;  
Integer Destpin, Destport, Msglength;  
Option Privileged, Uncallable;  
Logical Flags;

Destpin, Destport, and Msglength had better be within range and reasonable (process and port exist), since SENDMSG checks and will crash if the parameters are bad.

The caller of SENDMSG stacks the message contents before calling the procedure. SENDMSG expects the first msg word to be at Q-7-Msglength, and the last msg word at Q-8. The message contents at Q-8 to Q-7-Msglength are deleted from top of stack by the exit from SENDMSG to the caller.

Flags.(1:1)=1 ==> Wake-up destination process from a  
message wait  
. (0:1)=1 ==> place message in secondary message  
table

Return CC=CCG if process was already awake else CC=CCE.

- B. Logical Procedure PORTSTATUS(Portnumber);  
Value Portnumber;  
Integer Portnumber;  
Option Privileged, Uncallable;

When supplied a valid port number, PORTSTATUS returns a true value if the port is non-empty and a false value if the port is empty.

When passed a -1 as portnumber parameter, PORTSTATUS returns the portnumber of the process' most urgent non-empty port (the smaller the number, the more urgent the port).

If all ports are empty, PORTSTATUS returns CC=CCE. If at least one port is non-empty, PORTSTATUS returns CC=CCG.

C. Procedure RECEIVMSG(Portnum,Msglength,Flags);  
Value Portnum,Msglength,Flags;  
Integer Portnum,Msglength;  
Option Privileged,Uncallable;  
Logical Flags;

Portnum and Msglength had better be within range or else  
its Suddenddeath time.

The caller of RECEIVMSG does an ADD S Msglength to make  
space for the message contents. RECEIVMSG stores the  
message contents into Q-8,Q-9,...,Q-7-Msglength.  
Q-7-Msglength contains the first word of the message.

Flags.(0:1)=1 ==> do not release message from head of  
port's message queue (non-destructive  
read)

Return CC=CCG if port was empty, else CC:=CCE.

### III. Supporting Data Structures

#### A. Message Harbor Table [DST #57 (%71)]

-----

The message facility is presently used only by the Dispatcher and should not be used by any process. The Message Harbor Table is created during system generation. It is a resident structure, though needn't reside in bank 0. Its base is located through the DST entry which describes it.

```
*.....*
* LINK TO FIRST MSG PORT 0 * MESSAGE HARBOR
*-----*
* LINK TO FIRST MSG PORT 1 * TABLE ENTRY
*-----*
* LINK TO FIRST MSG PORT 2 * FORMAT
*-----*
* LINK TO FIRST MSG PORT 3 *
*-----*
* NON-EMPTY PORT MASK *
*.....*
```

FIRST MSG QUEUE LINK .(0:1) =1 ==> NEXT MESSAGE IN SECONDARY  
MESSAGE TABLE  
. (1:15) = INDEX OF NEXT ENTRY IN  
APPROPRIATE TABLE

#### B. Message Tables

-----

Prim Msg Tab DST = #58 (%72)  
Sec Msg Tab DST = #17 (%21)

There are two types of tables which are used to buffer sent messages, the primary and secondary message tables. The tables are identical in format, but independently configurable with respect to size. Both tables are resident structures, though they needn't be located in bank 0. The bases of the message tables are located by looking up their addresses in the DST entry describing them.

```
*****
* # OF CONFIGURED ENTRIES *
*-----*
* # ENTRY SIZE (5) * MESSAGE TABLE
*-----*
* # ENTRIES AVAILABLE * ENTRY ZERO
```

```

*-----*
* INDEX OF FIRST FREE ENTRY *          FORMAT
*-----*
* PIN OF FIRST IMPEDED PROCESS *
*.....*

*.....*
* NEXT MSG IN QUEUE LINK *          MESSAGE TABLE
*-----*
* MSG WORD 1 *          ASSIGNED ENTRY
*-----*
* MSG WORD 2 *          FORMAT
*-----*
* MSG WORD 3 *
*-----*
* MSG WORD 4 *
*.....*

*.....*
* %100000 *
*-----*
* INDEX NEXT FREE ENTRY *          FREE ENTRY
*-----*
* Don't Care *          FORMAT
*-----*
* Don't Care *
*-----*
* Don't Care *
*.....*

```

```

NEXT MSG IN QUEUE LINK .(0:1) =1 ==> NEXT MESSAGE IN SECONDARY
                                MESSAGE TABLE
                                .(1:15) = INDEX OF NEXT ENTRY IN
                                APPROPRIATE TABLE

```

### C. Message Port Assignments

-----

```

Message Port 0 : Junk Port (to be used when no message
                        interference can occur.)
Message Port 1 : Reserved (for message facility)
Message Port 2 : Reserved (for message facility)
Message Port 3 : Image Port / deferred IOMESSPROC task

```

DISC CONTROLLER INTERRUPT

EVENT 191(%277)

EVENT NAME: DISKINTRPT

DESCRIPTION: A 7905/7920 CONTROLLER IS PROCESSING AN ATTENTION INTERRUPT  
(ONLINE/OFFLINE)

CALLING MODULE: HARDRES

CALLING PROCEDURE: SIODM

PARAMETERS	PARAMETER DESCRIPTION
P1= @DITP	(US)--ie.WHO GOT THE INTERRUPT
P2= @DITP	(THEM)--ie. WHO RAN THE POLL PROGRAM
P3= DITP	"OUR" DIT FLAGS WORD

THERE SHOULD BE AT LEAST AN %300 AND AN %303 FOR EACH SIO PRGM.  
A SINGLE ISOLATED (IN TIME) REQUEST WILL GENERATE AT LEAST A  
%303, %300, %303. IF THE QUEUE OF IOQE'S ON A DIT NEVER EMPTIES,  
THERE WOULD BE ONE %300 AND ONE %303 PER SIO PRGM.

EVENT 192(%300)

EVENT NAME: GIPINTERUPT

DESCRIPTION: INTERRUPT JUST PROCESSED

CALLING MODULE: HARDRES

CALLING PROCEDURE: GIP

PARAMETERS	PARAMETER DESCRIPTION
P1= (0:7)	LDEV note a) its easy to read in octal b) ldevs > 127 will be recorded mod 128
(8:9)	ADDRESS CONTAINED IN DRT WORD 0 RE- LATIVE TO SIO PROGRAM AREA (ie where did it stop?) ABS(DRTN*4)-(ILTP(ISIOP)+SYSDB))
P2= DEVICE STATUS	(the TIO GIP just did)
P3= LSW of a call to TIMER	

EVENT 193(%301)

EVENT NAME: STARTIO

DESCRIPTION: Issuing SIOP machine instruction.

CALLING MODULE: HARDRES

CALLING PROCEDURE: START'HPIB, STARTIO

PARAMETERS	PARAMETER DESCRIPTION
P1=	DRT number.
P2=	Absolute address of SIO program to start.
P3=	LSW of TIMER

EVENT 194(%302)

EVENT NAME: SIODM-ENTRY  
DESCRIPTION: Entering SIODM

CALLING MODULE: HARDRES

CALLING PROCEDURE: SIODM

PARAMETERS	PARAMETER DESCRIPTION
P1= (0:7) LDEV	-- SAME AS 192(%300)
(8:9)	a IOQ table relative index to convert this into the number that is formatted by DPAN2, multiply this number by %13 and add %10, that will be the number in the left column of returned IOQ'S-- add the table base to get the DPAN number for "in-use" entries.
P2= DIT WORD 0 (DIT FLAGS)	-- note that P2.(12:4) contains the state we are "leaving"
P3= (0:4) THE CONTENTS OF DIT0.(12:4)	ie, the state we entered in
(4:12) LSW OF TIMER	-- note the difference between P3 of %300 and P3 of %303, these 12 bits will hold ~4.1 seconds which is enough for 30229 controllers purpose and DS timeouts (some types).

EVENT 195(%303)

  - .BLOCKED - Blocked I/O, do blocked AWAKE when I/O is complete
  - .COMPLETE - Request has been completed
  - .DATAFRZN - The DST has been frozen

.MAMERRORD - MAM failed to freeze the DST  
.SFALL - The I/O program failed to start  
due to no SIO OK  
.PFALL - The Abort bit was set because  
of a power failure  
.TIMED - An I/O timeout request has completed  
.MSGDONE - A message reply has been completed

DSGLOBAL DATA SEGMENT

0	DSGLOBINFO TABLE BASE OFFSET (SEG. REL)	
1	DSXREF TABLE BASE OFFSET (SEG. REL)	
2	DSDEVICE TABLE BASE OFFSET (SEG. REL)	
	DS GLOBAL INFORMATION TABLE	(-1) ( 0)
	DSXREF TABLE	(-1) ( 0)
	DSDEVICE TABLE	(-1) ( 0)

NOTES

The DSGLOBAL data segment is referenced by a DST number stored at SYSDB+%320. All tables in this segment have a standard format which require the negative oneth and zeroth entries to contain the number of entries and an entry size respectively. Segment relative table bases point to entry zero.

DSGLOBINFO

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
NUMBER OF REAL ENTRIES															(-1)
ENTRY SIZE															( 0)
NUMBER OF CONFIGURED DS LINES IN SYSTEM															( 1)
///RS RE RM ///  DS CAPABILITY MASK (WORD)															( 2)
DS INFO DATA SEGMENT NUMBER															( 3)

NOTES

This table is used to hold information which is global in respect to the DS/3000 software within the system.

CURRENT NUMBER OF ENTRIES: 3  
 CURRENT ENTRY SIZE (WORDS): 1

- RS - Remote can use sequence numbers.
- RE - Remote can use exclusive mode w/o excl. protocol.
- RM - Remote supports multi-packet algorithm.

DSXREF

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
NUMBER OF REAL ENTRIES															(-1)
ENTRY SIZE															( 0)

DSXREF TABLE NOTES (DS1)

The DSXREF table will contain an entry for each process in the system. For pseudo terminals for which a session exists, the entry corresponding to the main PIN contains one of the preceding single word entry formats. If this is a master request, the Request Control Word is contained as the DSXREF entry. If the current request is initiated by a slave, the RCW is contained in word 9 of the IODSTRM0 (pseudo terminal) DIT.

Request state:

- 0 = Command out
- 1 = PTOP out
- 2 = PTOP in break mode; reply pending
- 3 = PTOP in break mode.

SLAVE ENTRY FORMAT (DS1)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
1	P														
											SLAVE PSEUDOTERM LDEV				
											0				
											0				

MASTER ENTRY FORMAT (DS1)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
0	P	PB	REQ. STATE													
											CURR MASTER REQ. LDEV					RCW
											0					
											0					

- P - Inhibit next breakmode request across line.
- PB - Current BREAK request issued by PCLOSE.
- RCW - Request control word.

DSXREF table notes (X.25)

The DSXREF table will contain an entry for each process in the system. The current entry size is 3 words, which contains Request Control Word (RCW), Line Control Word (LCW) and Saved IOQ Word (SIOQW).

The format for master ( or slave master ) entries is:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
RCW	0		PB	REQ.	STATE											
LCW		R			Num. son	proc.										
SIOQW																

If the current request is initiated by a slave process (slave acting as a master), and the process number is equal to the mainpin then the RCW, LCW and SIOQW are contained in IODSTRMX DIT.

IODSTRMX DIT

.	
RCW	%11 TMSTR
.	
LCW	17 TLCW
.	
SIOQW	20 TSIOQW
.	
.	

For pseudo terminals for which a session exists, the entry corresponding to the mainpin in DSXREF table contains the following:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
RCW	0		PB	REQ. STATE	Slave	Pseudo	Term	LDEV								
LCW		R														
SIOQW																

Notes:

- R - Request in progress
- PB - Current break request issued by PCLOSE break
- Num. son proc. - Current number of sons processing  
DSbreak (Break, Abort, Resume).

REQ. STATE -

Master or Slave Master States

- 0 = Command Out
- 1 = PTOP Out
- 2 = PTOP in break mode reply pending
- 3 = PTOP in break mode, flow issued
- 4 = PTOP in break mode
- 5 = PTOP in break, resume issued
- 6 = PTOP in break, saved IOQ on line
- 7 = PTOP in break, abort issued

Slave States

- 0 = Null
- 1 = PTOP in break
- 2 = PTOP in break flow not issued
- 3 = PTOP in break flow issued
- 4 = PTOP in break Resume/Abort received
- 5 = PTOP in break PCLOSE BREAK received

```

STATE - Device recognition state  
           (For DS device)                   (For virtual terminal)

0 - Available (for use)	Available (not owned)
1 - Not available	Owned or recognized
2 - :DSCONTROL device lock	DEVREC service request
3 - not used	DEVREC service granted

(For virtual terminals only)

J - Job accepting  
 DA - Data accepting  
 CY - Control Y detected  
 DU - Duplicative  
 IN - Interactive  
       (For DS device) Remote side can compress data

EOF - End of file condition

0 - No :EOF
1 - Hardware EOF
2 - :DATA
3 - :EOD
4 - :HELLO
5 - :BYE
6 - :JOB
7 - :EOJ

BR - (For virtual terminal) Break detected  
       (For DS device)                   DSMON not created

C - Default is data compression.

SUBTYPE - (For DS device)

0 - default is no data compression
1 - default is data compression

## IODSO DIT NOTES

A - Monitor is currently executing  
NR- New request has occurred while processing  
Q - X21 Queued flag  
P - Pre-emptive  
R - Reply  
E - Reject  
C - Continuation  
B - Break mode  
D - DSMON request bit  
N - Keeps DSIOM delay in effect (NULLF)  
PS- Primary/Secondary CSline  
CR- Capability mask reply bit  
RS- Remote can use sequence numbers  
RE- Remote can use exclusive mode w/o excl. protocol  
RM- Remote supports multi-packet algorithm

### STATE - CSline state

0 = unconnected  
1 = control  
2 = text

X - Exclusive mode valid if set.  
M - Master mode valid if set.  
S - Slave mode valid if set.

Note: Bits 0 and 1 of the IODSO DIT must be 0 to fit MPE IO system conventions.

\*\*\*\*\*  
\* PAD TERMINAL EXTRA DATA SEGMENT \*  
\*\*\*\*\*

The PAD terminal extra data segment is a buffer for storing both write and read data as well as carriage control characters. This extra data segment is acquired at logon time and is released when the terminal logs off. It is never frozen in memory.

Its areas include:

- (1) Five words giving the segment relative offsets to tables and buffers. The offsets are byte offsets. Note that at the present time, the parity conversion tables are not used. These offsets are used only for parity conversion, but not implemented now.
- (2) A table of carriage control characters to be sent with the user write data.
- (3) Two areas for parity conversion tables, unused at the present time.
- (4) The initial PAD parameters set for the terminal user when he logs on to the host.
- (5) The values of the PAD parameters that are to be set by this driver, sent as a SET or SET AND READ PAD command.
- (6) The area in which to read in the values of the PAD parameters following a SET AND READ level-1 data message to the PAD.
- (7) Two write buffers, each of length defined below.
- (8) The buffer area for level-0 reads, of length defined below.

This buffer area is expandable when larger reads are needed. The maximum size allowable for the entire extra data segment (XDS) is 31232 words.

B - Broken.  
BC - Sense of request is in bytes.  
IO - Wake caller on completion of request.  
BL - Blocked I/O. Wait in attachio until completion.  
CO - Request is completed and caller waken if requested.  
CF - Continuation record flag (are processing cont recds)  
CI - Continuator record initiator IOQ.  
PF - IOQ aborted because of power failure.  
HA - Hard Pre-empt. This is a DSMON request.  
SO - Soft Pre-empt. This is a non-DSMON request.  
ST - Request started.  
DO - DSMON request is complete. (Two part requests only)

.QLINK - SYSDB relative pointer to first word of next IOQ.  
.QLDEV - Logical Device number.  
.QMISC - If DSMON request, then DSLCB address. (DSMON DST relative) Else, the offset in DS data segment of the header address.  
.QDSTN - Contains the DST number of the target data area.  
.QADDR - Transmit address.  
.QFUNC  
DSDST - DS DST number in AFT(1) for non-DSMON requests.  
Set to zero for DSMON requests.  
FUNC - 0 = Reserved for DSWRITECONV.  
1 = DSWRITE.  
2 = DSOPEN.  
3 = DSCONTROL.  
4 = DSCLOSE.  
5 = DSWRITECONV.  
.QWBCT - Transmit count.  
.QPAR1 - Receive address. (DSWRITECONV only)  
.QPAR2 - Receive count. (DSWRITECONV only)  
.QSTAT - Request completion status and PCB number which is associated with this request.  
.QPCBN - PCB number associated with this request.  
If zero, this IOQ element will be returned by the system when the request is completed.

DS DEVICE (IODS0) ATTACHIO CALLS

	QMISC	DSTX	ADDR	FUNC	COUNT	P1	P2	FLAGS

WRITECONV (DSMON)	LCB	DSMON Stack	BUF2 (output)	5	Output Length	BUF1 (input)	Input Length	

DS DEVICE (IODS0) ATTACHIO CALLS

RETURN := ATTACHIO( LDEV, QMISC, DSTX, ADDR, FUNC, COUNT, P1, P2, FLAGS)

LDEV - logical device number of DS device

QMISC - miscellaneous request-dependent parameter

HEADER - address of DSCB header area in device-process DS XDS

LCB - address of Line Control Block in DSMON's stack

RTE TIMESTAMP - ???

DSTX - DST number for data segment containing ADDR buffer

Data DST - DST number for stack or extra data segment with data

Stack DST - DST number for stack (of course)

ADDR - address of data or other request information (in DSTX)

Output Buffer - address of buffer holding outgoing data

Info Buffer - address of buffer holding open info (see OPEN MON REQ)

BUF2 - address of DSMON's BUF2, holding incoming messages

Trace file name - character string name of trace file (optional)

Line Speed - double value for CS line speed

Retry Count - integer value for CS error retry count

Dummy Buffer - address not used by request

FUNC - function code identifying request

COUNT - length of data in ADDR buffer

Output Length - length of data in Output Buffer (+words/-bytes)

Info Length - length of data in Info Buffer (+words)

Trace File Length - length of Trace File Name (+words)

P1 - request-dependent parameter

Break Type - ???

Reject Stuff - ???

DS Options - master/slave enabled (see OPEN MON REQ)

Close Type - if bit 14 = 1 then final close else not final close

Input Buffer - address of buffer to holding incoming data

BUF1 - address of DSMON's BUF1, to hold outgoing messages

Request Type - code selecting type of CONSREQ

P2 - request-dependent parameter

Pin - ???

From/to process - ???

Input Length - length of Input Buffer (+words/-bytes??)

Trace Options - see TRACE DSMON REQUEST

Open Options - see OPEN/SHUT DSMON REQUEST

Monitor Options - see MON DSMON REQUEST

Debug Options - see DEBUG DSMON REQUEST

FLAGS - flags specifying wait/no wait IO, preemption, etc.

%200 - Soft preempt, no wait (slave PTOP DSWRITECONV)

%201 - Soft preempt, wait (other user DSWRITECONVs)

%203 - Soft preempt, nowait, no PCB (DSREJECT and DSBREAK)

%241 - Soft preempt, wait, special (CONSREQ)

%400 - Hard preempt, no wait (DSMON DSWRITECONV)  
 %401 - Hard preempt, wait (DSMON DSWRITECONV)  
 DSparm - %200, %201, %400, or %401

DS DEVICE (IODSO) ATTACHIO RETURN VALUES

	Word 1		Word 2
	(0:8)	(8:8)	
REJECT			
BREAK	main pin		
DSWRITE - nowait	IOQ index		
DSWRITE - wait		comp code	
OPEN		comp code	actual buffer size
CLOSE		comp code	
CONSOLE REQ - all		comp code	
DSWRITECONV - nowait	IOQ index		
DSWRITECONV - wait		comp code	received data length

Word 1:

main pin - apparently not used in DSBREAK??  
 comp code - completion code:  
           0 = IO request not yet completed  
           1 = IO request successfully completed  
           > 1 = IO request failed; CS error code  
 IOQ index - pointer to IOQ for nowait IO request

Word 2:

actual buffer size - actual size of DSMON buffer  
 received data length - actual length of data moved into INBUF

IODSX IOQ NOTES

.QFLAG

AB - ABORT REQUEST AND RETURN ERROR TO CALLER  
SP - :DSCONTROL OPERATOR REQUEST FROM CONDSLIN'  
IO - WAKE CALLER ON COMPLETION OF REQUEST  
BL - BLOCKED I/O. WAIT IN ATTACHIO UNTIL COMPLETION  
CO - REQUEST IS COMPLETED AND CALLER WAKEN IF REQUESTED  
RE - RESET REQUEST ISSUED TO DSMONX.  
HA - HARD PRE-EMPT. THIS IS A DSMONX REQUEST.  
SO - SOFT PRE-EMPT. THIS IS A NON DSMONX REQUEST.  
ST - REQUEST STARTED.  
DO - MESSAGE DONE.

.QLINK

SYSDB RELATIVE POINTER TO FIRST WORD OF NEXT IOQ.

.QLDEV

LOGICAL DEVICE NUMBER OF DSDEVICE.

.QMISC

MISCELLANEOUS REQUEST-DEPENDENT PARAMETER:

.QDSTN

DST NUMBER FOR DATA SEQMENT CONTAINING ADDR BUFFER

.QADDR

ADDRESS OF DATA OR OTHER REQUEST INFORMATION IN DSTN

.QFUNC

DSDST - DS DST NUMBER IN AFT(1) FOR NON-DSMONX REQUESTS.

FUNC - FUNCTION CODE IDENTIFYING REQUEST

FUNC 0	DSBREAK
	DSREJECT
FUNC 1	DSWRITE
FUNC 2	DSOPEN
FUNC 3	DSCLOSE
FUNC 4	DSCONSREQ
FUNC 5	DSWRITECONV
FUNC 6	ABORT READ
FUNC 7	INCOMING REPLY
FUNC 8	TIMER
FUNC 9	ABORT TIMER
FUNC 10	RESET
FUNC 11	FLOW CONTROL
FUNC 12	PAD CLEAR REQUEST

.QWBCT

LENGTH OF DATA IN ADDR BUFFER

.QPAR1

.QPAR2

REQUEST DEPENDENT PARAMETERS

.QSTAT

REQUEST COMPLETION STATUS AND PCB NUMBER WHICH IS ASSOCIATED WITH THIS REQUEST.

PCBN - PCBN ASSOCIATED WITH THIS REQUEST. IF ZERO, THIS IOQ ELEMENT WILL BE RETURNED BY THE SYSTEM WHEN THE REQUEST IS COMPLETED.

DS DEVICE (IODSX) ATTACHIO CALLS

QMISC	DSTN	ADDR	FUNC	COUNT	P1	P2	FLAGS

DS DEVICE (IODSX) ATTACHIO CALLS (NOTES)

RETURN := ATTACHIO( LDEV,QMISC,DSTN,ADDR,FUNC,COUNT,P1,P2,FLAGS)

LDEV - logical device number of DS device.

QMISC -

RTE Time - RTE time stamp used by 1000 systems.  
HEADER - Address of DSCB header area in device-process DS XDS. The DST number for this XDS is given in DSDST field of QFUNC.  
UC Num - UC number associated with the close request.  
Terminal DITP - Terminal DIT pointer.  
Request Code - Request code associated with incoming request. (Clear or Reset)  
Time Requested- Time requested by DSMONX for Timer request.

DSTN -

Data DST - DST number for stack or extra data data segment.  
Stack DST - DST number for stack.

ADDR - Address of data or other request information in DSTN.

Output Buffer - Address of buffer holding outgoing data.  
Info Buffer - Address of buffer holding call information to be used by DSMONX or passed to high levels.  
Dummy Buffer - Address not used by request.  
Line Speed - Double value for CS line speed.  
TraceFile name- Character string name of trace file (optional).

FUNC - Function code identifying request.

COUNT - Length of data in ADDR buffer.

Output length - Length of data in Output buffer (+words/-bytes).  
Info length - Length of data in Info buffer (+words/-bytes).  
Trace File Len.- Length of trace file name (+words).

P1 - Request-dependent parameter.

Break Type - Break = -1  
Control Y = 0  
Resume = 1  
Abort = 2  
Reject Stuff - This word contains the following:  
( 0: 4) := R.E.C.B  
( 4: 6) := Message Class  
(10: 6) := Stream Type  
DSoptions - Master/Slave enabled. If bit 10=1 then slave first DSOPEN.  
Close Type - If bit 14=1 the final close else not final close.  
Input Buffer - Address of buffer holding incoming data.  
Console code - Code selecting type of CONSREQ.

P2 - Request-dependent parameter  
   Pin - Current Pin.  
   From/To process- From and To process number.  
   Input Length - Length of input buffer (+words/-bytes).  
   Trace Options - see Trace DSMON REQUEST.  
   Open Options - see OPEN/SHUT DSMON REQUEST.  
   Debug Options - see DEBUG DSMON REQUEST.  
   MainPin - Mainpin associated with this request.

FLAGS - Flags specifying wait/no wait IO, preemption, etc.  
   %200 -Soft preempt, no wait (slave PTOP DSWRITECONV)  
   %201 -Soft preempt, wait (other user DSWRITECONV)  
   %203 -Soft preempt,no wait,no PCB  
   %241 -Soft preempt,wait,special (CONSREQ)  
   DSPARM - %200, %201

## IODSTRMO IOQ NOTES

### .QFLAG

- AB - Abort request and return error to caller.
  - CI - Currently in CI prompt/read sequence.
  - XR - Print buffer expansion requested.
  - BC - Request is in bytes.
  - IO - Wake caller on completion of request.
  - BL - Blocked I/O. Wait in attachio until completion.
  - CO - Request is completed and caller waken if requested.
  - CF - Continuation record flag (are processing cont recds).
  - CI - Continuation record initiator IOQ.
  - MO - IOQ modified by driver
  - HA - Hard Pre-empt. This is a DSMON request.
  - SO - Soft Pre-empt. This is a non-DSMON request.
  - ST - Request started.
  - DO - DSMON request is complete. (Two part requests only)
- 
- .QLINK - SYSDB relative pointer to first word of next IOQ.
  - .QLDEV - Logical Device number.
  - .UNIT - Logical unit number.
  - .QDSTN - Contains the DST number of the target data area.
    - D - 1 = DB relative offset.
    - 0 = Segment relative offset.
  - .QADDR - Offset to the target area data segment.
  - .QFUNC - Function code field.
  - .QWBCT - Word count or byte count and control returns.
  - .QPAR1 - Parameter one. (Function dependent use)
  - .QPAR2 - Parameter two. (Function dependent use)
  - .QSTAT - Request completion status and PCB number which is associated with this request.
  - .QPCBN - PCB number associated with this request.
    - If zero, this IOQ element will be returned by the system when the request is completed.
  - .QUAL - A code that further defines the general status.
  - .GEN - General status. Indicates the current status according to the following codes:
    - 0 = Not started or awaiting completion.
    - 1 = Successfully completed.
    - 2 = End of file detected.
    - 3 = Unusual conditon encountered.
    - 4 = Irrecoverable error encountered.

# IODSTRMX IOQ NOTES

## .QFLAG

AB - ABORT REQUEST AND RETURN ERROR TO CALLER.  
CI - CURRENTLY IN CI PROMPT/READ SEQUENCE.  
IO - WAKE CALLER ON COMPLETION OF REQUEST.  
BL - BLOCKED I/O. WAIT IN ATTACHIO UNTIL COMPLETION.  
CO - REQUEST IS COMPLETED AND CALLER WAKEN IF REQUESTED.  
RE - RESET REQUEST ISSUED TO DSMONX.  
MO - IOQ MODIFIED BY DRIVER.  
HA - HARD PRE-EMPT.  
SO - SOFT PRE-EMTP.  
ST - REQUEST STARTED.  
DO - MESSAGE DONE.

.QLINK - SYSDB RELATIVE POINTER TO FIRST WORD OF NEXT IOQ.  
.QLDEV - LOGICAL DEVICE NUMBER.  
.UNIT - LOGICAL UNIT NUMBER.  
.QDSTN - CONTAINS THE DST NUMBER OF THE TARGET DATA AREA.  
.QADDR - OFFSET TO THE TARGET AREA IN DATA SEGMENT.  
.QFUNC - FUNCTION CODE FIELD.

0. READ	%20. DISABLE TIMER
1. WRITE	%21. ENABLE TIMER
2. FILE OPEN	22. READ TIMER
3. FILE CLOSE	23. DIABLE PARITY
4. DEVICE CLOSE	24. ENABLE PARITY
5. SET TIMEOUT	25. LOGGED ON
6. SET INSPEED	26. SET PARITY
7. SET OUTSPEED	27. SET TERMINAL TYPE
%10. ECHO ON	30. ALLOCATE TERMINAL
11. ECHO OFF	31. CLEAR FLUSH AND WRITE
12. DISABLE BREAK	32. ENABLE CONTROL X !!! ECHO
13. ENABLE BREAK	33. DISABLE CONTROL X !!! ECHO
14. DISABLE ESCAPE	34. NOT USED
15. ENABLE ESCAPE	35. PTAPE READ
16. DISABLE TAPEMODE	36. SET/RESET BREAK MODE
17. ENABLE TAPEMODE	37. SET/RESET CONSOLE MODE

.QWBCT - WORD OR BYTE COUNT AND CONTROL RETURNS.  
.PCBN - PCB NUMBER ASSOCIATED WITH THIS REQUEST. IF ZERO THIS IOQ ELEMENT IS RETURNED BY THE SYSTEM WHEN THE REQUEST IS COMPLETED.  
.QUAL - A CODE WHICH FURTHER DEFINES OR QUALIFIES THE GENERAL STATUS.  
.STATUS - GENERAL STATUS. INDICATE THE CURRENT OR RESULTANT STATUS OF THE REQUEST ACCORDING TO THE FOLLOWING CODES:  
0 - NOT STARTED OR AWAITING COMPLETION.  
1 - SUCCESSFULLY COMPLETED.  
2 - END OF FILE DETECTED.  
3 - UNUSUAL CONDITION.  
4 - IRRECOVERABLE ERROR.

IOPADO IOQ PARAMETERS 1 AND 2 AND IOQ FUNCTIONS

IOQ FUNCTION	MEANING OF QPAR1 AND QPAR2	
0: Read	P1.(0:1) P1.(13:3)	1: Suppress line feed following read. 0: reset EOF and read 1: detect :EOF: 2: detect all data EOF's 3: detect all session EOF's 4: detect all job EOF's 5: no EOF check; don't return saved EOF data on this read.
	P2.(0:8) P2.(9:1) P2.(10:1) P2.(11:2)	Special end-of-read character if not 0. V/3000 read if set. User block mode read if set. Binary read.
1: Write	P1	Vertical format specification  %01 : Use first character of user data as vertical format specification. %53 : Carriage return only. %55 : Triple space and carriage return. %60 : Double space. %61 : Formfeed. %200-277 : (n-%200) LF's then carriage return. %320 : No vertical formatting. others : carriage return and line feed.
	P2.(15:1)	: If set, prespace vertical formatting characters, e.g. in Fortran.
2: File open	P1 P2	: Terminal type. : Terminal speed.
3: File close	P1,P2	: Unused.
4: Device close	P1,P2	: Unused.
5: Set read timeout	P1	: Read time out in seconds; if 0 disable read timeout.
6: Set input speed	P1,P2	: This function is done by PAD, not driver.
7: Set output speed	P1,P2	: This function is done by PAD, not driver.
8: Enable echo	P1,P2	: Unused. Old echo setting returned in returned byte count.

9: Disable echo P1,P2 : Unused. Old echo setting returned in returned byte count.

10-20: P1,P2 : The parameters in these function requests are not used.

21: Set logon type P1 : 0 data, break not enabled  
1 session, break enabled  
2 job, break not enabled.

22: Unused.

23: Set terminal type P1 : Terminal type.

24: Allocate terminal P1 : Terminal type.  
P2 : Line speed. (unused).

25: Clear flush and write : Same parameters as write.

26-29: : No parameter values checked.

30: Set break mode P1 : Odd, terminal in break;  
Even, terminal not in break.

31: Set console mode, unused.

32: Set parity, unused presently.

33: Same as function 33.

34: Same as function 23.

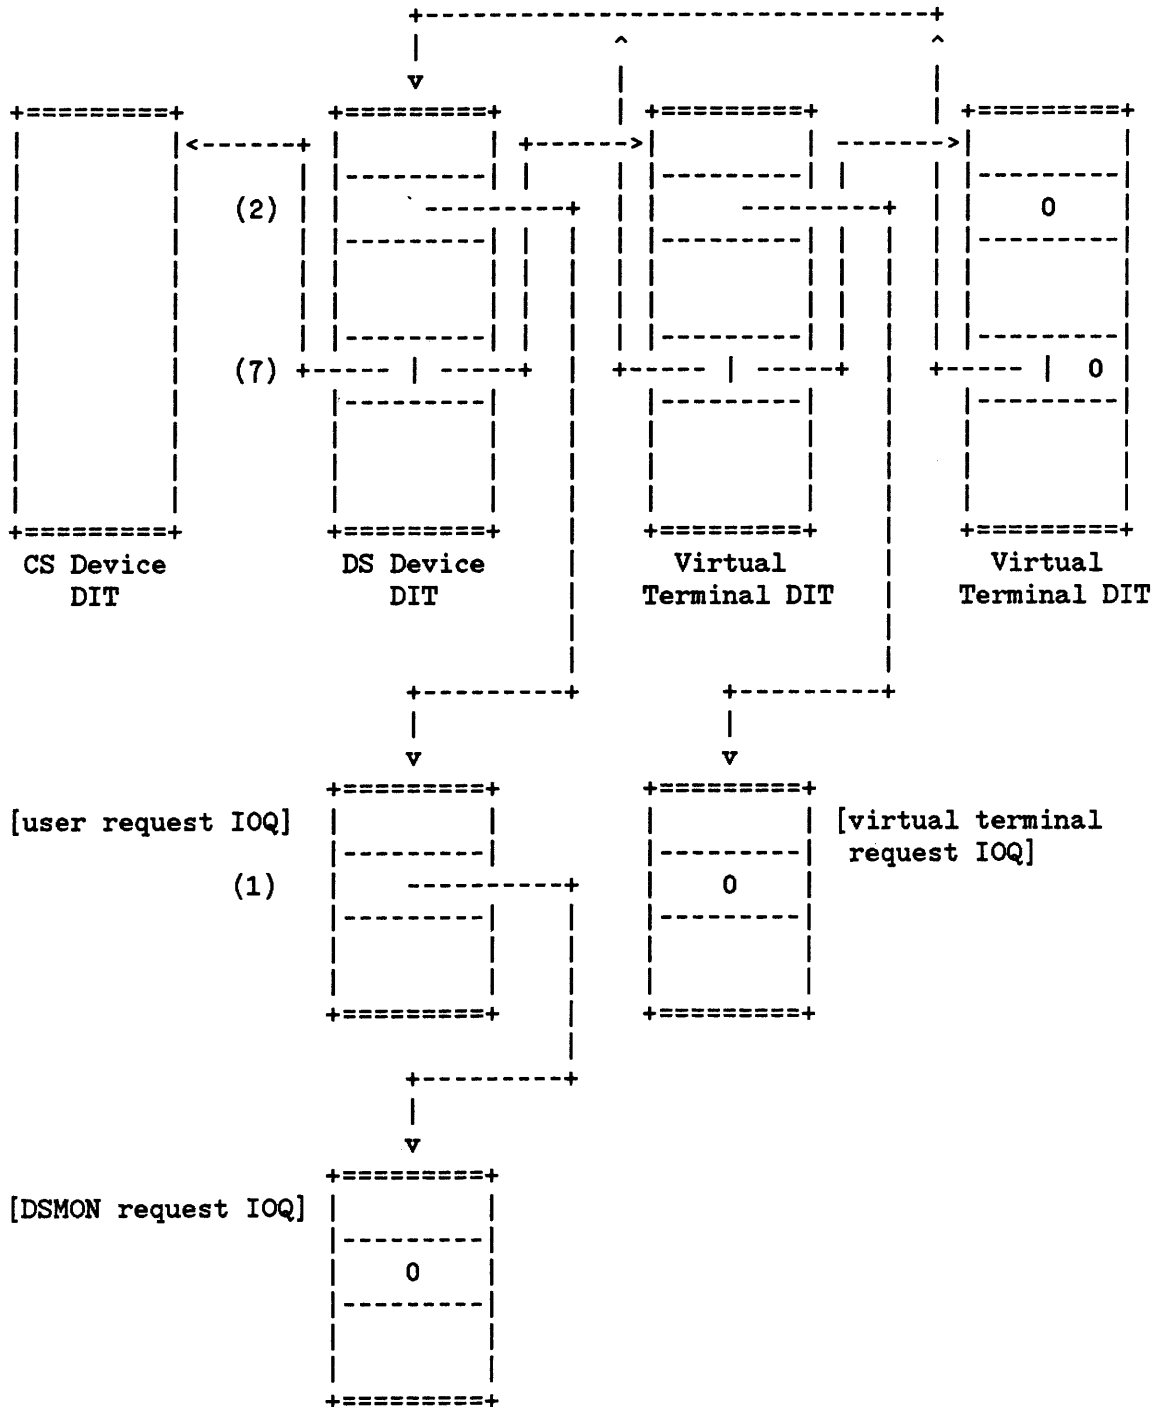

35: Return terminal type : Terminal type returned in byte count.

36: Return output speed : Return speed in CPS in byte count.

37: Set new stop and subsystem  
break characters P1 : if 0, disable special character;  
. (0:8) : subsystem break character  
. (8:15): stop character

3	BUFFER SIZE															.BUFSIZE				
4	UNUSED						N		Q		L		STATE		X		M		S	.FLAGS
5	0																			
6	0																			
7	0																			

NOTES

This pseudo-header may at times be seen in words 8-15 (%10-%17) of the IODSO DIT.

.REQ - If DSMON request number is still the same when returned from DSIOM, then the request was processed. If a -1 is returned, and if ERRCOD = 0, then request was discarded due to a CWRITE in progress and DSIOM has to resubmit the request. If a -1 returned and ERRCOD <> 0, then a CSERROR occurred on this request, and ERRCOD contains the CSERROR code.

.FLAGS - Same as in the IODSO DIT. (DIT0.(9:7))

N - DSMON has a null CWRITE outstanding

Q - DSMON has a CREAD ENQ outstanding

L - CS line is a secondary

STATE - CS line state

0 - unconnected

1 - control

2 - text

X - exclusive mode enabled

M - master mode enabled

S - slave mode enabled

## DSMON REQUEST FORMATS

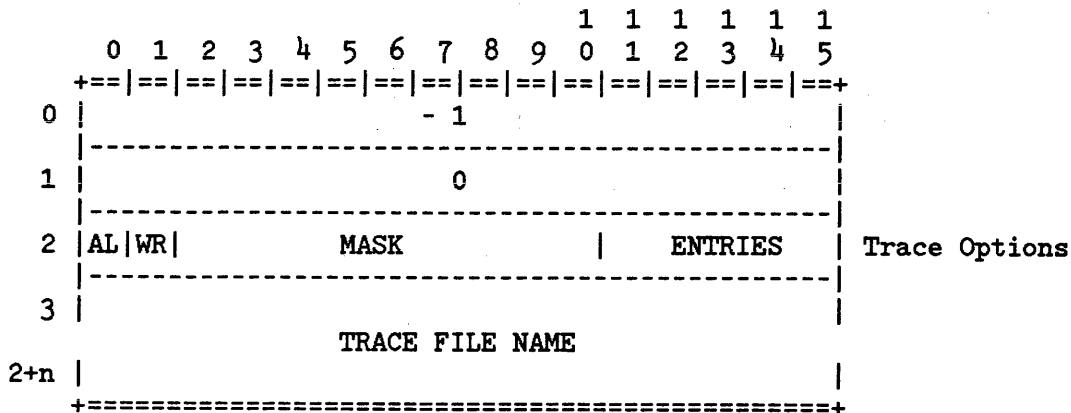

DSMON requests are internal messages sent from a user to a DSMON process to request some service (opening or closing a CS line, turning on CS tracing, etc.) The request is sent and executed by the following mechanism:

1. The user calls ATTACHIO to initiate an IO request. (See DS DEVICE ATTACHIO PARAMETERS)
2. ATTACHIO calls DSIOM, which calls the IODSO driver to execute the IO request.
3. IODSO calls DSMONREQ to transmit the request to DSMON.
4. DSMONREQ formats a DSMON request message, and moves it to DSMON's incoming message buffer BUF1.
5. DSIOM completes a pending DSWRITECONV from DSMON.
6. DSMON awakes and notices the DSMON request in its BUF1. It executes the appropriate MONxxx procedure based on the request type, then calls DSWRITECONV to return the results of the request in a DSMON-DSIOM communications block.
7. DSWRITECONV calls ATTACHIO which calls DSIOM.
8. DSIOM processes the DSMON-DSIOM communications block and notices that a DSMON request has been completed. It calls IODSO again to finish completion of the IO request.
9. IODSO does associated bookkeeping (incrementing usecounts, etc) sets the ATTACHIO status returns to reflect the success or failure of the request, and calls DSCOMPLETE to complete the pending IO request.
10. The user's ATTACHIO call completes, giving the user the status of its request. (See DS DEVICE ATTACHIO RETURNS).

DSMON REQUEST FORMATS

Request type 0 - MONTRCON - turns on CS tracing

Request type = 0

Request parameter - Trace Options

- AL (0:1) - 0 = trace I/O errors only  
1 = trace all activity
- WR (1:1) - 0 = no wrap on trace entries  
1 = wrap trace entries if table is full
- MASK (2:8) - 0 = use default trace mask  
>0 = mask indicating driver actions to trace
  - bit 2 - STN
  - bit 3 - OPR and EDT
  - bit 4 - RCT
  - bit 5 - RTX
  - bit 6 - SCS, POL, SEL
  - bit 7 - STX
  - bit 8 - 3270 STN
  - bit 9 - not used
  - bit 10 - mainframe IC
- ENTRIES (11:5) - 0 = use driver default for max entries per record  
>0 = (max number of entries per record)/8

Request buffer - Trace file name, a string of 2n ascii characters with one or two trailing blanks

DSMON REQUEST FORMATS

Request type 1 - MONTRCOFF - turns off CS tracing

	0	1	2	3	4	5	6	7	8	9	0	1	1	1	1	1	1
0								-	1								
1									1								
2									0								

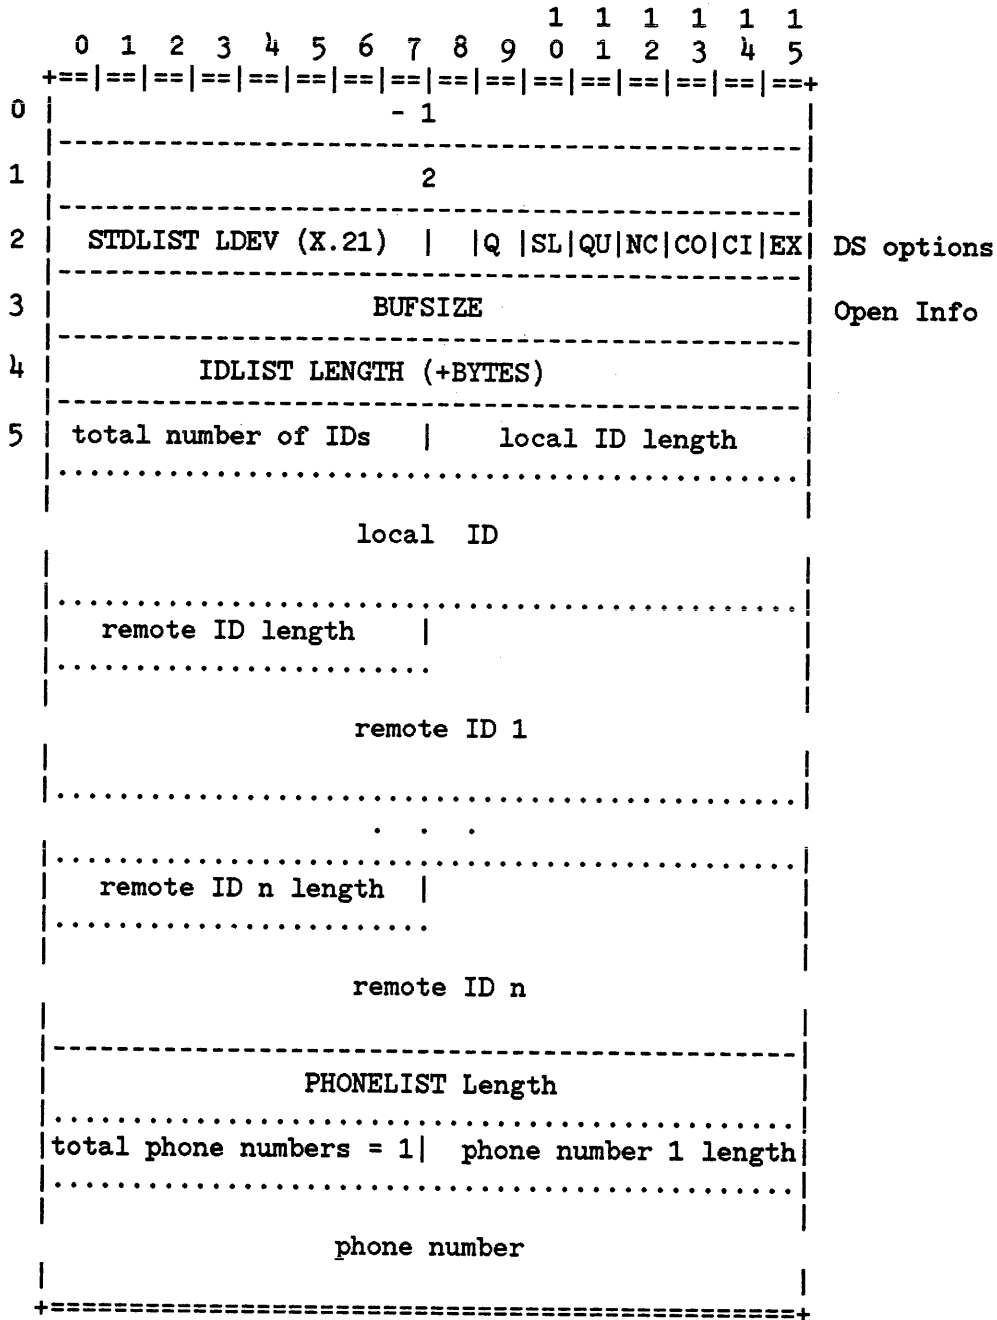

Request type - 1

Request parameter - unused

Request buffer - none

DSMON REQUEST FORMATS

Request type 2 - MONOPEN - first open to DS device; causes DSMON to COPEN CS device

## DSMON REQUEST FORMATS

Request type - 2

Request parameter - DS (open) options

Q (9:1) - X.21 queued flag  
SL (10:1) - first slave DSOPEN  
QU (11:1) - QUIET  
NC (12:1) - NOCOMP  
CO (13:1) - COMP  
CI (14:1) - open from DSLINE or REMOTE HELLO  
EX (15:1) - EXCLUSIVE mode

Request buffer - COPEN related parameters

BUFSIZE - size of DS line buffer (from :DSLIN LINEBUF)  
IDLIST - local and remote IDs (from :DSLIN LOCID and REMID)  
IDLIST length = 0 - configured default id sequences  
PHONELIST - remote phone number (from :DSLIN PHNUM)  
PHONELIST length = 0 - configured default phone list

DSMON REQUEST FORMATS

Request type 3 - MONCONSCMD - opens or shuts master and slave access

Request type - 3

Request parameter - Open options (from :DSCONTROL command)

- SL (12:1) - Dev is X.21 switched line
- X (13:1) - Dev is X.21 related
- M (14:1) - MASTER mode enabled
- S (15:1) - SLAVE mode enabled

Request buffer - Line speed (double word value, from :DSCONTROL)  
(Line speed = 0 - use configured default)

DSMON REQUEST FORMAT

Request type 4 - MONCLOSE - last DSCLOSE to DS device; causes DSMON to CCLOSE the CS line

	0	1	2	3	4	5	6	7	8	9	0	1	1	1	1	1	1	
0																		
1									4									
2									0									

Request type - 4

Request parameter - not used

Request buffer - none

NOTE: Request types 5 (MONSYSOPEN) and 6 (MONSYSREAD) no longer exist. They appear to have been a planned feature of DS that fell through the cracks and was lost and forgotten. Remains of this prehistoric code can be found in DSMON.

DSMON REQUEST FORMATS

Request type 7 - MONMON - turns on (off) CS and DS MMSTAT monitoring

Request type - 7

- Request parameter - Monitor options
- CS (14:1) - 0 = doesn't effect CS monitoring  
1 = turn on (off) CS monitoring
  - DS (15:1) - 0 = doesn't effect DS monitoring  
1 = turn on (off) DS monitoring
  - ON (15:1) - 0 = turn off monitoring  
1 = turn on monitoring

Request buffer - none

DSMON REQUEST FORMATS

Request type 8 - MONDEBUG - activates or deactivates DSMON breakpoints

Request type - 8

Request parameter - Debug option

0 = deactivate DSMON breakpoint

1 = activate DSMON breakpoint

2 = activate fatal error traps:

if DS error, cause System Failure 915

if CS error, cause System Failure 916

Request buffer - none

DSMON REQUEST FORMATS

Request type 9 - MONRETRIES - changes number of CWRITE error retries

	0	1	2	3	4	5	6	7	8	9	0	1	1	1	1	1	1
0	- 1																
1	9																
2	0																
3	NUMBER OF RETRIES																

Request type - 9

Request parameter - not used

Request buffer - number of retries (single word value)

The code for S or J is the same as in the Job Information Table. (JIT)

FORMAT FOR INFO ON AN IODS0 LDEV  
 (THIS INFORMATION IS FOR EACH PIN)

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15		
ENTRYLDEVX	Number of DSOPENS								IODS0 ldev								%0	0
ENTRYLDEVX1	L	N	M	S	X	C	Q	////////////////////////////////////								%1	1	

NOTES

ENTRYLDEVX

- No of DSOPENS - This corresponds to the PIN and IODS0 ldev under consideration.
- IODS0 ldev - The logical device number of the IODS0 device under consideration.

ENTRYLDEVX1

- L - On if the PIN is on the remote (slave) side of the DS line.
- N - On if a session exists for the PIN.
- M - On if Master access is opened for this DS line.
- S - On if Slave access is opened for this DS line.
- X - On if the user has exclusive access over the DS line.
- C - On if the user has set the compress option for the DS line.
- Q - On if the user has set the quiet option for the DS line.

## NOTES ON THE DS INFO DATA SEGMENT

This XDS contains information that is global to the system. Entry zero contains some header information. The number of real entries is the no of PINs allowed on the system. The ENTRY'SIZE is variable with each system and is:

$$\text{ENTRY'SIZE} = \text{FIRSTLDEVX} + \text{NUMLDEVS} * 2$$

This allows two words of information for each IODSO ldev. Real entries contain information only if the corresponding PIN is alive and at least one DSOPEN has been executed by that PIN. If the first word of the entry is non-zero then it has information according to the above format else all the other words are also zero. An entry contains information on IODSO ldevs in the same order as in the header entry. A non-zero entry has non-zero information on all IODSO ldevs for which at least one DSOPEN has been executed. This XDS is initialized as a fixed size data segment at system startup time.

POINTER LINKAGE IN DEVICE/PROCESS DS XDS

# DESCRIPTION OF SESSION/JOB DS DATA STRUCTURE

## OVERALL SESSION/JOB DS DATA STRUCTURE

Each session and job which is using DS has its own data structure consisting of a set of extra data segments and areas within MPE tables. The MPE structures include:

- . Job Information Table (JIT): one word with the data segment number of the job's DS extra data segment.
- . Available File Table (AFT) entries: one for each active DS service within each process.

The DS extra data segments provide space for control information and data buffers. There are two types:

- . Job DS XDS: one for the entire job/session, with global DS information.
- . Device-process DS XDS: one for each remote system (i. e., DS device) being accessed by each process.

The following is a sample list of actions and the DS data structures created by those actions :

ACTIONS	CREATED STRUCTURES
:DSLIN to DS device a	Job DS XDS; sets JIT pointer DeviceProcess DS XDS for ldev a, CI AFT (to ldev a) in CI stack
:DSLIN to DS device b	DeviceProcess DS XDS for ldev b, CI AFT (to ldev b) in CI stack
:RUN son process	
.	
.	
.	
POPEN to DS device a	DeviceProcess DS XDS for ldev a, SON AFT (to ldev a) in SON stack
FOPEN to DS device a	AFT (to ldev a) in SON stack
POPEN to DS device b	DeviceProcess DS XDS for ldev b, SON AFT (to ldev b) in SON stack

## AFT AND PCBX STRUCTURES

The PCBX area, at the beginning of each process stack below the DL address, is used by MPE, the File System, and datacomm subsystems to hold process-related information.

The File System's Available File Table (AFT) is the primary structure used by DS. Each DS service (remote commands, remote files and data bases, PTOP, etc.) in use by the process has assigned an AFT entry. An active DS service is identified by a DS number, which is equivalent to an opened file's file number. The DS number is used to index into the AFT to select the proper entry. Since the AFT starts at the end of the PCBX and grows back towards the beginning of the segment, DS numbers are used to compute a DB-minus address with the formula

$$\text{AFT address (relative to DB)} := \text{DL address} - \text{AFTsize} * \text{DSnumber}$$

There are two types of AFTs associated with DS:

A DS AFT supplies limited information about the DS service, including the ldev of the DS device to the remote. The DSCB Vector (word 2 of the AFT) specifies the DS Control Block in the Device-process DS XDS associated with the service. Each successful call to DSOPEN creates a new DS AFT. The AFT is deleted by DSCLOSE when the service is terminated.

A REMOTE FILE AFT is created by the File System when a remote file is FOPENed in a local process. It supplies the file number to be used by the remote File System (RFNUM) and the DS number of the DS AFT created for the remote file.

The active DS AFTs are linked in a chain, with the Last DS AFT field (PXFILE(3).(0:8)) giving the DS number of the most recently created DS AFT, and each Previous AFT field supplying the DS number of the preceding DS AFT. If the process is a remote CI, the slave DS AFT field (PXFILE(3).(8:8)) indicates the DS number of the DS AFT opened to reply to the master. Otherwise, the slave DS AFT field is zero.

Finally, error numbers for the last DSOPEN and COPEN executed are held in PXFILE(1). DSCHECK and CCHECK can look there for errors on opens.

## JOB DS EXTRA DATA SEGMENT

The job DS XDS contains information that is global to the job, and is known to all processes using DS within the job. This includes the total number of active DS services (DSOPENS) and some control information for each DS device (line to a remote) access by the session. The job DS XDS has the same general format as the Device-Process DS XDS, with the unused data structures deleted.

## DEVICE-PROCESS DS EXTRA DATA SEGMENT

A device-process DS XDS is created for each DS device (remote system) in use within the process. It holds control information and data buffers to be used for the process' communication with the remote. Originally (see above) there was only one DS XDS for all processes, but it was discovered that certain types of concurrent DS activity required separate sets of buffers and control blocks. The current data segment per device per process scheme solves these problems. Each of these segments has essentially the same format as the old DS XDS, so changes to DS code have been minimized.

Elements of the device-process DS XDS:

- . DSCB pointer area: holds up to 64 pointers that link AFTs to DSCBs
- . DSLCBs: see below; only one DSLCB in the segment
- . DSCBs: see below
- . RFA buffer: used for intermediate buffering of remote FREAD and FWRITE data
- . PTOP buffer: used for intermediate buffering of PWRITE data on the slave side
- . IMAGE control block: holds plabels for IMAGE intrinsics used in processing remote data base access requests; dynamically loaded via LOADPROC when the first remote DBOpen executed. (When DS was released, both DS and IMAGE were optional products, so calls to IMAGE from DS could not be coded directly.)
- . Compression buffers: one or two (depending on your point of view) buffers used during compression and decompression of data; also used to hold READ and PRINT data to and from the remote pseudo terminal.

### DS LINE CONTROL BLOCK (DSLCLB)

The DS Line Control Block holds control information pertaining to the use of a DS device, that is, access to a remote system. There are two types of DSLCLBs:

There is a JOB DSLCLB (in the Job DS XDS) for each DS device being accessed by any process within the job. This DSLCLB holds control information that is global throughout the job and/or must be available to all processes in the job. Some of this information is used for occasional processing, like the establishment and termination of the remote session (DSLCLBHELLOP, DSLCLBSESSION). A job DSLCLB is created when a

:DSLIME DSdevice;OPEN is executed (the first DSOPEN for the DSdevice), and is destroyed when the :DSLIME DSdevice;CLOSE is performed.

There is one DEVICE-PROCESS DSLCB in each Device-process DS XDS. This DSLCB contains information relating to a particular process' access to a DS device. Some of the information is copied from the corresponding job DSLCB (e.g. DSLCBBUFSIZE, DSLCBLDEV). Other fields are used in DS activity local to the particular process (e.g. DSLCBFOPEN, DSLCBPTOPGET). The device-process DSLCB is created when its associated DS XDS is created (on the first DSOPEN in the process for the DS device), and is deleted when the DS XDS is released.

These two types of DSLCBs resulted when the original single DS data segment was split for the Moulinex fix. The format of the original DSLCB was retained, but certain fields are maintained only in the job or the device-process copies, and some fields are present in both. This was done on a functional basis -- those fields that are job-specific in nature and are rarely accessed are in the job DSLCB; those fields that are process-specific and/or frequently accessed are in the device-process DSLCB. Hopefully this minimizes the data segment switches, with most of the DS processing done with DB pointing at a device-process DS XDS.

NOTE: There are, unfortunately, TWO data structures called DS Line Control Blocks within DS. One (this one) is found in the DS XDSs and is used by the user services ("higher") level (DSSEG1-DSSEG5). The other is found in the DL-DB area of the DSMON process stack and is used by the DS IO ("lower") level (DSIOM, DSMISC, IODS0, IODSTRM0). Do not confuse them!

## DS CONTROL BLOCK (DSCB)

A DS Control Block exists for each DS service in use by a process. Each DSOPEN (for a :DSLIN, FOPEN of a remote file, POPEN, etc.) creates a DSCB, and the corresponding DSCLOSE deletes the DSCB. The DSCB holds control information specific to a service and provides space for the header and appendage of messages relating to the service. There are three sections in the DSCB:

- . Miscellaneous control information
  - . a pointer to the DSLCB for the remote system
  - . three words used for messages to RTE (HP1000) remotes
  - . four words used for PTOP slave processing
- . Message header - built by MANAGEWRITECONV for each request
  - . message identification (class and stream type)
  - . routing information (from and to processes)
  - . various lengths (headlength, dsdatalength)
  - . various status flags (rejection, continuation, etc.)
- . Message appendage - supplied by the caller of MANAGEWRITECONV contains request specific information (such as FOPEN parameters). See Message Formats for details.

The DSCB is always allocated as a 153 word block to hold the largest appendage. Normally there will be unused space after the appendage.

-----  
TERMINAL IOQ FIELDS AND DEFINITIONS  
-----

QFLAG - Flags and request state.

ABORT            Abort this request and return an error indication to  
                 the caller.

SPECIAL         Special handling is to be applied to this request. Has  
                 no meaning for terminal requests.

DIAGNOSTIC      This is a request from a diagnostic subsystem. Not used  
                 by terminal system.

SYSBUFERS       Target is an index relative to the SBUF table of the  
                 data buffer.

IOWAKE          Wake caller on completion of request.

BLOCKED         Blocked I/O. The caller is waited in ATTACHIO until the  
                 request is completed. Implies wake.

COMPLETED      Request has been completed and caller woken if requested.

DATAFRZN        If set then the data segment has been frozen in memory.  
                 Set by MAM when a MAKEPRESENT request is successfully  
                 completed.

MAMERRD         An error has occurred in trying to make the target data  
                 segment present and freeze it in core.

READERERRORS   This field contains a code specifying the resulting  
                 status on a read termination.  
                 0 - no error  
                 1 - read terminated on special read termination  
                        character  
                 2 - read completed because break was enabled and  
                        detected and allowed.  
                 3 - read data lost because of no TBUFS available,  
                        PTAPE swing buffer write not completed in time  
                        or term=11 and char following DC2 was not a CR.  
                 4 - character lost because interrupt not service  
                        before next character was input  
                 5 - read parity error occurred and parity checking  
                        enabled  
                 6 - read timed out  
                 7 - block mode read timed out

TERMINAL IOQ (CONT.)

- 
- RPLEVEL Request preempt level. If the preempt type of the request was zero then this is the value of TMODE when the request was queued, otherwise it is the preempt type of the request.
- 0 - terminal in normal mode and non preemptive request
  - 2 - normal request, terminal was in console mode when the request was queued
  - 3 - soft preemptive, preempt reads with no data input
  - 4 - hard preemptive, preempt all non preemptive requests
- QLINK - SYSDB relative pointer to the next IOQ element. Points to the first word of the next element.
- QLDEV - Logical device number.
- QLDEVN Logical device number
- QMISC - Request state and flags
- FLUSH (FL) This flag is set when a control Y is detected and accepted while this request was waiting or being processed. Causes reads and writes to be successfully completed, although no I/O takes place.
- READSTOP Stop read operation if not zero.
- 0 - null or no stop
  - 1 - break has been detected and is allowed
  - 2 - subsystem break has been detected and is allowed
  - 3 - request has been preempted
  - 4 - read operation has been timed out
  - 5 - request has been aborted
  - 6 - block mode read has timed out
- NOTE: BIT 10 is NO STOP bit; suppresses aborts and prompts
- RSTATE Request state. Any codes not described below are unused.
- 0 - Request not started or new.
  - 1 - Request has been started. Reads or writes may be waiting for the current write to finish to be continued.
  - 2 - A read operation is in progress.
  - %43 - A read operation has been completed but the data has not been transferred to the callers buffer.
  - %44 - A read operation has been stopped. The cause and corresponding action to be taken is identified by the STOPREAD field in QMISC.
  - 5 - Read initiation conditions have been checked and the read can be started as soon as the current operation (usually a write) is completed.
  - %30 - Waiting (because 270 bytes tanked or no TBUFs) to enter a CRLF because a post space write follows a previous prespace write.

TERMINAL IOQ (CONT.)

-----

- %31 - Waiting (because 270 bytes tanked or no TBUFs) to enter prespace carriage control bytes.
- %32 - Waiting (because 270 bytes tanked or no TBUFs) to enter callers data into terminal buffers.
- %33 - Waiting (because 270 bytes tanked or no TBUFs) to enter post space carriage control bytes.
- %34 - %37 Correspond to states %30 - %33 but waiting to enter an ENQ for the 2640/44. When the ENQ has been entered into the TBUF, the state reverts to the current state -4.

STACKFLAG(SF) If the QADDR is the offset from DB to target address, otherwise QADDR is offset from DST base.

QDSTN - Contains the data segment number of the target data area.

QADDR - Offset to the target data area in the data segment or bank. For PTAPE reads, this word contains an SBUF index to the first of a pair of SBUFs used to read the data into.

QFUNC - Function code. See ATTACHIO description for details.

FUNC	Function code field.	
	0 - read	%24 - enable parity
	1 - write	%25 - logged on
	2 - file open	%26 - set parity
	3 - file close	%27 - set terminal type
	4 - device close	%30 - allocate terminal
	5 - set timeout	%31 - clear flush and write
	6 - set inspeed	%32 - enable control X !!! echo
	7 - set outspeed	%33 - disable control X !!! echo
%10	- echo on	%34 - not used
%11	- echo off	%35 - PTAPE read
%12	- disable break	%36 - set/reset break mode
%13	- enable break	%37 - set/reset console mode
%14	- disable escape	%40 - set parity
%15	- enable escape	%41 - allocate terminal
%16	- disable tapemode	%42 - set terminal type
%17	- enable tapemode	%43 - return terminal type
%20	- disable timer	%44 - return outspeed
%21	- enable timer	%45 - set stop characters
%22	- read timer	%46 - change console interrupt
%23	- disable parity	%47 - speed sense
		%50 - powerfail recovery

QWBCT - Word or byte count and control returns. On initiation specifies a word count if positive or a byte count if negative. At completion of the request this location contains the actual transmission count in the same units as the call specified. Certain control requests return information through this location.

TERMINAL IOQ (CONT.)

-----  
QPAR1 - Parameter one. See first page of driver listing for details.

QPAR2 - Parameter two. See first page of driver listing for details.

NOTE: During PTAPE reads, QPAR1 and QPAR2 contain a double word disc base address of the virtual memory area where the spooled data is saved temporarily.

QSTAT - Request completion status and PCB number associated with this request.

PCBN            PCB number associated with request. If zero this IOQ element is returned by the system when the request is completed.

QUALIFIER      A code which further defines or qualifies the general status. See ATTACHIO description for details.

STATUS         General status. Indicates the current or resultant status of the request according to the following codes.  
0 - not started or awaiting completion  
1 - successfully completed  
2 - end of file detected  
3 - unusual condition  
4 - irrecoverable error

ATC/SERIES II,III FIELDS AND DEFINITIONS

-----  
DFLAG - FLAGS AND DEVICE STATE  
-----

TERMINAL      Device is a terminal

UP            If set, device is on line, has been speed sensed or has been initialized and can do I/O. If clear then in speed sense mode.

ACTIVE        If set, monitor is currently active servicing this device.

REQUEST      Service for this device was requested while the monitor was active.

SPECIH        Use special interrupt handler.

SPOOLING     Input has been requested through the PTAPE procedure.

WRTWAIT      A character or sync is in the process of being output and a completion interrupt is expected.

PAIR         Pair is set whenever no read is in progress or when the action on the next character is dependent on the previous character input or the previous state. See paircode for details on the various pair conditions.

NEWLINE      A linefeed was the last character input or output. Used to determine if a CR/LF is necessary on mode changes or at FOPEN time.

PTYCHK/  
2645K  
FLAG         Read data is to be checked for correct parity, and if incorrect a parity error indication is to be returned to the caller.

TERMCHAR     A special read termination character has been specified. The read data is to be checked and if the termination character is found the read will be terminated and the character set in the buffer. If the binaryread bit is set then this bit indicates a "transparent" read is in progress with sub system break and EOR characters in DSTOP. Both a termchar and a transparent read may be in progress simultaneously if the termchar field of QPAR2 is not zero.

-----

**BINARYREAD** A binary or transparent read was specified. If TERMCHAR is clear then a binary read is in progress. All 8 bits are transferred and no editing takes place. A binary read is terminated only when the count is satisfied. If termchar is set, then a transparent read is in progress. No editing takes place but only 7 bits are transferred. An EOR and sub system break character are held in DSTOP.

**ACKWAIT** An ENQ was sent to a 2640/44. Waiting for an ack or time out before continuing the write. Has this meaning during write operations only.

**DSTATE** Device state. Specifies the current device activity and is used to determine the next state.

- 0 - null or no activity.
- 1 - writing.
- 2 - reading.
- 3 - XON write, reading next.
- 4 - turning 202 modem to write state, next state in NXTD STATE.
- 5 - wait for less terminal activity to start read/write
- 6 - end of record (EOR) LF in progress, null state next.
- 7 - EOR CR in progress, EOR CR state next.
- %10 - EOR sync in progress, EOR CR state next.
- %11 - write being waited for a break allowed check by term.
- %12 - delete LF or delete echo character being written or start read next. Send XON to start read next.
- %13 - delete CR being written, delete LF state next.
- %14 - "!!!" or syncs being written. Next state is delete CR or saved in WAITEDSTATE if sync set.
- %15 - 1st character of a termtyp 11 read is being echoed.
- %16 - have TIP start a read operation.
- %17 - finish up read then do DSTATE operation held in NXTDSTATE.

**DLINK** - Link word for linked list of the devices waiting for service  
----- by the system IO process. If not zero or -1 (end of list) then a DIT pointer to the next device waiting.

**DIOQP** - SYSDB relative pointer to the first IOQ element in the request  
----- list for this device.

**DLDEV** - Logical device number and unit number.  
-----

**FLUSH** This flag is set whenever a break has been detected and accepted. While it is set, writes are returned completed without any I/O being done. Reads are returned with an unusual condition status, %173. It also holds off any further break service requests. It is reset with a function code 25 operation.

DIT for ATC/SERIES II,III (CONT.)

-----  
NO'CX'ECHO     if set, then "!!!" is not to be echoed when a control  
                  X is detected to delete a line.

.NO PTY        Termtyp is 8 bit in nature.(no pty set or check allowed)

UNIT           unit number of device.

LDEVN          Logical device number.

DDLTP - SYSDB relative pointer to driver linkage table (DLT).  
-----

DILTP - SYSDB relative pointer to interrupt linkage table (ILT).  
-----

DRQST - Monitor service request flags. The requests are serviced in  
----- a left to right order. The bit position determines the  
                  priority with which the request is serviced.

HANGUPTO       Hangup timeout has been completed.

DISCNCT        Dataset has disconnected (dataset ready has dropped).

CFAILTO        Timeout started when carrier failed has completed. If  
                  103 then hangup else try to turn 202 around again.

TURNT0         CB or SB is not true 5 seconds after starting the read  
                  to write turnaround on the 202. Hangup device.

HP2640T0       An ACKWAIT from an ENQ to 2640/44 has timed out. The  
                  ACKWAIT is terminated and the write restarted.

SPOOLEND       A control Y has been detected terminating PTAPE input.

SPOOLSW        Switch PTAPE input buffers.

READT0         A read operation has been timed out.

ONLINE         A colon has been input and the device speed sensed. If  
                  not connected through a dataset, initiate a log on time  
                  out.

DSETRDY        Dataset ready has been detected. Initiate a log on  
                  time out.

LOGONT0        A log on time out has occurred. The caller has not  
                  logged on. The device is hungup.

BRK            A break has been detected or SB has dropped while writing.

DIT for ATC/SERIES II,III (CONT.)

-----  
**ESC**            A control Y has been detected.

**BLOCK TO**        Block mode read has timed out before completion. Read is returned with IO timeout code.

**STAT DONE**       Logical write and associated status request have been completed for 2631B.

**DTYPE** - Terminal type and other flags.  
 -----

**TIMING**            A request to measure the time taken to complete a read operation has occurred and the time at the initiation of the read has been saved in DRTIMED. When the read is completed, the time taken will be saved in DRTIME.

**TIMEREAD**        The time required to complete a read operation is to be monitored and saved in DRTIME.

**DELECHO**        This field contains a code which specifies the character to be output when a delete character (control H) is input. Different characters are output if the word count is zero to keep the carriage at the proper place.

CODE	INPUT<>0	INPUT=0	COMMENT
0	nothing	space	terminal backspaces
1	"/"	nothing	hard copy no backspace
2	line feed	space	hard copy backspaces
3	control Y	nothing	2600 control Y backspaces

**FORMFEED**        If set then a form feed is output when the form feed character (%14) is to be output. If clear a LF is output in place of the form feed character. In either case, the character is preceded by an XOFF and carriage return. Usually clear for terminals which do not respond to a form feed.

**TTYTYPE**        terminal type as specified in the MPE ERS.

0 - ASR 33	9 - mini bee (HP2615)
1 - ASR 35	10 - HP2640/44
2 - ASR 37	11 - HP2640/44 & auto enter cap
3 - execuport	12 - HP2645K Katakana/Roman data
4 - datapoint	13 - term connected to packet switching
5 - Memorex	network or other computer
6 - terminet	15 - HP2635A print term (8 bit)
7 - 2741 call 360	16 - HP2635A print term (7 bit)
8 - 2741 PTTC/EBCDIC	18 - Generic CRT
	19 - HP2631B (7 bit)
	20 - HP2631B (8 bit)
	21 - HP2631B (7 bit)
	22 - HP2631B (8 bit)

-----  
ETXSENT           End of Text (ETX) character has been sent to  
                  a 2640X on a 202 to stop the terminal from  
                  listening. Carrier may now be dropped.

CONSTRNTRPT.(11:1) If set then Control A on the Console will  
                  cause PROGEN to be awoken. If clear, then  
                  Control A is ignored.

PAIRCODE        when the action to be taken on the next character is  
                  dependant on the previous state or character input then  
                  this field contains a code specifying the previous  
                  character or condition.

- 0 - no read in progress
- 1 - XOFFPAIR. Last character input was an XOFF during  
      a tapemode read on a terminet. EOR has been  
      returned and if the next char is a CR then ignore  
      it.
- 2 - DELETEDPAIR. A LF was echoed on a char delete. No  
      LF echo is needed if next char is a control H.
- 3 - ESCPAIR. Last character was an escape. Check next  
      character for an escape sequence.
- 4 - NODATAYET. A "NONSYNC" terminal read has been  
      started with echo on but no data has been input  
      yet. If the first character is a DC2 then paircode  
      is set to enter (the DC2 is not saved) otherwise  
      process as a regular character.
- 5 - NOECHO. A termtype 11 read has been started with  
      echo off. If first char is a DC2 then set paircode  
      to enter (1st char not saved) otherwise write  
      character.
- 6 - CRWAIT. A 2640/44 block mode read has  
      been satisfied and stopped and waiting for a CR to  
      complete the read. No Control X checks are made to  
      restart read.
- 7 - CRWAITLF. Same as CRWAIT but an LF is to be echoed  
      if requested after the CR is detected.  
      Continue read with echo on.
- 8 - ENTER. First character of a noecho read was a  
      DC2. If next character not a CR then set Data Lost  
      status, else set PRIMED and if Reading then restart  
      read to input data.
- 9 - DC2PAIR. Last character read was a DC2 from  
      a 2640/44. If the next character is a CR then set  
      primed, delete all data input and restart read.

DMODEM - Modem state and control flags

-----  
PREMPT        When set indicates that at least one request is  
                  preemptive. In this case a scan of the request list is  
                  made to determine which request should be processed  
                  first and if the current request is to be stopped.

DIT FOR ATC/SERIES II,III (CONT.)

-----

MTYPE            Modem Type  
                  0 - hardwired            2 - 202S  
                  1 - 103                    3 - 2002  
                  4-7 -- Same as 0-3 except no speed sensing is done.

CF                Carrier detected status from dataset.

CB                Clear to send status from dataset. Request to send delayed.

SB                Secondary receive status. Senders CB when writing.

NOSYNC            If set specifies that no delays are used by this terminal. Instead an ENQ is sent after 80 characters and the write doesn't continue until an ACK is received or a timeout occurs. Set for 2640/44 terminals.

RDCOUNTED        When set, indicates the "number of terminals doing block mode reads counter" has been incremented and when this operation completes the counter is to be decremented.

WRTCOUNTED     When set, indicates that the "number of terminals doing writes" has been incremented and when this unit completes its operation the counter is to be decremented.

PRIMED            When set indicates an "ESC D" sequence has been written or a DC2 has been received by a NOSYNC terminal. Before any read operation is initiated to a primed terminal to do a block mode read, the number of terminals doing I/O must be less than 13. If it is greater then a request to start the read is queued.

TMODE            Terminal Mode.  
                  0 - normal  
                  1 - break mode  
                  2 - console mode  
                  3 - console mode and return to break mode

LPLEVEL          Preempt level of last request. If preempt level of new request is higher then generate a CR/LF.  
                  0 - normal request  
                  1 - Not Used  
                  2 - normal request with terminal in console mode  
                  3 - soft preempt (preempt reads with no input yet)  
                  4 - hard preempt (preempt all requests)

DSPEED - Multiplexor speed and other flags.  
-----

TAPEMODE         Input from paper tape. No characters are emitted in response to delete commands or at end of record.

-----  
RESTART

If set indicates that a write completion interrupt has occurred while the terminal buffers were being filled. The filling procedure restarts the write by issuing a SYNC. During a read if this bit is set, the read is to be restarted when a CR is detected because a control X deleting the line was detected.

DIT for ATC/SERIES II,III (CONT.)

- 
- SYNC            If set and DSTATE=Repeating then SCOUNT contains the number of SYNC characters to be output after the completion of the current operation. If clear and DSTATE=Repeating, then SCOUNT contains the number of "!" remaining to be output in response to a Control X.
- ECHO            If set specifies that characters read during input are to be echoed if the device is operating full duplex.
- SPDSENSING     If set indicates that the device is in the speed sensing mode. When in the speed sensing mode a control has been sent to the multiplexor connecting the main channel to the diagnostic channels.
- ESC             Control Y breaks have been enabled through an FCONTROL call.
- OUTSPEED       A code used to determine the baud rate and character size of the data output.
- |                                     |            |
|-------------------------------------|------------|
| 0 - 240 CPS or not determined       | 4 - 30 CPS |
| 1 - 240 characters per second (CPS) | 5 - 15 CPS |
| 2 - 120 CPS                         | 6 - 10 CPS |
| 3 - 60 CPS                          | 7 - 14 CPS |
- FILLING        Set when IOTERMO is putting data into TBUFS. If the last TBUF is to be returned by TIP when this flag is set then the write is waited and DCNT is set to -2 by TIP to indicate TIP is waiting.
- BRKOK          If set then break is allowed otherwise break is ignored. Set and cleared through FCONTROL calls.
- INSPEED        A code used to determine the baud rate and character size to be used to input data. The codes have the same meaning as those specified in outspeed above.
- DCNTRL - This is a control word output to the multiplexor board to  
-----  
send control and data to the particular channel. It also contains other information in the unused areas.
- PCL            - Parity Control bit. If set, parity is enabled. If it is zero, parity is disabled.
- PARITY         This bit is ORED into the eighth bit position on all characters output. If the eighth bit is zero it represents the parity of the character output if the parity control option is selected, otherwise it represents the sense of the eighth bit output. Also represents the parity expected during a read. Set when speed sensed or by function 21.

DIT FOR ATC/SERIES II,III (CONT.)

- 
- NXTDSTATE** This is the next DSTATE to be set after a 202 modem turnaround is completed. Also contains the next DSTATE after a FINISHREAD (DSTATE=%17) operation is completed.
- PRESPLAST** If set then the last write operation was a PRESPLACE. If next write is a postspace and newline is not set then a CR/LF is output to clean up the carriage.
- DRBCT** - For read and write request, this word holds the requested  
-----  
transfer count in bytes.
- DBCNT** - During reads this word contains the number of characters input.  
-----  
During writes it contains the number of characters remaining to be written, including any already written from the current TBUF.
- DSAVE** - Holds next DSTATE after waiting and repeating DSTATEs and  
-----  
also the next byte to be output after a 202 turnaround is completed.
- WAITEDS** Holds the current DSTATE when a break is detected and an operation is suspended in order that term may check that break is allowed. It also holds the next DSTATE after "SYNC's" are output in the repeating DSTATE.
- HSTATE** Hangup state.  
0 - null or hungup  
1 - on line or normal operating condition  
2 - log on time out in progress  
3 & 5 - INITWAIT. speed sense failed, disconnected speed  
4 - DCLOSE issued, disconnect next.  
6 - hangup turn to read is in progress. the 202 dataset needed to be put in read state before hanging up.  
7 - hang up settling timeout is in progress.  
sensing delay, then reinitialize channel.
- TURN2OWRT** If DSTATE is TURN202, then if set indicates a turn to write else the turn is a turn to read.
- TURNCHAR** Holds the character to be output after the 202 is turned around from read to write.
- DSTOP** - Holds the subsystem break and end of record characters if not  
-----  
zero indicating no editing is to be applied to a read. If not zero then no editing is to be applied to the characters

-----  
input except for the following characters.

BREAKCHAR     Detection of this character causes the same action as the detection of control Y for a normal read.

EORCHAR       Detection of this character terminates input.  if the device is in tapemode or 264X doing block mode input, the read is not terminated until a CR is detected.

DWAIT - Link word for a linked list of the devices waiting to be  
-----  
started when the terminal activity decreases.  If not zero then a DIT pointer of the next device waiting.  If -1 then signifies that this device is the last one in the list.

DXCNT - Holds the number of bytes transferred so far to the TBUFs  
-----  
during a spacing or user's data transfer operation.  Used to restart the TBUF fill operation after a wait because more than 270 bytes have already been tanked.  (Valid for write.)

DBTIME- Contains the timeout length for block mode read.  (Valid for  
-----  
read.  This is the same word of the DIT as DXCNT.)

DRCNT - When read data has been saved because an EOF was returned this word contains the byte count of the saved data.

DCNT    - During a write, this word contains the number of characters  
-----  
remaining to be written from the current TBUF.  During a read it contains the number of characters remaining to fill the current TBUF or to satisfy the read count.  Set to -2 to indicate a write completed during a fill operation.  When -1 then new TBUF need to get next byte from.

DHEAD - A SYSDB relative pointer to the current TBUF being written  
-----  
from or the first TBUF of a linked list during a read.

DTAIL - A SYSDB relative pointer to the current TBUF being read  
-----  
into or the last TBUF of a linked list during a write.

DPNTR - A SYSDB relative byte index to the last byte written or  
-----  
to last byte read.  During a read if a new buffer is to be gotten to save the current byte input then this pointer is set to -1.

DIT FOR ATC/SERIES II,III (CONT.)

-----  
DRPTR - When not zero, this word points to a linked list of TBUFs  
----- which contain the data saved from a read which returned an  
EOF requesting the read to be saved.

DLAST - Holds the default terminal type, parity save data and  
----- preconfigured speed code.

TERMT           Default terminal type. The terminal is set to this type  
                  when it is speed sensed.

BWRITE           If set the last write was in binary mode and PTYSAVE  
                  contains the original parity control and sense bits.

PTYSAVE          Holds the PTYCNTRL and parity bits during a binary write  
                  when parity generation is disabled and the parity sense  
                  is set to zero.

NEWFORM          Last carriage control was a form feed.

DSPEED           Preconfigured default speed code. See OUTSPEED  
                  for definition.

DTBLK - Link word for a linked list of the devices waiting for a TBUF  
----- to be available. If not zero or -1 (end of list) then a DITP  
                  pointer of the next device waiting.

DNXTB - Holds the pointer to a TBUF allocated to a device which has  
----- been waiting. Used to insure that a waiting device gets at  
                  least one TBUF when it comes to the top of the TBUF waiting  
                  list.

DRTIME- During a times read, this is the reading of the timer at  
----- the initiation of the read. After a timed read is completed,  
                  the time in 1/100 of a second is saved in DRTIME as a  
                  single word. If it is -1 then the time was greater than 32K.

DRTMAX- When a read operation time out is requested, this quantity  
----- represents the maximum time in seconds allowed for the read  
                  to be completed.

DSYNC - CR and LF SYNC counts and the current SYNC count  
-----

LFSYNC           Contains the number of SYNCs to be issued after a carriage  
                  return is output. If >7, then actual count will be (N-6)\*5

DIT FOR ATC/SERIES II,II (CONT.)

-----  
CRSYNC            Contains the number of SYNCs to be issued after a carriage return is output. If >7, then actual count will be (N-6)\*5.

SCOUNT            SYNC COUNTER. Represents the number of SYNCs remaining to be issued after the current SYNC character is completed. This field also holds the number of "!"'s remaining to be echoed after a control X is input.

NOTE - Holds 80 minus the number of characters written since the last read or ENQ for 2640/44 terminals. When this count goes to zero, an ENQ is inserted in the write stream.

DBREAK- On broken reads, this word holds a pointer to an IOQ element which contains the count, head, tail and DPNTR pointers used to restart the broken read.

DTRLX - Holds read and data set time out request indexes.  
-----

2640TRLX        holds the timer request index for 2640/44 block mode reads and ENQ/ACK time outs.

READTRLX        holds logon, hangup and read time out request indexes.

DDSET - Holds the TRLX indexes for the timeouts associated with the data set control operations.  
-----

CFAILTRLX       Holds the TRLX index to time out loss of carrier detect

TURNTRLX        Holds the TRLX index to time out turn the 202 to write  
-----

.LOGONTYPE- indicates type of logon type to this terminal

0= :DATA  
1= :JOB  
2= :HELLO

.XONWAIT - XOFF has been received during write, waiting for XON to continue. This bit is set when a write is paused by a CONTROL S.

.AUTOEJECT- 2631B will skip over perforations.

.CFAILCNT - carrier fail detect count

.MCODE - Monitor function and control code.

.(13:5) - Function

0 - Null or no monitoring  
1 - Call help  
2 - Monitor activity  
3 - Form Delta time histogram  
7 - Monitor calls/counts/initiations

DIT for ATC/SERIES II,III (CONT.)

-----

- .(10:1) - Apply above to DSET1,DSET2 and DSETCONTROL
- .(11:1) - Apply above to TIP
- .(12:1) - Apply above to TERM

DMMTIM - 2 words used for timing statistics

-----

DMISC - miscellaneous bit fields:

-----

- .REQSTAT - requesting 2631B status
- .ESCSEQCNT- index into escape sequence for 2631B and VIEW

During PTAPE reads, several of the DITP words are used for different purposes than those in a normal read. The words and their use are listed below.

DBCNT - A 16 bit logical quantity representing the total number of characters input during this PTAPE read.

DCNT - SYSDB relative pointer to the base of the SBUF currently being used to hold the data as it is input.

DHEAD - SYSDB relative pointer to the base of the SBUF to be written to virtual, memory or the pointer to the buffer to be used when the current one is full.

DTAIL/

DPNTR- Double word logical disc address to the area where the next SBUF is to be written in virtual memory when it is full or the PTAPE read is terminated.

DIT for ATC/SERIES II,III (CONT.)

-----  
 TERMINAL SPEED ENCODING

The default speed code set in the DIT will be used to initialize both the input and output speeds. This parameter will be used to determine the speed when an FCONTROL 37 (Allocate Terminal) is issued which does not specify a speed.

CODE (Future rel)	SPEED (Baud)	CODE (SERIES II/III)
0	Undefined	0
1	Externally Clocked	
2	50	
3	75	
4	110	6
5	134.5	7
6	150	5
7	200	
8	300	4
9	600	3
10	1200	2
11	4800	1
13	7200	
14	9600	
15-63	Reserved for future expansion	

The default speed code will be set in word %27 bits 10 thru 15 of the terminal DIT.

DIT INFORMATION

-----

0 - DFLAG

- .TERM (0:1) - SET IF DEVICE IS A TERMINAL
- .UP (1:1) - SET IF DEVICE IS ON LINE AND HAS BEEN SPEED SENSED,  
OR HAS BEEN INITIALIZED (BY ALLOCATING TERMINAL)  
AND READY TO DO IO
- .ACTIVE (2:1)- SET IF IOTERM0 IS CURRENTLY ACTIVE SERVICING THIS  
TERMINAL
- .REQUEST (3:1)- SET IF SERVICE FOR THIS TERMINAL IS REQUESTED  
WHILE IOTERM0 IS ACTIVE
- .SPECIH (4:1) - SET IF SPECIAL INTERRUPT HANDLER IS USED, NOT  
APPLICABLE
- .SPOOLING (5:1) - A READ OPERATION TO USE SYSBUF HAS BEEN REQUESTED  
THROUGH THE PTAPE PROCEDURE
- .MODACTIVE (6:1) - SET IF SIO PROGRAM TO CONTROL MODEMS IS  
CURRENTLY ACTIVE
- .PAIR (7:1) - SET (1) WHEN NO READ IS IN PROGRESS, OR (2) DURING  
READING, THE NEXT CHARACTER INPUT MAY REQUIRE SOME  
SPECIAL ACTION, SEE PAIRCODE FOR DETAILS
- .NEWLINE (8:1) - SET IF THE LAST CHARACTER OUTPUT IS A LF, USED  
TO DETERMINE IF A CR/LF IS NECESSARY DURING  
MODE CHANGES OR AT FOPEN TIME
- .PTYCHK (9:1) - SET IF PARITY CHECKING/GENERATION IS ENABLED, ODD/  
EVEN PARITY IS DETERMINED BY ODDPTY IN DCNTRL
- .TERMCHAR (10:1) - SEE BINREAD
- .BINREAD (11:1) --  

TERMCHAR	BINREAD	
-----	-----	
0	0	REGULAR READ
0	1	BINARY READ IN PROGRESS, THE READ IS ONLY TERMINATED WHEN THE REQUESTED BYTE COUNT IS SATISFIED
1	0	SPECIAL EOR CHARACTER IS SPECIFIED IN QP2 TO TERMINATE READ
1	1	TRANSPARENT READ IN PROGRESS, NO EDITING IS PERFORMED ON INPUT DATA, READ IS TERMINATED BY EOR CHARACTER SPECIFIED IN DSTOP OR QP2 OR SUBSYS BREAK CHARACTER IN DSTOP
- .ENQACKWAIT (11:1) - DURING WRITE, BIT 11 IS SET WHEN THE CURRENT  
CHANNEL PROGRAM SUSPENDS THE WRITE BY SENDING  
AN ENQ AND THEN WAITS FOR AN ACK FROM THE  
TERMINAL

.DSTATE(12:4) - DEVICE STATE OF THE TERMINAL, SPECIFIES THE CURRENT ACTIVITY AND DETERMINES THE NEXT STATE

- 1 - WRITING
- 2 - READING
- 4 - TURN202; CURRENTLY TURNING AROUND THE 202 MODEM TO DO READ OR WRITE, NEXT DSTATE IS IN DCNTRL.NXTDSTATE
- 6 - EORLF; END OF RECORD CARRIAGE CONTROL IN PROGRESS, NULL STATE NEXT
- 7 - SPDSENSW -- SPEED SENSE SIO IN PROGRESS
- %10 - EORSYNC
- %11 - WAITED; READ OR WRITE OPERATION BEING SUSPENDED, WAITING FOR IOTERMO TO CHECK IF BREAK IS ALLOWED
- %14 - REPEATING; "!!!" BEING WRITTEN AFTER CONTROL X IS DETECTED, EORLF NEXT TO OUTPUT CR/LF
- %16 - MODEMSIO; CHANNEL PROGRAM CURRENTLY ACTIVE IN SETTING UP THE ADCC MODEM CONTROL LOGIC. WHEN THE CHANNEL PROGRAM COMPLETES, IF DCNTRL.DOMOD IS SET, A NEW CHANNEL PROGRAM IS STARTED TO SET THE MODEM LOGIC TO A NEW SET OF CONDITIONS. THE NEXT DSTATE IS IN NXTDSTATE.
- %17 - FINREAD; FINISH UP READ OPERATION AND PERFORM THE DSTATE INDICATED IN NXTDSTATE.

- 1 - DLINK  
LINK WORD FOR A LINKED LIST OF DEVICES WAITING FOR SERVICE BY THE SYSTEM I/O PROCESS.  
0 => NONE WAITING  
-1 => LAST DEVICE ON LINKED LIST  
DITP -- A POINTER TO THE DIT OF THE NEXT WAITING DEVICE
- 2 - DIOQP  
SYSDB RELATIVE POINTER TO THE 1ST IOQ ELEMENT IN THE SERVICE REQUEST LIST FOR THIS DEVICE
- 3 - DLDEV  
.FLUSH (0:1) - SET WHEN A BREAK HAS BEEN DETECTED AND ACCEPTED. AS LONG AS IT REMAINS SET, ALL WRITE REQUESTS ARE RETURNED AS COMPLETED WITHOUT ANY ACTUAL I/O BEING PERFORMED. READS ARE RETURNED WITH AN UNUSUAL CONDITION STATUS, %173.  
.NOCXECHO (1:1) - IF SET, THEN "!!!" IS NOT ECHOED WHEN A CONTROL X TO DELETE A LINE HAS BEEN DETECTED  
.RDFLUSH (2:1) - NO TBUFS; FLUSH READ, WAIT FOR EOR  
.LDEVN (8:8) - LOGICAL DEVICE NUMBER  
DO STAT REQ (3:1) - SET WHEN A STATUS REQUEST IS NEEDED FROM A 2631B REMOTE SPOOLED PRINTER.  
SYNCSTATE (4:4) - SAVES SYNC CHARACTER INTERRUPT CODE FOR HALF DUPLEX MODES.  
.ABORWRT (5:1) - WRITE SIO HAS BEEN ABORTED
- 4 - DDLTP  
SYSDB RELATIVE POINTER TO THE DRIVER LINKAGE TABLE (DLT)
- 5 - DILTP  
SYSDB RELATIVE POINTER TO INTERRUPT LINKAGE TABLE (ILT)

6 - DRQST

REQUESTS FOR IOTERMO SERVICE THAT HAVE BEEN GENERATED BY TIP.  
THE REQUESTS ARE SERVICED IN A LEFT TO RIGHT ORDER, SO THE BIT  
POSITION DETERMINES THE REQUEST PRIORITY.

- .HANGUP (0:1) - DATASET HANGUP TIMEOUT HAS BEEN COMPLETED
- .DISCNCT (1:1) - DATASET HAS BEEN DISCONNECTED (CC HAS DROPPED)
- .CFAILTO (2:1) - TIMEOUT FOR CARRIER FAIL HAS BEEN COMPLETED,  
HANGUP A 103 MODEM OR TRY TO TURNAROUND A 202.
- .TURNTO (3:1) - CB OR SB FROM THE 202 MODEM DID NOT RISE 5 SECONDS  
AFTER STARTING THE "READ TO WRITE TURNAROUND",  
HANG UP THE DATASET.
- .2640TO (4:1) - A 10 SECOND TIMEOUT TO WAIT FOR AN ACK FROM THE  
TERMINAL HAS EXPIRED, TERMINATE THE WAIT AND  
RESTART THE WRITE OPERATION
- .SPOOLSW (6:1) - ONE OF THE TWO SYSBUFS USED FOR PTAPE READ HAS  
BEEN FILLED, SWITCH THEM SO THAT IT CAN BE EMPTIED  
ONTO DISC.
- .SPOOLEND (7:1) - A CONTROL Y TO TERMINATE PTAPE READ HAS BEEN  
DETECTED
- .READTO (8:1) - A READ OPERATION HAS BEEN TIMED OUT
- .ONLINE (9:1) - ALSO SPFOUND, A CR HAS BEEN INPUT AND SPEED  
SENSED, INITIATE A LOG ON TIMEOUT
- .DSETRDY (10:1) - DATASET READY (CC) HAS BEEN DETECTED, INITIATE  
A LOGON TIMEOUT
- .LOGONTO (11:1) - A LOGON TIMEOUT HAS EXPIRED AND THE CALLER STILL  
HAS NOT LOGGED ON; HANGUP THE DEVICE
- .BRK (12:1) - A BREAK HAS BEEN DETECTED, OR SB FROM THE DATASET HAS  
DROPPED DURING A WRITE OPERATION
- .SSBRK (13:1) - A SUBSYSTEM BREAK HAS BEEN DETECTED
- .BLOCKTO (14:1) - BLOCK MODE READ HAS TIMED OUT
- .STATDONE (15:1) -

7 - DTYPE

- .TIMING (0:1) - SET IF THE TIME REQUIRED TO DOMplete THE CURRENT  
READ OPERATION IS TO BE RECORDED, THE STARTING  
TIME HAS BEEN RECORDED IN DRTIME, WHEN THE READ  
IS COMPLETED, THE ELAPSED TIME WILL BE SAVED IN  
DRTIME
- .TIMEREAD (1:1) - SET WHEN THERE IS A REQUEST TO MEASURE THE TIME  
REQUIRED TO COMPLETE A READ OPERATION, CAUSES  
TIMING TO GET SET WHEN THE READ IS INITIATED.
- .DELECHO (2:2) - THIS FIELD CONTAINS A CODE WHICH SPECIFIES THE  
REQUIRED ACTION WHEN A CONTROL H IS DETECTED
- .FORMFEED (4:1) - SET FOR TERMINALS THAT RESPOND TO A FORMFEED, IF  
CLEAR, A LF IS SENT IN PLACE OF THE FF CHARACTER;  
THE CHARACTER TO BE OUTPUT (FF OR LF) IS PRECEDED  
BY A XOFF AND CR.
- .TTYTYPE (5:5) - TERMINAL TYPE, A SUBSET OF THE SERIES III TERM TYPES
- .WAITXON (10:1) - WAITING FOR XON
- .CONSINTRPT (11:1) - SET IF CONTROL A CAN BE ACKNOWLEDGED WHEN THE  
TERMINAL IS USED AS A SYSTEM CONSOLE

- .PAIRCODE (12:4) - WHEN THE NEXT INCOMING CHARACTER MAY REQUIRE SPECIAL ACTION, THIS FIELD CONTAINS A SPECIAL CODE SPECIFYING THE CONDITIONS AND ACTIONS TO BE TAKEN:
  - 0 - NO READ IN PROGRESS
  - 1 - CRWAIT; A BLOCK MODE READ HAS BEEN SATISFIED AND STOPPED, NOW WAITING FOR A CR TO COMPLETE THE READ
  - 2 - CRWAITLF; SAME AS CRWAIT BUT AFTRE THE CR IS DETECTED, A LF IS TO BE ECHOED IF REQUESTED
  - 3 - NOECHO; A TERMTYPE 11 READ HAS BEEN STARTED WITH ECHO OFF, IF THE FIRST INCOMING CHARACTER IS A DC2, THEN A BLOCK MODE READ IS ABOUT TO BEGIN, OTHERWISE THE CHARACTER IS TO BE ECHOED BACK TO THE TERMINAL AND ECHO TO BE TURNED BACK ON.
  - 4 - DC2PAIR; THE LAST CHARACTER READ WAS A DC2, IF THE NEXT CHARACTER IS A CR AND IF OWN DC1/DC2 HANDSHAKE IS ENABLED, THE READ OPERATION WILL BE COMPLETE; IF THE NEXT CHARACTER IS A CR AND OWN DC1/DC2 HANDSHAKE DISABLED, THEN THE CR IS IGNORED AND READ WILL CONTINUE.
  - 5 - NODATAYET; A REGULAR READ HAS BEEN STARTED WITH ECHO ON.
  
- 8 - DMODEM
  - .PREMPT (0:1) - WHEN SET BY ATTACHIO, AT LEAST ONE PENDING REQUEST IS PREEMPTIVE
  - .MTYPE (1:3) - MODEM TYPE:
    - 0 - HARDWIRED TERMINAL
    - 1 - 103 MODEM
    - 2 - 202C MODEM
    - 3 - 2002 MODEM
    - 4-7 => SAME AS 0-3, BUT NO SPEED SENSING (6&7 NOT CURRENTLY SUPPORTED)
  - .CF (4:1) - CURRENT CARRIER DETECT STATUS FROM MODEM
  - .CB (5:1) - CURRENT CLEAR TO SEND STATUS FROM MODEM
  - .SB (6:1) - CURRENT SECONDARY RECEIVE STATUS FROM MODEM
  - .NOSYNC (7:1) - SET FOR HP263X, HP264X TERMINALS; INDICATES THAT NO DELAYS BETWEEN CHARACTERS ARE NECESSARY FOR THIS TERMINAL, INSTEAD, AN ENQ IS SENT AFTER EVERY 80 CHARACTERS AND THE WRITE OPERATION IS SUSPENDED UNTIL AN ACK IS RECEIVED OR A 10 SECOND TIMEOUT OCCURS.
  - .PRIMED (10:1) - INDICATES THAT A DC2 HAS BEEN RECEIVED FROM THE TERMINAL DOING A FAST READ. A BLOCK MODE READ IS IN PROGRESS.
  - .TMODE (11:2) - TERMINAL MODE:
    - 0 - NORMAL
    - 1 - BREAK MODE
    - 2 - CONSOLE MODE
    - 3 - CONSOLE MODE AND RETURN TO BREAK MODE
  - .LPLEVEL (13:3) - PREEMPT LEVEL OF LAST REQUEST, IF PREEMPT LEVEL OF THE NEW REQUEST IS HIGHER, CR/LF IS TO BE OUTPUT TO THE TERMINAL:
    - 0 - NORMAL REQUEST
    - 2 - NORMAL REQUEST WITH TERMINAL IN CONSOLE MODE
    - 3 - SOFT PREEMPT (PREEMPT READ OPERATION THAT HAS NOT INPUT ANY DATA YET)

## 9 - DSPEED

- .TAPEMODE (0:1) - CURRENT INPUT IS FROM PAPER TAPE, INCOMING CHARACTERS ARE TRANSPARENT
- .RESTART (1:1) - WHEN THE TERMINAL IS IN TAPEMODE OR BLOCK MODE READ AND A CONTROL X HAS BEEN DETECTED, PAIRCODE IS SET TO CRWAIT TO WAIT FOR A CR T TERMINATE THE READ, AT WHICH TIME THE READ IS TO BE RESTARTED
- .ECHOON (2:1) - ECHO WAS TURNED OFF, REENABLE IT FOR CURRENT OPERATION
- .ECHO (3:1) - IF SET, ALL INCOMING CHARACTERS ARE TO BE ECHOED IF OPERATING IF FULL DUPLEX MODE
- .SPDSENSING (4:1) - SET IF CURRENTLY IN SPEED SENSE MODE, THE FIRST PORTION OF A POSSIBLE CR HAS BEEN IDENTIFIED AND WAITING TO RECEIVE THE REST OF THE CHARACTER.
- .SSBRKOK (5:1) - SUBSYSTEM BREAKS HAVE BEEN ENABLED VIA A FCONTROL CALL.
- .OUTSPEED (6:4) - CONTAINS AN ADCC CODE FOR THE CURRENT OUTPUT BAUDRATE; ADCC CODES FOR DIFFERENT BAUDRATES:
  - % 7 - 240 CPS
  - %10 - 960 CPS
  - %11 - 480 CPS
  - %13 - 120 CPS
  - %15 - 30 CPS
  - %16 - 15 CPS
  - %17 - 10 CPS
- .RESTARTSPDS (10:1) - RESTART IDLE WAIT OR SPEEDSENSE AFTER CURRENT CHANNEL PROGRAM COMPLETES.
- .BRKOK (11:1) - BREAK IS ALLOWED IF SET, OTHERWISE IGNORED. SET AND CLEARED VIA FCONTROL CALLS.
- .INSPEED (12:4) - CANTAINS AN ADCC CODE FOR THE CURRENT INPUT BAUDRATE

## 10 - DCNTRL

- .HIOPWAIT (0:1) - THE ACTIVE CHANNEL PROGRAM CANNOT BE HALTED IMMEDIATELY WHEN AN HIOP INSTRUCTION WAS EXECUTED; A SUBSEQUENT INTERRUPT WILL OCCUR AND SOFTWARE IS TO IGNORE IT.
- .LFLAST (1:1) - A POSTSPACE LF HAS BEEN TANKED INTHE WRITE TBUF'S
- .SPDSIO (2:1) - SET WHEN AN IDLE WAIT CHANNEL PROGRAM IS ACTIVE, WHEN THE TERMINAL IS NOT ACTIVE DOING READ/WRITE, AN IDLE WAIT PROGRAM IS STARTED TO LISTEN TO THE KEYBOARD.
- .DONXTMOD (3:3) - AN ATTEMPT TO START A CHANNEL PROGRAM TO CONTROL THE ADCC MODEM LINES FAILED BECAUSE A PREVIOUS MODEM CONTROL PROGRAM IS STILL ACTIVE. THIS FIELD CONTAINS A CODE SPECIFYING THE CONTROL TO BE DONE WHEN THE PREVIOUS CHANNEL PROGRAM COMPLETES AND THE NEW ONE CAN BE STARTED.
- .DOMOD (6:1) - ATTEMPT TO START A MODEM CONTROL CHANNEL PROGRAM FAILED BECAUSE A PREVIOUS ONE IS STILL ACTIVE; WHEN IT COMPLETES, START THE MODEM CONTROL CHANNEL PROGRAM AS SPECIFIED IN DONXTMOD

- .PTYON (7:1) - SPECIFIES PARITY GENERATION ON WRITE DATA AND PARITY CHECKING ON READ DATA
  - .ODDPTY (8:1) - IF SET, ODD PARITY IS USED FOR GENERATION AND CHECKING, OTHERWISE EVEN PARITY IS USED.
  - .NXTDSTATE (9:4) - CONTAINS THE NEXT DSTATE TO BE USED WHEN A 202 MODEM TURNAROUND IS COMPLETED, ALSO CONTAINS THE NEXT DSTATE WHEN A FINISHREAD (DSTATE=%17) OPERATION IS COMPLETED.
  - .PRESPLAST (13:1) - INDICATES THAT THE LAST WRITE OPERATION WAS A PRESPLAST WRITE, IF THE NEXT WRITE IS POSTSPACE AND NEWLINE IS NOT SET THEN A CR/LF IS OUTPUT TO START WRITING A NEW LINE.
  - .FILLING (14:1) - INDICATES THAT IOTERMO IS CURRENTLY TRANSFERRING WRITE DATA FROM THE CALLER'S STACK INTO A TBUF.
  - .ADDENQ (15:1) - IOTERMO IS CURRENTLY PUTTING AN ENQ INTO THE TBUF AFTER 80 BYTES OF WRITE DATA HAVE BEEN TANKED.
- 11 - DRBCT  
HOLDS THE REQUESTED READ/WRITE BYTE COUNT
- 12 - DBCNT  
DURING A READ OPERATION, IT SPECIFIES THE NUMBER OF BYTES THAT HAVE BEEN READ. DURING A WRITE OPERATION, IT SPECIFIES THE NUMBER OF BYTES REMAINING TO BE WRITTEN.
- 13 - DSAVE
- .WAITEDSTATE (0:4) - HOLDS THE CURRENT DSTATE WHEN A BREAK IS DETECTED AND THE CURRENT OPERATION SUSPENDED SO THAT IOTERMO MAY CHECK THAT BREAK IS ALLOWED, IF DISALLOWED, THE CURRENT DSTATE WILL BE RESUMED.
  - .HSTATE (4:3) - THE MODEM HANGUP STATE:
    - 0 - NULL OR HUNGUP
    - 1 - ON LINE OR NORMAL OPERATION
    - 2 - LOGGON; LOG ON TIMEOUT IN PROGRESS
    - 4 - DCLOSE ISSUED, DISCONNECT NEXT
    - 6 - HANGUPTURN; HANGUP TURNAROUND TO READ IN PROGRESS, THE 202 MODEM NEEDS TO BE IN A READING STATE BEFORE HANGUP
    - 7 - HANGUP SETTLING TIMEOUT IN PROGRESS
  - .TURN202 (7:1) - WHEN THE 202 MODEM IS BEING TURNAROUND (DSTATE=TURN202), A 1 INDICATES TURNAROUND TO WRITE, A 0 INDICATES TURNAROUND TO READ.
  - .DELACK (8:1) - AN ENQ HAS JUST BEEN SENT DURING A WRITE WHEN A BREAK WAS DETECTED, DELAY THE NEXT WRITE FOR 0.5 SECOND TO AVOID OVERRUNNING THE TERMINAL.
  - .CC (9:1) - THE CURRENT DATASET READY STATUS FROM MODEM
  - .BLOCKRD (10:1) - DURING A READ OPERATION, 2 CHANNEL PROGRAMS, EACH WITH ITS OWN TBUF, ARE USED TO SERVICE INCOMING DATA; THIS BIT IS SET IF THE 2ND CHANNEL PROGRAM IS CURRENTLY ACTIVE RECEIVING DATA.
  - .AUTOEJECT (11:1) - 2631B WILL SKIP OVER PERFORATIONS
  - .NOTLOGON (12:1) - IF CLEAR AND THERE IS A LOGON TIMER GOING, THEN YOU ARE IN A SPEEDSENSE MODE. IF SET AND

THERE IS A LOGON TIMER GOING, YOU THEN ARE IN  
TIMING SEQUENCE FOR A MODEM.

.REQSTAT (13:1) - REQUESTING 2631B STATUS  
.ININ (14:1) - INITIALIZING TERMINAL PORT  
.CCON (15:1) - CC ALWAYS ON

14 - DSTOP

IF NOT ZERO, CONTAINS THE USER SPECIFIED SUBSYSTEM BREAK AND  
END OF RECORD CHARACTERS. IF THEY ARE SPECIFIED, THEN NO EDITING  
IS DONE TO THE INCOMING DATA DURING A READ.

.BRKCHAR (0:8) - DETECTION OF THIS CHARACTER DURING READING CAUSES  
THE SAME ACTION AS THAT OF A CONTROL Y.  
.EORCHAR (8:8) - DETECTION OF THIS CHARACTER TERMINATES THE READ  
AND IS INCLUDED WITH THE REST OF THE READ DATA TO  
BE TRANSFERED TO THE CALLERS STACK

15 - DWAIT

LINK WORD FOR A LINKED LIST OF DIT'S WAITING TO DO I/O WHEN THE  
TERMINAL ACTIVITY DECREASES,

0 - NONE WAITING

-1 - THIS DIT IS THE LAST ONE ON THE LIST

OTHER - A DIT POINTER TO THE NEXT DEVICE WAITING

16 - DXCNT(WRITE)/DBTIME(READ)

DXCNT (VALID DURING WRITES) INDICATES THE NUMBER OF BYTES TRANSFERRED  
SO FAR INTO TBUF'S WHEN CARRIAGE CONTROL BYTES OR DATA BYTES ARE  
BEING TANKED. USED TO RESTART THE FILL TBUF OPERATION WHEN 540  
BYTES HAVE ALREADY BEEN TANKED AND THE FILL OPERATION HAS TO BE  
SUSPENDED.

DBTIME (VALID DURING READ) - TIMEOUT PERIOD FOR BLOCKMODE READ.

17 - DRCNT

CONTAINS THE BYTE COUNT OF THE READ DATA SAVED WHEN AN EOF WAS  
DETECTED.

18 - DCNT

DURING A WRITE, IT INDECATES THE NUMBER OF CHARACTERS TO BE  
WRITTEN BY THE CURRENT EXECUTION OF THE CHANNEL PROGRAM. DURING  
A READ, IT INDECATES THE NUMBER OF CHARACTERS TO BE READ BY THE  
CURRENT CHANNEL PROGRAM. WHEN=-2, IT INDECATES THAT ALL TANKED  
DATA HAS BEEN WRITTEN OUT AND THAT IOTERMO IS INTHE MIDDLE OF  
FILLING A TBUF. FILLING A TBUF.

19 - DHEAD

A SYSDB RELATIVE POINTER TO

(1) DURING WRITE, THE CURRENT TBUF CONTAINING DATA TO BE WRITTEN,

(2) DURING READ, THE 1ST TBUF ON THE LINKED LIST OF INPUT DATA.

20 - DTAIL

A SYSDB RELATIVE POINTER TO

(1) DURING WRITE, THE LAST TBUF ON THE LINKED LIST OF TANKED DATA,

(2) DURING READ, THE CURRENT TBUF USED FOR RECEIVING DATA.

- 21 - DPNTR  
A WORD POINTER USED DURING WRITES TO INDICATE THE OFFSET WITHIN A TBUF OF THE 1ST BYTE OF DATA TO BE WRITTEN BY THE CURRENT CHANNEL PROGRAM.
- 22 - DPNTR  
A SYSDB RELATIVE POINTER TO A LINKED LIST OF TBUF'S CONTAINING THE DATA SAVED WHEN AN EOF WAS DETECTED.
- 23 - DLAST  
.TERMTYPE (0:7) - THE DEFAULT OR CONFIGURED TERM TYPE. WHEN THE TERMINAL IS SPEED SENSED, THIS IS THE TERM TYPE USED.  
.BINWRT (7:1) - SET IF THE LAST WRITE OPERATION WAS IN BINARY MODE.  
.EIGHTBITS (8:1) - SET IF THE 8-BIT PROTOCOL IS USED AND PARITY GENERATION/CHECKING IS DISALLOWED. USED FOR TERM TYPES 12 AND 15.  
.NEWFORM (9:1) - LAST CARRIAGE CONTROL WAS A FORM FEED.  
.DEFAULTSPEED (10:6) - THE ADCC CODE OF THE DEFAULT OR CONFIGURED TERMINAL BAUDRATE.
- 24 - DTBLK  
A DIT POINTER TO THE NEXT TERMINAL WAITING FOR A TBUF.
- 25 - DNXTB  
A POINTER TO A TBUF ALLOCATED TO A TERMINAL WHICH HAS BEEN WAITING; THIS IS TO INSURE THAT A WAITING TERMINAL GETS AT LEAST ONE TBUF WHEN IT COMES TO THE TOP OF THE TBUF WAITING LIST.
- 26, 27 - DRTIME  
DURING A TIMED READ OPERATION, THIS IS THE READING OF THE TIMER AT THE INITIATION OF THE READ. AFTER THE READ IS COMPLETED, THE TOTAL ELAPSED TIME IN 1/100 OF A SECOND IS SAVED IN DRTIME AS A SINGLE WORD. IF IT IS -1 THEN THE ELAPSED TIME WAS GREATER THAN 32K.
- 28 - DRTMAX  
WHEN A TIME LIMIT ON A READ OPERATION IS REQUESTED, THIS QUANTITY REPRESENTS THE MAXIMUM TIME (SECONDS) ALLOWED FOR THE READ OPERATION TO COMPLETE; IF THIS LIMIT IS EXCEEDED, THE READ OPERATION WILL BE TERMINATED.
- 29 - DSYNC  
.LFSYNC (0:4) - CONTAINS THE NUMBER OF SYNC CHARACTERS TO BE SENT AFTER A LF IS OUTPUT  
.CRSYNC (4:4) - CONTAINS THE NUMBER OF SYNC CHARACTERS TO BE SENT AFTER A CR IS OUTPUT  
.SYNBCCOUNT (8:8) - SPECIFIED THE NUMBER OF DATA CHARACTERS THAT CAN BE TANKED BEFORE AN ENQ HAS TO BE INSERTED IN THE TBUF. FOR WRITE OPERATIONS TO A 264X TERMINAL, AFTER 80 CHARACTERS HAVE BEEN SENT SINCE THE LAST ENQ OR THE LAST READ OPERATION, AN ENQ HAS TO BE SENT AND THE WRITE SUSPENDED UNTIL AN ACK IS RECEIVED.

- 30 - DBREAK  
 WHEN A BREAK WAS DETECTED DURING A READ OPERATION, THE DATA ALREADY INPUT IS SAVED AND THIS WORD CONTAINS A POINTER TO AN IOQ USED TO STORE THE BYTE COUNT, TBUF HEAD AND TAIL OF THE SAVED DATA.
- 31,32 - DTRLX  
 HOLDS TIMEOUT REQUEST INDICES  
 .2640TRLX (0:8) - HOLDS THEN INDEX OF A 10 SECOND TIMEOUT REQUEST FOR THE ENQ/ACK HANDSHAKE/BLOCK MODE TIMEOUT  
 .RREADTRLX (8:8) - HOLDS THE LOGON, HANGUP AND TIMED READ TIME-OUT REQUEST INDICES  
 .CFAILTRLX (0:8) - HOLDS THE INDEX OF A TIMEOUT REQUEST DUE TO LOSS OF CARRIER DETECT FROM THE DATASET.  
 .TURNTRLX (8:8) - HOLDS THE INDEX OF A TIMEOUT REQUEST FOR A LINE TURNAROUND ON A 202 DATASET.
- 33 - DTANKB  
 A COUNT OF THE BYTES TANKED IN THE LINKED TBUF'S; THIS COUNT IS USUALLY GREATER THAN DBCNT, THE COUNT OF BYTES REMAINING TO BE OUTPUT, BECAUSE THE DATA IN A TBUF IS SENT OUT IN BLOCKS SEPARATED BY AN ENQ.
- 34 - DMONTR  
 .LOGONTYPE (0:2)  
 .SYNCSTATE (2:2) STATE OF TANKING LF/SYNC  
 0 => TANK XOFF/CR; 1=> DETERMINE LF'S TO TANK  
 2 => TANK LF/SYNC  
 .CFAILCNT (4:6) - A COUNT OF THE TIMES WHEN LOSS OF CARRIER DETECT FROM THE DATASET IS DETECTED DURING A READ OPERATION; WHEN THE COUNT EXCEEDS 50, THE USER IS HUNG UP AND THE DATASET DISCONNECTED  
 .LFCOUNT (10:6) - NUMBER OF LF'S FOR %2NN CARRIAGE CONTROL
- 35 - DSIOPC  
 STORES THE POINTER TO THE CHANNEL PROGRAM WHICH IS TO BE STARTED WHEN A DATASET LINE TURNAROUND IS COMPLETE; THE CHANNEL PROGRAM TO BE STARTED IS EITHER FOR A READ OR WRITE OPERATION.
- 36 - DBLKTAIL  
 POINTER TO THE SECOND TBUF SEF FOR A READ OPERATION; 2 READ CHANNELPROGRAMS, EACH WITH ONE TBUF, ARE USED TO INSURE AGAINST DATA OVERRUNS DURING FAST BLOCK MODE READS.

MULTIPOINT TERMINAL DIT (CONT.)

DFLAG - Flags and SIODM state.

.ACTIVE - SIODM is currently active servicing this device.

.REQUEST - Service for this device was requested while SIODM was active.

.PREMPT - Peemptive request flag.

.IAK - Response has occurred (interrupt acknowledge flag).

.STATE - SIODM state.

DLINK - SYSDB relative pointer to the DIT for the next device requesting service or this resource.

DIOQP - SYSDB relative pointer to the DIT for the next device requesting service or this resource.

DLDEVT - Logical device number and unit number.

.LDEVNT - Logical device number of the multipoint terminal.

.UNIT - Unit number representing terminal address (group and device ID).

DDLTP - SYSDB relative pointer to Driver Linkage Table (DLT).

DILTP - SYSDB relative pointer to dummy Interrupt Linkage Table (ILT) to satisfy SIODM requirements (no real ILT is associated with multipoint terminals).

DTIME - Timer flags.

.READTOF - Read timeout has occurred.

.LOGONTOF - Log on timeout has occurred.

DMISCT - Miscellaneous flags.

.GSIN - Last character received from the terminal was the GS character.

.READEROR - Read error has occurred.

.CRITICAL - If set, IOMPTRMO will not attempt to release extra data segments previously acquired by MPMON

MULTIPOINT TERMINAL DIT (CONT.)

-----

- .FILTERCRLF - Proper editing of input data with respect to CR and LF characters has already been made.
- .MARKED - This DITT has already been processed during construction of SUPLIST.
- .WPOSTP - Current write request has been postponed.
- .READPEND - Read request is pending against this terminal.
- .DATAREADY - Input data has been received and is ready in the terminal read buffer.
- .UP - Device has been initialized through the log on procedure or has been allocated.
- .PRESPACEF - Last write operation was with a prespace request. If the next write operation is with a post space request, output CR and LF before data.
- .READTIMERF - Read timing requested and not yet in progress.
- .TIMING - Current read request is being timed.
- .BRKOK - System break is enabled.
- .SSBRKOK - Subsystem break is enabled.
- .FLUSH - This flag is set whenever break has been detected and accepted. While it is set, writes are returned completed without any I/O being done. Reads are returned with an unusual condition status %173. It also holds off any further break service requests. It is reset with a function code 25 operation.
- .LASTPREMEPT - Last request was a preemptive request.

DLDEVL

- . LOGONTYPE - 0: JOB  
                  1: SESSION  
                  2: DATA
- . WACK - If set then WACK or EOT condition has been detected and the terminal was placed in the WACK queue.

MULTIPOINT TERMINAL DIT (CONT.)

- . REJECT - If set then a terminal error has been detected and the terminal was placed in the REJECT queue.
  - . DOWN - If set then this terminal was declared down through the console operator command or the configuration file.
  - . DOWNREQ - If set then a request is pending to declare the terminal down.
  - . UPREQ - If set then a request is pending to declare the terminal up.
  - .ECHO'OFF'D - For 3270 terminals, set true if no echo print to the terminal is wanted.
  - . LDEVNL - Logical device number of the controller servicing the multipoint line.
- DDSBUF - Data segment number of the terminal read buffer.
- DWLIM - Write limit counter.
- DFORMAT
- .FORMATF - This field holds information about vertical format specification for writes obtained from P1 parameter of the IOQ element or from the first data byte.
- DNEXT - SYSDB relative pointer to the DITT for the next terminal on the same line.
- DNWRITE - SYSDB relative pointer to the DITT for the next terminal with postponed write.
- DSTATION - Flags and station number.
- .LFLUSH - This flag is set to indicate that data for this terminal already scheduled to be written from the output buffer should not be physically sent to the terminal (break or subsystem break environment).

MULTIPOINT TERMINAL DIT (CONT.)

-----

- .DISCONREQ - Request to disconnect the terminal.
- .BREAKMODE - Terminal is in break mode.
- .ATTENTERM - Terminal is in attention mode.
- .SSEMODE - Terminal is in subsystem break mode.
- .WLQUEUE - A write request was forced to be queued by MPE I/O system.
- .DJSTATE - State of terminal straps D and J.
  - 0 - Initial state.
  - 1 - Straps D and J are open or will be open before the next write.
  - 2 - Undefined D and J setting.
- .STATIONINDIT - Station number assigned to this terminal by CS.
- DFIRST - Storage for first word for ASCII writes if vertical format is specified by first data byte.
- DBCNT - Actual byte count for reads.
- DTIND - Timer indexes.
  - .READTINDEXF - Read timer index.
  - .LOGONTINDEXF - Log on timer index.
- DRTIME (DRTIMED) - During a timed read, this is the reading of the timer at the initiation of the read. After a timed read is completed, the time in 1/100 of a second is saved in DRTIME as a single word. If it is -1 then the time was greater than 32K.
- DRTMAX - When a read operation timeout is requested, this quantity represents the maximum time in seconds allowed for the read to be completed.

MULTIPOINT TERMINAL DIT (CONT.)

-----

DTYPE - Terminal type and speed.

.TERMINALTYPE - Configured terminal type. Multipoint terminal is type 14.

.SPEED - Reserved field for configured terminal speed (not used for multipoint terminals).

DWCNT - Logical/physical write counter.

DBUNMODE - Holds unedited mode characters while in break mode.

DDSHL - DST number of data segment holding "HELLO" message (or backspaced data).

DHBCNT - Byte count for "HELLO" message (or backspaced data).

DWACK - Pointer to next DIT in WACK queue.

DREJECT - Pointer to next DIT in REJECT queue.

DMOD1VER - Current version number of the multipoint terminal driver (IOMPTRMO).

DUNMODE - Unedited mode characters.

.ATTENCHAR - Attention character.

.ENDCHAR - End-of-character. (Effective as a control character is set to %137, otherwise not used).

DDSBUF2 - Data segment number of secondary read buffer.

DBCNT2 - Byte count for read if secondary read buffer is used

DGROUP

.L'WRITE'D - Set true if last I/O request was a write.

.EOS'D - Set true if a write to a 3270 terminal reaches end of screen.

MULTIPOINT TERMINAL DIT (CONT.)

---

- .ODD'BYTE'3270 - Set true if there is an odd number of bytes in a write.
- .WRITEPEND - Reserved.
- .ZERO'WRITE - Set true if no byte is transmitted in a write because of an error other than a conversation write.
- .WRITEDONE - Set true after a write issued is completed.  
GROUPINDIT - Logical group number assigned to this terminal by CS.

MULTIPOINT SUPERVISOR DIT (CONT.)

DFLAG -

DLINK - Same as for DITT

DIOQP -

DLDEVS - Logical device number and unit number.

.LDEVNS - Logical device number of the Multipoint Supervisor.

.UNIT - Unit number (always 0).

DDLTP - Same as for DITT

DILTP

DTIME -

.WACKTO If set, then WACK timeout has expired

.REJECTIO If set, then REJECT timeout expired.

DMISCS - Miscellaneous flags.

.MPOK - If set, then IOMPSO is allowed to process I/O requests against the Multipoint Supervisor.

.DUPLEX - Reserved.

.DEBUGON - If set, then DEBUG will be called from MPMON. This flag is set through the MPLINE command.

.TRACEON - Trace facility is enabled.

.TRACEOFFREQ - Trace facility is to be disabled.

.TRACEONREQ - Trace facility is to be enabled.

.SHUTNOW - Request to shut the line immediately.

.SHUTREQ - Request to shut line after all terminals are released  
New sessions are not allowed to be initiated.

.BUSYHEAD - The line write buffer contains data to be written to a terminal on the line.

MULTIPOINT SUPERVISOR DIT (CONT.)

- .MPONACT - MPMON process is active.
- .MPMONUP - MPMON process has been created and activated.
- .GENWPOSTP - A write request for one or more terminals on the line has been postponed.
- .GENDISCON - Request to disconnect the line.
- .GENWACK - If set then there is a terminal in the WACK queue.
- .GENREJECT - If set then there is a terminal in the REJECT queue.
- .COMPLREQ - Request to complete dummy read pending against the Multipoint Supervisor.

DLDEVL

- .LDEVNL - Logical device number of the controller servicing the multipoint line.
- DDITSP - SYSDB relative pointer to the DIT for the Multipoint Supervisor (DITS).
- DTBUFOFFS - Offset to the trace buffer in MPMON stack.
- DWLCON - Write limit constant.
- DNEXT - SYSDB relative pointer to the DITT for the first terminal on the line (the terminal with the lowest logical device number).
- DNWRITE - SYSDB relative pointer to the DITT for the first terminal with postpond write.
- DMOD2VER - Current version number of the Multipoint Supervisor driver (IOMPSO).
- DINBUFA - Address of the line read buffer in MPMON stack.
- DOUTBUFA - Address of the line write buffer in MPMON stack.
- DOSPEED - Output speed.
- DHEADI - Index of head entry in the line write buffer.
- DTAILI - Index of tail entry in the line write buffer.

MULTIPOINT SUPERVISOR DIT (CONT.)  
-----

DENDI - Index of last available word in the line write buffer.

DTYPE

.TERMINALTYPE - Configured terminal type. Multipoint Supervisor is type 14 (same type as multipoint terminals).

.SUPER - This device is a Multipoint Supervisor.

.DITSOK - DIT's for the multipoint terminals and the Multipoint Supervisor on this line have been rearranged and their format corresponds to standard DIT format for SIO devices.

.SPEED - Reserved field for configured terminal speed (not used for Multipoint Supervisor).

.INITDONE - If set then all multipoint terminals belonging to the same multipoint supervisor have been linked.

DMOD3VER - Current version number of the MPLINE command processor (MPMONCMD).

DMONDSTN - Data segment number of MPMON stack.

DLSPEED (DLSPEEDD) - If not equal to 0, then the line is opened with speed specified in this double word.

DWACK - Pointer to the first terminal DIT in the WACK queue.

DREJECT - Pointer to the first terminal DIT in the REJECT queue.

DWRT1

.WACKTINDEX - WACK timer index.

.REJECTTINDEX - REJECT timer index.

DCF01 through DCF67 - String of characters representing:

- a) the name of the configuration file, or
- b) the logical device number of the terminal, or
- c) terminal group and device ID.

DCONFL

.REOPEN - If set then a request for line reopening has been made.

.UPDOWNREQ - If set then a request to set the terminal UP or DOWN has been made.

MULTIPOINT SUPERVISOR DIT (CONT.)

-----  
.FALLBACK - Reserved.

.CHDUPL - Reserved.

.FORCE'SHUT - If set then a request has been made to shut the  
                  line immediately.

.DUMP'INP - Reserved.

.DUPLEX'SPEC - Reserved.

.MON'MODE - Reserved.

.UP'DOWN - If true then the terminal is to be set UP else the  
          terminal is to be set DOWN. This flag is used in  
          conjunction with .UPDOWNREQ flag.

.MSGOFF - If set then certain MTS messages are not displayed on  
          the operator console.

22.1) Disc Resident Data Structures

There are two disc resident free space data structures, the bit map and the descriptor table, for each disc volume that has a free space map, i.e. system discs and private volumes. The addresses of these data structures are kept in the disc label. The symbols that define the descriptor table and bit map are in the include file INCLDFS2.

22.1.1) Bit map

The bit map is divided up into pages, which is the physical block of the map that is read or written. At the moment, a page is defined to be one sector (128 words) long, this may be changed by changing a compile time constant. The last word of the page is a checksum for that page, all other words are data. There is a one to one correspondence between bits in the map and sectors of the disc. A one bit represents a free sector and a zero bit represents an allocated sector. The bit map is a contiguous set of pages, enough to represent the entire disc, excluding spare tracks and spare sectors.

22.1.2) Descriptor table (DT)

The descriptor table is an array of three word entries, one entry for each page of the bit map. Each entry looks like this:

```

=====
=                                     =
word 0  =  largest space  =
=                                     =
=====
=                                     =
word 1  =  starting space =
=                                     =
=====
=                                     =
word 2  =  ending space   =
=                                     =
=====
    
```

51 Thus the descriptor table looks like this:

```
52
53 -----
54 =          =  entry for page 0
55 -----
56 =          =  entry for page 1
57 -----
58 =          =  entry for page 2
59 -----
60 =          =  entry for page 3
61 -----
62           .
63           .
64           .
65 -----
66 =          =  entry for last page
67 -----
68
```

69 Each entry describes the free space on the corresponding  
70 page of the bit map. The largest space word is the size of  
71 the largest contiguous block of free space on the page, which  
72 is not at the very beginning or very end of the page. That  
73 is, the first bit physically representing the space is not the  
74 first bit of data on the page or the last bit representing the  
75 space is not the last bit of data on the page. Starting space  
76 is the number of sectors of contiguous space represented by  
77 the set of bits whose first bit is the first bit of data on  
78 the page. Ending space is the number of sectors of contiguous  
79 space represented by the set of bits whose last bit is the  
80 last bit of data on the page. The starting space and ending  
81 space fields allow looking across page boundaries, thus pre-  
82 venting fragmentation on page boundaries. Thus, if all sectors  
83 represented on a page are free, then starting and ending space  
84 will be the same and have the total number of free sectors  
85 represented on the page. Largest space will be zero, as there  
86 is no block of space that is not at the beginning or end of  
87 the page. A value of -1 for all the fields in an entry in-  
88 dicates the corresponding page is bad, either from a checksum  
89 or I/O error.

90  
91  
92

## 93 22.2) Virtual Memory Resident Data Structures

94

95 For each system disc or physically mounted private volume  
96 there is a data segment which has information about the disc  
97 free space map, the current copy of the descriptor table, some  
98 work space for the procedures while in spilt stack mode and  
99 buffers for pages of the bitmap. The DST number of the data  
100 segment for a given disc is found in the LDTX entry for that  
101 disc.

102

104 22.2.1) Disc Free Space Data Segment

156

For each system disc or physically mounted private volume in the up and running system there is a DST which contains info about the disc free space map for that disc, some work area, a copy of the descriptor table and buffers for the pages of the bit map. All symbols that define these data segments are in the include file INCLDFS1, and they are prefixed with "ds'". The structure of the data segment is as follows:

```

=====
0 (%0) = ds'ldev =
-----
1 (%1) = ds'dst =
-----

186      34 (%42) =      ds'error'status        =
187      =-----=

```

188  
189 The rest of the data segment contains tables whose size and  
190 location is dependent on the size of the disc and or the num-  
191 ber of buffers in the data segment. They are shown below just  
192 to demonstrate there relation to one another, for there ac-  
193 tual location, the pointers should be examined. The symbol  
194 "ds'array'area" defines the start of the area.

195  
196 The first table is the descriptor table, it is in the same  
197 format as the disc copy, but a dummy entry of all zeros is  
198 added before and after the table, these are needed by proced-  
199 ures "Find'Page" and "Build'Descriptor'Entry". The pointer to  
200 this table is "ds'descriptor'table", it points to the entry  
201 for page zero, not the dummy entry.

```

202
203
204
205      =====
206      =              0              =
207      =-----= dummy
208      =              0              =
209      =-----= entry

```

```

210 =                0                =
211 =====
212 =          largest space          =
213 =-----= entry for
214 =          starting space         =
215 =-----= page 0
216 =          ending space           =
217 =====
218 =          largest space          =
219 =-----= entry for
220 =          starting space         =
221 =-----= page 1
222 =          ending space           =
223 =====
224 =                :                =
225 =                :                =
226 =                :                =
227 =====
228 =          largest space          =
229 =-----= entry for
230 =          starting space         =
231 =-----= last page
232 =          ending space           =
233 =====
234 =                0                =
235 =-----= dummy
236 =                0                =
237 =-----= entry
238 =                0                =
239 =====

```

240  
241 The next table is ds'buffer'page'number table, it has a one  
242 word entry for each buffer in the data segment. Each entry  
243 contains the page number of the page currently in the corre-  
244 sponding buffer or -1 if the buffer is empty. This is pointed  
245 to by "ds'buffer'page'number".  
246

```

247 =====
248 =          buffer 0 entry          =
249 =====
250 =          buffer 1 entry          =
251 =====
252 =                :                =
253 =                :                =
254 =                :                =
255 =====
256 =          last buffer entry       =
257 =====
258
259
260

```

261 The next table is the ds'buffer'dirty table, which has a  
 262 one word entry for each buffer. A TRUE indicates the page in  
 263 the corresponding buffer is dirty, i.e. the disc copy is not  
 264 uptodate. A FALSE indicates that the buffer is clean.  
 265 If DFS was compiled with dirty buffer management turned off,  
 266 this table is not present and the ds'buffer'dirty pointer is  
 267 zero.

```

268
269 =====
270 =          buffer 0 entry          =
271 =====
272 =          buffer 1 entry          =
273 =====
274                               :
275                               :
276                               :
277 =====
278 =          last buffer entry       =
279 =====
  
```

281  
 282 The remainder of the data segment contains the buffers,  
 283 each buffer is the size of one page of the bit map, which is  
 284 currently one sector (128 words). The beginning of the buffer  
 285 area is pointed to by "ds'buffer'area" and the number of buf-  
 286 fers is the value in "ds'last'buffer'index" plus one.

```

287
288 =====
289 =                                     =
290 =                                     =
291 =                                     =
292 =          buffer 0                  =
293 =                                     =
294 =                                     =
295 =                                     =
296 =====
297 =                                     =
298 =                                     =
299 =                                     =
300 =          buffer 1                  =
301 =                                     =
302 =                                     =
303 =                                     =
304 =====
305                               :
307                               :
308                               :
309 =====
310 =                                     =
311 =                                     =
312 =                                     =
313 =          last buffer                =
  
```

```

314           =                               =
315           =                               =
316           =                               =
317           =====
318

```

319 Each of the fields of the data segment is described in the  
320 include file INCLDFS1, where they are defined. It should be  
321 noted that the following fields are just workspace, used to  
322 pass information between procedures while in spilt stack mode  
323 and have no meaning between calls to the disc free space man-  
324 agement subsystem:

```

325
326     ds'page'number           ds'word'number
327     ds'bit'number           ds'page'ptr
328     ds'starting'word'number ds'starting'bit'number
329     ds'number'of'sectors    ds'entry'type
330     ds'bit'count            ds'buffer'index
331     ds'disc'address
332

```

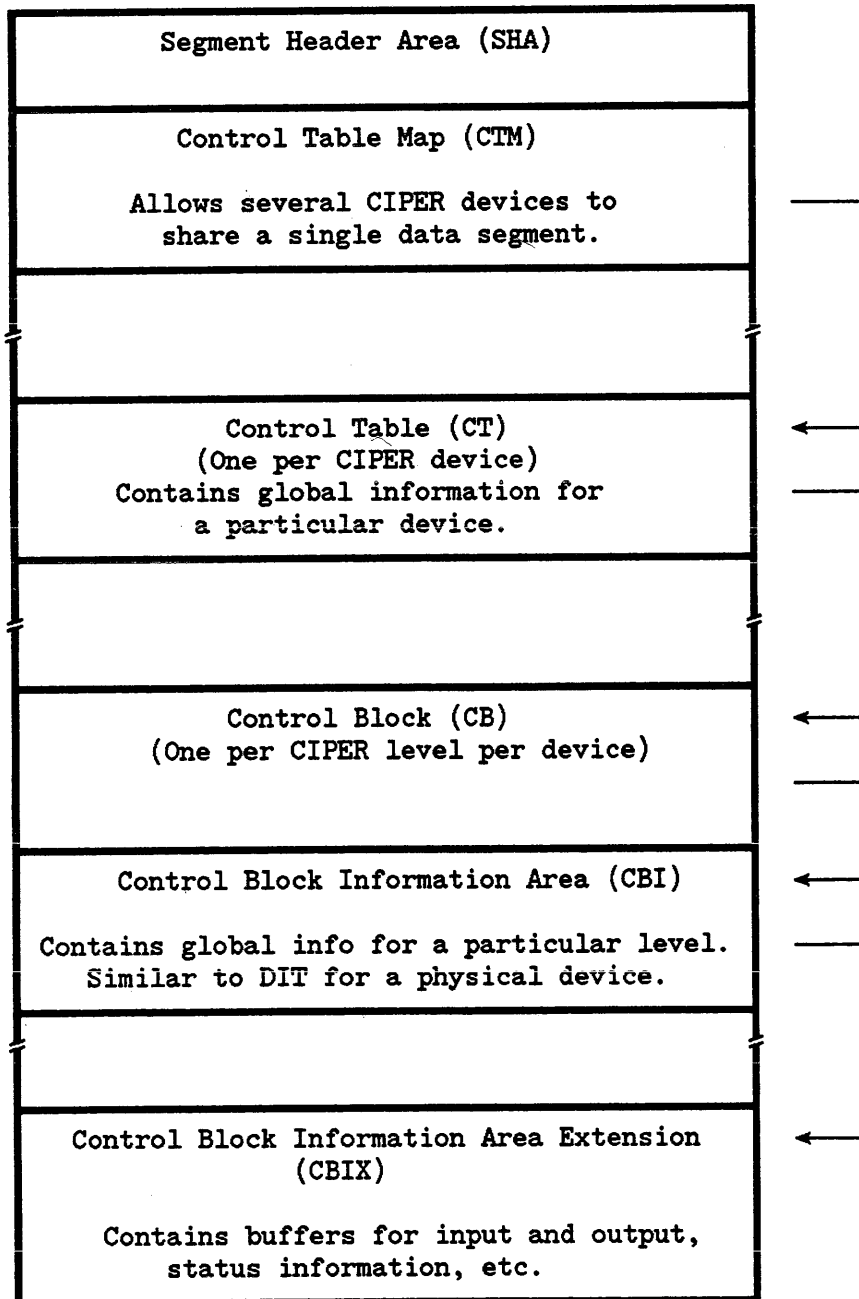

333 The field ds'error'status normally has no meaning between  
334 calls unless the error'type field has a value greater than  
335 "fatal'dfs'error", in which case it means that disc space may  
336 no longer be allocated on this disc.  
337

## CHAPTER 23 CIPER TABLES

-----

### CIPER Data Segment (CDS) Overview

The CIPER data segment (CDS) is the primary data structure accessed by SOFTIO. The general format of the segment is illustrated below. The following data structures are expansions of the general format and are self explanatory within each structure detailed.

## Segment Header Area (SHA)

The SHA is the first data structure encountered within the data segment. There is only one Segment Header Area per segment.

Word	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	SHA'FREE'SPACE'TBL'PTR															
1	SHA'CDS'DST'NUM															
2	SHA'MAX'SEG'SIZE															
3	SHA'SEG'SIZE															
4	SHA'CTM'PTR															
5	SHA'LIOQ'LIST'PTR															

### Discussion:

SHA'FREE'SPAC'TBL'PTR - Data segment base relative address of the upper stop boundary of the dynamically managed memory area.

SHA'CDS'DST'NUM - The number of this data segment.

SHA'MAX'SEG'SIZE - The maximum size this data segment is configured for in virtual memory (ie, maximum possible size).

SHA'SEG'SIZE - The current size of this data segment (either main memory or disc).

SHA'CTM'PTR - Data segment base relative address of the Control Table Map.

SHA'LIOQ'LIST'PTR - Data segment base relative address of the Logical IO Queue list (not used at this time).

### Memory Allocation Manager Typical Layout

The SOFTIO module contains a Memory Manager which manages all data structures within the CIPER/3000 data segment (CDS). The structures used are ambles (Pre & Post). The Preamble is two words in length, while the postamble is 1 word in length. The MAM preamble and postamble surround each portion of the CDS allocated.

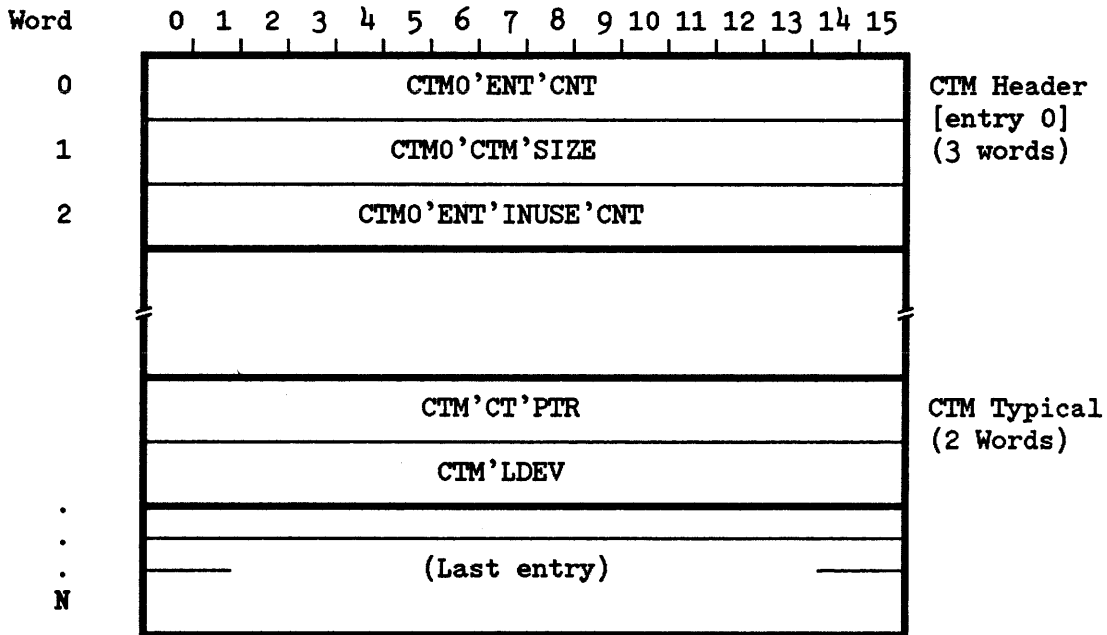

NOTE: If N is less than or equal to zero then the area is currently deallocated.

If N is greater than zero then the area is currently allocated.

## Control Table Map (CTM)

This table is a series of entries, one for each logical device. The LDTX contains an index to the logical device Control Table Map. There is only one logical device per data segment. Therefore, the CTM is comprized of only one entry.

### Discussion:

CTMO'ENT'CNT - The number of entries in the CTM (not counting the header entry).

CTMO'CTM'SIZE - The size of each entry in the CTM (disregarding the size of entry 0, the size of each entry is currently 2).

CTMO'ENT'INUSE'CNT - The number of entries in the CTM (not counting the head entry) currently in use.

CTM'CT'PTR - Data segment base relative address of the Control Table (CT).

CTM'LDEV - The logical device number for which this entry is associated.

Control Table (CT)

The Control Table Map points to the Control Table where specific device, caller, and level control information is stored.

Word

0	CT'SIR
1	CT'SIR'SAVE
2	CT'CDS'DST'NUM
3	CT'CTMI
4	CT'MSW'CALLERS'DB (CT'D'CALLERS'DB)
5	CT'LSW'CALLERS'DB
6	CT'CALLERS'STK
7	CT'CALLERS'STK'DB
8	CT'LVL'CNT
9	CT'LVL'ACTIVE
10	CT'LVL'ACTIVE'PTR
11	CT'VDT'PTR
.	CT'LVL1'CB'PTR
.	CT'LVL2'CB'PTR
.	CT'LVL3'CB'PTR
.	CT'LVL4'CB'PTR
.	CT'LVL5'CB'PTR
.	CT'LVL6'CB'PTR
N	CT'LVL7'CB'PTR

Discussion:

CT'SIR - Not currently used.

CT'SIR'SAVE - Not currently used.

CT'CDS'DST'NUM - The number of this data segment.

CT'CTMI - The control table map index used to reach this control table.

CT'D'CALLERS'DB - The result of the call to CHANGEDB which moved DB to the CIPER data segment (CDS). It is used to return DB to the same spot the caller had it at.

CT'CALLERS'STK - The dst number of the calling processes' stack.

CT'CALLERS'STK'DB - The offset from the data segment base in the calling processes' DB.

CT'LVL'CNT - The number of levels currently loaded into this control table.

CT'LVL'ACTIVE - The level which is currently within this control table.

CT'LVL1'CB'PTR - Not currently used.

CT'LVL2'CB'PTR - Not currently used.

CT'LVL3'CB'PTR - Not currently used.

CT'LVL4'CB'PTR - The pointer to the control block of level four (network protocol).

CT'LVL5'CB'PTR - Not currently used.

CT'LVL6'CB'PTR - Not currently used.

CT'LVL7'CB'PTR - The pointer to the control block of level seven (the logical driver).

## CIPER Level 'N' Control Block

For every level that exists in the CIPER Protocol model, there is a control block which contains specific control information for the level at which the operation is being accomplished. This implementation of CIPER contains level 7, 6, 4, 2, and 1. Therefore, it would seem to follow that there are seven control blocks. However, that is a false assumption. Level 7 is really the user interface in which MPE is the file system, SPOOLER, ATTACHIO and the Logical Driver. Thus, level 7 resides only partially in SOFTIO. Level 6 is the CIPER translator (procedure CPR'XLATOR). In this implementation, it is not a user-callable intrinsic and hence does not need a CB of its own. However, should it ever become a user-callable intrinsic, it will then require a level 'N' CB. Levels 7 and 4 do require control blocks since they use the data segment extensively. Levels 5 and 3 do not exist and do not currently need space. Levels 2 and 1 refer specifically to the physical driver. In the case of the HBIB driver, the DIT and IOQ hold the information that would ordinarily be in the Level 'N' CB. Thus, the HPIB driver does not need this structure. For the Multi-Point Terminal System (MTS), the process and physical driver do not require space in the data segment for control information. However, MTS does access the CIPER data segment for the data being read or written from/to the device.

In summary: there are two level 'N' CBs for this implementation. There is one for Level 7 and one for Level 4. The format for the control block is as follows:

Word

### Discussion:

CB'PLABEL - Control Block Program label. The PLABEL of the module which will be called for this level. Allows multiple modules for any level. Not currently used.

CB'QH'PTR - Control Block Queue Head pointer.  
Data segment relative pointer to the Communication Queue Head.

CB'INFO'PTR - Data segment base relative address to the control block information area. This information area is level dependent. The information within the 'INFO' block pointed to by CB'INFO'PTR contains variable length information which only the level module

called 'knows' about.

CB'SIZE - currently the CB size is set to 3 words.

NOTE: Since there are only two levels (level 4 and level 7), there are only two level 'N' control blocks and two 'INFO' areas at this time.

### Communication Queue Head

Communication Queue Heads are used for passing internal messages within CIPER. CIPER runs on the caller's stack. The Queue Head mechanism is useful for passing messages between procedures at the same level and to the level above and below the current level. This helps to synchronize all of the events occurring within CIPER. The level 'N' CB contains a data segment relative pointer to the queue head. The queue head mechanism is logically similar to the message harbor table mechanism in the MPE internal message system.

When a message is to be passed by some procedure at some level, it merely calls one of the T'LINK'XXX procedures to do so. The memory manager acquires chunks of free memory in the data segment to hold the data. The pointers in the following table are data segment relative pointers to that chunk (or those chunks) of memory that are reserved for the message data.

Head'entry
Tail'entry
Entry'size
Free'list'ptr
Free'count
In'use'count
Max'used'count
Back'pointer

#### Discussion:

Head'entry: this is a pointer to the first entry in the queue. Items are typically removed from the head.

Tail'entry: this is a pointer to the last entry in the queue.

Entry'size: specifies the queue entry size of all entries in this particular queue. Size is in words.

Free'list'ptr: pointer to a queue of available entries. Elements are added and removed from the head.

Free'count: the number of queue elements available in the freelist.

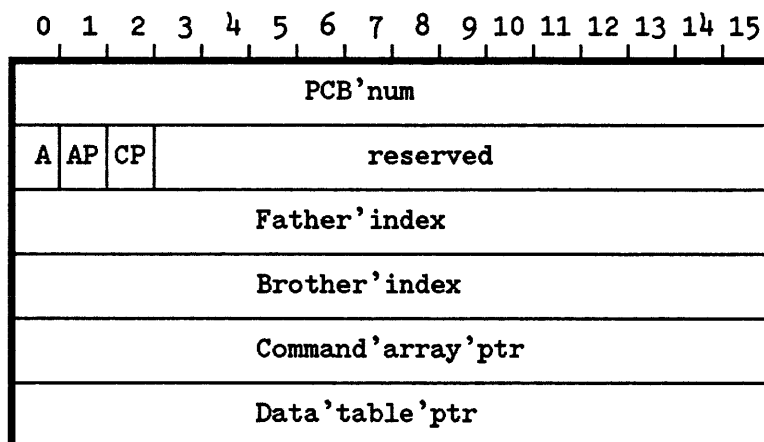

In'use'count: the number of queue elements currently linked in the request queue.

Max'used'count: a high-water mark which tallies the maximum value that In'use'count ever assumes.

Back'pointer: an optional backward reference pointer to the request queue. Could be used for a two-way linked list.

In general, a given level (n) has four request queues associated with it. There is a command queue from the level above (n+1), and a response queue back to that level. There is also a command queue to the next lower level (n-1), and a response queue from that level.

COMQUELEMENT (Communications Queue Element)

Discussion:

PCB'num: the Process Control Block number of the process issuing the request. Maintained at all levels to facilitate ABORTPROCIO requests.

A: abort bit. Set in response to an ABORTIO(LDEV) command. Allows Ciper'IO'Process to clean up the request as soon as possible.

AP: process abort bit. Set in response to an ABORTPROCIO command. Allows Ciper'IO'Process to clean up the request when it is convenient for it to do so.

CP: Ciper'IO'Process flag, which is set if CIP issued this particular request, either on its own behalf or for a user process.

Father'index: a request queue pointer to level (n+1)'s queue element that caused this request to be generated.

Brother'index: a request queue pointer to a level n queue element that is related to this element, by virtue of having the same level (n+1) queue element generating the request.

Command'array'ptr: a pointer to a command array specified by the calling level. Contents of the command array depend on the interface established between levels. The first word will always be the request flags passed from the user (or CIP) which must be maintained to the lowest level.

Data'table'ptr: a pointer to the virtual data table associated with this request.

## Control Block Information Area

For every level 'N' Control Block, there is a Control Block Information Area (CBI). In this implementation there are 2 CBI's since there is a level 7 and a level 4 Control Block. The CBI is a variable length extension to the CB. It can be different lengths for different levels. The level 7 and level 4 CBI's are outlined below.

### LEVEL 7 CONTROL BLOCK INFORMATION (CBI)

42	STATUS 'RECEIVED
43	STATUS 'REPORTED

## Discussion:

CDS'AREA'BASE - contains the CDS relative address of the Control Block Information eXtension (CBIX). The CBIX is the area that contains all record buffer, status tanks, and other arrays used by the logical driver.

INITIALIZED - a logical flag set to true when the entire CBIX and all other information areas have been completely initialized.

JOB'ACTIVE - a logical flag set to true when a command has been sent to start a job, and that command has been passed to the device.

FREE'BUFF'LIST - a word pointer which contains the CBIX relative address of the first entry in a linked list of record buffer areas that are currently not in use.

O'R'BASE - a word pointer which contains the CBIX relative address of the base of the output record buffer area. This buffer is normally contained within the region pointed to by cds'area'base, but it does not have to be.

I'R'BASE - a word pointer which contains the CBIX relative address of the base of the input record buffer area. Like the output record buffer area, this is typically contained within the region pointed to by cds'area'base.

COMPOSITE'STATUS'BASE - word pointer to the area that contains composite status. Composite status is the logical "OR" of any device status reports that are received during any one call to the logical driver.

DEV'STATUS'BASE - a word pointer which contains the CBIX relative address of the base of the device status buffer area, which is used to store incoming device status reports.

ENV'STATUS'BASE - a word pointer which contains the CBIX relative address of the base of the environmental status buffer, which is used to store incoming device environmental status reports.

JOB'REPORT'BASE - a word pointer which contains the CBIX relative address of the base of the job report buffer area, which is used to store incoming job reports.

EXPANDED'FEATURES - a logical flag which is set to true when a driver call is performed requesting access to the extended features of the peripheral. This access may not be granted if the caller has insufficient capability. The default is that the user is not in expanded features mode.

INPUT'SEQUENCE'COUNT - an integer counter which contains the input record sequence count. This value is used in error checking to determine if the protocol at the logical level has been violated (such as an entire record lost). This counter is set to zero upon completion of a device clear sequence, and increments by one after reception of an input record.

OUTPUT'SEQUENCE'COUNT - an integer counter which contains the output record sequence count. Each time a record is sent to the peripheral, this value is incremented by one. The peripheral maintains a similar count, which it uses to perform error checking on the records it receives. This counter is set to zero upon completion of a device clear sequence.

RECEIVE'READY'COUNT - an integer counter which maintains the number of available buffers in the peripheral. This count is increased by the value the peripheral sends in its RECEIVE READY report, and is decremented by one each time a record is sent to the peripheral. If the count ever reaches zero, then the logical driver must wait for a RECEIVE READY before it can send any more records.

CPR'XLATE'FLAGS - a double integer which is used by the CIPER function code translator during its process of translating MPE function codes into device recognizable commands.

SEQUENCE'1'BUFFER - a word pointer which contains the CBIX relative address of an array used by the CIPER function code translator to buffer any escape sequences which must be placed ahead of the user's data.

O'R'DATA'TYPE - an integer which contains a code signifying the type of data being currently sent to the peripheral. This is initially set to zero (specifies user data with the control mask invoked), but it may be changed by an appropriate call to the logical driver.

I'R'DATA'TYPE - an integer which contains a code specifying the type of data requested from the peripheral by the user. This is initially set to zero (specifies responses to user escape sequences) but may be changed by an appropriate call to the logical driver.

FILE'OPEN'COUNT - an integer which counts the number of nested file open calls that have currently been made against the device. In the final version of CIPER, this count will be used to determine if the user is finished with the device so resources used by the logical driver may be returned to the system.

DEVICE'ALLOCATED - set TRUE when the first FOPEN is requested. Set FALSE upon completion of device close request.

LOGICAL'DEVICE - an integer which is used to store the logical device number of the device for which this data segment has been allocated. The logical driver will pass this value on to lower levels, as it must reach the physical driver.

CIPER'DST - an integer which is used to store the data segment number of this data segment. The logical driver will pass this down to lower levels, as it must reach the physical driver.

OUT'RECS'OVERWRITTEN - an integer counter which tallies the number of times a device clear command had to be written over an output record buffer of user data. This is used for internal debugging and protocol validation only.

IN'RECS'OVERWRITTEN - an integer counter which tallies the number of times a CLEAR RESPONSE has overwritten user's data in the input record buffer area. This is used for internal debugging and protocol validation only.

DEVICE'BUFFER'SIZE - an integer which contains the size, in bytes, of the peripheral's record maximum record size. This information is returned in the peripheral's CLEAR RESPONSE.

DEVICE'ENV'STATUS'SIZE - an integer which contains the size, in bytes, of the peripheral's largest environmental status report. This information is returned in the peripheral's CLEAR RESPONSE.

PRODUCT'NUMBER - a word pointer which contains the CBIX relative address of a buffer area used to store the ASCII encoded product number of the peripheral. This information is returned in the peripheral's CLEAR RESPONSE.

STORAGE'REQUIREMENTS - an integer which contains the size in words, of the region in the CIPER data segment that the logical driver requires for its buffer areas and other storage. The value contained does not include the size of the CBIX.

TEMP'AREA - a word pointer which contains the DB relative address of a small region of the CIPER data segment which is allocated only during the initialization phases, then later released.

CT'PTR - a word pointer which contains the DB relative address of the control table for the logical device. This is a backward pointer.

PACKET'HEADER'SIZE - an integer which contains the size, in bytes, of the Level 2 packet header. This value is used by the logical driver to reserve space at the front of the record for use by the network protocol level.

PACKET'TRAILER'SIZE - an integer which contains the size, in bytes, of the Level 2 packet trailer. This value is used by the logical driver to reserve space at the front of the record for use by the network protocol level.

PACKET'SIZE - indicates size, in bytes, of level 4 packet.

DEV'CLR'COUNT - count of current recursion level in B08'DEVICE'CLR. If preset limit exceeded, we give up.

DEV'CLR'IN'PROGRESS - a count of how many times the DEVICE CLEAR procedure has been recursively entered. If this count exceeds a preset level, then the DEVICE CLEAR has been unable to restore normal communications with the device, probably due to a catastrophic hardware malfunction.

SR'ENABLE - configuration information used to construct a CONFIGURE record in the event the device powerfails and must be initialized.

ESB'FREQUENCY - configuration information that tells the device how many checkpoints can occur before the transmission of an environmental status block becomes mandatory.

LOGGING'DST - the data segment number of a DST used for performance evaluation. This DST will not be allocated when CIPER is released.

LOGGING'BUFFER - contains the CBIX relative address of an area used for construction of log entries for performance logging.

EVENT'MAP - a bit map that describes which performance events (currently there is only one type defined) are to be logged.

STATUS'ENABLED - a bit map set by the caller (spooler) which defines the types of peripheral status reports the caller is interested in receiving. When (if) any of the enabled types is received, the caller will be notified via a special return code (%41).

STATUS'RECEIVED - bit map of which status types have been received since the last time the caller read those status reports.

STATUS'REPORTED - bit map of which status types that have been received have been reported to the caller via the %41 status return code.

DEFAULT'ACCESS'MODE - during initialization, set TRUE if device subtype=9, otherwise, set FALSE. Indicates whether access mode is FEATURE or TRANSPARENT after a start of job request.

COMP'STAT'AVAILABLE - set to TRUE whenever a new version of composite status becomes available. Set to FALSE whenever composite status is either read or cleared.

#### Level 4 Control Block Information (CBI)

Word

0	LVL'2'HEADER'SIZE
1	LVL'2'TRAILER'SIZE
2	LVL'2'PACKET'SIZE
3	HEADER'MOVE'SIZE
4	TRAILER'MOVE'SIZE
5	INITIALIZED

#### Discussion:

LVL'2'HEADER'SIZE - Contains the number of words required by the physical driver (CIPER level 2) for frame headers. Returned by the physical driver during initialization.

LVL'2'TRAILER'SIZE - Contains the number of words required by the physical driver (CIPER level 2) for frame trailers. Returned by the physical driver during initialization.

LVL'2'PACKET'SIZE - Contains the size (in bytes) of the largest frame the physical driver can accept in one call. Returned by the physical driver during initialization.

HEADER'MOVE'SIZE - Contains the combined number of words (level 4 and level 2) that must be moved to make room for packet and

frame trailers.

TRAILER'MOVE'SIZE - Contains the combined number of words (level 4 and level 2) that must be moved to make room for packet and frame trailers.

INITIALIZED - Set to TRUE if the CBI has been successfully initialized. Otherwise, set to FALSE.

### Control Block Information Extension

The first table is a typical sub-area within the CBIX, such as is used for status tanks, buffer areas, etc. The second table actually shows the order of the different sub-areas within the CBIX. This CBIX is for Level 7, the Logical Driver.

### General Entry Format

Word

NOTE: LENGTH - Is the size of the sub-area, including the length word itself. Thus, length ALWAYS contains N+2.

Each entry in the CBIX has the general from of the above entry.

### Level Seven Control Block Info Extension (CBIX)

The following describes the current CBIX form for level seven. Note that in this layout, the drawing is not to any scale.

Level Seven CBIX (Continued)

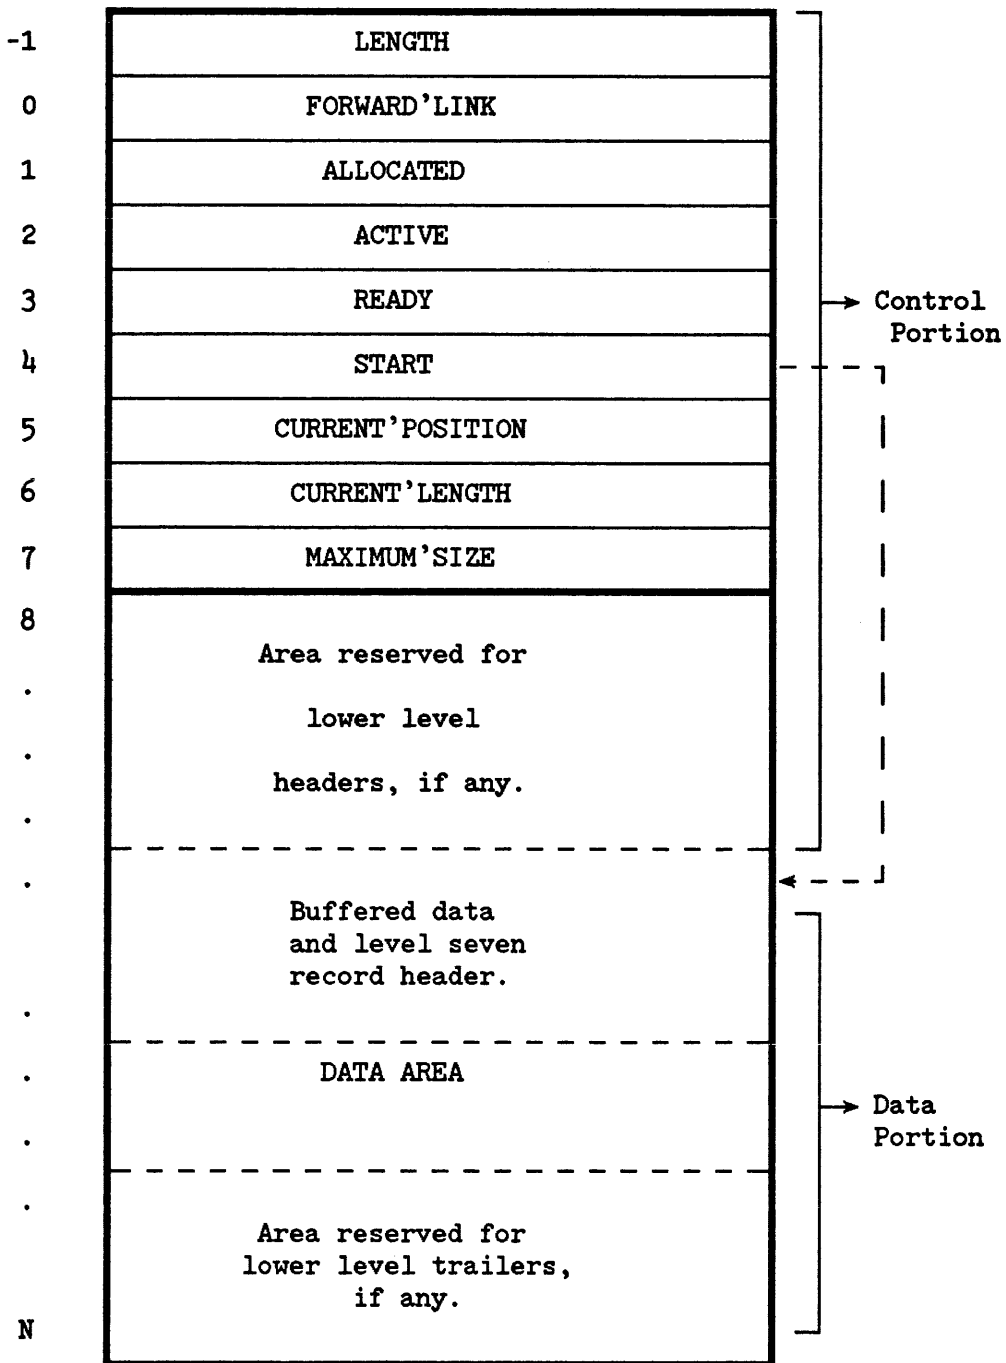

Level 7 CBIX (Continued)

NOTES:

- o Device status tank actually holds two copies - one copy of the previous report is used to compare against a new copy to see if any states have changed (such as going from on-line to offline).
- o Composite status is the logical "OR" of all device status reports received during a particular call to the logical driver. This was done to reduce the possibility of the calling program missing an error condition due to multiple device status reports over-writing themselves. The area is cleared out at the start of most calls to B08'LOGICAL'DVR, so only those status reports which are received during the call will be returned.
- o The logging buffer area is allocated all of the time, but the code to use it is not in place unless SOFTIO is compiled with the X7 toggle set "ON." When logging, this area is used to construct a log record before writing it to a logging data segment. The head entry of the current logging DST is kept in the logging buffer.
- o Five record buffer areas are allocated during initialization. One is used as a dedicated output buffer, one is a dedicated input buffer, and the other three are linked into a free-list. The free-list buffers are used to send asynchronous requests (e.g. ESB Immediate) without disturbing a record under construction (such as a write data record).

Typical Record Buffer Area

Word

Discussion:

Control Portion

LENGTH - Is the number of words, including the length word, allocated to a particular buffer area.

FORWARD'LINK - Is used if the buffer area is linked in a free-list. If so, FORWARD'LINK contains the CBIX relative address of the next buffer in the list. Otherwise, contains a zero.

ALLOCATED - Is set FALSE if the buffer area is in the free-list. It is set to TRUE when not in the free-list.

ACTIVE - Is set to TRUE if the buffer area contains any pending data.

READY - Is set to TRUE when a buffer area being used for output is ready for transmission (currently not being used for this release).

START - Is an offset (in words) to the start of the data portion of the buffer area. The offset is relative to the zeroth word of the control portion (not the -1 word!!!).

CURRENT'POSITION - Is an offset (in bytes) to the next available byte in the data portion. The offset is relative to the zeroth word of the control portion (not the -1 word!!!).

CURRENT'LENGTH - Contains a count (in bytes) of the data currently contained in the data portion.

MAXIMUM'SIZE - Contains the maximum number of bytes that a record may contain. This quantity is a device dependent value.

Data Portion

This is where a record going to or coming from the peripheral is assembled or interpreted. In the case of the HP 2608S, the first four (4) bytes are always the record header.

The amount of space required by lower levels for headers and trailers is determined at initialization and the appropriate number of words allocated when the record buffer area is set up.

### Logical Device Table Extension (LDTX)

The LDTX is the last of three tables in the LDT data segment. Refer to Chapter 13 for a full description of these tables. The procedure B08 'Logical' Driver uses the CIPER entry to locate and access the CIPER data segment.

DST %16 = 14

SIR %12 = 10

#### Zero Entry

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	Highest Entry							Entry Size								
1																
2																
3

CIPER Entry

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	0	0	1	0	reserved				DB	0						
1	CIPER Device Control Data Segment (CDCDS)															
2	DN	CTM Index for this device (CTMI)														
3	0															
4	0															

Discussion:

0.(2:1): This logical device uses the CIPER protocol.

CTMI: Control Table Map Index (an index into the Control Table Map (CTM) which is located in the Ciper Device Control Data Segment (CDCDS)).

DN: Ciper is shutdown. If set, an internal data integrity error has occurred and the device has been locked out from user access.

DB: If set to 1, then debugging in effect.

HIOCIPRO DIT (HP2608S)

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IOQ element (however, this driver only supports one device per controller.) The following diagram shows the DIT used for the HP-IB CIPER physical driver.

Word	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC
0	0	0	AC	RQ	0	0	0	IO	IA	NO	ST	0					
1	SYSDB relative pointer to the DIT for the next device requesting this resource or service																DLINK
2	SYSDB relative pointer to the first IOQ in request list for this device																DIOQP
3	IOT		Phys. unit				Logical device number										DLDEV
4	SYSDB relative pointer to Device Linkage Table																DDLTP
5	SYSDB relative pointer to Intrp Linkage Table																DILTP
6	VS	AB	RE	TP	NR	NR CNT		DEVICE STATUS									
7	Hardware error status. Set when the driver detects an error. Whenever <0, the driver monitor logs an I/O error and clears this word																DSERR
8	Bit 0 is set at completion of timer																DTIME
9	Holds the time out request entry index while a timer is active.																DRQST
10	RF	UE	DE	TO	UNIT CNT		DATA CNT		TO CNT		PRTY CNT						
11	Error logging location 1																DLOGERROR
12	Error logging location 2																DLOGCOUNT

DFLAG - Flags and request state

AC ACTIVE - A monitor is currently servicing this device.

RQ REQUEST - A service request is pending while the monitor is active.

IO IOPROG - An I/O Channel Program is running for this device.

IA IAK - An interrupt or response has occurred for this device.

NO NOTRDY - Go to state %10 after Idle Channel Program is started.

ST STWAIT - The device monitor is starting an Idle Channel Program for this device. There is no IOQ associated with this type of request.

STATE - State of the device monitor. Specifies the next action to be taken in SIODM in servicing the request:

- 0 - start new request
- 1 - not used
- 2 - call driver initiator procedure
- 3 - call driver completor procedure
- 4 - not used
- 5 - process request completed
- 6 - initiate device recognition sequence
- 7 - start operator intervention wait
- %10 - wait for interrupt (operator intervention)  
restart at state 0
- %11 - wait for data segment freeze, then state 2
- %12 - wait for driver initiator to be frozen, then  
allocate controller (state 2)
- %13 - wait for I/O completion interrupt, then state 3
- %14 - wait for controller, then call driver initiator
- %15 - not used
- %16 - wait for initiator make present, then state 2
- %17 - wait for completor make present, then state 3

DLDEV - I/O system type, unit and logical device number

- 0 - HP3000 Series 2/3
- 1 - HP3000 Series 33 (HPIB)
- 2 - Unused
- 3 - Unused

DSAVE - Device processing flags

- VS - VALID STATUS - Set to indicate Device Status has been updated.
- AB - DVRABFLAG - Sequence Abort in progress due to ABORT request.
- RE - RETRYFLAG - Sequence Abort in progress due to an error.
- TP - TIMERPOPPED - Current error is due to software timer popping.
- NR - NOTRDYFLAG - Not Ready Wait in progress.

NR CNT - Number of Not Ready Waits during this request.

DEVICE STATUS - Device status returned during a Sequence Abort.

BIT 8 - CRC available and enabled.

BIT 9 - Reserved.

BIT 10 - Reserved.

BIT 11 - Reserved.

BIT 12 - Power fail or reset has occurred.

BIT 13 - A protocol error has been detected.

BIT 14 - A parity error has been detected.

BIT 15 - The peripheral has data to send.

DSERR - Pointer to status to be logged.

Bits.(0:8) - Number of words to be logged.

Bits.(8:8) - Offset relative to DITP(0).

DCOUNTS - Error flags and error counts (4).

RF - REQ FAILED - An error has forced this request to be aborted.

UE - UNIT ERROR - The current error is a Unit Error.

DE - DATA ERROR - The current error is a Data Error.

TO - TIME OUT - The current error is a GIC Time Out Error.

UNIT CNT - Number of Unit Errors during this request.

DATA CNT - Number of Data Errors during this request.

TO CNT - Number of GIC Time Outs during this request.

PRTY CNT - Number of HP-IB Parity Errors during this request.

CIPER IOQ Element

Word	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC
0	Request dependent flags (see below)															QFLAG	
1	SYSDB relative pointer to next IOQ element. Points to first word of element.															QLINK	
2								Logical device number								QLDEV	
3																QMISC	
4	S	If QFLAG.(3:1) is clear then this is the DST number of the target data segment. If S is set, QADDR is DB relative.														QDSTN	
5	Offset in the data segment or system buffer table to the target data buffer.															QADDR	
6	Used by the new Disc routines for special status returns.							Function code for this request. (See next section.)								QFUNC	
7	On initiation, specifies the word count (0) or byte count (<0). At completion of the request this location contains the actual transmission count in the same units (bytes or words) as in the request.															QWBCT	
8	Parameter 1.															QPAR1	
9	Parameter 2.															QPAR2	
10	PCBN					QUALIFIER					RSTATUS					QSTAT	

QFLAG - Request dependent flags

- Bit 0 ABORT - Abort this request and return an error indication to the caller.
- Bit 1 SPECIAL - Apply special handling to this request. (Not used)
- Bit 2 DIAG - This is a request from the diagnostic subsystem.
- Bit 3 SYSBUFF - Target is an index relative to the SBUF Table of the data buffer.

- Bit 4 IOWAKE - Wake caller on completion of request.
- Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACHIO until the request is completed. Implies IOWAKE.
- Bit 6 COMPLETED - The request has been completed and the caller awakened if he had requested (with IOWAKE).
- Bit 7 DATAFRZN - Set by the memory management routines (MAM) when a MAKEPRESENT request is successfully completed and indicates the data segment is frozen in memory.
- Bit 8 MAMERRORD - An error has occurred while MAM was trying to make the target data segment present and freeze it in memory.
- Bit 9 PREQ - (Not used)
- Bit 10 SFAIL - Delayed failure of SIO instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
- Bit 11 PFAIL - The request was aborted because of a system power failure.

QSTAT - PCB number and request completion status.

PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.

RSTATUS - General status indicating the final state of the request. The following codes are used:

- 0 - Not started or awaiting completion.
- 1 - Successful completion.
- 2 - End-of-file detected.
- 3 - Unusual, but recoverable, condition detected.
- 4 - Irrecoverable error has occurred.

QUALIFIER - A code which further defines or qualifies the general status.

General Status (13:3)	Qualifying Status (8:5)	Overall (8:8)
0 - Pending	1 - Waiting For Completion	%10
	3 - Not Ready Wait	%30
1 - Successful	0 - No Errors	%1

- 2 - End of File (Not Used)
- 3 - Unusual Condition
  - 3 - Request Aborted %33
  - 6 - Powerfail Abort %63
  - %21 - Device Powered Up %213
- 4 - Irrecoverable Error
  - 0 - Invalid Request %4
  - 1 - Transfer Error %14
  - 2 - I/O Timed Out Before Complete %24
  - 4 - SIO Failure %44
  - 5 - Unit Failure %54
  - %12 - System Error %124
  - %14 - Channel Failure %144
  - %21 - Parity Error %214

Device Reference Table

There is one DRT per device controller. The contents of this table are used for processing interrupts.

Word	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC
0	Channel Program Pointer (SIOP)															DRT0	
1	Channel Program Variable Area pointer (CPVA)															DRT1	
2	Interrupt Handler Program Label															DRT2	
3	ST	SH	PF	( status )								WS	GF	DT	WT	DRT3	

DRT3

- Bit 0 - ST, Channel Program Status; 0 - halted, 1 - running
- 1 - SH, SIOP or HIOP instruction pending
- 2 - PF, Power Fail recovery in progress
- 12 - WS, Waiting for device status request
- 13 - GF, GIC FIFO buffer not empty
- 14 - DT, DMA transfer active
- 15 - WT, Channel Program in Wait state

### Interrupt Linkage Table

There is one ILT for each device controller configured on the system. A controller may support more than one unit, however the HP-IB CIPER physical driver currently only supports one unit.

Word	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC
0	Channel															ICPVA0	
1	Program															ICPVA1	
2	Variable															ICPVA2	
3	Area (ICPVA)															ICPVA3	
4	DMA															ICPVA4	
5	Abort Address															ICPVA5	
6	0															ISRQL	
7	LI	CHANQUE					CHAN			DEV						ICNTRL	
8	SYSDB relative pointer to Channel Program area															ISIOP	
9	SYSDB relative pointer to Status Return area. (Always zero for this driver.)															ISTAP	
10	single instruction that is executed to extract the device unit number from the status pointed to by ISTAP. (Since there is only one unit on the controller, this entry is not used.)															IUNIT	
11	SYSDB relative DIT pointer of the device currently using the channel to perform a data operation.															ICDP	
12	SIOPSIZE						CQUEN									IQUEUE	
13	RW	WP	IG							HCUNIT						IFLAG	
14	SYSDB relative DIT pointer for unit 0															IDITP0	
15	Peripheral Channel Program																
N	(Variable length)																

ICPVA0/3 - Channel Program Variable Area

The first word is used by the channel program processor to store status information after I/O channel aborts. The next word is used by the driver to indicate if status should be examined for special conditions or errors. The other two words are not used.

ICPVA4/5 - DMA abort address

If a DMA abort occurs, the absolute address where the abort occurred is stored in this area.

ICNTRL - Contains controller information

- LIM - If this bit is set, the controller is sharing a software channel resource in order to limit bandwidth.
- CHANQUE - The software channel resource number.
- CHAN - Channel number (four most significant bits of DRTN).
- DEV - Device number (three least significant bits of DRTN).

IQUEUE -

- SIOPSIZE - (number of words + 1)/2 in the channel program area.
- CQUEN - For a multi-unit controller this field contains the software controller resource number.

IFLAG - Controller and Channel Program state flags

- RUNWAIT - An Idle Channel Program should be started when there are no active requests to process. This flag is always 0 for this version of the driver.
- WAITPROG - An Idle Channel Program has been started for this controller. This bit is reset by an interrupt.
- IGNOREHI - An HIOP instruction has been issued against this controller but the channel program was not in a wait statement. Therefore ignore the interrupt generated by the channel code when this program halts.
- HCUNIT - Highest configured unit number for this controller.
