DT 0023  
1620-1/1311-3 DIAGNOSTIC MANUAL

PROGRAM DESCRIPTION

Purpose

DT 0023 is a fault finding program which tests the file beginning with the simplest operations and progressing to the more complex (e.g., Read Sector). This arrangement allows a trouble to appear in the simplest instruction that will fail, thereby simplifying trouble analysis.

This program will not pin point the trouble for the Customer Engineer, rather, it is intended to indicate the Failing Function very rapidly after which the C.E. must rely on his standard "trouble shooting" techniques.

Program Requirements

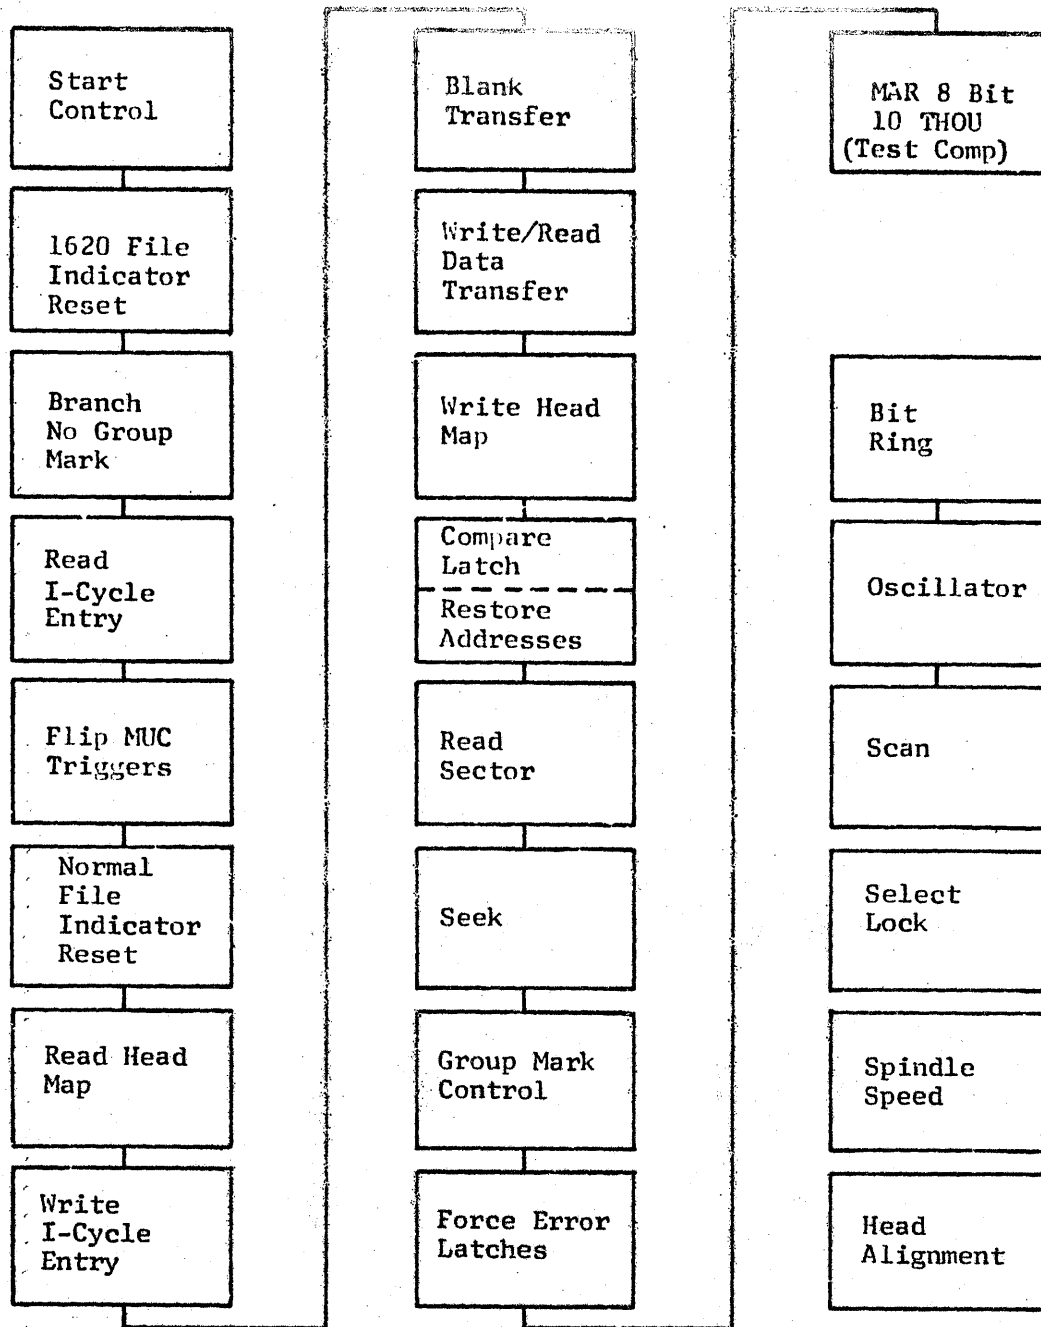

This test is to be used on the 1620-1/1311-3. Its use on the 1620-II/1311-3 is not recommended.

Equipment Requirements

Some routines make use of jumper wires to allow the 1620 to test large blocks of functional circuitry (e.g., bit ring) independent of the remaining file circuitry. Whenever jumpers are used, be sure to follow instructions implicitly to prevent damage to the machine circuits. If a jumper should be inadvertently installed in the wrong location, write down the erroneous pin location before removing the jumper - this will greatly simplify trouble shooting any resulting circuit damage.

The C.E. disk pack should be used with DT 0023 but any (scratch) pack may be used as long as the addresses are correct and readable.

GENERAL PROGRAM FLOW

NOTE: See Pages 01.03 and for starting addresses of Routines.

USE PROCEDUREBefore Running DT 0023

1. The 1620-I must be functioning properly.
2. Install C.E. Disk Pack (or scratch pack). Disk Pack must have good addresses.
3. Turn on 1311 start/stop switch.
4. Verify proper initial seek sequence before proceeding.
  - a. Carriage seeks to track zero after loading heads.
  - b. Ready (green) light turns on.
5. If "a" or "b" above do not function properly, correct before proceeding.

Control Switch Settings

1. Normal program run, turn all switches down ("off" and "Program").  
Alternate sense switch settings:
  - a. SS 1 ON By-pass error typeout during diagnostic loops
  - b. SS 2 ON Redevelop error
  - c. SS 3 ON Loop in core load and suppress normal typeout
  - d. SS 4 ON Loop in routine

Program Loading

1. Clear 1620 storage 31 00003 00002
2. Put program deck in card reader and press LOAD key or load paper tape (insert, 36 00000 00300 RS)

Operating Instructions

1. Respond to instructions from typewriter. (Type Module number, RS.)
2. Read and execute instructions in Reference A (Machine hang up conditions).
3. Follow typeout of program sequence. If an error is detected, look up error number or reference number in this manual.
4. If the 1620 fails to start after correct execution of instructions in Reference A, check the following:
  - a. Sector cycle on Solid-Logic, 05.07.10.1
  - b. File Control cycle on solid - Logic 05.07.20.1
  - c. Cylinder overflow on solid - Logic 05.30.10.1
  - d. Address cylinder check on solid - Logic 05.30.10.1
5. To RESTART PROGRAM, branch to 00500 (either core load 1 or 2).
6. After correcting trouble, ALWAYS RERUN COMPLETE PROGRAM (from step 1, program loading)

Printouts

## 1. Normal typeout

The typewriter prints out the address and name of each test routine as it sequences through the program.

Example                    04506 - BRCH NO GM  
                                  04860 - RD I-CYC ENTRY  
                                  etc.

## 2. REFERENCE Printouts.

The typewriter will print out reference statements such as "REF A", "REF B", etc. These references provide additional information required to implement certain test routines. The references are arranged in alphabetic order starting on page 02.01.

## 3. ERROR Printouts

The typewriter types error numbers such as "ERR 001", "ERR 102", etc. when the program detects a failing function. Descriptions of error numbers are arranged in order starting on Page 03.01.

After each ERROR typeout, the machine will halt. Pressing the 1620 "START" key puts the program in a diagnostic loop. Further ERROR typeouts and Halts may be suppressed by turning SW #1 on.

## 4. DIAGNOSTIC LOOP

This is a short programmed loop designed to exercise the failing function. It can be used as a scoping loop or to check repair.

Duplicate DT 0023

## 1. Cards:

- a. Place program deck in card reader and blank cards in punch hopper
- b. Clear 1620 storage
- c. Insert    37 00501 00500  
                  39 00501 00400  
                  49 00000 RS

## 2. Paper Tape

- a. Load program tape onto reader
- b. Insert 36 00000 00300 RS
- c. After program is loaded, branch to 00588.

REFERENCE A

What To Do When The Machine "Hangs Up"

- IMPORTANT: 1. Machine is now in a hang up condition. These hang up conditions may occur during normal operation of the program. It is essential that the following steps be taken.
2. To get out of hang up conditions:  
Push Reset and Release keys simultaneously, then push the start key. The test will proceed.

REFERENCE B

Attach a jumper from A1 D40K to J pin. This will prevent the 1620 clock from stopping on an illegal operation.  
Press 1620 start key to continue.

REFERENCE C

A select lock occurred which cannot be isolated in core load 2.  
Read in core load 1 and branch to the Select Lock test (00556).

Note: If Select Lock is on when DI 23 starts execution,  
ERR 100 will type out.

REFERENCE D

Read Scan - This routine reads a track into core and prints out the First Record. (Set typewriter margin to type 70 characters per line). The File Op. used is a RTN with head 0.

1. Install jumper from A1 F33R to J pin.  
This brings up "Gate A of the I/A record" which causes all data (AGC, address and record) to be transferred to the CPU on a Read Op.
2. Turn switch #1 ON to cause the Read Op. to loop.
3. Press I620 start key to begin.
4. To type out a data scan, turn switch #1 off momentarily, returning it to the ON position as soon as the typewriter starts.
5. Compare the typeout to the scan typeout model on page 02.05. Mark the location of the first character on the typeout that fails to compare to the model. This will help to identify the matching error typeout.
6. Return to Ref "P" or "N" and proceed.

Scope Simulator

The typewriter may be used in lieu of the scope when using the scan routine. This is done by substituting the signal to be displayed for the standard read data line, thereby converting logic levels into read data, and transferring this information to core.

1. Remove the slip-on terminal at edge connector A1 DO2F and install one end of a long jumper to this pin. Use the other end of this jumper to probe any logic line desired.
2. The scan jumper, A1 F33R to J pin must be on.
3. Press I620 start key. (I311 start/stop switch should be on).
4. Turn switch #1 off to type out.
5. Note the time base of the display on the prior read data typeout. This is important since some machine failures will change the time base (number of machine cycles) between sector start pulses.

(Continued)

DT 0023  
PN 2172366  
EC 412531

Scope Simulator (Continued)

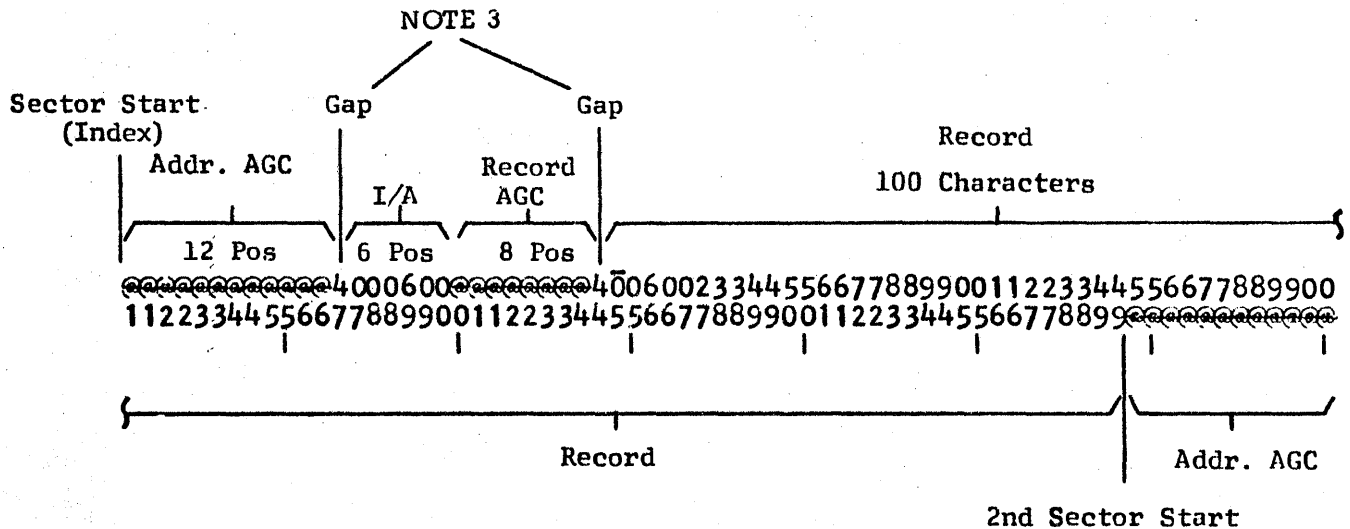

6. Interpret the voltage levels as follows:

⊖ = Voltage + for entire Bit Ring cycle  
⊕ = Voltage - for entire Bit Ring cycle

anything else = Voltage - for some part of Bit Ring cycle

Example: 7 = Voltage - for 4, 2 & 1 of Bit Ring cycle

(Continued)

REFERENCE D (Continued)Scan Typeout Model

## NOTES:

1. The above typeout is a typical example of the information sent to core on a Read Op. with "Gate A of the I/A record" conditioned by means of a jumper.
2. The Read Gate is off during most of the AGC. This blocks read data and results in no bits set into FBR. The read translator decodes "no" bits as 8/4's. Even parity 8/4's typeout as @ (center scored "at signs").
3. The gaps ordinarily type out as 4's; however, this is not extremely significant. They may type out correctly as any combination of 4, 2 or 1.
4. The I/A and record typeouts both show the actual data written on disk. The I/A in the model shows that cylinder 03 was read.
5. The addr. AGC of the second sector is displayed so that any failure occurring near the end of first sector might be recognized.

DT 0023  
 PN 2172366  
 EC 412531

REFERENCE ERead Head Map

This routine reads full track with addresses from each R/W head at cylinder 03. On each read operation, the first five characters of the read data in core are analyzed and the R/W head number is decoded. This information is then stored in a matrix (Head Map) along with a record of any errors occurring on the data transfer. If no error is detected, a digit representing the R/W head number is stored in the map.

Meaning of the Symbols

- = (Flag) invalid address
- @ = no data transferred
- ‡ = read checks or parities
- digit 0 through 9 = Head address actually read

Examples

0123456789 - Normal map

@123456789 - No data Xferred when head 0 tried; all others OK.

012345‡789 - Parities when head 6 tried; all others OK.

REFERENCE GTo Run The Bit Ring Test

1. Turn off 1311 start/stop switch.
2. Attach the following jumpers:
  - a. A1 F09F to B1 D24R (Read Parity to S<sub>1</sub> or S<sub>2</sub>).  
logic pages 05.05.22.1 and 05.14.30.1
  - b. A1 A15E to B1 E36Q (MQ4 to Bit ring advance)  
logic pages 05.06.10.1 and 05.20.20.1
  - c. A1 A15D to B1 E43F (MQ1 to A resets)  
logic pages 05.06.10.1 and 05.32.10.1
3. Press 1620 start key.

(Continued)

DT 0023  
PN 2172366  
EC 412531

REFERENCE G (Continued)

This routine resets the Bit ring to  $S_2$  then proceeds to advance the bit ring until  $S_1$  or  $S_2$  is sensed. The program counts the number of advance pulses sent between  $S_1$  and  $S_2$  bits sensed, to determine where the failure occurred.

Note: Correct operation is indicated if Ref. "Z" types after several seconds.

REFERENCE HTo Run The Read Oscillator Test

1. Turn off the 1311 start/stop switch.
2. Attach a jumper from A1 F09F to B1 B44C. This connects Read Parity to counter 000 - logic pages 05.05.22.1 and 05.15.60.1.
3. Turn on the C.E. clock gate switch.
4. Press 1620 start key.

Adjusting The Oscillator

With the program looping, the osc. repetition rate will type out periodically. Turn the adjusting screw on the SMS card at B1 D20 in very small increments until at least two typeouts indicate that the oscillator is in spec.

Turning the screw clockwise decreases the time interval between oscillator pulses.

For B Suffix 1311s (with two oscillators), after adjusting one oscillator card, exchange the SMS cards at B1 D20 and 19 and repeat the adjustment on the oscillator now located at D20. Both oscillators will then be in adjustment. Turn Switch 2 on to Exit.

REFERENCE I

1. Turn on the Write Address and Compare Disable switches.
2. Press the 1620 start key.

REFERENCE K

You have told the processor that the carriage is not positioned at cylinder 03.

1. Manually operate the detent and move the arm to cylinder 03.
2. Press the 1620 start key.

DT 0023  
PN 2172366  
EC 412531

REFERENCE M

Return the 1311 to customer operating condition.

Make sure:

1. All manual jumpers have been removed.
2. All operating switches are in their normal operating position.
3. Remove the C.E. disk pack.
4. Install machine covers, etc.

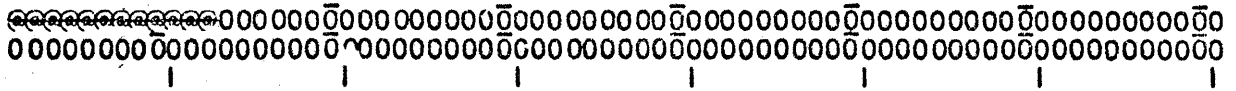

REFERENCE N

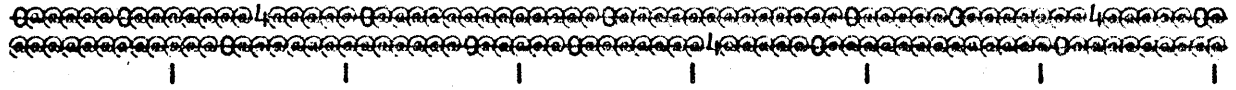

The file failed to Read (no data transferred) from any head.  
(See REF E for detailed explanation of Head Map.)

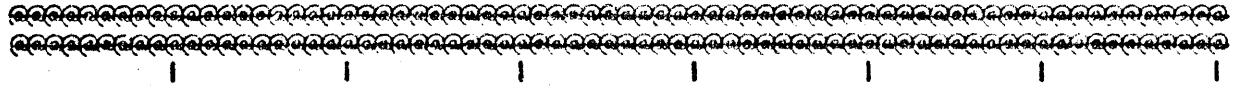

1. Press 1620 start key.
2. Do Ref. G.
3. If no Error typeout, press 1620 start key.
4. Do Ref. H.
5. If no Error typeouts, press 1620 start key.
6. Do Ref. D.
7. Compare the scan typeout to the error typeouts shown on page 02.09  
Note the number of the typeout which matches or most nearly resembles the typeout given by your machine.
8. Refer to Functional Failures listed by error number on page 02.10

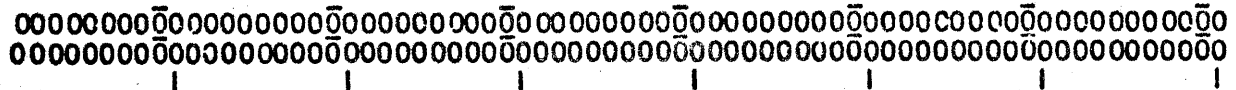

REFERENCE N (Continued)

Scan Error Typeouts

1. 

2. 

3. 

4. 

(Continued)

DT 0023  
PN 2172366  
EC 412531

REFERENCE N (Continued)Functional Failures (possible causes of Read Scan errors)

1. No data is read from the disk - there is no read amp output. Only the 1st AGC appears in the typeout. This is possible because the following are present: AGC gate, clock gate, osc pulses, bit ring pulses, MUC counts, O/E tgr. flips and CPU sync pulses are generated. The lack of any bits in FBR translate as 8/4's and typeout as @'s. Check the following possible causes:
  - a. No head selected - 05.25.40.1
  - b. No signal gate - 05.22.30.1
  - c. No read gate - C2.33.20.1
  - d. Open coax or dead read amp. - C2.33.15.1
  - e. No gap gate - 05.22.50.1
2. Check for end I/A gate up solid - 05.22.60.1
3. Check for AGC gate up solid - 05.22.10.1
4. No AGC information or data has been transferred. Check for the following failures:
  - a. No CPU sync - 05.09.20.1
  - b. No read enable - 05.09.10.1
  - c. O/E tgr. off solid - 05.08.30.1
  - d. No phase A, B or C pulses - 05.14.10.1
  - e. No clock gate - 05.22.30.1
  - f. No sector start - 05.21.10.1
  - g. End of record gate on solid - 05.22.60.1
  - h. Group mark or WLR on solid - 05.30.10.1
  - i. Functional reset up or down solid - 05.32.20.1
  - j. NRF tgr. on solid - 05.21.30.1
  - k. Gap gate on solid - 05.22.50.1
  - l. Compare latch on solid - 05.21.30.1

REFERENCE P

Parity errors occurred on two or more heads.  
(See REF E for detailed explanation of Head Map.)

1. Press 1620 Start key.
2. Do Steps 1 through 6 of Ref D.
3. Compare the scan typeout to the error typeouts shown on Pages 02.12 and 02.13: note the number of the typeout which matches or most nearly resembles the typeout given by your machine.
4. Refer to Functional Failures listed by error number on Pages 02.14 and 02.15.

NOTE: The scope simulator may be used in lieu of the scope to check the items listed under Functional Failures.

(Continued)

DT 0023  
PN 2172366  
EC 412531

REFERENCE P (Continued)Functional Failures (possible causes of Read Scan errors)

Check items listed under Error No. corresponding to Error typeout number shown on previous pages.

NOTE: Either Scope or Scope Simulator may be used (See Ref. D).

<u>ERROR NO.</u>	<u>POSSIBLE CAUSE</u>	<u>REFER TO LOGIC PAGE</u>
1.	Check for following error conditions occurring during the record portion of the sector.	
	a. Solid addr. compare gate	- 05.15.70.1
	b. Write strobe on (Bit ring C)	- 05.12.60.1
	c. Counter 003 or 004 gate MAR	- 05.15.60.1
	d. No standard read data	- 05.12.10.1
2.	Even FBR B bit on solid	- 05.12.10.1
	A similar typeout would be given for any bit of either FBR (O/E). Note that extra bit is present even during the AGC's when no read data is gated.	
3.	No AGC gate	- 05.22.10.1
4.	O/E trigger failing to flip	- 05.08.30.1
	a. No O/E tgr. advance	
	b. O/E tgr. on solid	
5.	Address AGC is too short.	
	Set counter 8-10 pulse missing	- 05.15.30.1
6.	a. No standard read data	- 05.12.90.1
	b. Count 000 latch failing to set	- 05.15.40.1
	NOTE: If the count 000 latch fails to set, the high order triggers in MUC will turn on erroneously with the set counter to 13 pulse. Since MUC must count down to zero to turn off AGC and turn on the read gate, no data will be read.	
7.	No Even Standard read data	- 05.12.90.1
8.	Even Read translator 8 bit up solid	- 05.11.20.1
	Any bit of either translator (O/E) would give similar typeout.	
	NOTE: When 8 or 4 bit is up solid, typeout appears to be normal during AGC. This happens because the failure is masked by the 8/4 bit combination.	

(Continued)

DT 0023  
PN 2172366  
EC 412531

(Continued)

9. AGC disable on solid - 05.22.20.1  
NOTE: Read data is scrambled during address and record.
10. One "read bit latch" failing to latch - 02.33.20.1  
(This trouble applies only to 1311's with two oscillators.)  
Note that failure pattern may be consistent for several characters.
11. Missing address gate - 05.22.10.1  
Presence of all bits during record AGC shows that the read gate failed to go off after the I/A. Record gate is coming up early (at beginning of address instead of beginning of record). This also causes end of record to come up early as seen by the location of the AGC for the second sector.
12. a. No end I/A gate - 05.22.60.1  
b. No I/A gate - 05.15.70.1  
c. Counter 000 latch failing to latch - 05.15.40.1  
Presence of all bits during record AGC shows that the read gate failed to go off after the I/A.
13. Oscillator out of adjustment -  
Branch to oscillator test routine. (49 00516)  
AGC information is correct but record and possibly address data are scrambled. Format is OK.
14. Read bit trigger failing to set - C2.33.20.1  
(This trouble applies only to the 1311 with two oscillators.)
15. Functional reset latch failing to latch - 05.32.20.1
16. Trigger 30 set failing to latch - 05.08.10.1
17. a. No record gate - 05.15.70.1  
b. No end of record gate - 05.22.60.1  
Read data in first sector is correct. Failure occurs during AGC of second sector since record is not terminated properly.

REFERENCE RTo Run Select Lock Test

1. Attach a jumper from A1 C17L to B1 D14C. Leave this jumper on till the end of the test (Ref. M). This connects MAR 8 bit 10 THOU to select lock reset. - logic pages 05.06.30.1 and C2.33.05.1.

(Continued)

DT 0023  
PN 2172366  
EC 412531

Continued (Ref. R)

2. Install "scratch" packs on all modules being tested.
3. Turn on 1311 start/stop switch on all modules being tested.
4. Press 1620 start key.

#### Interpreting the Module Select Lock Map

This routine checks for a multiple module select condition. The "one" indicates that a Select lock occurred, the "zero" indicates correct operation. The map will consist of from two to four characters depending on the number of modules being tested.

(EXAMPLE)

MAP	PROBLEM
$\begin{array}{r} 0123 \\ \hline 1101 \end{array}$ (Module No.)	This example indicates that Module 2 is always being selected (erroneously).

#### Interpreting The Head Select Lock Map

This routine checks for a multiple head select condition or a missing head select. The "one" indicates that select lock occurred, the "zero" indicates correct operation. See examples on following page.

## REFERENCE R (Continued)

## EXAMPLES

MAP										PROBLEM: Some Head Select Is On Solid.
0	1	2	3	4	5	6	7	8	9	(HEAD POSITION)
0	1	1	1	1	1	1	1	1	1	Y0
1	0	1	1	1	1	1	1	1	1	Y1
1	1	0	1	1	1	1	1	1	1	Y2

DT 0023  
 PN 2172366  
 EC 412531

02.18

REFERENCE S

1. Pull the write-erase safety card at Bl B13.
2. Press the 1620 start key.

REFERENCE T

1. Pull the Read-Write "And" card at Bl C09.
2. Press 1620 start key.

REFERENCE U

1. Replace the R/W "And" card pulled at Ref. T (BIC09).
2. Pull the AC-DC safety card at Bl C06.
3. Stop and start the 1311 to restore the carriage.
4. Press 1620 start key.

REFERENCE V

To Check Spindle Speed

1. Attach the following jumpers:
  - a. Al F09F to Bl B27 D (read parity to gated index)  
logic pages 05.05.22.1 and 05.21.10.1
  - b. Bl B26A to J pin (gated index every revolution)  
logic page 05.21.10.1
  - c. Bl E32Q to J pin (conditions resets)  
logic page 05.32.10.1
2. Press 1620 start key - program will count index pulses for one minute, then typeout the R.P.M.

DT 0023  
PN 2172366  
EC 412531

REFERENCE YTo Check Head Alignment

1. Install C.E. disk pack.
2. Attach a jumper from Bl A31G to J pin. This blocks the End of Record Gate and prevents an early disconnect from the read operation.  
This step allows for a more stable scope display.
3. Scope the output of the high level amplifier - sync on gated index.
4. Press the 1620 start key - the machine will start reading head 0 on Track 35.
5. Display approximately two sectors (500 us/div).
6. Loosen the clamps and adjust the arm adjusting screw for the selected head until the read envelope shows definite nulls (points of zero amplitude). See the C.E. Reference manual for details.
7. Turn switch #2 on, then immediately back off to select the next lower head in physical sequence: i.e., 0, 3, 4, 7, 8, 1, 2, 5, 6 & 9.

REFERENCE Z

1. Remove all jumpers.
2. Restore all switches to their normal (Read Sector) positions:  
i.e., Write address and compare disable off, C.E. panel switches off, Start/Stop Switch On.
3. Press the 1620 start key.

03.02

ERROR 010

Bit ring S<sub>2</sub> failed to turn on. It should be turned on by Reset A5.  
Turn on Switch 1 and push Start Key for two instruction loop  
which will continue to try to Reset Bit Ring S<sub>2</sub> on for scoping.  
See logic 05.20.40.1

ERROR 011

Bit ring S<sub>1</sub>, A, S<sub>2</sub> or 1 failed to turn off.  
Check for faulty trigger card or missing Adv. 2 pulse.  
See Note.  
See logic 05.20.40.1

ERROR 012

Bit ring failed to advance correctly. See note.  
Compare the number of advance pulses sent (See typeout) to the  
statements below:

Sent 02 ADV	Bit ring B or 2 failed to turn off.
Sent 03 ADV	Bit ring C or 4 failed to turn off.
Sent 04 ADV	Bit ring W or 8 failed to turn off.

See logic 05.20.40.1

ERROR 013

Bit ring S<sub>1</sub>, 8, 4, 2 or 1 failed to turn on. See note.  
Check for faulty trigger card or missing Adv. 1 or Adv. 3 pulse.  
See logic 05.20.40.1

ERROR 014

S<sub>1</sub> or S<sub>2</sub> failed to turn on after six advance pulses were sent. See note.  
Check the output of the bit ring triggers to determine the last trigger  
set. Faulty circuit should be the last trigger set or the following  
stage.

See logic 05.20.30.1

ERROR 015

Bit ring W, C, B or A failed to turn on. See note.  
Check for faulty trigger card.  
See logic 05.20.30.1

**NOTE:** Push Start Key. The Program will go into a loop which resets  
(Scope Loop) and sends advance pulses to the Bit Ring.

DT 0023  
PN 2172366  
EC 412531

ERROR 020

Counter Zero is failing to turn on.  
 See Note below. See Logic 05.15.60.1.  
 (A misplaced jumper may also cause this error - check  
 jumper location)

ERROR 021

Counter zero is on solid. See note below.  
 See Logics 05.14.10.1 and C2.33.20.1.

NOTE: To Scope, turn on the clock gate switch on the 1311  
 (Scope Loop) CE panel. This causes the oscillator, bit ring, and  
 MUC to run. They may now be scoped. The CPU  
 need not be running at this time.

After correcting trouble turn CE clock gate switch off  
 (to reset Bit ring), then back on. Push start key.  
 Turn Switch 2 on to exit from routine.

OSCILLATOR TEST

03.04

ERROR 030

Hang up condition occurred during Read Track operation in the Scan routine.

(Check for proper location of the jumper installed at REF D.)

As long as error is present (Failure to get file exit) the machine will stay in a loop. The error typeout can be suppressed by turning on Switch 1, however, because of the type of error, the CE must press Reset and Release Simultaneously each time he wishes to execute the loop. See ILD 04.02

DT 0023  
PN 2172366  
EC 412531

ERROR 100\*

An illegal operation failed to stop the 1620 clock. The instruction, 36 P P P P 00708 (MQ = 8), should stop the clock causing a program hang up condition.

See logic 05.06.10.1

Turn on Switch 1 and press Start Key. The Program is now in a two instruction diagnostic loop. Scope the failing circuit.

\* NOTE: If Select Lock Light is on at this time, insert and branch to select Lock Test.  
(49 00556)

03.06

ERROR 110

Address check indicator (36) failed to reset. See Note below.  
See logic 01.25.17.1

ERROR 111

Wrong length Record/Read back check indicator (37) failed to reset.  
See Note Below.  
See logic 01.25.17.1

ERROR 112

Cylinder overflow indicator (38) failed to reset. See Note Below.  
See logic 01.25.17.1

ERROR 113

Any Disk Check indicator (39) failed to reset. See Note below.  
See Logic 01.05.17.1

ERROR 114

Read check indicator (06) failed to reset. See Note Below.  
See logic 01.81.45.1 and 04.30.30.1

ERROR 115

Write check indicator (07) failed to reset. See Note below.  
See logics 01.81.45.1 and 05.30.30.1

**NOTE:** One or more Error Typeouts have occurred. Turn Switch 1 on.  
Push Start Key. The Program will go into a Diagnostic Loop  
attempting to reset all of the above indicators. Scope the  
failing circuit. After correcting trouble turn Switch 2 on to  
exit from loop. Push start key to continue.

DT 0023  
PN 2172366  
EC 412531

ERROR 120

CPU erroneously branched on a group Mark. See Note Below.

CPU failed to branch on a seven. See Note Below.  
See logic 01.63.50.1

ERROR 123

CPU failed to branch on a Record Mark. See Note Below.  
See logic 01.63.50.1

**NOTE:** One or more error typeouts have occurred. Turn Switch 1 on. Push Start Key. The Program will go into a Diagnostic Loop to INTERROGATE the above indicators. Scope the failing circuit.

03.08

ERROR 130

Hang up condition occurred during File Load Cycle. The operation being executed is an Illegal Op. which should force an exit (to I-cycles). The program will remain in a loop to allow Single Cycling through File Load Cycles. See Note on following page.

Check for -S File Exit

See logic 05.07.30.1 and ILD pages 04.01 & 04.02.

ERROR 131

1620 clock is being stopped erroneously. Check for -S Clock Stop (should be plus). See Note on following page.

See logic 05.06.10.1

ERROR 132

Hang up condition occurred during File Control Cycle of a Read operation with a sector count of 000. Switch thousand and Sector test gate should turn on File Exit latch. Program will remain in a diagnostic loop. See Note on following page.

Check for +Y FC File Exit

See logic 05.07.20.1 and ILD page 04.02

ERROR 133

Machine failed to exit from a Seek (to cycle 03) operation. Program will remain in a diagnostic loop. See Note on following page.

Check for missing -Y Promised Exit

See logic 05.07.30.1

ERROR 134

The carriage went to positive stop on a Seek to cylinder 00. See Note on following page.

Check for following failures:

1. -Y counter 000 off solid -05.15.60.1
2. One or more MUC triggers on solid -05.15.40.1

After correcting trouble push 1311 start/stop to restore carriage.

ERROR 135

Busy latch failing to reset. Reset normally occurs when +S 15 MS goes plus after the detent seats. See Note on following page.

Check for down level on +Y File Not Ready

See logic 05.06.10.1

DT 0023  
PN 2172366  
EC 412531

**ERROR 136**

Carriage will not seek past cylinder 00. Program attempted a seek to cylinder 03. See Note. Check for -Y counter 000 on solid.

See logic 05.15.60.1

**ERROR 137**

Machine failed to turn on Exit latch on an Address Check. See Note.

See logic 05.07.30.1

Check following possible causes:

1. No gated sector.
2. No gated index.
3. NRF tgr. fails to set.
4. No Addr. Cyl. check.
5. File reset up solid.
6. No selected pre-sector or sector.

**ERROR-138**

Machine failed to turn on Exit latch on a Read track operation. See Note.

Check for missing -S End track

See logic 05.30.10.1

**NOTE:  
(Scope Loop)**

Turn on Switch 1. Push Start Key. (If Ref Z types, remove jumpers that were installed and push start key again.) You have entered a two instruction routine which follows each of the above errors. It is built into the program to allow the repeating of the failing instruction. Because all of the errors on this and the preceeding page are Hang Up Type Errors, it will be necessary to push the Reset and Release keys simultaneously, then the start or single cycle key to repeat this routine. After correcting trouble turn switch 2 on to exit from routine. Push start key to continue.

03.10

ERROR 140

The carriage went to positive stop on a Seek to cylinder 01.  
See Note on following page.  
Check for the following failures:

1. MUC 1-2 trigger failed to turn off (AC reset). -05.15.40.1
2. The set gate failed to come up.
3. No count track pulses.
4. Busy latch failed to set. -C2.23.02.1

ERROR 141

The carriage went to positive stop on a Seek to cylinder 02. See  
Note on following page. Check for MUC 2-4 trigger failure to  
turn off when MUC 1-2 turned on (AC inputs).  
See logic 05.15.40.1

ERROR 142

The carriage went to positive stop on a Seek to cylinder 04. See  
Note on following page.  
Check for the following failures:

1. MUC 4-8 trigger failed to turn off when MUC 2-4 turned on  
(AC inputs).
2. Set gate up solid.
3. Count 000 latch failed to reset.  
See logic 05.15.40.1

ERROR 143

The carriage went to positive stop on a Seek to cylinder 05. See  
Note on following page. Check for MUC 8-10 trigger failure to  
turn off when MUC 4-8 turned on (AC inputs).  
See logic 05.15.40.1

ERROR 144

The carriage went to positive stop on a Seek to cylinder 10. See  
Note on following page. Check for MUC 16-20 trigger failure to  
turn off when MUC 8-10 turned on (AC inputs).  
See logic 05.15.40.1

DT 0023  
PN 2172366  
EC 412531

ERROR 145

The carriage went to positive stop on a Seek to cylinder 20.  
See Note. Check for MUC 32-40 trigger failure to turn off  
when MUC 16-20 turned on (AC inputs).  
See logic 05.15.40.1

ERROR 146

The carriage went to positive stop on a Seek to cylinder 40.  
See Note. Check for MUC 64-80 trigger failure to turn off  
when MUC 32-40 turned on (AC inputs).  
See logic 05.15.40.1

ERROR 147

The carriage went to positive stop on a Seek to cylinder 50.  
See Note. Check for MUC 128-100 failure to turn off when  
MUC 64-80 turned on (AC inputs).  
See page 05.15.40.1

**NOTE:**  
**(Scope Loop)**

A Two instruction Routine following each of the errors  
on this and the preceding page is built into the  
program to allow repeating the failing instruction.  
Push the start key to enter this Routine. Because all  
of the above errors are hang up type errors, it will  
be necessary to push the reset and release keys  
simultaneously, then the start or single cycle key to  
repeat this routine. Turn on Switch 2 to Redevelop  
error. After correcting trouble push 1311 start/stop to  
restore the carriage. Push start key to continue.

03.12

ERROR 150

Address check reset failed (Read track Op). See Note.  
Check for track gate latch failing to turn on or missing  
track start pulse.

See logic 05.30.20.1

ERROR 151

Overflow check reset failed (track Op.). See Note.  
See logic 05.30.20.1

ERROR 152

WLR/RBC reset failed (track Op.). See note.  
See logic 05.30.20.1

ERROR 153

Address check reset failed (Sector Op). See Note.  
See logic 05.30.20.1

ERROR 154

Overflow check reset failed (Sector Op). See Note.  
See logic 05.30.20.1

ERROR 155

WLR/RBC reset failed (Sector Op). See Note.  
See logic 05.30.20.1

NOTE: Turn Switch 1 on and push Start Key for two instruction  
(Scope Loop) Scope Loop.

DT 0023  
PN 217366  
EC 412351

ERROR 160

The file failed to read good data from any head. The Head Map shows that 2 or more of the 10 R/W heads failed to transfer any data and the remaining heads had parities. Turn Switch 1 on and push start key for Scope Loop.

Check for the following error conditions:

1. Read oscillator running continuously -C2.33.20.1
2. I/A record gate on solid -05.22.50.1

If failure is neither of the above items Branch to REF D.

See REF E for detailed explanation of Head Map.

ERROR 161

Miscellaneous read failure pattern. Push start key. If this error types again start test over. Failure should fall out under different error number with high probability.

ERROR 162

The Head Map shows that 2 or more of the 10 R/W heads failed to transfer any data and the remaining heads read good data (no parities). This indicates a Head Address Register failure. Compare the Head Map typed out to the statements below:

<u>HEAD MAP</u>	<u>CIRCUIT FAILURE</u>
1. 0@2245@779	Solid HAR Not 2 Bit
2. @323@@878@	Solid HAR 4 Bit
3. 10@1456@69	Solid HAR Not 4 Bit
4. 00@@455@@9	Solid HAR 8 Bit
5. 0123@5678@	Solid HAR Not 8 Bit

See logic pages 05.25.30.1, 05.25.40.1 and ILD pages 06.03 and 06.04.

Push Start Key. The typewriter will ask to loop on a single head or all heads. Turn Switch 1 on. Insert the desired head selection character. Type RS. Scope the failing circuit. If Switch 1 is off the typewriter will type the address and first part of the data read. Turn Switch 2 on to exit from loop.

See REF E for detailed explanation of Head Map.

ERROR 163

File failed to read correctly (parity) from one head. All other heads read correctly. Branch back to beginning of test (00500). If trouble appears solid, bring in the second core load (Branch to 00532). (This will rewrite the addresses and data on Track 3.)

(Continued)

DI 0023  
PN 2172366  
EC 412351

ERROR 163 (Continued)

After test is completed, return the test head to start test over. If trouble fails to appear, suspect bad data on the pack (cause unknown); if trouble persists, the disk pack may be damaged - change disk packs.

If DT 0023 has never been run on this pack, errors may occur on the first pass of the diagnostic - possible cause - bad data on cylinder 03.

ERROR 164

File failed to read sequentially from heads 9-0.  
Head Addr. Register (HAR) or HAR decoding circuit is failing.  
Compare the Head map typeout with the failure maps shown below.

EXAMPLE:	<u>HEAD MAPS</u>	<u>CIRCUIT FAILURE</u>
1.	5678956789	Solid HAR 1 Bit
2.	0123401234	Solid HAR Not 1 Bit
3.	0133056885	Solid HAR 2 Bit

Push Start key. The typewriter will ask to loop on a single head or all heads. Turn switch 1 on. Insert the desired head selection character. Type RS. Scope failing circuit. If switch 1 is not turned on, the typewriter will type the address and the first part of the data read. Turn Switch 2 on to Exit from loop. See logic pages 05.25.30.1, 05.25.40.1 and ILD pages 06.03 and 06.04.

See REF E for detailed explanation of Head Map.

ERROR 165

File failed to Read (transfer any data) from one head - all others OK. The Head map typeout indicates the failing head position with an @. Press 1620 start key to put program into a diagnostic loop which will select and read from the failing head. Turn Switch 2 on to exit from loop.

See REF E for detailed explanation of Head map.

ERROR 166

R/W heads failed to load to the disk surface 15 sec. after the 1311 start/stop switch was turned on. This normally takes place during the power-on seek.

Possible cause: Latch magnet not energized or excessive "slop" in the head loading linkage.

See logic C2.13.10.1

DT 0023  
PN 2172366  
EC 412531

ERROR 167

The carriage failed to Seek to cylinder 03. Turn on Switch 1 and push start key for scope loop.

Check following possible causes:

- |                                    |             |
|------------------------------------|-------------|
| 1. No Set counter 1-2 or 2-4 pulse | -05.15.30.1 |
| 2. No gate MAR to MUC              | -05.15.10.1 |
| 3. No home Seek gate               | -05.07.20.1 |

ERROR 168

The machine is unable to decode the address read from disk. This is probably caused by incorrect read format.

Press start key. The typewriter will ask to loop on a single head or all heads. Insert the desired head selection character. Type Rs. If Switch 1 is off, the typewriter will output the first part of the data read; If Switch 1 is on, error typeouts are bypassed. Scope the failing circuit.

EXAMPLE HEAD MAP

3333333333

CIRCUIT FAILURE

Missing Set Counter 4-8 pulse  
(logic 05.15.30.1)

See Ref E for detailed explanation of head map.

PN 2172366  
EC 412531

03.16

ERROR 170

Write Erase circuit turned on Select Lock. Replace the card pulled at B1B13. Scope as noted below.

ERROR 171

Read and Write gate "And" turned on Select Lock. Replace the card pulled at B1C09. Scope as noted below.

ERROR 172

AC-DC Safety circuit turned on Select Lock. Replace the card pulled at B1C06 and scope the failing circuit in the DC (CPU not running) condition. After correcting trouble, push start key to continue.

ERROR 173

Multiple Modules Selected turned on Select Lock. Refer to Module Select Lock map at Ref R.

**NOTE:**  
(Scoping loop)

1. First core load: no scoping loop is provided. Scope the failing circuit in the DC condition. After correcting trouble, push start key to continue.
2. Second core load: push start key for scoping loop. After correcting trouble, turn switch 2 on to exit from loop.

DT 0023  
PN 2172366  
EC 412531

03.17

**ERROR 180**

Index is failing to come up.

See logic 05.21.10.1

Check jumper location. (A misplaced jumper will also cause this error)

**ERROR 181**

Disk array is running too slow. Check for bad spindle bearings, slipping belt or dragging brake. Check frequency of the input power. Note that motor may be 50 or 60 cycle - be sure that proper pulley is used for the input frequency.

**ERROR 182**

Disk array is running too fast. Check frequency of input power. Note that motor may be 50 or 60 cycle - be sure that proper pulley is used for the input frequency.

DT 0023  
PN 2172366  
EC 412531

03.18

ERROR 200

Machine failed to Exit from a Write sector operation (Sector count = 000.) See Note.

See logic 05.07.30.1 and ILD page 04.02

ERROR 201

Machine failed to Exit from a Write Op. with an Address Check. See Note.

See logic 05.07.30.1 and ILD page 04.02.

ERROR 202

Machine failed to Exit from a Write track Op. See Note.

See logic 05.07.30.1 and ILD page 04.02

ERROR 203

Machine failed to Exit from a RBC full track Op. See Note.

See logic 05.07.30.1 and ILD page 04.02

ERROR 204

Machine failed to Exit from a Read Full track Op. with WLR checking. See Note.

See logic 05.07.30.1 and ILD page 04.02

NOTE:  
(Diagnostic  
Loop)

A two instruction routine following each of the above errors is built into the program to allow repeating the failing instruction. Push the start key to enter this routine. Because all of the above errors are hang up type errors, it will be necessary to push the Reset and Release keys simultaneously, then the Start or Single cycle key to repeat this loop. To redevelop error, turn on Switch 2.

DT 0023  
PN 2172366  
EC 412531

**ERROR 210**

One or more bit lines in the write translator is up erroneously. The CPU attempted to write only the  $S_1$  and  $S_2$  on disk by sending 8/4 bits (@) to the file. This combination is blocked by the write translator and normally sets no bits in FBR. Any bit erroneously set into FBR will be written on disk (possibly, along with the 8/4 bits should this combination fail to be blocked). Note, on the Read Op. the no bit combination from disk is converted back to an 8/4 (@) by the Read translator.

If the read field consists of variable, valid data, then the write operation must have failed to write on disk.

The typewriter will ask for a character which will be written on disk and read back to assist in diagnosing the failure. To isolate the trouble, analyze the bit configuration of the read field typed out.

For a Scope Loop:

1. Turn on Switch 1.
2. Type digit which the program will attempt to write and read.
3. Type RS.
4. To type in new digit, turn Switch 1 off.
5. To exit from routine turn Switch 2 on. Type RS.

See logic 05.11.10.1

**ERROR 211**

Writing even parity failed to turn-on Write Parity check. Turn on Switch #1 to enter write loop. Push start key.

See logic 05.30.30.1

**ERROR 212**

Reading even parity failed to turn on Read Parity check. Turn on Switch #1 to enter read loop. Push start key.

See logic 05.30.30.1

**ERROR 213**

Even serial FBR data picked up a bit writing blanks ( $S_1$  &  $S_2$ ) on disk. Error bit is typed out. Typewriter will call for a test digit to help diagnose the trouble. For scope loop turn on Switch 1, enter Digit, RS. The program will attempt to write then read that digit. To enter new digit, turn off Switch 1. To exit from routine turn Switch 2 on.

See logic 05.12.80.1

**ERROR 214**

Odd serial FBR data picked up a bit while writing blanks ( $S_1$  &  $S_2$ ) on disk. Error bit is typed out. Typewriter will call for a test digit to help diagnose the trouble. For scope loop turn on Switch 1, enter Digit, RS. The program will attempt to write then read that digit. To enter new digit, turn off Switch 1. To exit from routine turn Switch 2 on. Type RS.

See logic 05.12.80.1

DT 0023  
PN 2172366  
EC 412531

ERROR 220 (Continued)

In this example 4 different test digits were keyed in (one at a time), 1, 2, 4 and 8. The output shows that only the first five characters of each record were written and read back correctly; this corresponds to the five characters placed in the address location. The failure seen here apparently is caused by losing format control after the I/A, thus the record (and record AGC) are incorrect. If your typeout matches this example, check for a missing "set counter 16-20" pulse.

## Scope Loop:

1. Turn on Switch 1.
2. Type digit which program will attempt to write then read.
3. Type RS.
4. To enter new digit, turn switch 1 off.
5. To exit from this loop turn switch 2 on.

See logic 05.15.30.1

## Character Coding:

1620 → Write Xlator → 1311 → Read Xlator → 1620

03.22

ERROR 230

One or more heads failed to write correctly.

Scope Loop:

1. Turn on Switch 1.
2. Push Start Key.

See logic C2.30.05.1

DT 0023  
PN 2172366  
EC 412531

ERROR 240

Read Back Check indicator was turned on but compare data was equal (Rd/Wr data compared equal in 1620 core in the data transfer routine).

Check for compare latch failing to set or failure of 1311 compare "And" circuits. See Note

See logic 05.21.30.1

ERROR 241

WLR/RBC indicator (37) failed to turn on with either a Wrong Length Record or Read Back Check error.

Check for a solid WLR/RBC reset. See note.

See logic 05.30.20

ERROR 242

RBC indicator (37) failed to turn on in a Read Back Check operation with unequal data. See Note.

See logic 05.21.30.1

Also, the RBC Op. may be terminating too early (before any unequal data is compared).

Check for a missing pulse, set counter 64-80.

See logic 05.15.30.1

NOTE:           1. Turn on Switch 1.  
(Scope Loop)  2. Push Start Key.

DT 0023  
PN 2172366  
EC 412531

ERROR 251

Address check occurred on a one sector Read Op. See Note

Check the following possible causes:

- |  |             |
|--|-------------|
|  | See logic:  |
| 1. No counter 000 through 004 gate MAR | -05.15.60.1 |
| 2. I/A gate failing to turn off        | -05.15.70.1 |
| 3. No compare sample gate              | -05.21.30.1 |
| 4. I/A skip check latch ON solid       | -05.21.30.1 |

ERROR 252

Failed to transfer one complete record (100 characters) on a Sector Read Op. (Data is located at 15000 in core). The operation may be terminating early because counter 000 comes up too soon during the record. Check for missing pulse on "set counter 32-40" or "set counter 64-80". See Note.

See logic 05.15.30.1

Also check for transferring more than one sector.

ERROR 253

File encountered an incorrect address on a Sector Read Op., but failed to give a "No address compare" error. See Note.

See logic 05.21.30.1

ERROR 254

Address check occurred in a 21 sector Read operation. Scope output of high level amplifier. See Note.

See logic C2.33.20.1

ERROR 255

Failed to transfer 21 complete records on a 21 sector Read Operation. Scope output of high level amplifier. See Note.

See logic C2.33.20.1

ERROR 256

Address compare occurred in a 21 sector Read operation. Addresses should be 00600 through 00621. Scope output of high level amplifier. See Note.

See logic C2.33.20.1

NOTE: 1. Turn on Switch I.  
(Scope Loop) 2. Push Start Key.

**ERROR 260**

Carriage failed to detent on a Seek operation. Press [31] Start/Stop to reset the carriage. Press Start to redevelop error. Scope the failing circuit.

**ERROR 261**

Check to see if the carriage is at cylinder 010. If it is, this indicates that the CPU cannot indirect address the P- field of a Seek instruction; if it is not, the carriage failed to seek correctly. (The program checks the CPU for indirect addressing and will not use the feature if it is not installed.)

**ERROR 262**

The carriage failed to seek to the correct cylinder. The typeout indicates the cylinder used in the Disk Control Field as well as the cylinder (decoded) where the carriage actually detented. Push start key to redevelop error.

## DIAGNOSTIC TEST 0023

THIS PROGRAM CHECKS THE IBM 1311 DISK  
 STORAGE DRIVE, MODEL 3 AS ATTACHED  
 TO THE IBM 1620 MOD ONE ONLY

## ASSUMPTIONS-

THIS PROGRAM ASSUMES THAT THE BASIC  
 1620 CPU IS OPERATING PROPERLY AND  
 THAT THE USER IS FAMILIAR WITH THE  
 1311 DISK STORAGE DRIVE.

## SCOPE-

THIS TEST IS DESIGNED TO DETECT AND  
 ISOLATE MALFUNCTIONS IN THE OPERATION  
 AND CONTROL OF THE 1311 DISK STORAGE DRIVE.

HEAD MAP ROUTINE

THIS ROUTINE GENERATES A HEAD MAP.  
 THIS MAP IS 10 DIGITS LONG AND IS  
 A SERIES OF DIGITS 0-9, AT SIGNS, AND RM.

- FIRST A SEEK IS PERFORMED TO MOVE THE ACCESS MECHANISM TO SOME CYLINDER (03)
- SECOND A READ TRACK IS USED TO TRANSFER DATA FROM HD 0-9 TO THE 1620.
- THIRD GENERATE MAP - HD NO. ORDER 0123456789
  - AT SIGN = NO DATA TRANSFER
  - RECORD MARK = PARITY OR RD CK ON TRANSFER
  - DIG 0 - 9 = SCTR ADRS DECODED TO HD NO

-FOURTH  
 NORMAL MAP           0123456789

-ERROR TYPEOUT

THIS ROUTINE CHECKS THAT THE WRITE TRANSLATOR OR  
 FBR OUTPUT GATING \*SERIALIZER\* CIRCUITRY IS FUNCTIONING.  
 2100 EVEN PARITY 8-4 BITS ARE WRITTEN TO THE DISK. THERE  
 THE BITS GO THROUGH THE WRITE TRANSLATOR WHICH BLOCK THE  
 8-4 BITS. THEREFORE ONLY S1 AND S2 BITS ARE WRITTEN \*EXCEPT  
 FOR THE FIRST ADDRESS DIGIT WHICH IS C82 BITS\* . WHEN THE

15490\* DATA IS READ BACK INTO CONTROL MEMORY FOR INTO THE READ FLATOR  
 15500\* WILL FORCE 8-6 BITS BACK INTO MEMORY. IF ANY BIT LANE IS  
 15510\* SHORTED IT WILL SHOW UP.  
 15520\* ALSO READ AND WRITE PARITY LATCHES ARE CHECKED.  
 15530\*

THIS ROUTINE CHECKS THE SEEK OPERATION.  
 THE MUC (MULTIPLE USE COUNTER) SET CONTROL  
 LINES ARE CHECKED, EACH BIT TRIGGER IN THE  
 MUC COUNTER, AND THE MECHANICAL LINKAGES  
 ARE EXERCISED TO DETERMINE PROPER OPERATION.

	PHASE	CYL	SCTR ADRS	MUC (100-80-40-20-10-8-4-2 TRIG)
