

These Twins were exactly like one another; very well featured, having also pretty neat and handsome Limbs. They had their hair more than ordinarily thick, and about half an Inch long, and the nails full grown.

We might have proceeded to further Observations, but time and the tumultuous concourse of people, as also the night, and likewise the Fathers importunity to hasten the Birth to the Grave, hindered us.

The Mother is at this time in as good a Condition of Health, as Women in Child-bed use to be.

*Observations on Insects, lodging themselves in Old Willows,
Produced before the Royal Society by Dr. Edmund King,
July 14. 1670.*

— **Y**OU may remember, that about the *beginning* of *May* last, a piece of old Willow-wood, being sent me from Sir *John Bernhard* out of *Northamptonshire*, was produced before you; in which were lodged many Insects curiously wrapt up in green Leaves, in several channels or burrows, each with 12, 14, or 16. leaves round the Body, and several of them with as many little round bites of leaves at each end, to stop them up close. These, thus made up, are near an Inch long or the best part of an inch, put in one after another into a bore made in the wood, fit for their reception. They are in the manner of Cartrages of Powder, wherewith Pistols are wont to be Charged, or like long slugs of lead, as are sometimes used in some parts of those burrows; they are placed so near one another as to touch; in others, at some considerable distance. These Insects observe this method in placing themselves, that sometimes they make a direct way into the length of the wood, sometimes they bore out into the side, and run another way, those Channels being not unlike the burrows of Rabbits; all which they fill up with these round appearances of wrapt leaves, all regularly wrought: In which I find either something alive, or appearances of something that hath dyed there, and is putrified: In some a great number of Mites,
of

of a dark asfh-colour, fhap'd not unlike common Mites ; in others, I find feeming excrements of fome fmall Infeét, with the decayed parts of the dead Infeét; in others, white Maggots, which you faw. Some of thefe Maggots I took out of their *Theca* or bagg, and put them in warm places in the Sun ; and they thereupon grew fomewhat bigger, but changed not fhape nor colour, but dyed. The reft I kept clofe in a box till the eighth of *July* prefent : then I took one of them out of the wood, and open'd the leaves, and felt fomewhat ftir, hearing alfo an humming noife like that of a Bee ; and as foon as I had open'd the *Theca*, a perfect Bee did fly out againft my window, as ftroingly as a common Bee out of an Hive, having much of the colour and bigneffe of thofe when they are new Flyers. Then being pleas'd at the fight, I took five more (all I had left) and put them in a Box into my Pocket, to fhew them the Lord *Brouncker*, before they were taken out, or had eaten their way out ; but his Lordfhip not being at home, I brought them back again ; and they being difturbed, they all eat themfelves out ; and coming home, they were all creeping about my Box, and are fince dead there, and are thefe, I here prefent to your View. They have all ftings as other Bees have. I had fome thoughts at firft fight, by the yellowifh Circles under their Bellies, that they might be a fort of Wasps ; but now am of opinion, that they are common Bees.
