

Porro, cum Angulum sic, ut dictum est, definiverat, p. 67; subiungit, p. 68. *Quondsi magnitudines illæ sint duæ lineæ, comprehensus ab iis angulus, Planus vocabitur: quasi quidem de Triangulis sphericis nil unquam inaudiret;* nec alius esse possit superficialis angulus, quam in *Plano*.

Adhæc, illud duarum pluriumve, de Lineis non tuto dicitur. *Trium enim linearum concursus, non angulum, sed angulos saltē duos, constituunt;* non enim lineæ plures duabus ad unum superficialem angulum constituendum concurrunt. Item, cum p. 67. Angulum in genere per *duarum pluriumve, &c.* definiverat; Angulum p. 68. *una vel pluribus superficiebus comprehensum ait (& una quidem angulum verticalem Coni comprehensum;)* quasi quidem *una*, fuerit, *duæ vel plures*.

Insuper, quid demum illud est, quod per *brevissimam distantiam insinuatum* vult? Quippe in ipso concursus punto, *Nulla est distantia; extra illud, nulla minima:* nulla utique assignari poterit, qua non sit minor: sed re vera tota hæc, quam de *Angulo* notionem concipit, est parum sana. Defini endus utique est non per *distantiam seu remotionem*, sed per *Inclinationem*. qnod ex *Euclidis* definitione didicisset.

Deniq; (ne multis nunc sim) p. 171. in duabus his Quadraticarum æquationum formulis $aa - ca + dd = 0$, & $aa + ca + dd = 0$; utramque radicem affirmativam esse pronunciat. quod omnino secus est. Et quidem in priore, Radix utraque Affirmativa; sed in posteriore, Negativa utraque.

Atque hæc quadem, ex multis pauca, si non sufficient, ut ex ungue Leonem æstimes, plura facile congerentur. Num autem hos *Incuria*, an *Inscitiae*, errores fuderit (prout ipse pag. ult. distinguit) non determino. Vale.

Hæc Dn. Wallisius epistola una; cui postea submisit alteram, 18. Julii ad me scriptam, quam istoc mense, ob alia, non licebat typis committere; nec quidem licet hoc ipso: ne scil. hasce Schedulas, publicationi variorum, idque imprimis sermone *Anglico*, destinatas, disceptationibus *Latinis* compleamus. Proxima occasione, quæ idem Author porro notanda invenit vel in *unico primo Capite Synopseos Laurentianæ*, Lectori (cum particularia flagitet Dn. Du Laurens) ob oculos sistemus.

An Account of Two Books.

I. *R. de GRAAF Med. D. de VIRORUM ORGANIS GENERATIONI INSERVIENTIBUS, &c.* Ludg. Bat. 1668. in 12°.

This Treatise was promised by the Author in a printed *Epi stle* of his, which we gave an account of in April last, *Numb. 34.* p. 663. There being at the same time publisht a *Predromus* of Job. Van Horne, suspecting, that the Observations of *De Graaf* were much the same with his upon this Subject; we do now upon the perusal of this Book, find chiefly these considerable Differences between them.

p. 663.

First, the said *Van Horne* makes the Spermatick Artery in man to goe to the Testicles in a winding, but *De Graaf*, in a streight way.

Secondly, the former affirms, that the *vasa deferentia* have no communication with the *vesiculae seminales*; but the latter maintains, and demonstrateth it to the Ey, there is so great a commerce betwixt them, *ut semen dum à Testibus per vasa differentia affluens in Urethram effluere nequit, propter carunculam clausam; necessariò influat in Vesiculas, in iisque pro futuro coituro reservetur.*

Thirdly, the former is of opinion, *triplicem esse materiam seminis;* but *De Graaf* will have but *one only*; answering the Arguments, used both by *Van Horne* and *Dr. Wharton* to prove that *triplicity*.

But that, which *De Graaf* much insists on in this Book, is, to shew what is the *true Substance* of the *Testicles*, and to vindicate the Discovery thereof to himself; affirming positively, that no man, before him ever knew the truth

of it. * For the making out of which, he first de- * See the Letter
nyeth, that the *Testes* are *glandulous*, or *pultaceous*; ter of Doctor
and then affirms that their substance is nothing else N. 35. p. 681.
but a *Congeries minutissimorum vasculorum semen*
conficiuntiam, *qua si absque ruptione dissoluta sibi invicem adne-*
ctaretur, facile viginti ulnarum longitudinem excederent. Which
he affirms, he can prove by ocular Demonstration.

Then he sheweth, how the seminal vessels pass è *Testibus ad Epididymides*, vid. not by one Trunck (as *Dr. Highmore* thinks) but by 6. or 7. small *ductus's*; assigning the cause, why *Doctor Highmore* did not see them.

Further he examines, An semen in *testibus conficiatur*; utrum ex *Sanguine* vel ex *Lympha*: quomodo elaboretur, crat- fescat, lactescat: *qua via à Testibus ad Urethram excurrat.*

Moreover he endeavours to prove, *Vesiculos seminales ordinatas esse non seminis generationi, sed receptieni & affirmationi.*

He also observeth concerning the *seminal matter*, that 'tis composed *ex dupli materia*, which after *Aristotle*, he calls *λεπτήν καὶ ζύχον μερικαίαν*, considering this twofold matter like *Dough and Ferment*, this infecting and quickning that, and the grosser part being a conservatory and vehicle to that, which is most elaborate.

When he examins the *Penis*, he taketh notice, *Omnes habent*

nus Anatomicos perperam assignasse usum muscularum Penis, quos Erectores appellant; Eorum quippe provinciam non esse, Penem erigere, & dilatare Urethram, cum omnis Musculi actio sit contractio, qua extensioni contraria est; eos potius Penem versus interiora retrahere quam erigere: Interim, hisce Penis Musculo, coarctando corpora nervosa circa corum exortum, materiam seminalem versus Penis partem anteriorum propellere, atque hac ratione corporum nervorum distensione erectionem augere.

Before we conclude this Account, we cannot but take notice, that the Author occasionally inserts in this Book divers curious and remarkable Examples and Observations; some whereof are.

1. Concerning those, that are born, either *absque Testibus*; or, *cum Testiculo uno*; or, *cum tribus, idque hereditario per aliquot familias, admodum facundas.*

2. About the *situs præternaturalis Testiculorum, generationis tamen virtutem non impidentis.*

3. Concerning *laetescens Bloud* in a man living at *Delft* in *Holland*, whose Bloud alwayes turn'd into Milk, when let out either by venæ-sections, or by bleeding at the Nose, or by a wound. V. pag. 84, 85. Compare Numb. 6. pag. 105, 117, 118. and Numb. 8. pag. 139. of these *Transactions*.

4. Concerning the strange alteration made in Femals, *ab Aurora seminali*: quod confirmat exemplo felis, diu fugentis (idque ad integrum fere sui nutritionem) lac mammatum caniculae, per aliquot annos à coitu prohibita; deinceps vero, postquam catella admiserat canem, nunquam ab eo tempore lac ex mammis ejus exsugere volentis.

5. About a strange *Hæmorrhagy per Penem*, which amounted to 14. pound, in a Porter of 52. years old, falling down with a heavy load upon a board, laid over a ditch, and so turning about, when the said porter trod upon it, that it cast him down upon its edge, turn'd between his legs; yet the Patient by the skill and care of our Author recover'd.

6. Various Observations of Clysters and Suppositories, cast up by Vomits, p. 195, 196.

7. Several wayes of performing unbloudy dissections of Animals, p. 228, 229, &c.

II. LOGARITHMOTECHNIA NICOLAI MERCATORIS.

Concerning which we shall here deliver the account of the judicious Dr. I. Wallis, given in a Letter to the Lord Viscount Brouncker, as follows;

Incidebam heri (Illustrissime Domine) in D. *Mercatoris Logarithmotecnium*, nuper editam. Quæ ita mihi placuit, ut non prius dimiserim quām perlegisset totam. Et quamquam pauca quædam, Phraseologiam quod spectat seu loquendi formulas nonnullas, mutata mallem; sunt tamen ipsa sensu suo sana: Eaque quæ superstruitur Doctrina, Logarithmos expedite atque subtiliter construendi, perspicue satis atque ingeniose traditur.

Quæ huic subjungit *Quadratura Hyperbolæ*, elegans admodum est atque ingeniosa. Nempe ad hunc sensum. V. Fig. I.

Postquam in Hyperbola MBF, (cujus Asymptotæ AN, AH, ad angulum rectum coeunt) ostenderat, prop. 14, Rectangula BIA, FHA, spA, &c. (ductis BI, FH, sp, &c, parallelis Asymptotæ AN,) invicem esse æqualia; adeoque latera habere reciproce proportionalia; (quæ nota est Hyperbolæ proprietas:) Positis $AI = BI = 1$, & $HI = a$: ostendit, prop. 15.

$FH = \frac{1}{1+a}$ (Nempe propter analogiam AH. $AI :: BI$. FH . hoc est.

$$\frac{1}{1+a} = 1 - a + a^2 - a^3 + a^4, \text{ &c.}$$

Sed & (quod Di-

Sed & (quod Di-

\hline +a^{458} + a^{459} \\$$

$$\begin{aligned} 1 &= a + a^2 - a^3 + a^4 \&c. \\ 1 &= 2a + 4a^2 - 8a^3 + 16a^4 \&c. \\ 1 &= 3a + 9a^2 - 27a^3 + 81a^4 \&c. \\ &\text{& sic deinceps usque ad} \\ 1 &= A + A^2 - A^3 + A^4 \&c. \end{aligned}$$

Cum itaque sint

$$\begin{aligned} 1 &+ 1 + 1 \&c. (\text{usque ad ultimum}) = A \\ a &+ 2a + 3a \&c. (\text{usque ad } A) = \frac{1}{2}A^2 \\ a^2 &+ 4a^2 + 9a^2 \&c. (\text{usque ad } A^2) = \frac{1}{3}A^3 \\ a^3 &+ 8a^3 + 27a^3, \&c. (\text{usque ad } A^3) = \frac{1}{4}A^4 \\ &\text{& sic deinceps:} \end{aligned}$$

(quod ostendit ille prop. 16, estque à me alibi demonstratum:) Recte colligit, prop. 17. Expositum spatium Hyperbolicum $B_{IRU} = A - \frac{1}{2}A^2 + \frac{1}{3}A^3 - \frac{1}{4}A^4 + \frac{1}{5}A^5, \&c.$ Adeoque si (assignato, ipsi $A = 1r$, valore suo in numeris, ut res postulaverit,) distribuantur in duas classes $A, \frac{1}{2}A^2, \frac{1}{3}A^3, \frac{1}{4}A^4, \&c.$ (potestates affirmatae,) $\& \frac{1}{5}A^5, \&c.$ (potestates negatae;) harumque Aggregatum, ex Aggregato illarum, subducatur; Residuum erit ipsum B_{IRU} spatium Hyperbolicum.

Ne quis autem operam lusum iri existimet,, propter Addendorum seriem in utraque classe infinitam; adeoque non absolvendam: Hinc incommodo medelam (tacitus) adhibet: ponendo $A = 0.1$, vel $A = 0.21$, aliive fractioni decimali æqualem, adeoque minorem quam 1: (Hoc est, sumpta I_r minore quam $A_1 = 1$.) Quo fit, ut posteriores ipsius A potestates tot gradibus infra Integrorum sedem descendant, ut merito negligi possint.

Exempli gratia ; positis $A_1 = 1$, & $I_r = 0.21$. erit

$$\begin{aligned} A &= 0.21 \\ \frac{1}{2}A^2 &= 0.003087 \\ \frac{1}{3}A^3 &= 0.000081682 \\ \frac{1}{4}A^4 &= 0.000002572 \\ \frac{1}{5}A^5 &= 0.000000088 \\ \frac{1}{6}A^6 &= 0.000000003 \end{aligned} \quad \begin{aligned} \frac{1}{2}A^2 &= 0.02205 \\ \frac{1}{3}A^3 &= 0.000486202 \\ \frac{1}{4}A^4 &= 0.000014294 \\ \frac{1}{5}A^5 &= 0.000000472 \\ \frac{1}{6}A^6 &= 0.000000016 \end{aligned}$$

$$+ 0.213171345 - 0.022550984 = 0.190620361 = B_{IRU}$$

Quæ est brevis Synopsis Quadraturæ suæ satis elegans.

Dissimulandum interim non est; si quis totius B_{IRF} spatii (cujus latus I_r longius intelligatur quam A_1) quadratram postuleat; rem non ita feliciter successuram: propter medelam, quam modo diximus, malo minus sufficientem. Cum enim jam ponenda sit $A > 1$; manifestum est, posteriores ipsius potestates, altius in Integrorum sedes penetraturas, adeoque minime negligendas.

Huic autem incommodo, levi constructionis immutatione, facile subvenitur.

Vid. Fig. 1.

Cæteris utique ut prius constructis; Quadratum exponatur HF spatium

tium; (cujuscunque fuerit longitudinis A H; puta major minorve quam AI, vel huic æqualis: sumptoque ubivis inter A & H, puncto r; puta ultra citrave punctum I, vel in ipso I puncto:) Ponantur autem (non, ut prius $AI = 1$, & $Ir = A$: sed) $AH = 1$; & $Ir = A$, quæ intelligatur in æquales partes innumeratas dividi, quarum quælibet sit a . Erunt itaque, post $AH = 1$, reliquæ deinceps decrescentes $1-a$, $1-2a$, $1-3a$, &c. usque ad $A r = 1-A$. Item, propter æqualia Rectangula FHA, urA, BIA, &c. puta, $= b^2$: Erit $HF = \frac{b^2}{1}$; reliquæque deinceps

$\frac{b^2}{1-a}$, $\frac{b^2}{1-2a}$, $\frac{b^2}{1-3a}$, &c., usque ad $r u = \frac{b^2}{1-A}$ spatium HF ut comple-

tes. (Quæ omnia ostensa sunt, in mea *Arithmetica Infinitorum*, prop. 88, 94, 95.)

Factaque Divisione; reperiatur

$$\frac{b^2}{1-a} = b^2 + b^2 a + b^2 a^2 + b^2 a^3$$

$$+ b^2 a^4, \text{ &c.}$$

Hoc est,

$$b^2 \text{ in } 1+a+a^2+a^3+a^4, \text{ &c.}$$

(sumptis ipsius a potestatibus conti-
nue sequentibus affirmatis omni-
bus.) Cumque de reliquis idem
sit judicium; erunt rectæ omnes,
ipsis HF & ru interjectæ,

$$\begin{array}{c} 1-a \\ \hline b^2 - b^2 a \\ \hline + b^2 a^2 \\ \hline + b^2 a^2 - b^2 a^3 \\ \hline + b^2 a^3 - b^2 a^4 \\ \hline + b^2 a^4 \\ \hline \end{array}$$

$$\left. \begin{array}{c} 1+a+a^2+a^3+a^4 \text{ &c.} \\ 1+2a+4a^2+8a^3+16a^4 \text{ &c.} \\ 1+3a+9a^2+27a^3+81a^4 \text{ &c.} \\ \vdots \\ 1+A+A^2+A^3+A^4 \text{ &c.} \end{array} \right\} \text{in } b^2.$$

& sic deinceps usque ad

Omniumq; Aggregatū, $A + \frac{1}{2}A^2 + \frac{1}{3}A^3 + \frac{1}{4}A^4 + \frac{1}{5}A^5$ &c, in $b^2 = FHru$.
(per *Aritm. Infin.* prop. 64.)

Exempli gratia:

Qua-

Qualium i. \equiv ANG N $\left\{ \begin{array}{l} \text{Quadrato,} \\ \text{Rhombo,} \end{array} \right\}$ si angulus A sit $\left\{ \begin{array}{l} \text{Rectus.} \\ \text{Obliquus.} \end{array} \right\}$

Quæ quidem tam absoluta est tamque expedita Hyperbolæ quadratura, ut nesciam an melior sperari debeat.

Atque hæc sunt quæ hac de re scribenda duxi. Quæ si D. Mercatori imperiveris; non displicebit, credo, hæc suæ Quadraturæ facta recessio.

Posse hæc ad Logarithmorum inventionem accommodari, non est quod moneam: Sed & ad Summam Logarithmorum inveniend: m: (quæ inquirit ille prop. 19.) Nempe, Positis $A H = 1$, $A I = IB = b$, (ut prius) planoque $B I H F = pl.$ Erit $pl - b^2 + b^2 = BIps + BIqt + BIru$, &c. usque ad $B I H F$. Si autem non ab ipsa BI incipiatur; sed ultra citrave, puta à ps : Posita $pH = a$ & $psFH = pl.$ erit (universaliter) $psqt + psur &c$ (usque ad $psFH$) $= pl - ab^2$: qualium i, æqueatur cubo ipius AH .) Quod alias, si opus erit, demonstrabitur. Tu interim, Illustrissime Domine, Vale.

Oxon. d. 8. Julii, 1668.

Fig 1.

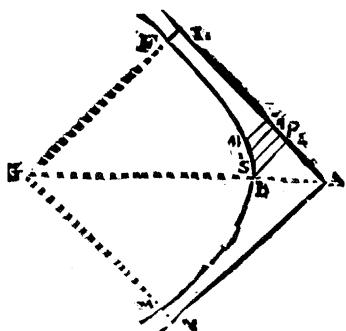

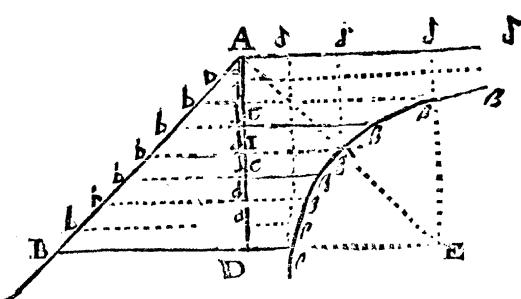

Fig 2.

The Demonstration

Promised at the end of the foregoing Letter, follows in another from the same Author to the same Noble Lord, thus;

Petis (Illustrissime Domine) per literas tuas Aug. 3. datas (quas hester-
na nocte accepi) ut demonstrare velim methodum meam, Logarithmorum
summam inveniendi, quam literis meis Julii 8. datis, brevissime insinua-
veram.

Quæ quidem, cum sit cum Ungularum doctrina (quam alibi trado) conne-
cta; opus erit ut utramque simul exponam: sed & rem totam (quæ in D. Mer-
catoris

entoris figuræ & methodo quantum res ferebat accommodaveram) ad principia mea revocatam ab origine repetam. V. Fig. 2.

Ostensum est, in mea *Arithmetica Infinitorum*, prop. 95. Spatiū Hyperbolium $AD\beta\delta\beta$ (in infinitum continuatum à parte $\beta\delta$, sed à parte $D\beta$ ubi vis terminatum,) Figuram esse quam ex *Primanorum Reciprocis* conflatam appello, Prop. 88. definitam: Cujus nempe Ordinatim—applicatae d^3 , d^3 , sunt Primanis (seu Arithmetice proportionalibus) db , db , (Triangulum complementibus) adeoque ipsis dA , dA , (suis à vertice distantiis) Reciproce Proportionales. Hoc est, (posito $A D \equiv d$; & rectangulo $AD\beta \equiv b^2$; particulisque infinite exiguis a , a , &c;) si à vertice $A\beta$ incipias $\frac{b^2}{o}$, $\frac{b^2}{a}$, $\frac{b^2}{2a}$, $\frac{b^2}{3a}$, &c. usque ad $\frac{b^2}{d} \equiv D\beta$: vel, si à base $D\beta$ incipias, $\frac{b^2}{d}$, $\frac{b^2}{d-a}$, $\frac{b^2}{d-2a}$, $\frac{b^2}{d-3a}$, &c. usque ad $\frac{b^2}{d-d} \equiv A\beta$ infinitæ, (nempe, si ad Verticem usque processum continuaveris;) vel, usque ad $\frac{b^2}{d-A} \equiv C\beta$, (posito $DC \equiv A$,,) si continuaveris usque ad $C\beta$, ubi vis intra $A\beta$ & $D\beta$ sumptam. (Adeoque omnium Aggregatum, $\frac{b^2}{d} + \frac{b^2}{d-a} + \frac{b^2}{d-2a} + \frac{b^2}{d-3a}$, &c, est ipsum $DC\beta\beta$ planum.)

Manifestum itaque est, (& ibidem prop. 94. ostensum) si intelligantur singulæ $d\beta$, in suas à vertice distantias Ad , ductæ; hoc est, $\frac{B^2}{a}$ in $2a$, $\frac{B^2}{a}$ in $2a$, (& sic de reliquis;) erunt omnia rectangula $A d\beta$; hoc est, rectangulum $d\beta$ momenta respectu $A\beta$, (intellige, facta ex magnitudine in distantia arcta;) seu plana semiquadrantalē Ungulam (cujus acies $A\beta$) complementia, (eisdem $d\beta$ rectis perpendiculariter insistentia;) invicem æqualia. Quippe singula $\equiv b^2$. (Quorum cum unum sit $AIV\beta$ quadratum, erit $AI \equiv b^2$.)

Adeoque Totius $AD\beta\beta\beta$ (plani infiniti) seu omnium $d\beta$ illud complementum, momentum respectu rectæ $A\beta$, (ut axis æquilibrii;) seu Ungula semiquadrantalē eidem $AD\beta\beta\beta$ insistens (aciem habens $A\beta$;) sunt totidem b^2 ; hoc est, $d b^2$. (Ungula magnitudinis finitæ plano infinitæ magnitudinis insistens.) Eiusque pars plano $AC\beta\beta\beta$ insistens (propter $AC \equiv d - A$) similiter ostendetur æqualis ipsi $d - A$ in b^2 . ductæ; hoc est, $d b^2 - A b^2$. Adeoque pars reliqua, ipsi $DC\beta\beta\beta$ insistens, æqualis ipsi $A b^2$. Quod itaque est ejusdem $DC\beta\beta\beta$ momentum respectu $A\beta$.

Atque hoc momentum per plani $D\beta\beta$ magnitudinem, puta per pl , divisum; exhibet plani distantiam Centri gravitatis $ab A^\delta, \frac{ab^2}{pl}$: adeoque distantiam ejusdem a $D\beta$, $d = \frac{ab^2}{pl}$.

Hæc itaque à $D\beta$ distantia, in pl (planii magnitudinem) ducta; exhibet $dp l - A b^2$ ejusdem $D\beta\beta$ momentum respectu $D\beta$; seu Ungulam eidem $D\beta\beta$ insitentem, cuius acies sit $D\beta$.

Hæc denique Ungula (cujus altitudo, in $D\beta$, nulla sit, sed, in $C\beta$, ipsi $D\beta$ æqualis:) si ex planis ipsi $D\beta\beta$ parallelis conflari intelligitur; eunt ea, $CD\beta\beta$, $Cd\beta\beta$, & sic deinceps; hoc est, aggregatum omnium $Cd\beta\beta$, $Cd\beta\beta$, usque ad $CD\epsilon\epsilon$.

Sunt autem ea plura (ut ex *Gregorii de Santo Vincentio*, aliorumque post illum, doctrina constat) tanquam Logarithmi Arithmetice proportionalium Cd , Cd , &c. usque ad CD ; (seu $a, 2a, 3a$, &c. usque ad λ). Ergo Ungula ipsa, est eorundem Aggregatum. Hoc est (posito $D = 1$,) $dp l - A b^2 = pl - A b^2$. Quod ostendendum erat.

$$\text{Porro; cum sit } \frac{b^2}{d-a} (= d\beta) = \frac{b^2}{d} + \frac{ab^2}{d^2} + \frac{a^2b^2}{d^3} + \frac{a^3b^2}{d^4} \text{ &c.}$$

(Quod dividendo b^2 per $d-a$, patebit:) vel, posito $d = 1$, (quòd ipsius d potestates omnes delectantur,) $b^2 + ab^2 + a^2b^2 + a^3b^2$ &c. seu $1 + a$

$$+ a^2 + a^3, \text{ &c. in } b^2. \text{ & similiter } \frac{b^2}{d-2a} = \frac{b^2}{d} + \frac{2ab^2}{d^2} + \frac{4a^2b^2}{d^3}$$

$$+ \frac{8a^3b^2}{d^4} \text{ &c.} = b^2 + 2ab^2 + 4a^2b^2 + 8a^3b^2 \text{ &c.} = b^2 \text{ in } 1$$

+ $2a + 4a^2 + 8a^3$, &c. & similiter in reliquis:

$$\text{Erunt omnes } d\beta, (\text{ipatum } D\beta\beta \text{ complectentes,}) \quad \left\{ \begin{array}{l} 1 + a + a^2 + a^3 + a^4 \text{ &c.} \\ 1 + 2a + 4a^2 + 8a^3 + 16a^4 \text{ &c.} \\ 1 + 3a + 9a^2 + 27a^3 + 81a^4 \text{ &c.} \end{array} \right\} \text{ in } b^2.$$

$$\text{Adeq; (per Arithm. Infin. prop. 64.) omnium Aggrega-} \quad \left\{ \begin{array}{l} \text{tum, seu ipsum } D\beta\beta \text{ spati-} \\ \text{um, erit } A + A^2 + A^3 + A^4 + A^5 \text{ &c., in } b^2 = pl. \end{array} \right\}$$

Qualium $1 = AB E \beta$ Quadrato vel Rhombo

Ideoque, Plani $D\beta\beta$ momentum respectu $D\beta$; seu semiquadrantalis Ungula eidem insitens cuius acies sit $D\beta$; seu planorum aggregatum ipsam constituentium; seu Logarithmorum summa quos ea representant, $dp l - A b^2 = pl - Ab^2 = \frac{1}{2}A^2 + \frac{1}{2}A^3 + \frac{1}{2}A^4 + \frac{1}{2}A^5$ in b^2 :

Qualium

Qualium Cubus (seu Rhombus solidus) A D E & sit 1.
Si vero non ponatur d = 1, sed cujuscunque magnitudinis: erit saltem

$$\frac{A}{d} + \frac{A^2}{2d^2} + \frac{A^3}{3d^3} + \frac{A^4}{4d^4} \text{ &c. in } b^1 = p1.$$

Vel (posito $\frac{A}{d} = e$) erit $e + \frac{1}{2}e^2 + \frac{1}{3}e^3 + \frac{1}{4}e^4 \text{ &c. in } b^1 = pl.$ Qualium

$d^2 = A D E &$ Quadrato vel Rhombo.

Ungulaque (ut prius) $d pl = A b^2$. Qualium $d^3 = A D E &$ Cubo, vel
(si angulus A sit obliquus) Rhombo solidio.

Cumque A (posito $d = 1$) vel e (quicunque ponatur valor ipsius d) sit
minor quam 1, (propter $A < d$;) illius potestates posteriores ita continue
decrescunt, ut tandem neglegi possint; planique valor pl. exhibeatur quan-
tumlibet vero propinquus.

Atque hæc est, Illustrissime Domine, Methodi, quam innuebam, ex meis
principiis deductio, & demonstratio brevis. Vale. Oxon. d. 5. Aug. 1668.

*Some Illustration
of the Logarithmotechnia of M. Mercator, who communicated it to
the Publisher, as follows.*

Si quorum in manus incidit Logarithmotechnia mea, non inviti, opinor,
adspicient paucula hæc exempla, miram istius methodi facilitatem cum sum-
ma præcisione conjunctam ostendentia.

Tum prima figura numeri dati semper distinguatur à sequentibus separatrix, hoc modo : 7, 4305816, & ipsi primæ figuræ semper adjiciatur 1, ita conflantur, hoc loco, 8. Quærenda est nunc rationis 8 ad 7,4305816 mensura naturalis. Id ut fiat commodius, dic : ut 8 ad 7, 4305816, ita 1 ad 0, 9288227, hunc quartum proportionalem aufer ab 1, reliquum 0, 0711773 voco potestatem primam, quæ ducenda est in se ita, ut in facto idem numerus partium extet, qui erat in ipso 0, 0711773 ; productum 0, 0050662 est potestas secunda, quæ rursus ducatur in primam 0, 0711773, ut idem numerus partium extet, prodit 0, 0003606, quæ est tertia potestas ; & eodem modo invenitur quarta 0, 0000256, & quinta 0, 0000018. Deinde

Potestas

Potestas prima	0, 0711773	
Et secundæ semis	25331	
Et tertiæ triens	1202	
Et quartæ quadrans	64	
Et quintæ pars quinta	4	
summa	0,0738374	est mensura rationis 8 ad
		7,4305816, eadem scilicet cum ratione 8000000 ad 74305816.
		Porro Log-us absoluti 8000000 facile acquiritur ex superiori tabella; cum enim index primæ figuræ numeri 8000000 sit 7, è régione 7 ⁱⁱ ex secunda columnâ excerpto Log-um absoluti 1000000 (hoc est unitatis septem cyphris affecta).
qui reperitur	16, 11809565	
cui subscribo Log-um 8 ⁱⁱⁱ	2, 07944154	addo
summa est Log-us absoluti 8000000	= 18, 19753719	
ablate mensura rationis 8000000 ad 743005816 = 0, 0738374		
restat Log-us absoluti 74305816	= 18, 1236997,	atque
tanta est area B I H F.		

Mantissa loco accipe modum facillimum quadrandi quamvis hyperbolæ partem per Log-os tabulares. Dati numeri 74305816 Log-us tabularis est 7,87102278, per superioris tabellæ columnam secundam reducendus ad naturalem, proditque eadem, quæ supra, area B I H F = 18, 123699872.

Postremo, ne quis hæsitationi locus restet, accipe, quo pacto ex Prop. 13, 15, 16. Logarithmot. calculum superiorem derivem.

Differentia terminorum rationem quamvis exprimentium si concipiatur divisa in partes æquales innumeræ; composita erit ratio tota extremorum terminorum ex innumeris ratiunculis terminorum à minimo ad maximum infinitissima parte ipsius differentiæ se mutuo excedentium. Sin iidem illi termini innueri accipientur pro mediis Arithmeticis aliorum terminorum simili parte infinitissima distantium; summa omnium ratiuncularum posterioribus hisce terminis intercedentium deficit à tota ratione extremorum, non nisi semiffe primæ & ullimæ ratiuncularum à prioribus terminis contentarum, id est, ratiuncula minori, quam quæ ulla numeris exprimi possit. Quare posito Maximo termino = 1, & parte infinitissima differentiæ = 1, & mensura rationis minimæ itidem 1; erit ut medium Arithmeticum terminorum rationis minimam proxime præcedentis, ad medium Arithmeticum terminorum ipsius minimæ; ita mensura minimæ, ad mensuram proxime majoris; hoc est:

$$\begin{aligned}
 1 - 1 . 1 : : 1 . 1 + 1^3 + 1^4 &\text{ &c. mensuræ ultimæ} \\
 1 - 21 . 1 : : 1 . 1 + 211 + 41^3 + 81^4 &\text{ &c. penultimæ add.} \\
 1 - 31 . 1 : : 1 . 1 + 311 + 91^3 + 271^4 &\text{ &c. antepenultimæ} \\
 \text{sit summa ratiuncul. } = 31 + 611 + 141^3 + 361^4 &\text{ &c. = numero terminorum,}
 \end{aligned}$$

rum, plus summa eorundem terminorum, plus summa quadratorum ab iisdem, &c.

Sin minimus terminus ponatur = 1, manentibus cæteris ut *se* *pra*, evadit summa ratiuncularum = $3i - 6ii + 14i^3 - 36i^4$, &c.

Hinc data differentia terminorum = $0i^1$, erit numerus terminorum = $0i^1$, & per 16 Logarithmot. summa eorundem terminorum = 0, 005, & summa quadratorum = 0, 000333. At data differentia terminorum = $0i^{10}$; numerus terminorum est = 0,01, & summa eorundem = 0,0005, & summa quadratorum = 0,0000333, &c.

Nota. Prop. IV. Logarithmot. Signa speciebus intercedentia debebant esse alternatim affirmata & negata: atque ubique, Lector offendit in finitissimam, legat infinitefimam.
