muth of the greater Star is taken) by a Micrometer (contifling of divers fine Threads parallel and transverse) may (at the same time) be observed the Distance of the two Stars, each from other, in that Position (both being at once within the reach of the Micrometer;) which distance (the Instrument remaining unmoved) if it be found (at different times of the Year) not to be the same; this will prove, that there is a different Parallax of these two Stars.

This latter part of the Observation (of their different di-Plances at different times) I suggest, as more easily practicable though not so nice as the former. For it may be done, I think, without any further Apparatus there than a good Telescope, of ordinary form, furnished with a Micrometer, (this being carefully kept unvaried during the Interval of these Observations.) And if this part only of the Observation (without the other) be pursued; it matters not though the two Observations (near the two Solftices) be, one at the Eastern, the other at the Western Azimuth (whereby both may be taken in the Night-time,) for the distance must (at both Azimuths) be the same, if after observing the Azimuth of the greater Star it be necessary to move the Micrometer for measuring its distance from Alcor that may be done another Night (and it is not necessary to be done at one Observation) for that distance cannot be discernably varied in a Night or two.

I shall give you no farther trouble at present, but subscribe

my self, Sir, Yours, &c.

IX. An Account of a BOOK.

Synopsis Methodica Animalium Quadrupedum & Serpentim Generis Auth. Joanne Raio, S.R.S.

Serpents, continues to oblige the World with fresh and frequent Specimens, not only of his great Penetration in discovering, but of his particular Sagacity in ranging and digesting the vast Body of Nature in most proper Classes and Orders; whereby the Memory is extreamly assisted, and the Beauty of S s

the Creation illustrated. Of this the Worthy Author has already been pleas'd to publish very conspicuous Proofs in the Histories of Plants, Birds, Fishes, and perhaps may do more in Insects.

The Design of this present Work, intended for a Manual or Pocket-Book, is to reduce all Quadrupeds into the most proper and natural Method, for the more easie Comprehension and Memory of them; and to add to the several Species such short Characterick Notes, as whereby they may be certainly known and distinguished from others of the same kind.

First of all, there is proposed the most exact division of all Animals in general, which is first into Sanguineous and Exanguious. Under the Exanguious, or such as want that red Liquor we call Blood, are comprehended, 1. All crustaceous Fishes, Crabs, Lobsters, Shrimps, 2. All Testaceous or Shell-Fishes, as Cockles, Muscles, Oysters, Scallops, Perinvinkles, Whilks, &c. as also all Land Shell-Snails, 3. Those they call Mollia, or Soft sishes, as Pulps, Cuttle-sishes, naked Snails, &c. 4. Insects of all sorts.

The Sanguineous kind are divided into such as breath by Lungs, and such as breath by Gills, of which kind are all Sanguineous Fishes except the Whale-kind. Such as breath by Lungs are divided into those that have but one Ventricle in the Heart, and such as have two Ventricles. Of the former kind are those they call Ovipareus Quadrupeds and Serpents.

The latter are again subdivided into Viviparous, or such as bring forth living Young, and Oviparous, or such as lay Eggs, which are Birds or feathered Foul.

Lastly, The Viviparous are divided into Aquatic, or the Whale-kind and Terrestrial (under which the Author comprehends the Amphibious) or Quadrupeds; although all viviparous Animals of this kind are not Four-sooted, there being one exception, viz. The Manati or Sea cow, which hath but two Feet. But all of them without exception are hairy, and so may be distinguished from the Whale-kind; all of which have a smooth Skin.

Then follows a Division and Table of Viviparous Quadrupeds or Viviparous bairy Animals: which are either boof'd or claw'd.

The boof'd are either whole-footed, or whole-koof'd, as the Horse and Ass; or cloven-footed. The Cloven-boof'd are either Bisulc, such as have the Hoof divided into two parts, as the Ox, Sheep and Goat, or Quadrisulc, which have the Hoof divided into four. The former are either Ruminant, such as chew

the Cud; or Non-Ruminant, viz. The Hog-kind. The Ruminant are divided in respect of their Horns, of which there are three Kinds. 1. The Beef-kind, which have four Teats. 2. The Sheep-kind which bear Wool, have but two Teats, and wreathed Horns. 3. The Goat-kind which have streighter Horns, and are covered with Hair instead of Wool; and such as have folid, branched and deciduous Horns, as the Deer-kind. The Claw'd, have the Foot divided either into two Claws, viz. the Camel-kind, or into more, called therefore Multifidous.

The Multifidous are divided into such as have broad Nails, and a humane Shape, as Apes and Monkeys, and such as have

narrower and pointed Nails.

These latter in respect of their Teeth are divided into such as have many fore Teeth or Cutters in each Jaw; and such as have but two, all which last are Herbivorous or Physicorous Animals, and from the most known Creature of this Tribe called the Hare-kind.

Those that have more fore Teeth or Cutters are distinguished into greater, which have either a shorter Snout, and round or square Head; or a longer Snout and Head: These from their likeness to the most known Animals of each kind, the Cat and the Dog, we call the former the Cat-kind, and the latter the Dog-kind: To the Cat-kind belong the Lion, Tyger, Leopard, Ounce, &c. to the Dog-kind belong the Wolf, Fox, Badger, Otter, &c. and lesser, which from their long stender Bodies, like to the Weasel, we call the Vermineous or Weezel-kind.

To the Cat-kind are referred some anomalous Animals, viz. The Bat, and the American Creature called Ai or Sloth. To the Dog-kind from their having a longer Snout are referred; The Urchin or Hedge-bog, the Tatou or Armadillo, the Mole, the Shrew-mouse or Erd, i.e. Earth-shrew, the Tamandua or Ant-

bear; which hath no Teeth at all.

Then are briefly described the several Species of all these kinds in order: and to some of them large Anatomical Descriptions and Observations added. As first of the Uterus of a pregnant Sow, wherein the Adhasion of the Chorion to the Uterus round about is shown; and notice taken, I. Of the two large diaphanous Bladders, one at each end of the Tunica Allantoides, into which is a Passage out of the Allantoides, so that the Liquor contained therein may easily be impelled into the Bladders, and out of the Bladders back again into the Allan

Sí 2 toides.

toides, 2. Of the great quantity of Water contained in the Allantoides, more by far then the Urine of so small an Animalin so short a time can likely amount to, and inquiry made into the Original and Use of it. Its likely part of it may be separated from the Blood, and excerned into the Cavity of the Tunicles by certain little Glandules, which the Author observed disseminated all over the Chorion. The Tuhæ uterinæ or Fallopianæ in this Creature are described; and shewn to be when extended at least 9 Inches long. They do manifestly persorate the Cornua uteri, so that a Style or Probe may easily be thrust either upward out of the Uterus into the Tuhæ, or downward out of the Tuhæ into the Cornua uteri, without resistance or the impediment of any Valve.

Secondly, Dr. Tylon's Description of the Tajacu or American Musk bog, recorded in the Philosophical Transactions, Numb. 153. is inserted at large, wherein are many curious Remarks, which I shall not mention, because I suppose they are well known, having been so lately published in these Papers.

Thirdly, An Anatomical Description of the Elephant by the Learned and Ingenious Dr. Moulins, which also having by the Author been published in English, I shall for the Reason forementioned, forbear to set down Particulars.

Fourthly, Excerpta out of the Description of the Ape set forth by Parisian Academists, wherein the Differences between the internal and external Parts of the Ape and Man are observed and noted.

It is especially remarked, that though the Muscles of the Os byoides, or Tongue-bone, the Tongue, the Larynx, and Pharynx, which especially serve for the Articulation of the Voice, be in Apes altogether like to those of a Man, at least much more than the Muscles of the Hands, which the Ape uses almost as perfectly as Man himself to all purposes; yet is the Ape deprived of Speech. Whence it is clear, that Speech is an Action peculiar to Mankind, by which he is more distinguished from Brutes, than by the use of the Hand: neither doth it necessarily follow, that natural Agents do perform such and such Actions, because they are furnished with Organs proper for the Performance of them.

Laftly, Such Sanguineous Creatures as breath by Lungs, and have but one Ventricle in their Hearts are enumerated and described. They are of four kinds, 1. Frogs, 2. Tortoises, 3. Lizards, 4. Serpents: Concerning each of which there are curious Anatomical Observations added: But especially a large Description of the outward and inward parts of the Rattle-Inake, composed by the fore-mentioned Learned Person Dr. Tyson, and published in these Transactions, Numb. 144. the Particulars whereof I shall therefore omit.

Before this Synopsis are premised some Discourses concern-

ing Animals in general.

As First, Whether they are meer Machines, or have any Sence and Perception, that is, whether they reflect upon, and are conscious of what they do or suffer. The Affirmative whereof seems most probable to the Author.

Secondly, Concerning the Generation of Animals there are Three Questions discussed. 1. Whether there be any Spontaneous or Equivocal Generation? The Author's Opinion is, That there is no such thing, but that all Animals, even the vilest Insects, are generated by Animal Parents of their own kind. 2. Whether all Individuals of every Species of Amimals, that ever were or shall be, were at first created by God, or whether there are every day new ones produced by Generation? The Author is inclinable to their Opinion that hold all were at first created, but not consident of it. Seeing neither Man nor any other Creature is capable of forming such an Engine as an Animal Body; and fince all Females have in them from their first Formation the Seeds of all the Individuals they shall during their whole Life bring forth, it is clear they have no power of producing new ones; and a ffrong Presumption, that all that have been or shall be were at first created. 2. Whether the Seeds of Animals, or rather the primordial Animalcules are lodged in the Egg of the Female, or in the Sperm of the Male. The Author is of the former Opinion, for many Reasons which may be seen in the Book.

Thirdly, The Diffinction of Animals into Viviparous and Oviparous is confidered; and it is shewn, that if the Word Viviparous fignifies according to the Etymology of it, such as bring forth live Young, then Animals of the same Genus may be some Viviparous and some Oviparous: So for Example, Some Serpents, as the Adder, are Viviparous, and some, as the common Snake, Oviparous: But if the Word Viviparous fignifies such Animals as continually afford Nourishment to the Fatus during gestation from the Womb it self: And Oviparous fuch as either lay Eggs, or produce perfect Eggs, that is fuch as contain all the Nourishment of the Fatus till it be excluded. though they retain such Eggs in the Womb till exclusion, affording them only warmth and harbour; then the diffinction may be of good use; and as well such Serpents and Lizards as hatch their Eggs in their own Bodies, as those that lay them in a Dunghil, or other warm place to be cherished and hatch'd by the Heat of the Sun, may be called Ovi-Darous.

For the more easie and clear Comprehension and Distinction of the several Kinds of Animals, Mr. Ray gives two Schemes or Tables of them: The first a General one of all Animals;

the second a Particular one of Quadrupeds.

Animals are either

(Sanguineous, that is such as have Blood, which breath either by Lungs, * having either Two Ventricles in their Hearts; ** and those either Vivioarous. Aquatic, as the Whale-kind Terrestrial, as Quadrupeds, or in general all hairy / Animals. Oviparous, as Birds, which have immoveable and perforated Lungs. But one Ventricle in their Hearts, as Frogs. Tortoiles, Serpents. Gills, as all Sanguineous Fishes except the Whale kind. Exanguious, or without Blood, which may be divided into The Greater, either Naked (Terrestrial, as Naked Snails Aquatic, as the Poulp or Pour-contrel, Polypus: the Cuttle-fish, Sepia; The Sleave or Ink-fish Lolligo Covered, with a Tegument either Crustaceous, as Lobsters and Crab-fish. Test accous, whether Univalve as Limpets, or Bivalve.

> as Oysters, Muscles, Cockles; or turbinate, as Periwinkles, Snails, &c.

* Gills and Lungs differ in that Gills are but as it were inverted Lungs: The Air being drawn inwardly into the Lungs, whereas it only outwardly touches or slides by the Gills.

** Animals that have two Ventricles in their Hearts use a frequent and constant inspiration and exspiration, taking in and breathing out the Air. But those that have but one Ventricle use no such frequent inspiration and exspiration; but receive in and retain the Air a considerable time in their Lungs before they breath it out again.

A TABLE of Viviparous hairy Animals or Quadrupeds.

Viviparous Quadrupeds or Viviparous hairy Animals are either Hoof'd, which are either Whole-focted or hoof'd, as the Horse and Als. Cloven-footed, having the Hoof divided into Two principal parts, called Bisulca, either Such as chew not the Cud; as all forts of Swine Ruminant, or such as chew the Cud, divided into Such as have perpetual and hollow Horns, of which there are three Kinds, viz. 1. The Beef-kind. 2. The Sheep-kind. 3. The Goat-kind. Such as have folid, branched and deciduous Horns; as the Deer-kind. Four parts, which we call Quadrifulca; as the Rhinocerot and Hippopotamus. Clawed, or Digitata, having the Foot divided into Two parts or Toes, having two Nails, as the Camel-kind. Many Toes or Claws; either (Undivided, sticking all together, covered with a common Skin, the tips of the Toes only peeping out or appearing outwardly, and being covered with Nails, as the Elephant. Divided from each other a good way down, which have either (Broad Nails and an Humane Shape, as Apes and Monkeys. Narrower and more pointed Nails; in which in respect of their Teeth are divided into such as have Many fore Teeth or Cutters in each Jaw, either The greater, which have (A shorter Snout and rounder Head, which we call the Cat-\(\) \(\) kind.
\(\) \(A \) longer Snout and Head, which we call the Dog-kind.
