Description

This document provides information that supplements the documentation for Phone Book Administrator (PBA). For more information about PBA, see Connection Point Services in Help and Support.

Installation instructions

To install PBA, run [pbainst.exe](#) from the SUPPORT\PBA directory on the product CD for a Microsoft® Windows® Server 2003 with Service Pack 1 (SP1) operating system.

Requirements

PBA requires Microsoft Windows XP Professional or Windows Server 2003.

Limitations

1. You can post phone books created with this version of PBA to servers running older versions of Phone Book Service (PBS). However, you cannot run an older version of PBA on a computer running Windows Server 2003 because the database libraries are incompatible. If a phone book file has been edited with this version of PBA, the file cannot be edited with older versions of PBA.
2. If you delete a phone book using PBA, the server is not notified of the deletion. For more information about fully deleting phone books, see Connection Point Services in Help and Support
3. Phone book databases are encrypted in this version of PBA. You cannot open these databases in Microsoft Access or any other database program.
