SAFTRACE

Vanguard EXPO 2007

June 11-14, 2007
St. Louis, MO

SESSION RTA4

John Reale, III
RACF Level 2
IBM - z/OS Software Service
Poughkeepsie, NY

jreale@us.ibm.com

Agenda

- Overview
  - What is SAFTRACE?
  - Why and when should it be used?
  - Who should use it and how do I use it?
    - examples - RACROUTE - AUTH
- Objectives
  - Understand how (and perhaps when) to use SAFTRACE
- 2 new examples of it IN ACTION !!
- Session Summary
- Sources and Additional Information
- Appendices (A & B)

What is SAFTRACE?

A security product trace

- SAFTRACE provides the ability to trace all Racroutes, RACF Callable services, and RACF Database Manager requests that go through the RACF routers. When tracing these services, the trace routine will copy the parameter list into a GTF record **before and after** the service runs.

  (creating a pre and post trace record)
- Available at z/OS V1R2 and above.....

IPCS formatting

- Once collected records are formatted with IPCS exit IRRUSR57 (alias AMDUSR57) making them readable.

Who should use it?

SAFTRACE is a powerful DIAGNOSTIC TOOL targeted for use by IBM Support or customers with a STRONG working knowledge of RACF interfaces.

- **Primarily RACF L2**

- Other L2 teams

- On site support (with direction if required)

- Customers with "some" RACF internals knowledge (i.e. especially parameter lists)
  - format is oriented towards an MVS SYSPROG
  - may need to weed through high volume of data

How can SAFTRACE be used?

Diagnostic situations where SAFTRACE can be helpful:

- To understand WHAT calls are being made for any given situation.
- If RACF database contention has been observed:

  Trace DATABASE(ALTER) requests on the specific ASID indicated via GRS contention displays. Alter requests generally prevent readers (majority) from getting service.
- Excessive database i/o (for a given address space)

  Trace reads to see what CLASS / ENTITIES are related.
- Excessive Verify's:

  If your systems has an excessive amount of Verify's, set a trace on RACROUTE(TYPE(2,5,9)) and determine who is issuing all of the RACROUTE calls.
- Timings - use a statistical package to calculate time difference between pre to post call for each 'pair' of GTF records. Insure pairings are correct.
- USS CALLABLE services.... What exactly is occuring?

  What info is passed to this call and what RCs do we return?. Best used in concert with USS CTRACE facility..

Where are the trace points?

Where do we trace?

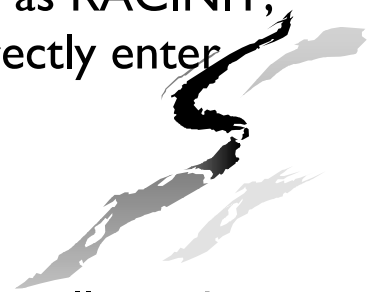
Trace Points...

IBM SAF routers ICHSFR00 and IRRSFR11

- Internal calls to the security product may not be traced.
  Internal calls are calls RACF makes to itself, such as RACINIT calling RACHECK for auth in xyz class.

- All calls made via RACROUTE or Callable Service interface will be traced.

- Calls that issue SVC (pre-RACROUTE, such as RACINIT, RACDEF, RACHECK, RACLIST, etc.) or directly enter the security product **will not be** traced



RACF Database manager ICHEINTY interface

- All ICHEINTYs and internal security product calls to the database manager.

How Do I use it?

Activating the trace?

Activating a trace...

```
[subsystem-prefix] SET  [TRACE(
                  [ RACROUTE(ALL * | NONE | TYPE(t1, t2,...)) |
                        NORACROUTE ] |

                  [ DATABASE ([ALL * | NONE] |
                        [ALTER | NOALTER]     |
                        [ALTERI | NOALTERI]   |
                        [READ | NOREAD])      |
                         NODATABASE  ]        |

               [ CALLABLE(ALL | NONE | TYPE(t1, t2, ...))  |
                         NOCALLABLE]

                 [ ASID(asid1, asid2, .. |*.) |NOASID | ALLASIDS ]
                 [ JOBNAME(jobname1, jobname2, ... | *) |
                        NOJOBNAME | ALLJOBNAMES  ]
                                )]
```

The ASID and JOBNAME are filter keywords. At least one of them **must** be specified. At least one filter test must be successful for a trace to be performed.

All type field numbers are entered in decimal format.

These options are NOT preserved over IPLS.

See Appendix A for the possible values in the type fields.

***** ALL is not recommended for RACROUTE or DATABASE as trace output could be **very** large.

Activating a trace

Sample GTF PROC

```
//GTFRACF PROC MEMBER=GTFPRM#O
//BR14     EXEC PGM=IEFBR14,REGION=512K
//SYSPRINT DD SYSOUT=*
//D DD DISP=(OLD,DELETE),UNIT=3380,VOL=SER=TEMP01,
//  DSN=SYS1.TRACE
//IEFPROC EXEC PGM=AHLGTF,PARM='MODE=EXT,DEBUG=NO,SA=100K,AB=100K',
//            REGION=2880K,TIME=NOLIMIT
//IEFRDER DD   DSNAME=SYS1.TRACE,UNIT=3380,VOL=SER=TEMP01,
//            DISP=(NEW,CATLG),SPACE=(TRK,(100))
//SYSLIB  DD   DSNAME=RACFDRVR.PARMLIB.R6(&MEMBER),DISP=SHR
```

Sample Parmlib Member: GTFPRM#O

```
TRACE=USRP
USR=(F44),END
```

Activating a trace...

1. Start the GTF using the GTFRACF (see Sample PROC 1.) or other procedure:

   START GTFRACF.GTF,,,NOPROMPT

   Noprompt implies that the PROC has what it needs.

2. Use the SET command to enable your trace:

   @SET TRACE(RACROUTE(TYPE(1))
   JOBNAME(HARDGR2)) LIST

   **** types are in DECIMAL here ****

   << use of JOBNAME is key >>

3. Reproduce the scenario that trace is required for, e.g.; start batch job, login, start application, use CICS application or access resource.

Activating a trace...

4. Next stop GTF to prevent excessive traces

   STOP GTF

   NOTE: Always be sure your GTF datasets are protected.

5. shut off the TRACE

   @SET TRACE(NORACROUTE NOJOBNAME)

6. Use IPCS to view the trace data.

   The input trace data is contained in the dataset specified on the IEFRDER DD card in the GTFRACF (or other) procedure.

   The sample GTFRACF procedure specifies 'SYS1.TRACE' . Once the TSO IPCS session is active use the IPCS subcommand:

   "IP GTF USR"

   to display the formatted trace.

Usage notes

Things to know:

- The RACF subsystem must be up and running.
- GTF must be active.
- For OMVS calls, you need an '*' in the jobname filter to trace spawned processes. Otherwise, you will not get a complete set of records. Example:
- @SET TRACE(CALLABLE(TYPE(xx)) JOBNAME(HARDGR*)) LIST will trace jobnames HARDGR1, HARDGR2 etc

  **** types are in DECIMAL here ****

How do I read a trace?

SET LIST - Sample output

```
  - RACFR12  IRRH005I (@) RACF SUBSYSTEM INFORMATION:
  -    TRACE OPTIONS                    - NOIMAGE
  -                                     - NOAPPC
  -                                     - RACROUTE
  -                                       1
  -                                     - CALLABLE
  -                                       2 5 9
  -                                     - NODATABASE
  -                                     - NOASID
  -                                     - JOBNAME
  -                                       IBMUSER*
  -    SUBSYSTEM USERID                 - IBMUSER

How do I read a trace? (continued)

Special Control Blocks and other handling:

- ACEE: not only is the ACEE unloaded, but so are the USP, TOKEN, and ACEX if available.
- CRED: (IRRPCRED) After the CRED structure is unloaded, the first path name, the second path name, the first filename and second filename are unloaded.

Things not dumped

- Work Areas: Work Areas in general are not unloaded.
- Passwords: Are not unloaded.
- Installation parameters
- ENVRIN and ENVROUT parameters
- Certificates

Raw data portion of trace output

```

Using a trace I... RACF / USS

Sample RACROUTE trace for a specific situation....

Situation 1 to be traced

- Customer reported that in a USS environment the use of the switch user <su> command wasn't being audited.
- Command is **su -s nuthrusr** and profiles of the form BPX.SRV.userid in the SURROGAT class protects/allows this SU (w/o a password) to occur.
- Created environment
- SETUP SAFTRACE

  @set trace(RACROUTE(TYPE(1)) JOBNAME(USER*)) LIST where the activity being trace is AUTH checks and for TSO session and any spawned asids
- Executed su -s nuthrusr
- examined TRACE - next few pages have the answer

```
   Following is a formatted R_TRACE record.
 This trace record was generated by IRRTRC00 with
IDENT(R_TRACE).

```

Conclusion:

Call to RACF to allow / disallow the use of the SURROGAT profile of the form **BPX.SRV.userid** is issued in such a way as to not perform any RACF / SMF AUDITING.

FYI -see- USS (not RACF) APAR OA16402 - SU IS NOT AUDITED, NO SMF TYPE 80 IS PRODUCED - CLOSED SUG

But subsequently,
USS APAR OA18016 fixed it! (1.6+)

Using a trace 2... OMVS

Sample Callable trace for specific situations....

Situation2 to be traced

- Customer reported that in a USS environment the ls -l command wasn't translating (i.e mapping) GID1 to a RACF group name..
- Command is ls -l and output looked like this...

```
 $ ls -l
total 160

2.9.6 Return and Reason Codes

IRRSGM00 returns the following values in the reason and return code parameters:

SAF Return Code	RACF Return Code	RACF Reason Code	
8	8	4	If search by GID: GID is not defined. If search by group name: The current group's profile has no OMVS segment.

so the 1's in this list go untranslated / unmapped to any group.

```
$ ls -l
total 160
drwxr-xr-x   6 BPXROOT  1           8192 May  6  2004 SYSTEM
drwxr-xr-x   4 BPXROOT  1          24576 Apr 11 12:46 bin
lrwxrwxrwx   1 BPXROOT  1             12 Mar  6 15:21 dev -> $SYSNAME/dev
lrwxrwxrwx   1 BPXROOT  1             12 Apr 11 12:48 etc -> $SYSNAME/etc
drwxr-xr-x   2 BPXROOT  1           8192 May 17  2004 krb5
drwxr-xr-x   2 BPXROOT  1           8192 May  3  2005 lib
drwxr-xr-x   2 BPXROOT  1           8192 May 17  2004 opt
drwxr-xr-x   4 BPXROOT  1           8192 Nov 15  2005 samples
lrwxrwxrwx   1 BPXROOT  1             12 Mar  6 15:21 tmp -> $SYSNAME/tmp
drwxr-xr-x   3 BPXROOT  1           8192 Sep 11  2004 u
drwxr-xr-x  10 BPXROOT  1           8192 May  6  2004 usr
lrwxrwxrwx   1 BPXROOT  1             12 Apr 11 12:48 var -> $SYSNAME/var
```

Conclusion:

No mapping profile describes GID of 1.

System uses UNIXMAP and an RLIST UNIXMAP G1 showed

ICH13003I G1 NOT FOUND

SAFTRACE

Used in performance situations

Since there is a time stamp in the PRE and POST record - computing the difference CAN be useful.

A few REXX's have been written to do so...

Other uses..... require an adhoc approach....

Session Summary

- What SAFTRACE is.
- Uses of the trace.
- Activating a trace.
- Read a trace.
- Several "real world" examples
