

IBM CICS Performance Analyzer for z/OS

# User's Guide

*Version 5 Release 1*

IBM CICS Performance Analyzer for z/OS

# User's Guide

*Version 5 Release 1*

**Note**

Before using this information and the product it supports, read the information in “Notices” on page 775.

This edition applies to Version 5 Release 1 of IBM CICS Performance Analyzer for z/OS (product number 5655-Y23) and to all subsequent releases and modifications until otherwise indicated in new editions.

This edition replaces SC34-7153-01. The technical changes for this edition are summarized under “Summary of changes” on page xiii and are indicated by a vertical bar in the left margin.

## About this book . . . . . ix

Who should read this book . . . . .	ix
Conventions used in this book . . . . .	ix
Highlighting conventions . . . . .	ix
Command syntax notational conventions . . . . .	x
\$ (the dollar symbol) . . . . .	x
Terminology used in this book . . . . .	x
Service updates and support information . . . . .	xi
Where to find information . . . . .	xi
Accessibility . . . . .	xi

## Summary of changes . . . . . xiii

December 2012: CICS PA V5.1 . . . . .	xiii
Previous changes . . . . .	xiv
June 2011: updates to V3.2 . . . . .	xiv
December 2010: CICS PA V3.2 . . . . .	xv
April 2010: updates to V3.1 for Performance Alerts . . . . .	xvi
October 2009: updates to V3.1 . . . . .	xvi
August 2009: updates to V3.1 . . . . .	xvii
May 2009: CICS PA V3.1 . . . . .	xviii

---

## Part 1. Introduction . . . . . 1

### Chapter 1. Overview . . . . . 3

What is CICS PA? . . . . .	3
Data input . . . . .	4
CICS PA reports and extracts . . . . .	5
Performance reports . . . . .	5
Exception reports . . . . .	6
Transaction Resource Usage reports . . . . .	7
Statistics reports . . . . .	7
Subsystem reports . . . . .	8
System reports . . . . .	9
Performance Graph reports . . . . .	9
Extracts . . . . .	9
The CICS PA dialog . . . . .	10
CICS PA Primary Option Menu . . . . .	11
CICS PA Profile . . . . .	12
System Definitions . . . . .	12
Report Sets . . . . .	13
Report Forms . . . . .	14
Object Lists and Resource Lists . . . . .	15
Historical Database . . . . .	15
Statistics reporting . . . . .	16
The CICS PA commands . . . . .	16

### Chapter 2. Installing CICS PA . . . . . 17

CICS PA system requirements . . . . .	17
Hardware requirements . . . . .	17
Software requirements . . . . .	17
Storage requirements . . . . .	17
CICS PA components . . . . .	18
CPAOREXX command . . . . .	18

Installing the CICS PA dialog . . . . .	18
Dynamic setup . . . . .	18
Static setup . . . . .	19
Overriding the default application . . . . .	19
Overriding the data set low level qualifiers . . . . .	19
Migrating from an earlier release . . . . .	20
Including a V3.1 Performance HDB in the manifest . . . . .	20

## Chapter 3. Setup and getting started 23

CICS PA Primary Option Menu . . . . .	24
How to use the dialog . . . . .	24
Standard ISPF interface . . . . .	26
Recommended ISPF setup . . . . .	26
Screen size and scrolling . . . . .	26
Function keys . . . . .	26
Prompt (F4) . . . . .	26
Mouse options . . . . .	26
CUA attribute settings . . . . .	27
Point-and-Shoot fields . . . . .	27
Displaying messages . . . . .	28
CICS PA Profile Options . . . . .	28
CICS PA Settings . . . . .	29
Reporting Allocation Settings . . . . .	32
CICS PA Control Data Sets . . . . .	34
File selection options . . . . .	36

## Chapter 4. The CICS PA plug-in for CICS Explorer. . . . . 37

Define a Performance HDB for export to DB2 . . . . .	37
Define a Statistics HDB for export to DB2 . . . . .	39
Load the HDB . . . . .	41
Export to DB2 . . . . .	42
Build the manifest . . . . .	44
Extract performance data to CSV . . . . .	45
Loading CSV data in the CICS PA plug-in . . . . .	46
Access the data using the CICS PA plug-in . . . . .	47

---

## Part 2. Specifying CICS-related SMF data for reporting . . . . . 51

### Chapter 5. SMF data used by CICS PA 53

CICS Monitoring Facility data (SMF 110, subtype 1) . . . . .	53
Classes of CMF data . . . . .	53
When CMF data is passed to SMF . . . . .	56
Controlling the CICS Monitoring Facility . . . . .	56
Required CMF fields for CICS PA . . . . .	60
CICS Statistics data (SMF 110, subtypes 2, 3, 4, 5) . . . . .	60
CICS Transaction Gateway Statistics data (SMF 111) . . . . .	60
DB2 accounting data (SMF 101 records) . . . . .	61
DB2 accounting trace . . . . .	61
Accounting for processor usage in a CICS DB2 environment . . . . .	61
WebSphere MQ accounting data (SMF 116 records) . . . . .	62

Accounting for processor usage in a CICS MQ environment . . . . .	62
MQ accounting trace . . . . .	62
OMEGAMON XE for CICS data (SMF 112 records)	63
System Logger data (SMF 88 records). . . . .	63
Preparing SMF data for CICS PA processing . . . . .	64
Unloading SMF records . . . . .	64
CICS PA System Definitions and SMF Data Take-Up . . . . .	65
Dictionary records for CMF Performance Class data . . . . .	66

## Chapter 6. Personal System Definitions 69

Personal System Definitions overview . . . . .	69
Systems . . . . .	70
SMF Files . . . . .	72
Groups . . . . .	73
Take-up . . . . .	73
Personal System Definitions Menu. . . . .	73
Maintaining Personal System Definitions . . . . .	75
Set Filter (Systems) . . . . .	78
New System . . . . .	79
Mass Update of Personal CICS System Definitions	80
CICS System (APPLID) definition . . . . .	82
Files the System uses . . . . .	85
Select SMF Files . . . . .	86
Select a Unit . . . . .	87
VOLSER list . . . . .	87
Groups the System belongs to . . . . .	87
Select Groups. . . . .	88
MVS Image definition . . . . .	88
DB2 Subsystem definition . . . . .	89
MQ Subsystem definition. . . . .	91
System Logger definition . . . . .	92
Maintaining Personal SMF Files . . . . .	94
Set Filter (Files) . . . . .	96
Systems that use this File. . . . .	97
Maintaining Personal Groups . . . . .	99
Set Filter (Groups). . . . .	101
Systems in this Group . . . . .	102
Personal Take-Up from SMF File . . . . .	104
Take-Up JCL . . . . .	106
Job output . . . . .	106
Applying Take-Up details . . . . .	107
Example: Working with Personal Systems . . . . .	107

## Chapter 7. Shared System Definitions 115

Use Shared or Personal? . . . . .	115
Shared SMF File definitions. . . . .	115
Shared System Definitions Menu . . . . .	118
Maintaining Shared System Definitions. . . . .	118
CICS System (APPLID) definition . . . . .	119
View 1. System Definition attributes . . . . .	119
View 2. Cyclic SMF Files . . . . .	119
View 3. Daily SMF Files . . . . .	127
Image definition . . . . .	128
DB2 System definition . . . . .	128
MQ System definition . . . . .	129
Logger System definition . . . . .	129
Maintaining Shared Group Definitions . . . . .	130

Mass Updating Shared CICS System Definitions	130
Take-up from Personal System Definitions. . . . .	130
Take-up from SMF File . . . . .	131
Take-up JCL. . . . .	134
Take-up Recap report. . . . .	135
Example: Working with Shared Systems . . . . .	136
File Selection example 1 . . . . .	138
File Selection example 2 . . . . .	139

## Part 3. Requesting reports using the dialog 141

### Chapter 8. Report Sets 143

Report Set tree . . . . .	143
Activating reports . . . . .	144
Running Report Sets . . . . .	145
Maintaining Report Sets. . . . .	146
Creating new Report Sets . . . . .	147
Specifying Report Set contents. . . . .	148
Global Options . . . . .	151
Selection Criteria . . . . .	154
Specifying Selection Criteria . . . . .	156
Specifying Select Statements . . . . .	157
Fields checked by Performance Selection Criteria . . . . .	165
Selection Criteria in Report Forms . . . . .	166
Requesting reports and extracts . . . . .	167
Performance reports . . . . .	167
Performance List report . . . . .	167
Performance List Extended report . . . . .	176
Performance Summary report . . . . .	177
Performance Totals report . . . . .	180
Wait Analysis report . . . . .	181
Transaction Profiling report. . . . .	183
Cross-System Work report . . . . .	194
Transaction Group report . . . . .	196
BTS report . . . . .	198
Workload Activity report . . . . .	199
Transaction Tracking List report . . . . .	201
Transaction Tracking Summary report . . . . .	203
Exception reports . . . . .	205
Exception List report . . . . .	205
Exception Summary report . . . . .	207
Transaction Resource Usage reports . . . . .	208
File Usage Summary report . . . . .	208
Temporary Storage Usage Summary report . . . . .	211
Distributed Program Link Usage Summary report . . . . .	214
Transaction Resource Usage List report. . . . .	216
Statistics reports . . . . .	218
Statistics Alert reports . . . . .	218
CICS Transaction Gateway reports . . . . .	221
Subsystem reports. . . . .	223
DB2 report . . . . .	223
WebSphere MQ report . . . . .	228
OMEGAMON reports . . . . .	233
System reports . . . . .	237
System Logger report. . . . .	237
Performance Graph reports. . . . .	242
Transaction Rate Graph report. . . . .	242

Transaction Response Time Graph report . . . . .	244
Extracts . . . . .	246
Cross-System Work extract . . . . .	246
Performance Data extract . . . . .	253
Record Selection extract . . . . .	259
HDB Load . . . . .	264
System Logger extract . . . . .	267
Statistics extract . . . . .	270
Running Report Sets . . . . .	273
Set run-time options . . . . .	276
Report Set JCL generation . . . . .	280
System selection . . . . .	280
Report Set JCL generation failure . . . . .	284
Report Set JCL . . . . .	285
Processing the output . . . . .	286

## **Chapter 9. Report Forms . . . . . 287**

Maintaining Report Forms . . . . .	288
Sample Report Forms . . . . .	290
Available Sample Report Forms . . . . .	291
Creating new Report Forms . . . . .	297
Select field categories . . . . .	299
Specifying Report Form contents . . . . .	300
LIST Report Form . . . . .	300
Upgrading Report Forms . . . . .	307
Performance field selection . . . . .	308
LISTX Report Form . . . . .	308
SUMMARY Report Form . . . . .	313

## **Chapter 10. Object Lists. . . . . 323**

Object Lists versus Resource Lists . . . . .	323
Maintaining Object Lists. . . . .	324
Creating new Object Lists . . . . .	325
Specifying values in Object Lists . . . . .	326

## **Chapter 11. Application Grouping. . . . . 331**

Defining Application Groups . . . . .	332
---------------------------------------	-----

## **Chapter 12. Performance alerts. . . . . 337**

Defining performance alerts . . . . .	338
Performance alert examples . . . . .	344

## **Chapter 13. Statistics alert reporting 347**

Defining statistics alerts . . . . .	348
--------------------------------------	-----

## **Part 4. Requesting reports using batch commands . . . . . 353**

### **Chapter 14. JCL for reports and extracts . . . . . 355**

JCL generation . . . . .	355
JOB, EXEC and DD statements . . . . .	356
External sorting . . . . .	359
Using sysout2pdf to output batch reports as PDF . . . . .	361
Using sysout2pdf . . . . .	362
How sysout2pdf works . . . . .	369

## **Chapter 15. Using the CICS PA commands . . . . . 371**

General command format . . . . .	371
General conventions . . . . .	372
Rules for operands . . . . .	372
CICSPA report operands. . . . .	375
Common options . . . . .	377
Filtering using SELECT and SELECT2 . . . . .	380
Tailoring using FIELDS . . . . .	380
CICSPA control operands . . . . .	384
APPLID . . . . .	385
PRECISION . . . . .	385
FORMAT. . . . .	386
INput . . . . .	386
LINECount . . . . .	387
SELECT . . . . .	387
SELECT2. . . . .	388
SMFSTART and SMFSTOP . . . . .	388
READ2EOF . . . . .	389
ZONE. . . . .	389
LIST - Performance List report . . . . .	390
LIST(FIELDS . . . . .	392
LIST examples . . . . .	395
LISTX - Performance List Extended report. . . . .	401
LISTX(BY(field1,field2,field3) . . . . .	403
LISTX(BY(UOWID) . . . . .	403
LISTX(LIMIT . . . . .	403
LISTX(FIELDS . . . . .	404
LISTX examples . . . . .	408
SUMMARY - Performance Summary report . . . . .	413
SUMMARY(FIELDS . . . . .	415
SUMMARY examples . . . . .	423
TOTAL - Performance Totals report . . . . .	433
TOTAL examples . . . . .	434
WAITANALYSIS - Wait Analysis report. . . . .	435
WAITANALYSIS(BY . . . . .	436
WAITANALYSIS examples . . . . .	437
PROFILING - Transaction Profiling report. . . . .	438
PROFILING examples . . . . .	447
CROSSsystem - Cross-System Work report and extract. . . . .	455
Report options . . . . .	455
Extract options . . . . .	456
Report and extract options . . . . .	457
CROSSsystem examples . . . . .	458
TRANGROUP - Transaction Group report . . . . .	462
TRANGROUP examples. . . . .	463
BTS - BTS report . . . . .	464
BTS examples . . . . .	464
WORKLOAD - Workload Activity report . . . . .	465
WORKLOAD examples . . . . .	466
TRACKINGLIST - Transaction Tracking List report . . . . .	467
TRACKINGLIST examples . . . . .	469
TRACKINGSUMMARY - Transaction Tracking Summary report . . . . .	470
TRACKINGSUMMARY examples . . . . .	472
LISTEXC - Exception List report . . . . .	472
LISTEXC examples . . . . .	473
SUMEXC - Exception Summary report . . . . .	474
SUMEXCception examples . . . . .	475
RESUSAGE - Transaction Resource Usage reports . . . . .	475

RESUSAGE examples . . . . .	477
STATSALERT - Statistics Alert reports . . . . .	482
STATSALERT examples . . . . .	483
CTGSTATISTICS - CICS TG Statistics reports . . . . .	485
CTGSTATISTICS examples . . . . .	485
DB2 - DB2 report . . . . .	486
DB2 examples . . . . .	488
MQ - WebSphere MQ report . . . . .	491
MQ examples . . . . .	493
OMEGAMON - OMEGAMON reports . . . . .	493
OMEGAMON examples . . . . .	495
LOGGER - System Logger report and extract . . . . .	495
LOGGER examples . . . . .	498
GRAPH - Graph reports . . . . .	500
GRAPH examples . . . . .	502
EXTRACTPERFORMANCE - Performance data extract . . . . .	502
EXTRACTPERFORMANCE examples . . . . .	503
RECSEL - Record Selection extract . . . . .	504
RECSEL examples . . . . .	505
HDB(LOAD - HDB Load . . . . .	506
HDB(LOAD examples . . . . .	506
EXTRACTSTATISTICS - Statistics extract . . . . .	507
EXTRACTSTATISTICS examples . . . . .	508
Using SELECT statements . . . . .	508
Specifying Selection Criteria in Report Forms PERFORMANCE EXCEPTION LOGGER record types . . . . .	509
INCLUDE EXCLUDE actions . . . . .	510
SELECT(PERFORMANCE . . . . .	515
SELECT(EXCEPTION . . . . .	516
SELECT examples . . . . .	518
COPY instruction . . . . .	526

## Chapter 16. Sample library. . . . . 529

## Part 5. Statistics reporting using the dialog . . . . . 533

### Chapter 17. Using the Statistics reporting dialog . . . . . 535

CICS Statistics Reporting Menu . . . . .	536
SMF File list . . . . .	537
Statistics HDB list . . . . .	537
Statistics intervals . . . . .	539
Set Filter . . . . .	540
Statistics categories and reports . . . . .	541
Statistics report tree . . . . .	544
Expand and collapse the report tree . . . . .	546
Display report information . . . . .	547
Display label reports for global statistics . . . . .	548
Display tabular reports for resource statistics . . . . .	548
Sorting . . . . .	549
Hyperlink . . . . .	549
Statistics Report Forms . . . . .	551
Statistics field help . . . . .	552
Printing Statistics reports . . . . .	553

## Part 6. Using the Historical Database (HDB) . . . . . 555

### Chapter 18. Guided Tour: Performance HDB . . . . . 557

What is an HDB? . . . . .	557
List HDB . . . . .	557
Summary HDB . . . . .	558
Statistics HDB . . . . .	558
HDB data . . . . .	560
How to analyze HDB data . . . . .	560
HDB tour outline . . . . .	560
Historical Database Menu . . . . .	562
Repository . . . . .	562
HDB Templates . . . . .	563
Defining a Performance HDB . . . . .	565
Loading data into a Performance HDB . . . . .	568
HDB Load Audit . . . . .	571
Performance HDB Reporting . . . . .	571
Tailoring the HDB report format . . . . .	574
Exporting Performance HDB data to DB2 . . . . .	576
Creating DDL to define a DB2 table . . . . .	577
Loading data into the DB2 table . . . . .	580
Extracting Performance HDB data to CSV . . . . .	582
Tailoring the HDB extract format . . . . .	585
Analyzing the extract data . . . . .	585
Maintaining Performance HDBs . . . . .	585
Maintaining HDB definitions . . . . .	586
Maintaining HDB container data sets . . . . .	586

### Chapter 19. Guided Tour: Statistics HDB . . . . . 589

Historical Database Menu . . . . .	590
Repository . . . . .	590
Defining a Statistics HDB . . . . .	591
Loading data into a Statistics HDB . . . . .	593
HDB Load Audit . . . . .	596
Statistics HDB Reporting . . . . .	596
Sorting . . . . .	599
Forms . . . . .	599
Hyperlink . . . . .	601
Statistics Field Help . . . . .	601
Print . . . . .	602
Exporting Statistics HDB data to DB2 . . . . .	603
Step 1. Create the DB2 table . . . . .	605
Step 2. Load the DB2 table . . . . .	607
Extracting Statistics HDB data to CSV . . . . .	608
Maintaining Statistics HDBs . . . . .	610

### Chapter 20. Using the HDB dialog . . . 613

Historical Database Menu . . . . .	613
Repository . . . . .	615
HDB Templates . . . . .	617
List of Templates . . . . .	617
Creating new Templates . . . . .	619
List Template . . . . .	622
Summary Template . . . . .	630
Performance Selection Criteria . . . . .	632
Resource Lists . . . . .	633

List of Resource Lists . . . . .	634
Creating new Resource Lists . . . . .	635
Specifying values in Resource Lists . . . . .	635
Define a Performance HDB . . . . .	636
Select a Template . . . . .	640
Load HDBs . . . . .	641
Load JCL . . . . .	643
Load Recap report . . . . .	646
HDB Reporting . . . . .	646
Run List HDB report . . . . .	647
Run Performance Summary HDB report . . . . .	649
Performance HDB report JCL . . . . .	651
Performance HDB report output . . . . .	652
Run Statistics HDB Alerts report . . . . .	652
HDB Export to DB2 tables . . . . .	654
Export HDB . . . . .	654
Export HDB Data Set . . . . .	655
HDB Extract to CSV . . . . .	657
HDB Maintenance . . . . .	661
Maintain HDB definitions . . . . .	662
Maintain HDB data sets . . . . .	662
HDB Load Audit . . . . .	664
Maintain manifest . . . . .	666
Create DB2 table . . . . .	667
Housekeeping . . . . .	668

## **Chapter 21. Using the HDB commands 671**

JCL for HDB load, report, extract . . . . .	671
HDB Loading . . . . .	672
HDB Reporting . . . . .	672
Statistics HDB Alerts Reporting . . . . .	674
HDB Extract to CSV . . . . .	674
HDB Export to DB2 . . . . .	676
HDB Housekeeping . . . . .	676
JCL for HDB housekeeping . . . . .	676
HDB examples . . . . .	677

## **Chapter 22. Analyzing HDB DB2**

<b>Export data . . . . .</b>	<b>679</b>
Field formats . . . . .	679
SQL queries for Summary HDB . . . . .	680
Simple query . . . . .	680
Grouping by APPLID . . . . .	681
Calculating averages . . . . .	682
Calculating standard deviation . . . . .	682
Calculating peak percentile . . . . .	683
SQL queries for List HDB . . . . .	684
Top ten worst transaction times . . . . .	684

## **Chapter 23. Analyzing CSV extract data . . . . . 685**

Importing into Lotus 1-2-3 . . . . .	685
Importing into Lotus Approach . . . . .	685

## **Part 7. Reference . . . . . 687**

### **Chapter 24. Messages. . . . . 689**

Return codes . . . . .	689
Message format . . . . .	690
0000–0999 Batch processing messages . . . . .	692
1000–1099 Dialog messages . . . . .	718
2000–2099 Data Take-up messages . . . . .	723
3000–3099 HDB messages . . . . .	725
4000–4099 HDB SMF Statistics messages . . . . .	726

### **Chapter 25. Problem determination 729**

Eliminating user errors . . . . .	729
Collecting helpful diagnostic information . . . . .	729
Identifying types of problems . . . . .	729
Common causes of CICS PA problems . . . . .	730
Diagnosis . . . . .	733
Types of failure . . . . .	733
Release level (VRM) . . . . .	735
Maintenance level . . . . .	735
Problem materials and evidence . . . . .	735

### **Chapter 26. CMF Field IDs by CICS version . . . . . 737**

### **Chapter 27. CICS PA field names by CICS version . . . . . 747**

### **Chapter 28. Fields by forms, HDB templates . . . . . 757**

### **Chapter 29. CICS PA-specific fields 769**

## **Part 8. Appendixes . . . . . 773**

<b>Notices . . . . .</b>	<b>775</b>
Trademarks . . . . .	776

### **Bibliography. . . . . 777**

CICS Performance Analyzer books . . . . .	777
Books from related libraries . . . . .	777

### **Index . . . . . 779**

## About this book

This book contains information for IBM® CICS® Performance Analyzer for z/OS® Version 5 Release 1, and is intended to do the following:

- Provide an overview of the CICS Performance Analyzer for z/OS
- Serve as a learning aid for both new and infrequent users
- Provide reference information to experienced users

CICS Performance Analyzer for z/OS is a reporting tool for analyzing and tuning the performance of CICS systems. In this book, CICS Performance Analyzer for z/OS is referred to by its short name of CICS Performance Analyzer or CICS PA, and CICS Transaction Server is referred to as CICS.

This book describes the purpose, concepts, and operation of CICS Performance Analyzer and how to get started. It describes the reports and extracts and how to generate them using the CICS PA dialog or commands. There are examples and Guided Tours to help you become familiar with the dialog. Problem determination procedures and error messages are also included.

The following releases of CICS are supported:

- 640 CICS Transaction Server for z/OS Version 3 Release 1
- 650 CICS Transaction Server for z/OS Version 3 Release 2
- 660 CICS Transaction Server for z/OS Version 4 Release 1
- 670 CICS Transaction Server for z/OS Version 4 Release 2
- 680 CICS Transaction Server for z/OS Version 5 Release 1

---

## Who should read this book

This book is intended for managers, database administrators, system programmers, and application programmers responsible for monitoring and improving the performance of CICS systems. It assumes that you understand basic CICS concepts and your installation's CICS systems. If you are new to MVS™, z/OS, DFSORT, or CICS, you might want to review the information in the Bibliography before using this book and the CICS Performance Analyzer for z/OS.

Before you read this book, you need to have a good understanding of how CICS works. This assumes familiarity with many of the books in the CICS Transaction Server for z/OS library. You will also need to have a good understanding of the CICS Monitoring Facility (CMF), which is described in the *CICS Performance Guide*.

---

## Conventions used in this book

This book uses the following conventions.

### Highlighting conventions

This book uses the following highlighting conventions:

- **Boldface type** indicates dialog commands or user interface controls such as names of fields or menu choices.
- **Monospace type** indicates examples of text and batch commands that you enter exactly as shown.

- *Italic type* indicates variables that you should replace with a value. It is also used to indicate book titles and to emphasize significant words.

## Command syntax notational conventions

The notational conventions used in this book to describe the syntax of CICS PA batch commands are as follows:

### Use of symbols

The levels of nesting in the syntax are separated by parentheses. When you enter the commands, enter the following symbols exactly as they appear in the list:

,	comma
-	hyphen
=	equals
.	period
:	colon
( )	parentheses

The following symbols are used to distinguish operands and command syntax. Do *not* enter them when you enter commands:

#### brackets [ ]

mean that you *can* select one of the operands, but they can be omitted. If the brackets are nested, the outermost operand (enclosed by one pair of brackets) is the highest level of nesting. That operand must be selected to select the next lower-level operand nested within it, and so forth.

#### underscore \_\_\_\_\_

denotes a default option. If you don't specify an operand, this is the operand the system selects.

#### vertical bar |

separates operand alternatives within brackets.

### Use of case

Uppercase letters represent information that you must enter as shown. Some operands can be abbreviated. The letters that must be used are in uppercase. The subsequent letters in lowercase can be omitted. For example, you can enter the operand CROSSsystem either as a full word or abbreviated. The uppercase letters CROSS are the shortest truncation that CICS PA accepts.

Lowercase letters represent variable information that you supply, such as start time, owner, delimiter, DDname, and so on. For example, OUTPUT(ddname) shows that the OUTPUT operand requires a DDname parameter.

## \$ (the dollar symbol)

In the character sets given in this book, the dollar symbol (\$) is used as a national currency symbol and is assumed to be assigned the EBCDIC code point X'5B'. In some countries a different currency symbol, for example the pound symbol (£), or the yen symbol (¥), is assigned the same EBCDIC code point. In these countries, the appropriate currency symbol should be used instead of the dollar symbol.

---

## Terminology used in this book

In this book, CICS Performance Analyzer for z/OS is referred to by its short name of CICS Performance Analyzer or the abbreviation CICS PA, and CICS Transaction Server for z/OS is referred to as CICS TS.

CICS PA can produce various types of output, including reports (text or numeric data formatted for human readers), graphs (also for human readers), and extracts (data intended for use by other software applications). These outputs are often referred to collectively as “reports”.

Much of the terminology in this book is based on CICS terminology. See *CICS Transaction Server for OS/390®: Glossary*, GC33-1705.

The following Web site consolidates in one convenient location several of the main glossaries created for IBM products, including the *Glossary of Computing Terms*:

<http://www.ibm.com/ibm/terminology/>

---

## Service updates and support information

To find service updates and support information, including software FixPaks, PTFs, Frequently Asked Question (FAQs), technical notes, troubleshooting information, and downloads, see the following Web page:

[www.ibm.com/cics/support](http://www.ibm.com/cics/support)

---

## Where to find information

The CICS Library Web page provides current product documentation and IBM Redbooks® that you can view, print, and download. To locate publications with the most up-to-date information, see the following Web page:

[www.ibm.com/cics/library](http://www.ibm.com/cics/library)

---

## Accessibility

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully.

You can perform most tasks required to set up, run, and maintain your CICS system in one of these ways:

- using a 3270 emulator logged on to CICS
- using a 3270 emulator logged on to TSO
- using a 3270 emulator as an MVS system console

IBM Personal Communications provides 3270 emulation with accessibility features for people with disabilities. You can use this product to provide the accessibility features you need in your CICS system.

---

## Summary of changes

Significant changes in this edition are summarized here, and marked by a vertical bar in the left margin.

---

### **December 2012: CICS PA V5.1**

CICS Performance Analyzer for z/OS, V5.1 includes the following features and changes:

#### **Support for CICS Transaction Server V5.1**

CICS PA supports SMF 110 records created by CICS TS V5.1.

#### **New CICS PA-specific derived fields**

These include new transaction rate summary fields (RATEMIN and RATESEC), CPU time fields, and fields relating to CICS LM locking.

#### **Plug-in templates for all supported CICS TS releases**

New HDB templates for all supported CICS TS releases are provided for use with the CICS PA plug-in for CICS Explorer®.

#### **CICS Transaction Gateway Statistics batch reports**

Activity Summary

Usage and Capacity report

#### **Support for CICS Transaction Gateway V8.1 and V9.0**

CICS PA supports SMF 111 records generated by CICS Transaction Gateway for z/OS V8.1 and V9.0, which are known by CICS PA as CICS TG VRM 810 and 900 respectively.

#### **WebSphere MQ V7.1 Support**

CICS PA supports SMF 116 records created by WebSphere MQ V7.1.

#### **Log stream support**

Support for SMF log streams throughout CICS PA, including Report Sets SMF input, Transaction Profiling, Shared System Definitions, HDB Load, and Statistics online reporting.

#### **Facility for removing data loaded to CICS PA DB2 tables**

The HDB Housekeeping function can now delete expired DB2 data. The HDB definition allows the specification of separate retention periods for DB2 data and HDB container data sets.

#### **CICS Statistics online reporting - filtering of SMF files**

For SMF files defined in Personal Systems and Shared Systems, only the SMF files that meet the APPLID and Image filter criteria are selected. The remaining filter criteria are applied to limit the statistics intervals.

Filter criteria are now automatically applied to option 6.4 Process SMF File.

#### **New sample report forms**

These can be tailored to help in areas such as Transaction CPU analysis, CICS Lock Delay analysis, MAXTASKS analysis, Storage analysis, CICS TCB Usage and Delays, and URIMAP analysis.

#### **ISPF dialog enhancements**

- Ability to merge personal and shared system definitions. This allows JCL generation to combine the selected files from both system types without the need to duplicate definitions.
- New option 5 File Selection on the Profile Options Menu allows you to specify preferences for working with personal and shared system definitions and log streams.
- HDB default collection settings for statistics reports.
- Ability to initialize a new Object List or Resource List using a sample list.
- HDB Register renamed to CICS PA Repository.

CICS PA V5.1 includes all new features that were introduced in CICS PA V3.2 through service updates. For details, see “Previous changes.”

---

## Previous changes

This section outlines what was new and changed in previous editions.

### June 2011: updates to V3.2

APAR PM30692 includes the following new features and changes:

#### Support for CICS Transaction Server V4.2

All CICS PA reports, HDB, and the ISPF dialog support CICS Transaction Server for z/OS (CICS TS) V4.2, which is known by CICS PA as CICS Version 670.

#### New Transaction Tracking List report and Summary report

CICS TS V4.2 introduces Previous Hop (PH) data to the CMF record. CICS PA provides a new Transaction Tracking List report and Transaction Tracking Summary report to exploit these fields and the originating transaction data fields that were introduced in CICS TS V3.2.

Two new CICS PA-specific fields are available for use in the new reports:

- OSLATNCY reports the latency since the start of the originating transaction.
- PHLATNCY reports the latency between the start times of the current transaction and the previous hop transaction.

#### Sample Statistics Alert definitions

Two new sample Alert Definitions, CTSSERVER and CTGSAMPL, are provided for use when defining statistics alerts. The two existing sample Alert Definitions KEYALERT and SAMPLES have been updated and renamed CTSKEY and CTSSAMPL.

#### New sample Report Forms

Eleven new sample Report Forms PHCSUM1 to PHPSUM4 are provided to help you analyze transaction flow using the new CMF Previous Hop data.

#### Run reports directly from a Report Form

New primary commands RUN and JCL enable you to run reports directly from a Report Form.

#### Support for generic APPLID in HDB definition

HDB definition now accepts masking in the APPLID field.

#### Support for DB2® 10 for z/OS

CICS PA now supports DB2 10 for z/OS.

## December 2010: CICS PA V3.2

CICS Performance Analyzer for z/OS, V3.2 includes the following features and changes:

### **New CICS TS and CICS TG statistics data available through CICS Explorer**

In addition to the current Explorer Summary table, the CICS PA plug-in for CICS Explorer can now source CICS Statistics and Statistics Alerts data.

The additional data is made available through the following facilities:

- New fields in the HDB definition: Explorer, a flag to identify HDBs intended for the CICS PA plug-in, and Qualifier, used to associate related HDBs/DB2 tables.
- Use of a report set or the HDB Load dialog to load the required data into the associated HDBs and also to load the HDB updates into their associated DB2 tables.
- The manifest, which is a catalog of HDBs that are associated with a qualifier and for which the Explorer indicator is set.

### **Capture statistics alerts in HDB**

Statistics Alert reporting enables you to report on the statistics that match specified conditions. CICS PA now supports specifying an alert definition in the statistics HDB definition. You select the required Statistics reports to be collected in this HDB. When a CICS TS or CICS TG alert report is activated to collect in this HDB, you can use a new line action called AO (Activate Alert-only collection) to collect only the reports that related to this Alert. "Alert only" reports are only collected if Alert is triggered.

You can collect records that trigger alert conditions in the CICS TS and CICS TG Alert reports, or restrict existing reports to only those records which triggered alert conditions, or you can do both. Where both the alert and the original report record are collected you can hyperlink between them by use of a PF key.

### **Output batch reports as Portable Document Format (PDF) files**

You can use the new z/OS UNIX utility sysout2pdf that converts plain text batch reports generated by CICS Performance Analyzer for z/OS into Adobe Portable Document Format (PDF) files. You can write plug-in filters for sysout2pdf to manipulate the report contents, highlight text, or add PDF navigation features such as bookmarks. You can also use sysout2pdf to e-mail the PDF. See "Using sysout2pdf to output batch reports as PDF" on page 361.

### **New publication: CICS PA *Getting Started Guide*, SC34-2817-00**

This is intended to help new users to understand the main CICS PA concepts and to become productive with the ISPF dialog interface and generating CICS PA reports.

### **Support for CICS Transaction Gateway V8.0**

CICS PA supports SMF 111 records generated by CICS Transaction Gateway for z/OS V8.0, which is known by CICS PA as CICS TG VRM 800.

### **Dropping support for CICS Transaction Server V2.2 and V2.3**

CICS PA has dropped support for SMF records created by CICS TS V2.2 and V2.3. CICS PA V3.2 supports CICS TS V3.1 and later. Historical data from CICS TS V2.2 systems is still supported.

CICS PA V3.2 includes all new features that were introduced in CICS PA V3.1 through service updates.

## April 2010: updates to V3.1 for Performance Alerts

APAR PM04580 introduces Performance Alerts in CICS Performance Analyzer for z/OS V3.1, and includes the following new features and changes:

### Performance Alerts

Allow you to compare CICS transaction performance against user-defined levels of acceptable performance. A Performance Alert Definition specifies a list of CICS resources to be monitored or managed, together with thresholds that benchmark expected levels of performance. The reports apply to CMF data only. You can report Performance Alerts in various ways, including By Transaction and By Transaction Summary.

### Resource Definitions

Primary menu option 9 now invokes the Resource Definitions menu. It includes the two options previously available from the Application Grouping menu which allowed you to define Resource Lists and Application Groups. A third option has been added to allow you to define Performance Alerts.

### Copy alert definitions

You can now copy definitions of Statistics Alerts and Performance Alerts to the same or another repository.

### Report Forms

Report Forms have been enhanced to enable Performance Alert reporting while utilizing the flexibility of Forms. List and Summary Report Forms now allow the SEV function for alert reporting fields. Existing List Forms will be automatically upgraded next time you edit them to include the new Fn (Function) column required for the new alert SEV function. For SEV fields in the Summary Report Form, specify the alert severity level, INFO, WARNING or CRITICAL, and report type COUNT or PERCENT. In addition, the Summary Report Form supports the new ALERT field name to provide total counts or percentages of transactions for each alert severity for the summary key.

### Report Sets

Performance List and Summary report and extract specifications have been enhanced to include predefined Performance Alerts to work together with, or instead of, Report Forms.

Also, you can request an interval-based Performance Summary report or extract to add or override the Form summary key fields without altering the underlying Report Form.

### Sample JCL

Four new JCL members are provided in the CICS PA sample library, SCPASAMP. The new sample jobs are CPAPALST, CPAPASUM, CPAPAXTL, and CPAPAXTS to request a List or Summary report or extract using pre-defined Performance Alerts.

## October 2009: updates to V3.1

Contains updates for the following new feature introduced by APAR PK95922:

### Extract CICS statistics to CSV files directly from SMF files

You can now extract CICS statistics to delimited text files, such as comma-separated value (CSV) files, directly from SMF files. You can then use these files with other applications, such as PC-based spreadsheets, for

further processing. Previously, to extract statistics to delimited text files, you had to load the data from SMF files into a Statistics HDB, and then extract the data from the HDB.

To extract CICS statistics from SMF files, select Report Sets from the CICS PA ISPF dialog primary option menu, and then select the new Statistics option from the Extracts category. The subsequent Statistics Extract panels allow you to select the CICS statistics that you want to extract. These panels generate JCL containing the new CICSPA command operand `EXTRACTSTATISTICS`. For details, see “Statistics extract” on page 270

The corresponding extract for performance data, previously known as the Export Extract, has been renamed to Performance Data Extract (or simply Performance Extract), to better distinguish it from the new Statistics Extract. Similarly, Export in the Extracts category of a Report Set has been renamed to Performance. The CICSPA command operand `EXPORT` is still supported, but is now deprecated in favor of the new synonym `EXTRACTPERFORMANCE`.

## August 2009: updates to V3.1

Contains updates for fixes and new features introduced by APAR PK90007:

### **New Distributed Program Link (DPL) Usage Summary and List reports**

CICS TS V4.1 introduces new transaction resource class data fields for distributed program links (DPLs). CICS PA provides new DPL Usage Summary and List reports for these fields. For details, see “Transaction Resource Usage reports” on page 208.

### **Transaction Resource Usage List report: now includes originating transactions**

If the `APPLID` or the task number of a transaction, or both, do not match its originating transaction, then the Task Identification section of the Transaction Resource Usage List report contains a second line that describes the originating transaction. For details, see the *Report Reference*.

### **Record Selection extract: support for identity class data**

CICS TS V4.1 introduces a new monitoring identity class data record (SMF 110 subtype 1, class 6). You can now use CICS PA to extract these records from an SMF file, optionally compress them, and then save them to another file for future processing. For details, see “Record Selection extract” on page 259.

### **Cross-System Work Extended report: support for unit-of-work post-processing Performance Selection Criteria**

The `LISTX` operand of the `CICSPA` batch command now supports the `SELUOW` suboperand. This means that you can now select the units of work that you want to include in a Cross-System Work Extended report.

Previously, if you used the CICS PA ISPF dialog to request a Cross-System Work Extended report (by specifying a Cross-System Work report with a Report Form), then CICS PA ignored any Performance Selection Criteria unit-of-work post-processing that you might have specified. Similarly, if you wrote your own batch job to use the `CICSPA` `LISTX` operand to produce a Cross-System Work Extended report, CICS PA ignored the `SELUOW` suboperand.

### **RECCOUNT field: now available in Performance Selection Criteria, and as a sort field for LISTX**

You can now use the field `RECCOUNT` (CICS field ID: `PERRECNT`)

DFHCICS A131) in Performance Selection Criteria. You can also now use RECCOUNT as a sort field in the List Extended report.

**Documentation update: suppressing default fields in Performance Summary reports and extracts**

“Customizing or suppressing default fields” on page 419 clarifies why, in some situations, a Performance Summary report or extract contains fields that you have not specified in the FIELDS operand.

**Documentation update: how CICS PA calculates peak percentiles**

The description of the item **nn** in “SUMMARY(FIELDS)” on page 415 clarifies how CICS PA calculates peak percentiles, and why these values are accurate only if your data is normally distributed.

## **May 2009: CICS PA V3.1**

CICS Performance Analyzer for z/OS V3.1 includes the following features and changes:

**Statistics alert reporting**

Statistics alert reporting enables you to define conditions, in terms of CICS Transaction Server statistics or CICS Transaction Gateway statistics field values, that interest you. You can then use those conditions to report on statistics stored in SMF files or historical databases. For details, see Chapter 13, “Statistics alert reporting,” on page 347.

**Support for CICS Transaction Server V4.1**

All CICS PA reports, HDB, and the ISPF dialog support CICS Transaction Server for z/OS (CICS TS) V4.1, which is known by CICS PA as CICS Version 660.

**Support for CICS Transaction Gateway V7.2**

CICS PA support for CICS Transaction Gateway statistics (SMF type 111 records) has been enhanced to support CICS Transaction Gateway V7.2.

**Dropping support for CICS TS V1.3 and V2.1**

CICS PA has dropped support for SMF records created by CICS TS V1.3 and V2.1. CICS PA V3.1 supports CICS TS V2.2 and later.

**Documentation for the CICS PA plug-in for the CICS Explorer**

Chapter 4, “The CICS PA plug-in for CICS Explorer,” on page 37 provides step-by-step instructions on setting up CICS PA to work with the CICS Explorer.

**CICS PA plug-in sample report forms and DB2 view definition**

To create comma-separated value (CSV) files for use with the CICS PA plug-in for the CICS Explorer, use the sample summary report form EXPLORE3 (for CICS TS V3) or EXPLORE4 (for CICS TS V4). (EXPLORE3 was already included in CICS PA V2.1 via the PTF for APAR PK71846.)

To create a DB2 view for use with the CICS PA plug-in, use member CPAXPLRV of the CICS PA sample library (SCPASAMP).

For details, see Chapter 4, “The CICS PA plug-in for CICS Explorer,” on page 37.

**Repository data set name on Control Data Sets panel**

In addition to the other panels where you can specify this data set name, you can now specify the Repository data set name on the CICS PA Control Data Sets panel (CICS PA dialog option 0.3).

**z/OS V1.10 users: apply fix for DFSORT APAR PK80962**

Without this fix, DFSORT can produce system abend SA78-10 in CICS PA.

**Terminology: “shared object lists” now “resource lists”**

Shared object lists, previously also known as “HDB object lists”, are now known as *resource lists*. Object lists, sometimes previously also known as “personal object lists”, remain as object lists. For a comparison of these types of list, see “Object Lists versus Resource Lists” on page 323.

---

## Part 1. Introduction

These topics introduce you to CICS Performance Analyzer for z/OS, its main concepts and components, and how to install it.

---

## Chapter 1. Overview

This chapter provides a brief introduction to CICS PA. It describes the reports and extracts that you can request and the types of data they process. It also describes the historical database facility.

---

### What is CICS PA?

CICS Performance Analyzer for z/OS (CICS PA) is a reporting tool that provides information on the performance of your CICS systems and applications, and helps you tune, manage, and plan your CICS systems effectively. CICS PA also provides a historical database facility to help you manage CICS statistics and performance data for your CICS transactions.

CICS PA is not an online monitoring tool. It produces reports and extracts using data normally collected by your system in MVS System Management Facilities (SMF) data sets and log streams:

- CICS Monitoring Facility (CMF) performance class, exception class, and transaction resource class data in SMF 110 records
- CICS statistics and server statistics data in SMF 110 records
- CICS Transaction Gateway statistics data in SMF 111 records
- DB2 accounting data in SMF 101 records
- WebSphere® MQ accounting data in SMF 116 records
- System Logger data in SMF 88 records
- IBM Tivoli® OMEGAMON® XE for CICS on z/OS (OMEGAMON XE for CICS) data in SMF 112 records, containing transaction data for Adabas, CA-Datcom, CA-IDMS, and Supra database management systems

It is designed to complement the CICS-supplied utilities and sample programs such as DFH\$MOLS, DFHSTUP, and DFH0STAT.

CICS PA can help:

- System Programmers to track overall CICS system performance and evaluate the results of their system tuning efforts
- Application Programmers to analyze the performance of their applications and the resources they use
- Database Administrators to analyze the usage and performance of database systems such as IMS™ and DB2
- MQ Administrators to analyze the usage and performance of their WebSphere MQ messaging systems
- Managers to ensure transactions are meeting their required Service Levels and measure trends to help plan future requirements and strategies

CICS PA reports all aspects of CICS system activity and resource usage, including:

- Transaction response time
- CICS system resource usage
- Cross-system performance, including multi-region operation (MRO) and advanced program-to-program communication (APPC)
- CICS Business Transaction Services (BTS)

- CICS Web support
- External subsystems, including DB2, IMS, and WebSphere MQ
- CICS transaction usage of database management systems that are monitored by OMEGAMON XE for CICS: Adabas, CA-Datcom, CA-IDMS, and Supra
- System Logger performance
- Exception events that cause performance degradation
- Transaction file and temporary storage usage

---

## Data input

The primary data source for CICS PA is the data collected by the CICS Monitoring Facility.

### CMF data (SMF type 110)

CMF data is written to the MVS System Management Facilities (SMF) data set as SMF type 110 records, subtype 1. Subsequently the data can be made available offline for analysis by CICS PA.

There are three types, or “classes”, of CMF data analyzed by CICS PA:

#### CMF Performance class data

Detailed transaction-level information, such as the processor and elapsed time for a transaction, or the time spent waiting for I/O.

#### CMF Exception class data

Information about exceptional conditions suffered by a transaction, such as queuing for file strings, or waiting for temporary storage. This data highlights possible problems in system operation.

#### CMF Transaction resource class data

Additional transaction-level information about individual resources accessed by a transaction. Currently, the transaction resource class covers file and temporary storage resources only.

To understand the function of CICS PA and to interpret the reports and extracts properly, some knowledge of the CMF data records and their relationship to one another is necessary. For a complete description of CMF data fields and to understand how the fields are collected, see the *CICS Performance Guide*.

**Note:** Take care when using the information in this section to analyze monitoring data that is appropriate to your release of CICS. You can use Table 17 on page 737 to determine in which CICS release particular monitoring fields are available.

Another major data source for CICS PA is:

#### CICS statistics and server statistics data

SMF type 110 records, subtypes 2, 3, 4, and 5.

#### CICS Transaction Gateway statistics

SMF type 111 records.

### Other data sources

CICS PA also analyzes the following types of data:

#### DB2 accounting data

SMF type 101 records written by DB2 on behalf of CICS attached tasks.

**WebSphere MQ accounting data**

SMF type 116 records written by WebSphere MQ on behalf of CICS attached tasks.

**System Logger data**

SMF type 88 records written by the MVS System Logger on behalf of CICS Transaction Server journaling.

**OMEGAMON XE for CICS data**

SMF type 112 records written by OMEGAMON XE for CICS to log CICS transaction usage by the database management systems Adabas, CA-Datcom, CA-IDMS, and Supra.

The **CICS PA Historical Database** is a repository for CMF performance class data, CICS statistics and server statistics data, and CICS Transaction Gateway statistics data.

---

## CICS PA reports and extracts

CICS PA provides an ISPF menu-driven dialog to help you request and submit your reports and extracts. The available reports and extracts are grouped by category.

A brief description of the report categories and the reports and extracts follows. For a detailed discussion, see Chapter 8, “Report Sets,” on page 143.

### Performance reports

The Performance reports are produced from CMF performance class data.

**Performance List**

Lists in detail the CMF performance class data.

See “Performance List report” on page 167.

**Performance List Extended**

Sorts and lists in detail the CMF performance class data.

See “Performance List Extended report” on page 176.

**Performance Summary**

Summarizes the CMF performance class data.

See “Performance Summary report” on page 177.

**Performance Totals**

Provides totals and averages of the CMF performance class data.

See “Performance Totals report” on page 180.

**Wait Analysis**

Summarizes transaction activity by wait time. For each Transaction ID, the resources that cause this transaction to be suspended are shown in the order of most to least expensive. This report highlights the system resource bottlenecks that might be causing bad response time. More detailed analysis can then be performed, focusing on the problem resources identified.

See “Wait Analysis report” on page 181.

**Transaction Profiling**

Compares two sets of CMF performance class data.

See “Transaction Profiling report” on page 183.

#### **Cross-System Work**

A detailed listing of segments of work performed by the same or different CICS systems via transaction routing, function shipping, or distributed transaction processing on behalf of a single network unit-of-work id.

See “Cross-System Work report” on page 194.

The format can be tailored to produce the Cross-System Work Extended report (see Figure 201 on page 413).

#### **Transaction Group**

A detailed listing of segments of work performed by the same or different CICS systems on behalf of a single transaction group id.

See “Transaction Group report” on page 196.

#### **BTS (CICS Business Transaction Services)**

A detailed listing of the segments of work performed by the same or different CICS systems on behalf of a single CICS Business Transaction Services (BTS) process.

See “BTS report” on page 198.

#### **Workload Activity**

Provides a transaction response time analysis by MVS Workload Manager (WLM) service and report class. This can be used in conjunction with the z/OS Resource Measurement Facility (RMF™) workload activity reports to understand from a CICS perspective how well your CICS transactions are meeting their response time goals. The Workload Activity List report is a cross-system report that correlates CMF performance class data from single or multiple CICS systems for each network unit-of-work. The Workload Activity Summary report summarizes response time by WLM service and report classes.

See “Workload Activity report” on page 199.

#### **Transaction Tracking List**

Provides performance data for groups of related transactions. This allows monitoring and measurement of transaction performance from the perspective of transaction flow. The report shows how a process flowed from one transaction or system to the next and back again. The report combines CMF records for each originating transaction and its subordinate (group) transactions.

See “Transaction Tracking List report” on page 201.

#### **Transaction Tracking Summary**

Provides performance data for groups of related transactions. The report combines CMF records for each originating transaction and its subordinate (group) transactions. The summarized data is presented on a single line for each grouped Originating transaction.

See “Transaction Tracking Summary report” on page 203.

## **Exception reports**

The Exception reports are produced from CMF exception class data.

#### **Exception List**

Lists in detail the CMF exception class data.

See “Exception List report” on page 205.

### **Exception Summary**

Summarizes the CMF exception class data.

See “Exception Summary report” on page 207.

## **Transaction Resource Usage reports**

The Transaction Resource Usage reports are produced from CMF performance class and transaction resource class data. The reports in this category are:

### **File Usage Summary**

Provides two summaries of file usage:

- The Transaction File Usage Summary report summarizes File usage by Transaction ID. For each Transaction ID, it gives Transaction and File statistics followed by a breakdown of File usage for each File used.
- The File Usage Summary report summarizes File activity. For each File, it gives a breakdown of File usage by Transaction ID.

See “File Usage Summary report” on page 208.

### **Temporary Storage Usage Summary**

Provides two summaries of temporary storage usage:

- The Transaction Temporary Storage Usage Summary report summarizes Temporary Storage usage by Transaction ID. For each Transaction ID, it gives Transaction and Temporary Storage statistics followed by a breakdown of Temporary Storage usage for each Temporary Storage Queue used.
- The Temporary Storage Usage Summary report summarizes Temporary Storage activity. For each Temporary Storage Queue, it gives a breakdown of Temporary Storage usage by Transaction ID.

See “Temporary Storage Usage Summary report” on page 211.

### **DPL Usage Summary**

Provides two summaries of distributed program link (DPL) usage:

- The Transaction DPL Usage Summary report summarizes DPL usage by Transaction ID. For each Transaction ID, it gives Transaction and DPL statistics followed by a breakdown for each DPL used.
- The DPL Usage Summary report summarizes DPL activity. For each DPL, it gives a breakdown of DPL usage by Transaction ID.

See “Distributed Program Link Usage Summary report” on page 214.

### **Transaction Resource Usage List**

Provides a list of all Transaction resource class records in the sequence that they appear in the SMF file. It gives Transaction information, detailing their individual Temporary Storage, File, and DPL usage. This report processes only transaction resource class data, not performance class data.

See “Transaction Resource Usage List report” on page 216.

## **Statistics reports**

The Statistics reports are produced from CICS statistics data stored in SMF files.

**Alert** Process CICS Transaction Server and CICS Transaction Gateway statistics records.

See Chapter 13, “Statistics alert reporting,” on page 347.

In addition to producing the batch Statistics Alert reports, you can view statistics using the CICS PA dialog and extract statistics to delimited text files. See Chapter 17, “Using the Statistics reporting dialog,” on page 535 and “Statistics extract” on page 270.

### **CICS Transaction Gateway**

Provide reporting of CICS Transaction Gateway Statistics SMF 111 records.

- The Activity Summary provides a high-level overview of CICS TG daemon address spaces and their workloads. This report also indicates whether connected users or systems might have experienced problems due to communications failure or request time out.
- The Usage and Capacity report summarizes CICS TG daemon resource usage over time.

See “CICS Transaction Gateway reports” on page 221.

## **Subsystem reports**

The Subsystem reports are produced from database subsystem accounting data stored in SMF files. (Note that the DB2 report also processes CMF performance class data whereas the WebSphere MQ and OMEGAMON reports do not.)

**DB2** Correlates CICS CMF performance class (SMF 110) records and DB2 accounting (SMF 101) records by network unit-of-work to produce a consolidated and detailed view of DB2 usage by your CICS systems. The DB2 report enables you to view CICS and DB2 resource usage statistics together in a single report. The DB2 List report shows detailed information of DB2 activity for each transaction. The DB2 Summary reports summarize DB2 activity by transaction.

See “DB2 report” on page 223.

### **WebSphere MQ**

Processes WebSphere MQ accounting (SMF 116) records to provide comprehensive performance analysis and resource usage for your CICS transactions that use MQ.

The WebSphere MQ List report provides a trace of MQ accounting records, reporting the comprehensive performance contained in subtype 0, 1 and 2 records. The WebSphere MQ Summary report provides two summarized views of your MQ transactions:

- Summary by CICS Transaction ID, showing the MQ system and queue resources use
- Summary by WebSphere MQ Queue name, showing the Transactions they service and resources used

See “WebSphere MQ report” on page 228.

### **OMEGAMON**

Processes OMEGAMON XE for CICS (SMF 112) records to produce a detailed view of how CICS transactions use the following types of database management system (DBMS): Adabas, CA-Datcom, CA-IDMS, and Supra.

For each type of DBMS, you can request up to three reports:

- A List report, showing database usage for each transaction.
- A Transaction Summary report, showing database usage summarized by transaction ID.
- A Database Summary report, showing database usage summarized by database.

The information in each report varies depending on the DBMS, but typically includes elapsed times and counts for each method that is used by transactions to access a database, such as read, write, add, update, and delete.

See “OMEGAMON reports” on page 233.

## System reports

The System reports are produced from system data stored in SMF files. Note that the System Logger report does not process CMF performance class data. There is only one report in this category:

### System Logger report

Processes System Logger (SMF 88) records to provide information on the System Logger logstreams and coupling facility structures that are used by CICS Transaction Server for logging, recovery and backout operations. The report can assist with measuring the effects of tuning changes and identifying Logstream or Structure performance problems. The System Logger List report shows information on Logstream writes, deletes, and events, as well as Structure Alter events for each SMF recording interval. The System Logger Summary report summarizes Logstream and Structure statistics so you can measure Logger performance over a longer period. These reports help to provide a comprehensive analysis of the logstream activity for all your CICS systems.

See “System Logger report” on page 237.

## Performance Graph reports

The Performance Graph reports are graphical-style reports produced from CMF performance class data. The graph reports can be useful as daily indicators of system activity, as well as for analyzing particular performance problem areas in your CICS system.

### Transaction Rate

A set of two graphs illustrating the average response time and the number of transactions that completed in a specified time interval.

See “Transaction Rate Graph report” on page 242.

### Transaction Response Time

A set of two graphs illustrating the average and maximum response time, respectively, for all transactions that completed in a specified time interval.

See “Transaction Response Time Graph report” on page 244.

## Extracts

While the other categories produce reports and graphs intended for human readers, the extracts produce data sets intended for use by software applications, including CICS PA itself.

### Cross-System Work

This data set is useful for cross-system analysis. CICS PA allows you to merge CMF performance class data from segments of work performed by the same or different CICS systems via transaction routing, function shipping, or distributed transaction processing on behalf of a single network unit-of-work ID. This Cross-System Work data set can be used as input to CICS PA Performance Reports such as the List, Summary, and Totals reports to monitor the total amount of resources used by a transaction within a single CICS system or across multiple CICS systems.

See “Cross-System Work extract” on page 246.

#### **Performance Data**

This data set contains a selected subset of CMF performance class data, extracted and formatted as a delimited text file. This file can then be imported into DB2 databases or PC spreadsheet applications such as Lotus® 1-2-3® for further reporting and analysis. The extract records have a default format which includes all the clock fields, or the format can be tailored like the Performance List or Performance Summary reports.

See “Performance Data extract” on page 253.

#### **Record Selection**

This data set contains only the SMF record types that are of interest to you. You can extract any combination of the SMF record types supported by CICS PA. The extract file can then be used as input to CICS PA, allowing for more efficient reporting.

See “Record Selection extract” on page 259.

#### **HDB Load**

The HDB Load is a facility that loads SMF data into a Historical Database (HDB). This same facility is available from Primary Menu option 5 Historical Database, where the full set of HDB reporting facilities is available. However, from Report Sets you have the advantages of batch JCL generation and multiple load requests supported in the one job. A Recap report containing processing statistics is always printed at the end of load processing.

See “HDB Load” on page 264.

#### **System Logger**

This data set contains a selected subset of System Logger data, extracted and formatted as a delimited text file. This file can then be imported into DB2 databases or PC spreadsheet applications such as Lotus 1-2-3 for further reporting and analysis.

See “System Logger extract” on page 267.

#### **Statistics**

This data set contains CICS statistics, extracted and formatted as a delimited text file. This file can then be imported into DB2 databases or PC spreadsheet applications such as Lotus 1-2-3 for further reporting and analysis. The format of the extract records depends on the CICS statistics ID of the extracted data: each statistics ID defines its own set of fields.

See “Statistics extract” on page 270.

---

## **The CICS PA dialog**

The CICS PA dialog is an ISPF-based menu-driven dialog that helps you create, maintain and submit your report requests. It also helps you to specify your input data and tailor requests specific to your requirements without you having to understand the SMF data.

## CICS PA Primary Option Menu

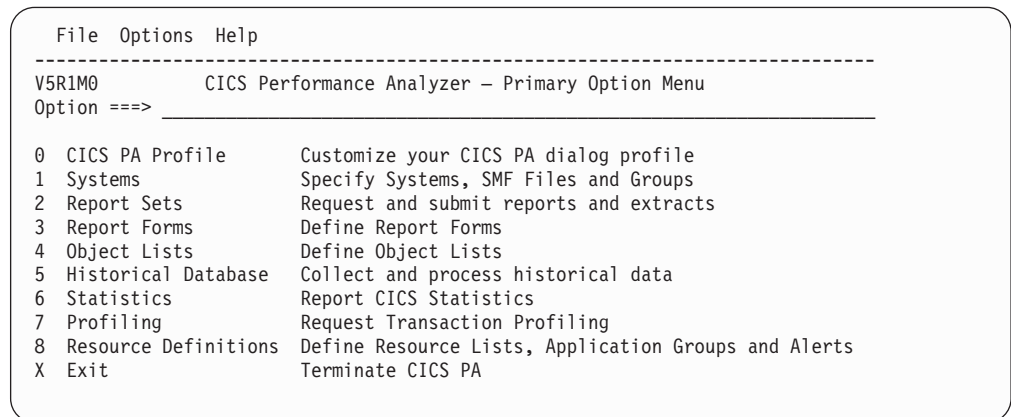

Figure 1. CICS PA Primary Option Menu

The following steps introduce the primary menu options and explain briefly how to use the dialog to start reporting:

1. Define your CICS systems and their SMF files. When your CICS systems are defined, you can start reporting against them. You can automate this process by using the Take-Up facility. CICS PA extracts the relevant information about your CICS systems from your SMF files or log streams. If you define your own CMF user fields, then specify your MCT definition. The user fields can then be incorporated into your CICS PA reports.

Related CICS systems, such as systems that connect via IRC/MRO, ISC/APPC, or IPIC, can be grouped together for reporting purposes. For example, assigning the CICS MRO systems (CICSPTOR, CICSIPAOR, CICSPPFOR, CICSPPDOR) and DB2 subsystem (DB2P) to a Group allows you to report on these systems as a single entity. CICS PA reports can then show a complete end-to-end picture of your MRO transaction activity, incorporating detailed DB2 statistics derived from the DB2 accounting data of subsystem DB2P.

You can use the Systems menu to define both Personal System Definitions and Shared System Definitions. Personal System Definitions are typically maintained in a Personal Profile Library and used by an individual for reporting. Shared System Definitions are typically maintained by a central administrator in the Repository and used by all users.

2. Define Report Sets to build, submit, and save your report requests. A Report Set contains the set of reports and extracts that you want to run in a single job. Simply select the ones you require and submit.

Specify Selection Criteria to filter the input records to report only the information that you are interested in. For example, you can specify Selection Criteria to restrict reporting to:

- A particular date/time range
- A group of related Transaction IDs
- Transaction response times that exceed your thresholds

Run your Report Sets (or individual reports or extracts). The CICS PA dialog builds the JCL and commands to produce the reports and extracts. You can edit these jobs, or you can write your own jobs.

3. Define Report Forms to tailor the format and content of your reports and extracts. A simple to use editor allows you to design your own report by selecting the required CMF fields. Most CMF fields can be selected for

reporting, and detailed explanations of each CMF field are available from the dialog. A comprehensive set of Sample Report Forms is provided to help you tailor your reports and extracts.

4. Define Object Lists to help you specify values for filtering and grouping objects such as transaction IDs and terminals. Object Lists are used when specifying Selection Criteria for reports and extracts.
5. Define and maintain Historical Databases (HDBs) as repositories of performance data. Generate reports against your HDBs or export HDB data to DB2 for further manipulation and analysis.
6. Report on statistics from eligible SMF files or HDBs, or create and maintain Statistics Alert definitions (required for Statistics Alert reports).
7. Request a Transaction Profiling report (you can also request this in a Report Set, using option 2).
8. Define Resource Definitions, including Resource Lists, Application Groups, and Performance Alerts.

## CICS PA Profile

This facility allows you to customize your CICS PA user profile, which includes:

- CICS PA dialog settings such as the name of your Personal Profile Library (where personal system definitions are stored), your preferred date format, and the job card CICS PA is to use when generating JCL.
- The allocation attributes of data sets that might need to be created during Report Set processing. CICS PA uses these when generating JCL.
- Control data sets: the data sets to use for Report Sets, Report Forms, Object Lists, and the Repository.
- DB2 settings, for exporting data to DB2 tables.
- File Selection options: which system definitions (personal or shared or both) to use at run time, and options for using log streams across CICS PA.

You can bypass this menu option because CICS PA uses defaults and prompts you if and when further information is required.

## System Definitions

Use System Definitions to define:

- CICS systems (including CICS Transaction Gateway systems) and SMF files that you want to report against
- DB2 subsystems and SMF files for the DB2 report and Record Selection extract
- MQ subsystems and SMF files for the WebSphere MQ report and Record Selection extract
- System Loggers and SMF files for the System Logger report and Record Selection extract

You can specify SMF data sets for each system (CICS, DB2, MQ, Logger) or for each MVS system (image) where they run. In addition you can define groups of systems for reporting purposes, such as those systems that connect via IRC/MRO, ISC/APPC, or IPIC.

Your System Definitions are then used in the following ways:

- By specifying the Systems (or Groups) in your Report Sets, CICS PA can determine the related files (and, in the case of shared systems, log streams) to include in Report Set JCL generation.

- By specifying a CICS APPLID when creating Report Forms and HDB Templates, CICS PA can determine the user fields and CICS version. CICS PA can then populate your Report Form or HDB Template with CMF fields appropriate to the release of CICS and user fields for the particular CICS system.
- By specifying a CICS APPLID for the Cross-System Work extract, CICS PA can determine the user fields for the particular CICS system for inclusion in the extract file.
- The SSID of specified DB2 Subsystems provides filtering on SSID for the DB2 report and Record Selection extract.
- The SSID of specified MQ Subsystems provides filtering on SSID for the WebSphere MQ report and Record Selection extract.

For reporting, you can use either Personal System Definitions or Shared System Definitions, or both. If you use both, you can specify the order of precedence if two definitions have the same name: Personal then Shared, or Shared then Personal. Set **Systems** in the action bar to the definitions that you want to use for reporting.

## Personal Systems

Personal System Definitions are maintained using option 1 on the Systems Menu. They are saved in your Personal Profile Library (specified in option 0 CICS PA Profile Settings). Personal definitions are typically maintained and used by an individual for reporting.

The dialog provides a take-up facility to automatically define your personal systems from an SMF file.

## Shared Systems

Shared System Definitions are maintained using option 2 on the Systems Menu. They are saved in the Repository. Shared definitions are typically maintained by a central administrator and used for reporting by all users of that repository.

The dialog provides a take-up facility to automatically define your shared systems from an SMF file or log stream. The dialog provides a second take-up facility to automatically load your personal definitions into the Shared System Definitions.

## Report Sets

A Report Set defines a selection of reports and extracts with their associated options. The CICS PA reports and extracts are listed in “CICS PA reports and extracts” on page 5.

You can define any number of Report Sets and select any number of reports and extracts in a Report Set. The reports in a Report Set are produced as a group from one pass of the input data sets.

A Report Set can be run on a one-off basis, or run repeatedly against different input each time. Changes are made to Report Sets using the CICS PA dialog, and immediately affect the next run of the Report Set.

The data to be analyzed by a Report Set can optionally be restricted by a Start/Stop date and time specified at submit time. This reduces the volume of data to be analyzed as only a subset of the data in the input files is passed to the report processors, thereby increasing the efficiency of the report processing.

## Selection Criteria

Selection Criteria can be specified to provide filtering of the data to be reported or extracted. Selection Criteria are made up of a series of SELECT Statements which specify whether to include or exclude data based on:

- date-time ranges or time slots
- started, stopped, or continuing (active) transactions
- particular field values

You can filter on many fields, and specify value lists, masks or ranges. Object Lists are a convenient way to specify the values and define groups of objects such as transaction IDs and terminals.

## Running Report Sets

The CICS PA dialog generates the JCL for batch report processing. The Report Set (or individual report or extract), and any Report Forms and Object Lists it uses, are converted to a stream of commands for batch execution. Eligible data sets specified in your System Selection are built into the JCL as input to the batch reporting programs.

Enter the **RUN** command to run your Report Set. This prompts you to check or change your run-time options before generating the JCL. Run-time options include System Selection, Report Interval, and whether you want to edit the JCL before submitting the job for batch execution.

Alternatives to the RUN command are JCL and SUB. These do the same as the RUN command except:

- The **JCL** command selects the run-time option Edit JCL before Submit. This allows you to review or modify the JCL before submit, or to save the JCL in an external library for later submission independent of the CICS PA dialog.
- The **SUBMIT** or **SUB** command does not select the run-time option Edit JCL before Submit. It requests that the job be submitted immediately.

## Analyzing the output

View or print your reports using standard facilities such as SDSF or ISPF Outlist Utility.

Process your extract data sets according to their purpose:

- Analyze the Cross-System Work extract data using CICS PA Performance Reports such as the List, Summary, and Totals reports.
- Analyze the Performance Data Extract or System Logger Extract using external programs such as DB2, or PC tools such as Lotus 1-2-3.
- Specify the Record Selection extract data sets as your SMF Files in System Definitions to reduce the volume of data processed by CICS PA.

## Report Forms

Report Forms can be used to tailor the format and content of the following reports and extracts:

- Performance List report
- Performance List Extended report
- Performance Summary report
- Cross-System Work report
- Performance Data extract
- Transaction Tracking List
- Transaction Tracking Summary

One Report Form can be used by many reports of compatible type. The Report Form defines the CMF fields to include in the report, the order of the columns, sort sequence (where applicable), and report title. Optionally, your List or Summary Report Form can define which fields are for performance alert reporting. Alternatively, Performance Alert Definitions can be used for reporting together with, or instead of, a Report Form. Note that alerts are not supported in ListX Report Forms.

List and Summary Report Forms can also be used to tailor HDB reports.

You can run reports directly from a Report Form as well as using the Report Form in a Report Set.

## **Object Lists and Resource Lists**

Object Lists provide a convenient way to specify field values for filtering the CMF data and grouping objects for reporting purposes. For example, to analyze the resource usage of a particular group of transactions.

An Object List defines particular values, masks, or ranges of values which can be used in the Selection Criteria for as many reports and extracts as required. Long lists of field values can be defined once and then reused in Report Sets as often as they are needed.

Resource Lists offer similar benefits for specifying field values in HDB load selection criteria, and Resource field values in Application Grouping and Statistics Alerts. For a comparison of these two types of list, see “Object Lists versus Resource Lists” on page 323.

## **Historical Database**

Historical Database (HDB) is a facility that allows you to manage performance and statistics data for your CICS transactions. SMF data is saved in HDB container data sets that are managed from the CICS PA dialog.

There are three types of HDB:

### **Performance List HDB**

A List HDB is built from CMF performance class data. In a List HDB data set, one record represents one transaction. Typically, List HDBs are used to analyze recent transaction events. Data is usually only required for a short period of time. The type of information and level of detail contained in a List HDB is determined by the List Template on which it is based.

### **Performance Summary HDB**

A Summary HDB is built from CMF performance class data. In a Summary HDB data set, one record represents a summary of transaction activity over a user-specified time interval. Typically, Summary HDBs are used for long-term trend analysis and capacity planning. Data is retained for a longer period of time, sometimes years. The type of information and level of detail contained in a Summary HDB is determined by the Summary Template on which it is based.

### **Statistics HDB**

A Statistics HDB contains collections of CICS statistics and server statistics and CICS Transaction Gateway statistics over a specified time interval.

You can run reports against your HDB, export the HDB data to DB2 tables, or export the HDB data to extract data sets in CSV format.

## Statistics reporting

CICS PA provides comprehensive reporting and analysis of CICS statistics and server statistics data. It complements the CICS statistics reporting utilities DFHSTUP and DFH0STAT. CICS PA also provides comprehensive reporting and analysis of statistics data from CICS Transaction Gateway. CICS PA can interactively process, report, and extract statistics data directly from SMF files or from an HDB after collection. An advantage of collecting statistics data in an HDB is that you can then export the data to DB2 for further analysis.

Features of the interactive statistics reporting facility include:

- Tabular reporting, sorting by field (column)
- Forms to design personalized reports
- Hyperlinks to jump directly to related reports
- Print facility, either to a data set or to SYSOUT

In addition to interactively reporting statistics, you can also process statistics using the batch Statistics Alert reports and CICS Transaction Gateway reports, and extract statistics to delimited text files.

---

## The CICS PA commands

The CICS PA commands are used to request reports and extracts. The CICS PA dialog automatically generates the commands and JCL when you submit a Report Set. You can edit these jobs or set up your own jobs.

The standard command format for producing reports and extracts is:

Name	Command	Operands	Comments
name in columns 1-8 (or blank)	<b>CICSPA</b>	one or more operands	comments (or blank)

The general format of the command as it appears in the //SYSIN DD statement of the CICS PA batch JCL is:

```
CICSPA operand[(suboperand)][,operand[(suboperand)],]...
```

For a full discussion, see Chapter 15, "Using the CICS PA commands," on page 371.

---

## Chapter 2. Installing CICS PA

This chapter describes the procedure for installing the CICS PA dialog components and migrating from an earlier release of CICS PA. Before installing the dialog, follow the installation instructions in the Program Directory supplied with CICS PA.

---

### CICS PA system requirements

Make sure that you have the following hardware, software, and storage requirements in place before installing and running CICS PA.

#### Hardware requirements

If your z/OS operating system and CICS were installed in compliance with their documented minimum hardware requirements, you have only the following additional requirements to consider in installing CICS PA:

- DASD storage required for the CICS PA product. For information on DASD requirements, see the Program Directory that is shipped with CICS PA.
- Optionally:
  - Printer for printing reports and graphs
  - PC for downloading extract data

#### Software requirements

CICS PA requires the following software products:

- z/OS Version 1 Release 12 or later (contains SMP/E) (5694-A01)
- z/OS Version 1 Release 12 DFSORT feature or later, or an equivalent sort product

CICS PA can process SMF data produced by the following CICS systems:

- CICS Transaction Server for z/OS Version 5 (5655-Y04)
- CICS Transaction Server for z/OS Version 4 (5655-S97)
- CICS Transaction Server for z/OS Version 3 (5655-M15)

#### Storage requirements

CICS PA runs in a virtual storage region. Region size will vary based on your specific report requirements and the amount of data input.

Typical storage use begins at 2048K, which includes storage for:

- CICS PA programs
- Access methods and buffers
- Report queues (most are located above the 16 MB line)

Installations with large CICS systems might experience greater resource requirements.

Operating system requirements are additional.

---

## CICS PA components

The components of the CICS PA dialog are delivered in the following libraries: where *xxx* identifies the national language, such as **ENU** for U.S. English.

**SCPAEXEC**

REXX EXECs

**SCPALINK**

Executable load modules

**SCPAM<sub>xxx</sub>**

ISPF messages

**SCPAP<sub>xxx</sub>**

ISPF panels

**SCPAS<sub>xxx</sub>**

ISPF skeletons

**SCPAT<sub>xxx</sub>**

ISPF input tables

In addition, sample JCL for running batch reports and extracts is supplied in the **SCPASAMP** library. See Chapter 16, “Sample library,” on page 529.

---

## CPAOREXX command

The CICS PA initialization module CPAOREXX accepts four parameters:

**qual** The data set high level qualifier for CICS PA data sets. For example, CICSPA.V5R1M0. Alternatively, specify NODYNAM to tell CICS PA to use the existing allocation settings.

**lang** Identifies the national language. The default is **ENU** (U.S. English).

**PASSAPPL**

Optional. Overrides the enforcement of the default CICS PA application NEWAPPL(CPAO). CICS PA uses the invoking application's APPL specification. See “Overriding the default application” on page 19.

**low level qualifiers**

Optional. Overrides the default low level qualifiers for the six CICS PA data sets. All six qualifiers must be specified in the correct order, enclosed in brackets and separated by commas. See “Overriding the data set low level qualifiers” on page 19. For example:

(EXEC, LINKLIB, MSG, PNL, SKL, TBL)

---

## Installing the CICS PA dialog

You can either install the CICS PA libraries statically within your ISPF library setup, or allow them to be set up dynamically when the CICS PA dialog is used. Then you can optionally add CICS PA to an ISPF menu.

Dynamic setup is the simplest and quickest approach.

### Dynamic setup

To enable the CICS PA libraries to be dynamically set up when the CICS PA dialog is invoked, do the following:

1. On the TSO command processor panel, enter:

```
EX 'qual.SCPAEXEC(CPAOREXX)' 'qual lang'
```

For example:

```
EX 'CICSPA.V5R1M0.SCPAEXEC(CPAOREXX)' 'CICSPA.V5R1M0 E'
```

If the high level qualifier for your CICS PA installation data sets is not CICSPA.V5R1M0, then alter the command accordingly.

2. To add CICS PA to an ISPF menu, set &ZSEL to:

```
CMD(EX 'qual.SCPAEXEC(CPAOREXX)' 'qual lang') NOCHECK
```

NOCHECK is specified to support entry of concatenated commands via the direct option (trail). Also specify on the calling panel:

```
&ZTRAIL=.TRAIL
```

**Note:** Dynamic setup requires that the supplied library names are retained. These are listed under “CICS PA components” on page 18.

## Static setup

To install the CICS PA libraries statically within your ISPF library setup, do the following:

1. Include the library *qual.SCPAEXEC* in your SYSEXEC or SYSPROC concatenation. This library contains the required EXECs. It is allocated with fixed-block 80 record format during installation.

You should put these libraries in the SYSEXEC concatenation. However, if you want to put them in SYSPROC, it must have a record length of 80 bytes.

Ensure that all libraries contained in your concatenations are either in the same format (F, FB, V, VB) and have the same block size, or are in order of decreasing block sizes. Otherwise, you might experience problems using the CICS PA panels.

2. Add the remaining libraries to your ISPF library setup:

- Include the link/load module library *qual.SCPALINK* in the ISPLLIB concatenation.
- Include the message library *qual.SCPAMxxx* in the ISPMLIB concatenation.
- Include the panel library *qual.SCPAPxxx* in the ISPLLIB concatenation.
- Include the skeleton library *qual.SCPASxxx* in the ISPSLIB concatenation.
- Include the table library *qual.SCPATxxx* in the ISPTLIB concatenation.

3. On the TSO command processor panel, enter:

```
%CPAOREXX 'NODYNAM lang'
```

4. To add CICS PA to an ISPF menu, set &ZSEL to:

```
CMD(%CPAOREXX 'NODYNAM lang') NOCHECK
```

## Overriding the default application

To override the default CICS PA application, use the PASSAPPL parameter in the ISPF menu &ZSEL setting:

```
CMD(EX 'qual.SCPAEXEC(CPAOREXX)' 'qual lang PASSAPPL') NOCHECK NEWAPPL(CPAP)
```

CICS PA will then use **CPAP** as the application, rather than the default of CPAO.

## Overriding the data set low level qualifiers

The default CICS PA data set low level qualifiers are listed under “CICS PA components” on page 18. You can override these by specifying the required

qualifiers as the last parameter in the ISPF menu &ZSEL setting. All six qualifiers must be specified in the correct order, enclosed in brackets and separated by commas. For example:

```
CMD(EX 'qual.SCPAEXEC(CPAOREXX)' 'qual lang (EXEC,LNK,MSG,PNL,SKL,TBL)')
```

CICS PA will then use the following libraries:

'qual.EXEC'  
REXX EXECs

'qual.LNK'  
Executable load modules

'qual.MSG'  
ISPF messages

'qual.PNL'  
ISPF panels

'qual.SKL'  
ISPF skeletons

'qual.TBL'  
ISPF input tables

---

## Migrating from an earlier release

No additional setup is required if migrating from an earlier release of CICS PA. Your System Definitions, Report Sets, Report Forms, Object Lists, and HDBs are upgraded automatically so you can take advantage of the new and changed features in CICS PA V5R1.

### Including a V3.1 Performance HDB in the manifest

In V3.2 there was a change in how performance HDB data is made available for viewing in the CICS PA plug-in for CICS Explorer. HDB and DB2 tables that were set up for the CICS PA plug-in in V3.1 must be changed before they can be included in the new Manifest and accessed from the CICS PA plug-in.

#### About this task

To include the Performance HDB in the Manifest, you must modify the HDB definition to specify a qualifier, select the Explorer indicator, and replace the current Template with the internal template EXPLOR41.

The process for migrating the DB2 table depends on whether you REPLACE your DB2 table every time you reload it; or RESUME (that is, append) new data to the existing data in the table. The following procedure covers both “REPLACE” and “RESUME” users.

#### Procedure

1. Select the performance HDB from the HDB Maintenance panel and make the following changes:
  - a. Specify a qualifier. This HDB will be included in the manifest for the corresponding qualifier.
  - b. Select the Explorer indicator.
  - c. Replace the current template with EXPLOR41, which is an internal template designed for use with the CICS PA plug-in.

- d. Press the Exit key (F3) to save the HDB definition.
2. Update the DB2 table and VIEW as follows:
    - REPLACE users: DROP the existing table and its associated VIEW.  
In the HDB Maintenance panel, enter the T line action next to the performance HDB. This will generate DB2 commands to create the new DB2 table and VIEW. Submit the generated JCL.
    - RESUME users: Rename the existing DB2 table to *qqqqqqq.CPA\_CMFPSUM*, where *qqqqqqq* is the qualifier specified in the HDB definition.  
In the HDB Maintenance panel, use the T line action next to the performance HDB. This will generate DB2 commands to create the DB2 Table and VIEW. Delete the TABLE CREATE command and change the VIEW DROP command to DROP VIEW EXPLORER\_SUMMARY. Submit the JCL to DROP and then recreate the VIEW so that it picks up the new table name.

---

## Chapter 3. Setup and getting started

CICS PA provides a menu-driven dialog to request generation of reports and extracts for analyzing and tuning the performance of your CICS Transaction Server systems. CICS Monitoring Facility (CMF) performance class, exception class, and transaction resource class data in MVS System Monitoring Facility (SMF) files provide the input to the CICS PA reports and extracts. In addition, DB2 and MQ accounting, System Logger, and OMEGAMON XE for CICS records in SMF files are analyzed by specific reports.

Facilities are provided to help you to specify your input files, filter the data, and tailor the reports and extracts to suit your requirements.

The dialog requires no special customization or setup. Reporting can commence immediately.

To get started with using CICS PA to analyze the performance of your CICS systems and applications, proceed as follows:

1. Before installing CICS PA, check that the system requirements are met. See “CICS PA system requirements” on page 17.
2. To install CICS PA, follow the instructions in the Program Directory. Then to complete the installation, see “Installing the CICS PA dialog” on page 18.
3. If you are unfamiliar with System Monitoring Facility (SMF) data and how to prepare it for CICS PA reporting, see Chapter 5, “SMF data used by CICS PA,” on page 53.
4. To get started with using the CICS PA dialog to define and run report and extract requests, see “How to use the dialog” on page 24.

By following the topic on 'Defining a Report Set for daily monitoring' in the *CICS Performance Analyzer for z/OS Getting Started Guide* you can quickly get an insight into how to use the dialog.

The Performance Totals report is a useful starting point as it is only a few pages and can provide an immediate indication of which area to look into next. Another good report to try is the Performance Summary report with the data summarized by Transaction ID within APPLID.

5. To understand the JCL generated by the dialog, or set up your own jobs, see Chapter 14, “JCL for reports and extracts,” on page 355.

Sample jobs for each report and extract are provided in Chapter 16, “Sample library,” on page 529.

6. To understand the CICS PA commands generated by the dialog or to code them directly in your job stream, see Chapter 15, “Using the CICS PA commands,” on page 371. This chapter includes many syntax examples and sample reports.
7. For help analyzing the report and extract output, and interpreting the CMF performance and exception data, see the *CICS Performance Analyzer for z/OS Report Reference*.
8. If results are not as expected, see Chapter 24, “Messages,” on page 689, and Chapter 25, “Problem determination,” on page 729 to help you diagnose and resolve problems.
9. To define and populate a historical database for analyzing performance over time, refer to Chapter 18, “Guided Tour: Performance HDB,” on page 557.

## CICS PA Primary Option Menu

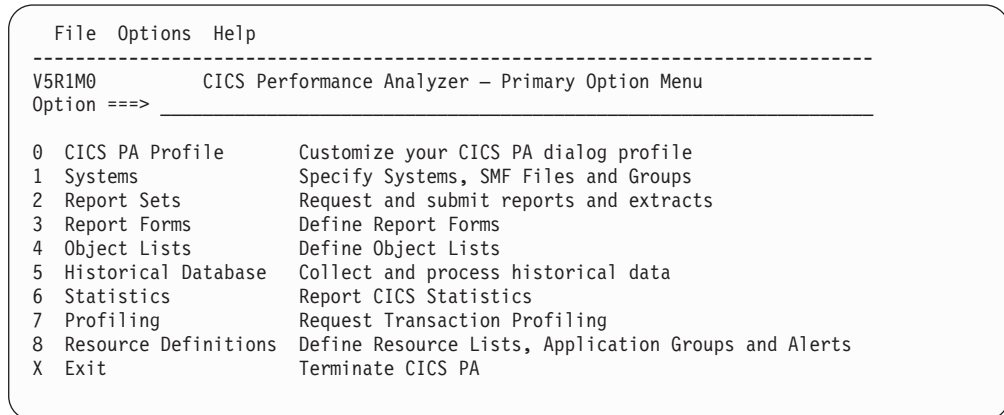

Figure 2. CICS PA Primary Option Menu

Figure 2 shows the CICS PA dialog main menu panel. For a brief explanation of the main CICS PA concepts introduced here, see “The CICS PA dialog” on page 10.

### How to use the dialog

The following steps briefly describe how to use the dialog to start reporting.

#### Initial setup (defaults apply)

This is applicable when using CICS PA for the first time.

Initial setup is optional. CICS PA uses default settings and prompts you to allocate data sets (with default allocation attributes) as they are required. However, if you want to step through the process, the initial setup procedure is:

1. Check your **ISPF environment settings**. See “Recommended ISPF setup” on page 26.
2. Specify the **CICS PA Settings**. This allows some customization of the CICS PA dialog and JCL used for generating reports and extracts. See “CICS PA Settings” on page 29.
3. Specify default **Reporting Allocation Settings** (UNIT= and SPACE=) for the Extract data sets, External Work data sets, and Sort Work data sets. These are used by the CICS PA dialog to generate the corresponding DD statements in the JCL. See “Reporting Allocation Settings” on page 32.
4. Specify the **Control Data Sets** that contain the Report Sets, Report Forms, Object Lists, and the Repository. See “CICS PA Control Data Sets” on page 34.
5. If you plan to export HDB data to DB2, specify your DB2 settings. Select option 0, CICS PA Profile, from the Primary Option Menu, and then select DB2 Settings.
6. Specify which system definitions (personal or shared or both) to use at run time. If you plan to report on data stored in log streams, specify Log stream options. Select option 0, CICS PA Profile, from the Primary Option Menu, and then select File Selection.

## Everyday operation

The normal procedure to request and generate reports and extracts is as follows:

1. Specify the **System Definitions** by identifying your personal and shared systems (CICS APPLID, MVS Image, DB2 SSID, MQ SSID, System Logger), SMF Files, and Groups. You can automate much of this process by using the Take-up facility. See Chapter 6, “Personal System Definitions,” on page 69 and Chapter 7, “Shared System Definitions,” on page 115.
2. Define a **Report Set**:
  - Create a new Report Set. See “Creating new Report Sets” on page 147.
  - Specify any **Global Options and Selection Criteria**. The Global Options apply to all reports and extracts within the Report Set. The global Performance Selection Criteria apply to all Performance reports and extracts within the Report Set. The global Exception Selection Criteria apply to all Exception reports within the Report Set.
  - Select and tailor the **Reports and Extracts** that you require. If report-specific options and selection criteria are specified, they take precedence over the corresponding Global Options and Selection Criteria at JCL build time. You can request more than one of each type of report or extract (for example, 3 Performance List Reports and 2 Cross-System Work Extracts), and specify different options for each. Exclude any of a particular type you do not want to generate, and Deactivate if you want to generate none of a particular type. See “Maintaining Report Sets” on page 146 for details of all reports, extracts, and their options.
3. Define any **Report Forms** used to tailor the format of the Performance List, Performance List Extended, Performance Summary and Cross-System Work reports, and Performance Data extract. See “Maintaining Report Forms” on page 288.
4. Define any **Object Lists** used to enhance the Selection Criteria. See “Maintaining Object Lists” on page 324.
5. Enter the **RUN** command to run the Report Set. The Active status controls which reports in the Report Set are run. Only active reports in active categories are selected, but you can use the **RUN** line action to temporarily override this. A panel is displayed for you to enter run-time options. Then CICS PA generates the JCL for batch report processing. Global Options and Selection Criteria, requested reports and extracts, and any Report Forms and Object Lists they use, are converted to a stream of commands for batch execution. You can choose to submit the JCL directly, or edit it first and optionally save the JCL in an external library. See “Running Report Sets” on page 273.
6. View or print the job output using your usual method, such as SDSF or ISPF Outlist utility.
7. Process the Extract data sets using a method appropriate to each. For example:
  - Analyze the Cross-System Work Extract data using CICS PA Performance Reports such as the List, Summary, and Totals reports.
  - Analyze the Performance Data Extract, Statistics Extract, or System Logger Extract data using external programs such as DB2 or PC tools such as Lotus 1-2-3.
  - Specify the Record Selection Extract data sets as your SMF Files in System Definitions to reduce the volume of data processed by CICS PA.
8. Define and maintain **Historical Databases (HDBs)** as repositories of performance data. Generate reports from your HDBs or export HDB data to DB2 tables for further analysis.

---

## Standard ISPF interface

CICS PA has been designed to follow CUA conventions, while also accommodating established ISPF conventions. For example:

- Possible actions are presented in action bar pull-down menus; those available from the File, Edit, or View pull-down menus can also be requested from the command line.
- A menu or selection list item can be selected either by positioning the cursor over it (point-and-shoot) or by specifying its corresponding number, and then pressing Enter.
- For many entry fields you can select from a list of available choices by positioning the cursor on the field and pressing **Prompt** (F4). A + (plus sign) at the end of the field or column heading indicates that Prompt is available.
- Short-cut navigation to the primary CICS PA functions is available. For example, to invoke Report Sets where you request your reports and extracts, you can select option **2** from the CICS PA primary menu, or enter **=2** on the command line from anywhere in the CICS PA dialog.

Help is available throughout the CICS PA dialog. Context-sensitive help is available for each panel and input field, and there is an online tutorial.

---

## Recommended ISPF setup

The CICS PA dialog is an ISPF application following Common User Access (CUA) conventions. You can use ISPF standard facilities to customize the screens. This section contains some recommendations to help you use CICS PA efficiently.

### Screen size and scrolling

Set the screen size in your session parameters to 32 lines. CICS PA screens are optimized for 32 lines, but accommodate 24 lines by scrolling **Backward** (F7) and **Forward** (F8).

### Function keys

CICS PA uses standard conventions for function keys. For example: F1=Help, F3=Exit, F4=Prompt, F5=Rfind, F7=Backward, F8=Forward, F11=Right, F12=Cancel. However, you can use the ISPF commands **KEYS** and **KEYLIST** to assign alternative functions to the keys. For a list of the CICS PA default settings, enter the **KEYSHELP** command or select **Help->Keys Help** in the action bar.

If you are new to CICS PA, ensure that the function keys are displayed at the bottom of the screens. The ISPF command **PFSHOW ON|OFF** turns on and off the display of the function key settings.

### Prompt (F4)

Prompt is available on various data entry fields throughout the CICS PA dialog to help you specify valid values. To use this facility, position the cursor on the field and press **Prompt** (F4). A list of available values is displayed from which you can select one or more depending on the circumstance.

### Mouse options

The CICS PA Report Set panel is a tree structure of report categories and reports. The report categories act as folders that can expand (to show) and collapse (to hide) the reports contained within them. If your terminal emulation permits,

configure your Mouse Options to activate the lightpen function. You can then use the left-button of your mouse to click on the + to expand and - to collapse the report categories. Alternatively, you can use cursor selection on the + and -, or enter line action S.

### CUA attribute settings

The CICS PA dialog is designed to use the default CUA attributes. However, we recommend that you set the **Point-and-Shoot** field to easily distinguish Point-and-Shoot fields from other types of fields. You can use the ISPF CUAATTR command to change the attribute settings. For example, you could set Point-and-Shoot to yellow as shown in Figure 3, or for better distinction, you could also set the highlight attribute to REVERSE (reverse video).

CUA Attribute Change Utility				Defaults
Command ===>				
Panel Element	Color	Intensity	Highlight	More: +
Choice Entry Field . . . . .	TURQ	LOW	USCORE	
List Entry Field . . . . .	TURQ	LOW	USCORE	
List Item Description . . . .	GREEN	LOW	NONE	
List Items . . . . .	WHITE	LOW	NONE	
Normal Entry Field . . . . .	TURQ	LOW	USCORE	
Normal Text . . . . .	GREEN	LOW	NONE	
<b>Point-and-Shoot . . . . .</b>	<b>YELLOW</b>	HIGH	NONE	
Reference Phrase . . . . .	WHITE	HIGH	NONE	

Figure 3. Recommended CUAATTR settings for CICS PA

### Point-and-Shoot fields

CICS PA employs point-and-shoot fields. For efficient use, enter the ISPF **SETTINGS** command to display the ISPF Settings screen then select **Tab to point-and-shoot fields**.

ISPF Settings				More: +
Command ===>				
Options		Print Graphics		
Enter "/" to select option		Family printer type 2		
Command line at bottom		Device name . . . .		
7 Panel display CUA mode		Aspect ratio . . . 0		
/ <b>Long message in pop-up</b>				
Tab to action bar choices				
7 <b>Tab to point-and-shoot fields</b>		General		
/ Restore TEST/TRACE options		Input field pad . . N		
Session Manager mode		Command delimiter . ;		
7 Jump from leader dots				
Edit PRINTDS Command				
7 Always show split line				
_ Enable EURO sign				
:				
Terminal Characteristics				
Screen format 3 1. Data 2. Std 3. Max 4. Part				

Figure 4. Recommended ISPF settings for CICS PA

## Displaying messages

CICS PA uses both long and short messages. Short messages display at the top right, on the same line as the screen title. Long messages are designed to display in a pop-up window. However, long messages of less than the screen width can be customized to display just below or above the command line rather than in a window. If you always want long messages in a pop-up window, enter the ISPF **SETTINGS** command to display the ISPF Settings screen, then select **Long message in pop-up** as shown in Figure 4 on page 27.

Messages displayed in a window can be moved to another location on the screen by doing the following:

1. Position the cursor on the top or bottom border of the message window, and press Enter.
2. Position the cursor at the location on the screen to which you want to move the message, then press Enter.

---

## CICS PA Profile Options

To display the CICS PA Profile Options Menu, either:

1. From the CICS PA Primary Option Menu, select option 0 **CICS PA Profile**
2. From any CICS PA panel, select **Options** from the action bar

Figure 5. Profile Options Menu

This menu allows you to customize your CICS PA user profile. Defaults are set initially so you can start using CICS PA, but you can change these at any time to suit the particular way you want to interact with the CICS PA dialog. Typically you would set the profile options just once.

The menu items are:

### CICS PA Settings

Customize some aspects of the CICS PA dialog and the job card it uses when generating Report Set JCL.

### Reporting Allocation Settings

Specify the allocation attributes of data sets that might need to be created during Report Set processing. The CICS PA dialog uses these when generating the Report Set JCL.

### CICS PA Control Data Sets

Specify the data set names where CICS PA stores Report Sets, Report Forms, Object Lists, and the Repository.

### DB2 Settings

Specify settings for exporting data from historical databases (HDBs) to DB2. For details, see “Creating DDL to define a DB2 table” on page 655.

## File Selection

Specify which system definitions (personal or shared or both) to use at run time and options for using log streams across CICS PA.

## CICS PA Settings

This facility allows you to customize the CICS PA dialog and batch JCL for running Report Sets and processing Historical Databases.

To display the CICS PA Settings panel, select option 1 **CICS PA Settings** from the Profile Options Menu.

```

==> _____
==> _____
==> _____
==> _____
==> _____
```

Figure 6. CICS PA Settings

All options have initial settings, but you can change these at any time to suit the way you use CICS PA. Values must be specified for all options, except the DASD Work File Unit Name and CICS PA Load Library which have system defaults.

The options are:

### CICS PA Load Library

Specify the name of the library that contains the CICS PA executable modules. This is used by the CICS PA dialog when generating the JCL for executing Report Sets. It need not be specified if the modules reside in the system LINKLIST. The initial setting is 'xxxx.SCPALINK' where xxxx is the DSN prefix specified at dialog start up. The default initial setting is 'CICSPA.V5R1M0.SCPALINK'.

### Personal Profile Library

The CICS PA dialog utilizes ISPF tables for storing some user data such as your personal system definitions.

Specify the name of the data set to be used for maintaining these ISPF tables. As the data is typically user-specific and sharing with other users is

not an issue, it is recommended that each user has their own data set to avoid contention with other users for access to tables.

The initial setting is 'xxx.CICSPA.TABL' which CICS PA translates to 'xxx.CICSPA.TABL' where xxx is determined by your TSO prefix and userid.

If the specified data set does not exist, CICS PA uses default allocation parameters to create it when it is required. The data set can be allocated using ISPF facilities outside the dialog if your site has local requirements not satisfied by the defaults.

#### **Delete Confirmation**

This option applies *only* to Delete requests from panels which have **Confirm** in the action bar: the CICS PA “primary object” list panels (Report Sets, Report Forms, Object Lists). From these list panels, deleted items cannot be reinstated, so you might always want to be prompted to confirm your Delete requests. On all other panels, deleted items can be reinstated by a Cancel request.

Specify **YES** to request CICS PA to display a confirmation pop-up to prompt you to confirm your Delete request before it is actioned. This is the initial setting.

Specify **NO** to have CICS PA action Delete requests immediately without prompting for confirmation.

**Note:** This option does not apply to HDB where the default is always **YES**.

#### **Cancel Confirmation**

This option applies *only* to Cancel requests from panels which have **Confirm** in the action bar: CICS PA “primary object” panels (Report Set, Report Form, Object List), System Definitions and HDB.

Specify **YES** to display a confirmation pop-up if you attempt to Cancel when there have been updates. This is to alert you that you have made changes that will be discarded if you proceed with the Cancel request.

Specify **NO** to have CICS PA action Cancel requests immediately, without first prompting for confirmation. This is the initial setting.

#### **Automatic Save on Exit**

This option applies *only* to attempts to Exit edit sessions after making changes on CICS PA “primary object” panels (Report Set, Report Form, Object List) and the System Definitions panel. It is not applicable to HDB.

Specify **YES** to automatically save the changes on Exit. This is the initial setting.

Specify **NO** to automatically discard the changes on Exit. To save any changes before exit you must remember to use the **SAVE** command.

Specify **PROMPT** to display a message if there have been updates when you attempt to Exit. To save the changes, you can use the **SAVE** command. Otherwise, to discard the changes, you can use the **CANCEL** command.

#### **Reports in Upper Case**

Specify **NO** to receive reports in upper and lower case characters. This is the initial setting.

Specify **YES** to translate all reports to upper case characters only. This is particularly for printers that cannot handle mixed case. This generates the UPPER parameter on the EXEC statement in CICS PA JCL generation generates the

#### Read SMF File to EOF

Select this option to force CICS PA to process all records in the SMF file through to EOF. Normally CICS PA stops reading the SMF file as soon as the first record is encountered that is later than the **To** time (SMFSTOP). However, if the file is not in ascending time sequence, reading might end before all records earlier than SMFSTOP have been found.

This option is only effective when the **To** time is specified. Select it when the SMF file has been presorted and you want to ensure that all records within the **From** and **To** time range are processed.

#### Preferred Date Format

The CICS PA dialog can accept and present dates in the following formats:

1. YYYY/MM/DD ISO
2. MM/DD/YYYY US
3. DD/MM/YYYY European

Enter either **1**, **2**, or **3** for the date format you prefer. **1 (ISO)** is the initial setting.

**Note:** This option does *not* apply to the format of dates presented on batch reports, which is typically MM/DD/YYYY. Further, there are exceptions within the CICS PA dialog where the functionality dictates the date format. For example, the **Changed** time stamp field of component lists (Report Sets, Report Forms, Object Lists) always presents as YYYY/MM/DD HH:MM to be able to sort on this field.

#### DASD Work File Unit Name

Specify the device type or group name to be used by CICS PA to allocate DASD data sets as required by facilities such as:

- Report Set, Report Form, Object List Data Sets
- Extract, External and Sort Work Data Sets used in batch processing (if the Reporting Allocation Settings are not set).

The name must represent a device that is defined as DASD in the Eligible Device Table of the current processor. For example, SYSDA, SYSALLDA, 3390.

If not specified, the system default is used. Blank (for system default) is the initial setting.

#### Job Statement Information

Specify the JCL JOB statement, which can be continued to a maximum of six lines. These are used by CICS PA to supply the job statement for batch Report Set and HDB processing. All the rules of JCL must be followed in specifying the job statement. CICS PA does not validate this information. Blank lines are ignored.

The default is **//userid JOB (ACCOUNT),'NAME'**.

It is recommended that you include a **REGION=** parameter on your job card to allocate a virtual storage region size for CICS PA of at least 4M.

## Reporting Allocation Settings

This facility is used to specify allocation attributes for data sets that CICS PA might need to create during batch processing of Report Sets.

To display the Reporting Allocation Settings panel, select option 2 **Reporting Allocation Settings** from the Profile Options Menu.

```
File Options Help
-----
Reporting Allocation Settings
Command ==>

Specify data set allocation settings.

Extract Data Sets:
==> // UNIT=SYSDA, SPACE=(CYL,(10,10))
==>
==>

External Work Data Sets:
==> // UNIT=SYSDA, SPACE=(CYL,(10,10))
==>
==>

Sort Work Data Sets:
==> // UNIT=SYSDA, SPACE=(CYL,(10,10))
==>
==>
```

Figure 7. Reporting Allocation Settings

CICS PA provides default settings for each type of data set. Figure 7 shows the default allocation settings. The defaults are displayed when you first invoke the panel or when you clear a setting.

The required data set allocation settings are:

### Extract Data Sets

Specify the UNIT and SPACE attributes for the following extract data sets:

- Cross-System Work
- Performance
- Record Selection
- System Logger
- Statistics

These are sequential data sets. You do not need to specify the DCB attributes as CICS PA sets the appropriate DCB at Extract run time. However, if you specify DCB attributes, CICS PA will override RECFM and LRECL with the correct values. CICS PA will also assign the BLKSIZE to an allowable value closest to your specification. For example, if you want half track blocking, simply specify DCB=BLKSIZE=27998 (for UNIT=3390) and CICS PA will assign the highest allowable BLKSIZE not exceeding 27998.

CICS PA provides default settings. To reset to the default, erase the field then press Enter.

When the CICS PA dialog builds the Report Set JCL for a new Extract Data Set, the specified allocation settings are appended to a statement of the form:

```
//DDname DD DSN=datasetname,DISP=(disp,CATLG),
```

where *DDname* is generated by CICS PA, and *datasetname* and *disp* are the data set name and disposition specified on the corresponding Extract panel.

### External Work Data Sets

Specify the UNIT and SPACE attributes for the External Work Data Sets which might be required by the following:

- Performance List Extended report
- Performance Summary report (optional)
- Transaction Profiling report (optional)
- Cross-System Work report and extract
- Transaction Group report
- BTS report
- Workload Activity report (possibly)
- Transaction Tracking List report
- Transaction Tracking Summary report
- Statistics Alert reports
- DB2 report
- System Logger report
- Performance Data extract (optional for Summary Form)

These work data sets are temporary sequential data sets used by CICS PA to store records passed to the external SORT facility. You do not need to specify the DCB attributes as CICS PA sets the appropriate DCB at Report Set run time.

CICS PA provides default settings. To reset to the default, erase the field then press Enter.

When the CICS PA dialog builds the Report Set JCL, the specified allocation settings are appended to a statement of the form:

```
//CPAXWnnn DD DISP=(NEW,DELETE),
```

where *nnn* is **001-999** to uniquely identify each data set.

### Sort Work Data Sets

Specify the UNIT and SPACE attributes for the Sort Work Data Sets which might be required by the following:

- Performance List Extended report
- Performance Summary report (optional)
- Transaction Profiling report (optional)
- Cross-System Work report and extract
- Transaction Group report
- BTS report
- Workload Activity report (possibly)
- Transaction Tracking List report
- Transaction Tracking Summary report
- Statistics Alert reports (optional)
- DB2 report
- System Logger report
- Performance Data extract (optional for Summary Form)

These work data sets are temporary sequential data sets used by the SORT facility.

CICS PA provides default settings. To reset to the default, erase the field then press Enter.

When the CICS PA dialog builds the Report Set JCL, the specified allocation settings are appended to a statement of the form:

```
//CPASWKn DD DISP=(NEW,DELETE),
```

where *nn* is **01-04** to uniquely identify each data set.

## CICS PA Control Data Sets

To work with CICS PA Report Sets, Report Forms, and Object Lists, you must first identify the data sets where they are to be stored. These are called the CICS PA Control Data Sets.

To specify the control data sets, select option 3 **CICS PA Control Data Sets** from the Profile Options Menu, or enter CDS from the command line anywhere in the CICS PA dialog.

```
File Options Help
-----
CICS PA Control Data Sets
Command ==>

Specify the names of the CICS PA Control Data Sets.

Report Sets . . . 'xxx.CICSPA.RSET' _____ +
Report Forms . . . 'xxx.CICSPA.FORM' _____ +
Object Lists . . . 'xxx.CICSPA.OBJL' _____ +
Repository . . . . 'CICSPA.XYX.REPOSTRY' _____ +

Missing Data Sets Option:
1 1. Allocate now
2. Allocate when required
```

Figure 8. CICS PA Control Data Sets

Specify the name of the data sets where Report Sets, Report Forms, and Object Lists are maintained:

### Report Sets

Report Sets define selections of reports and extracts and their associated options.

### Report Forms

Report Forms are used to tailor the format and content of particular reports and extracts.

### Object Lists

Object Lists are user-defined lists of objects that are defined by name and can be specified in selection criteria to provide filtering of the report data.

You can specify the same data set for all three components. However, it is recommended that each type of component is stored in a separate data set to avoid conflict with member names.

For a particular component, related definitions should share a common data set. For example, keep related Report Sets together in the one data set, related Report Forms in another, and related Object Lists in a third.

However, you can have multiple data sets for each component, such as a separate data set for each CICS subsystem or a personal data set. For each component, only

one data set at a time is used by the dialog. That is, there is only one current Report Sets data set, one current Report Forms data set, and one current Object Lists data set. To change the current data set, enter the data set name or press **Prompt** (F4) to select from a list of data sets previously used.

If you have not previously specified a data set name, CICS PA assigns a default that you can erase or overwrite.

Default Data Set Name	Explanation
'prefix.CICSPA.type'	TSO prefix and userid are the same
'prefix.userid.CICSPA.type'	TSO prefix and userid are different
'userid.CICSPA.type'	User has no TSO prefix

where *type* is RSET, FORM, or OBJL. Figure 8 on page 34 shows an example of the Control Data Sets panel with the default names specified.

The control data sets must be cataloged, partitioned data sets (PDS or PDSE) with RECFM=FB and LRECL=80. You can let CICS PA create the data sets dynamically using the default attributes of LRECL=80, BLKSIZE=6160, SPACE=(CYL,(1,1,50)). Alternatively, you can use standard facilities such as ISPF option 3.2 Data Set Utility to create and catalog the data sets.

When specifying the data set name, standard TSO conventions apply. For example, if the TSO option **PROFILE PREFIX** is in effect, the prefix is appended as the high-level qualifier unless the data set name is enclosed in quotes.

Specify the **Missing Data Sets Option** to tell CICS PA whether to allocate new data sets now or leave that until later when you try to perform functions that require them.

If the data set is not cataloged, a Confirm Create pop-up asks you to confirm that you want CICS PA to create the data set for you using default allocation attributes.

You can also specify the data set name of the **Repository** on this panel. The default name is 'CICSPA.HDB.REPOSTRY'. For information on this data set, see "Repository" on page 615.

## Maintaining CICS PA data sets

The CICS PA data sets are partitioned data sets and carry product sensitive information in the directory. You can use DFSMSdss utilities and data set utility IEBCOPY for maintenance purposes.

Members in these data sets are saved in a special format. Members must *not* be created or modified using facilities other than CICS PA as this can cause them to become unusable by CICS PA. Should this occur, a message similar to this one is displayed by panels that use the member:

Only Report Set members in the data set are included in the list.  
Some members have been excluded.

Ensure that you specified the correct data set name. If correct, you can use ISPF to determine the offending member or members. For example, use ISPF option 3.1 to display the list of members in the Report Sets data set. Members created by CICS PA will display with no modification details, whereas those edited using ISPF will show their modification details. To correct the situation, either:

- Use ISPF to remove (move or delete) the offending members from the data set.

- Use CICS PA facilities. When the Report Sets panel is displayed, enter **SELECT** in the command line and specify the name of the offending member. If the contents of the member are valid Report Set details, they will display on the EDIT Report Set panel. Save the Report Set and the member will appear in the list of Report Sets in the specified sort order. If it is not a valid Report Set, an error message is displayed.

## File selection options

This facility allows you to specify which system definitions (personal or shared or both) to use at run time and options for using log streams across CICS PA.

To display the File Selection panel, select option 5 **File Selection** from the Profile Options Menu.

```

File  Options  Help
-----
                                File Selection
Command ==> _____
Systems Definitions in use:
1  1. Personal only
  2. Shared only
  3. Personal, then Shared
  4. Shared, then Personal

Log stream options:
/  DASDONLY
_  Use Log Streams when available
  
```

Figure 9. File selection options

The options are:

### Systems Definitions in use

Select which system definitions to use. You can work with either personal system definitions or shared system definitions or both.

1. Personal only.  
Select to use only your personal system definitions for reporting.
2. Shared only.  
Select to use only your shared system definitions for reporting.
3. Personal, then Shared.  
Merge personal and shared system definitions for reporting. If there are two definitions with the same name, your personal definition will take precedence over the shared definition.
4. Shared, then Personal.  
Merge shared and personal system definitions for reporting. If there are two definitions with the same name, the shared definition will take precedence over your personal definition.

### DASDONLY

A DASD-only log stream can contain data from only one system in the sysplex and can be accessed only by that system. To generate the JCL to correctly route jobs, use this option to indicate that all log streams will be treated as DASD-only and will require an Image name to execute.

### Use Log Streams when available

If you select this option, CICS PA will first look for a log stream. If no log stream is available, Cyclic or Daily SMF files will be used instead.

---

## Chapter 4. The CICS PA plug-in for CICS Explorer

The CICS PA plug-in for CICS Explorer (CICS PA plug-in) is an Eclipse plug-in that operates on top of the IBM CICS Explorer to help you analyze CICS data, including the Performance Summary and CICS PA Statistics and Statistics Alerts reports.

Using the CICS PA plug-in, you can perform the following tasks:

- For performance data:
  - View and sort the CSV or database data in a spreadsheet viewer.
  - Select single or multiple transactions for analysis.
  - Perform CPU time analysis.
  - Perform file analysis.
  - Perform response time analysis.
  - Perform storage analysis.
  - Perform threadsafe analysis.
- For statistics data:
  - Perform CICS Statistics analysis.
  - View CICS statistics alert reports and navigate to specific records.

For more information about the IBM CICS Explorer, see <http://www.ibm.com/cics/explorer>.

The procedure that follows describes how to use CICS PA to get data from an SMF data set into a DB2 table or CSV file for use by the CICS PA plug-in.

The step-by-step procedure presented here shows you how to:

1. Define a performance HDB.
2. Define a statistics HDB, optionally including statistics alert data.
3. Load the HDB.
4. Export data:
  - To a DB2 table.
  - To a CSV file (Performance HDB only).
5. Build the manifest. (This step is only required if the data is exported to DB2.)
6. Access the data using the CICS PA plug-in.

While this procedure describes each step in detail, with enough information to move on to the next step, many of the steps are described individually in more detail in other parts of this book.

---

### Define a Performance HDB for export to DB2

The manifest should be rebuilt whenever you add or change an HDB in a way that affects its eligibility for inclusion in the manifest. For example, if an HDB is currently included in the manifest and you change its qualifier or clear the Explorer option, it is no longer eligible for inclusion in the manifest.

See “Build the manifest” on page 44.

1. On the **Historical Database** menu, select option **2 Define**.  
The **New HDB Definition** pop-up menu appears.
2. Select the HDB type **Performance** and then press Enter.  
The **New HDB Definition** window appears:

File Systems Options Help	
New HDB Definition	
Command ==> _____	
Specify new HDB definition options then press EXIT to save.	
Name . . . . .	EXPLOR5P APPLID _____ + Image _____
Qualifier . . .	GF9IJG / Explorer
Description . .	Explorer HDB for CICS TS V5
HDB Format:	Selection Criteria:
Template . . .	EXPLOR51 + _ Performance
Data Retention Period:	
HDB: Years 1	Months _____ Weeks _____ Days _____ Hours _____
DB2: Years _____	Months _____ Weeks _____ Days _____ Hours _____
Data Set Allocation Settings:	
DSN Prefix . . . . .	USER
Management class . . .	_____ (Blank for default management class)
Storage class . . . . .	_____ (Blank for default storage class)
Volume serial . . . . .	_____ (Blank for system default volume)
Device type . . . . .	_____ (Generic unit or device address)
Data class . . . . .	_____ (Blank for default data class)
Space Units . . . . .	CYLS (TRKS, CYLS)
Primary quantity . .	10 (In above units)
Secondary quantity	5 (In above units)
F1=Help F3=Exit F4=Prompt F7=Backward F8=Forward F10=Actions	
F12=Cancel	

3. Type a name for the HDB.  
**If you plan to export to DB2:** The DB2 table names for a Performance HDB intended for the CICS PA plug-in are fixed as *qualifier.CPA\_CMFPSUM* and *qualifier.CPA\_CMFACSUM*. This is unlike a user Performance HDB, where the DB2 table name is the same as the HDB name. Note that the qualifier is also specified as the Schema in the plug-in DB2 connection settings.  
When you export a Performance HDB to DB2, the CICS PA dialog generates JCL to perform the export. This JCL specifies the DB2 table name. Do not change the DB2 table name in the generated JCL as this would result in the CICS PA plug-in not finding the DB2 table.
4. Specify a Qualifier in ISPF member name format. This value is used as an identifier to associate related HDB tables in the manifest. It is also incorporated into the DB2 table name, for example: *qualifier.CPA\_CMFPSUM*.  
Multiple performance HDBs with the same qualifier will be exported to the same DB2 table. This allows you to consolidate data from multiple HDBs into a single DB2 table for analysis using the CICS PA plug-in.
5. Select the Explorer option to make this HDB eligible for inclusion in the manifest. This also ensures that only internal templates are listed in the Template field.
6. Press **Prompt** (F4) in the Template field to select an internal template that has been predefined for use with the CICS PA plug-in.

7. Optionally, enter S in the Performance field to specify selection criteria for this HDB. Alternatively, you can specify the selection criteria in the Template by editing the Template.
8. Optionally, specify data retention periods indicating how long you want to keep the container data sets and DB2 rows associated with this HDB. You can use the HDB Housekeeping program to delete expired container data sets and DB2 rows. If the HDB container data sets are no longer required after their data has been exported to DB2, specify a retention period of 0 in any of the HDB periods to make the data sets expire immediately.
9. Specify the data set allocation settings. The only required fields are:
  - DSN prefix
  - Space units
  - Primary and secondary quantitiesCICS PA creates HDB data set names in the following pattern:  
`dsn-prefix.hdb-name.Ddyddd.Thmmss.HDB`  
where the date and time indicate when the HDB data set was allocated (CICS PA allocates the data set just before loading data).
10. Press the Exit key (F3) to save the HDB definition.

---

## Define a Statistics HDB for export to DB2

The manifest should be rebuilt whenever you add or change an HDB in a way that affects its eligibility for inclusion in the manifest. For example, if an HDB is currently included in the manifest and you change its qualifier or clear the Explorer option, it is no longer eligible for inclusion in the manifest.

In addition, the manifest will only contain entries for statistics reports with a status of Collect=Yes or Alt and DB2 Load=Yes. If these indicators are not set, the report will not be included in the manifest and therefore will not be accessible through the CICS PA plug-in. Therefore you should rebuild the manifest whenever any changes are made to the status of a statistics report in an eligible Statistics HDB.

See “Build the manifest” on page 44.

1. On the **Historical Database** menu, select option **2 Define**.  
The **New HDB Definition** pop-up menu appears.
2. Select the HDB type **Statistics** and then press Enter.  
The **New HDB Definition** window appears:

File Systems Options Help	
New HDB Definition	
Command ==> _____	
Specify new HDB definition options then press EXIT to save.	
Name . . . . .	EXPLORST APPLID _____ + Image _____
Qualifier . . .	Explorer
Description . .	Explorer Stats DB for CICS TS V4
Statistics Reports: Alert Definition	
_ Select to specify Statistics Reports	Alert . . _____ +
Data Retention Period:	
HDB: Years 1	Months _____ Weeks _____ Days _____ Hours _____
DB2: Years _____	Months _____ Weeks _____ Days _____ Hours _____
Data Set Allocation Settings:	
DSN Prefix . . . . .	USER
Management class . . .	_____ (Blank for default management class)
Storage class . . . .	_____ (Blank for default storage class)
Volume serial . . . .	_____ (Blank for system default volume)
Device type . . . . .	_____ (Generic unit or device address)
Data class . . . . .	_____ (Blank for default data class)
Space Units . . . . .	CYLS (TRKS, CYLS)
Primary quantity . .	10 (In above units)
Secondary quantity	5 (In above units)
F1=Help F3=Exit F4=Prompt F7=Backward F8=Forward F10=Actions	
F12=Cancel	

3. Type a name for the HDB.
4. Specify a Qualifier in ISPF member name format. This value is used as an identifier to associate related HDB tables in the manifest. It is also incorporated into the DB2 table name: *qualifier.CPA\_statid*, and is used as the Schema in the plug-in DB2 connection settings.  
Multiple Statistics HDBs with the same qualifier will be exported to the same set of DB2 *statid* tables. This allows you to consolidate data from multiple HDBs into a single set of tables for analysis using the CICS PA plug-in.
5. Select the Explorer option to make this HDB eligible for inclusion in the manifest.
6. Statistics HDBs, by default, do not collect any statistics. You must select **Select to specify Statistics Reports** and then press Enter to activate the types of statistics (reports) that you want to collect.
  - Use the A line action to activate collection for the corresponding report or category. This will result in status indicator Collect=Yes.
  - Use the AO line action to activate collection only of data that satisfies an Alert condition. This will result in status indicator Collect=Al t.
  - Use the AL line action to activate load to DB2. This will result in status indicator DB2 Load=Yes.
 Press Exit (F3) to save the **Statistics Reports** settings and return to the **New HDB Definition** panel.
7. If you used line action AO against any report, or you used line action A (activate collection) against either of the Alert reports, you must specify an Alert Definition. Press Prompt (F4) in the Alert field to select from a list of Alert Definitions.
8. Optionally, specify data retention periods indicating how long you want to keep the container data sets and DB2 rows associated with this HDB. You can

use the HDB Housekeeping program to delete expired container data sets and DB2 rows. If the HDB container data sets are no longer required after their data has been exported to DB2, specify a retention period of 0 in any of the HDB periods to make the data sets expire immediately.

9. Specify the data set allocation settings. The only required fields are:

- DSN prefix
- Space units
- Primary and secondary quantities

CICS PA creates HDB data set names in the following pattern:

`dsn-prefix.hdb-name.Ddyddd.Thhmmss.HDB`

where the date and time indicate when the HDB data set was allocated (CICS PA allocates the data set just before loading data).

10. Press the Exit key (F3) to save the HDB definition.

## Load the HDB

1. On the **Historical Database** menu, select option **3 Load**. (You can also load the HDB from the Report Set panel by selecting HDB Load in the Extracts category.)

The list of HDBs appears.

2. Select the HDB that you want to load.

The **Load HDB** pop-up window appears:

File Systems Options Help	
Load SUMMARY HDB - EXPLOR5P	
Command ==> _____	
Specify HDB load options then press Enter to continue submit.	
System Selection:	Report Interval _____
APPLID . . _____ +	YYYY/MM/DD HH:MM:SS.TH
Image . . _____ +	From _____
Group . . _____ +	To _____
DB2 Export Options:	Table Load Options
_ Load DB2 Table	1 1. Resume 2. Replace
Include Clock Field Components	Summary Options
1 1. Time and Count	_ Include Sums of Squares
2. Time only	
3. Count only	Enter "/" to select option
	/ Edit JCL before submit

3. Select the CICS systems whose data you want to load.
4. Specify the time interval of the data that you want to load.  
If you omit the time interval, and there is more than one SMF data set for the systems that you selected, then CICS PA selects all SMF data sets defined for that system.
5. If you want to load the HDB and export the data to the DB2 tables in a single job, select Load DB2 Table option and specify Table Load Options. Note that to do this the DB2 table must already be defined.  
For a Performance HDB, if Load DB2 Table is selected ensure that Include Clock Field Components is set to 1 (Time and Count), and Summary Options is not selected (blank).
6. Press Enter to submit the load job.

If you selected the “Edit JCL before submit”, then the JCL appears in an edit panel. To submit the job, enter **sub** on the command line, and then press the Exit key (F3) to return to the CICS PA panel.

7. Check the results of the load job. In SDSF, list the data sets for the job, and then browse the data set named HDBLnnnn: this contains the “HDB LOAD Recap Report”, which describes the success or failure of the load.

If you did not select Load DB2 Table option, only the HDB is loaded at this point. You will need to export the data in the HDB to DB2 tables.

## Export to DB2

1. On the **Historical Database** menu, select option **5 Export**.

The list of HDBs appears.

2. Select the HDB that you want to export.

The **Export HDB** panel appears, showing the list of container data sets for the selected HDB:

File Options Help	
Export SUMMARY HDB - EXPLORE5	
Command ==>	Row 1 to 1 of 1 Scroll ==> PAGE
Select to export HDB data sets to DB2.	
HDB Name . . : EXPLORE5	Type . . : SUMMARY
Data Set Name	----- Start ----- Volume
USER.EXPLORE5.D05332.T180224.HDB	2009/02/20 00:05:00 DB0037
***** Bottom of data *****	

3. Enter **S** next to the container data sets whose data you want to export.

An HDB can consist of several data sets. You can export from one or more container data sets.

The **Export HDB Data Set** panel appears:

File Options Help	
Export HDB Data Set	
Command ==>	
HDB Name . . . : EXPLOR5P	
Data Set Name . : USER.EXPLORE5.D05332.T180224.HDB	
Select option	
1 1. Create DDL to define table	2. Load data into table
Create Options	
- Create Database	1 1. Resume
- Create Storage Group	2. Replace
DB2 Settings:	
DB2 Subsystem ID . . . DH2C	
DSNTIAD Plan Nam e . . DSNTIA91	
DB2 Load Library . . . 'DB2.V910.SDSNLOAD'	
DB2 Exit Library . . . 'DB2.V910.SDSNEXIT'	
DB2 RUNLIB Library . . 'DSN910.RUNLIB.LOAD'	
Database . . . . . FGS187FC	Storage Group . . SYSDFLT
VCAT Catalog name . . DB2CAT	Volume . . . . .
Allocation: Primary 10	Secondary . . . . 5
Include Clock Field Components	
1 1. Time and Count	Summary Options
2. Time only	- Include Sums of Squares
3. Count only	

4. Contact your DB2 administrator for your local DB2 settings, and then type the values into the panel.

Exporting an HDB to DB2 is a two-step process. First, you use this panel to create and submit JCL that defines the DB2 tables (and, optionally, the database and storage group) that will contain the exported data. Second, you use the panel to create and submit JCL that loads data into the tables.

You only need to define the DB2 tables, database and storage group once. If these are already defined, go to step 1.

5. If the DB2 table has not already been created, select the option “Create DDL to define table”. If the database or storage group that you want to export to do not yet exist, then select the options to create those, too.

For a Performance HDB, ensure that Include Clock Field Components is set to 1 (Time and Count), and Summary Options is not selected (blank).

6. Press Enter. The panel prompts you to press Enter again to proceed. Press Enter again. An edit panel appears, containing JCL to create the required DB2 tables.

**What DB2 tables will this define?** For a performance HDB, CICS PA defines a single DB2 table with the following name:

*qualifier.CPA\_CMFPSUM*

For a statistics HDB, CICS PA defines one DB2 table for each stat ID, with the following name:

*qualifier.CPA\_statid*

For a Performance HDB, the generated JCL includes a step to create a DB2 view for use by the CICS PA plug-in.

7. Enter **sub** to submit the JCL, and then press the Exit key (F3) to return to the CICS PA panel.
8. Check the SYSPRINT file in the job output queue, to confirm that the tables were successfully defined.
9. In the CICS PA panel, select the option “Load data into table”.

For a Performance HDB, ensure that Include Clock Field Components is set to 1 (Time and Count), and Summary Options is not selected (blank).

The JCL to perform the load appears in an edit panel.

10. Enter **sub** on the command line to submit the job, and then press the Exit key (F3) to return to the CICS PA panel.

## Build the manifest

A manifest is a proprietary DB2 table that contains all the information required by the CICS PA plug-in to access and use historical data. The manifest is a catalog of DB2 tables for HDBs that are associated with the same qualifier and for which the Explorer indicator is set.

Rebuild the manifest whenever you add or change an HDB in a way that affects its eligibility for inclusion in the manifest. For example, if an HDB is currently included in the manifest and you change its qualifier or clear the Explorer option, it is no longer eligible for inclusion in the manifest.

In addition, the manifest will only contain entries for statistics reports with a status of Collect=Yes or Alt and DB2 Load=Yes. If these indicators are not set, the report will not be included in the manifest and therefore will not be accessible through the CICS PA plug-in. Therefore you should rebuild the manifest whenever any changes are made to the status of a report in an eligible Statistics HDB.

1. On the **Historical Database** menu, select option **5 Export** or **7 Maintenance**.

The list of HDBs appears.

2. Select **Explorer -> Manifest Maintenance** from the action bar.

The **Manifest Maintenance** panel appears:

FileOptionsHelp

Manifest Maintenance

Command ==>

Specify Qualifier for Manifest.

Qualifier . . . GF9IJGCreate Tablespace

Repository . . . . . : CICSXA.XYX.REPOSTRY

CICS versions (VRM):

Transaction Server . : 680

Transaction Gateway : 900

DB2 Settings:

DB2 Subsystem ID . . . DH2C

DSNTIAD Plan Name . . . DSNTIA91

DB2 Load Library . . . 'DB2.V910.SDSNLOAD'

DB2 Exit Library . . . 'DB2.V910.SDSNEXIT'

DB2 RUNLIB Library . . . 'DSN910.RUNLIB.LOAD'

Database . . . . . FGS187FCStorage Group . . . SYSDFLT

VCAT Catalog name . . . DB2CATVolume . . . . .

F1=HelpF3=ExitF7=BackwardF8=ForwardF10=ActionsF12=Cancel

Figure 10. Manifest Maintenance

3. Type the name of a qualifier.

The manifest table will be named *qualifier*.CPA\_MANIFEST. HDBs that have the same qualifier and which are otherwise eligible will be included in this manifest.

4. When creating the first manifest, select Create Tablespace. The tablespace name is MANIFEST. On subsequent uses of Manifest Maintenance (either when creating a manifest for a new qualifier or recreating a manifest to add or delete HDBs) do not select Create Tablespace.
5. Contact your DB2 administrator for your local DB2 settings, and then type the values into the panel.
6. Press Enter. The panel prompts you to press Enter again to proceed.  
Press Enter again. An edit panel appears, containing JCL to create the required DB2 table.
7. Enter **sub** to submit the JCL, and then press the Exit key (F3) to return to the CICS PA panel.
8. Check the Recap report, which is written to MANB0001. This contains output from the job step that populates the manifest, and will include details of the HDBs that were included.
9. Check the SYSPRINT file in the job output, to confirm that the manifest table was successfully defined.

## Sample Recap report

This example shows an example of the Recap report that is written by the manifest build job to MANB0001. This shows the total number of Performance and Statistics tables included in the manifest. Duplicate entries are listed in the report, though only the first occurrence is included in the manifest.

## Extract performance data to CSV

This task describes how to create CSVs using HDBs. However, CSVs can also be created by using the Performance Extract report within Report Sets.

1. On the **Historical Database** menu, select option **6 Extract**.

The list of HDBs appears.

2. Select the HDB that you want to export.

The **Run SUMMARY HDB Extract** pop-up window appears:

Run SUMMARY HDB Extract - EXPLORE4

Command ==> \_\_\_\_\_

Specify Extract request options then press Enter to continue submit.

Report Interval	HDB contains data
YYYY/MM/DD HH:MM:SS.TH	in the range:
From _____	2009/02/01 19:00      Extract Recap:
To _____	2009/02/03 23:00      DDname . . . <u>HXTS0001</u>

Output Data Set:

Data Set Name . . . 'USER.CICSPA.EXTRACT.CSV'

Disposition . . . 1 1. OLD 2. MOD (If cataloged)

Extract Format:

Form . . . . . <u>EXPLORE4</u> +	Enter "/" to select option
Delimiter . . . . . <u>,</u>	/ Include Field Labels
	_ Numeric Fields in Float format

Processing Options:

Time Interval . . . _____ (hh:mm:ss)	Enter "/" to select option
Precision . . . . . <u>4</u> (4-6)	/ Edit JCL before submit

3. Fill in the fields on the panel.

In the Form field, press **Prompt** (F4) to select a compatible report form.  
 Example: select EXPLORE5 if you are using the CICS PA plug-in on CICS TS V5.1.

If the required EXPLORE $n$  form is not defined, select Samples in the action bar of the Report Forms panel to add the samples to your Report Forms data set.

Press Enter to submit the extract job.

4. **Tips for extracting CSV files**

- A quick way to extract all data in the HDB is to leave the “from” and “to” dates and times blank.
- To use the CSV file on a PC with the CICS PA plug-in:
  - Specify a comma (,) as the delimiter character, not the CICS PA default semicolon (;).
  - Include field labels.
  - Do not select the (z/OS host-specific) float format for numeric fields.

5. Transfer the CSV file to your PC as an ASCII text file with file extension .csv.

## Loading CSV data in the CICS PA plug-in

You can load CSV data in the CICS PA plug-in in three ways: using copy and paste, by dragging and dropping, or using the import function of the CICS PA plug-in.

**Note:** Using an application other than the CICS PA plug-in to make changes to the CSV file might cause errors and make the data unusable by the CICS PA plug-in.

Locate the performance data file that you want to analyze and follow one of the methods below to load the data into the CICS PA plug-in:

### Using copy and paste

You can copy and paste a file into the CICS PA plug-in by performing the following steps:

1. Copy the data file by right-clicking and selecting **copy** from the menu.

2. In the Project Explorer view, select the folder where you want to store the data.
3. Right-click and select **paste** from the menu.

A copy of the data file is now in the CICS PA plug-in and available for analysis.

For further information on loading data and other Eclipse functions, see the Eclipse Workbench User Guide.

## Using drag and drop

You can drag a file from your file manager and drop it into the CICS PA plug-in by performing the following steps:

1. In your file manager, select the data file.
2. Hold down the left mouse button, and drag the file across to the Project Explorer view.
3. Still holding the left mouse button, place the cursor over the folder where you want to store the data file.
4. Release the button.

A copy of the data file is now in the CICS PA plug-in and available for analysis.

## Using the Import function.

You can import a file into the CICS PA plug-in from your local file system using the Eclipse import function:

1. Right-click anywhere in the white space of the Project Explorer view and select **Import**.
2. In the **Import** dialog box, select **File System**. To assist in locating the file system, you can type **File System** in the text field. Click **Next**.
3. In the Import wizard, enter the directory path of the data, or click **Browse** and select the directory from the list. All the files in the directory are displayed in the Import wizard.
4. Click the box next to the data file to be imported.
5. In the **Into folder** text box, type the name of the folder where the data will be stored, or click **Browse** and select the target from the list. Click **Finish**.

A copy of the data file is now in the CICS PA plug-in and available for analysis.

---

## Access the data using the CICS PA plug-in

You can analyze performance data that is produced by CICS Performance Analyzer for z/OS and stored in a database such as DB2. You must connect to the database before you can analyze the data, to do this you must create a credential, a set of information that you use to authenticate a connection to the CICS PA plug-in.

### Before you begin

See the topic *Defining connection credentials* in the CICS Explorer User Guide for further information.

You must have your database connection details, the correct level of authorization, and be connected to your company's network.

**Note:** System connections can now be secured using the SSL protocol. For more information, see *Using SSL security for Explorer connections*, and *Managing SSL security and certificates*.

## Procedure

1. Click **Window > Manage connections**.
2. In the Host Connections view, select Performance Analyzer and click **Add**. The Add Performance Analyzer Connection dialog opens.

3. Complete the fields with the details provided by your system administrator:

Option	Description
Name	The local name used to identify this database connection. The name can be anything you choose and is used to help you distinguish between different database connections.
Host name	The TCP/IP host name of your database server.
Port Number	The port used to access the server. By default, DB2 on z/OS® listens for connections on port 448.
Secure connection (TLS/SSL)	Select this field if the connection uses SSL security.
DB2 Location	The name of the DB2 location on the server.
DB2 Schema (Qualifier)	The name of the schema used for the database.

4. Click **Save and Close** to save the configuration without connecting or Click **Save and Connect** to save the configuration and connect immediately.
5. If you chose to connect immediately, you will need to select your user credentials.

## What to do next

When you click **Connect**, the CICS PA plug-in attempts to connect to the database you have configured. If you did not previously enter your password in your credential settings, you are asked to enter it now.

If the connection is successful, a message is displayed in the CICS Explorer status bar and the connection icon is green. You can now select data for analysis.

If the connection is not successful, an error message is displayed in the CICS Explorer status bar providing a reason for the failure. Check the values in the fields, correct any errors, and click **Connect** to retry the connections.

---

## Part 2. Specifying CICS-related SMF data for reporting

CICS Performance Analyzer for z/OS processes SMF data to produce reports and extracts and build historical databases. The chapters in this part provide an overview of the SMF data that CICS PA processes, and describe how to specify to CICS PA your SMF data files, CICS and related systems and groups.

---

## Chapter 5. SMF data used by CICS PA

CICS PA produces reports and extracts using data normally collected by your system in MVS System Management Facilities (SMF) data sets and log streams:

### **SMF 110, subtype 1**

CICS Monitoring Facility (CMF) performance class, exception class, and transaction resource class records

### **SMF 110, subtypes 2, 3, 4, 5**

CICS statistics and server statistics records

### **SMF 111**

CICS Transaction Gateway statistics

### **SMF 101**

DB2 accounting records

### **SMF 116**

WebSphere MQ accounting records

### **SMF 112**

OMEGAMON XE for CICS records

### **SMF 88**

System Logger records

Most CICS PA reports and extracts process CMF data. The DB2 report processes both CMF data and DB2 accounting data. The WebSphere MQ report processes only MQ accounting data. The CICS TG reports process only CICS TG statistics data. The OMEGAMON report processes only OMEGAMON XE for CICS data. The Record Selection extract processes all of the SMF record types listed in this topic. The System Logger report and extract process only System Logger data.

---

## CICS Monitoring Facility data (SMF 110, subtype 1)

When CICS is running and the CICS Monitoring Facility (CMF) is active, data is collected by CMF and written to the MVS System Management Facilities (SMF) data set as type 110 records, subtype 1. The CMF data is subsequently analyzed offline by CICS PA.

### Classes of CMF data

There are three types, or “classes”, of monitoring data that you can request CMF to collect: performance class, exception class, and transaction resource class data.

You can switch CICS monitoring on or off, and change the classes of data being collected, either at CICS initialization or dynamically while CICS is running. It is preferable to start all classes of monitoring data at CICS initialization. If you activate a class of monitoring data while CICS is running, the data for that class becomes available only for transactions that are started thereafter.

CICS PA analyzes three classes of CMF data:

- **Performance class data.** Detailed transaction-level information, such as the processor and elapsed time for a transaction, or the time spent waiting for I/O. There is at least one performance record per transaction.

- **Exception class data.** Information about exceptional conditions suffered by a transaction, such as queuing for file strings, or waiting for temporary storage. This data highlights possible problems in system operation. There is one exception record for each exception condition.
- **Transaction resource class data.** Additional transaction-level information about individual Files and Temporary Storage Queues used by a transaction.

## Performance Class data

Performance class data provides detailed resource-level data that can be used for accounting, performance analysis, and capacity planning. This data contains information relating to individual task resource usage, and is completed for each task when the task terminates. This information could be used periodically to calculate the charges applicable to different tasks. If you want to set up algorithms for charging users for resources used by them, you could use this class of data collection to update the charging information in your site's accounting programs.

CMF collects performance class data at system-defined event-monitoring points (EMPs) in the CICS code. You cannot relocate these EMPs, but you can add additional ones in your application programs using the EXEC CICS MONITOR command (see the *CICS Application Programming Reference* for programming information about this command). For example, you could use additional EMPs to count the number of times a certain event occurs, or to time the interval between two events. Additional EMPs are also provided in some IBM program products, such as IMS DBCTL.

For each EMP that you code in an application program, you must code a corresponding definition in the Monitoring Control Table (MCT) using DFHMCT TYPE=EMP. In the MCT, you can also use DFHMCT TYPE=RECORD to *exclude* specific system-defined performance data from a CICS run. See the *CICS Resource Definition Guide* for details of the DFHMCT macros.

Performance data records are written to a CICS performance record buffer and not passed to SMF until the buffer is full, performance class monitoring is switched off, or CICS quiesces. If CMF is deactivated or there is an immediate shutdown of CICS, the records in the buffer not yet written to SMF are lost.

You can enable performance class monitoring in either of the following ways:

- At CICS initialization. Specify MNPER=ON (together with MN=ON) in the SIT.
- Dynamically when CICS is running. Use either:
  - Master terminal command:  
CEMT SET MONITOR ON PERF
  - API command from within an application program:  
EXEC CICS SET MONITOR STATUS(ON) PERFCLASS(PERF)

## Exception Class data

CMF passes an exception record directly to SMF when any of the following exception conditions encountered by a transaction is resolved:

- Wait for storage in the CDSA
- Wait for storage in the UDSA
- Wait for storage in the SDSA
- Wait for storage in the RDSA
- Wait for storage in the ECDSA
- Wait for storage in the EUDSA
- Wait for storage in the ESDSA

- Wait for storage in the ERDSA
- Wait for storage in the GCDSA
- Wait for auxiliary temporary storage
- Wait for auxiliary temporary storage string
- Wait for auxiliary temporary storage buffer
- Wait for auxiliary temporary storage write buffer
- Wait for temporary storage queue
- Wait for temporary storage data set extension
- Wait for shared temporary storage
- Wait for shared temporary storage pool
- Wait for coupling facility data tables locking (request) slot
- Wait for coupling facility data tables non-locking (request) slot
- Wait for file buffer
- Wait for LSRPOOL string
- Wait for file string

An exception record is created each time any of the resources covered by CMF exception class monitoring becomes constrained by system bottlenecks. If performance data is also being recorded, it keeps a count of the number of exception records generated for each task and also the total time that the task was delayed due to encountering a resource shortage. The exception records can be linked to the performance data by the transaction identifier in the TASKNO and NETUOW fields in each type of record.

This data is intended to help you identify constraints that affect the performance of your transaction. The information is written to the SMF data set as soon as the task that was originally constrained has been released.

You can enable exception class monitoring in either of the following ways:

- At CICS initialization. Specify MNEXC=ON (together with MN=ON) in the SIT.
- Dynamically when CICS is running. Use either:
  - Master terminal command CEMT SET MONITOR ON EXCEPT
  - API command from within an application program EXEC CICS SET MONITOR STATUS(ON) EXCEPTCLASS(EXCEPT)

## Transaction Resource Class data

Transaction resource class data provides additional transaction-level information about individual Files and Temporary Storage Queues used by a transaction.

The maximum number of files and temporary storage queues monitored for each transaction is limited by the FILE and TSQUEUE parameters on the DFHMCT TYPE=INITIAL macro, up to a maximum of 64 files and 64 temporary storage queues. The default is FILE=8 for files and TSQUEUE=8 for temporary storage queues. Therefore, you might need to assemble an MCT that specifies either or both FILE and TSQUEUE options if the default values are insufficient, or if you do not want to collect transaction resource data for either files or temporary storage queues. One transaction resource record is written for each transaction that is being monitored, provided the transaction accesses at least one of the resources for which monitoring data is requested, (for example, at least 1 file if you specify FILE=*number*).

Performance class data also provides information about file and temporary storage queue resource accesses, but this information in the performance record is given in total only for all files (see DFHFILE fields) and all temporary storage queues (see DFHTEMP fields). Transaction resource data breaks this information down by

individual file name and temporary storage queue name, up to the maximum number specified in the MCT. It also provides elapsed times for the File Control and Temporary Storage Control events.

Transaction resource information is completed for each task when the task terminates.

You enable transaction resource class monitoring in either of the following ways:

- At CICS initialization. Specify MNRES=ON (together with MN=ON) in the SIT.
- Dynamically when CICS is running. Use either:
  - Master terminal command:  
CEMT SET MONITOR ON RESRCE
  - API command from within an application program  
EXEC CICS SET MONITOR STATUS(ON) RESRCECLASS(RESRCE)

## When CMF data is passed to SMF

The different classes of CICS monitoring records are not written to SMF in the same way:

- **Performance data records** are written to a performance record buffer, which is defined and controlled by CICS, as the records are produced. The performance records are passed to SMF for processing when the buffer is full, when the performance class of monitoring is switched off, and when CICS itself quiesces. When monitoring itself is deactivated or when there is an immediate shutdown of CICS, the performance records are not written to SMF and the data is lost.
- **Exception data records** are passed directly to SMF when the exception condition completes. Each exception record describes one exception condition. You can link performance records with their associated exception records by matching the transaction identification number (TASKNO field) or network unit-of-work ID (NETNAME and NETUOWSX fields) in each type of record.
- **Transaction resource data records** are written to a transaction resource record buffer, which is defined and controlled by CICS, as the records are produced. The transaction resource records are passed to SMF for processing when the buffer is full; when the transaction resource class of monitoring is switched off; and when CICS itself quiesces. When monitoring itself is deactivated or when there is an immediate shutdown of CICS, the transaction resource records are not written to SMF and the data is lost.

## Controlling the CICS Monitoring Facility

When CICS is initialized, you can switch the CICS monitoring facility on by specifying the system initialization parameter MN=ON. The default setting is MN=OFF. You can also select the classes of monitoring data that you want to be collected using the MNPER, MNEXC, and MNRES system initialization parameters. You can request any combination of performance class, exception class, and transaction resource class data. The class settings can be changed whether monitoring itself is ON or OFF. For more information about the monitoring system initialization parameters, see the *CICS System Definition Guide*.

When CICS is running, you can control the CICS monitoring facility dynamically. Just as at CICS initialization, you can switch monitoring on or off, and you can change the classes of monitoring data that are being collected. There are two ways of doing this:

1. You can use the master terminal CEMT INQUIRE and SET MONITOR command, which is described in the *CICS Supplied Transactions*.

2. You can use the EXEC CICS INQUIRE and SET MONITOR commands; programming information about these commands can be found in the *CICS System Programming Reference*.

When you activate a class of monitoring data, data is collected only for transactions that start thereafter, not transactions already active. You cannot change the classes of monitoring data collected for a transaction after it has started. It is often preferable, particularly for long-running transactions, to start all classes of monitoring data at CICS initialization.

## Event Monitoring Points

CICS monitoring data is collected at system-defined event monitoring points (EMPs) in the CICS code. Although you cannot relocate these monitoring points, you can choose which *classes* of monitoring data that you want to be collected. Programming information about CICS monitoring can be found in the *CICS Application Programming Reference* and the *CICS Customization Guide*.

If you want to gather more performance class data than is provided at the system-defined event monitoring points, you can code additional EMPs in your application programs, from within task-related user exit or from global user exits. At these points you can add or change up to 16384 bytes of user data within each performance record. Up to this maximum of 16384 bytes you can have, for each ENTRYNAME qualifier, any combination of the following:

- Between 0 and 256 counters
- Between 0 and 256 clocks
- A single 8196-byte character string

You could use these additional EMPs to count the number of times a certain event occurs, or to time the interval between two events. If the performance class was active when a transaction was started, but was not active when a user EMP was issued, the operations defined in that user EMP would still run on that transaction's monitoring area. The DELIVER option would result in a loss of data at this point, because the generated performance record cannot be output while the performance class is not active. If the performance class was not active when a transaction was started, the user EMP would have no effect.

User EMPs can use the EXEC CICS MONITOR command. For programming information about this command, see the *CICS Application Programming Reference*.

Additional EMPs are defined in some IBM program products, such as IMS DBCTL. From the CICS point of view, these are like any other user-defined EMP. EMPs in user applications and in IBM program products are defined by a decimal number. The numbers 1 through 199 are available for EMPs in user application, and the numbers from 200 through 255 are for use in IBM program products. In addition, the numbers can be qualified with an *entry name* so that you can use each number more than once. For example, PROGA.1, PROGB.1 and PROGC.1, identify three different EMPs because they have different entry names.

For each user-defined EMP there must be a corresponding monitoring control table (MCT) entry, which has the same entry name and identification number as the EMP that it describes.

You do not have to assign entry names and numbers to system-defined EMPs, and you do not have to code MCT entries for them.

Here are some ideas about how you might make use of user fields provided using the CICS monitoring facility:

- If you want to time how long it takes to do a table lookup routine within an application, code an EMP with, say, ID=50 just before the table lookup routine and an EMP with ID=51 just after the routine. The system programmer codes a TYPE=EMP operand in the MCT for ID=50 to start user clock 1. You also code a TYPE=EMP operand for ID=51 to stop user clock 1. The application then runs. When EMP 50 is processed, user clock 1 is started. When EMP 51 is processed, user clock 1 is stopped.
- One user field could be used to accumulate an installation accounting unit. For example, you might count different amounts for different types of transaction. Or, in a browsing application, you might count 1 unit for each record scanned and not selected, and 3 units for each record selected.

You can also treat the fullword count fields as 32-bit flag fields to indicate special situations, for example, out-of-line situations in the applications, operator errors, and so on. The CICS monitoring facility includes facilities to turn individual bits or groups of bits on or off in these count fields.

- The performance clocks can be used for accumulating the time taken for some sort of I/O operation. This is usually any waiting time for the transaction to regain control after the requested operation has completed. Because periods are counted as well, you can get the average time waiting for the I/O operation as well as the total waiting time. If you want to highlight an unusually long individual case, set a flag on in a user count as explained in the previous item.
- One use of the performance character string is for systems in which one transaction ID is used for widely differing functions. The application can enter a subsidiary ID into the string to indicate which particular variant of the transaction applies in each case.

Some users have a single transaction ID so that all user input is routed through a common prologue program for security checking or some other purpose, for example. In this case, it is very easy to record the subtransaction identifier in this prologue. (However, it is equally possible to route transactions with different identifiers to the same program, in which case this technique is not necessary.)

## Application Naming and Event Monitoring Points

You can also use application naming event monitoring points. Application naming is an enabling function that allows your application programs to invoke special CICS event monitoring points. These special EMPs allow you to include additional task identification information (an alternative Transaction ID and Program name) in your CMF performance records.

You can use the application naming EMPs that are generated for you automatically when you specify APPLNAME=YES in the DFHMCT TYPE=INITIAL macro. The generated data is:

- The application naming Transaction ID, taken from the first 4 bytes of the 12 byte APPLNAME field.
- The application naming Program name, taken from the last 8 bytes of the 12 byte APPLNAME field.

For information about the APPLNAME parameter that you use to enable application naming support, see the *CICS Resource Definition Guide*.

## The Monitoring Control Table (MCT)

The monitoring control table (MCT) is used to tell CICS:

- The type of resource for which you want to collect transaction resource monitoring data. Available resource types are Files and Temporary Storage Queues (see “DFHMCT TYPE=INITIAL”).
- To enable application naming support, which makes available the CICS-generated DFHAPPL EMPs to your application programs (see “DFHMCT TYPE=INITIAL”).
- About any user event monitoring points (EMPs) that you have coded in your application programs and the data that is to be collected or manipulated at these points (see “DFHMCT TYPE=EMP”).
- That you want certain CICS system-defined performance class data fields to not be recorded by CICS (see “DFHMCT TYPE=RECORD”).

IMS DBCTL users can collect DBCTL statistics in the CMF performance class records by including the DFH\$MCTD copy member in the MCT definition.

Full details of the MCT are provided in the *CICS Resource Definition Guide*. Examples of MCT coding are included with the programming information in the *CICS Customization Guide*.

### DFHMCT TYPE=INITIAL

You use the DFHMCT TYPE=INITIAL macro to indicate whether you want application naming support and transaction resource monitoring.

For information about the APPLNAME, FILE and TSQUEUE parameters that control these facilities, see the *CICS Resource Definition Guide*.

### DFHMCT TYPE=EMP

There must be a DFHMCT TYPE=EMP macro definition for each user-code event monitoring point (EMP). This macro has an ID operand, whose value must be made up of the ENTRYNAME and POINT values specified on the EXEC CICS MONITOR command. The PERFORM operand of the DFHMCT TYPE=EMP macro defines to CICS for the specified user EMP, the user fields (counts, clocks or characters) and the operations that CICS is to perform on them when the user event monitoring point is invoked.

### DFHMCT TYPE=RECORD

The DFHMCT TYPE=RECORD macro allows you to *exclude* specific system-defined performance class data fields from a CICS run. Table 1 shows the default length of the performance class monitoring records for each CICS release supported by CICS PA, without taking into account any user data that can be added, or any excluded fields.

*Table 1. Default performance record length by CICS TS for z/OS release*

CICS TS release	Record length
3.1	1848 bytes
3.2	2352 bytes
4.1	2672 bytes
4.2	2960 bytes
5.1	3260 bytes

Each field of the performance class data that is gathered at the system-defined EMPs belongs to a group of fields that has a specific group identifier. Each

performance data field also has its own numeric identifier that is unique within the group identifier. For example, the transaction sequence number field in a performance class record belongs to group DFHTASK, and has a numeric identifier of 031. Using these identifiers, you can exclude specific fields or groups of fields, and reduce the size of the performance class records.

### Sample MCTs

Four sample monitoring control tables are provided in the CICS sample library:

**DFHMCTT\$**

For terminal-owning regions (TORs)

**DFHMCTA\$**

For application-owning regions (AORs)

**DFHMCTD\$**

For application-owning regions (AORs with DBCTL)

**DFHMCFT\$**

For file-owning regions (FORs)

These samples show how to use the EXCLUDE and INCLUDE operands to reduce the size of the performance class record, reducing the volume of data that CICS writes to SMF.

## Required CMF fields for CICS PA

If you are using the CICS Monitoring Control Table (MCT) EXCLUDE/INCLUDE parameters to reduce the size of the performance class record, you must ensure that the data fields required for some of the CICS PA reports and extracts are not excluded. These reports and extracts are:

- Cross-System Work report and extract
- Transaction Group report
- BTS report
- Workload Activity report
- Transaction Tracking List report
- Transaction Tracking Summary report
- DB2 report

See the *CICS Performance Analyzer for z/OS Report Reference* for the list of required CMF fields for each of these reports.

---

## CICS Statistics data (SMF 110, subtypes 2, 3, 4, 5)

When CICS is running, statistics data is written to the SMF data set as type 110 records with the following subtypes:

- |   |   |
|---|---|
| 2 | Statistics                                      |
| 3 | Shared Temporary Storage Server Statistics      |
| 4 | Coupling Facility Data Table Server Statistics  |
| 5 | Named Counter Sequence Number Server Statistics |

Statistics data is subsequently analyzed offline by CICS PA.

---

## CICS Transaction Gateway Statistics data (SMF 111)

You can configure CICS Transaction Gateway for z/OS to write statistics data to the SMF data set as type 111 records.

Statistics data is subsequently analyzed offline by CICS PA.

---

## DB2 accounting data (SMF 101 records)

DB2 accounting data is processed by the CICS PA DB2 report and Record Selection extract. DB2 accounting data is written by DB2 as SMF type 101 records.

### DB2 accounting trace

The DB2 accounting trace provides information related to application programs, including:

- Start and stop times
- Number of commits and aborts
- Number of times certain SQL statements are issued
- Number of buffer pool requests
- Counts of certain locking events
- Processor resources consumed
- Thread wait times for various events
- RID pool processing
- Distributed processing
- Resource limit facility statistics

The DB2 accounting trace begins collecting this data at successful thread allocation to DB2. It writes a completed record when the thread terminates or when the authorization ID changes.

DB2 accounting records are produced when a thread is terminated or sign-on occurs. This means that the period reported in the DB2 accounting record is the time between start or user sign-on (if reusing a thread previously used by another user) and thread termination or another sign-on. You can use the ACCOUNTREC(TXID) parameter in the DB2ENTRY or DB2CONN to cause a DB2 accounting record to be produced when the transaction ID changes, and when the thread terminates or another sign-on occurs.

For thread reuse, this means that many users are included in the same record, which can cause difficulties for both accounting and problem determination. The ACCOUNTREC(TASK) or ACCOUNTREC(UOW) settings in a DB2ENTRY or DB2CONN provide more granularity. This is because a record is produced for each user. It involves the passing of a token between CICS and DB2, which is present in both CICS and DB2 traces. ACCOUNTREC(TASK) ensures that there is a minimum of one accounting record for each task. There can be more depending on thread reuse.

The CICS PA DB2 report only supports ACCOUNTREC(TASK) and ACCOUNTREC(UOW).

For more information about accounting and monitoring in a CICS DB2 environment, see the *CICS DB2 Guide*. For more information about setting up DB2 accounting, see the *DB2 UDB for OS/390 and z/OS Administration Guide*.

### Accounting for processor usage in a CICS DB2 environment

The processor times reported in the DB2 accounting records are the TCB time for the thread TCB running code in CICS or in the DB2 address space, using cross-memory services; and the SRB time for work scheduled in CICS.

The DB2 accounting trace can be started with CLASS 1, CLASS 2, or CLASS 3. However, CLASS 1 must always be active to externalize the information collected by activating CLASS 2, CLASS 3, or both classes. CLASS 1 (the default) results in

accounting data being accumulated by several DB2 components during normal execution. This data is then collected to write the DB2 accounting record. The data collection does not involve any overhead of individual event tracing. CLASS 2 and CLASS 3 activate many additional trace points. Every occurrence of these events is traced internally, the additional total statistics computed and written to the DB2 accounting record.

For accounting CLASS 1, a task processor timer is created when the task control block (TCB) is attached. When a thread to DB2 starts, the timer value is saved. When the thread is terminated (or the authorization ID is changed), then the timer is checked again. Both the timer start and end values are recorded in the DB2 accounting record.

For accounting CLASS 2, the timer is checked on every entry and exit from DB2 to record the 'IN DB2' time in the DB2 accounting record. In this case, it is the difference that is stored in the record.

For accounting CLASS 3, the I/O elapsed time and lock and latch suspension time spent 'IN DB2' are collected and written to the DB2 accounting record.

---

## WebSphere MQ accounting data (SMF 116 records)

WebSphere MQ accounting data is processed by the CICS PA WebSphere MQ report and Record Selection extract. MQ accounting data is written by WebSphere MQ as SMF type 116 records.

### Accounting for processor usage in a CICS MQ environment

WebSphere MQ accounting information can be collected for three subtypes:

- 0 Message manager accounting records (how much of the central processing unit (CPU) was spent processing WebSphere MQ API calls and the number of MQPUT and MQGET calls). This information is produced when a named task disconnects from WebSphere MQ. The information contained within the record might cover many hours.
- 1 Accounting data for each task, at thread and queue level.
- 2 Additional queue-level accounting data (if the task uses more queues than can fit in the subtype 1 record).

Subtype 0 is produced with trace class 1. Subtypes 1 and 2 are produced with trace class 3.

### MQ accounting trace

You can start the WebSphere MQ trace facility at any time by issuing the WebSphere MQ START TRACE command.

Accounting data can be lost if the accounting trace is started or stopped while applications are running. To collect accounting data successfully, the following conditions must apply:

- The accounting trace must be active when an application starts. It must still be active when the application finishes.
- If the accounting trace is stopped, any accounting data collection that was active stops.

You can also start collecting some MQ accounting data automatically if you specify YES in the SMFACCT (SMF ACCOUNTING) parameters of the CSQ6SYSP macro.

You cannot use this method to start collecting class 3 accounting information (thread-level and queue-level accounting). You must use the START TRACE command to do this. However, you can include the command in your CSQINP2 input data set so that the trace is started automatically when you start your queue manager.

For more information about setting up WebSphere MQ accounting, see the *WebSphere MQ for z/OS System Setup Guide*, SC34-6052.

---

## OMEGAMON XE for CICS data (SMF 112 records)

OMEGAMON XE for CICS data is processed by the CICS PA OMEGAMON report and the Record Selection extract. OMEGAMON XE for CICS writes this data as SMF type 112 records.

For more information about these records, see the *IBM Tivoli OMEGAMON II for CICS Configuration and Customization Guide*, GC32-1981.

---

## System Logger data (SMF 88 records)

System Logger data is processed by the CICS PA System Logger report. The MVS System Logger writes SMF type 88 records to record the System Logger activity of a single system in a sysplex. For capacity planning purposes, we recommend that you view the steady-state performance requirements of an application. Various flags in the SMF type 88 record highlight exception scenarios for additional analysis or changes in report processing.

Record type 88 focuses on the logstream data for a system in a sysplex, including use of interim storage. Interim storage is where log data is initially written, before being written to direct access storage device (DASD) log data sets. You can quickly access data in interim storage without incurring DASD I/O. In a coupling facility logstream, interim storage for log data is in coupling facility list structures. In a DASD-only logstream, interim storage for log data is contained in local storage buffers on the system and duplexed to staging data sets. Using record type 88 can help an installation avoid the STRUCTURE FULL exception, and perform other tuning, capacity planning analysis, or both.

Given a specific logstream, a record type 88 summarizes all of that logstream's activity on that system, as long as at least one address space is connected to the logstream on that system. If no System Logger write activity is performed on the logstream during a particular SMF interval, a record is produced showing zero for the various System Logger activity total fields.

The System Logger SMF record is cut for all logstreams connected at the expiration of the SMF global recording interval. Record type 88 is also triggered by the disconnection of the last logstream on that system.

SMF fields relating to resource events, either structure full or staging data set full conditions, should be handled depending on:

- Whether the resource is shared sysplex-wide and each system will take action
- Whether the resource is shared sysplex-wide but only one system will take action
- Whether the resource is consumed on a system-local basis

To obtain a sysplex-wide view of System Logger activity, correct processing for most SMF 88 data fields is to sum the field contents for the target interval across all the SMF 88 records produced in the sysplex. There are, however, exceptions to this rule. Because each system must take its own action — that is, wait for an ENF signal indicating that System Logger is available — an analysis program should use the maximum value for these fields: SMF88ERI, SMF88ERC, and SMF88ESF. For example, if a structure rebuild is initiated in a sysplex with three systems, the event is recorded on all three systems. The correct number of structure rebuild initiations is not three, but one or the maximum number provided SMF88ERI.

For DASD-only logstreams, staging data sets are a required part of the logstream configuration. For coupling facility logstreams, use of staging data sets implies a trade-off between performance workload and data integrity. You should try to tune the staging data set size to minimize the number of Staging\_Dataset\_Threshold\_Hit conditions. Without this type of tuning, such conditions can impact performance during staging data set processing. Only an installation can determine what the proper trade-off between performance and data integrity should be.

Because System Logger maintains interim storage differently for coupling facility based logstream versus DASD-only logstreams, the difference is reflected in the SMF record 88 report:

- For a coupling facility based logstream, the Structure (Interim Storage) section of the record 88 report shows information about the usage of coupling facility structure space allocated for a logstream and the flow of log data through the structure.
- For a DASD-only logstream, the Structure (Interim Storage) section of the record 88 report shows information about usage of staging dataset space and the flow of data through the staging data set for the logstream.

Not all fields in the Structure (Interim Storage) section of the record 88 report apply to DASD-only logstreams. For a DASD-only logstream, fields that do not apply contain zeros. The SMF88STN field contains \*DASDONLY\* for a DASD-only log stream because there is no structure name.

---

## Preparing SMF data for CICS PA processing

CICS PA processes non-active SMF data sets. There is no special preparation required for CICS PA other than to dump the active data sets into non-VSAM data sets at an appropriate time. Then define these output data sets to CICS PA as the input data sets for report processing.

### Unloading SMF records

After all the SMF data from the CICS region is on the active SMF data set, you need to dump this data to an inactive SMF data set. First you switch the recording of SMF data from one data set to another. All SMF data in storage is written out before the transfer is made. This switch is performed by issuing the /I SMF operator command. The switch of SMF data sets takes place automatically when the active SMF data set becomes full.

To dump the SMF data set, use the SMF dump program (IFASMFDP). This program transfers the contents of the active SMF data set to an output data set, then resets the status of the dumped data set to ALTERNATE so that SMF can use it again for recording data. For more information about the IFASMFDP program, see the *z/OS MVS System Management Facilities (SMF)*.

The sample job shown in Figure 11 is an example of using the SMF program IFASMFDP to unload SMF records for offline processing by CICS PA.

```
//SMFJOB   JOB (Job Accounting)
//SMFDUMP  EXEC PGM=IFASMFDP,REGION=0M
//INDD1    DD DSN=SYS1.MV2C.MANA,DISP=SHR,AMP=('BUFSP=131072')
//INDD2    DD DSN=SYS1.MV2C.MANB,DISP=SHR,AMP=('BUFSP=131072')
//INDD3    DD DSN=SYS1.MV2D.MANA,DISP=SHR,AMP=('BUFSP=131072')
//INDD4    DD DSN=SYS1.MV2D.MANB,DISP=SHR,AMP=('BUFSP=131072')
//OUTDD1   DD DSN=CICS.CMF.DAILY(0),
           DISP=(MOD,CATLG),SPACE=(CYL,(25,5)),UNIT=SYSDA
//OUTDD2   DD DSN=CICS.TG.DAILY(0),
           DISP=(MOD,CATLG),SPACE=(CYL,(25,5)),UNIT=SYSDA
//OUTDD3   DD DSN=CICS.SMF.DAILY(0),
           DISP=(MOD,CATLG),SPACE=(CYL,(25,5)),UNIT=SYSDA
//SYSPRINT DD SYSOUT=A
//SYSIN    DD *

Figure 11. Sample JCL using the SMF Unload utility

## CICS PA System Definitions and SMF Data Take-Up

Before you request CICS PA reports and extracts, you must first define the CICS systems (generic APPLIDs) on which you want to report. Depending on your reporting requirements, you also might need to define: DB2 subsystems; MQ subsystems; MVS System Loggers; and CICS systems for CICS Transaction Gateway. Then specify the SMF data sets for these systems (CICS, DB2, MQ, Logger) or the MVS System (Image) where they run, or both.

An easy way to do this is to let CICS PA create your system definitions by using the Take-up facility. This facility extracts the system details directly from the SMF files. For more information, see “Personal Take-Up from SMF File” on page 104.

If you use the Take-up facility with SMF files that contain only OMEGAMON XE for CICS (SMF 112) records, then the facility defines CICS systems only, because SMF 112 records do not contain information about other types of system. Also, these CICS system definitions will not specify a CICS version (VRM field); again, because the SMF 112 records do not contain this information.

If you use the Take-up facility with SMF files that contain CICS Transaction Gateway statistics (SMF 111) records, then the facility defines CICS systems for the CICS Transaction Gateway APPLIDs. CICS system definitions taken up from SMF 111 records have a blank VRM field value, because this field is for CICS Transaction Server versions, not CICS Transaction Gateway versions. If the Take-up facility finds CICS Transaction Server and CICS Transaction Gateway systems with the same APPLID, it creates a single CICS system definition with a VRM field value according to the first system it finds.

Optionally, you can then define groups of systems for reporting purposes. For example, systems that connect via interregion communication/multiregion operation (IRC/MRO), intersystem communication/advanced program-to-program communication (ISC/APPC), or internet protocol interconnectivity (IPIC).

## Dictionary records for CMF Performance Class data

A dictionary record holds definitional information about each data field in a performance class data record. It contains information for predefined CICS fields, and from any user fields in the Monitoring Control Table (MCT) specified for the CICS run.

When CICS monitoring is switched on, and you activate the monitoring performance class (MNPER=ON), CICS first writes a performance class dictionary record to the current SMF data set, and then begins to write the monitoring performance class data records. A new dictionary record, which always precedes the monitoring performance class data it relates to, is written whenever the user:

- Starts CICS with the performance class active, and CICS monitoring on.
- Changes the status of the monitoring performance class from inactive to active, with CICS monitoring on. If monitoring is off and the monitoring performance class is switched from inactive to active, a dictionary record is scheduled to be written the next time monitoring is activated.

However, if SMF switches data sets during the period when CICS monitoring is writing performance class data, CICS does not write a new dictionary record, and therefore a CICS performance dictionary record is not the first monitoring performance record on the new SMF data set.

### How CICS PA uses dictionary records

When processing performance class data, CICS PA requires a dictionary record that relates to the data being processed before attempting to analyze the data.

If the dictionary record is missing from the SMF data set, CICS PA can use the default dictionary record for the release of the CICS system being processed. This is usually adequate, so there is nothing more you need to do in this regard.

However if you want to report user fields, you must ensure that there is a matching dictionary record for the monitoring data for each APPLID that you want to process. You can use the CICS PA dialog to do this.

**Using CICS PA to create dictionary records:** You can use the CICS PA dialog to create a dictionary record when you define the CICS System (APPLID). Figure 20 on page 82 shows the CICS System panel where you can do this. Specify a dictionary data set name then select **Dictionary** in the action bar to write the dictionary record. CICS PA includes the dictionary data set in the report JCL in the **CPADICTR DD** statement.

**Order of precedence:** When processing performance class data, CICS PA might read more than one dictionary record. CICS PA applies the following order of precedence to determine the dictionary record to use to analyze the data:

1. SMF file
2. CPADICTR DD statement
3. Default

That is, if the SMF data set that contains the performance record being processed has a dictionary record, then CICS PA uses that dictionary record. CICS PA uses the last dictionary record read and disregards any previously read. If the dictionary record is missing, then CICS PA uses the dictionary record in the CPADICTR data set. If that too is missing, then CICS PA uses the default dictionary record for the release of the CICS system being processed.

## Using DFHMNDUP to create dictionary records

Alternatively, you can write your own job to create dictionary records. The remainder of this section describes how to do this using the CICS-supplied monitoring dictionary utility program, DFHMNDUP, to write a dictionary record for a specific APPLID to a sequential data set. This discussion on DFHMNDUP is included for historical interest only. *You do not need to do any of it, as CICS PA does it more appropriately.*

Figure 12 shows an example of using the dictionary utility program to create a dictionary record for APPLID CICSPROD.

```
//MNDUPJOB JOB (Job Accounting)
//MNDUP    EXEC PGM=DFHMNDUP,REGION=0M
//STEPLIB DD DSN=CICS.SDFHLOAD,DISP=SHR
//SYSUT4   DD DSN=userid.applid.MNDUPREC,DISP=(NEW,CATLG),
//          UNIT=SYSDA,SPACE=(TRK,(1,1))
//SYSPRINT DD SYSOUT=A
//SYSUDUMP DD SYSOUT=A
//SYSIN    DD *
MCT=NO
SYSID=MVS1
GAPPLID=CICSPROD
SAPPLID=CICSPROD
/*
//
```

Figure 12. Sample job stream to run the DFHMNDUP utility

### Note:

1. In addition to the CICS library containing the DFHMNDUP program, the STEPLIB concatenation must also include the library that contains any monitoring control table (MCT) that you specify on the MCT parameter.
2. The dictionary record is written to the data set specified by the SYSUT4 DD statement.
3. You might decide to keep a permanent dictionary data set, one for each CICS region, to hold the dictionary record. Specify the DISP parameter according to whether the data set already exists, or a new one is to be created and cataloged.
4. Control information for the DFHMNDUP program is provided in the SYSIN data set so that it can generate the correct dictionary record for the performance class data you are processing.

## Extracting and printing the dictionary records

A possible user error that results in CICS PA producing large numbers of messages or incomplete reports can be caused by inconsistencies between the dictionary records and its corresponding performance data records. This typically occurs when you create the dictionary records using the dictionary utility program, DFHMNDUP.

Figure 13 on page 68 shows a sample job that can be used to extract the dictionary records from the SMF input file(s) and then use the CICS supplied monitoring sample program DFH\$MOLS to print *only* the dictionary records.

```

//DICTPRNT JOB (Job Accounting)
//DICTCOPY EXEC PGM=SORT,REGION=0M
//SORTIN DD DSN=smf110.data.set.name,DISP=SHR
//SORTOUT DD DSN=&&TEMP,DISP=(NEW,PASS),UNIT=SYSDA,SPACE=(TRK,(5,2))
//DFSMSG DD SYSOUT=A
//SYSOUT DD SYSOUT=A
//SORTDIAG DD SYSOUT=A
//SYSIN DD *
OPTION COPY,VLSHRT
RECORD TYPE=V
INCLUDE COND=(6,1,FI,EQ,110,AND,
              23,2,BI,EQ,X'0001',AND,67,2,BI,EQ,X'0001')
END
/*
//MOLSPRNT EXEC PGM=DFH$MOLS,REGION=0M,COND=(5,LT,DICTCOPY)
//STEPLIB DD DSN=CICSTS23.CICS.SDHFLDAD,DISP=SHR
//INPUT DD DSN=&&TEMP,DISP=(OLD,DELETE)
//SYSOUT DD SYSOUT=A
//SYSPRINT DD SYSOUT=A,DCB=BLKSIZE=133
//SYSABEND DD SYSOUT=A,DCB=BLKSIZE=133
//SYSUDUMP DD SYSOUT=A,DCB=BLKSIZE=133
//SYSIN DD *
* Print the dictionary records only
PRINT DIC
* Disable the date/time sequence checking
TIMEOFF
/*
//

```

Figure 13. Sample job to extract and print the Dictionary records

In this example, the DFH\$MOLS program will abend with the following message:

```
IEF450I DICTPRNT MOLSPRNT - ABEND=S000 U0107 REASON=00000000
```

and the following message is printed at the end of the dictionary report produced by DFH\$MOLS:

```
NO MONITORING RECORDS WERE SELECTED FOR PROCESSING; REPORT IS TERMINATED
```

For more information on the dictionary utility program DFHMNDUP and the monitoring sample program DFH\$MOLS, see the *CICS Operations and Utilities Guide*.

---

## Chapter 6. Personal System Definitions

The systems and data files that you want to report against must be defined to CICS PA. The Personal System Definitions Menu provides options to do this. Typically your personal definitions are maintained by you and used by you for reporting. They are saved in your Personal Profile Library (CICS PA Settings). Shared System Definitions are typically maintained by a central administrator in the Repository and are used by all users for reporting.

To define your systems, files, and groups, select option 1 **Personal Systems** from the Systems menu. Alternatively, you can select **Systems** in the action bar of reporting panels, or enter **SYSDEFS** in the command line anywhere in the dialog.

---

### Personal System Definitions overview

Use **Personal System Definitions** to define your CICS (and other related) systems and their SMF files.

Before you can run reports using Personal System Definitions, you must first define the CICS and related systems that you want to report against. You can fast-track this process by using **Take-up**. Simply specify an SMF file that contains records from the systems that you want to report against, and CICS PA will create system definitions for you based on the records in that file.

To walk through an example of how to do this, see “Example: Working with Personal Systems” on page 107.

CICS PA uses your System Definitions when you:

1. Run (submit) your report requests.

At Report Set run time, CICS PA automatically generates JCL that includes:

- Report requests for the CICS (and other related) systems that you select
- DD statements for the required SMF files

2. Create a new Report Form.

The version of your CICS system determines which CMF fields are available for reporting and your MCT specification allows you to incorporate user fields into your reports.

3. Create Cross-System Work Extract data sets.

Your MCT specification allows you to incorporate user fields into your extracts.

System Definitions is a menu driven facility that allows you to:

1. Define your CICS and associated DB2, MQ and Logger **Systems** and define the **Images** (MVS systems) where they run
2. Maintain the **SMF files** that contain data for these systems
3. Define **Groups** that enable you to connect systems for consolidated reporting
4. Use **Take-up** to populate your System Definitions from an SMF file

To access this facility, select option 1 **Systems** from the Primary Option Menu, and then select option 1 **Personal Systems** from the Systems menu. When first invoked, the System Definitions Menu is displayed as shown in Figure 14 on page 70. You

can choose to bypass this menu in the future.

```
File  Confirm  Options  Help

   4. Take-up from SMF File

Enter "/" to select option
_  Always go directly to Systems View
```

Figure 14. Personal System Definitions: Menu

## Systems

The systems specified in System Definitions are your CICS and other related systems that are eligible for report processing by CICS PA.

Each system is identified by its name, type, and optionally, its image:

**Name** The primary system identifier.

**Type** Five system types are supported:

**CICS** CICS Transaction Server region or CICS Transaction Gateway region. The system name is the CICS Transaction Server generic APPLID or the CICS Transaction Gateway APPLID.

**Image** MVS Image where your CICS regions run. The system name is usually the MVS SMF ID but it can be a unique arbitrary name.

**DB2** DB2 subsystem that services your CICS regions. The system name is the DB2 subsystem ID.

**MQ** WebSphere MQ subsystem that services your CICS regions. The system name is the MQ subsystem ID.

**Logger**

MVS System Logger used by your CICS regions. The system name is an arbitrary name that represents the MVS System Logger.

**Image** Optionally, CICS, DB2, MQ and Logger systems can be further qualified by specifying the Image (MVS SMF ID) where they run.

### CICS System

CICS systems define the CICS Transaction Server or CICS Transaction Gateway regions that you want to report against. They are identified by their CICS Transaction Server generic APPLID or CICS Transaction Gateway APPLID and optionally qualified by the MVS Image where they run.

CICS system names can be specified as patterns containing masking characters. For example, if your CICS development regions are called CICSD1, CICSD2, CICSD3, and their SMF records are on the same file, then you can define them once as a system called CICSD\*. Then at report run-time, you can request that all CICSD\* systems are processed, or any individual system matching the pattern can be requested. For example, CICSD1.

You can define SMF files to CICS systems. These files contain the SMF 110 and SMF 112 records for CICS Transaction Server regions, and the SMF 111 records for CICS Transaction Gateway regions. When this system is requested for reporting, CICS PA builds JCL that includes DD statements for these files.

You can also define CICS systems to Groups. This allows you to connect systems for consolidated cross-system style reporting. See “Groups” on page 73 for more information.

## Image System

Image systems define the MVS systems where your CICS and other related systems run. They are usually identified by their MVS SMF ID but you can assign a unique arbitrary name to identify Images.

You can define SMF files to Image systems. These files contain the data for the CICS, DB2, MQ and Logger systems that belong to this Image. When an Image is selected for report processing, all systems with data on the Image's SMF files are reported.

Image systems have some special characteristics:

1. Images can be used to further qualify CICS, DB2, MQ and Logger systems. For example, CICS region CICSD1 runs on Image DEV1. Using Image to qualify your systems allows you to:
  - Distinguish between systems with same name but run on different images.
  - Specify your SMF files once only. When SMF files are defined to an Image, other systems that belong to the Image use these files if they don't have their own specified. This saves the duplication of assigning files to every system that needs them.
2. Images implicitly define all the systems that run on them. This allows you to just define the Image without defining the CICS and other systems that run on it. You can request reporting for any CICS system qualified by the Image but not explicitly defined in your System Definitions. CICS PA assumes that the report data for the CICS system is contained in the Image's files.

For example, CICS regions CICSP1, CICSP2 and CICSP3 run on MVS Image MVS1. You can decide to only define Image MVS1 to CICS PA and not the CICS regions. The regions are still eligible for reporting. When you request reporting for CICS system CICSP1 qualified by Image MVS1, CICS PA generates report requests for APPLID CICSP1, and assumes that the SMF Files defined to Image MVS1 contain the data for CICSP1.

## DB2 System

DB2 systems define the DB2 subsystems used by your CICS regions. They are identified by their DB2 subsystem ID and optionally qualified by the MVS Image where they run.

Defining your DB2 subsystems allows you to run the DB2 report which presents a consolidated picture of DB2 resource usage by your CICS transactions.

You can define SMF files to DB2 systems. These files contain the DB2 accounting (SMF 101) data for that system. When this system is requested for reporting, CICS PA builds JCL that includes DD statements for these files.

You can also define DB2 systems to Groups. This allows you to connect a DB2 system to the CICS systems it services. See “Groups” on page 73 for more information.

## MQ System

MQ systems define the WebSphere MQ subsystems used by your CICS regions. They are identified by their MQ subsystem ID and optionally qualified by the MVS Image where they run.

Defining your MQ subsystems allows you to run the MQ report which presents a consolidated picture of MQ resource usage by your CICS transactions.

You can define SMF files to MQ systems. These files contain the MQ accounting (SMF 116) data for that system. When this system is requested for reporting, CICS PA builds JCL that includes DD statements for these files.

You can also define MQ systems to Groups. This allows you to connect an MQ subsystem to the CICS systems it services. See “Groups” on page 73 for more information.

## Logger System

Logger systems define the MVS System Loggers used by your CICS regions that you want to report against. They are identified by an arbitrary name and optionally qualified by the MVS Image where they run. The Logger system name is not a formal name associated with any aspect of your CICS System Logger set-up such as Logstream name, but simply a name you choose to identify this system by.

Defining Logger systems allows you to run the Logger report which presents a detailed analysis of the Logstreams and coupling facilities used by your CICS regions.

You can define SMF files to Logger systems. These files contain the System Logger (SMF 88) data for that system. When this system is requested for reporting, CICS PA builds JCL that includes DD statements for these files.

You can also define Logger systems to Groups. This allows you to connect a Logger system to the CICS systems it services. See “Groups” on page 73 for more information.

## SMF Files

SMF Files are data sets that contain the SMF records for your systems. See “Systems” on page 70 for the type of records expected in the SMF file for each system type.

You define your SMF Files to the system(s) that they have data for. If your SMF File contains data for all systems running on an MVS Image, then define the file once to the Image system. Then all systems that run on that Image (CICS, DB2, MQ and Logger) will use the Image's file specification.

System Definitions has an SMF File maintenance facility that allows you to view all the SMF files you have defined and the systems that use each file. See “Maintaining Personal SMF Files” on page 94 for more information.

If you choose not to specify your SMF files in System Definitions initially, CICS PA will give you the opportunity to specify them at Report Set run time. Depending on your run-time options, you can either:

- Link to System Definitions to specify the required files, or

- Request that CICS PA generate report JCL with the SMF file data set names unresolved. Before submitting, you can specify the data set names directly in the JCL.

## Groups

A Group is a collection of systems that require consolidated reporting. Instead of running a report against a particular System, you can run the report against a Group. This provides a facility for consolidated cross-system style reporting.

Some practical uses for Groups include:

- CICS systems that are connected by IRC/MRO, ISC/APPC, or IPIC — specify your TOR, AOR, FOR and DOR regions in a Group for cross-system reporting.
- CICS systems that use DB2 — specify your CICS DOR region and DB2 subsystem in a Group for DB2 reporting.
- CICS systems that use WebSphere MQ — specify your CICS region and MQ subsystem in a Group for MQ reporting.
- CICS systems that require System Logger reporting — specify your CICS region and Logger systems in a Group for Logger reporting.

Systems can belong to more than one Group.

System Definitions has a Group maintenance facility that allows you to view all the Groups that you have defined and the systems that belong to each Group. See “Maintaining Personal Groups” on page 99 for more information.

## Take-up

Rather than creating system definitions yourself, you can use the take-up facility to create them for you. The take-up facility extracts system details from an SMF file that you specify, and uses these details to create system definitions. For more information, see “Personal Take-Up from SMF File” on page 104.

---

## Personal System Definitions Menu

The first time that you invoke System Definitions, you are presented with a menu. You can choose to bypass this in the future.

```

File  Confirm  Options  Help
-----
                Personal System Definitions Menu
Command ==> _____

Select an option then press Enter.

1  1. Define Systems, SMF Files and Groups
   2. Maintain SMF Files
   3. Maintain Group definitions
   4. Take-up from SMF File

Enter "/" to select option
_  Always go directly to Systems View

```

*Figure 15. Personal System Definitions: Menu*

The System Definitions Menu displays the options available for specifying and maintaining Systems, SMF Files, and Groups. These are the three primary views of your System Definitions. For each of these views, there is a hierarchy of panels for maintaining their relationships:

- For a System, you can specify the SMF Files it uses and the Groups it belongs to.
- For an SMF File, you can specify the Systems that use it.
- For a Group, you can specify the Systems that belong to it.

This menu also provides a Data Take-up facility to extract details of Systems from an SMF File for automatic take-up into your System Definitions.

You can bypass the System Definitions Menu by selecting **Always go directly to Systems View**. Then option 1 from the Primary Option Menu will always go directly to the System Definitions panel.

To access the Systems, SMF Files, and Groups panels without using the menu, select from **View** in the action bar or enter one of the commands **VIEW SYSTEMS**, **VIEW FILES**, or **VIEW GROUPS**.

To redisplay the menu, select **View->Menu** in the action bar or enter the **MENU** command.

Regardless of your bypass choice, if you have Automatic Save on Exit set to **PROMPT** in your Profile Settings, the menu will always be displayed when you attempt to exit System Definitions. This allows you to enter **SAVE** or **CANCEL** before exit.

**Primary Commands:** The following primary commands are available:

**SAVE** This command saves any changes you have made during this invocation of System Definitions.

Also available from **File** in the action bar.

#### **CONFIRM ON|OFF**

**CONFIRM ON** (or **CONFIRM**) instructs CICS PA to prompt for confirmation when you request to Cancel from System Definitions when there are changes. With **CONFIRM OFF**, Cancel requests are actioned immediately, discarding any changes.

The **CONFIRM** command changes the setting only for the current invocation of System Definitions. On exit, it reverts to the default set by **Cancel Confirmation** in CICS PA Settings.

Also available from **Confirm** in the action bar.

#### **Note:**

1. The **SAVE** command is available only at the four possible “exit points” of System Definitions: the Menu, and the Systems, SMF Files, and Groups views. All System Definitions changes are saved upon issuing a **SAVE** command from any of these panels.
2. Updates to the current view are saved when you change views (**VIEW SYSTEMS|FILES|GROUPS** command) or display the menu (**MENU** command).
3. **CANCEL** (F12) discards all updates.
4. **EXIT** (F3) saves your System Definitions as follows:
  - If the System Definitions Menu is *not* being bypassed, your System Definitions are not saved until Exit from the Menu.
  - If the System Definitions Menu *is* being bypassed, your System Definitions are saved on Exit from any view (Systems, Files, or Groups).

## Maintaining Personal System Definitions

The System Definitions panel is displayed when you select option 1 **Define Systems, SMF Files and Groups** from the System Definitions Menu. However, if you opted to bypass the menu and go straight to the Systems view, then selecting option 1 **System Definitions** on the Primary Option Menu displays the System Definitions panel immediately. You can also change to the Systems view from the Files or Groups view by selecting from **View** in the action bar or by entering the **VIEW SYSTEMS** command.

The System Definitions panel is the primary panel for maintaining your system definitions. When the list of Systems is displayed:

- To define a new system, enter the **NEW** command and it is added at the top of the list. Alternatively, you can enter the line action **I** (Insert) on the row before where you want the new entry to be added.
- To update or view details of a system including its related files and groups, enter the **S** line action against the system where it appears in the list.
- To delete a system that is no longer required, enter the **D** line action against the system where it appears in the list.
- You can also use **C** or **R** to copy or repeat a system entry together with its associated files and groups. Note however that an MVS Image must have a unique name.
- **FIND** and **SORT** commands are available to help you locate entries in the list.
- You can select **Filter->Set Filter** in the action bar to reduce the volume of the display to only the systems that match your specified criteria.

```

```

Figure 16. Personal System Definitions

This panel lists the Systems that are available for Report Set processing.

A System is identified by the combination of:

- System ID
- Type of System (CICS, Image, DB2, MQ, Logger)
- MVS (SMF) Image ID

Each row shows System, Type, Image, Description, and the SMF Files System. The fields are display-only except for Description.

## System

The system name is one of the following depending on the type:

- CICS Transaction Server generic APPLID
- CICS Transaction Gateway APPLID
- MVS (SMF) Image ID
- DB2 Subsystem ID
- WebSphere MQ Subsystem ID
- MVS System Logger ID

Enter the **I** line action or the **NEW** command to define a new System.

Enter the **S** line action against a System to specify its details and related SMF Files and Groups.

CICS PA automatically inserts an Image definition when a System is added or updated with a new Image. The Image is inserted in the list immediately after the System that created it.

The purpose of Image definitions is two-fold:

1. To allow you to report against all systems running on an MVS Image without having to explicitly specify the system names.
2. To allow you to specify the SMF data set names once. Simply define your SMF files for an MVS Image, and all systems running on that Image (with no files of their own) will use these files.

If they are uniquely defined, the order of the system definitions is not relevant to CICS PA. You can list them on this panel in the order that is convenient for you. Line action **M** (Move) or the **SORT** command is available for this purpose.

**Type** The type of system is one of the following:

1. **CICS System.** Either a CICS Transaction Server system identified by its generic APPLID, or a CICS Transaction Gateway system identified by its APPLID. CICS PA matches this name against the CICS Transaction Server generic APPLID specified in SMF 110 and SMF 112 records, and the CICS Transaction Gateway APPLID specified in SMF 111 records.
2. **MVS Image.** MVS System, identified by its MVS SMF ID (SID parameter in SMFPRMnn) or any name that uniquely identifies your system. The name need not match any formal MVS definition.
3. **DB2 Subsystem.** DB2 Subsystem, identified by its SSID. CICS PA matches this name against the SSID specified in the DB2 accounting records.
4. **MQ Subsystem.** MQ Subsystem, identified by its SSID. CICS PA matches this name against the SSID specified in the MQ accounting records.
5. **System Logger.** MVS System Logger, identified by the CICS or MVS system it services or any name that identifies the Logger system. The name need not match any formal MVS definition.

**Image** Image is the SMF identifier of the MVS System which collects the SMF data and runs the CICS System, DB2 Subsystem, MQ Subsystem, or System Logger. Image is blank when the System is an Image because the System name is the Image name.

## Description

Description is free-format text up to 36 characters to describe the system. This is for your reference only, although CICS PA will insert it as a comment in your Report Set JCL.

## SMF Files System

The SMF Files System identifies where you have defined the files for this system. These are the files that CICS PA will use for Report Set JCL generation.

CICS PA allows systems to share files. So if an MVS Image is running a number of CICS, DB2 or MQ systems, you need only specify the files once for the Image.

If this indicator is blank, the system (and its associated Image) have no files defined or they are all Excluded. If your Report Set requests this system, the JCL generation process will invoke the "Missing SMF Files Option".

Enter the **S** line action to view or modify the SMF File specifications (and Groups) for the system.

**Line Actions:** The valid line actions for the list of systems are:

<b>/</b>	Display the menu of line actions
<b>S</b>	Select (edit) the System
<b>I</b>	Insert a row
<b>R</b>	Repeat this row
<b>C</b>	Copy this row
<b>M</b>	Move this row
<b>A</b>	Move/Copy after this row
<b>B</b>	Move/Copy before this row
<b>D</b>	Delete this row
<b>U</b>	Include CICS system in mass update

**Note:** A line action on this panel applies to the System definition and all its associated information. For example, copying a row copies the System details and all its File and Group relationships. Deleting a row deletes the System and its relationships, but not the Files and Groups themselves.

**Primary Commands:** The following primary commands are available:

### **NEW name CICS|IMAGE|DB2|MQ|LOGGER**

This command creates a new System. If all required parameters are specified, the Definition panel for the system is displayed. Otherwise, the New System window is displayed to allow you to specify the name and type of the new System.

Also available from **File** in the action bar.

See "New System" on page 79 for information on how to proceed.

**SAVE** This command saves any changes you have made during this invocation of System Definitions.

Also available from **File** in the action bar.

### **FIND string**

This command (or **F**) looks for the specified character string in all columns of displayed data. The string need only be enclosed in quotes if there are embedded spaces. The search is not case sensitive. The display scrolls to the row where the string is found and positions the cursor on the matching data. To find more occurrences, use **F5** or the **RFIND** command repeatedly.

If there is no match but the search did not begin at the top of the list, the screen does not change and the message \*Bottom of data reached\* is displayed. Use **F5** or **RFIND** to search from the top.

If there is no match in the entire list, the screen does not change and a String not found message is displayed.

Also available from **Edit** in the action bar.

#### **SORT SYSTEM|TYPE|IMAGE|DESCRiption**

This command sorts the list of Systems on the specified column. The default is SYSTEM (then TYPE and IMAGE). The order is retained on exit.

Also available from **Edit** in the action bar.

#### **SELECT pattern**

This command inserts line action **S** next to all Systems whose names match the specified pattern.

#### **SELECT|S pattern**

This command inserts line action **S** next to all Systems whose names match the specified pattern (such as PROD\*, to match all Systems whose name begins with the letters PROD).

#### **SELECT|S pattern U**

This command inserts line action **U** (include in mass update) next to CICS Systems whose names match the specified pattern.

#### **RESET**

This command (or **RES**) removes all outstanding line actions.

Also available from **Edit** in the action bar.

#### **VIEW FILES|GROUPS**

This command takes you to the Files or Groups view. Updates are saved when you change views.

Also available from **View** in the action bar.

#### **MENU**

This command takes you to the System Definitions Menu. Updates are saved when you go to the menu.

Also available from **View** in the action bar.

#### **Note:**

1. The **SAVE** command is available only at the four possible “exit points” of System Definitions: the Menu, Systems view, SMF Files view, and Groups view. All System Definitions updates are saved on issuing a **SAVE** command from any of these panels.
2. Updates are saved when you change views (**VIEW SYSTEMS|FILES|GROUPS** command) or display the menu (**MENU** command).
3. **CANCEL** (F12) discards all updates.
4. **EXIT** (F3) saves changes as follows:
  - If the System Definitions Menu is *not* being bypassed, the System Definitions are not saved until Exit from the Menu.
  - If the System Definitions Menu *is* being bypassed, the System Definitions are saved on Exit from any view (Systems, Files, or Groups).

## **Set Filter (Systems)**

The following panel is displayed when you select **Filter->Set Filter** in the action bar of the System Definitions panel.

```

----- Set Filter -----
Command ==> _____

Specify or revise filtering criteria then press Enter.

System ID . . . . C*_____ (Blank or pattern)
MVS Image . . . . _____ (Blank or pattern)

/ Include CICS Systems
7 Include MVS Images
7 Include DB2 Subsystems
7 Include MQ Subsystems
7 Include System Logger

```

Figure 17. System Definitions: Set Filter (Systems)

This facility allows you to filter the amount of information displayed in the current view.

Specify any combination of the following filtering criteria:

#### System ID, MVS Image

Specify a name or pattern for one or both. Masking characters % and \* are allowed. Only systems that match the pattern are eligible for display. For example, CIC\*1 will display CICPROD1 and CICST1 but not CICST1A.

#### Include CICS Systems, MVS Images, DB2, MQ, System Logger

Type / against the type of systems you want displayed. Only those selected are eligible for display.

Press Enter to set the filter.

A system will only be displayed in the filtered view when all the specified filtering options are matched. All others are hidden (they are not deleted). Exit, Save, or Cancel processing applies to the entire list of systems, regardless of whether they are displayed or filtered out.

When filtering is in effect **Filter Mode - More:** is displayed in the top right corner after the panel title. On initial entry to the Systems view, no filtering is in effect.

To reset the filter and redisplay all intervals and the row count, select **Filter->Set filter off** in the action bar. The filtering criteria will remain dormant in the Set Filter panel.

## New System

The New System panel is displayed when you enter the **NEW** command or the line action **I** (Insert) from the System Definitions panel.

New System

Command ==> \_\_\_\_\_

Specify the name and type of system.

System Name . . **CICSGP2\_**

System Type . . \_

1. CICS System  
 2. MVS Image  
 3. DB2 Subsystem  
 4. MQ Subsystem  
 5. System Logger

*Figure 18. System Definitions: Specifying a New System*

This panel allows you to create a new system definition. You must specify the system name and type.

You can bypass this panel by entering the command **NEW name CICS|IMAGE|DB2|MQ|LOGGER** in full.

The options are:

**System Name**

Specify the name of the new system. Names can contain only alphanumeric (A-Z,0-9) or special (@,#,\$) characters. For a CICS APPLID, DB2 or MQ SSID, or Logger name you can also specify a pattern using the % and \* masking characters.

A CICS APPLID, Image, or Logger name has a maximum length of 8 characters, whereas for a DB2 or MQ SSID it is 4 characters.

**Type** Select the type of system:

1. **CICS System.** Either a CICS Transaction Server system identified by its generic APPLID, or a CICS Transaction Gateway system identified by its APPLID. CICS PA matches this name against the CICS Transaction Server generic APPLID specified in SMF 110 and SMF 112 records, and the CICS Transaction Gateway APPLID specified in SMF 111 records.
2. **MVS Image.** MVS System, identified by its MVS SMF ID (SID parameter in SMFPRMnn) or any name that uniquely identifies your system. The name need not match any formal MVS definition.
3. **DB2 Subsystem.** DB2 Subsystem, identified by its SSID. CICS PA matches this name against the SSID specified in the DB2 accounting records.
4. **MQ Subsystem.** WebSphere MQ Subsystem, identified by its SSID. CICS PA matches this name against the SSID specified in the MQ accounting records.
5. **System Logger.** MVS System Logger, identified by the CICS or MVS system it services or any name that identifies the Logger system. The name need not match any formal MVS definition.

---

## Mass Update of Personal CICS System Definitions

Suppose that, some time ago, you created CICS System Definitions in CICS PA using version-specific data set names for the MCT and SDFHLOAD libraries. Now you want to upgrade your CICS System Definitions in CICS PA to match this change in your system environment. Rather than selecting and then editing each system definition individually, you can upgrade several (or all of them) together.

- ### Notes:

- Once you have selected the systems you want to update, press Enter to display the Mass Update CICS Systems panel:

Figure 19. System Definitions: Mass Update CICS Systems

- Chapter 6. Personal System Definitions 81

The “From” fields for Description and data set names (MCT Load Library, SDFHLOAD Library, Dictionary DSN, and Log Stream) can specify an asterisk (\*) as a wildcard to indicate zero or more characters, or the percent symbol (%) as a wildcard to indicate any single character.

3. To view a report of the changes that your “From” and “To” field values would have on each of the selected CICS System Definitions, select the “Report only” option. To perform the changes and then view a report of the changes, select “Perform update and report”.

## CICS System (APPLID) definition

The CICS System panel is displayed when:

- You enter the **S** line action against a CICS System listed on the System Definitions panel.
- You enter the **NEW** command with a type of **CICS**.

```

```

Figure 21. System Definitions: CICS System (with Groups)

For each system, CICS PA remembers its last view and returns there next time.

This panel is used to define a CICS system (CICS Transaction Server or CICS Transaction Gateway) to CICS PA. The definition includes:

- CICS Transaction Server generic APPLID or CICS Transaction Gateway APPLID, which must be specified
- MVS (SMF) ID where the CICS system runs
- Suffix of the Monitoring Control Table (MCT)
- Load Library containing the MCT load module
- SDFHLOAD Library containing the CICS utility program DFHMNDUP which CICS PA uses to generate CMF Dictionary records
- Name of a sequential data set which contains the Dictionary record for this CICS system
- Files used by the CICS system
- Groups the CICS system belongs to

The CICS system details are:

#### **APPLID**

The CICS Transaction Server generic APPLID or CICS Transaction Gateway APPLID. An APPLID is up to eight alphanumeric (A-Z,0-9) or special (@,#,\$) characters, and must be specified. You can also specify a pattern using the % and \* masking characters.

#### **Image**

The SMF identifier of the MVS system where the CICS system runs. An Image ID is up to 8 alphanumeric (A-Z,0-9) or special (@,#,\$) characters.

**VRM** The VRM value is displayed if it can be determined from the MCT load library or the SDFHLOAD library, otherwise it is blank.

#### **Description**

Description is free-format text up to 36 characters to describe the system. This is for your reference only, although CICS PA will insert it as a comment in your Report Set JCL.

#### **MCT Suffix**

The suffix of the CICS Monitoring Control Table (MCT), which should be the same as the MCT= parameter in DFHSIT. The suffix is one or two alphanumeric (A-Z,0-9) or special (@,#,\$) characters. If not specified, CICS PA uses the system default MCT. If specified, the MCT Load Library must also be specified. The MCT is needed to include user fields in your reporting.

#### **MCT Load Library**

The name of the load library containing the MCT load module. If not specified, CICS PA cannot use the MCT to determine the user fields defined in the MCT.

#### **SDFHLOAD Library**

The name of the library containing the CICS utility program DFHMNDUP which CICS PA uses to generate a Dictionary record. CICS PA uses the Dictionary record to interpret the CMF performance data records processed from the SMF files. If not specified, CICS PA cannot determine the CICS VRM or report user fields defined in the MCT.

#### **Dictionary DSN**

The name of the data set that contains the Dictionary record for this CICS system. It can be either the name of a data set with Variable record format (RECFM=V) or the name of a member of a partitioned data set (PDS).

You only need to specify this if you want to report the user fields defined in the MCT. If you are not reporting user fields, then you can let CICS PA use the default Dictionary record for your release of CICS.

If you want CICS PA to generate the Dictionary record for this CICS system, do the following:

1. Specify the Dictionary DSN.
2. Specify the SDFHLOAD Library so that CICS PA can use the DFHMNDUP utility to generate the Dictionary record.
3. Select **Dictionary** in the action bar. CICS PA immediately populates the specified data set with the Dictionary record for this CICS system. If the data set is not cataloged, CICS PA will allocate it before writing the record. If the data set is cataloged, CICS PA will overwrite its contents with the new Dictionary record.

At JCL generation time, CICS PA inserts the Dictionary DSN (if cataloged) in the **CPADICTR DD** statement.

Dictionary records describe the format of CMF performance records and are required for CICS PA reporting. Usually the SMF data set contains a Dictionary record to describe the format of its records. If it is missing, CICS PA uses the record in the CPADICTR data set if present, otherwise it uses the default Dictionary record for the release of the CICS system being processed.

## Primary Commands

### FIND string

This command (or **F**) looks for the specified character string in SMF Data Set and Group columns of displayed data. The string need only be enclosed in quotes if there are embedded spaces. The search is not case sensitive. The display scrolls to the row where the string is found and positions the cursor on the matching data. To find more occurrences, use **F5** or the **RFIND** command repeatedly.

If there is no match but the search did not begin at the start of the list, the screen does not change and the message \*Bottom of data reached\* is displayed. Use **F5** or **RFIND** to search from the top. If there is no match in the entire list, the screen does not change and a String not found message is displayed.

Also available from **Edit** in the action bar.

### SORT GROUP|DESCRiption

This command sorts the list of Groups by name (the default) or description. The order is retained on exit.

Also available from **Edit** in the action bar.

**Note:** The SORT command is not available for Files since it is important that the data set names are specified in time sequence.

### RESET

This command (or **RES**) removes all outstanding line actions and deletes any blank rows.

Also available from **Edit** in the action bar.

## Files the System uses

See Figure 20 on page 82 for a view of the CICS System panel where you can list all the files that the system uses.

Each listed data set has the following attributes:

**Exc** The data set is marked by an asterisk \* if it is to be Excluded from reporting. Excluded data sets are not eligible for Report Set JCL generation. Enter the **X** line action to reverse the status (Exclude/Include) of the data set.

### SMF Data Set Name

The name of an SMF data set containing data for

- Report Set processing:
  - CMF performance class, exception class, and transaction resource class data (SMF 110 records)
  - DB2 accounting data (SMF 101 records)
  - WebSphere MQ accounting data (SMF 116 records)
  - System Logger data (SMF 88 records)
  - OMEGAMON XE for CICS (SMF 112 records)
- Statistics reporting:
  - CICS statistics and server statistics data (SMF 110 records)
  - CICS Transaction Gateway statistics data (SMF 111 records)

You can select data set names from a list of available data sets by using **Prompt** (F4) or the **S** line action.

Normal ISPF data set conventions apply. Fully qualified data set names must be enclosed in quotes, except if **PROFILE NOPREFIX** is set.

The data sets, if not Excluded, are processed by CICS PA JCL generation in the order in which they are specified on the panel. For reporting to span more than one data set, specify the data sets in time sequence (earliest first).

If the data set is not cataloged, then specify UNIT, SEQ, or VOLSER.

### UNIT

The generic or esoteric device type of the data set, such as 3390, SYSDA, or CART. This must represent a device type that is defined in the Eligible Device Table of the current processor as either TAPE or DASD. To select one from a list of possible Units, position the cursor on the UNIT field and press **Prompt** (F4).

UNIT can be specified without a VOLSER, in which case CICS PA will use the explicitly specified device type when generating JCL but will not include the UNIT parameter in the generated JCL. In this way the JCL generation process can be made aware of the device type of a data set that is yet to be cataloged, or is cataloged on another system. CICS PA uses the device type to determine tape unit affinity when generating JCL.

### SEQ

The File Sequence Number is only required for uncataloged tape data sets. It identifies the relative position of the data set on a tape volume. Omit, or code 0 or 1 to indicate the first data set on the tape volume.

## VOLSER

The volume serial number of the data set. It is only required for uncataloged data sets. If a VOLSER is specified, then a UNIT must also be specified.

CICS PA appends a + sign to the VOLSER to indicate that the data set spans multiple volumes.

To display the VOLSER List of up to 16 volumes, do one of the following:

- Enter the **V** line action.
- Place the cursor on the + sign and press **Enter**.
- Place the cursor on the VOLSER field and press **Prompt** (F4).

## Line Actions

The valid line actions for the System Files view are:

<b>/</b>	Display the menu of line actions
<b>S</b>	Select Files from a list
<b>I</b>	Insert a blank row for entry of a related file
<b>R</b>	Repeat this row
<b>C</b>	Copy this row
<b>M</b>	Move this row
<b>A</b>	Move/Copy after this row
<b>B</b>	Move/Copy before this row
<b>D</b>	Delete this row
<b>U</b>	Select Unit from a list
<b>V</b>	Display the VOLSER List for up to 16 volumes
<b>X</b>	Reverse the Exclude indicator (Include/Exclude)

## Select SMF Files

The Select SMF Files panel is displayed when you enter the line action **S** or press **Prompt** (F4) from an SMF Data Set Name field on a system definition panel (CICS System, MVS Image, DB2 Subsystem, MQ Subsystem, System Logger). It displays the list of files not already defined to the system. This list is a subset of the files maintained in the Files view (see Figure 32 on page 94).

Select SMF Files
Row 1 to 6 of 6

Command ==>
Scroll ==>

Select one or more Files then press EXIT.

SMF Data Set Name	UNIT	SEQ	VOLSER
. 'CICSPAOR.CMF1'	SYSALLDA	1	000010
. 'CICSPAOR.CMF2'	3390		
. 'CICSPAOR.CMF3'			
. 'CICSPTOR.CMF1'	SYSALLDA	1	00110
. 'CICSPTOR.CMF2'	3390		
. 'CICSPTOR.CMF3'			

\*\*\*\*\* End of list \*\*\*\*\*

Figure 22. System Definitions: Select SMF Files

This is a list of SMF Files that are available for selection.

Enter a **/** or **S** line action to select one or more files from the list.

Press **Exit** (F3) to complete your selection.

## Select a Unit

The Select a Unit panel is displayed when you press **Prompt** (F4) from the UNIT field when specifying a data set:

- For a Personal System Definition
- In the Files view
- On the Data Take-Up panel

It lists the unit device types that are defined as either TAPE or DASD in the Eligible Device Table of the processor CICS PA is running on.

Enter a **/** or **S** line action (or point-and-shoot) to select a unit device type from the list.

## VOLSER list

The list of Volsers is displayed when you press **Prompt** (F4) from the VOLSER field when specifying a data set:

- For a Personal System Definition
- In the Files view
- On the Data Take-Up panel

The VOLSER List is used to specify up to 16 volume serial numbers when the SMF data set spans more than one volume. The VOLSERS are listed in the JCL in the same order as they are specified here.

## Groups the System belongs to

See Figure 21 on page 82 for a view of the CICS System panel where you can list all the groups that the system belongs to.

Each group in the list has the following attributes:

**Group** The name of a Group that this system belongs to. A system can belong to any number of groups. A group name need not be a formal CICS definition, but any name you choose to identify a group of related systems. You can select one or more from a list of available groups by using **Prompt** (F4).

By specifying a Group name, you can group related systems for reporting purposes, such as cross-system reporting for CICS systems that connect via IRC/MRO, ISC/APPC, IPIC, or transaction grouping.

### Description

Description is free-format text up to 36 characters to describe the group.

## Line Actions

The valid line actions for the System Groups view are:

- |          |                                  |
|----------|----------------------------------|
| <b>/</b> | Display the menu of line actions |
| <b>S</b> | Select Groups from a list        |
| <b>I</b> | Insert a row                     |
| <b>R</b> | Repeat this row                  |

- C** Copy this row
- M** Move this row
- A** Move/Copy after this row
- B** Move/Copy before this row
- D** Delete this row

## Select Groups

The Select Groups panel is displayed when you enter the line action **S** or press **Prompt** (F4) from a Group field on a system definition panel (CICS System, MVS Image, DB2 Subsystem, MQ Subsystem, System Logger). It displays the list of groups that the system does not already belong to. This list is a subset of the groups maintained in the Groups view (see “Maintaining Personal Groups” on page 99).

```

----- Select Groups -----
                                     Row 1 to 4 of 4
Command ===> _____ Scroll ===> ____

Select one or more Groups then press EXIT.

Figure 25. System Definitions: MVS Image (with Groups)

This panel is used to define an MVS Image to CICS PA. The definition includes:

- MVS (SMF) ID of the MVS Image where CICS APPLIDs, DB2 SSIDs, MQ SSIDs, or System Loggers run
- Description of the Image
- Files the Image uses
- Groups the Image belongs to

Scroll **Right** (F11) to switch between Files and Groups. Files is the initial view. However, for each system, CICS PA remembers its last view and returns there next time.

The Image details are:

#### MVS Image

The name of the MVS Image. The Image name must be unique. An Image name is up to eight alphanumeric (A-Z,0-9) or special (@,#,\$) characters.

#### Description

Description is free-format text up to 36 characters to describe the MVS system. This is for your reference only, although CICS PA will insert it as a comment in your Report Set JCL.

The primary commands are the same as on the CICS System panel. See “CICS System (APPLID) definition” on page 82.

The lists of related Files and Groups work the same here as on the CICS System panel. See “Files the System uses” on page 85 for the Files and “Groups the System belongs to” on page 87 for the Groups.

## DB2 Subsystem definition

The DB2 Subsystem panel is displayed when:

- You enter line action **S** against a DB2 Subsystem listed on the System Definitions panel.
- You enter the **NEW** command with a type of **DB2**.

File Edit View Options Help

Figure 27. System Definitions: DB2 Subsystem (with Groups)

This panel is used to define a DB2 Subsystem to CICS PA. The definition includes:

- SSID of the DB2 Subsystem
- MVS Image where the DB2 Subsystem resides
- Description of the Subsystem
- Files used by the DB2 Subsystem
- Groups the DB2 Subsystem belongs to

Scroll **Right** (F11) to switch between Files and Groups. Files is the initial view. However, for each system, CICS PA remembers its last view and returns there next time.

The DB2 Subsystem details are:

### DB2 SSID

The DB2 Subsystem ID. A DB2 SSID can be up to four alphanumeric (A-Z,0-9) or special (@,#,\$) characters. You can also specify a pattern using the % or \* masking characters.

### MVS Image

The SMF identifier of the MVS system where the DB2 subsystem runs. An Image ID is up to eight alphanumeric (A-Z,0-9) or special (@,#,\$) characters.

## Description

Description is free-format text up to 36 characters to describe the system. This is for your reference only, although CICS PA will insert it as a comment in your Report Set JCL.

The primary commands are the same as on the CICS System panel, see “CICS System (APPLID) definition” on page 82.

The lists of related Files and Groups work the same here as on the CICS System panel, see “Files the System uses” on page 85 for the Files and “Groups the System belongs to” on page 87 for the Groups.

**Note:** Usually, you only need to specify files for DB2 subsystems when the DB2 Accounting records reside in a different data set to the CICS CMF records.

---

## MQ Subsystem definition

The WebSphere MQ Subsystem panel is displayed when:

- You enter line action **S** against an MQ Subsystem listed on the System Definitions panel.
- You enter the **NEW** command with a type of **MQ**.

```

Figure 29. System Definitions: MQ Subsystem (with Groups)

This panel is used to define an WebSphere MQ Subsystem to CICS PA. The definition includes:

- SSID of the WebSphere MQ Subsystem

- MVS Image where the WebSphere MQ Subsystem resides
- Description of the Subsystem
- Files used by the WebSphere MQ Subsystem
- Groups the WebSphere MQ Subsystem belongs to

Scroll **Right** (F11) to switch between Files and Groups. Files is the initial view. However, for each system, CICS PA remembers its last view and returns there next time.

The WebSphere MQ Subsystem details are:

#### WebSphere MQ ID

The WebSphere MQ Subsystem ID. A WebSphere MQ SSID can be up to four alphanumeric (A-Z,0-9) or special (@,#,\$) characters. You can also specify a pattern using the % or \* masking characters.

#### MVS Image

The SMF identifier of the MVS system where the WebSphere MQ subsystem runs. An Image ID is up to eight alphanumeric (A-Z,0-9) or special (@,#,\$) characters.

#### Description

Description is free-format text up to 36 characters to describe the system. This is for your reference only, although CICS PA will insert it as a comment in your Report Set JCL.

The primary commands are the same as on the CICS System panel. See “CICS System (APPLID) definition” on page 82.

The lists of related Files and Groups work the same here as on the CICS System panel. See “Files the System uses” on page 85 for the Files and “Groups the System belongs to” on page 87 for the Groups.

## System Logger definition

The System Logger panel is displayed when:

- You enter line action **S** against a System Logger listed on the System Definitions panel.
- You enter the **NEW** command with a type of **LOGGER**.

Figure 31. System Definitions: System Logger (with Groups)

This panel is used to define a System Logger to CICS PA. The definition includes:

- ID of the System Logger
- ID of the MVS Image the System Logger services
- Description of the Logger
- Files used by the Logger
- Groups the Logger belongs to

Scroll **Right** (F11) to switch between Files and Groups. Files is the initial view. However, for each system, CICS PA remembers its last view and returns there next time.

The System Logger details are:

#### Logger

The name of the System Logger. This is not a formal MVS or CICS definition but any name you choose to identify the System Logger for your CICS systems. The name contains up to eight alphanumeric (A-Z,0-9) or special (@,#,\$) characters. You can also specify a pattern using the % and \* masking characters.

#### MVS Image

The SMF identifier of the MVS system where the System Logger runs. An Image ID is up to eight alphanumeric (A-Z,0-9) or special (@,#,\$) characters.

#### Description

Description is free-format text up to 36 characters to describe the system. This is for your reference only, although CICS PA will insert it as a comment in your Report Set JCL.

The primary commands are the same as on the CICS System panel. See “CICS System (APPLID) definition” on page 82.

The lists of related Files and Groups work the same here as on the CICS System panel. See “Files the System uses” on page 85 for the Files and “Groups the System belongs to” on page 87 for the Groups.

## Maintaining Personal SMF Files

The SMF Files view is the primary panel for maintaining your file definitions.

To display the SMF Files view:

- From the System Definitions Menu, select option 2 **Maintain SMF Files**
- From the System Definitions list panel, enter the **VIEW FILES** command or select **View->Files** in the action bar

From the list of SMF Files you can perform the following actions:

- Define a new data set using the line action **I**, or copy or repeat a data set along with its associated systems
- Use the line action **S** to update or view the systems that use a data set
- Delete a data set that is no longer required
- Use the **FIND** and **SORT** commands to locate entries in the list
- Use **Filter->Set Filter** in the action bar to display only files that match your specified criteria

```

```

Figure 32. System Definitions: Personal SMF Files

This panel is used to maintain SMF data sets that you want to run your Report Sets against. The SMF data sets contain the CICS Monitoring Facility (CMF) performance class, exception class, and transaction resource class data, DB2 accounting records, MQ accounting, and MVS System Logger records.

Through the related Systems (and their Groups), CICS PA uses the specified SMF data sets in the generation of Report Set JCL. The Use count shows the number of Systems that use this File. The count ignores Exclude indicators.

Each listed data set has the following attributes:

**Use** The File Use count. This indicates the number of Systems that use this File. The count ignores the Exclude indicator.

### SMF Data Set Name

The name of an SMF data set containing data for

- Report Set processing:
  - CMF performance class, exception class, and transaction resource class data (SMF 110 records)

- DB2 accounting data (SMF 101 records)
- WebSphere MQ accounting data (SMF 116 records)
- System Logger data (SMF 88 records)
- OMEGAMON XE for CICS (SMF 112 records)
- Statistics reporting:
  - CICS statistics and server statistics data (SMF 110 records)
  - CICS Transaction Gateway statistics data (SMF 111 records)

Normal ISPF data set conventions apply. Fully qualified data set names must be enclosed in quotes, except if **PROFILE NOPREFIX** is set.

If the data set is not cataloged, then specify UNIT, SEQ, or VOLSER

### UNIT

The generic or esoteric device type of the data set, such as 3390, SYSDA, or CART. This must represent a device type that is defined in the Eligible Device Table of the current processor as either TAPE or DASD. To select one from a list of possible Units, position the cursor on the UNIT field and press **Prompt** (F4).

UNIT can be specified without a VOLSER, in which case CICS PA will use the explicitly specified device type when generating JCL but will not include the UNIT parameter in the generated JCL. In this way the JCL generation process can be made aware of the device type of a data set that is yet to be cataloged, or is cataloged on another system. CICS PA uses the device type to determine tape unit affinity when generating JCL.

### SEQ

The File Sequence Number is only required for uncataloged tape data sets. It identifies the relative position of the data set on a tape volume. Omit, or code 0 or 1 to indicate the first data set on the tape volume.

### VOLSER

The volume serial number of the data set. It is only required for uncataloged data sets. If a VOLSER is specified, then a UNIT must also be specified.

CICS PA appends a + sign to the VOLSER to indicate that the data set spans multiple volumes.

To display the VOLSER List of up to 16 volumes, do one of the following:

- Enter the **V** line action.
- Place the cursor on the + sign and press Enter.
- Place the cursor on the VOLSER field and press **Prompt** (F4).

### Line Actions

<b>/</b>	Display the menu of line actions
<b>S</b>	Specify related Systems
<b>I</b>	Insert a blank row after this row to specify a new DSN
<b>R</b>	Repeat this row
<b>C</b>	Copy this row
<b>M</b>	Move this row
<b>A</b>	Move/Copy after this row
<b>B</b>	Move/Copy before this row

- D** Delete this row
- U** Select Unit from a list
- V** Display the VOLSER List for up to 16 volumes

**Note:** A row command on this panel applies to the SMF File specification and all its associated information. For example, copying a row copies all details of the data set (name, unit, file sequence number, up to 16 volume serial numbers) and all its System relationships. Deleting a row deletes the SMF File specification and its System relationships, but not the Systems themselves.

## Primary Commands

**SAVE** This command saves any changes you have made during this invocation of System Definitions.

Also available from **File** in the action bar.

### **FIND string**

This command (or **F**) looks for the specified character string in all columns of displayed data. The string need only be enclosed in quotes if there are embedded spaces. The search is not case sensitive. The display scrolls to the row where the string is found and positions the cursor on the matching data. To find more occurrences, use **F5** or the **RFIND** command repeatedly.

If there is no match but the search did not begin at the start of the list, the screen does not change and the message \*Bottom of data reached\* is displayed. Use **F5** or **RFIND** to search from the top.

If there is no match in the entire list, the screen does not change and a String not found message is displayed

Also available from **Edit** in the action bar

### **SORT DSN**

This command sorts the list of Files on data set name. The order is retained on exit.

Also available from **Edit** in the action bar.

### **RESET**

This command (or **RES**) removes all outstanding line actions and deletes any blank rows

Also available from **Edit** in the action bar.

### **VIEW SYSTEMS | GROUPS**

This command takes you to the Systems or Groups view. Updates are saved when you change views.

Also available from **View** in the action bar.

### **MENU**

This command takes you to the System Definitions Menu. Updates are saved.

Also available from **View** in the action bar.

## Set Filter (Files)

The Set Filter panel is displayed when you select **Filter->Set Filter** in the action bar of the SMF Files panel.

```

----- Set Filter -----
Command ==> _____

Specify or revise filtering criteria then press Enter.

SMF File   'CICSP*_____ (Blank or
                                pattern)

```

Figure 33. System Definitions: Set Filter (Files)

This facility allows you to filter the amount of information displayed in the current view.

Specify a name or pattern for **SMF File** then press **Enter** to set the filter on. Masking characters % and \* are allowed.

A file will only be displayed in the filtered view if the data set name and any enclosing quotes match the pattern. For example, 'CMF\*' will display 'CMFPERF.DATA' but not CMFEXCPT.DATA.

Files that are not displayed are not deleted. Exit, Save, or Cancel processing applies to the entire list of files, regardless of whether they are displayed or filtered out.

When filtering is in effect **Filter Mode - More:** is displayed in the top right corner after the panel title. On initial entry to the Files view, no filtering is in effect.

To reset the filter and redisplay all intervals and the row count, select **Filter->Set filter off** in the action bar. The filtering criteria will remain dormant in the Set Filter panel.

## Systems that use this File

To display the panel for maintaining the Systems that use a File, enter the line action **S** against the File listed in the Files view.

```

File Edit Options Help

```

Figure 34. System Definitions: Systems that use this File

This panel allows you to specify the systems that use the SMF data set. To select one or more from a list of available systems, enter the line action **S** or position the cursor on the System field and press **Prompt** (F4).

**Note:** When a system is specified here, the file is added at the end of the list of files for that system. For example, see Figure 20 on page 82. You might need to adjust the order of the files into the correct time sequence.

Each system in the list has the following attributes:

**Exc** The system is marked by an asterisk \* if the file is to be Excluded from reporting for this system. Excluded data sets are not eligible for Report Set JCL generation.

Enter the line action **X** to reverse the status (Exclude/Include).

### System, Type, Image

A System is identified by the combination of:

- System name which is one of the following depending on the type:
  - CICS generic APPLID
  - MVS (SMF) Image ID
  - DB2 Subsystem ID
  - MQ Subsystem ID
  - MVS System Logger
- Type of System: CICS, Image, DB2, MQ, or Logger
- MVS (SMF) Image ID

You can enter a system name directly. Alternatively, to select one or more from a list, enter the line action **S** or press **Prompt** (F4) from the System field.

### Description

Description is free-format text up to 36 characters to describe the system. This is for your reference only, although CICS PA will insert it as a comment in your Report Set JCL.

### Line Actions

- /** Display the menu of line actions.
- S** Select System(s) from a list.
- I** Insert a blank row after this row to specify a related System. You can only specify known Systems; you cannot define new Systems from this panel.
- R** Repeat this row.
- C** Copy this row.
- M** Move this row.
- A** Move/Copy after this row.
- B** Move/Copy before this row.
- D** Delete this row. Only the relationship is deleted, not the System itself.
- X** Reverse the status (Exclude/Include).

### Primary Commands

#### FIND string

This command (or **F**) looks for the specified character string in all columns of displayed data. The string need only be enclosed in quotes if there are embedded spaces. The search is not case sensitive. The display scrolls to the row where the string is found and positions the cursor on the matching data. To find more occurrences, use **F5** or the **RFIND** command repeatedly.

If there is no match but the search did not begin at the start of the list, the screen does not change and the message \*Bottom of data reached\* is displayed. Use **F5** or **RFIND** to search from the top.

If there is no match in the entire list, the screen does not change and a String not found message is displayed.

Also available from **Edit** in the action bar

### **SORT SYSTEM|TYPE|IMAGE|DESCRiption**

This command sorts the list of Systems on the specified column. The default is SYSTEM (then TYPE and IMAGE). The order is retained only until exit or another SORT command is issued.

Also available from **Edit** in the action bar.

### **RESET**

This command (or **RES**) removes all outstanding line actions and deletes any blank rows.

Also available from **Edit** in the action bar.

## **Select Systems**

The Select Systems panel is displayed when you press **Prompt** (F4) from a System field or enter line action **S** on the Systems with this File panel.

It displays the systems that are not already defined to the File. This list is a subset of the systems maintained in the System Definitions view (see Figure 16 on page 75).

Command ==> \_\_\_\_\_

Systems

Row 1 to 5 of 5  
Scroll ==> \_\_\_\_\_

Select one or more Systems then press EXIT.

	System	Type	Image	Description

\*\*\*\*\* End of List \*\*\*\*\*

Figure 35. System Definitions: Select Systems (for a File)

This panel displays a list of systems that are available for selection.

Enter a **/** or **S** line action to select one or more systems from the list.

Press **Exit** (F3) to complete your selection.

---

## **Maintaining Personal Groups**

The Groups view is the primary panel for maintaining your group definitions. You use Groups to group systems for reporting purposes.

To display the Groups view:

- From the System Definitions Menu, select option 3 **Maintain Group definitions**
- From the System Definitions list panel, enter the **VIEW GROUPS** command or select **View->Groups** in the action bar

From the list of Groups you can perform the following actions:

- Define a new group, or copy or repeat a group along with its associated systems

- Update or view the systems that belong to a group, or delete a group that is no longer required
- Use the **FIND** and **SORT** commands to locate entries in the list
- Use **Filter->Set Filter** in the action bar to display only groups that match your specified criteria

File Edit Filter View Options Help

Figure 36. System Definitions: Personal Groups

This panel is used to maintain Groups. CICS PA uses the related Systems (and their SMF Files) in the generation of Report Set JCL. The Use count shows the number of Systems that are defined to each Group.

**Note:** The order of the Systems defined to the Group determine the file sequence in the generated JCL. You might need to adjust the order so the files are in the correct time sequence.

Each listed group has the following attributes:

**Use** The Group Use count. This indicates the number of Systems defined to the Group.

**Group** The name of a Group. The name can be up to eight alphanumeric (A-Z,0-9) or special (@,#,\$) characters.

A Group name is an arbitrary name used to identify a group of related Systems for reporting purposes, such as those systems that connect via IRC/MRO, ISC/APPC, IPIC, or transaction grouping.

**Description** Description is free-format text up to 36 characters to describe the group.

## Line Actions

/	Display the menu of line actions
S	Specify a group and the systems that belong to it
I	Insert a new group
R	Repeat this row
C	Copy this row
M	Move this row
A	Move/Copy after this row
B	Move/Copy before this row
D	Delete this row

**Note:** A row command on this panel applies to the Group definition and all its associated information. For example, copying a row copies the Group details and all its System relationships. Deleting a row deletes the Group and its relationships, but not the Systems themselves.

## Primary Commands

### **NEW name**

This command creates a new Group. The group name must be unique.

Also available from **File** in the action bar.

See Figure 38 on page 102.

**SAVE** This command saves any changes you have made during this invocation of System Definitions.

Also available from **File** in the action bar.

### **FIND string**

This command (or **F**) looks for the specified character string in all columns of displayed data. The string need only be enclosed in quotes if there are embedded spaces. The search is not case sensitive. The display scrolls to the row where the string is found and positions the cursor on the matching data. To find more occurrences, use **F5** or the **RFIND** command repeatedly.

If there is no match but the search did not begin at the start of the list, the screen does not change and the message \*Bottom of data reached\* is displayed. Use **F5** or **RFIND** to search from the top.

If there is no match in the entire list, the screen does not change and a String not found message is displayed.

Also available from **Edit** in the action bar.

### **SORT GROUP|DEScRiption**

This command sorts the list of Groups by name (the default) or description. The order is retained on exit.

Also available from **Edit** in the action bar.

### **RESET**

This command (or **RES**) removes all outstanding line actions.

Also available from **Edit** in the action bar.

### **VIEW SYSTEMS|FILES**

This command takes you to the Systems or Files view. Updates are saved when you change views.

Also available from **View** in the action bar.

### **MENU**

This command takes you to the System Definitions Menu. Updates are saved when you go to the menu.

Also available from **View** in the action bar.

## Set Filter (Groups)

The Set Filter panel is displayed when you select **Filter->Set Filter** in the action bar of the Groups panel.

```

----- Set Filter -----
Command ==> _____

Specify or revise filtering criteria then press Enter.

Group Name . . . _____ (Blank or pattern)

```

Figure 37. System Definitions: Set Filter (Groups)

This facility allows you to filter the amount of information displayed in the current view.

Specify a name or pattern for **Group Name** then press **Enter** to set the filter on. Masking characters % and \* are allowed.

A group will only be displayed in the filtered view if the group name matches the pattern. For example, MRO% will display MRO1 but not MRO nor MRO999. MRO\* will display all three.

Groups not displayed are not deleted. Exit, Save, or Cancel processing applies to the entire list of groups, regardless of whether they are displayed or filtered out.

When filtering is in effect **Filter Mode - More:** is displayed in the top right corner after the panel title. On initial entry to the Groups view, no filtering is in effect.

To reset the filter and redisplay all intervals and the row count, select **Filter->Set filter off** in the action bar. The filtering criteria will remain dormant in the Set Filter panel.

### Systems in this Group

To display the panel for maintaining Systems that belong to a Group, enter the line action **S** (Select an existing Group) or **I** (Insert a new Group) from the Groups view.

```

File Edit Options Help

Figure 38. System Definitions: Systems in this Group

This panel allows you to specify the systems that belong to the Group. To select one or more from a list of available systems, position the cursor on the System field and press **Prompt** (F4) or enter the **S** line action.

A group is identified by its name and description:

### Group

The name of a Group to uniquely identify a group of systems. The name can be up to eight alphanumeric (A-Z,0-9) or special (@,#,\$) characters.

A Group name is an arbitrary name used to identify a group of related CICS systems for reporting purposes, such as those systems that connect via IRC/MRO, ISC/APPC, IPIC, or transaction grouping.

### Description

Description is free-format text up to 36 characters to describe the group.

Each system in the list has the following attributes:

### System, Type, Image

A System is identified by the combination of:

- System name which is one of the following depending on the type:
  - CICS generic APPLID
  - MVS (SMF) Image ID
  - DB2 Subsystem ID
  - WebSphere MQ Subsystem ID
  - MVS System Logger
- Type of System: CICS, Image, DB2, MQ, or Logger
- MVS (SMF) Image ID

You can enter a system name directly. Alternatively, to select one or more from a list, enter the line action **S** or press **Prompt** (F4) from the System field.

### Description

Description is free-format text up to 36 characters to describe the system. This is for your reference only, although CICS PA will insert it as a comment in your Report Set JCL.

**Line Actions:** The following line actions can be entered against any row in the list of related Systems:

- |          |   |
|----------|---|
| <b>/</b> | Display the menu of line actions.   |
| <b>S</b> | Select System(s) from a list.   |
| <b>I</b> | Insert a blank row after this row to specify a related System.            |
| <b>R</b> | Repeat this row.  |
| <b>C</b> | Copy this row.  |
| <b>M</b> | Move this row.  |
| <b>A</b> | Move/Copy after this row.   |
| <b>B</b> | Move/Copy before this row.  |
| <b>D</b> | Delete this row. Only the relationship is deleted, not the System itself. |

**Note:** You can only specify known Systems; you cannot define new Systems from this panel.

**Primary Commands:** The following primary commands are valid for this panel:

### FIND string

This command (or **F**) looks for the specified character string in all columns of displayed data. The string need only be enclosed in quotes if there are embedded spaces. The search is not case sensitive. The display scrolls to the row where the string is found and positions the cursor on the matching data. To find more occurrences, use **F5** or the **RFIND** command repeatedly.

If there is no match but the search did not begin at the start of the list, the screen does not change and the message \*Bottom of data reached\* is displayed. Use **F5** or **RFIND** to search from the top.

If there is no match in the entire list, the screen does not change and a String not found message is displayed.

Also available from **Edit** in the action bar.

#### **SORT SYSTEM|TYPE|IMAGE|DEScRiption**

This command sorts the list of Systems on the specified column. The default is SYSTEM (then TYPE and IMAGE). The order is retained on exit.

Also available from **Edit** in the action bar.

#### **RESET**

This command (or **RES**) removes all outstanding line actions and deletes any blank rows.

Also available from **Edit** in the action bar

### **Select Systems**

The Select Systems panel is displayed when you press **Prompt** (F4) from a System field or enter line action **S** on the Systems in this Group panel.

It displays the systems that are not already defined to the Group. This list is a subset of the systems maintained in the System Definitions view (see Figure 16 on page 75).

Command ==> \_\_\_\_\_
Systems
Row 1 to 4 of 4

Scroll ==> \_\_\_\_\_

Select one or more Systems then press EXIT.

System +	Type	Image	Description
. CICSPO01	CICS	MVS1	CICS system CICSPO01/MVS1
. CICSDO01	CICS		CICS system CICSDO01
. DB2P	DB2	MVS1	DB2 subsystem DB2P/MVS1
. MVS1	Logger		MVS system MVS1

\*\*\*\*\* End of List \*\*\*\*\*

*Figure 39. System Definitions: Select Systems (for a Group)*

This panel displays a list of systems that are available for selection.

Enter a **/** or **S** line action to select one or more systems from the list.

Press **Exit** (F3) to complete your selection.

## **Personal Take-Up from SMF File**

The Data Take-up panel is displayed when you select option 4 **Take-Up from SMF File** from the System Definitions Menu. However, if you opted to bypass the menu and go straight to System Definitions, you can redisplay the Menu by selecting **View->Menu** in the action bar or by entering the **MENU** command.

```

File  Options  Help
-----
                                Data Take-Up from SMF
Command ==> _____

Specify the SMF File for data take-up.

Data Set Name . . . 'CICSPA.LOGGER.SMFDATA1' _____

Specify details if data set is not cataloged:
UNIT . . . . . _____ +          VOLSER . . . _____ +
SEQ Number . . ____ (1 to 255)

Execution Mode:
1  1. Submit Batch JCL
_  2. Edit Batch JCL

F1=Help    F3=Exit    F4=Prompt  F6=Resize  F10=Actions
F12=Cancel

```

Figure 40. Personal System Definitions: Take-Up from SMF File

CICS PA can automatically populate your System Definitions with details extracted from SMF Files. This panel allows you to specify details of an SMF File for data take-up.

Specify the data set name and if not cataloged, the unit, sequence number, and up to 16 volume serial numbers.

A batch job is generated to extract the take-up details from the SMF data set. You can choose to submit the job immediately or first edit the JCL. See “Take-Up JCL” on page 106.

The options are:

#### Data Set Name

The name of an SMF data set from which you want CICS PA to extract System details for automatic take-up into your System Definitions.

Normal ISPF data set conventions apply. Fully qualified data set names must be enclosed in quotes, except if **PROFILE NOPREFIX** is set.

If the data set is not cataloged, then specify UNIT, SEQ, or VOLSER

**UNIT** The generic or esoteric device type of the data set, such as 3390, SYSDA, or CART. This must be a device type that is defined as either TAPE or DASD in the Eligible Device Table of the current processor. To select one from a list of possible Units, position the cursor on the UNIT field and press **Prompt** (F4).

**SEQ** The File Sequence Number is only required for uncataloged tape data sets. It identifies the relative position of the data set on a tape volume. Omit, or code 0 or 1 to indicate the first data set on the tape volume.

#### VOLSER

The volume serial number of the data set. It is only required for uncataloged data sets. If a VOLSER is specified, then a UNIT must also be specified.

If the data set spans multiple volumes, only the first one is displayed on this panel. To specify up to 16 volumes, position the cursor on the VOLSER field and press **Prompt** (F4) to display the VOLSER List.

## Execution Mode

Specify **1** to submit the batch job immediately.

Specify **2** to edit the JCL. From the edit panel, then enter the **SUBMIT** (or **SUB**) command to run the job.

Check the results of the batch job. See “Job output.”

When you next invoke System Definitions, you are prompted to update your System Definitions with the results of the batch job. See “Applying Take-Up details” on page 107.

## Take-Up JCL

Figure 41 is an example of the JCL that is generated to extract the take-up details from the SMF file.

CPA2000I Take-up processing has completed, RC=0
```

Figure 42. Personal System Definitions: Take-up job output

When the take-up job has completed, you can then apply the results of the Take-up. Next time you enter System Definitions, you are prompted to apply the results of Take-up.

## Applying Take-Up details

The following panel is displayed on entry to System Definitions when you have not yet processed the results of completed batch take-up jobs.

Command ==> \_\_\_\_\_

Data Take-Up from SMF

\*\*\*\*\*  
\* Take-Up from SMF \*  
\*\*\*\*\*

CICS PA has completed extracting systems from the following  
SMF File:  
  
Data Set . . : 'CICSPA.LOGGER.SMFDATA1'

Instructions:  
Press **ENTER** to continue adding the systems.  
Enter **DEFER** command to defer adding the systems.  
Enter **END** or **CANCEL** command to cancel adding the systems.

Figure 43. Personal System Definitions: Take-up (apply results)

You have three choices:

- Press **Enter** to proceed with the take-up. CICS PA merges the results of the take-up into your System Definitions. Only systems and files not already defined are added.
- Enter the **DEFER** command to defer the take-up but proceed with System Definitions as normal. Next time you invoke System Definitions you will again be prompted to process the results of the take-up.
- Enter **END** (F3) or **CANCEL** (F12) to discard the results of the take-up and continue with System Definitions as normal.

---

## Example: Working with Personal Systems

The System Definitions facility in the CICS PA dialog requires some planning to ensure that you are able to best meet your reporting requirements. CICS PA has some powerful features that will help you to define your System Definitions. This section provides some useful tips on how to use these features.

As you work through this example, if you do not understand some points, please see Chapter 6, “Personal System Definitions,” on page 69 for clarification.

### 1. The System Definitions menu.

From the Primary Option Menu, option 1 **System Definitions** takes you to the System Definitions menu. From this menu, you are able to define your CICS systems, and maintain your SMF Files and Groups.

### 2. Using Take-up to define your CICS systems.

You can explicitly define you CICS systems, but an easier way to define your systems is by using option 4 **Take-up from SMF File**. Take-up populates your System Definitions with systems found in your SMF File.

File	Options	Help
-----		
Data Take-Up from SMF		
Command ==> _____		
Specify the SMF File for data take-up.		
Data Set Name . . . 'MVS1.SMFDATA' _____		
Specify details if data set is not cataloged:		
UNIT . . . . .	_____ +	VOLSER . . . _____ +
SEQ Number . .	_____ (1 to 255)	
Execution Mode:		
1 1. Submit Batch JCL		
2. Edit Batch JCL		

Specify the SMF File that contains records from the systems that you want to define, and then press Enter to submit the Take-up job.

Review the Take-up job output to see the systems detected by CICS PA in the File.

V5R1M0 17:29:39 1/13/2012 CICS Performance Analyzer Page 1  
Take-up from SMF

```
CPA2012I Processing started for SMF file SMFIN001
CPA2017I SMF records for System MVS1 start at 1/13/2012 15:41:38.39
CPA2014I CMF record for CICS system found, APPLID=CICPTOR1 Release=6.8.0
CPA2014I CMF record for CICS system found, APPLID=CICPAOR1 Release=6.8.0
CPA2014I CMF record for CICS system found, APPLID=CICPAOR2 Release=6.8.0
CPA2014I CMF record for CICS system found, APPLID=CICPDOR1 Release=6.8.0
CPA2023I CICS TG record for CICS system found, APPLID=CICSTG01
CPA2015I DB2 Accounting record found, DB2 SSID=DB2P Release=8.1
CPA2016I MVS System Logger record found, System=MVS1LOGR
CPA2013I Processing ended for SMF file SMFIN001 - 8 system(s) found
CPA2000I Take-up processing has completed, RC=0
```

After the take-up job has completed, you can then apply the results of the Take-up. Next time you enter System Definitions, you are prompted to apply the results of Take-up.

Data Take-Up from SMF	
Command ==> _____	
*****	
* Take-Up from SMF *	
*****	
CICS PA	
has completed extracting systems from the following	
SMF File:	
Data Set . . : 'MVS1.SMFDATA'	
Instructions:	
Press <b>ENTER</b> to continue adding the systems.	
Enter <b>DEFER</b> command to defer adding the systems.	
Enter <b>END</b> or <b>CANCEL</b> command to cancel adding the systems.	

Press Enter to complete the Take-up process.

### 3. Updating your System Definitions.

You can now update your System Definitions by using option 1 **Define Systems, SMF Files and Groups**.

```

                                Personal System Definitions
Command ==> _____ Row 1 from 8
                                Scroll ==> PAGE

Select a System to edit its definition, SMF Files and Groups.

/ System Type Image Description SMF Files
- MVS1 Image MVS1 Production MVS Image is MVS1 MVS1
- CICPAOR1 CICS MVS1 Production AOR #1 MVS1
- CICPAOR2 CICS MVS1 Production AOR #2 MVS1
- CICPDOR1 CICS MVS1 Production DOR #1 MVS1
- CICPTOR1 CICS MVS1 Production TOR #1 MVS1
- CICSTG01 CICS MVS1 Production CICS TG #1 MVS1
- DB2P DB2 MVS1 Production DB2 subsystem MVS1
- MVS1LOGR Logger MVS1 System Logger for Image MVS1 MVS1
***** End of list *****

```

You will notice that your CICS (and possibly DB2, MQ, System Logger, and CICS Transaction Gateway) systems are defined. Update the System descriptions for easier identification.

Note the SMF Files indicators. Image MVS1 “owns” the SMF File, MVS1.SMFDATA. All other systems can use Image MVS1’s file because their definitions specify the same Image name of MVS1, that is, these systems run on Image MVS1.

The systems are now ready for immediate reporting, however we will assign the systems to a Group to demonstrate Cross-System style reporting.

#### 4. Defining a Group.

You can group your systems together by defining them to a Group by using option 3 **Maintain Group definitions**. Use the **NEW** command to define a new Group.

```

                                Systems in this Group
Command ==> _____ Row 1 to 1 of 1
                                Scroll ==> PAGE

Group . . . . . PROD
Description . . . Production CICS MRO Group

/ System + Type Image Description
S _____
***** End of list *****

```

Use the **S** line action to select systems for Group PROD.

```

                                Systems
Command ==> _____ Row 1 to 11 of 11
                                Scroll ==> PAGE

Select one or more Systems then press EXIT.

/ System Type Image Description
S CICPAOR1 CICS MVS1 Production AOR #1
S CICPAOR2 CICS MVS1 Production AOR #2
S CICPDOR1 CICS MVS1 Production DOR #1
S CICPTOR1 CICS MVS1 Production TOR #1
S CICSTG01 CICS MVS1 Production CICS TG #1
S DB2P DB2 MVS1 Production DB2 subsystem
S MVS1 Image MVS1 Production MVS Image is MVS1
S MVS1LOGR Logger MVS1 System Logger for Image MVS1
***** End of List *****

```

All CICS systems, the CICS Transaction Gateway system, the DB2 subsystem, and the System Logger are selected. Exit to insert these systems into Group PROD.

```

                                Systems in this Group                                Row 1 to 6
Command ==> _____ Scroll ==> PAGE

Group . . . . . PROD
Description . . . Production CICS MRO Group

/ System + Type      Image      Description
- CICPAOR1 CICS      MVS1      Production AOR #1
- CICPAOR2 CICS      MVS1      Production AOR #2
- CICPDOR1 CICS      MVS1      Production DOR #1
- CICPTOR1 CICS      MVS1      Production TOR #1
- CICSTG01 CICS      MVS1      Production CICS TG #1
- DB2P      DB2       MVS1      Production DB2 subsystem
- MVS1LOGR  Logger    MVS1      System Logger for Image MVS1
***** End of list *****

```

Group PROD is now ready for immediate reporting.

## 5. Running a Report Set.

Select Primary Option Menu option 2 **Report Sets** to invoke the Report Sets facility.

This section will not go into the detail of specifying reports in a Report Set, but rather give examples of how to specify System Selection at run time. Note that you can specify the System(s) to be reported by defining them explicitly in the Report Set, but we will specify them at run time.

```

                                Report Sets                                Row 1 to 4 of 4
Command ==> _____ Scroll ==> PAGE

Report Sets Data Set . . : user.CICSPA.RSET

/ Name      Description      Changed      ID
- CROSSSYS Cross-System reporting 2005/01/13 16:08 CICSPA
- DAILY     Daily CICS Performance reports 2005/01/13 16:08 CICSPA
RUN DB2     DB2 reporting      2005/01/13 16:08 CICSPA
- WEEKLY    Weekly CICS Performance reports 2005/01/13 16:09 CICSPA
***** End of list *****

```

Enter the **RUN** command to run Report Set DB2. This displays the Run Report Set panel from where you are able to specify the Systems to be reported.

## 6. Running a Report Set against an individual System.

To run a Report Set against an individual System, specify the CICS APPLID, DB2 SSID, MQ SSID, or Logger system name. In this example, we will run the DB2 Report Set against CICS APPLID CICPDOR1 that uses DB2 SSID DB2P.

File Systems Options Help			
-----			
Run Report Set DB2			
Command ==> _____			
Specify run Report Set submission options then press Enter to continue submit.			
System Selection:			
CICS APPLID . .	CICPDOR1	+ Image . .	MVS1_____ + Group . . _____ +
DB2 SSID . . .	DB2P	+ Image . .	MVS1_____ + Group . . _____ +
MQ SSID . . .	_____	+ Image . .	_____ + Group . . _____ +
Logger . . . .	_____	+ Image . .	_____ + Group . . _____ +
_ Override System Selections specified in Report Set			
_ Read SMF File to EOF			
Missing SMF Files Option:		----- Report Interval -----	
2	1. Issue error message	From	YYYY/MM/DD HH:MM:SS.TH
	2. Leave DSN unresolved in JCL	To	2004/12/08 09:00:00.00
	3. Disregard offending reports		2004/12/08 16:00:00.00
Enter "/" to select option			
/ Edit JCL before submit			
F1=Help F3=Exit F4=Prompt F7=Backward F8=Forward F10=Actions			
F12=Cancel			

The generated JCL will request the DB2 report to be run against the specified CICS APPLID CICPDOR1 using DB2 SSID DB2P:

```
//JOBNAME JOB (ACCOUNT),'NAME'
//* CICS PA V5R1 Report JCL
//CICSPA EXEC PGM=CPAMAIN
//STEPLIB DD DSN=CPA.V5R1M0.SCPALINK,DISP=SHR
//SYSPRINT DD SYSOUT=*
//* SMF Input Files
//SMFIN001 DD DSN=MVS1.SMFDATA,DISP=SHR

. . .
//* Command Input
//SYSIN DD *
* Report Set =DB2
* Description=DB2 reporting
      CICSPA SMFSTART(2004/12/08,09:00:00.00),
      SMFSTOP(2004/12/08,16:00:00.00)
* Reports for System=CICPDOR1
*       Image =MVS1
*       Description=Production DOR #1
      CICSPA IN(SMFIN001),
      APPLID(CICPDOR1),
      DB2(OUTPUT(DB2R0001),
      SSID(DB2P),
      LONGSUM)
/*
```

Notice that the APPLID and SSID operands specify the CICS generic APPLID and DB2 Subsystem ID that were requested for reporting.

## 7. Running a Report Set against a Group of Systems.

To run a Report Set against a Group, specify the Group name. In this example, we will run the CROSSSYS Report Set against Group PROD.

Run Report Set CROSSSYS			
Command ==> _____			
Specify run Report Set submission options then press Enter to continue submit.			
System Selection:			
CICS APPLID . . . _____	+	Image . . . _____	+
DB2 SSID . . . _____	+	Image . . . _____	+
MQ SSID . . . _____	+	Image . . . _____	+
Logger . . . . . _____	+	Image . . . _____	+
<input type="checkbox"/> Override System Selections specified in Report Set <input type="checkbox"/> Read SMF File to EOF			
Missing SMF Files Option:		----- Report Interval -----	
2 1. Issue error message		YYYY/MM/DD HH:MM:SS.TH	
- 2. Leave DSN unresolved in JCL		From 2004/12/08 09:00:00.00	
3. Disregard offending reports		To 2004/12/08 16:00:00.00	
Enter "/" to select option			
/ Edit JCL before submit			
F1=Help      F3=Exit      F4=Prompt      F7=Backward      F8=Forward      F10=Actions			
F12=Cancel			

The generated JCL will request the Cross-System report to be run against the specified Group PROD:

```
//JOBNAME JOB (ACCOUNT),'NAME'
//* CICS PA V5R1 Report JCL
//CICSPA EXEC PGM=CPAMAIN
//STEPLIB DD DSN=CPA.V5R1M0.SCPALINK,DISP=SHR
//SYSPRINT DD SYSOUT=*
//* SMF Input Files
//SMFIN001 DD DSN=MVS1.SMFDATA,DISP=SHR

. . .
//* Command Input
//SYSIN DD *
* Report Set =CROSSSYS
* Description=CICS PA Report Set
      CICSPA SMFSTART(2004/12/08,09:00:00.00),
      SMFSTOP(2004/12/08,16:00:00.00)
* Reports for Group=PROD
*      Description=Production CICS MRO Group
      CICSPA IN(SMFIN001),
      APPLID(CICPAOR1,
      CICPAOR2,
      CICPTOR1,
      CICPDOR1),
      CROSS(OUTPUT(CROS0001),
      EXTERNAL(CPAXW001),
      PRINTMULTIPLE,NOPRINTSINGLE,NOWRITE)
/*
```

Notice that the APPLID operand specifies all CICS generic APPLIDs belonging to group PROD which was the Group requested for reporting.

## 8. Running a Report Set against all Systems on an MVS Image.

To run a Report Set against an Image, specify the Image name. In this example, we will run the DAILY Report Set against Image MVS1.

Run Report Set DAILY

Command ==> \_\_\_\_\_

Specify run Report Set submission options then press Enter to continue submit.

System Selection:

CICS APPLID . . \_\_\_\_\_ + Image . . **MVS1**\_\_\_\_\_ + Group . . \_\_\_\_\_ +

DB2 SSID . . . \_\_\_\_\_ + Image . . \_\_\_\_\_ + Group . . \_\_\_\_\_ +

MQ SSID . . . \_\_\_\_\_ + Image . . \_\_\_\_\_ + Group . . \_\_\_\_\_ +

Logger . . . . \_\_\_\_\_ + Image . . \_\_\_\_\_ + Group . . \_\_\_\_\_ +

\_ Override System Selections specified in Report Set

\_ Read SMF File to EOF

Missing SMF Files Option:

2 1. Issue error message

\_ 2. Leave DSN unresolved in JCL

3. Disregard offending reports

----- Report Interval -----

YYYY/MM/DD HH:MM:SS.TH

From 2004/12/08 09:00:00.00

To 2004/12/08 16:00:00.00

Enter "/" to select option

\_ Edit JCL before submit

F1=Help F3=Exit F4=Prompt F7=Backward F8=Forward F10=Actions

F12=Cancel

The generated JCL will request the Performance Summary report to be run against the specified Image MVS1. Note the NOAPPLID operand, which specifies that all CICS systems are reported.

```

//JOBNAME JOB (ACCOUNT),'NAME'
//* CICS PA V5R1 Report JCL
//CICSPA EXEC PGM=CPAMAIN
//STEPLIB DD DSN=CPA.V5R1M0.SCPALINK,DISP=SHR

                DISPATCH(TIME(AVE)),
                CPU(TIME(AVE)),
                SUSPEND(TIME(AVE)),
                DISPWAIT(TIME(AVE)),
                FCWAIT(TIME(AVE)),
                FCAMCT(AVE),
                IRWAIT(TIME(AVE)),
                SC24UHW(M(AVE)),
                SC31UHW(M(AVE)),
                TITLE1(
                    'Transaction Summary by Time-of-Day
/*
'))

```

---

## Chapter 7. Shared System Definitions

Shared System Definitions define the CICS and other related systems to be reported via Report Sets or HDB. Shared System Definitions are saved in the Repository, and can be referenced by everyone who shares the same Repository.

---

### Use Shared or Personal?

Shared System Definitions offer an alternative to using Personal System Definitions (see Chapter 6, “Personal System Definitions,” on page 69). The advantages of using Shared System Definitions include:

- All CICS PA users can share the same definitions, avoiding duplication.
- SMF File selection for batch reporting requests is automated.
- One or more Personal System Definitions can be consolidated in to a single Shared System Definition repository by using Take-up.
- Support for SMF data in log streams.

At Report Set or HDB run time, you can choose to use either Personal System Definitions or Shared System Definitions to select the SMF input data sets, or to merge both sets of definitions. Merging Personal and Shared definitions gives great flexibility in combining systems without the need for duplicating definitions.

Use **Systems** in the action bar to switch between using only Personal System Definitions, only Shared System Definitions, or both. If you choose to use both, you can specify which is to take precedence if there are two definitions with the same name. In the following figure, option 5 is selected so the Personal System Definitions would take precedence.

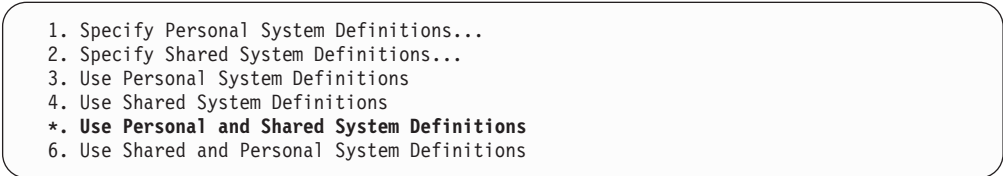

- 
1. Specify Personal System Definitions...
  2. Specify Shared System Definitions...
  3. Use Personal System Definitions
  4. Use Shared System Definitions
  - \*. Use Personal and Shared System Definitions
  6. Use Shared and Personal System Definitions

Figure 44. Systems action bar: Use Personal or Shared System Definitions

---

### Shared SMF File definitions

Shared SMF File definitions provide automatic SMF file selection when you generate Report Set or HDB load JCL. There are three types of SMF File definitions: daily SMF files, cyclic SMF files, and SMF log streams.

#### Daily SMF files

Daily SMF files span a period of time for the current day (today). They are used when you request reporting for today.

Daily SMF files are typically GDGs, one generation created by each SMF dump (IFASMFDP) job. They can only be defined by the **Take-up from SMF File** facility.

A daily SMF file remains available for reporting until you uncatalog or delete its data set. When a daily SMF data set is uncataloged or deleted,

CICS PA marks its SMF file definition as “expired” (no longer available for reporting). To delete expired daily SMF file definitions, run the HDB housekeeping utility.

### **Cyclic SMF files**

There are two types of cyclic SMF file:

#### **Cyclic files with an origin**

These files cover a known period of time, according to the origin, interval, and DISP values that you specify. CICS PA uses these values to determine which data sets to select for a requested reporting period. These cyclic SMF files are typically GDGs. For example, a weekly SMF GDG where the most recent cycle (generation 0) spans the current week, -1 is last week, and so on. CICS PA supports various intervals, including daily, weekly, monthly, yearly and fixed (number of days) cycles.

#### **Cyclic files with no origin**

Cyclic SMF files with an origin value of NONE (no origin) cover an undetermined period of time. Specify an origin of NONE when you want to explicitly select a particular SMF data set for reporting, regardless of the reporting period.

You cannot report on a mix of cyclic SMF files with and without origins. If a system contains definitions for cyclic SMF files with and without origins, then you must either exclude the files with no origin, or exclude all of the others.

You specify one or more cyclic SMF file definitions that match the way you collect and manage long-term SMF data at your installation.

### **SMF log streams**

CICS PA can read SMF log streams directly, giving you access to very recent data without the need for the SMF dump utility to first create an offline file. CICS PA can locate and process the required SMF data quickly, regardless of whether the reporting period spans several months or the last few minutes.

Like data sets, log streams are referenced by name. Wherever a log stream is specified in the product, the name must be prefixed with IFASMF and cannot be enclosed in quotes. Example:

IFASMF.FTS1.SMF.MAN1

There are two types of log stream: Coupling Facility (CF) and DASD-only. CF log streams are available to all images in the plex and do not require any special processing. DASD-only log streams are created by and can only be accessed by their local MVS Image. DASD-only log streams require the CICS PA job to be run on their local system and therefore require special handling.

It is possible to route different SMF records to separate log streams, so that for example one log stream contains CMF records, while another contains DB2 records, and yet another contains WebSphere MQ records. Since some CICS PA reports combine records from different data sources, CICS PA supports multiple log streams as input into reports.

Log streams have almost unlimited capacity. Therefore, when processing log streams in CICS PA, specification of the reporting time range is mandatory.

The DASDONLY profile option (menu option 0.5) determines the log stream type for all log streams in all system definitions. If selected, this option indicates that all log streams will be treated as DASD-only and will require an Image name to execute. If DASDONLY is not selected, all log streams are treated as CF log streams.

**Note:** Sites that have a mix of CF and DASD-only log streams are limited in their ability to combine the two log stream types. For example, if CICS SMF records are written to a DASD-only log stream and DB2 records are written to a CF log stream in different system images, a System Definition must be defined for every combination of DB2 and Image since the CICS and DB2 Images must be the same to be selected for DASD-only log streams.

## Log stream retention period (RETPD)

SMF log streams have a retention period specified in days (0-65536). Records older than the retention period are considered inactive but might not be deleted immediately. Inactive records that are still stored in the log stream are available for reporting through CICS PA.

You can specify a RETPD value in the system definition. This value is used to calculate a start date for CICS PA reporting. It has no effect on the SMF log stream itself. Specify a value in the following range:

**0** All records in the log stream are eligible for reporting.

**( < the log stream retention period)**

Records older than this are not eligible for reporting.

**( = the log stream retention period)**

Recommended. All active records are eligible for reporting.

**( > the log stream retention period)**

Records within this period are eligible for reporting even if they are inactive.

**65536** The maximum value.

## File selection at run time

When Shared System Definitions are used, all batch requests (that require SMF input) will have their SMF file DD statements generated automatically from either the Daily SMF File or Cyclic SMF File or log stream definitions. Specify the required reporting interval, and CICS PA will automatically select the required SMF files for your job.

If reporting is required for today, then CICS PA will use the Daily SMF Files (if available). Otherwise, CICS PA will use the Cyclic SMF File definitions to satisfy your request. If no SMF file definitions cover the required reporting interval, then CICS PA will honor the “Missing SMF Files Option” on the run panel.

A log stream is only selected if the report interval Start time falls within the span of the log stream and the “Use Log Streams when available” profile option is selected. Otherwise, normal file selection is performed. The log stream retention period (RETPD) in the System Definition is used to determine the start time of the first record in the log stream.

To avoid double accounting of SMF data, JCL generation prevents the use of a log stream with SMF files. However, you can define a log stream and SMF files in the same System Definition and either the log stream or files will be selected based on the specified report interval.

## Shared System Definitions Menu

Shared System Definitions are saved in the Repository.

To maintain Shared System Definitions, select option 1 **Systems** from the Primary Option Menu, and then select option 2 **Shared Systems** from the Systems menu. Alternatively, you can select **Systems** in the action bar of reporting panels (see Figure 44 on page 115). The Shared System Definitions Menu panel is shown in Figure 45.

Figure 46. Shared System Definitions: List of systems

The Shared System Definitions list is similar to the Personal System Definitions list. Shared systems differ slightly from personal systems because the file definitions are different.

Enter the **NEW** command or press **F6** to define a new system, or enter line action **S** to select a system from the list.

CICS PA supports the following types of system definitions:

- CICS (APPLID)
- MVS Image
- DB2
- MQ
- System Logger

## CICS System (APPLID) definition

The CICS System details are presented across three views:

1. System Definition attributes
2. Cyclic SMF Files
3. Daily SMF Files

Press **Next** (F11) or **Prev** (F10) to move between the views.

### View 1. System Definition attributes

The first view displays all the System Definition attributes.

### View 2. Cyclic SMF Files

The second view displays Cyclic SMF File definitions.

Cyclic SMF files are the definitions of SMF Files that cover a continuously recurring period of time, and consistently contain data for this system.

Cyclic SMF files are typically GDGs. For example, a weekly SMF GDG where the most recent cycle (generation 0) spans the current week, -1 is last week, and so on.

You specify one or more Cyclic SMF file definitions that match the way you collect and manage long-term SMF data at your installation. CICS PA supports the many ways you can setup your SMF environment, including daily, weekly, monthly, yearly and fixed (number of days) cycles.

The Cyclic SMF File definitions are used at report request time. Cyclic SMF Files are automatically inserted into your Report request JCL when you request reporting for a time period that is spanned by an active generation of a cycle, and Shared System Definitions are active (not Personal. Refer to **Systems** in the action bar when submitting a Report request).

For systems that share SMF Files, it is recommended that Cyclic SMF Files be defined to the associated MVS Image (rather than each System repetitively). CICS PA will detect this and use the SMF Files defined to the Image.

Figure 48. Shared CICS System Cyclic SMF Files

The Cyclic File details are:

#### Cyclic SMF File GDG Base or Data Set Name

The SMF File GDG Base name, or the SMF File data set name. For example:

```
'SMF.MVS1.DAILY'
'CICSPROD.SMF.WEEKLY'
```

You can use the following symbolic variables in an SMF File data set name:

```
&YYYY      4-digit year
&YY        2-digit year (20yy)
&MM        Month (01-12)
&DD        Day of the month (01-31)
&DDD       Day of the year (001-366)
```

For example:

```
'CICSPROD.SMF.D&YY&MM&DD'
'CICSPROD.SMF.D&YY.&MM.&DD'
```

You can optionally terminate a variable name with a period. This period will not appear in the resolved data set name, so these examples resolve to

the same name. If you want a period to appear after a variable value in the resolved name, insert a second period:

```
'CICSPROD.SMF.Y&YYYY..D&DDD'
```

If you use symbolic variables:

- In the Origin field, use asterisks to represent the digits of the origin date that are determined by symbolic variables.
- The origin date and the interval must be compatible with the symbolic variables. For example, if you use the variable &DDD, then the origin date must be in Julian format.

## Origin

The starting point of each new interval, defining the point in time when the SMF file was created. Origin can be:

**Day** A new cycle starts every day, defining a daily cycle.

### Day of the week

A new cycle starts on the specified day, defining the start of a weekly cycle. Allowed values are the seven days of the week: MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY, SUNDAY.

**Date** The first cycle starts on the specified date, and continues cycling forwards from that point in time. Cycles that commence on a date are monthly, yearly or fixed number of days cycles.

If the SMF data set name does not include symbolic variables, then the allowed values are:

```
yyyy-mm-dd
****-mm-dd
yyyy-ddd
****-ddd
```

where \*\*\*\* specifies the current year, indicating that the cycle restarts from this point every year.

If the SMF data set name includes symbolic variables, then there are many more allowed values: you use asterisks in the origin value to match the symbolic variables in the data set name. For some examples, see “How CICS PA selects cyclic SMF files for reporting” on page 123.

## CDATE

A new cycle starts on the file creation date. The SMF file contains data starting from the date the file was created.

**Note:** If you specify CDATE, CDATE+*nnn*, or CDATE-*nnn*, and the value resolves to a date earlier than 2000/01/01 (January 1, 2000), then the date is treated as if you had specified 2000/01/01.

### CDATE+*nnn*

A new cycle starts *nnn* number of days after the file creation date. That is, the SMF file contains data starting *nnn* number of days after the file was created. For example, CDATE+1 specifies a file that is created before midnight to contain tomorrow's data.

### CDATE-*nnn*

A new cycle starts *nnn* number of days before the file creation date. That is, the SMF file contains data starting *nnn* number of

days before the file was created. For example, CDATE-5 specifies a file that is created and then filled with data starting from five days ago.

#### **NONE**

No origin. Specify NONE when you want to explicitly select a particular SMF file for ad-hoc reporting, rather than CICS PA selecting appropriate SMF files for a requested reporting period. You cannot report on a mix of files with and without origins. If a system contains cyclic SMF file definitions with an origin of NONE and cyclic SMF file definitions with other origin values, then you must either exclude the files with an origin of NONE, or exclude all of the others.

#### **Interval**

The time duration of one cycle of data. Interval can be a number of days (0 indicating an indefinite interval) or DAY, WEEK, MONTH, YEAR.

The allowed interval values depend on the Origin specification:

##### **Origin Interval**

**DAY** 1 (day)

##### **Day of the week**

WEEK

**Date** All allowed values

**DISP** Specifies whether the SMF file accumulates (DISP=MOD) data or does not accumulate (DISP=OLD) data over the interval.

#### **DISP=MOD**

New cycles commence at the start of an interval, and continuously append new data to the SMF file until the end of the interval. For example, a daily SMF file is created at the start of the day and is continuously updated during the day by the SMF dump process. The most recent generation of the SMF file contains data for the current interval (today). DISP=MOD cycles cover the current interval (up until today).

#### **DISP=OLD**

New cycles are created at the end of the interval. For example, a weekly SMF file that is created at the end of the week from the daily SMF files for that week. The most recent generation contains data for the previous interval (last week), not the current interval (this week). Note that a weekly SMF file could also be defined as DISP=MOD if it is being built on a daily basis. DISP=OLD cycles do not cover the current interval. Other cyclic (or Daily) SMF Files are required in this case.

**Line Actions:** The valid line actions for the Cyclic SMF Files view are:

- /** Display the selection list of line actions
- I** Insert a blank row for entry of a related file
- R** Repeat this row
- C** Copy this row
- M** Move this row
- A** Move/Copy after this row
- B** Move/Copy before this row
- D** Delete this row
- X** Reverse Exclude Status (CICS PA omits excluded files from report requests)

- S        Show a list of the data sets that belong to the GDG base or that match the data set name for this SMF file

## Methods of managing SMF data sets

Cyclic file definitions support several methods of managing SMF data sets. Select one (or more) of the following methods that best suits your environment:

### GDG SMF files

Generation Data Group data sets span a regular interval: for example, daily, weekly, monthly, yearly, and fixed (number of days) cycles. Define GDG cyclic files by specifying the GDG base name. CICS PA will use this definition when one or more of the generations cover the required reporting period.

### SMF files with symbolic date variables

SMF files with symbolic date variables have data set names that change according to the date they were created. For example, `CICSPROD.D&YY&MM&DD..SMF` defines an SMF file that is created daily to contain today's SMF data. In this case, `CICSPROD.D060331.SMF` contains data for March 31, 2006.

### SMF files with fixed data set names

SMF files with fixed data set names cover a period of time determined by the interval that you specify. For example, `CICSPROD.JULY.SMF` contains SMF data for the month of July.

### Ad hoc SMF files

Ad hoc SMF files have fixed data set names, cover an undetermined period of time (an origin value of NONE), and are used for every report request regardless of the requested reporting period. For example, `CICSPROD.SMF` has SMF data that covers a recent time period that you want to use for every report request. Ad hoc SMF files are selected in the same way as SMF files defined in personal system definitions; that is, they are always selected if not excluded. Ad hoc SMF files cannot be specified with other cyclic SMF file types as they are incompatible.

## How CICS PA selects cyclic SMF files for reporting

You cannot report on a mix of cyclic SMF files with and without origins. If a system contains some cyclic SMF file definitions with origins and some without, then you must either exclude the files with no origin, or exclude all of the others. CICS PA does not select excluded files for reporting.

If you exclude the files with origin values, then CICS PA selects all of the files with no origin, regardless of the requested reporting period.

Otherwise, CICS PA calculates a "from" date and a "to" date for each file, indicating the date range of its SMF records. If this range overlaps or falls entirely within the requested reporting period, then CICS PA might use this file, depending on whether or not other files also meet this requirement. If a sequence of several files covers the same required date range, without gaps, as a single file, then CICS PA uses the sequence of files instead of the single file. CICS PA selects the combination of files that result in the least gap in data, without any overlaps. This ensures that, while a report can contain gaps, it will never contain duplicate data.

CICS PA calculates "from" and "to" dates based on the origin, interval, and DISP values for each cyclic SMF file. The following table shows the allowed combinations of origin, interval, and DISP, and the resulting "from" and "to" dates.

**Tip:** To view the “from” and “to” date for a cyclic SMF file, enter line action S next to the file definition. To view the “from” and “to” dates for all cyclic SMF files for the system, enter SHOW on the command line.

Table 2. Allowed combinations of origin, interval, and DISP for cyclic SMF files

Origin	Interval	DISP	From date	To date
DAY	1	MOD	Today	
		OLD	Yesterday	
<i>day of week</i>	WEEK	MOD	If <i>day of week</i> is today, then the “from” date is today.  Otherwise, the “from” date is the previous occurrence of that day of the week.	“From” date + (interval - 1 day)  For example, for an interval of WEEK:  “From” date + 6 days
		OLD	As for MOD, but one week prior.  For example, if <i>day of week</i> is Friday, and today is Monday, then the “from” date is not the Friday just passed, but the Friday before that.	
<i>yyyy-mm-dd</i> <i>yyyy-ddd</i>	DAY WEEK MONTH YEAR <i>number of days</i>	MOD	If the range of dates from the origin to “origin + interval” includes today, then the “from” date is the origin.  Otherwise, step the date range forwards one interval at a time until the date range includes today. The “from” date is the start of that date range.	
		OLD	As for MOD, but one interval prior.	
	0	Not applicable	Origin	
<i>****-mm-dd</i> <i>****-ddd</i>  See “Origin values for data set names with symbolic variables” on page 125 for other allowed values.	Any	MOD	Origin (with current year in place of ****)	“From” date + (interval - 1 day)
		OLD	One interval before the origin	
CDATE CDATE+nnn CDATE-nnn	DAY WEEK MONTH YEAR <i>number of days</i>	Not applicable	File creation date (plus or minus <i>nnn</i> days)	“From” date + (interval - 1 day)  For a GDG, only the “to” date of the latest generation is calculated in this way. For earlier generations, the “to” date is determined by the “from” date of the next generation.
NONE	Not applicable			

## Origin values for data set names with symbolic variables

Table 2 on page 124 shows the origin values with asterisks that are allowed if you do not use symbolic variables to specify the data set name of the SMF file. If you use symbolic variables, then there are many more allowed combinations of origin values with asterisks: you use asterisks in the origin value to match the symbolic variables in the data set name. For example (this is not a comprehensive list of the combinations):

*Table 3. Example SMF data set names with symbolic variables, and their allowed origin values*

Data set name	Origin
SMF.DAILY.D&YY.&MM.&DD..SAVE	20**-**-**
SMF.DAILY.D&MM&DD	****_**-**
SMF.DAILY.J&DDD	****_***
SMF.DAILY.D&DD	****_**-**
SMF.MONTHLY.M&YY&MM	20**-**-dd
SMF.MONTHLY.M&MM	****_**-dd
SMF.A&YYYY	****-ddd
SMF.A&YY	****-mm-dd
SMF.D&YYYY&DDD	****_***

## Verifying that you have correctly defined your cyclic SMF files

CICS PA uses cyclic SMF file definitions to determine which SMF data sets to use for a report request. Except for SMF files with no origin, CICS PA uses the origin, interval, and DISP values in these definitions to calculate the “from” and “to” date range for each SMF file, and uses this range to determine whether to use the file for a particular reporting period.

To verify that you have correctly defined a cyclic SMF file, so that its data sets covers the expected date range, enter line action S next to the file definition.

To show the date ranges for all SMF files for the system, enter SHOW on the command line.

For details on how CICS PA determines these dates, see “How CICS PA selects cyclic SMF files for reporting” on page 123.

Figure 49. Showing the available cyclic SMF data sets, and their from and to dates

## Cyclic GDG examples

Here are some examples of Cyclic SMF File GDGs.

### One day cycle for each day of the week

SMF.DAILY(0) contains data for today, SMF.DAILY(-1) contains data for yesterday, and so on.

GDG Base: SMF.DAILY      Origin: DAY      Interval: DAY      DISP: MOD

### Weekly cycle

Each cycle contains data for a whole week, from Monday to Sunday inclusive. SMF.WEEKLY(0) contains data for previous week starting on Monday, SMF.WEEKLY(-1) contains data for two weeks ago, and so on. Data for this week (starting on Sunday) can only be obtained from the SMF.DAILY cycle.

GDG Base: SMF.WEEKLY      Origin: MONDAY      Interval: WEEK      DISP: OLD

### Monthly cycle

Each cycle contains data for a whole calendar month, from the first of the month to the end. SMF.MONTH(0) contains data for previous calendar month, SMF.MONTH(-1) contains data for two months ago, and so on.

GDG Base: SMF.MONTH      Origin: \*\*\*\*-001      Interval: MONTH      DISP: OLD

### Fixed number of Days cycle

Each cycle contains data for a 28 day period. The oldest cycle starts on 2004-03-07.

GDG Base: SMF.DAYS28      Origin: 2004-03-07      Interval: 28      DISP: OLD

### Yearly cycle

Each cycle contains data for a whole calendar year, from January to December inclusive. SMF.YEAR (0) contains data for last year, SMF.YEAR(-1) contains data for two years ago, and so on..

GDG Base: SMF.YEAR      Origin: \*\*\*\*-001      Interval: YEAR      DISP: OLD

## Cyclic SMF File Data Set Name examples

Here are some examples of Cyclic SMF File data set names.

**Today** SMF.TODAY contains data for the current day (today).

DSN: SMF.TODAY      Origin: DAY      Interval: DAY      DISP: MOD

### Current week

SMF.WEEK contains data for this week, starting on Monday.

DSN: SMF.WEEK                      Origin: MONDAY              Interval: WEEK              DISP: MOD

### Monthly cycle

Each data set contains data the specified calendar month. If the current month is June, then SMF.JUN contains data for this month, SMF.MAY for the previous month, SMF.JUL for last July for example.

DSN: SMF.JAN                      Origin: \*\*\*\*-01-01      Interval: MONTH      DISP: MOD

DSN: SMF.FEB                      Origin: \*\*\*\*-02-01      Interval: MONTH      DISP: MOD

. . .

Figure 50. Shared CICS System Daily SMF Files

The **Take-up from SMF File** process manages the list of SMF Files automatically. Manual updating of Daily SMF File definitions is not required.

JCL to run Take-up is generated from option 4 from the Shared System Definitions Menu. Take-up typically runs as a second step to the SMF Dump process, to keep track of data sets (usually GDGs) created during the day. Refer to SCPASAMP(CPAHDB) for an example of how to run take-up in conjunction with the SMF Dump process.

The Daily SMF File definitions are used at report request time. Daily SMF Files are automatically inserted into your Report request JCL when you request reporting for a time period spanning today and Shared System Definitions are active (not Personal. Refer to **Systems** in the action bar when submitting a Report request).

Either run **HDB Housekeeping** to remove expired Daily SMF File definitions or enter line action **D** to delete unwanted Daily SMF File definitions from the list.

## Image definition

Like CICS System details, Image details are presented across three views:

- 1. System Definition attributes
- 2. Cyclic SMF Files
- 3. Daily SMF Files

The first view displays the System Definition attributes. Press **Next** (F11) or **Prev** (F10) to move between the views.

F10=Actions F12=Cancel
```

Figure 55. Shared Group Definitions

Shared Group Definitions operate in a similar way to personal Group Definitions. For more information, see “Maintaining Personal Groups” on page 99.

---

## Mass Updating Shared CICS System Definitions

Suppose that, some time ago, you created CICS System Definitions in CICS PA using version-specific data set names for the MCT and SDFHLOAD libraries. Now you want to upgrade your CICS System Definitions in CICS PA to match this change in your system environment. Rather than selecting and then editing each system definition individually, you can upgrade several (or all of them) together.

For details, see “Mass Update of Personal CICS System Definitions” on page 80.

---

## Take-up from Personal System Definitions

Select option 3 **Take-up from Personal System Definitions** from the Shared System Definitions Menu.

Before proceeding with loading your personal systems into the shared definition repository, a confirmation pop-up is displayed.

```

Take-Up from Personal System Definitions
Command ==> _____

Select the types of definition that you want to copy from
your personal profile library to the Repository. This does
not replace definitions that already exist in the
Repository.

Required Definitions:
- Systems and Groups
- Files

Instructions:
Press ENTER to continue.
Enter END or CANCEL to cancel Take-Up.

```

Figure 56. Shared System Definitions: Take-up from personal definitions

This take-up copies the personal system definitions from your personal profile library to the shared system definitions in a repository. This makes the definitions available to all users of the repository.

You can select the types of definition to copy:

**Systems and groups, but not files**

If a group in your personal system definitions already exists in the repository, then take-up adds the systems to the group in the repository.

**Files, but not systems or groups**

Only copies files belonging to systems that already exist in the repository.

**Systems, groups, and files**

All definitions.

Before performing take-up, delete any personal system definitions that you do not want copied to the repository. Consider making a backup copy of your personal profile library and the repository.

Take-up does not replace definitions with the same name in the repository. If a file with the same data set name exists in both your personal system definitions and the repository, then take-up does not affect the file definition in the repository.

Take-up copies files to the repository as cyclic files with an Origin value of NONE. If the file has an origin, then, after take-up, edit the file definition in the repository.

---

## Take-up from SMF File

Option 4 **Take-up from SMF File** from the Shared System Definitions Menu provides the facility to take-up system and file information from one SMF File.

Data Take-up from SMF File is a two-step process. First the system details are extracted from the file, then they are used to automatically update your Shared System Definitions. Successful completion of the first step generates a Recap report that provides information about all the systems contained on the SMF Files.

Take-up of Shared Systems from an SMF File optionally performs the following functions:

1. Defines new shared systems, including CICS, DB2, MQ, Logger, and Images
2. Defines Daily SMF Files, and associates them to either Systems with data on the file or its MVS Image

Because log streams can contain very large amounts of data, you can specify a time interval to limit the number of SMF records that must be processed. SMF Interval is mandatory for log streams but optional for data sets. To further improve the performance of take-up processing, the panel also includes options to specify Image and System types.

If system definition take-up finds CICS TS and CICS TG systems with the same APPLID, it creates a single CICS system definition. System definitions taken up from SMF 111 records have a blank VRM field value (this field is for CICS TS versions, not CICS TG versions). To help distinguish CICS TS systems from CICS TG systems, definitions taken up from SMF 111 records have the description “CICS TG system added by Take-up”.

Figure 57. Shared System Definitions: Take-Up from SMF File

### Take-up options

The take-up options are:

#### Data Set Name

The name of an SMF data set from which you want to extract System details for automatic take-up into your System Definitions. Normal ISPF data set conventions apply. Data Set Name and Log Stream are mutually exclusive. This option generates the IN keyword.

#### Log Stream

The name of an SMF log stream from which you want to extract System details for automatic take-up into your System Definitions. The first qualifier must be IFASMF. The log stream name must not be enclosed in quotes. Data Set Name and Log Stream are mutually exclusive. This option generates the IN keyword.

#### RETPD

The log stream retention period, specified in days (0-65536). This value is used to calculate a start date for determining what records are candidates for take-up processing.

#### Required Definitions

The following options apply to both SMF files and log streams.

## Systems

Select Systems to take-up all the CICS systems and related subsystems with data on the SMF File are defined to shared system definitions. Existing system definitions are not replaced. This option generates the SYSTEMS keyword.

## Files

Select Files to take-up the specified SMF File. The specified SMF File is registered as a Daily SMF File and connected to the systems that have SMF records on the file.

The **Connect files to** setting is only applicable when the Files option is selected. This setting specifies the type of systems the Daily SMF File is to be connected to:

### 1. System

Connects the Daily SMF file to all systems with SMF records on the file, including CICS, DB2, MQ, and Logger, as well as the MVS Image that owns the file.

The System option generates the FILESYSTEM keyword. This option ensures that, while the daily SMF file is defined to multiple systems, only SMF files that actually contain data for this system are connected to this system.

### 2. Image

Connects the Daily SMF file only to the MVS Image that owns the file. CICS and other subsystems that belong to the Image can request the selection of their SMF files from the Image if they do not have their own Daily SMF Files.

The Image option generates the FILEIMAGE keyword. This option ensures that the SMF File is only defined once, and is shared by all systems that belong to the Image.

For more information, see “Example: choosing between System and Image” on page 134.

## System Selection

System Selection is used to filter the records processed by take-up in order to minimize the processing time. These options apply to both log streams and data sets.

**Image** Use to specify the image (MVSID) for which SMF records will be processed by take-up. Records for all other images will be ignored. Only one image name can be specified. Wildcard characters are not supported. Mutually exclusive with Group.

**Group** Specifies a group containing one or more image definitions. Used when records for more than one image are required for take-up. Mutually exclusive with Image. Only systems whose Type=Image in the group are used. Other types are ignored. Group is not allowed when the DASDONLY profile option is selected.

**Types** System types to be taken up. This option is used to generate a list of SMF record codes.

## SMF Interval

The interval of SMF records to process from the log stream or data set. SMF Interval is mandatory for log streams but optional for data sets.

These fields generate the SMFSTART and SMFSTOP operands.

## Example: choosing between System and Image

Consider the following example to help you choose between the System option (FILESYSTEM) and the Image option (FILEIMAGE).

Take-up is run against two daily SMF files for Image MVS1:

1. DAILY.SMF(0) contains data for CICS systems CICS1 and CICS2
2. DAILY.SMF(-1) contains data for CICS systems CICS2 and CICS3

The **SYSTEMS** option will define the three CICS systems: CICS1, CICS2 and CICS3, and one image MVS1.

**FILEIMAGE** defines both SMF files to image MVS1. All three CICS systems are eligible to use both files because each system belongs to image MVS1. The drawback is that CICS3 has no data on generation 0, and CICS1 has no data on generation -1. But at report submission time, CICS PA has no way of knowing which image file has data for the selected system, so both files are selected. For example, reporting against CICS1 will select both files, even though generation -1 contains no relevant data.

**FILESYSTEM** defines the SMF file to image MVS1, and also defines it to each CICS system that has data on the file. CICS1 has one daily SMF file definition only, generation 0. Now at report submission time, CICS PA will select only generation 0. The drawback is that the file is defined to multiple systems. But this is not really a problem because daily SMF file maintenance is handled automatically by HDB housekeeping which deletes expired daily SMF file definitions, and the dialog itself which ignores expired daily SMF files.

## TAKEUP command syntax

The take-up command is:

```
CICSPA SMFSTART(YYYY/MM/DD,hh:mm:ss.nn),
      SMFSTOP(YYYY/MM/DD,hh:mm:ss.nn)
CICSPA IN(ddname|logstream),
      [MVSID(mvsids),]
      TAKEUP(SHARED,           analyze SMF file contents
      [SYSTEMS,]              load systems
      [FILEIMAGE|FILESYSTEM,] load files, connect to either image or system
      [TYPE(CICS,|DB2,|MQ,|LOGGER),]
      [RETPD(0-65536),]
      [OUTPUT(ddname)])       DDname for Recap report output
```

## Take-up JCL

Take-up JCL can be generated from the dialog. It is recommended that the take-up JCL is incorporated into your SMF Dump process. Sample job CPAHDB in library SCPASAMP provides an example of how to do this. Refer also to "Example: Working with Shared Systems" on page 136.

```

//CPAHDB JOB ,CLASS=A,NOTIFY=&SYSUID
/* SMF Dump
//SMFDUMP EXEC PGM=IFASMFDP
//INDD DD DSN=SYS1.MAN1,DISP=SHR
//OUTDD1 DD DISP=(NEW,CATLG),DSN=CICSPROD.SMFDAILY(+1)
//SYSPRINT DD SYSOUT=A
//SYSIN DD *
INDD(INDD,OPTIONS(ALL))
OUTDD(OUTDD1,TYPE(110))
/*
/*
/* CICS PA Take-up, HDB Load, and selected reports
//CICSPA EXEC PGM=CPAMAIN,REGION=4M,PARM=NOSTAE
//STEPLIB DD DSN=CPA.V5R1M0.SCPALINK,DISP=SHR
//SYSPRINT DD SYSOUT=*
/* SMF Input Files
//SMFIN001 DD DISP=(SHR,KEEP),DSN=CICSPROD.SMFDAILY(+1)
/* Repository
//CPAHDBRG DD DISP=SHR,DSN=<CPA.HDB.REPOSTRY>
/*
/* CICS PA command requests
//SYSIN DD *
CICSPA IN(SMFIN001),
APPLID(*),

* Take-up from SMF into Shared System Definitions
TAKEUP(SHARED,SYSTEMS,FILESYSTEM,OUTPUT(SDTU0001))

* HDB Load requests
HDB(LOAD(WEEKLY),OUTPUT(WEEKLY)),
HDB(LOAD(DAILY),OUTPUT(DAILY)),
HDB(LOAD(STATS),OUTPUT(STATS)),

* CMF Performance report requests
SUMMARY(FIELDS(TRAN),OUTPUT(SUMM0001)),
WAITANAL(BY(TRAN),OUTPUT(WAIT0001))
/*

```

*Figure 58. Sample JCL CPAHDB - SMF Dump, Take-up, HDB Load, then reports*

Step 1 is the SMF Dump process that reads online SMF MANx data sets (or other SMF data) and creates an extract data set of SMF records to be used for reporting purposes.

Step 2 is the CICS PA batch process that can perform the following tasks in parallel:

1. Take-up to define the systems and SMF file to shared System Definitions.
2. HDB Load requests to load performance data into Historical Databases.
3. CICS PA Performance reporting to produce one of more reports for performance analysis.

Note that by combining take-up, HDB load and reporting into a single job step, all CICS PA functions can be performed by a single pass of the SMF data.

## Take-up Recap report

The following example shows part of the Recap report that is generated at the end of file processing.

The Recap report provides a list of all the Systems with data on the SMF file together with a count of all SMF 110 records on the file. With this information you can elect to take-up Systems or Files or both, and specify whether to connect the Files to the System or the Image.

Note that the Recap report is showing what is available for take-up from the SMF files, it is *not* showing the results of take-up. Review the Shared System Definitions in the dialog to see the results of take-up.

Figure 59. Shared System Take-up Recap report

## Example: Working with Shared Systems

Consider an MVS Image MVS1 that runs our production CICS regions. We will implement Daily and Cyclic SMF File definitions to help us run our report requests against the SMF data collected for this system.

The first (optional) step is to implement Take-up for Daily SMF Files.

Daily SMF files are recommended when your SMFDUMP process creates extract GDG data sets whenever SMF is switched throughout the day. Daily files allow you to run report requests against today's SMF data without having to explicitly specify the data set names.

**Tip:** Append the take-up step to the end of your SMFDUMP job so that daily data sets are defined automatically. See “Take-up from SMF File” on page 131 for more information.

```
//SMFDUMP JOB ,CLASS=A,NOTIFY=&SYSUID
/* SMF Dump for MVS Image MVS1
//SMFDUMP EXEC PGM=IFASMFDP
//INDD DD DSN=SYS1.MAN1,DISP=SHR

/*
```

Figure 60. SMFDUMP job

CICS PA Take-up will define Image MVS1 if it is not already defined, and attach the new daily SMF file MVS1.SMF(+1) to the system.

The result when you view the daily SMF files for system MVS1 (System View 3) is the list of daily data sets definitions created by take-up, and the time interval they span.

```

Figure 62. Shared MQ Subsystem Cyclic SMF Files

To use shared System Definitions in preference to personal System Definitions, you need to change your personal profile. The **Systems** action bar is available on all run-time panels, for example Run Report Set. Select option 4 **Use Shared System Definitions**. With this setting you can now use the shared system definitions and their SMF Files.

Shared SMF File selection is controlled by the Report Interval you specify at run time.

## File Selection example 1

In this example, we specify a relative date of 0 (zero) to signify today, say July 17, 2012 (2012-07-17).

Missing SMF Files Option:			
1	1. Issue error message	From 2012/07/16	_____
2	2. Leave DSN unresolved in JCL	To 2012/07/20	_____
3	3. Disregard offending reports		
Enter "/" to select option			
_ Edit JCL before submit			

Figure 65. Run Report Set: specify relative dates

CICS PA will automatically generate the JCL that includes the cyclic SMF files that cover the specified reporting interval.

```
//* SMF Files for Image=MVS1  
//SMFIN001 DD DSN=MVS1.SMF.WEEKLY(-1)
```

*Figure 66. File selection*

CICS PA always chooses the smallest cyclic SMF file that covers the entire reporting period. This explains why, in the previous example, the weekly SMF GDG was chosen ahead of the monthly GDG.

CICS PA also knows the number of generations (GDG LIMIT) for each cycle. Therefore if only four generations of the weekly file are available, a reporting request for 5 weeks ago would be satisfied by the monthly GDG cycle, MVS1.SMF.MONTHLY(-1).

---

## Part 3. Requesting reports using the dialog

These topics tell you how to use the CICS PA dialog to request reports and extracts and submit them for batch processing.

---

## Chapter 8. Report Sets

A Report Set is used to request a set of reports and extracts. Reporting options and record selection criteria can be specified at the global-level to apply to all the reports and extracts in the Report Set, or at the report-level to apply to the individual report or extract. Report-level specifications take precedence unless at run time you choose to override them.

When you run a Report Set, CICS PA first prompts you to specify run-time options. Then CICS PA generates a one-step JCL deck with a command stream including active reports and extracts in active report categories.

The topic on 'Defining a Report Set for daily monitoring' in the CICS Performance Analyzer for z/OS *Getting Started Guide* provides a guided tour or worked example of how to define a report set.

---

### Report Set tree

Reports are displayed using a tree structure. The report tree structure is a hierarchical representation of report categories and reports; similar to the way some PC tools display folders and their contents. Report categories act as folders that can expand (to show) and collapse (to hide) the reports contained within them. The + or - character to the left of each report category shows its current display status, expanded (-) or collapsed (+). This allows you to view only the reports that you are currently interested in. Use your mouse or line action **S** against a report category to toggle the expand/collapse status of the category.

You can also enter line action **S** at the top of the Reports tree. This will expand all categories that are not already expanded. If all categories are expanded, then it will collapse all categories.

The following example shows the Performance Reports category expanded and all other categories collapsed.

Figure 67. Report Set tree

If your terminal emulation software permits, it is recommended that you configure your Mouse Options to activate the Lightpen function. Then you can flip the display status of Report Categories by (left button) clicking the + (to expand) and - (to collapse) characters with your mouse. Use of your mouse as a lightpen might vary depending on your terminal emulation software.

## Activating reports

Each category and report has an **Active** status indicator, displayed to the right of the report tree. Change the Active status to Yes to ensure the report is run.

When the Active status indicator for a category is set to Yes, reports in the category with an Active status of Yes will run. When set to No, no reports in the category will run, regardless of their Active status. Note that the Report Options have their Active status set to Yes automatically if there are active reports. This is because the options must always be used. You cannot deactivate them. CICS PA will deactivate them only when all reports are deactivated.

You can use line action **A** to activate a report or a report category and you can use line action **D** to deactivate.

You can use line action **AA** against a report category to activate all reports in the report category and the category itself. Line action **DD** will similarly deactivate all. These line actions entered at the top of the Reports tree will activate or deactivate *all* reports and options in the Report Set.

## Running Report Sets

The **RUN** command is used to run (submit) Report Sets. It oversees the specification of run-time options and the generation of JCL. The **SUBmit** and **JCL** commands are still available and considered to be specialized RUN requests to either submit JCL immediately or edit JCL before submit.

**RUN** can also be entered as a line action at the report category and individual report level. The RUN line action temporarily overrides the Active status. When used in this way, the selected categories and reports are run regardless of the Active status.

Figure 68 shows how to use the **RUN** line action to request the Summary, Totals and Wait Analysis Performance reports, as well as all active reports in the Subsystem Reports category, in this case the DB2 report.

    ** End of Reports **

F1=Help      F3=Exit      F7=Backward F8=Forward F10=Actions F12=Cancel
```

Figure 68. RUN line action

You can also use RUN line actions in conjunction with the RUN primary command (from the command line). This generates JCL command input for all active reports in all active categories, as well as for categories and reports selected via the RUN line actions.

For more information on running Report Sets, see “Running Report Sets” on page 273.

## Maintaining Report Sets

To display the list of Report Sets in the current Report Sets data set, select option 3 **Report Sets** from the CICS PA Primary Option Menu. From this panel you can review, update, or submit a selected Report Set for batch processing or create new one.

**Tip:** To set or change the current Report Sets data set, use the **Options** menu on the action bar or enter **CDS** from the command line.

```

***** End of list *****

```

Figure 69. Report Sets

The Report Sets are listed with the following user-defined attributes:

**Name** 1-8 character name in ISPF member name format, used to uniquely identify the Report Set within the Report Sets data set. By default, the panel is sorted on the Name field.

### Description

Free format text up to 32 characters that describes the contents and purpose of the Report Set.

**Line Actions:** The following line actions can be performed against a Report Set:

- /** Display the menu of line actions.
- E** Edit the Report Set.
- S** Select the Report Set (same as Edit).
- V** View the Report Set. This looks like the Edit panel but has no 'hold' on the data and has no Save capability, however SaveAs is available.
- RUN** Run the Report Set. Only active reports and extracts within active categories are selected. The Run Report Set panel is displayed for you to enter required run-time options before submission. See "Running Report Sets" on page 273 for more information. Alternative RUN commands are:
  - SUB** After your run-time options are validated, JCL is submitted directly for batch processing.
  - JCL** After your run-time options are validated, JCL is presented in an Edit session. You can alter the JCL before submission or save it in your JCL library.
- D** Delete the Report Set.
- R** Rename the Report Set.

**Primary Commands:** The following primary commands are available:

**NEW name [MODEL dsn(modelname)]**

This command creates a new Report Set. If all required parameters are specified, the Edit panel for the new Report Set is displayed. Otherwise, the New Report Set window is displayed to allow you to specify the name of the new Report Set and optionally the name of an existing Report Set to be used as a model. If the model is in the current Report Sets data set, specify just the name of the Report Set. If it is in another data set, specify both the name of the data set and the Report Set in the format **datasetname(modelname)**.

Also available from **File** in the action bar.

See “Creating new Report Sets” for information on how to proceed.

**SELECT name**

This command (or **S**) selects the specified Report Set for editing. If the Report Set does not exist, it is created as if the **NEW** command was used.

Also available from **File** in the action bar.

**SORT Name | Description | Changed | Id**

This command sorts the list of Report Sets on one or two columns. The default sort field is **Name**. The sort disregards upper and lower case. The sort sequence is ascending for all except the Changed column which is descending. The sort order is retained only until Exit or another SORT command is issued.

**LOCATE string**

This command (or **L** or **LOC**) is used to locate an entry in the list based on the primary sort field. By default, LOCATE operates on the **Name** field. The string should be no longer than the primary sort field and not enclosed in quotes. The display will scroll to the entry which matches the string, or the entry preceding it if an exact match is not found.

**CONFIRM ON | OFF**

**CONFIRM ON** (or **CONFIRM**) instructs CICS PA to prompt for confirmation when you request to Delete a Report Set.

With **CONFIRM OFF**, Delete requests are actioned immediately. Deleted Report Sets cannot be reinstated.

This command changes the setting only for the current invocation of the Report Sets panel. On exit, it reverts to the default set by **Delete Confirmation** in CICS PA Settings.

Also available from **Confirm** in the action bar.

---

## Creating new Report Sets

To create a new Report Set, do either of the following:

- In the command line, enter **NEW** followed by the name of the new Report Set and an optional model Report Set using the following syntax:

```
➤➤NEW—newname—┐
                  │
                  └─MODEL—modelName—┐
                                │
                                └─datasetname(modelname)—┐
                                                           ➤➤
```

- Select **File** from the action bar, then choose **New**. A pop-up dialog window is displayed as shown in Figure 70 on page 148.

New Report Set

Command ==> \_\_\_\_\_

Specify the name of the new Report Set and optional model.

Name . . . TRANGP2\_

Model . . TRANGP1\_

Figure 70. Specifying a New Report Set

This panel allows you to create a new Report Set. You must give the new Report Set a name. Optionally, you can model it on an existing Report Set, otherwise it is created empty with no reports or extracts defined.

You can bypass this panel by specifying all required details on the **NEW** command.

**Name** The name of the new Report Set. A 1-8 character name in ISPF member name format. The name must be unique within the Report Sets data set.

**Model** You can specify the name of an existing Report Set as a model so that your new Report Set is initialized with the same contents as the model. If the model is in the current Report Sets data set, specify just the member name. If it is in another data set, specify both the data set name and the Report Set name in the format **datasetname(modelname)**.

When you have specified the required details, press Enter to create the Report Set.

---

## Specifying Report Set contents

The Report Set Edit panel is displayed when, from the Report Sets panel, you do either of the following:

- Create a new Report Set.  
Use the **NEW** command or select **File->New** in the action bar.
- Select an existing Report Set.  
Enter line action **E** or **S** against a Report Set or use the **SELECT** command

The Report Set panel describes the Report Set and lists all the reports and extracts that can be requested.

The Report Set description can be modified. Specify up to 32 characters of text to describe the purpose of the Report Set. The description is shown on the Report Sets panel to help you distinguish between the Report Sets displayed. It also appears as a comment in the JCL. The description is initially set to **CICS PA Report Set**.

The reports and extracts are grouped to indicate the type of output (**report**, **graph report**, or **extract**) and the type of SMF data they process, either CMF data (**performance**, **exception**, **transaction resource**, or **statistics** class data), subsystem data (**DB2**, **WebSphere MQ**, **OMEGAMON**), or MVS system data (**System Logger**). Also listed are three specifications which apply globally to all reports and extracts in the Report Set:

- **Global Options** apply to all reports and extracts. They specify the global system selection (CICS System, DB2 Subsystem, MVS System Logger, WebSphere MQ ID) and report formatting options (lines per page, time zone, date/time delimiters).
- **Performance Selection Criteria** apply to all performance reports and extracts. They provide filtering of CMF performance records based on field values.
- **Exception Selection Criteria** apply to all exception reports. They provide filtering of CMF exception records based on field values.

**Note:** You can override some of the global options by specifying them for individual reports or extracts. System Selection (System, Image, Group) and Selection Criteria are primary examples of this feature. Report-level specifications take precedence.

The reports, extracts, and global selection criteria can be activated (**Active=Yes**) or deactivated (**Active=No**). They are automatically activated when created, and can be explicitly deactivated or activated at any time. The global options are automatically activated if at least one report or extract is active, but they cannot be explicitly activated or deactivated.

Each Report Category can be activated or deactivated. Only active reports in active report categories are included in the Report Set at submit time. A Report Set can be submitted for processing if there is at least one active report in an active report category.

However, there is a convenient exception. You can use the **RUN** line action to temporarily override the active status of a report or report category.

## Line Actions

### *Line Actions (\*\* Reports \*\*):*

The line actions that are valid for **\*\* Reports \*\*** at the top of the Report Set tree are:

- /** Display the menu of line actions.
- S** Expand/Collapse all categories.
- A** Activate all categories.
- AA** Activate all categories and reports.
- D** Deactivate all categories.
- DD** Deactivate all categories and reports.
- RUN** Run the Report Set. Only active reports within active categories are selected, together with any categories or reports selected by the **RUN** line action.

### *Line Actions (Global Options Category):*

- /** Display the menu of line actions.
- S** Expand/Collapse category.

### *Line Actions (Global Options):*

- /** Display the menu of line actions.
- S** Select (edit) the global options.

*Line Actions (Selection Criteria Category):*

- /      Display the menu of line actions.
- S      Expand/Collapse category.
- A      Activate category.
- AA    Activate category and all selection criteria.
- D      Deactivate category.
- DD    Deactivate category and all selection criteria.

*Line Actions (Performance and Exception Selection Criteria):*

- /      Display the menu of line actions.
- S      Select for edit or review.
- A      Activate the Selection Criteria.
- D      Deactivate the Selection Criteria.

*Line Actions (Report and Extract Categories):*

- /      Display the menu of line actions.
- S      Expand/Collapse the category.
- A      Activate the category.
- AA    Activate the category and all its reports and extracts.
- D      Deactivate the category.
- DD    Deactivate the category and all its reports and extracts.
- RUN   Run the active reports and extracts in the category, plus any selected by the **RUN** line action.

*Line Actions (Reports and Extracts):*

- S      Select for edit or review.
- A      Activate the report or extract.
- D      Deactivate the report or extract.
- RUN   Run the report or extract, ignoring the active status.

## **Primary Commands**

**SAVE** This command is only available from Edit mode and saves any changes you have made. To save any changes made in View mode, use **SAVEAS**.  
Also available from **File** in the action bar.

**SAVEAS rsetname | datasetname(rsetname)**

This command is available from both Edit and View mode to save the contents of this Report Set under another name, either in the current data set (assumed if no data set name is provided) or in another data set (if the name of a valid PDS is provided). If you then Cancel from this panel, the contents of the current Report Set remain unchanged.

Also available from **File** in the action bar

**RUN** Run the Report Set. Only active reports and extracts within active categories are selected. The Run Report Set panel is displayed for you to

enter required run-time options before submission. See “Running Report Sets” on page 273 for more information. Alternative RUN commands are:

**SUB** After your run-time options are validated, JCL is submitted directly for batch processing.

**JCL** After your run-time options are validated, JCL is presented in an Edit session. You can alter the JCL before submission or save it in your JCL library.

Also available from **File** in the action bar.

#### CONFIRM ON|OFF

**CONFIRM ON** (or **CONFIRM**) instructs CICS PA to prompt for confirmation when you request to Cancel from the Report Set panel when there have been updates.

With **CONFIRM OFF**, Cancel requests are actioned immediately, discarding any changes.

This command changes the setting only for the current Edit/View session. On exit, it reverts to the value set by **Cancel Confirmation** in CICS PA Settings

Also available from **Confirm** in the action bar.

**Note:** The **SAVE** and **SAVEAS** commands are only available on the Report Set panel, being at the top of the panel hierarchy. Changes made on the associated panels (global options, selection criteria, reports, extracts) are only saved when the Report Set is saved.

---

## Global Options

To display the Global Options panel, enter line action **S** to select **Global** in the **Options** category on the Report Set panel.

The screenshot shows a terminal window titled "SAMPLE - Global Options". At the top is a menu bar with "File Systems Options Help". Below the menu bar is a dashed line. The main content area is divided into two sections. The first section is "System Selection:" and contains four rows of options, each with a plus sign and a blank space for input: "CICS APPLID . . .", "DB2 SSID . . .", "MQ SSID . . .", and "Logger . . .". The second section is "Report Formatting Options:" and contains four rows of options, each with a blank space for input: "Print Lines per Page . . 60", "Time Zone . . .", "Date Delimiter . . . /", and "Time Delimiter . . . :". At the bottom of the panel is a footer with function key definitions: "F1=Help", "F3=Exit", "F4=Prompt", "F7=Backward", "F8=Forward", "F10=Actions", and "F12=Cancel".

Figure 71. Global Options

The Global Options define general control information applying to all reports and extracts in the Report Set. They specify the global System Selection (CICS System, DB2 Subsystem, MQ Subsystem, MVS System Logger) and report formatting options (lines per page, time zone, date/time delimiters). You can accept the default formatting options or change them to suit your requirements.

System Selection can be left blank, provided the systems are specified at the report-level, or when the Report Set is submitted.

The Global Options are:

#### System Selection:

At Report Set run-time, CICS PA needs to determine which systems the reports will analyze. System Selection identifies these systems. The systems must be defined in your System Definitions. You can type in the system names, or select from a list of defined systems using **Prompt** (F4).

If the required system is not defined to CICS PA, you can link directly to System Definitions to define it by selecting **Systems** in the action bar or entering the **SYSDEFS** command.

You can specify System Selection in three places:

1. Locally for each report within the Report Set. The local selection applies only to this single report.
2. In the Report Set Global Options. The global selection will only apply to reports that do not specify their own local selection.
3. At run time. If specified, this selection overrides the Report Set Global Options. In addition, if the **Override System Selections** option is requested, then the run-time selection also overrides the local report selections.

Each point of selection is optional, but at least one must be specified before CICS PA can proceed with JCL generation. You could choose not to specify any System Selections in your Report Set. Then at run time, you are prompted to specify the systems you want to report against.

You can specify four types of systems:

1. **CICS APPLID:** The CICS Generic APPLIDs you want reported. Specify either:
  - A unique APPLID.
  - An APPLID for a particular MVS Image. This identifies a particular CICS system when there are multiple CICS systems with the same APPLID.
  - An MVS Image. CICS PA will report on all APPLIDs running on this Image using the SMF files defined for the Image.
  - An APPLID and Image combination plus a Group. This is useful for uniquely identifying CICS systems when there are duplicate IDs defined in System Definitions.
  - A Group alone. CICS PA will report on all APPLID and Image combinations in the Group to produce a single consolidated report. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA generates the APPLID(applid1,applid2,applid3,...) and Input(SMFIN001,SMFIN002,SMFIN003,...) operands, and corresponding //SMFINnnn DD statements.

2. **DB2 SSID:** The DB2 Subsystem IDs. This is only used by the DB2 Report and Record Selection Extract. If the CICS APPLID Group contains the DB2 SSIDs, then it can be omitted.

CICS PA generates the SSID(ssid1,ssid2,ssid3,...) operands for the DB2 or RECSSEL commands and the DD statements for the associated files.

3. **MQ SSID:** The MQ Subsystem IDs. This is only used by the WebSphere MQ Report and Record Selection Extract. If the CICS APPLID Group contains the MQ SSIDs, then it can be omitted.  
CICS PA generates the operand SSID(ssid1,ssid2,ssid3,...) operands for the MQ or RECSEL commands and the DD statements for the associated files.
4. **Logger:** The MVS System Logger. This is only used by the System Logger Report, System Logger Extract, and Record Selection Extract. If the CICS APPLID Group contains the System Loggers, then it can be omitted.  
CICS PA generates the DD statements for the associated files.

#### **Print Lines per Page**

The maximum number of lines, including headings, to print on each page of the report. Valid values are from 1 to 255. The default is **60**.

The global value applies to all reports. (It is not applicable to extracts.) If a value is specified on the report panel, the report value takes precedence over the global for that report only.

CICS PA JCL generation translates this field to:

LINECount(nnn)

#### **Time Zone**

This provides a way to override your local CPU time zone setting and convert CMF, DB2, MQ, and System Logger clock fields to a different time zone. It is only useful if the data you are reporting was generated by a system running with a different time zone.

CMF, DB2, MQ, and Logger records have clock fields in STCK format based on Greenwich Mean Time (GMT). Every CMF record includes time zone conversion factors SMFMNLSO (Leap Second Offset) and SMFMNDTO (Date/Time Offset). CICS PA uses these to convert the time stamps to reflect the local time of the SMF data.

DB2, MQ, and System Logger records, however, do not have time zone conversion factors. CICS PA uses the reporting system's time zone obtained from the conversion factors CVTLSO (Leap Second Offset) and CVTLDTO (Date/Time Offset) in the CVT. When you run the DB2, MQ, or Logger report on a system with a different time zone setting to that of the SMF data, then you must specify the time zone option to match that of the SMF data. The time zone specification is used to convert the CMF, DB2, MQ, and Logger time stamps to reflect the local time of the SMF data.

Specify the time zone as an integer from **-12** to **+12** to represent the number of hours that local time is west or east of GMT. For example, specify **-5** for New York, **10** for Sydney. CICS PA will then convert GMT STCK values to the required local time for all record types.

The default is blank (not specified).

CICS PA JCL generation translates this field to:

ZONE(time-zone)

#### **Date Delimiter**

The separator character for the dates in reports and extracts. Any character or a space can be specified. The default is a slash (/).

CICS PA JCL generation translates this option to:

FORMAT(time-delimiter,date-delimiter)

### Time Delimiter

The separator character for the time-of-day in reports and extracts. Any character or a space can be specified. The default is a colon (:).

CICS PA JCL generation translates this option to:

FORMAT(time-delimiter,date-delimiter)

### Precision

The precision of numeric fields, and of time stamp fields that specify the TIMEP format. Numeric fields can be formatted to either 4, 5, or 6 decimal places. The default is 4.

- 4 decimal places is 0.0001 precision
- 5 decimal places is 0.00001 precision
- 6 decimal places is 0.000001 (microsecond) precision

For details on the TIMEP format, see “Suboperands for Time Stamp fields” on page 381.

This option generates the PRECISION(n) global operand.

---

## Selection Criteria

Some reports allow you to specify selection criteria to filter records based on their field values before they are passed on to report processing. This enables you to tailor your reports to include only the information that you are interested in. For example, you can specify selection criteria to restrict reports to:

- A particular date/time range
- A group of related Transaction IDs
- Transaction response times that exceed your thresholds

There are several types of Selection Criteria, to support the various types of record processed by CICS PA:

*Table 4. Selection Criteria, the record types they apply to, and the reports they affect*

Type of Selection Criteria	Filters these types of record...	For these reports...	Global?
Performance	CMF performance (SMF 110)	All Performance Reports, Transaction Resource Usage Reports, Performance Graphs  Some Extracts: Cross-System Work, Record Selection	Yes
	DB2 accounting (SMF 101)	DB2 reports (in the Subsystem Reports category)	Yes
	WebSphere MQ accounting (SMF 116)	WebSphere MQ reports (in the Subsystem Reports category)	Yes
	OMEGAMON XE for CICS (SMF 112)	OMEGAMON reports (in the Subsystem Reports category)  Record Selection extract (in the Extracts category)	Yes
Transaction Resource Usage	CMF performance (SMF 110, class 5)	Transaction Resource Usage Reports	Yes
Exception	CMF exception (SMF 110)	All Exception Reports  Record Selection extract (in the Extracts category)	Yes
Logger	System logger (SMF 88)	Logger report (in the System Reports category)  Logger extract and Report Selection (in the Extracts category)	No

You can specify Performance, Transaction Resource Usage, and Exception Selection Criteria in your Report Set in two places:

- Global Selection Criteria, which apply to all reports in the Report Set, except those that have their own Selection Criteria. Global Selection Criteria are accessed from the Report Set panel.
- Report Selection Criteria, which apply only to a specific report. When Report Selection Criteria are defined, they take precedence over the Global Selection Criteria. Report Selection Criteria are specified on the individual Report panels.

You specify Logger Selection Criteria individually for each System Report/Extract in your Report Set.

You can also specify Performance Selection Criteria in a Report Form. If Selection Criteria are specified in both the Report and the Report Form it uses, records must satisfy both criteria to be selected for the report. For details, see “Selection Criteria in Report Forms” on page 166.

Selection Criteria consist of one or more Select Statements. Select Statements in turn consist of one or more INCLUDE/EXCLUDE conditions. You specify these conditions to instruct CICS PA to check field values against the values you specify. For example, you might want to:

- INCLUDE only transactions that ran between 10am and 12pm, and
- INCLUDE only Transaction IDs whose names match the pattern ST\*, and
- INCLUDE only transactions with a response time greater than 100 milliseconds.

For each record, the Select Statements are checked one at a time until the record is either included in or excluded from report processing.

Specifying multiple Select Statements provides you with a powerful facility to enhance your reporting capability. For example, suppose that you have two application systems, FINANCE and STOCK. Each system has its own performance thresholds that must be met. FINANCE transactions, prefixed by FI, must have a response time less than or equal to 100 milliseconds during peak period. STOCK transactions, prefixed by ST, must have a response time less than or equal to 200 milliseconds during peak period.

In this case, you would specify two Select Statements, one for each application:

*Table 5. Select Statements Example*

Selection Criteria	Select Statement	Conditions
Global or Report	FINANCE	TRAN=FI* RESPONSE time from 0 to 100 Active during 09:00 to 16:00
	STOCK	TRAN=ST* RESPONSE time from 0 to 200 Active during 09:00 to 16:00

Each CMF Performance record is checked against the Select Statements. The first Select Statement for the FINANCE system is checked first. If its conditions are met, then the record is passed to report processing with no further checking. Otherwise, the second Select Statement for the STOCK system is checked next. If its conditions are met, then the record is passed to report processing with no further checking. CMF records failing both Select Statements bypass report processing.

For a detailed discussion and examples, see “Using SELECT statements” on page 508.

When you select Selection Criteria for the first time, you are taken directly to specify a Select Statement. When you have specified at least one, a list is displayed. You can then select (edit), delete, or include/exclude any Statements in the list, or add new ones.

Thus the panel flow is:

1. Edit/View Report Set
2. Selection Criteria (List of Select Statements)
3. Select Statement

## Specifying Selection Criteria

To specify Global Performance or Exception Selection Criteria that will apply to all reports in the Report Set, scroll to the **Selection Criteria** category on the Report Set panel, and then enter line action **S** to select **Performance** or **Exception**.

To specify Selection Criteria for an individual report, select the report on the Report Set panel, and then enter line action **S** next to the **Selection Criteria** field on that Report panel.

If Select Statements have already been specified for this type of Selection Criteria, the Performance Selection Criteria panel is displayed. Otherwise, the Select Statement panel is displayed for you to define your first statement; see “Specifying Select Statements” on page 157.

```

Figure 72. Performance Selection Criteria

This panel lists the Select Statements which together make up the Selection Criteria that you have chosen to specify. One or more Select Statements make up the Selection Criteria against which CICS PA compares each input record to determine whether to include or exclude it in the report. You can select (edit), delete, or include/exclude any statement, insert new ones, or rearrange them (move/copy). The order of the rows is important to the report processor as the final decision on whether to include or exclude a record in the report can depend on the order of the Select Statements against which it is compared.

Each description is translated by CICS PA JCL generation into a `SELECT(PERFORMANCE(...))`, `SELECT(EXCEPTION(...))`, or `SELECT(LOGGER(...))` operand, depending on the type of Selection Criteria.

The options are:

**Exc** Exclude Indicator. An asterisk \* in this field indicates that this Select Statement is excluded from report processing and will not be used to filter records.

To reverse the Exclude indicator, enter line action **X**.

#### **Description**

This is a summary of the Select Statement, truncated to fit the panel width. EXCLUDE is abbreviated to Excl and INCLUDE is omitted.

To display and edit the full specification, enter line action **S**.

**Line Actions:** Valid line actions are:

<b>/</b>	Display the menu of line actions.
<b>S</b>	Select this row for review or modification
<b>I</b>	Insert a row
<b>R</b>	Repeat this row
<b>C</b>	Copy this row
<b>M</b>	Move this row
<b>A</b>	Move/Copy after this row
<b>B</b>	Move/Copy before this row
<b>D</b>	Delete this row
<b>X</b>	Reverse the Exclude indicator (Include/Exclude)

## **Specifying Select Statements**

The Select Statement panel is where you specify the details of the Select Statements to filter records. A Select Statement consists of one or more clauses that include or exclude Report Intervals (Performance, and Exception Selection Criteria only) or Field Values (all Selection Criteria).

CICS PA JCL generation translates the Report Intervals into operands with the format:

```
SELECT(PERFORMANCE|EXCEPTION(INCLUDE|EXCLUDE(  
ACTIVE|START|STOP(FROM(date,time),TO(date,time))),...))
```

The Field Values translate to:

```
SELECT(PERFORMANCE|EXCEPTION|LOGGER(INCLUDE|EXCLUDE(  
field(values)),...))
```

To display the Select Statement panel for Global Selection Criteria, enter line action **S** next to **Performance** or **Exception** in the Selection Criteria category on the Report Set panel. For individual Report Selection Criteria, select the report on the Report Set panel, and then enter line action **S** next to the Selection Criteria field. If the Selection Criteria panel is displayed, enter line action **S** against a particular Select Statement listed there.

The Select Statement panels are similar for Performance, Exception, and Logger Selection Criteria. The differences are:

- Performance and Exception Selection Criteria allow you to specify date/time ranges ("report intervals") based on transaction start, stop, or active times. Logger Selection Criteria allow you to specify report intervals based on SMF recording interval end time only.
- The Performance Select Statement panel has two views. To display the second view (showing field lengths and dictionary definitions), press **F11**.

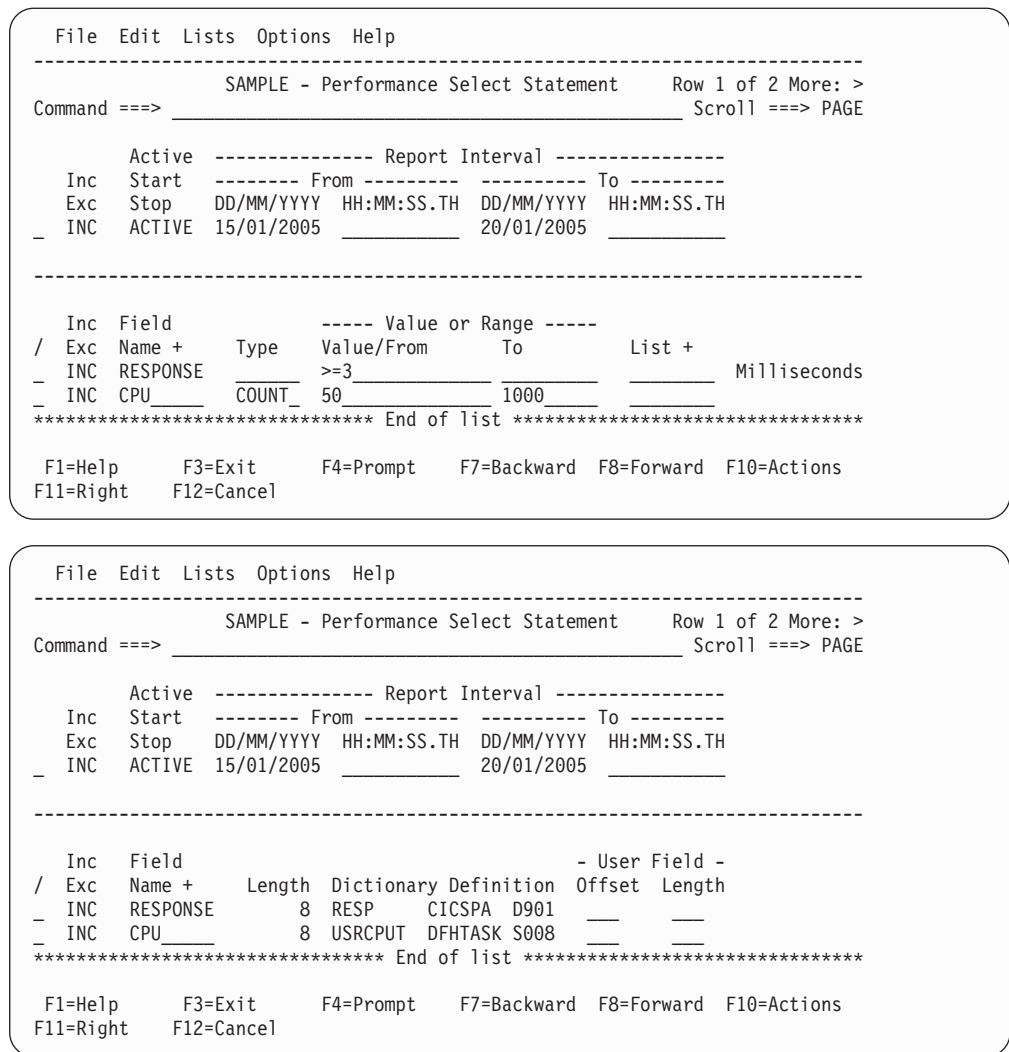

Figure 73. Performance Select Statement panel - default view and second view

The options for the **Report Intervals** are:

#### Inc/Exc

Specify **INC** to include data records in the report or extract if their transaction Start/Stop time is within the specified time range.

Specify **EXC** if data records whose transaction Start/Stop time is within the specified time range are to be excluded from the report or extract.

#### Active/Start/Stop

**START** refers to when the transaction was attached or when processing continued from a conversational transaction.

**STOP** refers to when the transaction was detached or a conversational transaction waited for terminal input.

**ACTIVE** refers to the entire time span between when the transaction started and stopped. Any part of the transaction active time that occurs between the specified report interval is considered a match. It can be used to make sure long-running transactions are included when their Start or Stop times fall out of the selection range.

For OMEGAMON records, Report Interval selection is limited to the START time; the STOP and ACTIVE options are ignored.

For System Logger records, Report Interval selection is limited to the STOP time.

### Report Interval

This is used to specify a *date/time range* or a *time slot* (times only).

**From** and **To** together specify the report interval. **Date** is either a calendar date in your preferred format or a relative date. **Time** is a time-of-day. (The same edit rules apply as for Report Set Start/Stop.)

Relative dates are specified as 0, -1, -2,... to signify a date relative to the current date. 0 represents today, -1 yesterday, -2 two days ago, and so on. If both From and To dates are specified, they must be in the same format.

For a *date/time range*:

- Either From or To can be omitted to indicate that the range is open-ended.
  - If From is omitted, it defaults to the first input record.
  - If To is omitted, it defaults to the end of file.
- If From date is specified with no time, the start of day is assumed.
  - If To date is specified with no time, the end of day is assumed.

For a *time slot*, both times must be present with no dates to signify the same time slot every day. The times can span midnight.

### More +

CICS PA allows up to 14 report intervals in a Select Statement. You can specify the first report interval on this panel. Enter line action **S** against the first report interval to display the window where you can specify multiple report intervals (see Figure 74 on page 161).

**More +** is displayed at the end of the first report interval to indicate that more than one report interval has been specified.

The options for the **Field Values** are:

### Inc/Exc

Specify **INC** if a data record is to be included in the report or extract when it matches the field and value specification.

Specify **EXC** if the data record is to be excluded from the report or extract if it matches the field and value specification.

### Field Name

The CICS PA name of the data field against which the record is compared. To select one from a list of available names, press **Prompt** (F4) from Field Name (see “Select a field” on page 162 or enter line action **S** (see “Field selection” on page 162).

For the Transaction Resource Usage reports you can specify FILENAME, TSQNAME, or DPLNAME to filter the CMF transaction resource class data on File name, Temporary Storage Queue name, or distributed program link (DPL) name. FILENAME, TSQNAME, and DPLNAME are ignored for CMF performance class data.

**Type** Some fields require you to specify a type. For example, clock fields require either **COUNT** or **TIME**.

### Value or Range

Enter the Field Value or Range against which the data records are compared.

- For **Character** fields, specify the Field Value. The value must not exceed the maximum field length. If the value is shorter than the field, it is padded to the right with blanks. Scroll **Right** (F11) to view the field length. The length of character type fields is commonly 8 bytes or less. However, UOWID is 6 bytes hexadecimal requiring an entry of 12 hexadecimal characters (0-F). TSQNAME can be up to 16 characters.

Masking characters % (exactly one character) and \* (any number of characters) are allowed. For example, specify TR\* to match all values starting with TR.

To specify a null value, specify two single quotes ' ' or ''.

If you need to specify a list of values, use an Object List.

- For Numeric (**Count** and **Time**) fields, specify a Range. The range can be specified as a From and To value. For example, from 1 to 100. If the To value is not specified then the From value is assumed.

Alternatively you can precede the From value with a comparison operator. For example, specify >=1 for a comparison of greater than or equal to 1. Allowed operators are:

= > >= < <=

Specify time values in seconds (using a decimal point) or milliseconds. For example, we can request RESPONSE in the range 1.12 to 1.25 seconds or the equivalent 1120 to 1250 milliseconds. CICS PA displays **Seconds** or **Milliseconds** accordingly.

**List** The name of an Object List in the current Object Lists data set. You can type in the name directly or to select one from a list of available Object Lists, place the cursor where you want the name inserted and press **Prompt** (F4). See Figure 78 on page 165 for an example of the Object List selection panel. The values in the Object List must be the same type (character or numeric) as the field for which the Object List is specified.

When Report Set JCL is generated, the values in the Object List are listed in the **SELECT** statements along with the explicitly specified values. The order in which the values are listed in the SELECT statement is the same order as they are specified in the Selection Criteria and Object List panel(s), however this order is of no consequence to CICS PA report processing.

### Length

The length of the field.

### Dictionary Definition (Performance Selection Criteria only)

The description of the CMF data field in the format:

informalname owner xnnn

where:

- *informalname* is the CMF field name
- *owner* is the CICS component that 'owns' the field
- *x* indicates the data type:
  - A - 32- or 64-bit count
  - C - character string
  - D - CICS PA derived time
  - P - packed decimal number
  - S - clock (time-count)
  - T - STCK time stamp
  - X - CICS PA calculated count
- *nnn* is the field identifier

Some special fields, such as APPLID and RESPONSE, are not defined in the CMF Dictionary and are given an owner of 'CICSPA'. They are either derived from the fixed section of the CMF record (for example, APPLID), or calculated from two or more other CMF fields (for example, RESPONSE).

User fields can be specified in Select Statements. However, you must specify in Global Options a CICS System that has user fields defined in its MCT. CICS PA recognizes the APPLID associated with the Select Statement, and when a row is selected (S line action), the list of field names will include the user fields at the bottom of the list.

**User Field Offset and Length (Performance Selection Criteria only)**

For character user fields when only part of the field is to be checked. **Offset** is the starting character position and **Length** is the number of characters from this position to be checked. For example, if the user field contains the value ABCDEFG, then specifying offset 3 and length 5 gives CDEFG. Both values are required for character user fields and default to the entire field (offset 1 and maximum length).

CICS PA JCL generation translates these values to:  
FIELDS(Character(SUBSTR(offset,length)),...)

**Line Actions (field rows):** The valid line actions for the **Field Value** rows are:

- / Display the menu of line actions.
- S Select a field name from a list (see "Field selection" on page 162).
- I Insert a field.
- R Repeat this row.
- C Copy this row.
- M Move this row.
- A Move/Copy after this row.
- B Move/Copy before this row.
- D Delete this row.

**Specifying more than one report interval**

To specify more than one **Report Interval**, enter line action **S** against the first Report Interval at the top of the Select Statement panel. **More +** is displayed at the end of the first Report Interval to indicate that more than one report interval has been specified.

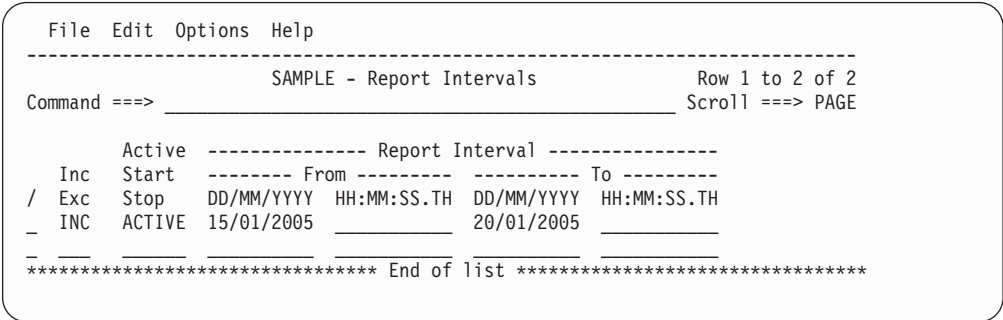

Figure 74. Performance Report Intervals

This panel is used to specify multiple report intervals for CMF performance record selection.

**Line Actions:** The valid line actions on this panel are:

- / Display the menu of line actions.

- I**      Insert a row.
- R**      Repeat this row.
- C**      Copy this row.
- M**      Move this row.
- A**      Move/Copy after this row.
- B**      Move/Copy before this row.
- D**      Delete this row.

## Field selection

Field Selection allows you to view expanded field descriptions and select a field name for insertion into your Selection Criteria. To display the Field Selection panel, enter line action **S** against a field or blank row on the Select Statement panel where you want to insert the selected field name.

File Help

Row 1 of 11 More: >

Command ===> \_\_\_\_\_ Scroll ===> CSR\_

Name . . . . . TASKNO\_ +  
 CMF ID . . . : TRANNUM DFHTASK P031  
 Description . : Transaction identification number

---

Transaction identification number.

Note: The transaction number field is normally a 4-byte packed decimal number. However, some CICS system tasks are identified by special character 'transaction numbers', as follows:

- ' III' for system initialization task
- ' TCP' for terminal control.

These special identifiers are placed in bytes 2 through 4. Byte 1 is a blank (X'40') before the terminal control TCP identifier, and a null value (X'00') before the others.

F1=Help
F3=Exit
F4=Prompt
F6=Resize
F7=Backward

F8=Forward
F10=Prev
F11=Next
F12=Cancel

*Figure 75. Performance field selection*

The panel cycles through all the CMF performance class fields and transaction resource class fields available for selection. Each field is displayed in turn with its expanded description like that in “Performance field help” on page 164. Details are only available for CICS-defined fields, not user fields.

To cycle through the list of fields, press **F11** or **F10** to move Forward or Backward through the list. You can restart anywhere in the cycle by entering a valid field name then move Forward or Backward from that point.

You can press **Prompt** (F4) from the Name field to display a selection list of fields (see Figure 76 on page 163).

When the required field is displayed in the Name field, press **Exit** (F3) to select it.

## Select a field

Field selection allows you to select a field name for insertion into your Select Statement. The panel lists all CMF performance class and transaction resource class fields available for selection.

To display the selection list, press **Prompt** (F4) from the Name field of the Select Statement.

Performance Selection Criteria, Exception Selection Criteria, and Logger Selection Criteria each present a different list of fields, matching the different record types to which they apply.

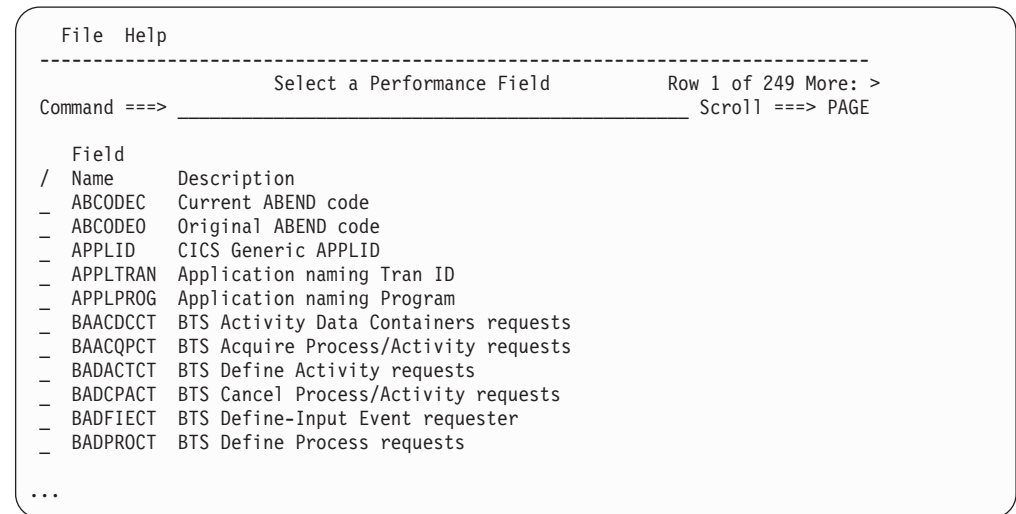

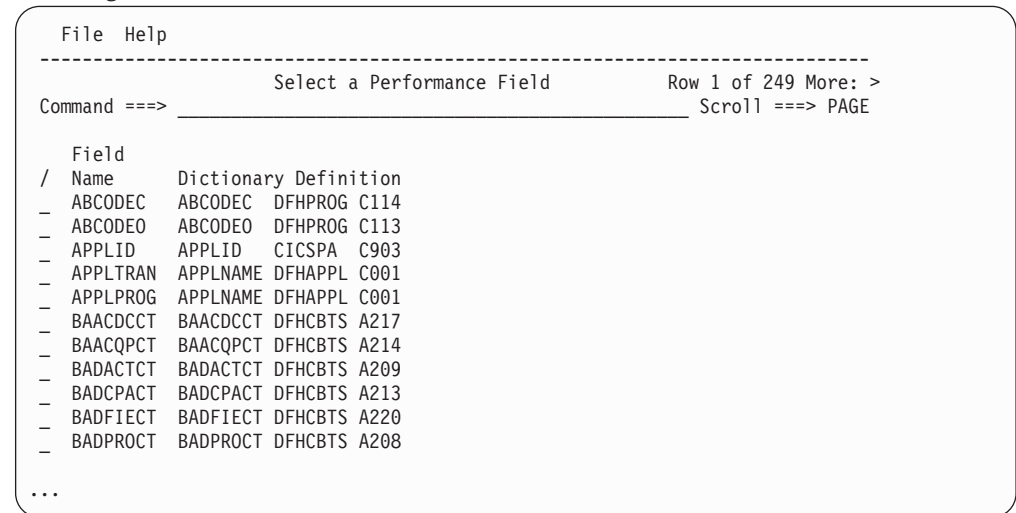

Figure 76. Select a performance field

Scroll **Right** (F11) to see all columns of information about the fields.

To help locate a particular field, you can use the **FIND** and **RFIND** commands, which search in all the displayed fields for a specified string.

To leave without selecting, use Exit or Cancel.

The columns are:

#### Field Name

The CICS PA name for the CMF data field. User fields are listed if an APPLID has been specified in Global Options and its MCT has user fields defined. User fields display at the bottom of the selection list.

Enter line action **S** to select a field. It is inserted into the Select Statement in the row where the cursor is positioned.

### Description

This is a short description of the field. Enter line action **H** (Help) for a more detailed description. See Figure 77 for an example of the help details displayed in a pop-up window.

### Dictionary Definition

The description of the CMF data field in terms of the CMF informal name, CICS owner, data type, and field identifier. See page 160 for further information.

## Performance field help

On the Select a Performance Field panel, if you enter the line action **H** against a field, a pop-up window will display a more detailed explanation of the field.

Select an Object List then press Enter.

      Name          Description
.  HRTRANS  HR application transactions
.  USERNETW  Userids of Network Team
S  ODDNUMS   Odd Numbers
***** End of list *****

```

Figure 78. Select an Object List

This panel displays the Object Lists defined in the current Object Lists data set.

Enter line action **S** (or point-and-shoot) to select an Object List name to insert into your Select Statement.

## Fields checked by Performance Selection Criteria

The field selection list for Performance Selection Criteria displays fields from several record types (described in Table 4 on page 154), even when you are specifying Selection Criteria for a report that processes only one of those record types. If you specify conditions for fields that do not belong to the record type for the report, those conditions are ignored for that report. The following topics list the Performance Selection Criteria fields that are checked for each record type.

### Selecting DB2 accounting records

The only Performance Selection Criteria fields checked against DB2 accounting records are:

```

START
STOP
ACTIVE
UOWID

```

All other fields are ignored.

DB2 accounting record selection applies to the DB2 report (see Figure 126 on page 224) and the Record Selection extract (see Figure 146 on page 260). Time-based selection depends on whether the DB2 thread Begin-End times are within the specified report intervals.

### Selecting MQ accounting records

The only Performance Selection Criteria fields checked against MQ accounting records are:

```

START
STOP
ACTIVE
TASKNO
TRAN

```

All other fields are ignored.

MQ accounting record selection applies to the WebSphere MQ report (see Figure 129 on page 230) and the Record Selection extract (see Figure 146 on page 260). Time-based selection depends on whether the MQ thread Begin-End times are within the specified report intervals.

## Selecting OMEGAMON records

CICS PA checks only the following Performance Selection Criteria fields when filtering OMEGAMON records:

### APPLID

CICS APPLID

### FILENAME

Database (or file) name

### NETUOWPX

Originating System VTAM network name

### START

Task start time.

**Note:** Report Interval-based selection for OMEGAMON XE for CICS records is limited to the Attach (START) time; the STOP and ACTIVE options are ignored.

### TASKNO

Transaction identification number

### TRAN CICS transaction ID

### UOWID

Unit of work ID

All other fields are ignored.

OMEGAMON record selection applies to the OMEGAMON reports (see "OMEGAMON reports" on page 233).

## Selecting Transaction Resource Class records

The Transaction Resource Usage Summary reports process both transaction resource class and performance class data. The Transaction Resource Usage List report processes only transaction resource class data. These reports use Performance Selection Criteria to filter both classes of data. For more information, see "Performance Selection Criteria" on page 218.

## Selection Criteria in Report Forms

In addition to specifying Selection Criteria in Report Sets, Selection Criteria can be used in Report Forms (and also in the History Database; see "Performance Selection Criteria" on page 632). For example, the Sample Report Form BADFILE reports the top 20 Worst File Request transactions. It specifies Selection Criteria (FCTOTAL>0) to ensure only transactions that use File Control services are considered for reporting.

Report Form Selection Criteria specification has two benefits:

1. Only transactions that use File Control Services (the focus of this Report Form) are selected.
2. CICS PA only processes (sorts) selected records, significantly reducing the time and overhead of generating the report.

Report Set and Report Form Selection Criteria can be used together:

- **Report Form Selection Criteria** typically focuses on the type of data being reported. For example, if your Form is targeting File Control activity then its Selection Criteria can specify `FCTOTAL>0` to include only transactions that used File Control services.

Report Set Selection Criteria generates batch commands using the `SELECT` operand.

- **Report Set Selection Criteria** typically focuses on the application targeted by the Form. For example, if the Report is targeting MY application then its Selection Criteria can specify `TRAN = MY*` to include only transactions in MY application.

Report Form Selection Criteria generates batch commands using the `SELECT2` operand.

The resultant report will include data for transactions matching `MY*` that use File Control services. For example:

```
CICSPA  SELECT(PERF(INCL(TRAN(MY*)))),
        SELECT2(PERF(INCL(FCTOTAL(>0)))),...
```

Both `SELECT` and `SELECT2` must match for the record to be processed.

---

## Requesting reports and extracts

In a Report Set, you can request any number of reports and extracts, and any number of instances of them with different reporting options specified. For example, you might request three variations of the Performance List report, one Performance Summary report, and two different Cross-System Work extracts.

When you select a report or extract from the Report Set panel:

- If there is at least one of this type already defined, a list is displayed. You can then select (edit), delete, or include/exclude any in the list, define new ones, or rearrange them (move/copy).
- The list is bypassed if none of this type of report or extract is defined yet, and the Report or Extract definition panel is displayed directly.

Thus the panel flow is:

1. List of Report Sets
2. Edit/View Report Set
3. List of Reports/Extracts
4. Define Report/Extract

For Report Set JCL generation, you must specify the systems that you want to analyze. The systems and files must be defined in System Definitions. You can link directly there by selecting **Systems** in the action bar.

It is recommended that you specify your System Selection at run time, not within the Report Set. This will allow you to run your Report Sets against any of your defined systems.

---

## Performance reports

The Performance Reports process CMF performance class data to produce tabular-style reports.

### Performance List report

The Performance List report provides a detailed list of the CMF performance class records.

To request the report, enter line action **S** against the **List** Performance Report on the Report Set panel. If reports of this type have been previously specified, the list of Performance List Reports is displayed. Otherwise, the Performance List Report panel is displayed for you to define your first report of this type.

```

```

Figure 79. Performance List Reports

This panel displays the list of Performance List Reports in this Report Set. You can select (edit), delete, or include/exclude any report, insert new ones, or rearrange them (move/copy).

The options are:

**Exc** An asterisk \* in this field indicates that the report or extract is excluded from report processing.

Use line action **X** to reverse the Exclude indicator.

### System Selection

Identifies the CICS APPLIDs whose data you want to select for processing.

You can specify any combination of APPLID, Image, or Group, but these must be defined in your System Definitions. If you do not specify System Selection here or in the Global Options, then you are prompted at run time to specify the System Selection. This will apply globally to all reports and extracts without their own System Selection. This is recommended as it allows you to run your Report Sets against any of your defined Systems. Press the Prompt key (F4) to select from a list of defined Systems, Images, or Groups. To modify your System Definitions, select Systems in the action bar.

Specify one of the following:

- A CICS APPLID. An APPLID that matches a defined System's name pattern is also allowed. For example, CICSPO1 can be specified if CICSPO\* is a defined system.
- An APPLID and an MVS Image. This identifies the MVS Image where your CICS system runs.
- An MVS Image. All CICS systems executing on this MVS Image is selected.
- An APPLID and Image combination plus a Group. This is useful for uniquely identifying a CICS system when there are multiple CICS systems with the same name defined.
- A Group alone. CICS PA will select all CICS APPLIDs defined to the Group. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA uses the System Selection in JCL generation to build the APPLID(applid1,applid2,applid3,...) and Input(SMFIN001,SMFIN002,SMFIN003,...) operands, and corresponding //SMFINnnn DD statements.

System Selection can also be specified either:

- In Global Options. The report-level specification takes precedence over the global.
- At run time. The run-time System Selection overrides the Global Options and optionally the report-level specification.

### **Output**

The DDname for the report output which CICS PA uses when generating the JCL to run the Report Set.

This option generates the OUTPUT(ddname) operand.

**Form** The name of a Report Form to be used to tailor the format and content of the report. The report must use a Report Form of a compatible type, that is LIST or LISTX. If not specified, CICS PA uses the default Form. See Figure 164 on page 301 for the default LIST Report Form.

CICS PA JCL generation translates the Report Form specification into the FIELDS operand.

**Alert** The name of a Performance Alert Definition to be used to report performance non-compliance.

### **Selection Criteria**

This indicator is generated by CICS PA.

**YES** indicates that Selection Criteria are activated for this report or extract.

**NO** indicates that Selection Criteria are not activated for this report or extract. This can mean that no Selection Criteria have been specified, all Select Statements are Excluded, or the Selection Criteria have been deactivated.

**Line Actions:** The valid line actions on the list of reports panel are:

<b>/</b>	Display the menu of line actions
<b>S</b>	Select this row for review or modification
<b>I</b>	Insert a row
<b>R</b>	Repeat this row
<b>C</b>	Copy this row
<b>M</b>	Move this row.
<b>A</b>	Move/Copy after this row
<b>B</b>	Move/Copy before this row
<b>D</b>	Delete this row
<b>X</b>	Reverse the Exclude indicator (Include/Exclude)

**Primary Commands:** The following primary commands are valid for this panel:

### **SHOW**

This command shows all items in the list, both Included and Excluded. This is the default on entry to the panel.

Also available from **Filter** in the action bar.

**HIDE** This command hides all Excluded items which have \* in the **Exc** column. Only the Included items, where **Exc** is blank, are displayed. If all items are Excluded, a blank row is inserted to accept entry of a new data set

specification. Row n from m after the panel title indicates the total number of items in the list. HIDE is only in effect until exit from this panel, or until the next SHOW command is issued.

Also available from **Filter** in the action bar.

#### EXCLUDE

This command Excludes all items by displaying \* in their **Exc** column.

Also available from **Edit** in the action bar.

#### INCLUDE

This command Includes all Excluded items by removing the \* from their **Exc** column.

Also available from **Edit** in the action bar.

#### RESET

This command (or **RES**) removes all outstanding line actions and deletes any blank rows.

Also available from **Edit** in the action bar.

#### SYSDEFS

This command opens the Personal System Definitions dialog.

Also available from **Systems** in the action bar.

To display the Performance List Report panel, enter line action **S** against the **List** Performance Report on the Report Set panel, then if the list of previously specified reports is displayed, enter line action **S** against a particular report in the list.

*Figure 80. Performance List Report*

Use this panel to specify report options, report format, and record selection criteria for the Performance List report. The only mandatory option is the DDname for the report output. You can let the other options default.

The precision of numerical fields in the report is specified in Global Options (see Figure 71 on page 151).

The options are:

### System Selection

Identifies the CICS APPLIDs whose data you want to select for processing.

You can specify any combination of APPLID, Image, or Group, but these must be defined in your System Definitions. If you do not specify System Selection here or in the Global Options, then you are prompted at run time to specify the System Selection. This will apply globally to all reports and extracts without their own System Selection. This is recommended as it allows you to run your Report Sets against any of your defined Systems. Press the Prompt key (F4) to select from a list of defined Systems, Images, or Groups. To modify your System Definitions, select Systems in the action bar.

Specify one of the following:

- A CICS APPLID. An APPLID that matches a defined System's name pattern is also allowed. For example, CICSP1 can be specified if CICSP\* is a defined system.
- An APPLID and an MVS Image. This identifies the MVS Image where your CICS system runs.
- An MVS Image. All CICS systems executing on this MVS Image is selected.
- An APPLID and Image combination plus a Group. This is useful for uniquely identifying a CICS system when there are multiple CICS systems with the same name defined.
- A Group alone. CICS PA will select all CICS APPLIDs defined to the Group. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA uses the System Selection in JCL generation to build the APPLID(applid1,applid2,applid3,...) and INput(SMFIN001,SMFIN002,SMFIN003,...) operands, and corresponding //SMFINnnn DD statements.

System Selection can also be specified either:

- In Global Options. The report-level specification takes precedence over the global.
- At run time. The run-time System Selection overrides the Global Options and optionally the report-level specification.

### Report Output DDname

The DDname for the report output. Specify 1-8 alphanumeric characters starting with an alphabetic character. The DDname is mandatory and should be unique to separate the output of multiple reports. Multiple reports of the same type can use the same DDname without consequence, however a mix of reports using the same DDname might interleave the print lines.

CICS PA assigns a default DDname **LISTnnnn** where nnnn is a sequential number **0001-9999** to ensure each report has a unique DDname.

This option generates the OUTPUT(ddname) operand.

### Print Lines per Page

The maximum number of lines, including headings, to print on each page of the report. Valid values are from 1 to 255. The default is **60**.

A global value can be specified to apply to all reports. If a value is also specified here on the report panel, it takes precedence over the global for this report only.

CICS PA JCL generation translates this field to the LINECount operand.

#### **Report Form**

The name of a LIST Report Form to be used to tailor the format and content of the report.

To select the name from a list of compatible Report Forms, position the cursor on the Form field and press **Prompt** (F4).

CICS PA JCL generation translates the Report Form specification into the FIELDS operand.

If a Report Form is not specified, CICS PA uses the default Form. See Figure 164 on page 301 for the default Report Form for the LIST report.

#### **Alert** The name of a Performance Alert Definition.

To select from a list of predefined names, position the cursor on the Alert field and press **Prompt** (F4).

CICS PA JCL generation translates the Alert specification into the ALERTDEF operand.

#### **Severity**

When an Alert name is specified, this sub-option allows you to specify the minimum severity level to be reported and type of transactions reported.

The minimum severity level selected for reporting is used to report transactions that have at least that level of reporting in *any* of the severity fields. This could result in transactions being reported with severity lower than the specified severity when the transaction also has one or more severity fields that meets the specified severity criteria. For example, if you specify SEVERITY(CRITICAL) for the report, only transactions with Critical severity are reported, however, if a transaction also exceeds Warning or Info thresholds, the lower severity will be also reported.

Press **Prompt** (F4) to select from the list of available options which are:

##### **CRITICAL**

Only Critical transactions are reported.

##### **WARNING**

Only Critical and Warning transactions are reported.

**INFO** All alerts are reported: Critical, Warning and Informational transactions.

##### **ELIGIBLE**

Only eligible transactions are processed and reported. Eligible transactions are those that have resource values that match resource values specified in the alert definition. The resulting report will include eligible only transactions with and without alerts.

This option provides the means to filter out transactions that would never generate an alert because their resource values do not match resource values specified in the alert definition.

### **ALL or blank**

All transactions are reported, whether or not they generate an alert and whether or not they are eligible. This is the default.

CICS PA JCL generation translates the Severity specification into the SEVERITY(CRITICAL|WARNING|INFO|ELIGIBLE|ALL) operand.

**Title** Title of the report. Specify up to 128 characters of text to describe the report. CICS PA concatenates the two lines of 64 exactly as entered to make one line which prints at the top of each page of the report below the heading. The default is blank (no title).

If the report uses a Report Form, and a title is specified on both, the title on this report panel takes precedence.

This option generates the TITLE1('left-half') and TITLE2('right-half') operands.

### **Performance Selection Criteria**

You can specify Selection Criteria to filter the CMF records on time period and field values to restrict reporting to the data that is of interest to you.

CICS PA JCL generation translates Selection Criteria to the SELECT(PERFORMANCE operand.

If you specify a Report Form that also has Selection Criteria specified, CICS PA JCL generation translates the Form's Selection Criteria to the SELECT2(PERFORMANCE operand. If both the report and the Form specify Selection Criteria, then a record must pass selection by both specifications to be included in the report.

#### **Line Actions:**

**/** Display the menu of line actions.

**S** Display the subpanel where Selection Criteria can be specified for this report. For details, see "Specifying Selection Criteria" on page 156.

**A** Activate the Selection Criteria so they are generated for this report when the Report Set is submitted. Selection Criteria can only be activated if one or more Select Statements are specified and not all are excluded. An asterisk \* indicates they are active.

**D** Deactivate the Selection Criteria. Any you have specified here will not be used.

### **Repository**

The data set name of the Repository that contains the Performance Alert Definitions.

### **Select a System (CICS APPLID)**

To report on a particular system, you can select one from a list of available systems by pressing **Prompt** (F4) from the **CICS APPLID** field in System Selection. Only the systems of that type are displayed. See Figure 81 on page 174 for an example showing a list of CICS APPLIDs.

Enter line action **S** (or point-and-shoot) to select a system from the list to insert in your System Selection.

Figure 84. Select a Report Form (LIST Example)

This panel displays the Report Forms defined in the current Report Forms data set. Only Report Forms of a compatible type to the report or extract are presented:

- Performance List Report - LIST Form
- Performance List Extended Report - LISTX Form
- Performance Summary Report - SUMMARY Form
- Transaction Profiling Report - SUMMARY Form
- Cross-System Work Report - LIST and LISTX (sort ignored) Forms
- Performance Data Extract - LIST, LISTX (sort ignored), and SUMMARY Forms

Enter line action **S** (or point-and-shoot) to select a Report Form to tailor your report.

## Performance List Extended report

The Performance List Extended report provides a detailed list of the CMF performance class records. It differs from the Performance List report in that you can specify the sorting criteria for the performance class records.

To request the report, enter line action **S** against the **List Extended** Performance Report on the Report Set panel. If reports of this type have been previously specified, the list of Performance List Extended Reports is displayed. Otherwise, the Performance List Extended Report panel is displayed for you to define your first report of this type.

Figure 86. Performance List Extended Report

Use this panel to specify report options, report format, and record selection criteria for the Performance List Extended report. The only mandatory option is the DDname for the report output. You can let the other options default.

The report options are the same as those for the Performance List Report. See “Performance List report” on page 167.

CICS PA provides a default **Report Output DDname** in the format **LSTXnnnn** where nnnn is **0001-9999**.

To select **Form** from a list of predefined LISTX Report Forms, use **Prompt** (F4). If a Form is not specified, CICS PA uses the default Form. See Figure 166 on page 309 for the default LISTX Report Form.

The precision of numerical fields in the report is specified in Global Options (see Figure 71 on page 151).

## Performance Summary report

The Performance Summary report is a summary of the CMF performance class records.

To request the report, enter line action **S** against the **Summary** Performance Report on the Report Set panel. If reports of this type have been previously specified, the list of Performance Summary Reports is displayed. Otherwise, the Performance Summary Report panel is displayed for you to define your first report of this type.

Figure 88. Performance Summary Report

Use this panel to specify report options, report focus, and record selection criteria for the Performance Summary report. The only mandatory option is the DDname for the report output. You can let the other options default.

The precision of numerical fields in the report is specified in Global Options (see Figure 71 on page 151).

The report options are the same as those for the Performance List Report (see "Performance List report" on page 167) but with the following additional options:

**Alert** Specifies the Performance Alert Definition name.

#### Eligible transactions only

Indicates that the report should only process transactions that are eligible for alert processing. That is, their resource values match those specified in the alert definition. This option results in only alert eligible transactions being summarized in the report regardless of whether they generate an alert or not. This option effectively makes it an alert specific report. This option is ignored if no Performance Alert Definition name is specified.

#### Report by time interval

Provide flexibility when reporting by time interval. You can override the Form key fields by prefixing, appending, or replacing it with one of the timestamp fields. This gives you an easy means of using a common Summary Form to generate various interval-based reports without creating individual Forms for each report. This is achieved by allowing you to manipulate the Form key through the use of these options to create the required reports.

#### Interval

The time interval applies when you want to summarize transaction activity over time. It is used when you specify a SUMMARY Report Form which has any of the key fields **OSTART**, **START**, or **STOP** included. When reporting, CICS PA accumulates the data for each interval in the report period and writes a report line for each.

Specify a value in the range **00:00:01** (1 second) to **24:00:00** (24 hours). The default is **00:01:00** (1 minute).

A time interval of less than one hour must fit evenly into the hour. CICS PA will round it down to the nearest interval that aligns to the hour. For example, 1.35 is reduced to 00:01:30 minutes which will produce 40 interval report lines for each hour of data.

A time interval of more than one hour must fit evenly into the day. CICS PA will round it down to the nearest interval that aligns to the day. For example, 10.30.23 is reduced to 08:00:00 hours which will produce 3 interval report lines for each day of data.

Minutes take precedence for an abbreviated entry. For example:

**1** becomes 00:01:00

**1.1** becomes 00:01:00 (rounded down from 00:01:01)

**1.1.1** becomes 01:00:00 (rounded down from 01:01:01)

This option generates the **INTERVAL(hh:mm:ss)** operand.

### Override Form

Specifies whether to **PREFIX**, **APPEND** or **REPLACE** the key fields specified in the Form. Based on the action in this option, JCL generation will generate the required Form key using the override option and field specified in Timestamp. Ensure that the resulting key conforms to the Summary key rules. No action will be taken if this field is blank. The Form itself is not affected, only the generated **FIELDS** key fields.

This option is ignored if no Form is specified.

### Timestamp

Specifies the field name to override the Form key fields. Valid timestamp fields are **START**, **STOP**, and **OSTART**.

### Totals Level

This option applies only to the Summary report. Leave blank if you do not want to include total lines in the report. This generates the **NOTOTALS** operand.

Specify a number between 1 and 8 to accumulate subtotals for up to 8 sort fields, print the subtotals when the sort field changes, and print a grand total at the end of the report. This generates the **TOTALS(n)** operand where n is a value between 1 and 8. Default: **8**

Specify 0 for no subtotals, but print only the grand total. This generates the **TOTALS(0)** operand.

### Use External Sort

Select / to use an external sort utility to process summary records. This is the default. It generates the **EXTERNAL(ddname)** operand. This provides the DDname of the work data set used by the external sort utility. CICS PA assigns an External Work File from a pool of External Work Files with default DDnames in the format **CPAXWnnn** where nnn is a sequential number **001-999** to uniquely identify the work file.

An external sort should be used when processing large volumes of data.

If not selected, an internal sort is used.

### Repository

The data set name of the Repository that contains the Performance Alert Definitions.

CICS PA provides a default **Report Output DDname** in the format **SUMMnnnnn** where nnnn is **0001-9999**.

To select a **Form** from a list of predefined SUMMARY Report Forms, use **Prompt** (F4). If a Form is not specified, CICS PA uses the default Form. See Figure 168 on page 314 for the default SUMMARY Report Form.

## Performance Totals report

The Performance Totals report provides detailed statistics of all fields in the CMF performance class records. The statistics are accumulated during input file processing, and printed at the End of File.

To request the report, enter line action **S** against the **Totals** Performance Report on the Report Set panel. If reports of this type have been previously specified, the list of Performance Totals Reports is displayed. Otherwise, the Performance Totals Report panel is displayed for you to define your first report of this type.

The report options are the same as those for the Performance List report (see “Performance List report” on page 167), except there is no Report Form.

CICS PA provides a default **Report Output DDname** in the format **TOTLnnnn** where nnnn is **0001-9999**.

## Wait Analysis report

The Wait Analysis report provides a breakdown of wait activity by Transaction ID (or other ordering fields). You can see at a glance which CICS resources are causing your transactions to be suspended. This report can help you to quickly identify the possible source of a performance response time problem.

To request the report, enter line action **S** against the **Wait Analysis** Performance Report on the Report Set panel. If reports of this type have been previously specified, the list of Wait Analysis Reports is displayed. Otherwise, the Wait Analysis Report panel is displayed for you to define your first report of this type.

Figure 92. Wait Analysis Report

Use this panel to specify report options and record selection criteria for the Wait Analysis report. The report format is fixed. The only mandatory option is the DDname for the report output. You can let the other options default.

The report options are the same as those for the Performance List Report (see “Performance List report” on page 167), except there is no Report Form and there are additional ordering and processing options:

#### Order by

Specify the Field names that the Wait Analysis report is to be ordered by. If not specified, the report is ordered by Transaction ID. You can use **Prompt** (F4) to select from a list of allowed fields: TRAN, START, STOP, APPLID, PROGRAM, TERM, USERID, APPLPROG, APPLTRAN, FCTY, LUNAME, RLUNAME, RPTCLASS, SRVCLASS, TCLASSNM, TCPSRVCE, TERMCNNM, ISIPICNM, WBATMSNM, WBPIPLNM, WBPROGNM, WBSVCENM, WBSVOPNM, WBURIMNM.

#### Time Interval

The time interval applies when you want to summarize wait activity over time, and is only applicable when one of the Ordering fields is a time stamp (START or STOP). For example, specify 00:15:00 if you want to summarize activity over 15 minute intervals.

Specify a value in the range **00:00:01** (1 second) to **24:00:00** (24 hours). The default is **00:01:00** (1 minute).

A time interval of less than one hour must fit evenly into the hour. CICS PA will round it down to the nearest interval that aligns to the hour.

For example, 1.35 is reduced to 00:01:30 minutes which will produce 40 interval report lines for each hour of data.

A time interval of more than one hour must fit evenly into the day. CICS PA will round it down to the nearest interval that aligns to the day. For example, 10.30.23 is reduced to 08:00:00 hours which will produce 3 interval report lines for each day of data.

Minutes take precedence for an abbreviated entry. For example:

- 1** becomes 00:01:00
- 1.1** becomes 00:01:00 (rounded down from 00:01:01)
- 1.1.1** becomes 01:00:00 (rounded down from 01:01:01)

This option generates the INTERVAL(hh:mm:ss) operand.

CICS PA provides a default **Report Output DDname** in the format **WAITnnnn** where nnnn is **0001-9999**.

## Transaction Profiling report

The Transaction Profiling report compares two sets of CMF performance class data. For example, the performance data for a particular CICS application in two different time periods, or the performance data for all applications on two systems. The two sets of data to be compared are known as the report data and the baseline data. The Transaction Profiling report can show differences between the report data and baseline data as a “delta” (report data values minus their equivalent baseline data values) or as a percentage change.

To understand how the Transaction Profiling report compares the two sets of data, it is useful to think of the Transaction Profiling report as a consolidated view of two Performance Summary reports: one for the report data and one for the baseline data. CICS PA summarizes the two sets of data separately, then consolidates them by finding a row in the summarized baseline data whose key fields match a row in the summarized report data. CICS PA then compares the values of the non-key fields in the two matched rows. For more information about Performance Summary reports, see “Performance Summary report” on page 177.

You can request the Transaction Profiling report as part of a Report Set, as described here, or you can request the report independently of any Report Set, using option 7 **Profiling** on the CICS PA Primary Option Menu. The Profiling option offers more flexibility than a Report Set for the source of the report data and baseline data. Using a Report Set, the report data must reside in one or more SMF files and the baseline data must reside in a performance HDB. Using the Profiling option, the report data and baseline data can reside in performance HDBs or SMF files. However, the Profiling option only allows you to request one Transaction Profiling report at a time, while a Report Set allows you to define many Transaction Profiling reports. For more information on the Profiling option, see “Requesting a Transaction Profiling report outside a Report Set” on page 192.

To request the report in a Report Set, enter line action S against the **Transaction Profiling** Performance Report on the Report Set panel. If reports of this type have been previously specified, the list of Transaction Profiling reports is displayed. Otherwise, the Transaction Profiling Report panel is displayed for you to define your first report of this type.

Figure 94. Transaction Profiling Report (in a Report Set)

Use this panel to specify the options of the Transaction Profiling report. The only mandatory options are DDname for the report output and Baseline Historical Database for the source of the baseline data. You can let the other options default.

The precision of numerical fields in the report is specified in Global Options (see Figure 71 on page 151).

The options are similar to the Performance Summary report, with additional options for Transaction Profiling:

### Report System Selection

Identifies the CICS APPLIDs whose records you want to select from SMF files for processing as the report data (for comparison with the baseline data in an HDB).

You can specify any combination of APPLID, Image, or Group, but these must be defined in your System Definitions. If you do not specify System Selection here or in the Global Options, then you are prompted at run time to specify the System Selection. This will apply globally to all reports and extracts without their own System Selection. This is recommended as it allows you to run your Report Sets against any of your defined Systems. Press the **Prompt** key (F4) to select from a list of defined Systems, Images, or Groups. To modify your System Definitions, select **Systems** in the action bar.

Specify one of the following:

- A CICS APPLID. An APPLID that matches a defined System's name pattern is also allowed. For example, CICSP1 can be specified if CICSP\* is a defined system.
- An APPLID and an MVS Image. This identifies the MVS Image where your CICS system runs.
- An MVS Image. All CICS systems executing on this MVS Image is selected.
- An APPLID and Image combination plus a Group. This is useful for uniquely identifying a CICS system when there are multiple CICS systems with the same name defined.
- A Group alone. CICS PA will select all CICS APPLIDs defined to the Group. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA uses the System Selection in JCL generation to build the APPLID(applid1,applid2,applid3,...) and INput(SMFIN001,SMFIN002,SMFIN003,...) operands, and corresponding //SMFINnnn DD statements.

System Selection can also be specified either:

- In Global Options. The report-level specification takes precedence over the global.
- At run time. The run-time System Selection overrides the Global Options and optionally the report-level specification.

### Report Output DDname

The DDname for the report output. Specify 1-8 alphanumeric characters starting with an alphabetic character. The DDname is mandatory and should be unique to separate the output of multiple reports. Multiple reports of the same type can use the same DDname without consequence, however a mix of reports using the same DDname might interleave the print lines.

CICS PA assigns a default DDname PROFnnnn where nnnn is a sequential number 0001-9999 to ensure each report has a unique DDname.

This option generates the OUTPUT(ddname) operand.

**Print Lines per Page**

The maximum number of lines, including headings, to print on each page of the report. Valid values are from 1 to 255. The default is **60**.

A global value can be specified to apply to all reports. If a value is also specified here on the report panel, it takes precedence over the global for this report only.

CICS PA JCL generation translates this field to the LINECount operand.

**Baseline Historical Database**

The List or Summary Performance HDB, in the current Repository, containing the baseline data that you want to compare with the report data. You must have already defined this HDB and loaded it with data.

The current repository is specified in either option 5 Historical Database or option 7 Profiling from the Primary Option Menu.

**Baseline Interval**

Specify a date/time range or a time slot (times only) to filter the baseline data based on the transaction start time (START field) in the HDB records. HDB records with a transaction start time (START field) within the specified From-To interval are processed by CICS PA, otherwise they are ignored.

You specify the Baseline Interval in the same way that you specify the Report Interval when you run the Report Set. For details, see the description of the Start Date/Time, Stop Date/Time option in "Set run-time options" on page 276.

**Report Form and Baseline Form**

The names of SUMMARY Report Forms that specify the key fields that you want report data and baseline data records to be grouped and sorted by, the "non-key" fields whose values you want to compare, and the functions for summarizing the non-key field values (for example, as an average or a total).

You must have already defined the SUMMARY Report Forms that you want to use. To select the name from a list of SUMMARY Report Forms, position the cursor on the field and press Prompt (F4).

CICS PA JCL generation translates the SUMMARY Report Form specification into the FIELDS operand.

To understand how the Transaction Profiling report uses the Report Form and the Baseline Form, it is useful to think of it as a comparison of two Performance Summary reports. See "Transaction Profiling report compares two Performance Summary reports" on page 192.

Using forms for the Transaction Profiling report involves the following additional considerations to using forms in the Performance Summary report:

- The Report Form specifies how the Transaction Profiling report summarizes the report data, and also which fields appear on the Transaction Profiling report.
- If you do not specify a Report Form, the Transaction Profiling report creates one:
  - If the report data resides in SMF files (see the following note), the Transaction Profiling report uses a default form.

- If the report data resides in an HDB, the Transaction Profiling report uses the HDB Template as the Report Form.

For a List HDB Template, the Transaction Profiling report treats all character and date fields as key fields, and uses the average function to summarize the other, non-key, fields. The key fields must precede the non-key fields in the Template: otherwise, CICS PA reports an error.

**Note:** If you request the Transaction Profiling report via the CICS PA ISPF dialog as part of a Report Set, then the report data must reside in SMF files. However, if you run the Transaction Profiling report independently of a Report Set, via the Profiling option on the CICS PA Primary Option Menu, then the report data can reside in SMF files or an HDB.

- The Baseline Form and the Report Form together specify how the Transaction Profiling report summarizes the baseline data:
  - The Transaction Profiling report ignores any fields in the Baseline Form that are not in the Report Form. For example, if the Baseline Form contains key fields that are not in the Report Form, then these key fields are ignored when summarizing the baseline data. Similarly, any non-key fields that appear in the Baseline Form but not the Report Form are ignored.
  - The Transaction Profiling report ignores the order of the fields in the Baseline Form. For example, when summarizing the baseline data, the Transaction Profiling report uses the key fields in the Baseline Form that also appear in the Report Form, but according to the order of those key fields in the Report Form.
  - If you do not specify a Baseline Form, the Transaction Profiling report creates one:
    - If the baseline data resides in an HDB (see the following note), the Transaction Profiling report uses the HDB Template as the Baseline Form. As for any Baseline Form, the Transaction Profiling report ignores any fields in the HDB Template that are not in the Report Form, and also ignores the order of the fields in the HDB Template. For a List HDB Template, the Transaction Profiling report treats character and date fields as key fields, and uses the average function to summarize the other, non-key, fields.
    - If the baseline data resides in SMF files, the Transaction Profiling report uses the Report Form as the Baseline Form.

**Note:** If you request the Transaction Profiling report via the CICS PA ISPF dialog as part of a Report Set, then the baseline data must reside in an HDB. However, if you run the Transaction Profiling report independently of a Report Set, via the Profiling option on the CICS PA Primary Option Menu, then the baseline data can reside in SMF files or an HDB.

- When summarizing baseline data, the Transaction Profiling report uses only the time-of-day part of any START or STOP key field (transaction start or stop), ignoring the date part. The summarized baseline data for a time-of-day interval matches the summarized report data for that time-of-day interval on any date. For example, if you specify a report data interval of five days and a baseline data interval of five days, then the Transaction Profiling report summarizes each day of report data separately, but summarizes the five days of baseline data together. The

Transaction Profiling report compares each daily set of summarized report data with the same set of summarized baseline data. To compare each weekday of the previous week with the same weekday from a week one year ago (compare Monday with another Monday, Tuesday with another Tuesday, etc.), you must run five separate Transaction Profiling reports.

- In a Performance Summary report, in addition to key fields, you can select one numeric field as Ascending or Descending to activate Alternate Sequencing. The Transaction Profiling report ignores any Alternate Sequencing.

Typically, you only need to specify a Report Form, not a Baseline Form: this ensures matching fields in the two sets of summarized data (assuming that the report data and the baseline data actually contain the fields specified in the form). However, a different Baseline Form is useful in the following cases:

- To specify selection criteria that apply only to the baseline data (you can specify selection criteria inside a form).
- To group the baseline data using fewer key fields than the Report Form uses to group the report data.

If you omit key fields from the Baseline Form that appear in the Report Form, then the Transaction Profiling report matches rows in the two sets of summarized data based on their common key fields. The typical effect is that several rows of summarized report data (with more key fields) match one row of baseline data.

- To limit which non-key fields show values in the Baseline, Delta, and Change lines.

If the Baseline Form omits some of the non-key fields specified by the Report Form, then the Transaction Profiling report shows blanks for these missing fields in the Baseline, Delta, and Change lines.

**Title** Title of the report. Specify up to 128 characters of text to describe the report. CICS PA concatenates the two lines of 64 exactly as entered to make one line which prints at the top of each page of the report below the heading. The default is blank (no title).

If the report uses a Report Form, and a title is specified on both, the title on this report panel takes precedence.

This option generates the TITLE1('left-half') and TITLE2('right-half') operands.

### Time Interval

The time interval applies when you want to summarize transaction activity over time. It is used when you specify a SUMMARY Report Form that includes time stamp sort key fields, such as START or STOP. When reporting, CICS PA accumulates the data for each interval in the report period and writes a report line for each.

**Summary HDBs only** Data in a Summary HDB is already summarized by the interval that was used to load the data into the HDB. To further summarize the data, specify a multiple of the interval that was used to load the data. If you specify an interval that is equal to or less than the interval used to load the data, the report uses the data as-is, without further summarization.

Specify a value in the range 00:00:01 (1 second) to 24:00:00 (24 hours). The default is 00:01:00 (1 minute).

A time interval of less than one hour must fit evenly into the hour. CICS PA will round it down to the nearest interval that aligns to the hour. For example, 1.35 is reduced to 00:01:30 minutes which will produce 40 interval report lines for each hour of data.

A time interval of more than one hour must fit evenly into the day. CICS PA will round it down to the nearest interval that aligns to the day. For example, 10.30.23 is reduced to 08:00:00 hours which will produce 3 interval report lines for each day of data.

Minutes take precedence for an abbreviated entry. For example:

**1** becomes 00:01:00  
**1.1** becomes 00:01:00 (rounded down from 00:01:01)  
**1.1.1** becomes 01:00:00 (rounded down from 01:01:01)

This option generates the INTERVAL(hh:mm:ss) operand.

### Totals Level

Specify a number between 1 and 8 to accumulate subtotals for up to 8 sort fields, print the subtotals when the sort field changes, and print a grand total at the end of the report. This generates the TOTALS(n) operand for n between 1 and 8. Default: 8.

Specify 0 for no subtotals, but print only the grand total. This generates the TOTALS(0) operand.

Leave blank if you do not want to include total lines in the report. This generates the NOTOTALS operand.

**Lines** Specifies the lines of data that you want the Transaction Profiling report to show for each non-key field in the Report Form:

### Report

Summarized report data value. This line is always implicitly specified.

### Baseline

Summarized baseline data value.

**Delta** **Report** minus **Baseline**.

### Change

Percentage difference between **Report** and **Baseline**. For example:

Report	1.0	0.1
Baseline	0.4	0.5
Change%	+150.00	-80.00

This option generates the REPORT, BASELINE, DELTA, and CHANGE values of the PRINT operand.

### Threshold

Specifies minimum thresholds for the Change values that you want the report to include. Change values are the percentage difference between the report data and the baseline data (for details, see the Lines option):

- If a Change value is within the thresholds, the report excludes the Change value and its corresponding Delta value (shows them as blanks).
- If all values on a Change line are within the thresholds, and you have also specified the Exclude within threshold option, then the report excludes that entire block of report data (the Change line, its corresponding Report, Baseline, and Delta lines, and its key field values).

You can specify either or both of the following thresholds:

### **% Above Baseline**

This threshold applies only to positive Change values; that is, where the Report value is greater than the Baseline value. The allowed values for this threshold are integers in the range 0-999.

For example, a threshold of 150 excludes Change values smaller than +150%.

If you specify a threshold of 0, the report includes all positive Change values.

### **% Below Baseline**

This threshold applies only to negative Change values. The allowed values for this threshold are integers in the range 0-100.

For example, a threshold of 80 excludes Change values smaller than -80%.

If you specify a threshold of 0, the report includes all negative Change values.

If you omit both thresholds or you specify both thresholds as 0, the report includes all Change values.

If you specify a value for % Above Baseline but you omit % Below Baseline, then the report:

- Applies the threshold to positive Change values
- Excludes all negative Change values

If you specify a value for % Below Baseline but you leave % Above Baseline blank, then the report:

- Applies the threshold to negative Change values
- Excludes all positive Change values

This option generates the THRESHOLD(nnn,nnn) operand.

### **Exclude within threshold**

Excludes all lines, including the Report line, where the difference between every non-key field in a row of summarized baseline data and the same fields in the matching row of summarized report data are all within the thresholds.

The Baseline Form can specify a subset of the non-key fields in the Report Form, leaving the summarized baseline data with fewer non-key fields than the summarized report data. Specifying this Exclude within threshold option, together with a Baseline Form that contains only one non-key field, enables you to produce a Transaction Profiling report that only shows data where that field is not within thresholds. For example, if you specify a Baseline Form where the only non-key field is average response time, then you can produce a Transaction Profiling report that shows only the transactions that are not within an acceptable percentage difference of a baseline average response time.

Selecting this option generates the EXCEPTIONSONLY value of the PRINT operand. Otherwise, the PRINT operand specifies FULL (the default value).

### **Exclude blank lines**

Excludes any Baseline, Delta, or Change lines whose data consists entirely of blank values. Blank values on these lines indicate either fields with no baseline data or, on the Delta and Change lines, fields where the difference between the report data and the baseline data is within the specified

thresholds. This option has no effect on the Report line, which shows the summarized report data even when this option excludes all other lines. To exclude all lines, including the Report line, when the difference between the report data and the baseline data is within the thresholds, select the Exclude within threshold option.

Selecting this option generates the NOBLANKLINES value of the PRINT operand (the default value). Otherwise, the PRINT operand specifies BLANKLINES.

### Performance Selection Criteria

You can specify Selection Criteria to filter input records on time period and field values to restrict reporting to the data that is of interest to you. These Selection Criteria apply to both the report data and to the baseline data.

CICS PA JCL generation translates these Selection Criteria to identical SELECT(PERFORMANCE operands in the PROFILING(REPORT(...))...)) operand and the PROFILING(BASELINE(...))...)) operand.

You can also filter report data and baseline data records using different Selection Criteria, by specifying Selection Criteria inside the Report Form or the Baseline Form. Selection Criteria in the Report Form apply only to the report data, even if you do not specify a Baseline Form. Selection Criteria in the Baseline Form apply only to the baseline data.

CICS PA JCL generation translates Selection Criteria in the Report Form to the SELECT2(PERFORMANCE operand in the PROFILING(REPORT(...))...)) operand, and Selection Criteria in the Baseline Form to the SELECT2(PERFORMANCE operand in the PROFILING(BASELINE(...))...)) operand.

If both the report and a Form specify Selection Criteria, then a record must pass selection by both specifications to be included in the report.

#### *Line Actions:*

- /      Display the menu of line actions.
- S      Display the subpanel where Selection Criteria can be specified for this report. For details, see “Specifying Selection Criteria” on page 156.
- A      Activate the Selection Criteria so they are generated for this report when the Report Set is submitted. Selection Criteria can only be activated if one or more Select Statements are specified and not all are excluded. An asterisk \* indicates they are active.
- D      Deactivate the Selection Criteria. Any you have specified here will not be used.

### Use External Sort

Select / to use an external sort utility to process summary records. This is the default. It generates the **EXTERNAL(ddname)** operand. This provides the DDname of the work data set used by the external sort utility. CICS PA assigns an External Work File from a pool of External Work Files with default DDnames in the format **CPAXWnnn** where nnn is a sequential number **001-999** to uniquely identify the work file.

An external sort should be used when processing large volumes of data.

If not selected, an internal sort is used.

## Transaction Profiling report compares two Performance Summary reports

It is useful to think of the Transaction Profiling report as a comparison of two Performance Summary reports: one for the report data and one for the baseline data.

The report data is specified by the PROFILING(REPORT(...), FIELDS(...)) operand. The baseline data is specified by the PROFILING(BASELINE(...), FIELDS(...)) operand.

Each Performance Summary report uses a SUMMARY Report Form (FIELDS operand) to:

1. Group and sort input records by key field values
2. Summarize the values of non-key fields in each group of records (for example, as an average or a total)

The Transaction Profiling report consolidates the two sets of summarized data by finding a row of summarized baseline data whose key fields match a row of summarized report data. The Transaction Profiling report then compares the values of the non-key fields in the two matched rows. Rows of summarized baseline data whose key field values do not match any rows of summarized report data are discarded.

When designing a Transaction Profiling report, you might find it useful to first run the two Performance Summary reports. This enables you to review the two sets of summarized data separately, before using the Transaction Profiling report to consolidate and compare them. Note that the Report Form and the Baseline Form both affect how the Transaction Profiling report summarizes baseline data. The Transaction Profiling report summarizes baseline data according to the order of the fields in the Report Form, and using only those fields that occur in both the Baseline Form and the Report Form.

## Requesting a Transaction Profiling report outside a Report Set

To request a Transaction Profiling report independently of any Report Set, select option 7 Profiling on the CICS PA Primary Option Menu. This displays the Transaction Profiling Menu:

```
File Options Help
-----
Transaction Profiling Menu
Command ==> _____
Select an option then press Enter.
1 1. SMF data against SMF Baseline
  2. SMF data against HDB Baseline
  3. HDB data against HDB Baseline
Repository . . . . 'CICSPA.XYX.REPOSTRY'_____ +
```

Figure 95. Transaction Profiling Menu

This menu offers several combinations for the source of the report data and the baseline data that you want to compare:

- Option 2 SMF data against HDB Baseline offers the same combination as a Transaction Profiling report in a Report Set: it compares report data from SMF files with baseline data from a List or Summary Performance HDB.

- Options 1 and 3, SMF data against SMF Baseline and HDB data against HDB Baseline, are not available in a Report Set.

Log streams are supported in the Report System Selection but not the Baseline System Selection fields.

For the combinations that involve HDBs, this menu allows you to specify the Repository that contains the HDBs you want to use.

Select the combination that you want. CICS PA displays the Run Transaction Profiling Report panel for that combination of report data and baseline data sources. The following figure shows the Run Transaction Profiling Report panel for option 1 SMF data against SMF Baseline.

Figure 96. Transaction Profiling Report (SMF data against SMF baseline)

This panel is similar to the panel for requesting a Transaction Profiling report in a Report Set, shown in Figure 94 on page 184, except that you specify all of the details for the report on a single panel (there are no Report Set global options, such as Report Interval, to inherit), and rather than specifying the name of an HDB containing the baseline data, you specify system selection details to identify the appropriate SMF files. On the Run Transaction Profiling panel for option 3 HDB data against HDB Baseline, you specify HDB names for both the report data and the baseline data.

For details on specifying the options for the Transaction Profiling report, see "Transaction Profiling report" on page 183. To request the report, enter SUB on the command line.

## Cross-System Work report

The Cross-System Work report accepts performance class data from a single or multiple CICS systems and correlates the data by network unit-of-work.

The report default is to print only the CMF performance class records that are contained in a unique network unit-of-work that includes multiple performance records. Note that the Cross-System Work report will also include multiple performance class records from a single system.

To request the report, enter line action **S** against the **Cross-System Work** Performance Report on the Report Set panel. If reports of this type have been previously specified, the list of Cross-System Work Reports is displayed. Otherwise, the Cross-System Work Report panel is displayed for you to define your first report of this type.

F12=Cancel

```

Figure 98. Cross-System Work Report

Use this panel to specify report options, report format, and record selection criteria for the Cross-System Work report. The mandatory options are the Report Output DDname and the network unit-of-work (UOW) Processing Option. You can let the other options default.

The report options are the same as those for the Performance List Report (see “Performance List report” on page 167), except there is an additional processing option and a LIST or LISTX Report Form can be specified:

#### Processing Options

Select option **1 - UOWs with more than one record** to report only the transaction performance records whose network unit-of-work spans multiple CMF records. This is the default. This selection generates the PRINTMULTIPLE operand.

Select option **2 - UOWs with a single record** to report only the transaction performance records consisting of network units-of-work that include only a single CMF record. This selection generates the PRINTSINGLE, NOPRINTMULTIPLE operand.

Select option **3 - All UOWs** to report all the transaction performance records. This selection generates the PRINTSINGLE, PRINTMULTIPLE operand.

#### Task Ordering Options

Controls the sorting order of tasks within UOW in the List report. You can choose to order tasks by descending stop time (the default order) or ascending start time.

This option generates the operand TASKORDER(START|STOP).

#### Report Form

The name of a Report Form to be used to tailor the format and content of the report. It can be either a LIST or LISTX Form. You can type the name directly, or to select one from a list of compatible Report Forms, use **Prompt** (F4).

CICS PA JCL generation translates the Report Form specification into the `FIELDS` operand of the `LISTX` command. This produces a Cross-System Work Extended report like that shown in Figure 201 on page 413.

### Performance Selection Criteria

You can specify Selection Criteria to filter the CMF records on time period and field values to restrict reporting to the data that is of interest to you. For the Cross-System Work report, there are two levels of filtering available:

- **Record pre-processing.** CICS PA JCL generation translates Selection Criteria to the `SELECT(PERFORMANCE` operand.  
If you specify a Report Form that also has Selection Criteria specified, CICS PA JCL generation translates the Form's Selection Criteria to the `SELECT2(PERFORMANCE` operand. If both the report and the Form specify Selection Criteria, then a record must pass selection by both specifications to be included in the report.
- **Unit-of-work post-processing.** Allows you to limit the report to specific units-of-work. This generates the `SELUOW` operand to provide filtering across tasks in multi-task UOWs. If one task in a UOW matches the `SELUOW` selection criteria, then the entire UOW is selected. For more information, see “CROSSsystem - Cross-System Work report and extract” on page 455.

CICS PA provides a default **Report Output DDname** in the format **CROSnnnn** where nnnn is **0001-9999**.

## Transaction Group report

The Transaction Group report accepts data from one or more CICS systems, correlating the data by transaction group id. The default is to print only the CMF performance class records that are contained in a transaction group that includes multiple performance records.

The Transaction Group report can be used to understand the correlation of the performance class records for the transactions that CICS runs as part of the same incoming work request (for example, the `CWXN` and `CWBA` transactions for CICS Web support requests).

To request the report, enter line action **S** against the **Transaction Group Performance Report** on the Report Set panel. If reports of this type have been previously specified, the list of Transaction Group Reports is displayed. Otherwise, the Transaction Group Report panel is displayed for you to define your first report of this type.

```

Figure 100. Transaction Group Report

Use this panel to specify report options and record selection criteria for the Transaction Group report. The report format is fixed. The mandatory options are the Report Output DDname and the Transaction Group Processing Option. You can let the other options default.

The report options are the same as those for the Performance List Report (see “Performance List report” on page 167), except there is no Report Form and there is an additional processing option:

## Processing Options

Select option **1 - Groups of more than one record** to report only the transaction performance records whose Transaction Group ID spans multiple CMF records. This is the default. This selection generates the PRINTMULTIPLE operand.

Select option **2 - Groups of a single record** to report only the transaction performance records consisting of a Transaction Group ID that includes only a single CMF record. This selection generates the PRINTSINGLE,NOPRINTMULTIPLE operand.

Select option **3 - All Groups** to report all the transaction performance records. This generates the PRINTSINGLE,PRINTMULTIPLE operand.

CICS PA provides a default **Report Output DDname** in the format **TRGPnnnn** where nnnn is **0001-9999**.

## BTS report

The BTS report accepts data from one or more CICS systems, correlating the data by CICS BTS process ID (root activity ID).

To request the report, enter line action **S** against the **BTS Performance Report** on the Report Set panel. If reports of this type have been previously specified, the list of BTS Reports is displayed. Otherwise, the BTS Report panel is displayed for you to define your first report of this type.

```

Figure 102. BTS Report

Use this panel to specify report options and record selection criteria for the BTS report. The report format is fixed. The only mandatory option is the DDname for the report output. You can let the other options default.

The report options are the same as those for the Performance List Report (see “Performance List report” on page 167), except there is no Report Form.

CICS PA provides a default **Report Output DDname** in the format **CBTSnnnn** where nnnn is **0001-9999**.

## Workload Activity report

The Workload Activity report provides a transaction response time analysis by MVS Workload Manager (WLM) service and report class. This can be used in conjunction with the z/OS Resource Measurement Facility (RMF) workload activity reports to understand from a CICS perspective how well your CICS transactions are meeting their response time goals.

The report processes all CMF transaction performance class records for network units-of-work containing multiple performance records as well as those with only a single performance record.

Two reports can be requested:

1. **Workload Activity List.** This is a cross-system report that correlates CMF performance class data from single or multiple CICS systems for each network unit-of-work. Importantly, this report ties MRO and function shipping tasks to their originating task so that their impact on response time can be assessed.
2. **Workload Activity Summary.** This report summarizes response time by WLM service and report classes.

To request the report, enter line action **S** against the **Workload Activity Performance Report** on the Report Set panel. If reports of this type have been previously specified, the list of Workload Activity Reports is displayed. Otherwise, the Workload Activity Report panel is displayed for you to define your first report of this type.

Figure 104. Workload Activity Report

Use this panel to specify report options and record selection criteria for the Workload Activity report. The report format is fixed. The only mandatory option is the Report Output DDname. You can let the other options default.

The report options are the same as those for the Performance List Report (see “Performance List report” on page 167), except there is no Report Form, you can select the reports you require, and there is an additional processing option:

## Reports Required

Enter / to select the reports you want produced.

- Select **List** to request the Workload Manager Activity List report, a detailed listing of transaction activity in begin-to-end (BTE) phases, completed execution phases (EXE Y), and incomplete execution phases (EXE N). This report requires an external sort.

You can choose how tasks are sorted within UOW in the List report: by descending stop time (the default order) or ascending start time. This option generates the operand TASKORDER(START|STOP).

- Select **Summary** to request the Workload Manager Activity Summary report.

Select **Include EXE Y tasks** to summarize transactions in both completed execution phases (EXE Y) and begin-to-end (BTE) phases, otherwise the report contains BTE transactions only. EXE N transactions cannot be summarized. The Summary report with both BTE and EXE transactions requires an external sort.

The default is the Summary report with BTE transactions only. It is a very quick report as no external sort is required.

## Peak Percentile

This option applies to the Workload Activity Summary report. Specify a number between 50 and 100 to report the response time within which that percentage of transactions completed. Computations assume a normal distribution. For example, 95 shows the response time that 95% of transactions completed within. The default is **90**.

CICS PA JCL generation translates this value to the PEAK(percentile) operand.

CICS PA provides a default **Report Output DDname** in the format **WKLDnnnn** where nnnn is **0001-9999**.

## Transaction Tracking List report

The Transaction Tracking List report provides a view of the flow of related transactions through the various CICS systems. This report allows you to analyze transaction performance from the perspective of transaction flow. Each section of the report describes an originating transaction together with its subordinate group transactions.

To request the report, enter line action **S** against the **Transaction Tracking List** Performance Report on the Report Set panel. If reports of this type have been previously specified, the list of Transaction Tracking List reports is displayed. Otherwise, the Transaction Tracking List panel is displayed for you to define your first report of this type.

Figure 106. Transaction Tracking List Report

Use this panel to specify report options and record selection criteria for the Transaction Tracking List report. The mandatory options are the Report Output DDname and the Transaction Tracking List Processing Option. You can let the other options default.

The report options are similar to those for the Performance List Report (see "Performance List report" on page 167), except that:

- There is no option to specify an Alert definition.

- Separate Report Forms can be specified for the Origin and Group sections of the report. The report must use a Report Form of a compatible type (that is, LIST).
- There is an additional processing option:

#### Processing Options

Select option **1 - Origins with multiple records** to report only on Origin transactions that have Group transactions. This is the default. This selection generates the PRINTMULTIPLE,NOPRINTSINGLE operand.

Select option **2 - Origins with a single record** to report only on Origin transactions that do not have Group transactions. This selection generates the NOPRINTMULTIPLE,PRINTSINGLE operand.

Select option **3 - All Origins** to report all transactions. This generates the PRINTMULTIPLE,PRINTSINGLE operand.

- Selection criteria can also be applied as a post-processing step. This is a second level of filtering that determines which Groups are to be included in the report. Only when all of the records in the Group fail this set of selection criteria will the whole group and associated Origin record be excluded from the report.

CICS PA provides a default **Report Output DDname** in the format **TTL\$nnnn** where nnnn is **0001-9999**.

## Transaction Tracking Summary report

The Transaction Tracking Summary report provides an overview of the flow of related transactions through the various CICS systems. This report allows you to analyze transaction performance from the perspective of transaction flow. For each originating transaction there is a block showing a summary line for all transactions that were associated directly or indirectly with the originating transaction. Grouping of transactions is based on a tracking key, which includes fields that identify the originating transaction, fields that identify the 'previous hop' transaction, and 1-4 user-specified key fields, which are used to display the actual summary data.

To request the report, enter line action **S** against the **Transaction Tracking Summary** Performance Report on the Report Set panel. If reports of this type have been previously specified, the list of Transaction Tracking Summary reports is displayed. Otherwise, the Transaction Tracking Summary panel is displayed for you to define your first report of this type.

```

Figure 108. Transaction Tracking Summary Report

Use this panel to specify report options and record selection criteria for the Transaction Tracking Summary report. The mandatory options are the Report Output DDname and the Transaction Tracking Summary Processing Option. You can let the other options default.

The report options are similar to those for the Performance List Report (see “Performance List report” on page 167), except for the following additional options:

### Tracking Key

Grouping of transactions in the report is based on a tracking key, which comprises three parts:

1. Fields that identify the originating transaction.  
In the PH Task 1 and 2 fields, specify the originating transaction ID fields. You can select APPLID, which specifies the originating CICS APPLID (OAPPLID), or TRAN, which specifies the originating transaction (OTRAN), or both. The default key is APPLID + TRAN.
2. Fields that identify each 'previous hop' transaction related to the originating transaction.

The previous hop identification fields are automatically paired in the report with the corresponding originating transaction fields. That is, if TRAN is selected then PHTRAN will be included and if APPLID is selected then PHAPPLID will be included.

3. 1-4 user-specified key fields.

In the Task 1 to 4 fields, select up to four CMF fields, which are used to display the actual summary data for each originating transaction and each related (previous hop) transaction. Use Prompt (F4) to select from a list of available fields.

### Processing Options

Select option **1 - Origins with multiple records** to report only on Origin transactions that have Group transactions. This is the default. This selection generates the PRINTMULTIPLE,NOPRINTSINGLE operand.

Select option **2 - Origins with a single record** to report only on Origin transactions that do not have a Group transaction. This selection generates the NOPRINTMULTIPLE,PRINTSINGLE operand.

Select option **3 - All Origins** to report all transactions. This generates the PRINTMULTIPLE,PRINTSINGLE operand.

### Selection Criteria

Selection criteria can also be applied as a post-processing step. This is a second level of filtering that determines which Groups are to be included in the report. Only when all of the records in the Group fail this set of selection criteria will the whole group and associated Origin record be excluded from the report.

When a report form is specified for this report, the following rules apply.

1. The key fields in the form are replaced by the tracking key.

**Note:** This can result in the report page width different to that calculated for the Form.

2. An error will be generated if PHCOUNT is a field in the Form as it is part of the Tracking key.
3. Fields with function Severity (SEV) are ignored and are not included in the report.

CICS PA provides a default **Report Output DDname** in the format **TTSUnnnn** where nnnn is **0001-9999**.

---

## Exception reports

The Exception Reports process CMF exception class data to produce tabular-style reports.

### Exception List report

The Exception List report provides two types of information:

- The cause of the exception condition
- The information necessary to relate this record to the performance class record on the Performance List report.

To request the report, enter line action **S** against the **List** Exception Report on the Report Set panel. If reports of this type have been previously specified, the list of Exception List Reports is displayed. Otherwise, the Exception List Report panel is

displayed for you to define your first report of this type.

```

```

Figure 110. Exception List Report

Use this panel to specify report options and record selection criteria for the Exception List report. The report format is fixed. The only mandatory option is the DDname for the report output. You can let the other options default.

The options are the same as those for the Performance List Report (see “Performance List report” on page 167), except there is no Report Form.

CICS PA provides a default **Report Output DDname** in the format **XLSTnnnn** where nnnn is **0001-9999**.

Whereas the Selection Criteria for Performance Reports apply to CMF performance class records, those for Exception Reports apply to CMF exception class records.

## Exception Selection Criteria

Selection Criteria allow you to filter the CMF exception records on time periods and field values to restrict reporting to the data that is of interest to you.

### Line Actions:

- /      Display the menu of line actions.
- S      Display the subpanel where Selection Criteria can be specified for this report. For details, see “Specifying Selection Criteria” on page 156.
- A      Activate the Selection Criteria so they are generated for this report when the Report Set is submitted. Selection Criteria can only be activated if one or more Select Statements are specified and not all are excluded. An asterisk \* indicates they are active.
- D      Deactivate the Selection Criteria. Any you have specified here will not be used.

## Exception Summary report

The Exception Summary report summarizes the exception records collected by the CICS Monitoring Facility (CMF). Records are summarized by transaction identifier code. The report provides the total number of exceptions for each transaction, according to the following:

- For auxiliary temporary storage VSAM buffer and string wait conditions
- For coupling facility data table pool wait conditions
- For VSAM LSRPOOL buffer and string wait conditions
- For VSAM file string wait conditions
- For temporary storage wait conditions
- For main storage wait conditions

To request the report, enter line action **S** against the **Summary** Exception Report on the Report Set panel. If reports of this type have been previously specified, the list of Exception Summary Reports is displayed. Otherwise, the Exception Summary Report panel is displayed for you to define your first report of this type.

Figure 112. Exception Summary Report

Use this panel to specify report options and record selection criteria for the Exception Summary report. The report format is fixed. The only mandatory option is the DDname for the report output. You can let the other options default.

The options are the same as those for the Performance List Report (see “Performance List report” on page 167), except there is no Report Form.

Whereas the Selection Criteria for Performance Reports apply to CMF performance class records, those for Exception Reports apply to CMF exception class records.

CICS PA provides a default **Report Output DDname** in the format **XSUMnnnn** where nnnn is **0001-9999**.

## Transaction Resource Usage reports

The Transaction Resource Usage reports are produced from CMF performance class and transaction resource class data. The reports in this category are:

- “File Usage Summary report”
- “Temporary Storage Usage Summary report” on page 211
- “Distributed Program Link Usage Summary report” on page 214
- “Transaction Resource Usage List report” on page 216

### File Usage Summary report

The File Usage Summary report provides a detailed analysis of CMF transaction resource class data for Files.

Two reports can be requested:

1. **Transaction File Usage Summary.** This report summarizes File usage by Transaction ID. For each Transaction ID, it gives Transaction Identification and File Control statistics followed by a breakdown of File usage for each File used by the Transaction.

2. **File Usage Summary.** This report summarizes File activity. For each File, it gives a breakdown of File usage by Transaction ID.

To request the report, enter line action **S** against the **File Usage Summary** Transaction Resource Usage Report on the Report Set panel. If reports of this type have been previously specified, the list of File Usage Summary Reports is displayed. Otherwise, the File Usage Summary Report panel is displayed for you to define your first report of this type.

```

Figure 114. File Usage Summary Report

Use this panel to specify report options and record selection criteria for the File Usage Summary report. The report format is fixed. The only mandatory option is the Report Output DDname. You can let the other options default.

The report options are the same as those for the Performance List Report (see “Performance List report” on page 167), except there is no Report Form, and you can select the reports you require.

The default **Report Output DDname** has the format **FILEnnnn** where nnnn is 0001-9999.

### Summary Reports Required

Enter / to select the required reports.

#### Transaction File Usage

This requests the Transaction File Usage Summary report, a summary of File activity by Transaction ID. For each Transaction ID, Transaction and File Control statistics are followed by File usage statistics for each File used by the Transaction.

This option generates the TRANSUMMARY(FILE) operand.

#### File Usage

This requests the File Usage Summary report, a summary of File activity by File.

- Select **Break down by Transaction ID** to show File usage statistics by Transaction ID for each File.
- Select **Include Transaction Totals** to show totals for each File.

This option generates the FILESUMMARY(BYTRAN,TOTAL) operand.

### Performance Selection Criteria

Performance Selection Criteria apply to both transaction resource class data and performance class data. You can request a report from all available records, or you can provide Selection Criteria to request a report from only the records that meet your specific requirements.

Transaction resource class records contain Task Identification and File Entry information. For more information on the format of transaction resource class records, see the *CICS Performance Analyzer for z/OS Report Reference*.

For the selection of transaction resource class records, only some fields in the Selection Criteria are applicable. All other fields are ignored.

The Selection Criteria fields applicable to Task Identification are:

ACTIVE  
FCTY  
LUNAME  
NETUOWSX  
PROGRAM  
RSYSID  
START  
STOP  
TASKNO  
TERM  
TRAN  
USERID  
OAPPLID  
OTRAN  
OUSERID  
OTCPSRVC  
OFCTY

The Selection Criteria fields applicable to File Entries (see note 1) are:

FILENAME (see note 2)  
FCAMCT (Count)  
FCADD (Count only, see note 3)  
FCBROWSE (Count only, see note 3)  
FCDELETE (Count only, see note 3)  
FCGET (Count only, see note 3)  
FCPUT (Count only, see note 3)  
FCTOTAL (Count only, see note 3)  
CFDTPWAIT (Time and Count)  
RLSWAIT (Time and Count)

**Note:**

1. Selection Criteria for File Entries can affect Task Identification selection. If all File entries for a task are excluded, then the task is also excluded.
2. FILENAME is a special field that applies only to transaction resource class data. It is ignored when processing performance class data.
3. Selection Criteria only supports the checking of the Count component of File request fields. The Time component cannot be checked. These fields are common to both performance class (Count) and transaction resource class (Clock - COUNT and TIME), but have differing data types. Since the performance fields are Count (not Clock) fields, only the Count component is supported by Selection Criteria.

## Temporary Storage Usage Summary report

The Temporary Storage Usage Summary report provides a detailed analysis of CMF transaction resource class data for temporary storage queues.

Two reports can be requested:

1. **Transaction Temporary Storage Usage Summary.** This report summarizes Temporary Storage usage by Transaction ID. For each Transaction ID, it gives Transaction Identification and Temporary Storage Control statistics followed by a breakdown of Temporary Storage usage for each Temporary Storage Queue used by the Transaction.
2. **Temporary Storage Usage Summary.** This report summarizes Temporary Storage activity. For each Temporary Storage Queue, it gives a breakdown of Temporary Storage usage by Transaction ID.

To request the report, enter line action **S** against the **Temporary Storage Usage Summary** Transaction Resource Usage Report on the Report Set panel. If reports of this type have been previously specified, the list of Temporary Storage Usage Summary Reports is displayed. Otherwise, the Temporary Storage Usage Summary Report panel is displayed for you to define your first report of this type.

Figure 116. Temporary Storage Usage Summary Report

Use this panel to specify report options and record selection criteria for the Temporary Storage Usage report. The report format is fixed. The only mandatory option is the Report Output DDname. You can let the other options default.

The report options are the same as those for the Performance List Report (see “Performance List report” on page 167), except there is no Report Form, and you can select the reports you require.

The default **Report Output DDname** has the format **TEMPnnnn** where nnnn is **0001-9999**.

### Summary Reports Required

Enter / to select the required reports.

### Transaction Temporary Storage Usage

This requests the Transaction Temporary Storage Usage Summary report. This report summarizes Temporary Storage usage by Transaction ID. For each Transaction ID, it gives Transaction Identification and Temporary Storage Control statistics followed by a breakdown of Temporary Storage usage for each Temporary Storage Queue used by the Transaction.

This option generates the TRANSUMMARY(TEMPSTOR) operand.

### Temporary Storage Usage

This requests the Temporary Storage Usage Summary report. This report summarizes Temporary Storage activity, breaking down individual TSQueue usage by Transaction ID.

- Select **Break down by Transaction ID** to include individual Transaction statistics.
- Select **Include Transaction Totals** to include total Transaction statistics.

This option generates the TEMPSTORSUMMARY(BYTRAN,TOTAL) operand.

## Performance Selection Criteria

Performance Selection Criteria applies to both transaction resource class data and performance class data. You can request a report from all available records, or you can provide Selection Criteria to request a report from only the records that meet your specific requirements.

Transaction resource class records contain Task Identification and Temporary Storage Entry information. For more information on the format of transaction resource class records, see the *CICS Performance Analyzer for z/OS Report Reference*.

For the selection of transaction resource class records, only some fields in the Selection Criteria are applicable. All other fields are ignored.

The Selection Criteria fields applicable to Task Identification are:

ACTIVE  
FCTY  
LUNAME  
NETUOWSX  
PROGRAM  
RSYSID  
START  
STOP  
TASKNO  
TERM  
TRAN  
USERID  
OAPPLID  
OTRAN  
OUSERID  
OTCPSRVC  
OFCTY

The Selection Criteria fields applicable to Temporary Storage Entries (see note 1) are:

TSQNAME (see note 2)  
TSGET (Count only, see note 3)

TSPUT AUX (Count only, see note 3)  
TSPUT MCT (Count only, see note 3)  
TSTOTAL (Count only, see note 3)  
TSSWAIT (Time and Count)  
TSWAIT (Time and Count)

**Note:**

1. Selection Criteria for Temporary Storage Entries can affect Task Identification selection. If all Temporary Storage entries for a task are excluded, then the task is also excluded.
2. TSQNAME is a special field that applies only to transaction resource class data. It is ignored when processing performance class data.
3. Selection Criteria only supports the checking of the Count component of Temporary Storage request fields. The Time component cannot be checked. These fields are common to both performance class (Count) and transaction resource class (Clock - COUNT and TIME), but have differing data types. Since the performance fields are Count (not Clock) fields, only the Count component is supported by Selection Criteria.

## Distributed Program Link Usage Summary report

The Distributed Program Link (DPL) Usage Summary report provides a detailed analysis of CMF transaction resource class data for DPLs.

Two reports can be requested:

1. **Transaction DPL Usage Summary.** This report summarizes DPL usage by Transaction ID. For each Transaction ID, it gives Transaction Identification and DPL statistics followed by a breakdown of each DPL used by the Transaction.
2. **DPL Usage Summary.** This report summarizes DPL activity. For each DPL, it gives a breakdown of DPL usage by Transaction ID.

To request the report, enter line action **S** against the **DPL Usage Summary** Transaction Resource Usage Report on the Report Set panel. If reports of this type have been previously specified, the list of DPL Usage Summary Reports is displayed. Otherwise, the DPL Usage Summary Report panel is displayed for you to define your first report of this type.

The report options are the same as those for the Performance List Report (see “Performance List report” on page 167), except there is no Report Form, and you can select the reports you require.

The default **Report Output DDname** has the format **DPLSnnnn** where nnnn is **0001-9999**.

### Summary Reports Required

Enter / to select the required reports.

#### Transaction DPL Usage

This requests the Transaction DPL Usage Summary report. This report summarizes DPL usage by Transaction ID. For each Transaction ID, it gives Transaction Identification and DPL statistics followed by a breakdown of DPL usage for each DPL used by the Transaction.

This option generates the TRANSUMM(DPL) operand.

#### DPL Usage

This requests the DPL Usage Summary report. This report summarizes DPL activity, breaking down individual DPL usage by Transaction ID.

- Select **Break down by Transaction ID** to include individual Transaction statistics.
- Select **Include Transaction Totals** to include total Transaction statistics.

This option generates the DPLSUMM(BYTRAN,TOTAL) operand.

## Performance Selection Criteria

Performance Selection Criteria applies to both transaction resource class data and performance class data. You can request a report from all available records, or you can provide Selection Criteria to request a report from only the records that meet your specific requirements.

Transaction resource class records contain Task Identification and distributed program link (DPL) information. For more information on the format of transaction resource class records, see the *CICS Performance Analyzer for z/OS Report Reference*.

For the selection of transaction resource class records, only some fields in the Selection Criteria are applicable. All other fields are ignored.

The Selection Criteria fields applicable to Task Identification are:

ACTIVE  
FCTY  
LUNAME  
NETUOWSX  
PROGRAM  
RSYSID  
START  
STOP  
TASKNO  
TERM  
TRAN  
USERID  
OAPPLID  
OTRAN  
OUSERID  
OTCPSRVC  
OFCTY

The Selection Criteria fields applicable to DPL Entries (see note 1) are:

DPLNAME (see note 2)  
PCDPL (number of DPL requests)

### Note:

1. Selection Criteria for DPL entries can affect Task Identification selection. If all DPL entries for a task are excluded, then the task is also excluded.
2. DPLNAME is a special field that applies only to transaction resource class data. It is ignored when processing performance class data.

## Transaction Resource Usage List report

The Transaction Resource Usage List report provides a detailed list of CMF transaction resource class data. The records are reported in the sequence that they appear in the SMF file.

The report gives Transaction information together with statistics by transaction of File and Temporary Storage usage.

To request the report, enter line action **S** against the **Transaction Resource Usage List** report on the Report Set panel. If reports of this type have been previously specified, the list of Transaction Resource Usage List Reports is displayed.

Otherwise, the Transaction Resource Usage List Report panel is displayed for you to define your first report of this type.

```

Figure 120. Transaction Resource Usage List Report

Use this panel to specify report options and record selection criteria for the Transaction Resource Usage List report. The report format is fixed. The only mandatory option is the Report Output DDname. You can let the other options default.

The report options are the same as those for the Performance List Report (see “Performance List report” on page 167), except there is no Report Form, and you can select the reports you require.

The default **Report Output DDname** has the format **RESUnnnn** where nnnn is 0001-9999.

### Detailed List Reports Required

Enter / to select the report.

#### File Usage

The File Usage List report provides a trace of Transaction resource class records that include File information. The report consists of Transaction information from the Task Identification section, followed by one sub-section for each File used.

This option generates the TRANLIST(FILE) operand.

#### Temporary Storage Usage

The Temporary Storage Usage List report provides a trace of Transaction resource class records that include TSQueue information. The report consists of Transaction information from the Task Identification section, followed by one sub-section for each TSQueue used.

This option generates the TRANLIST(TEMPSTOR) operand.

**DPL** The DPL Usage List report provides a trace of Transaction resource class records that include distributed program link (DPL) information. The report consists of Transaction information from the Task Identification section, followed by one sub-section for each DPL used.

This option generates the TRANLIST(DPL) operand.

### Performance Selection Criteria

Performance Selection Criteria applies to both transaction resource class data and performance class data. The Transaction Resource Usage List report processes only transaction resource class data and includes File Usage, Temporary Storage Usage, and Distributed Program Link (DPL) Usage statistics.

- For the Selection Criteria applicable to File Usage processing, see “Performance Selection Criteria” on page 210.
- For the Selection Criteria applicable to Temporary Storage Usage processing, see “Performance Selection Criteria” on page 213.
- For the Selection Criteria applicable to DPL Usage processing, see “Performance Selection Criteria” on page 216.

---

## Statistics reports

The Statistics reports are produced from CICS statistics stored in SMF files.

To extract CICS statistics to delimited text files for further processing by other applications, see “Statistics extract” on page 270.

You can also produce Statistics Alert reports outside of a Report Set, from CICS statistics stored in HDBs. For details, see “HDB Reporting” on page 646.

## Statistics Alert reports

The Statistics Alert reports process CICS Transaction Server and CICS Transaction Gateway statistics records.

To request a report, enter line action **S** against the **Alert** Statistics Report on the Report Set panel. If reports of this type have been previously specified, the list of Statistics Alert Reports is displayed. Otherwise, the Statistics Alert Reports panel is

displayed for you to define your first report of this type.

```

/  Exc  APPLID + Image + Group +      Output      Alert +
_      CICSPO01 MVS1_____      STAL0001      IDDS_____
***** End of list *****

```

Figure 121. Statistics Alert Reports

This panel displays the list of Statistics Alert Reports in this Report Set. You can select (edit), delete, or include/exclude any report, insert new ones, or rearrange them (move/copy).

The options are:

**Exc** An asterisk \* in this field indicates that the report is excluded from report processing.

Use line action **X** to reverse the Exclude indicator.

### System Selection

Identifies the CICS APPLIDs whose data you want to select for processing.

You can specify any combination of APPLID, Image, or Group, but these must be defined in your System Definitions. If you do not specify System Selection here or in the Global Options, then you are prompted at run time to specify the System Selection. This will apply globally to all reports and extracts without their own System Selection. This is recommended as it allows you to run your Report Sets against any of your defined Systems. Press the **Prompt** key (F4) to select from a list of defined Systems, Images, or Groups. To modify your System Definitions, select **Systems** in the action bar.

Specify one of the following:

- A CICS APPLID. An APPLID that matches a defined System's name pattern is also allowed. For example, CICSPO1 can be specified if CICSPO\* is a defined system.
- An APPLID and an MVS Image. This identifies the MVS Image where your CICS system runs.
- An MVS Image. All CICS systems executing on this MVS Image is selected.
- An APPLID and Image combination plus a Group. This is useful for uniquely identifying a CICS system when there are multiple CICS systems with the same name defined.
- A Group alone. CICS PA will select all CICS APPLIDs defined to the Group. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA uses the System Selection in JCL generation to build the APPLID(applid1,applid2,applid3,...) and INput(SMFIN001,SMFIN002,SMFIN003,...) operands, and corresponding //SMFINnnn DD statements.

System Selection can also be specified either:

- In Global Options. The report-level specification takes precedence over the global.
- At run time. The run-time System Selection overrides the Global Options and optionally the report-level specification.

## Output

CICS PA provides a default **Report Output DDname** in the format **STALnnnn** where nnnn is **0001-9999**.

**Alert** The Alert Definition containing the Conditions that you want to report. You must have already created this Alert Definition in the currently active Repository. To select from a list of Alert Definitions in the Repository, press **Prompt** (F4). To create a new Alert Definition, return to the primary option menu, and then select option 6.5. For details, see Chapter 13, “Statistics alert reporting,” on page 347.

To use a different Repository, return to the primary option menu, and then select option 0.3. If you define more than one Statistics Alert report in a Report Set, the reports must all refer to Alert Definitions stored in the same Repository; the JCL for a Report Set can refer to only one Repository.

CICS PA JCL generation translates this option to the STALTDEF operand.

The line actions available on this panel are the same as on similar Reports list panels. See “Performance List report” on page 167.

To display the Statistics Alert Report panel, enter line action **S** against the **Alert** Statistics Report on the Report Set panel, then if the list of previously specified reports is displayed, enter line action **S** against a particular report in the list.

Repository . . : CICSPA.XYX.REPOSTRY	

Figure 122. Statistics Alert Report

Use this panel to specify report options for the Statistics Alert report. The report format is fixed. The only mandatory options are the DDname for the report output and the Alert. You can let the other options default.

The options are:

#### **Report Output DDname**

The DDname for the report output which CICS PA uses when generating the JCL to run the Report Set. The DDname is mandatory and should be unique to separate the output of multiple reports.

CICS PA assigns a default DDname **STALnnnn** where nnnn is a sequential number **0001-9999** to ensure each report has a unique DDname.

This option generates the OUTPUT(ddname) operand.

#### **Print Lines per Page**

The maximum number of lines, including headings, to print on each page of the report. Valid values are from 1 to 255. The default is **60**.

The global value applies to all reports. If a value is specified on this report panel, the report value takes precedence over the global for this report only.

CICS PA JCL generation translates this field to the LINECount(nnn) operand.

#### **Report Sorted By and Report Type**

The sort order of the report. For reports sorted by APPLID or Alert, you can specify a report type: List (the default), Summary, or both. Other sorting options are available only as List reports. List reports show each instance of an Alert on a separate row, with details such as the threshold value and the Formula value that triggered the Alert. Summary reports show the number of Alerts for the report period, rather than the details of each instance.

This option generates the BY operand.

#### **Filter Criteria**

To limit the types of CICS statistics intervals that CICS PA includes in the report, enter / next to the types you are interested in:

**EOD** End-of-day  
**REQ** Requested  
**USS** Unsolicited  
**INT** Interval  
**RRT** Requested reset

Selecting none of the types is the same as selecting all types.

This option generates the TYPE operand.

**Title** Title of the report. Specify up to 128 characters of text to describe the report. CICS PA concatenates the two lines of 64 exactly as entered to make one line which prints at the top of each page of the report below the heading. The default is blank (no title).

This option generates the TITLE1('left-half') and TITLE2('right-half') operands.

## **CICS Transaction Gateway reports**

The CICS Transaction Gateway reports provide comprehensive reporting of CICS TG Statistics (SMF 111) records.

- The Activity Summary provides a high-level overview of CICS TG daemon address spaces and their workloads. This report also indicates whether connected users or systems might have experienced problems due to communications failure or request time out.

- The Usage and Capacity report summarizes CICS TG daemon resource usage over time.

To request the reports, enter line action **S** against the **CICS Transaction Gateway Statistics Report** on the Report Set panel. If reports of this type have been previously specified, the list of CICS Transaction Gateway Reports is displayed. Otherwise, the CICS Transaction Gateway Report panel is displayed for you to define your first report of this type.

```

F12=Cancel

```

Figure 124. CICS Transaction Gateway Report

Use this panel to select the reports and specify report options:

#### Reports Required

Enter / to select the reports you want produced:

##### Activity Summary

Requests the Activity Summary report. This option generates the ACTIVITY operand.

### Usage and Capacity

Requests the Usage and Capacity report. This option generates the USAGE operand.

**Ratio** This option applies only to the Usage and Capacity report. A warning indicator is inserted against the EXCI pipes or IPIC sessions columns when the Num/Max or Num/Avail ratio exceeds the specified value. The default is 90.

This value generates the RATI0(*value*) suboperand.

The report options and Title are the same as those for the Performance List report (see “Performance List report” on page 167).

CICS PA provides a default **Report Output DDname** in the format **STTGnnnn** where nnnn is **0001-9999**. All selected reports will be written consecutively to this ddname. To separate the reports, create individual CICS TG reports and change the Report Output DDname for each one.

---

## Subsystem reports

The Subsystem reports are produced from database subsystem accounting data stored in SMF files. The reports in this category are:

- “DB2 report”
- “WebSphere MQ report” on page 228
- “OMEGAMON reports” on page 233

### DB2 report

The DB2 report processes CICS CMF performance class (SMF 110) records and DB2 accounting (SMF 101) records to produce a consolidated and detailed view of DB2 usage by your CICS systems. The DB2 report enables you to view CICS and DB2 resource usage statistics together in a single report.

The DB2 report matches CMF Performance records with DB2 accounting records by network unit-of-work id. Your CICS-DB2 resources must be defined with **ACCOUNTREC(TASK)** or **ACCOUNTREC(UOW)** for matching to occur.

The DB2 List report shows detailed information of DB2 activity for each transaction. The DB2 Summary reports summarize DB2 activity by transaction:

- For CMF records: by APPLID/transaction/program
- For DB2 records: by APPLID/transaction/program/SSID/plan

The reports include the following DB2 information:

- DB2 Thread Identification, for easy cross-reference to DB2 PM
- Class 1 Thread elapsed and CPU times
- Class 2 In-DB2 elapsed and CPU times
- Class 3 Suspend times
- Buffer Manager statistics
- Locking statistics
- SQL DML statistics

A Recap report showing processing statistics is always printed at the end.

To request the DB2 report, enter line action **S** against the **DB2 Subsystem Report** on the Report Set panel. If reports of this type have been previously specified, the list of DB2 Reports is displayed. Otherwise, the DB2 Report panel is displayed for

you to define your first report of this type.

```

```

Figure 126. DB2 Report

Use this panel to specify report options and record selection criteria for the DB2 report. The only mandatory option is the Report Output DDname. You can let the other options default.

The options are:

### **CICS System Selection**

Identifies the CICS APPLIDs whose data you want to select for processing.

You can specify any combination of APPLID, Image, or Group, but these must be defined in your System Definitions. If you do not specify System Selection here or in the Global Options, then you are prompted at run time to specify the System Selection. This will apply globally to all reports and extracts without their own System Selection. This is recommended as it allows you to run your Report Sets against any of your defined Systems. Press the Prompt key (F4) to select from a list of defined Systems, Images, or Groups. To modify your System Definitions, select Systems in the action bar.

Specify one of the following:

- A CICS APPLID. An APPLID that matches a defined System's name pattern is also allowed. For example, CICSP1 can be specified if CICSP\* is a defined system.
- An APPLID and an MVS Image. This identifies the MVS Image where your CICS system runs.
- An MVS Image. All CICS systems executing on this MVS Image is selected.
- An APPLID and Image combination plus a Group. This is useful for uniquely identifying a CICS system when there are multiple CICS systems with the same name defined.
- A Group alone. CICS PA will select all CICS APPLIDs defined to the Group. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA uses the System Selection in JCL generation to build the APPLID(applid1,applid2,applid3,...) and INput(SMFIN001,SMFIN002,SMFIN003,...) operands, and corresponding //SMFINnnn DD statements.

System Selection can also be specified either:

- In Global Options. The report-level specification takes precedence over the global.
- At run time. The run-time System Selection overrides the Global Options and optionally the report-level specification.

### **DB2 System Selection**

DB2 System Selection identifies the DB2 subsystems that you want to report against. The DB2 subsystems must be those used by the specified CICS systems, otherwise they are ignored by DB2 report processing.

You do not need to specify a DB2 System Selection. If you don't, then the following will occur:

- When the CICS System Definition specifies a Group that contains DB2 SSIDs, then CICS PA uses the DB2 SSIDs defined to the Group.
- Otherwise CICS PA assumes that the DB2 Accounting records are contained in the same file as the CICS system's CMF records, and will automatically determine the correct DB2 subsystems for the CICS systems to be reported.

Any combination of SSID, Image, or Group can be specified but must be defined in your System Definitions. Use **Prompt** (F4) to select from a list of defined Systems, Images or Groups. To modify your System Definitions, select **Systems** in the action bar.

CICS PA uses the DB2 System Selection in JCL generation to build the SSID(ssid1,ssid2,ssid3,...) operand.

#### **Report Output DDname**

The DDname for the report output which CICS PA uses when generating the JCL to run the Report Set. The DDname is mandatory and should be unique to separate the output of multiple reports.

CICS PA assigns a default DDname **DB2Rnnnn** where nnnn is a sequential number **0001-9999** to ensure each report has a unique DDname.

This option generates the OUTPUT(ddname) operand.

#### **Print Lines per Page**

The maximum number of lines, including headings, to print on each page of the report. Valid values are from 1 to 255. The default is **60**.

The global value applies to all reports. If a value is specified on this report panel, the report value takes precedence over the global for this report only.

CICS PA JCL generation translates this field to the LINECount(nnn) operand.

#### **Reports Required**

Enter / to select the reports you want produced. The Recap report is always produced at the end to provide processing statistics.

- Select **List** to request the DB2 List report, a detailed list of all network units-of-work with DB2 activity, consolidating CMF performance class records and DB2 accounting data. This selection generates the LIST operand.
- Select **Long Summary** to request the DB2 Long Summary report which summarizes these details by transaction and program within APPLID, giving average and maximum values for each. This selection generates the LONGSUM operand.
- Select **Short Summary** to request the DB2 Short Summary report which is an abridged version of the Long Summary report with significantly less detail and averages only (no maximums). This selection generates the SHORTSUM operand and is the default.

#### **DB2 Accounting data to include in reports**

This option applies to the DB2 List and Long Summary reports, and then only if **Process DB2 Accounting records** is selected.

Enter / to select the DB2 detail lines to include in each report:

**Class1** Thread Time (default)

**Class2** In-DB2 Time (default)

**Class3** Suspend Time

**Buffer** Buffer Manager Summary (default)

**Locking**

Locking Summary (default)

**DML 1**

SQL DML Query/Update

**DML 2**

SQL DML 'Other'

The default is to include **Class1**, **Class2**, **Buffer**, and **Locking**.

**Note:** Thread Identification is always reported.

If the List report is selected, JCL generation translates this option to LIST(CLASS1,CLASS2,CLASS3,BUFFER,LOCKING,DML1,DML2).

If the LongSummary report is selected, JCL generation translates this option to LONGSUM(CLASS1,CLASS2,CLASS3,BUFFER,LOCKING,DML1,DML2).

### Report Options

The DB2 Report processes all CMF performance data records that are within a network unit-of-work that involves some DB2 activity. You can control the amount of processing and volume of output by restricting the data that is reported.

Enter / to select the type of data to include in the report:

#### Process DB2 Accounting records

Select this option for CICS PA to process DB2 Accounting (SMF 101) records. Selected is the default.

If not selected, then the CMFONLY operand is generated, and CICS PA just reports the DB2 statistics contained in the CMF performance records.

#### List records with no DB2 activity

This option only applies to the DB2 List report. Select this option to report CMF performance records with DB2REQCT=0 provided they are part of a network unit-of-work that has some DB2 activity. If selected, the LISTZERO operand is generated.

Not selected is the default.

#### Long Summary with DB2 maximums

Select this option to include maximum values in the DB2 Accounting detail lines of the Long Summary report. If selected, the MAXLONGSUM operand is generated and both average and maximum values are reported. Selected is the default.

If not selected, the NOMAXLONGSUM operand is generated and only the averages are reported.

**Title** Title of the report. Specify up to 128 characters of text to describe the report. CICS PA concatenates the two lines of 64 exactly as entered to make one line which prints at the top of each page of the report below the heading. The default is blank (no title).

This option generates the TITLE1('left-half') and TITLE2('right-half') operands.

### Performance Selection Criteria

For information on how the Selection Criteria applies to the DB2 Accounting records, see "Selecting DB2 accounting records" on page 165.

#### Line Actions:

/ Display the menu of line actions.

S Display the subpanel where Selection Criteria can be specified for this report. For details, see "Specifying Selection Criteria" on page 156.

A Activate the Selection Criteria so they are generated for this report

when the Report Set is submitted. Selection Criteria can only be activated if one or more Select Statements are specified and not all are excluded. An asterisk \* indicates they are active.

- D Deactivate the Selection Criteria. Any you have specified here will not be used.

### Select a System (DB2 SSID)

To report on a particular system, select it from a list of available systems by pressing **Prompt** (F4) from the DB2 SSID field in System Selection. Only systems of that type are displayed. See Figure 127 for an example showing a list of DB2 SSIDs.

Enter a / or S line action (or point-and-shoot) to select a system from the list to insert in your System Selection.

Command ==> \_\_\_\_\_
Systems
Row 1 to 4 of 4

Scroll ==> PAGE

Select a System then press Enter.

Figure 127. Select a System (DB2 SSID)

## WebSphere MQ report

The WebSphere MQ report processes WebSphere MQ SMF accounting (SMF 116) records to produce a detailed view of WebSphere MQ usage by your CICS systems.

The WebSphere MQ List reports provide, depending on the WebSphere MQ accounting traces that are active, details about:

- Transactions
- WebSphere MQ Queues that were referenced
- WebSphere MQ global (not Transaction-specific or Queue-specific) statistics
- WebSphere Queue-specific commands issued by Transaction

These can be sorted and aggregated by Transaction ID or Queue name or both.

To request the report, enter line action **S** against the **WebSphere MQ** Subsystem Report on the Report Set panel. If reports of this type have been previously specified, the list of WebSphere MQ Reports is displayed. Otherwise, the WebSphere MQ panel is displayed for you to define your first report of this type.

```

```

Figure 128. WebSphere MQ Reports

This panel displays the list of WebSphere MQ reports in this Report Set. You can select (edit), delete, or include/exclude any report, insert new ones, or rearrange them (move/copy).

The options are:

### System Selection

System Selection identifies the MQ Subsystems and associated SMF files that you want to report against. MQ System Selection can be specified here or on the WebSphere MQ Report panel. For details, see the description of this option following the next figure.

### Output

CICS PA provides a default **Report Output DDname** in the format **MQ00nnnn** where nnnn is **0001-9999**.

The line actions are the same as on similar Reports list panels. See “Performance List report” on page 167.

Enter line action **S** to select a report in the list.

F12=Cancel	

Figure 129. WebSphere MQ Report

Use this panel to specify report options and record selection criteria for the WebSphere MQ report. The only mandatory option is the Report Output DDname. You can let the other options default.

The options are:

### MQ System Selection

System Selection identifies the MQ Subsystems and associated SMF files that you want to report against. Any combination of MQ SSID, Image, or Group can be specified but must be defined in System Definitions. You can use **Prompt** (F4) to select from a list. To link directly to System Definitions, select **Systems** in the action bar.

Specify either:

- An MQ SSID.
- An MQ SSID for a particular Image. This identifies a particular MQ Subsystem when there is more than one with the same ID.
- An Image. CICS PA will report on all MQ systems running on this Image using the SMF files defined for the Image.
- An MQ SSID and Image combination plus a Group. This is useful to uniquely identify a system when there is more than one of the same name defined in System Definitions.
- A Group alone. CICS PA will report on all MQ systems in the Group to produce a single consolidated report.

CICS PA uses the System Selection in JCL generation to build the SSID(ssid1,ssid2,ssid3,...) and INput(SMFIN001,SMFIN002,SMFIN003,...) operands, and corresponding //SMFINnnn DD statements.

### Report Output DDname

The ddname for the report output which CICS PA uses when generating

the JCL to run the Report Set. The ddname is mandatory and should be unique to separate the output of multiple reports.

CICS PA assigns a default ddname **MQ00nnnn** where nnnn is a sequential number **0001-9999** to ensure each report has a unique ddname.

This option generates the OUTPUT(ddname) operand.

### Print Lines per Page

The maximum number of lines, including headings, to print on each page of the report. Valid values are from 1 to 255. The default is **60**.

The global value applies to all reports. If a value is specified on this report panel, the report value takes precedence over the global for this report only.

CICS PA JCL generation translates this field to the LINECount(nnn) operand.

### Reports Required

Enter / to select the reports you want produced.

- Select **List** to request the WebSphere MQ List report. This selection generates the LIST operand.
- Select **Summary** to request the WebSphere MQ Summary report. This selection generates the SUMMARY operand and is the default.

### Process Accounting Class Records

Select the type of MQ accounting data to process. Select either:

1. **Class 1** to request that the reports process MQ Class 1 records only. This is the default. This selection generates the CLASS1 operand.
2. **Class 3** to request that the reports process MQ Class 3 records only. This selection generates the CLASS3 operand.

If you need to report both Class 1 and Class 3 data, define another MQ report. CICS PA will produce both reports in a single pass of the data.

### Sort Summary by

Specify the required sorting sequence of the Summary report. You can order the Summary report by one of the following:

1. Transaction ID. This generates the SORT(TRAN) operand and is the default.
2. WebSphere Queue name. This generates the SORT(QUEUE) operand.
3. Transaction ID, then Queue name. This generates the SORT(TRAN,QUEUE) operand.
4. Queue name, then Transaction ID. This generates the SORT(QUEUE,TRAN) operand.

### Report Filter

Specify a Queue name to select records for a particular WebSphere MQ queue name. You can specify a pattern such as CICS MQ\* to include more than one queue name. The queue name is case-sensitive.

This option generates the QNAME(name) operand.

### Title

Title of the report. Specify up to 128 characters of text to describe the report. CICS PA concatenates the two lines of 64 exactly as entered to make one line which prints at the top of each page of the report below the heading. The default is blank (no title).

This option generates the TITLE1('left-half') and TITLE2('right-half') operands.

## Performance Selection Criteria

The fields that can be specified in Selection Criteria for filtering MQ accounting (SMF 116) records are:

### APPLID

CICS APPLID

**TRAN** CICS Transaction ID

### TASKNO

CICS Task ID

### START

MQ Thread Begin Time

**STOP** MQ Thread End Time

### ACTIVE

MQ Thread Begin-End Time

### Line Actions:

- /** Display the menu of line actions.
- S** Display the subpanel where Selection Criteria can be specified for this report. For details, see “Specifying Selection Criteria” on page 156.
- A** Activate the Selection Criteria so they are generated for this report when the Report Set is submitted. Selection Criteria can only be activated if one or more Select Statements are specified and not all are excluded. An asterisk \* indicates they are active.
- D** Deactivate the Selection Criteria. Any you have specified here will not be used.

## Select a System (MQ SSID)

To report on a particular system, you can select one from a list of available systems by pressing **Prompt** (F4) from the **MQ SSID** field in System Selection. Only the systems of that type are displayed. See Figure 130 for an example showing a list of MQ SSIDs.

Enter a **/** or **S** line action (or point-and-shoot) to select a system from the list to insert in your System Selection.

Command ==> \_\_\_\_\_ Systems \_\_\_\_\_ Row 1 to 2 of 2  
Scroll ==> PAGE \_\_\_\_\_

Select a System then press Enter.

System	Image	Files	Description
. MQ1T	MVS1	Yes	MQ Subsystem MQ1T/MVS1 _____
. MQ1P		No	MQ Subsystem MQ1P _____

\*\*\*\*\* End of list \*\*\*\*\*

Figure 130. Select a System (MQ SSID)

## WebSphere MQ accounting traces

WebSphere MQ accounting records are produced as a result of activating the Accounting Trace component of WebSphere MQ. That activation is a consequence of either coding a suitable parameter in a WebSphere MQ control block or by the issuing of a WebSphere MQ subsystem command from the MVS Operator Console. If the WebSphere MQ accounting trace is active, WebSphere MQ SMF accounting records (type 116) are produced with a subtype (0, 1 or 2) depending on what level of trace has been activated. If the MQ accounting trace is active, subtype 0 records

are always produced but subtypes 1 and 2 are only produced if CLASS(3) is specified when the trace is activated; this can only be performed via an MVS Operator Command.

## OMEGAMON reports

The OMEGAMON reports process OMEGAMON XE for CICS (SMF 112) records to produce a detailed view of how CICS transactions use the following types of database management system (DBMS):

Adabas  
CA-Datcom  
CA-IDMS  
Supra

For each type of DBMS, you can request up to three reports:

- A List report, showing database usage for each transaction.
- A Transaction Summary report, showing database usage summarized by transaction ID.
- A Database Summary report, showing database usage summarized by database.

The information in each report varies depending on the type of DBMS, but typically includes elapsed times and counts for each of the methods that transactions use to access a database, such as read, write, add, update, and delete.

To request one or more of these reports, enter line action **S** against the OMEGAMON Subsystem Report on the Report Set panel. If reports of this type have been previously specified, the list of OMEGAMON reports is displayed. Otherwise, the OMEGAMON panel is displayed for you to define your first report of this type.

Figure 132. OMEGAMON Report

Use this panel to specify report options and record selection criteria for the OMEGAMON reports. The only mandatory option is the Report Output DDname. You can let the other options default.

The options are:

### CICS System Selection

Identifies the CICS APPLIDs whose data you want to select for processing.

You can specify any combination of APPLID, Image, or Group, but these must be defined in your System Definitions. If you do not specify System Selection here or in the Global Options, then you are prompted at run time to specify the System Selection. This will apply globally to all reports and extracts without their own System Selection. This is recommended as it allows you to run your Report Sets against any of your defined Systems. Press the Prompt key (F4) to select from a list of defined Systems, Images, or Groups. To modify your System Definitions, select Systems in the action bar.

Specify one of the following:

- A CICS APPLID. An APPLID that matches a defined System's name pattern is also allowed. For example, CICSP1 can be specified if CICSP\* is a defined system.
- An APPLID and an MVS Image. This identifies the MVS Image where your CICS system runs.
- An MVS Image. All CICS systems executing on this MVS Image is selected.
- An APPLID and Image combination plus a Group. This is useful for uniquely identifying a CICS system when there are multiple CICS systems with the same name defined.

- A Group alone. CICS PA will select all CICS APPLIDs defined to the Group. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA uses the System Selection in JCL generation to build the APPLID(applid1,applid2,applid3,...) and INput(SMFIN001,SMFIN002,SMFIN003,...) operands, and corresponding //SMFINnnn DD statements.

System Selection can also be specified either:

- In Global Options. The report-level specification takes precedence over the global.
- At run time. The run-time System Selection overrides the Global Options and optionally the report-level specification.

### Report Output DDname

The DDname for the report output which CICS PA uses when generating the JCL to run the Report Set. The DDname is mandatory and should be unique to separate the output of multiple reports.

CICS PA assigns a default DDname **OMEGnnnn** where nnnn is a sequential number **0001-9999** to ensure each report has a unique DDname.

This option generates the OUTPUT(ddname) operand.

### Print Lines per Page

The maximum number of lines, including headings, to print on each page of the report. Valid values are from 1 to 255. The default is **60**.

The global value applies to all reports. If a value is specified on this report panel, the report value takes precedence over the global for this report only.

CICS PA JCL generation translates this field to the LINECount(nnn) operand.

### Reports Required

Enter / to select the reports you want produced:

**List** Requests the OMEGAMON List report. This option generates the LIST operand.

#### Summary

Requests the OMEGAMON Summary report. This option generates the SUMMARY operand.

There are two types of Summary report:

#### By Transaction

Requests the Transaction Summary report, which groups transaction data into sections for each transaction ID.

Within each section, the report shows the transaction data for each database accessed by that transaction ID, followed by total figures for that transaction ID across all databases.

This option generates the SUMMARY(TRAN) operand.

#### By Database

Requests the Database Summary report, which groups transaction data into sections for each database. Within each section, the report shows the transaction data for each transaction ID that has accessed that database, followed by total figures for that database for all transaction IDs.

This option generates the SUMMARY(DATABASE) operand.

If you select neither List nor Summary, then the generated command will contain neither the LIST operand nor the SUMMARY operand, and so the command will follow its default behavior, which is to produce both types of Summary report.

### **Summary Options**

The statistical functions that the Database Summary and Transaction Summary reports use to summarize transaction data. The options are: average, total, minimum, maximum, standard deviation, and peak percentile. Each option that you select produces additional rows in the reports, with the function name as the row heading.

### **Statistics to include**

Each OMEGAMON (SMF 112) record contains database usage details for a single transaction. A transaction might use one database, or it might use multiple databases from different types of DBMS. For each type of DBMS used by the transaction, the record contains a “totals” segment. For each database used by the transaction, the record contains a “detail” segment. This option specifies whether you want the report to include information from totals segments, details segments, or both:

#### **Total DBMS activity**

Includes information from totals segments. This option generates the PRINT(TOTALS) operand.

#### **Individual Database**

Includes information from detail segments. This option generates the PRINT(DB) operand.

### **DBMS Selection**

The types of DBMS for which you want to produce reports.

**Title** Title of the report. Specify up to 128 characters of text to describe the report. CICS PA concatenates the two lines of 64 exactly as entered to make one line which prints at the top of each page of the report below the heading. The default is blank (no title).

This option generates the TITLE1('left-half') and TITLE2('right-half') operands.

### **Performance Selection Criteria**

You can specify Selection Criteria to filter the OMEGAMON (SMF 112) records on time period and field values to restrict reporting to the data that is of interest to you.

CICS PA checks only the following Performance Selection Criteria fields when filtering OMEGAMON records:

#### **APPLID**

CICS APPLID

#### **FILENAME**

Database (or file) name

#### **NETUOWPX**

Originating System VTAM network name

#### **START**

Task start time.

**Note:** Report Interval-based selection for OMEGAMON XE for CICS records is limited to the Attach (START) time; the STOP and ACTIVE options are ignored.

**TASKNO**

Transaction identification number

**TRAN** CICS transaction ID

**UOWID**

Unit of work ID

All other fields are ignored.

**Line Actions:**

- /** Display the menu of line actions.
- S** Display the subpanel where Selection Criteria can be specified for this report. For details, see “Specifying Selection Criteria” on page 156.
- A** Activate the Selection Criteria so they are generated for this report when the Report Set is submitted. Selection Criteria can only be activated if one or more Select Statements are specified and not all are excluded. An asterisk \* indicates they are active.
- D** Deactivate the Selection Criteria. Any you have specified here will not be used.

---

## System reports

The System reports are produced from MVS system data stored in SMF files. Only the System Logger report is in this category.

### System Logger report

The System Logger report processes System Logger (SMF 88) records to provide information on the System Logger logstreams and coupling facility structures that are used by CICS Transaction Server for logging, recovery and backout operations. The report can assist with measuring the effects of tuning changes and identifying Logstream or Structure performance problems.

You can request two reports:

1. **System Logger List.** This report shows information on Logstream writes, deletes, and events, as well as Structure Alter events for each SMF recording interval.
2. **System Logger Summary.** This report summarizes Logstream and Structure statistics so you can measure Logger performance over a longer period of time.

These reports, when used in conjunction with the CICS Logger reports produced from the standard CICS statistics reporting utilities, provide a comprehensive analysis of the logstream activity for all your CICS systems.

To request a report, enter line action **S** against the **System Logger** System Report on the Report Set panel. If reports of this type have been previously specified, the list of System Logger Reports is displayed. Otherwise, the System Logger Report panel is displayed for you to define your first report of this type.

File Filter Edit Systems Options Help

Figure 133. System Logger Reports

This panel displays the list of System Logger Reports in this Report Set. You can select (edit), delete, or include/exclude any report, insert new ones, or rearrange them (move/copy).

The options are:

### System Selection

System Selection identifies the System Logger(s) and associated SMF files you want to report against. Any combination of Logger, Image, or Group can be specified but must be defined in System Definitions. You can use **Prompt** (F4) to select from a list. To link directly to System Definitions, select **Systems** in the action bar.

Specify either:

- A Logger.
- A Logger for a particular Image. This identifies a particular System Logger when there is more than one with the same ID.
- An Image. CICS PA will report on all systems running on this Image using the SMF files defined for the Image.
- A Logger and Image combination plus a Group. This is useful to uniquely identify a system when there is more than one of the same name defined in System Definitions.
- A Group alone. CICS PA will report on all System and Image combinations in the Group to produce a single consolidated report.

CICS PA uses the System Selection in JCL generation to build the INput (SMFIN001, SMFIN002, SMFIN003, ...) operand and corresponding //SMFINnnn DD statements.

### Output

CICS PA provides a default **Report Output DDname** in the format **LOGRnnnn** where nnnn is **0001-9999**.

The line actions are the same as on similar Reports list panels. See "Performance List report" on page 167.

To display the System Logger Report panel, enter line action **S** against the **System Logger** Performance Report on the Report Set panel, then if the list of previously specified reports is displayed, enter line action **S** against a particular report in the list.

Figure 134. System Logger Report

Use this panel to specify report options for the System Logger report. The report format is fixed. The only mandatory options are the DDname for the report output and the Sort order. You can let the other options default. Note that you cannot control the number of print lines per page for the System Logger Report. In addition to filtering by Logstream or Structure name or both, you can also filter records from processing by specifying selection criteria.

The options are:

### System Selection

System Selection identifies the System Logger(s) and associated SMF files you want to report against. Any combination of Logger, Image, or Group can be specified but must be defined in System Definitions. You can use **Prompt** (F4) to select from a list. To link directly to System Definitions, select **Systems** in the action bar.

Specify either:

- A Logger.
- A Logger for a particular Image. This identifies a particular System Logger when there is more than one with the same ID.
- An Image. CICS PA will report on all systems running on this Image using the SMF files defined for the Image.
- A Logger and Image combination plus a Group. This is useful to uniquely identify a system when there is more than one of the same name defined in System Definitions.
- A Group alone. CICS PA will report on all System and Image combinations in the Group to produce a single consolidated report.

CICS PA uses the System Selection in JCL generation to build the INput (SMFIN001,SMFIN002,SMFIN003,...) operand and corresponding //SMFINnnn DD statements.

### Report Output DDname

The DDname for the report output which CICS PA uses when generating

the JCL to run the Report Set. The DDname is mandatory and should be unique to separate the output of multiple reports.

CICS PA assigns a default DDname **LOGRnnnn** where nnnn is a sequential number **0001-9999** to ensure each report has a unique DDname.

This option generates the OUTPUT(ddname) operand.

### Reports Required

Enter / to select the reports you want produced.

- Select **List** to request the System Logger List report, a list of all Logger interval records in the SMF File. This selection generates the LIST operand.

You can also select **Include ALTER records** to include Structure Alter events in the report. These apply to Structures, not individual Logstreams, and are reported with a Logstream name of \*ALTER\*. This selection generates the LIST(ALTER) operand.

By default, the List report entries are printed in Logstream or Structure name sequence, depending on the Report Option selected. However, by selecting the **Sort by Time** option, the entries are printed in Logstream or Structure name sequence within each Interval expiry period. This selection generates the LIST(TIMESEQ) operand.

- Select **Summary** to request the System Logger Logstream Summary and Structure Summary reports. (A summary of ALTER activity is not included.) This selection generates the SUMMARY operand.

The default report is the Summary.

### Summary Interval

To present a single summary of records for the entire reporting period, leave this field blank (this is the default). To summarize records at intervals within the reporting period, enter a multiple of the SMF reporting interval, from 00:01 to 23:59. For example, if the SMF reporting interval was 5 minutes at the time that the logger records were written, then you can generate a System Logger Summary report that summarizes the logger records at any multiple of 5 minutes: 05:00, 10:00, 15:00 etc.

If you specify a Summary Interval, then ensure that the value you specify is an exact multiple of the SMF reporting interval. Otherwise, each of the summaries in the report might not be calculated from the same number of records.

This option appends a SUMMARYINTERVAL(hh:mm) suboperand to the SUMMARY operand.

### Ordering Options

The sort sequence for the System Logger List and Summary reports.

Select option **1** to sort by Logstream name, MVS ID, Structure name, then time stamp. This is the default. This selection generates a SORT(LOGSTREAMNAME) operand.

Select option **2** to sort by Structure name, Logstream name, MVS ID, then time stamp. This selection generates a SORT(STRUCTURENAME) operand.

### SMF Options: Recording Interval

The SMF global recording interval as specified in the INTVAL parameter of the SMFPRMnn PARMLIB member.

Specify an interval from 1 to 60 minutes. If not specified, CICS PA uses the recording interval in effect on the reporting system. The interval value is used by CICS PA for rate per second calculations in the System Logger Summary reports. If the interval used by CICS PA does not match the data, the total interval and rate calculations will be incorrect.

This option generates the INTERVAL(minutes) operand.

#### Selection Criteria

To specify Selection Criteria to filter the System Logger records on time period and other field values, enter S next to **Logger**.

*Line Actions:* Valid line actions are:

- / Display the menu of line actions.
- S Select to display the subpanel where Selection Criteria for this extract can be specified. See "Specifying Selection Criteria" on page 156 for a discussion on how to do this.
- A Activate the Selection Criteria so they are generated for this extract when the Report Set is submitted. Selection Criteria can only be activated if one or more Select Statements are specified and not all are excluded. An asterisk \* indicates they are active.
- D Deactivate the Selection Criteria. Any you have specified here will not be used.

CICS PA JCL generation translates Selection Criteria to the SELECT(LOGGER operand).

Optionally, specify the **Logstream Name** and **Structure Name** patterns to be reported. Masking characters % and \* are allowed. Examples of possible patterns are:

**TEST.DFHLOG**

which must match exactly

**PROD.\***

which can match PROD.DFHLOG

**PROD.MVSA%**

which can match PROD.MVSA1, but not PROD.MVSA1LOG

These options generate the LOGSTREAM('name.or.pattern') and STRUCTURE('name.or.pattern') operands.

- Title** Title of the report. Specify up to 128 characters of text to describe the report. CICS PA concatenates the two lines of 64 exactly as entered to make one line which prints at the top of each page of the report below the heading. The default is blank (no title).

This option generates the TITLE1('left-half') and TITLE2('right-half') operands.

#### Select a System (Logger)

To report on a particular system, you can select one from a list of available systems by pressing **Prompt** (F4) from the **Logger** field in System Selection. Only the systems of that type are displayed. See Figure 135 on page 242 for an example showing a list of System Loggers.

Enter a / or S line action (or point-and-shoot) to select a system from the list to insert in your System Selection.

## Performance Graph reports

The Performance Graph reports process CMF performance class data to produce graph-style reports showing response times (average, maximum) and transaction counts by time interval.

### Transaction Rate Graph report

The Transaction Rate Graph report helps you understand other graphs and reports by showing the number of transactions on which the reported data is based. It is also useful in understanding the rate at which the CICS system is running or is able to run. It is useful as a daily indicator of system activity, and helps you understand other graphs and reports by showing the number of transactions on which the reported data is based.

To request the report, enter line action **S** against the **Transaction Rate** Performance Graph on the Report Set panel. If reports of this type have been previously specified, the list of Transaction Rate Graphs is displayed. Otherwise, the Transaction Rate Graph panel is displayed for you to define your first report of this type.

Selection Criteria:
_ Performance *

F1=Help      F3=Exit      F4=Prompt      F7=Backward  F8=Forward  F10=Actions
F12=Cancel
```

Figure 137. Transaction Rate Graph

Use this panel to specify report options and record selection criteria for the Transaction Rate Graph report. The report format is fixed. The only mandatory option is the DDname for the report output (the CICS PA default is **GRTEnnnn**). You can let the other options default.

The report options are the same as those for the Performance List Report (see “Performance List report” on page 167), except there is no Report Form and there are additional options for the attributes of the graphs:

### Time Interval

The Transaction Rate Graph Report produces two graphs: average response time and number of transactions completed in each interval. Specify the time interval (in minutes) for the scale of the vertical axis of both graphs.

Specify a value in the range **00:00:01** (1 second) to **24:00:00** (24 hours). The default is **00:05:00** (5 minutes).

A time interval of less than one hour must fit evenly into the hour. CICS PA will round it down to the nearest interval that aligns to the hour. For example, 1.35 is reduced to 00:01:30 minutes which will produce 40 interval report lines for each hour of data.

A time interval of more than one hour must fit evenly into the day. CICS PA will round it down to the nearest interval that aligns to the day. For example, 10.30.23 is reduced to 08:00:00 hours which will produce 3 interval report lines for each day of data.

Minutes take precedence for an abbreviated entry. For example:

- 1** becomes 00:01:00
- 1.1** becomes 00:01:00 (rounded down from 00:01:01)
- 1.1.1** becomes 01:00:00 (rounded down from 01:01:01)

This option generates the **INTERVAL(hh:mm:ss)** operand.

### Average Response Time (seconds)

This applies to the graph of average response time (horizontal axis) in each

time interval (vertical axis). Specify the high end (in seconds) of the range of values for the horizontal axis. This option generates the RANGE1(seconds) operand.

#### Number of Transactions Completed

This applies to the graph of the number of transactions completed (horizontal axis) in each time interval (vertical axis). Specify the high end of the range of values for the horizontal axis. This option generates the RANGE2(number) operand.

## Transaction Response Time Graph report

The Transaction Response Time Graph Report shows the service level (response time) for completed transactions. It can be requested daily to determine, over a period of time, the level of service (response time).

To request the report, enter line action **S** against the **Transaction Response Time** Performance Graph on the Report Set panel. If graph reports of this type have been previously specified, the list of Transaction Response Time Graphs is displayed. Otherwise, the Transaction Response Time Graph panel is displayed for you to define your first report of this type.

```

Figure 139. Transaction Response Time Graph

Use this panel to specify report options and record selection criteria for the Transaction Response Time Graph. The report format is fixed. The only mandatory option is the DDname for the report output (the CICS PA default is **GRSPnnnn**). You can let the other options default.

The report options are the same as those for the “Performance List report” on page 167, except there is no Report Form and there are additional options for the attributes of the graphs:

### Time Interval

The Transaction Response Time Graph report produces two graphs: average response time and maximum response time in each interval. Specify the time interval (in minutes) for the scale of the vertical axis of both graphs.

Specify a value in the range **00:00:01** (1 second) to **24:00:00** (24 hours). The default is 00:05:00 (5 minutes).

A time interval of less than one hour must fit evenly into the hour. CICS PA will round it down to the nearest interval that aligns to the hour. For example, 1.35 is reduced to 00:01:30 minutes which will produce 40 interval report lines for each hour of data.

A time interval of more than one hour must fit evenly into the day. CICS PA will round it down to the nearest interval that aligns to the day. For example, 10.30.23 is reduced to 08:00:00 hours which will produce 3 interval report lines for each day of data.

Minutes take precedence for an abbreviated entry. For example:

- 1** becomes 00:01:00
- 1.1** becomes 00:01:00 (rounded down from 00:01:01)
- 1.1.1** becomes 01:00:00 (rounded down from 01:01:01)

This option generates the INTERVAL(hh:mm:ss) operand.

### Average Response Time (Seconds)

This applies to the graph of average response time (horizontal axis) in each

time interval (vertical axis). Specify the high end (in seconds) of the range of values for the horizontal axis. This option generates the RANGE1(seconds) operand.

#### **Maximum Response Time (Seconds)**

This applies to the graph of maximum response time (horizontal axis) in each time interval (vertical axis). Specify the high end (in seconds) of the range of values for the horizontal axis. This option generates the RANGE2(seconds) operand.

---

## **Extracts**

The extracts process SMF data to produce extract data sets suitable for further manipulation and analysis. For example:

- Analyze the Cross-System Work Extract data using CICS PA Performance Reports such as the List, Summary, and Totals reports.
- Analyze the Performance Data Extract, Statistics Extract, or System Logger Extract data using external programs such as DB2, or PC tools such as Lotus 1-2-3.
- Specify the Record Selection Extract data sets as your SMF Files in System Definitions to reduce the volume of data processed by CICS PA.

### **Cross-System Work extract**

The Cross-System Work Extract is created for the purpose of correlating performance class data from one or more regions. The extract records are based on a single network unit-of-work, as opposed to a single transaction. All performance class records contained in a single network unit-of-work are added, or combined. These records are then written to the extract data set as one record which represents all the work done on behalf of the network unit-of-work. A Recap report containing processing statistics is always printed at the end of extract processing.

The extract records have the same format as CMF performance class records written by the latest CICS release supported by CICS PA (VRM 680), regardless of the CICS releases of the input records.

You can use the extract data set as input to CICS PA for further processing, just like an SMF data set that contains CMF performance class records; for example, to run the Performance List, Performance List Extended, Performance Summary, and Performance Totals reports.

To request the extract, enter line action **S** against the **Cross-System Work** Extract on the Report Set panel. If extracts of this type have been previously specified, the list of Cross-System Work Extracts is displayed. Otherwise, the Cross-System Work Extract panel is displayed for you to define your first extract of this type.

Figure 140. Cross-System Work Extracts

This panel displays the list of Cross-System Work Extracts in this Report Set. You can edit, select (edit), delete, or include/exclude any extract, insert new ones, or rearrange them (move/copy).

The options are:

**Exc** The report or extract is marked by an asterisk \* if it is to be **Excluded** from reporting. Enter the line action **X** to reverse the Exclude status.

#### System Selection

Identifies the CICS APPLIDs whose data you want to select for processing.

You can specify any combination of APPLID, Image, or Group, but these must be defined in your System Definitions. If you do not specify System Selection here or in the Global Options, then you are prompted at run time to specify the System Selection. This will apply globally to all reports and extracts without their own System Selection. This is recommended as it allows you to run your Report Sets against any of your defined Systems. Press the Prompt key (F4) to select from a list of defined Systems, Images, or Groups. To modify your System Definitions, select Systems in the action bar.

Specify one of the following:

- A CICS APPLID. An APPLID that matches a defined System's name pattern is also allowed. For example, CICS P1 can be specified if CICS P\* is a defined system.
- An APPLID and an MVS Image. This identifies the MVS Image where your CICS system runs.
- An MVS Image. All CICS systems executing on this MVS Image is selected.
- An APPLID and Image combination plus a Group. This is useful for uniquely identifying a CICS system when there are multiple CICS systems with the same name defined.
- A Group alone. CICS PA will select all CICS APPLIDs defined to the Group. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA uses the System Selection in JCL generation to build the APPLID(applid1,applid2,applid3,...) and INput(SMFIN001,SMFIN002,SMFIN003,...) operands, and corresponding //SMFINnnn DD statements.

System Selection can also be specified either:

- In Global Options. The report-level specification takes precedence over the global.
- At run time. The run-time System Selection overrides the Global Options and optionally the report-level specification.

**Recap** The DDname for the Recap report which prints at the end of extract processing to provide processing statistics. The DDname is mandatory.

CICS PA assigns a default DDname **CROXnnnn** where nnnn is a sequential number **0001-9999** to ensure each Recap report has a unique DDname.

This option generates the OUTPUT(ddname) operand.

#### **Selection Criteria Indicator**

This indicator is generated by CICS PA.

**YES** indicates that Selection Criteria are activated for this extract.

**NO** indicates that Selection Criteria are not activated for this extract. This is because no Selection Criteria have been specified, all Select Statements are Excluded, or the Selection Criteria have been deactivated.

#### **Output Data Set**

The name of the data set where the extract records are written. If CICS PA is to create the data set at run time, the default allocation attributes specified on the Reporting Allocation Settings panel are used in generating the JCL. If the data set is already cataloged, then CICS PA will use DISP=OLD or DISP=MOD according to your request to overwrite or append to the existing data set.

When generating the JCL, CICS PA assigns a default DDname **CPAOXSnn** where nn is a sequential number **01-99** to ensure uniqueness.

When specifying the data set name, standard TSO conventions apply.

**Line Actions:** The line actions that can be performed against the list of extracts are:

<b>/</b>	Display the menu of line actions.
<b>S</b>	Select this row to review or modify.
<b>I</b>	Insert a row.
<b>R</b>	Repeat this row.
<b>C</b>	Copy this row.
<b>M</b>	Move this row.
<b>A</b>	Move/Copy after this row.
<b>B</b>	Move/Copy before this row.
<b>D</b>	Delete this row.
<b>X</b>	Reverse the Exclude status.

To display the Cross-System Work Extract panel, enter line action **S** against the **Cross-System Work** Performance Extract on the Report Set panel, then if the list of previously specified extracts is displayed, enter line action **S** against a particular extract in the list.

Figure 141. Cross-System Work Extract

Use this panel to specify extract options and record selection criteria for the Cross-System Work Extract. The mandatory options are the name and disposition of the Extract Data Set, the DDname for the Recap report, and the network unit-of-work (UOW) Processing Option. You can let the other options default.

### System Selection

The APPLIDs and SMF data files that apply to this extract.

You can specify any combination of APPLID, Image, or Group, but these must be defined in your System Definitions. If you do not specify System Selection here or in the Global Options, then you are prompted at run time to specify the System Selection. This will apply globally to all reports and extracts without their own System Selection. This is recommended as it allows you to run your Report Sets against any of your defined Systems. Press the **Prompt** key (F4) to select from a list of defined Systems, Images, or Groups. To modify your System Definitions, select **Systems** in the action bar.

Specify one of the following:

- A CICS APPLID. An APPLID that matches a defined System's name pattern is also allowed. For example, CICS<sup>\*</sup> can be specified if CICS<sup>\*</sup> is a defined system.
- An APPLID and an MVS Image. This identifies the MVS Image where your CICS system runs.
- An MVS Image. All CICS systems executing on this MVS Image is selected.
- An APPLID and Image combination plus a Group. This is useful for uniquely identifying a CICS system when there are multiple CICS systems with the same name defined.
- A Group alone. CICS PA will select all CICS APPLIDs defined to the Group. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA uses the System Selection in JCL generation to build the `APPLID(applid1,applid2,applid3,...)` and `Input(SMFIN001,SMFIN002,SMFIN003,...)` operands, and corresponding `//SMFINnnn DD` statements.

System Selection can also be specified either:

- In Global Options. The report-level specification takes precedence over the global.
- At run time. The run-time System Selection overrides the Global Options and optionally the report-level specification.

Optionally, user fields can be appended to the Cross-System Work Extract. The APPLID is used by CICS PA to initially populate the list of user fields which you can then modify using the **User Fields** option.

### Output Data Set

The name of the data set where the extract records are written. If CICS PA is to create the data set at run time, the default allocation attributes specified in Reporting Allocation Settings are used when generating the JCL. If the data set is already cataloged, then CICS PA will use `DISP=OLD` or `DISP=MOD` according to your request to overwrite or append to the existing data set. Alternatively, you can use a GDG to create a new data set each time the extract is run.

When generating the JCL, CICS PA assigns a default DDname **CPAOXSnn** where nn is a sequential number **01-99** to ensure uniqueness.

When specifying the data set name, standard TSO conventions apply. For example, if the TSO option **PROFILE PREFIX** is in effect, the prefix is appended as the high-level qualifier unless the data set name is enclosed in quotes.

### Disposition

The `DISP` value that you want the generated JCL to use for the output data set if it is already cataloged:

**OLD** Overwrites the data set contents with the new extract data.

**MOD** Appends the new extract data.

You must specify one of these dispositions regardless of whether the output data set is cataloged. If the output data set is not cataloged when CICS PA generates the JCL, then CICS PA generates the JCL using `DISP=(NEW,CATLG)` to catalog it.

### Record Compression

Select whether you want the SMF records in the extract file to be in compressed or uncompressed format. This option applies whether the records in the input SMF file are compressed or not.

If you select Yes, CICS PA writes CICS monitoring (SMF type 110, subtype 1) and OMEGAMON XE for CICS (SMF type 112) records in compressed format, regardless of the CICS release level of the input records. Other records are not compressed. Although CICS only introduced support for writing compressed SMF records in CICS Transaction Server Version 3.2, you can use CICS PA to create an extract file of compressed SMF records for any CICS release supported by CICS PA. You can use extract files containing compressed SMF records as input to CICS PA, just like any other SMF file, even though the CICS product level that originally created those SMF records cannot write them in compressed format.

Selecting this option generates the `COMPRESS` operand.

### Processing Options:

Select option **1 - UOWs with more than one record** to report only the transaction performance records whose network unit-of-work spans multiple CMF records. This is the default. This selection generates the `WRITEMultiple` operand.

Select option **2 - UOWs with a single record** to report only the transaction performance records consisting of network units-of-work that include only a single CMF record. This selection generates the `WRITESingle,NOWRITEMultiple` operand.

Select option **3 - All UOWs** to report all the transaction performance records. This selection generates the `WRITESingle,WRITEMultiple` operand.

### Record Formatting Options:

The APPLID and MVS Image that CICS PA is to write in all extract records.

CICS PA JCL generation translates the settings to the `SYSID(applid,mvsimage)` operand.

The extract records contain composite data from multiple CICS systems. For CICS PA to later process the extract file as input, you must define the file and this APPLID/MVS Image combination in System Definitions.

#### APPLID

The APPLID that CICS PA is to write in all extract records. Specify up to eight alphanumeric (A-Z,0-9) or special (@,#,\$) characters. The default is **MULTIPLE**.

**Image** The MVS Image that CICS PA is to write in all extract records. Specify up to four alphanumeric (A-Z,0-9) or special (@,#,\$) characters, with the first alphabetic or special. The default is **CICS**.

### Performance Selection Criteria

You can specify Selection Criteria to filter the CMF records on time period and field values to restrict reporting to the data that is of interest to you.

#### Line Actions:

- /** Display the menu of line actions.
- S** Display the subpanel where Selection Criteria can be specified for this report. For details, see "Specifying Selection Criteria" on page 156.
- A** Activate the Selection Criteria so they are generated for this report when the Report Set is submitted. Selection Criteria can only be activated if one or more Select Statements are specified and not all are excluded. An asterisk \* indicates they are active.
- D** Deactivate the Selection Criteria. Any you have specified here will not be used.

### Additional User Fields

User fields can be specified for inclusion in the Cross-System Work Extract records. CICS PA uses the specified APPLID to locate the MCT and initially populate the list of user fields. See Figure 142 on page 252.

**Line Actions:** The valid line actions are:

- /** Display the menu of line actions.
- S** Select to display the subpanel where user fields are specified.

When selected for the first time, an APPLID must be specified so the appropriate user fields can be found from the MCT.

- A** Activate the User Fields so they are included for this extract when the Report Set is submitted. User Fields can only be activated if at least one has been specified and not all are excluded. An asterisk \* indicates they are active.
- D** Deactivate the User Fields. Although you might have specified user fields for this extract, they will not be included when the Report Set is submitted.

## User fields for the Cross-System Work extract

To display the User Fields subpanel, enter line action **S** against User Fields on the Cross-System Work Extract panel.

File Filter Edit Options Help					
User Fields				Row 1 from 7	
Command ==> _____				Scroll ==> PAGE	
/	Exc	Dictionary	Definition	Char Length	Maximum Length
—		CLOCK1	CPAUSR1 S001	—	8

Figure 142. Cross-System Work Extract: User Fields

This panel displays the user fields to be included in the Cross-System Work Extract record. The list of fields is initially populated by CICS PA using the specified APPLID to locate the MCT. You can change the Include/Exclude status of the fields, or delete unwanted fields, but when deleted they cannot be reinstated. You can also modify the length of character fields.

The options are:

### Exclude Indicator

An asterisk \* in this field indicates that the row is excluded and will not be included in extract processing.

Use line action **X** to reverse the Exclude indicator.

### Dictionary Definition

The description of the user field in the format *informalname owner xnnn* where:

- *informalname* is the CMF informal name for the field. This is placed in the dictionary record of the Cross-System Work Extract and can be used in subsequent reporting, for example, as the column heading.
- *owner* is the CICS component that 'owns' the field.
- *x* indicates the data type:
  - A** - 32- or 64-bit count
  - C** - character string
  - S** - clock (both Time and Count parts are extracted)

- *nnn* is the field identifier. For Clock or Count fields, this identifies which of the 256 clocks and 256 counts are extracted. For character fields, it will always be 001.

### Character Field Length

The length of the field in the extract record, for character user fields only. If this length is shorter than the maximum length of the field, the value is truncated in the extract. Values longer than the field length are not allowed.

### Maximum Length

The original length of the user field. For clock or count fields, this is the length of the field in the extract record. For character fields, this length can be overridden by changing the **Char Length** value.

**Line Actions:** The valid line actions on this panel are:

- / Display the menu of line actions
- D Delete this field (Deleted fields cannot be reinstated)
- X Reverse this row's Exclude status (Exclude/Include)

## Performance Data extract

A Performance Data Extract is created as a delimited text file for the purpose of importing the CMF performance class data into PC spreadsheet or database tools for further detailed analysis and reporting. When transferred to a workstation file the extracted performance class data is available to PC applications such as Lotus 1-2-3.

A Recap report containing processing statistics is always printed at the end of extract processing.

To request the extract, enter line action **S** against the **Performance** Extract on the Report Set panel. If extracts have been previously specified, the list of Performance Extracts is displayed. Otherwise, the Performance Extract panel is displayed for you to define your first one.

Figure 144. Performance Extract

Use this panel to specify extract options and record selection criteria for the Performance Data extract. The mandatory options are the name and disposition of the Extract data set and the DDname for the Recap report. You can let the other options default.

The Extract record has a default format which includes all the Clock fields. Report Forms (LIST, LISTX, or SUMMARY) can be used to tailor the format and content of the records.

The options are:

#### System Selection

Identifies the CICS APPLIDs whose data you want to select for processing.

You can specify any combination of APPLID, Image, or Group, but these must be defined in your System Definitions. If you do not specify System Selection here or in the Global Options, then you are prompted at run time to specify the System Selection. This will apply globally to all reports and extracts without their own System Selection. This is recommended as it allows you to run your Report Sets against any of your defined Systems. Press the Prompt key (F4) to select from a list of defined Systems, Images, or Groups. To modify your System Definitions, select Systems in the action bar.

Specify one of the following:

- A CICS APPLID. An APPLID that matches a defined System's name pattern is also allowed. For example, CICSP1 can be specified if CICSP\* is a defined system.
- An APPLID and an MVS Image. This identifies the MVS Image where your CICS system runs.
- An MVS Image. All CICS systems executing on this MVS Image is selected.
- An APPLID and Image combination plus a Group. This is useful for uniquely identifying a CICS system when there are multiple CICS systems with the same name defined.
- A Group alone. CICS PA will select all CICS APPLIDs defined to the Group. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA uses the System Selection in JCL generation to build the APPLID(applid1,applid2,applid3,...) and INput(SMFIN001,SMFIN002,SMFIN003,...) operands, and corresponding //SMFINnnn DD statements.

System Selection can also be specified either:

- In Global Options. The report-level specification takes precedence over the global.
- At run time. The run-time System Selection overrides the Global Options and optionally the report-level specification.

### Output Data Set Name

The name of the data set where the extract records are written. If CICS PA is to create the data set at run time, the default allocation attributes specified on the Reporting Allocation Settings panel are used in generating the JCL. If the data set is already cataloged, then CICS PA will use DISP=OLD or DISP=MOD according to your request to overwrite or append to the existing data set.

When generating the JCL, CICS PA assigns a default DDname **CPAOEXnn** where nn is a sequential number **01-99** to ensure uniqueness.

When specifying the data set name, standard TSO conventions apply.

### Disposition

The DISP value that you want the generated JCL to use for the output data set if it is already cataloged:

**OLD** Overwrites the data set contents with the new extract data.

**MOD** Appends the new extract data.

You must specify one of these dispositions regardless of whether the output data set is cataloged. If the output data set is not cataloged when CICS PA generates the JCL, then CICS PA generates the JCL using DISP=(NEW,CATLG) to catalog it.

**Form** The name of a Report Form to be used to tailor the type of extract and the format of the extract records. The Report Form can be a LIST, LISTX, or SUMMARY Form:

- LIST and LISTX Forms produce an extracted data file like the Performance List Report. There is no restriction on the number of fields. Note that in contrast to the report, LISTX does not produce a sorted extract. Specifying a Form of this type generates the LIST report operand.

- SUMMARY produces an extracted data file equivalent to the Performance Summary report, sorting and summarizing on specified fields, but with no restriction on the number of fields. Specifying a Form of this type generates the SUMMARY report operand.
- If a Report Form is not specified, the default extract is produced using the EXTRACTPERFORMANCE report operand.

To select the name from a list of compatible Report Forms, position the cursor on the **Form** field and press **Prompt** (F4).

CICS PA JCL generation translates the Report Form specification into the LIST(FIELDS or SUMMARY(FIELDS operand.

**Alert** The name of a Performance Alert Definition. To select from a list of predefined names, position the cursor on the Alert field and press **Prompt** (F4). CICS PA JCL generation translates the Alert specification into the ALERTDEF operand.

This option only applies when a Form is specified, otherwise, it is ignored.

### Severity

When an Alert name is specified, this sub-option allows you to specify the minimum severity level to be reported and type of transactions reported.

For the List extract, the minimum severity level selected for reporting is used to report transactions that have at least that level of reporting in any of the severity fields. This could result in transactions being reported with severity lower than the specified severity when the transaction also has one or more severity fields that meets the specified severity criteria. For example, if you specify SEVERITY(CRITICAL), only transactions with Critical severity are reported, however, if a transaction also exceeds Warning or Info thresholds, the lower severity will be also reported.

Press **Prompt** (F4) to select from the list of available options which are:

#### For a List extract (ignored for Summary):

The following options only apply to a List report or extract. If specified for a Summary extract, SEVERITY(ALL) is assumed.

##### CRITICAL

Only Critical transactions are reported.

##### WARNING

Only Critical and Warning transactions are reported.

**INFO** All alerts are reported: Critical, Warning and Informational transactions.

#### For a List or Summary extract:

The following options apply to both List and Summary.

##### ELIGIBLE

Only eligible transactions are processed and reported. Eligible transactions are those that have resource values that match resource values specified in the alert definition. The resulting report will include eligible only transactions with and without alerts.

This option provides the means to filter out transactions that would never generate an alert because their resource values do not match resource values specified in the alert definition.

### **ALL or blank**

All transactions are reported, whether or not they generate an alert and whether or not they are eligible. This is the default.

CICS PA JCL generation translates the Severity specification into the following operands:

#### **List extract**

SEVERITY(CRITICAL|WARNING|INFO|ELIGIBLE|ALL)

#### **Summary extract**

SEVERITY(ELIGIBLE|ALL)

### **Interval**

The time interval applies when you want to summarize transaction activity over time. It is used when you specify a SUMMARY Report Form which has any of the key fields **OSTART**, **START**, or **STOP** included. When reporting, CICS PA accumulates the data for each interval in the report period and writes a report line for each.

Specify a value in the range **00:00:01** (1 second) to **24:00:00** (24 hours). The default is **00:01:00** (1 minute).

A time interval of less than one hour must fit evenly into the hour. CICS PA will round it down to the nearest interval that aligns to the hour. For example, 1.35 is reduced to 00:01:30 minutes which will produce 40 interval report lines for each hour of data.

A time interval of more than one hour must fit evenly into the day. CICS PA will round it down to the nearest interval that aligns to the day. For example, 10.30.23 is reduced to 08:00:00 hours which will produce 3 interval report lines for each day of data.

Minutes take precedence for an abbreviated entry. For example:

**1** becomes 00:01:00

**1.1** becomes 00:01:00 (rounded down from 00:01:01)

**1.1.1** becomes 01:00:00 (rounded down from 01:01:01)

This option generates the INTERVAL(hh:mm:ss) operand.

### **Override Form**

For the Summary extract, this option specifies whether to **PREFIX**, **APPEND** or **REPLACE** the key fields specified in the Form. Based on the action in this option, JCL generation will generate the required Form key using the override option and field specified in Timestamp. Ensure that the resulting key will conform to the Summary key rules. No action will be taken if this field is blank. The Form itself is not affected, only the generated FIELDS key fields.

### **Timestamp**

Specifies the field name to override the Form key fields. Valid timestamp fields are **START**, **STOP**, and **OSTART**.

### **Include Field Labels**

Select (/) to include field labels as the first record written to the extract data set. This is the default. CICS PA JCL generation translates this to the LABELS operand.

Blank out the field if you do not want field labels written. CICS PA JCL generation translates this to the NOLABELS operand.

### Numeric Fields in Float format

Select (/) to write numeric fields in the extract in S390 FLOAT format. This only applies when you specify a Form (FIELDS operand). CICS PA JCL generation translates this to the FLOAT operand.

Specify FLOAT format if you plan to import the extract into a DB2 table. When the DB2 Load Utility is used, it will interpret all numerical fields reliably and consistently in FLOAT format.

If FLOAT is not specified, the numeric fields are written in a mixture of integer, real and exponential using character digits. This is the default and is suitable when importing the extract data into a PC spreadsheet tool.

### Delimiter

The field delimiter used to separate each data field in the extract records. The default is a semicolon (;).

CICS PA JCL generation translates this to DELIMIT('delimiter'). Note that the value is enclosed in quotes in this operand.

### Performance Selection Criteria

You can specify Selection Criteria to filter the CMF records on time period and field values to restrict the extract to the data that is of interest to you. CICS PA JCL generation translates Selection Criteria to the SELECT(PERFORMANCE operand.

If you specify a Report Form that also has Selection Criteria specified, CICS PA JCL generation translates the Form's Selection Criteria to the SELECT2(PERFORMANCE operand. If both the report and the Form specify Selection Criteria, then a record must pass selection by both specifications to be included in the extract.

#### *Line Actions:*

- /      Display the menu of line actions.
- S      Display the subpanel where Selection Criteria can be specified for this report. For details, see "Specifying Selection Criteria" on page 156.
- A      Activate the Selection Criteria so they are generated for this report when the Report Set is submitted. Selection Criteria can only be activated if one or more Select Statements are specified and not all are excluded. An asterisk \* indicates they are active.
- D      Deactivate the Selection Criteria. Any you have specified here will not be used.

### Use External Sort

Select / to use an external sort utility to process Summary records. This is the default. It generates the **EXTERNAL(ddname)** operand. This provides the DDname of the work data set used by the external sort utility. CICS PA assigns an External Work File from a pool of External Work Files with default DDnames in the format **CPAXWnnn** where nnn is a sequential number **001-999** to uniquely identify the work file.

An external sort should be used when processing large volumes of data.

If not selected, an internal sort is used.

### Repository

The data set name of the Repository that contains the Performance Alert Definitions.

## Record Selection extract

The Record Selection Extract is a facility that allows you to create a small extract file containing only the records of interest to you. The extract file can then be used as input to CICS PA, allowing more efficient reporting.

The Record Selection Extract filters large SMF Files, writing only SMF records that match the following criteria:

- CICS, DB2, MQ, and Logger System Selection
- Selected record types, being any of:
  - Performance
  - Exception
  - Resource
  - Statistics (includes CICS Transaction Gateway statistics from SMF type 111 records)
  - OMEGAMON
  - DB2
  - WebSphere MQ
  - System Logger
  - Identity
- Performance Selection Criteria
- Exception Selection Criteria
- Logger Selection Criteria
- Run-time SMF reporting interval

A Recap report containing processing statistics is always printed at the end of extract processing.

To request the extract, enter line action **S** against the **Record Selection** Extract on the Report Set panel. If extracts of this type have been previously specified, the list of Record Selection Extracts is displayed. Otherwise, the Record Selection Extract panel is displayed for you to define your first one.

```

```

Figure 146. Record Selection Extract

Use this panel to specify extract options and record selection criteria for the Record Selection extract. The mandatory options are the name and disposition of the Extract Data Set and the DDname for the Recap report. You can let the other options default, although it is recommended that you specify Selection Criteria to reduce the volume of data.

The options are:

### System Selection

#### CICS APPLID

Identifies the CICS APPLIDs whose data you want to select for processing.

You can specify any combination of APPLID, Image, or Group, but these must be defined in your System Definitions. If you do not specify System Selection here or in the Global Options, then you are prompted at run time to specify the System Selection. This will apply globally to all reports and extracts without their own System Selection. This is recommended as it allows you to run your Report Sets against any of your defined Systems. Press the Prompt key (F4) to select from a list of defined Systems, Images, or Groups. To modify your System Definitions, select Systems in the action bar.

Specify one of the following:

- A CICS APPLID. An APPLID that matches a defined System's name pattern is also allowed. For example, CICSP1 can be specified if CICSP\* is a defined system.
- An APPLID and an MVS Image. This identifies the MVS Image where your CICS system runs.
- An MVS Image. All CICS systems executing on this MVS Image is selected.
- An APPLID and Image combination plus a Group. This is useful for uniquely identifying a CICS system when there are multiple CICS systems with the same name defined.
- A Group alone. CICS PA will select all CICS APPLIDs defined to the Group. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA uses the System Selection in JCL generation to build the APPLID(applid1,applid2,applid3,...) and INput(SMFIN001,SMFIN002,SMFIN003,...) operands, and corresponding //SMFINnnn DD statements.

System Selection can also be specified either:

- In Global Options. The report-level specification takes precedence over the global.
- At run time. The run-time System Selection overrides the Global Options and optionally the report-level specification.

## DB2 SSID

The DB2 Subsystems and SMF data files you want processed. The Record Selection extract processes DB2 101 accounting records only if they are part of a CICS thread, and will only process these if you specify the DB2 SSID(s). Any combination of SSID, Image, or Group can be specified but must be defined in System Definitions. You can type them in directly or select from a list of available SSIDs by using **Prompt** (F4). To link directly to System Definitions, select **Systems** in the action bar.

Specify either:

- A DB2 SSID.
- An SSID for a particular Image. This identifies the MVS Image where your DB2 Subsystem runs.
- An Image. CICS PA will report on all DB2 SSIDs running on this Image using the SMF files defined for the Image.
- An SSID and Image combination plus a Group. This is useful for uniquely identifying DB2 Subsystems when there is more than one of the same name defined in System Definitions.
- A Group alone. CICS PA will report on all SSID and Image combinations in the Group to produce a single consolidated report.

CICS PA uses the DB2 System Selection in JCL generation to build the SSID(ssid1,ssid2,ssid3,...) and INput(SMFIN001,SMFIN002,SMFIN003,...) operands, and corresponding //SMFINnnn DD statements.

DB2 System Selection can also be specified as a global option. The report-level specification takes precedence over the global. When

you submit your Report Set, you can also specify DB2 System Selection at that time and it takes precedence over the global for that run only.

### MQ SSID

The WebSphere MQ Subsystems and SMF data files you want processed. The Record Selection extract processes MQ 116 accounting records only if they are part of a CICS thread, and will only process these if you specify the MQ SSID(s). Any combination of SSID, Image, or Group can be specified but must be defined in System Definitions. You can type them in directly or select from a list of available SSIDs by using **Prompt** (F4). To link directly to System Definitions, select **Systems** in the action bar.

Specify either:

- An MQ SSID.
- An SSID for a particular Image. This identifies the MVS Image where your MQ Subsystem runs.
- An Image. CICS PA will report on all MQ SSIDs running on this Image using the SMF files defined for the Image.
- An SSID and Image combination plus a Group. This is useful for uniquely identifying MQ Subsystems when there is more than one of the same name defined in System Definitions.
- A Group alone. CICS PA will report on all SSID and Image combinations in the Group to produce a single consolidated report.

CICS PA uses the MQ System Selection in JCL generation to build the SSID(ssid1,ssid2,ssid3,...) and INput (SMFIN001,SMFIN002,SMFIN003,...) operands, and corresponding //SMFINnnn DD statements.

MQ System Selection can also be specified as a global option. The report-level specification takes precedence over the global. When you submit your Report Set, you can also specify MQ System Selection at that time and it takes precedence over the global for that run only.

### Logger

The MVS System Loggers and associated SMF data files that you want to report against. Any combination of Logger, Image, or Group can be specified but must be defined in System Definitions. You can type them in directly or use **Prompt** (F4) to select from a list. To link directly to System Definitions, select **Systems** in the action bar.

Specify either:

- A Logger.
- A Logger for a particular Image. This identifies a particular System Logger when there is more than one with the same ID.
- An Image. CICS PA will report on all systems running on this Image using the SMF files defined for the Image.
- A Logger and Image combination plus a Group. This is useful for uniquely identify a system when there is more than one of the same name defined in System Definitions.

- A Group alone. CICS PA will report on all system and Image combinations in the Group to produce a single consolidated report.

CICS PA uses the Logger System Selection in JCL generation to build the INput (SMFIN001,SMFIN002,SMFIN003,...) operand and corresponding //SMFINnnn DD statements. It also generates the LOGGER operand to request Logger records for the extract.

Logger System Selection can also be specified as a global option. The report-level specification takes precedence over the global. When you run your Report Set, you can also specify Logger System Selection at run time to override the global and optionally the report-level specification.

### Required CICS Record Types

Enter / to select the combination of record types that you want included in the extract.

Note that APPLIDs, DB2 SSIDs, MQ SSIDs, and Logger data are included in the extract according to your specified System Selection.

### Extract Recap DDname

The DDname for the Recap report which prints at the end of extract processing to provide processing statistics. The DDname is mandatory.

CICS PA assigns a default DDname **RSELnnnn** where nnnn is a sequential number **0001-9999** to ensure each Recap report has a unique DDname.

This option generates the OUTPUT(ddname) operand.

### Output Data Set

The name of the data set where the extract records are written. When specifying the data set name, standard TSO conventions apply.

If CICS PA is to create the data set at run time, the default allocation attributes specified on the Reporting Allocation Settings panel are used in generating the JCL. If the data set is already cataloged, then CICS PA will use DISP=OLD or DISP=MOD according to your request to overwrite or append to the existing data set.

CICS PA generates the DDNAME(ddname) operand and assigns a default DDname **CPAORSnn** where nn is a sequential number **01-99** to ensure uniqueness.

### Disposition

The DISP value that you want the generated JCL to use for the output data set if it is already cataloged:

**OLD** Overwrites the data set contents with the new extract data.

**MOD** Appends the new extract data.

You must specify one of these dispositions regardless of whether the output data set is cataloged. If the output data set is not cataloged when CICS PA generates the JCL, then CICS PA generates the JCL using DISP=(NEW,CATLG) to catalog it.

### Record Compression

Select whether you want the SMF records in the extract file to be in compressed or uncompressed format. This option applies whether the records in the input SMF file are compressed or not.

If you select Yes, CICS PA writes CICS monitoring (SMF type 110, subtype 1) and OMEGAMON XE for CICS (SMF type 112) records in compressed

format, regardless of the CICS release level of the input records. Other records are not compressed. Although CICS only introduced support for writing compressed SMF records in CICS Transaction Server Version 3.2, you can use CICS PA to create an extract file of compressed SMF records for any CICS release supported by CICS PA. You can use extract files containing compressed SMF records as input to CICS PA, just like any other SMF file, even though the CICS product level that originally created those SMF records cannot write them in compressed format.

Selecting this option generates the COMPRESS operand.

### Selection Criteria

To filter data for Performance, Resource Class, Statistics, DB2, MQ, Identity and Omegamon record selection, specify **Performance** Selection Criteria.

To filter data for Exception Class record selection, specify **Exception** Selection Criteria.

To filter data for System Logger record selection, specify any combination of **Logger** Selection Criteria, **Logstream Name**, and **Structure Name**.

Selection Criteria are not applicable to Statistics records.

#### *Line Actions:*

- /** Display the menu of line actions.
- S** Display the subpanel where Selection Criteria can be specified for this report. For details, see “Specifying Selection Criteria” on page 156.
- A** Activate the Selection Criteria so they are generated for this report when the Report Set is submitted. Selection Criteria can only be activated if one or more Select Statements are specified and not all are excluded. An asterisk \* indicates they are active.
- D** Deactivate the Selection Criteria. Any you have specified here will not be used.

## HDB Load

The HDB Load is a facility that loads SMF data into a Historical Database (HDB). This same facility is available from Primary Menu option 5 Historical Database. However, from Report Sets you have the advantages of:

- Reports and HDB Load in the one job
- Multiple load requests supported in the one job
- One pass of the data

A Recap report containing processing statistics is always printed at the end of load processing.

To request HDB Load, enter line action **S** against **HDB Load** in the **Extracts** category on the Report Set panel. If HDB Loads have been previously specified in this Report Set, the list of them is displayed. Otherwise, the HDB Load panel is displayed for you to request your first one.

```

```

Figure 148. HDB Load

Use this panel to specify the load options, including system selection, the name of the HDB in the current repository, and the DDname for the Recap report.

Specify the systems that you want to analyze. The systems and files must be defined in System Definitions. You can link directly there by selecting Systems in

the action bar. It is recommended that you specify your System Selection at run time, not within the Report Set. This will allow you to load data from any of your defined systems.

To run the load, enter the RUN command.

The options are:

### System Selection

#### CICS APPLID

Identifies the CICS APPLIDs whose data you want to select for processing.

You can specify any combination of APPLID, Image, or Group, but these must be defined in your System Definitions. If you do not specify System Selection here or in the Global Options, then you are prompted at run time to specify the System Selection. This will apply globally to all reports and extracts without their own System Selection. This is recommended as it allows you to run your Report Sets against any of your defined Systems. Press the Prompt key (F4) to select from a list of defined Systems, Images, or Groups. To modify your System Definitions, select Systems in the action bar.

Specify one of the following:

- A CICS APPLID. An APPLID that matches a defined System's name pattern is also allowed. For example, CICSP1 can be specified if CICSP\* is a defined system.
- An APPLID and an MVS Image. This identifies the MVS Image where your CICS system runs.
- An MVS Image. All CICS systems executing on this MVS Image is selected.
- An APPLID and Image combination plus a Group. This is useful for uniquely identifying a CICS system when there are multiple CICS systems with the same name defined.
- A Group alone. CICS PA will select all CICS APPLIDs defined to the Group. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA uses the System Selection in JCL generation to build the `APPLID(applid1,applid2,applid3,...)` and `INput(SMFIN001,SMFIN002,SMFIN003,...)` operands, and corresponding `//SMFINnnn DD` statements.

System Selection can also be specified either:

- In Global Options. The report-level specification takes precedence over the global.
- At run time. The run-time System Selection overrides the Global Options and optionally the report-level specification.

#### Extract Recap DDname

The DDname for the Recap report which prints at the end of load processing to provide processing statistics. The DDname is mandatory.

CICS PA assigns a default DDname **HDBLnnnn** where nnnn is a sequential number **0001-9999** to ensure each Recap report has a unique DDname.

This option generates the `OUTPUT(ddname)` operand.

## Historical Database

Specify the name of the HDB you want to load with SMF data. Press **Prompt** (F4) to select an HDB from the current repository.

The current repository is specified in option 5 **Historical Database** from the Primary Option Menu.

## DB2 Export Options

To export the data to DB2 directly after loading it into the HDB, select the Load DB2 Table option. For details of the JCL that this option generates, see "Load JCL" on page 643. (The remaining DB2 export options are only relevant if you select the Load DB2 Table option.)

The DB2 table to which you are exporting must already be defined.

To define a DB2 table, see "Creating DDL to define a DB2 table" on page 655.

If you select **2. Replace** for Table Load Options and the HDB load fails, then the result is an empty DB2 table.

## System Logger extract

A System Logger Extract is created as a delimited text file for the purpose of importing System Logger data into PC spreadsheet tools or database tools (such as DB2) for further detailed analysis and reporting. When transferred to a workstation file the extracted System Logger data is available to PC applications such as Lotus 1-2-3.

A Recap report containing processing statistics is always printed at the end of extract processing.

To request the extract, enter line action **S** against the **System Logger** Extract on the Report Set panel. If extracts of this type have been previously specified, the list of System Logger Extracts is displayed. Otherwise, the System Logger Extract panel is displayed for you to define your first extract of this type.

File Filter Edit Systems Options Help

Figure 149. System Logger Extracts

This panel displays the list of System Logger Extracts in this Report Set. You can select (edit), delete, or include/exclude any extract, insert new ones, or rearrange them (move/copy).

The options are:

### System Selection

System Selection identifies the System Logger(s) and associated SMF files you want to report against. Any combination of Logger, Image, or Group

can be specified but must be defined in System Definitions. You can use **Prompt** (F4) to select from a list. To link directly to System Definitions, select **Systems** in the action bar.

Specify either:

- A Logger.
- A Logger for a particular Image. This identifies a particular System Logger when there is more than one with the same ID.
- An Image. CICS PA will report on all systems running on this Image using the SMF files defined for the Image.
- A Logger and Image combination plus a Group. This is useful to uniquely identify a system when there is more than one of the same name defined in System Definitions.
- A Group alone. CICS PA will report on all System and Image combinations in the Group to produce a single consolidated report.

CICS PA uses the System Selection in JCL generation to build the INput (SMFIN001,SMFIN002,SMFIN003,...) operand and corresponding //SMFINnnn DD statements.

## Output

CICS PA provides a default **Recap Report Output DDname** in the format **LOEXnnnn** where nnnn is **0001-9999**.

The line actions are the same as on similar Reports list panels. See “Performance List report” on page 167.

To display the System Logger Extract panel, enter line action **S** against the **System Logger** Extract on the Report Set panel, then if the list of previously specified extracts is displayed, enter line action **S** against a particular extract in the list.

Figure 150. System Logger Extract

Use this panel to specify extract options and record selection criteria for the System Logger extract. The mandatory options are the name and disposition of the Extract data set and the DDname for the Recap report. You can let the other options default. The extract format is fixed.

The options are:

### System Selection

System Selection identifies the System Logger(s) and associated SMF files you want to report against. Any combination of Logger, Image, or Group can be specified but must be defined in System Definitions. You can use **Prompt** (F4) to select from a list. To link directly to System Definitions, select **Systems** in the action bar.

Specify either:

- A Logger.
- A Logger for a particular Image. This identifies a particular System Logger when there is more than one with the same ID.
- An Image. CICS PA will report on all systems running on this Image using the SMF files defined for the Image.
- A Logger and Image combination plus a Group. This is useful to uniquely identify a system when there is more than one of the same name defined in System Definitions.
- A Group alone. CICS PA will report on all System and Image combinations in the Group to produce a single consolidated report.

CICS PA uses the System Selection in JCL generation to build the `INput (SMFIN001,SMFIN002,SMFIN003,...)` operand and corresponding `//SMFINnnn DD` statements.

### Data Set Name

The name of the data set where the extract records are written. If CICS PA is to create the data set at run time, the default allocation attributes specified on the Reporting Allocation Settings panel are used in generating the JCL. If the data set is already cataloged, then CICS PA will use `DISP=OLD` or `DISP=MOD` according to your request to overwrite or append to the existing data set.

When generating the JCL, CICS PA assigns a default DDname **CPAOLEnn** where nn is a sequential number **01-99** to ensure uniqueness.

When specifying the data set name, standard TSO conventions apply.

### Disposition

The `DISP` value that you want the generated JCL to use for the output data set if it is already cataloged:

**OLD** Overwrites the data set contents with the new extract data.  
**MOD** Appends the new extract data.

You must specify one of these dispositions regardless of whether the output data set is cataloged. If the output data set is not cataloged when CICS PA generates the JCL, then CICS PA generates the JCL using `DISP=(NEW,CATLG)` to catalog it.

### Delimiter

The field delimiter used to separate each data field in the extract records. The default is a semicolon (;).

CICS PA JCL generation translates this to `DELIMIT('delimiter')`. Note that the value is enclosed in quotes in this operand.

### Include Field Labels

Select (/) to include field labels as the first record written to the extract data set. This is the default. CICS PA JCL generation translates this to the `LABELS` operand.

Blank out the field if you do not want field labels written. CICS PA JCL generation translates this to the NOLABELS operand.

#### **Numeric Fields in Float format**

Select (/) to write numeric fields in the extract in S390 FLOAT format. CICS PA JCL generation translates this to the FLOAT operand.

Specify FLOAT format if you plan to import the extract into a DB2 table. When the DB2 Load Utility is used, it will interpret all numerical fields reliably and consistently in FLOAT format.

If FLOAT is not specified, the numeric fields are written in a mixture of integer, real and exponential using character digits. This is the default and is suitable when importing the extract data into a PC spreadsheet tool.

#### **Selection Criteria**

To specify Selection Criteria to filter the System Logger records on time period and other field values, enter S next to **Logger**.

*Line Actions:* Valid line actions are:

- / Display the menu of line actions.
- S Select to display the subpanel where Selection Criteria for this extract can be specified. See "Specifying Selection Criteria" on page 156 for a discussion on how to do this.
- A Activate the Selection Criteria so they are generated for this extract when the Report Set is submitted. Selection Criteria can only be activated if one or more Select Statements are specified and not all are excluded. An asterisk \* indicates they are active.
- D Deactivate the Selection Criteria. Any you have specified here will not be used.

CICS PA JCL generation translates Selection Criteria to the SELECT(LOGGER operand).

Optionally, specify the **Logstream Name** and **Structure Name** patterns to be reported. Masking characters % and \* are allowed. Examples of possible patterns are:

**TEST.DFHLOG**

which must match exactly

**PROD.\***

which can match PROD.DFHLOG

**PROD.MVSA%**

which can match PROD.MVSA1, but not PROD.MVSA1LOG

These options generate the LOGSTREAM('name.or.pattern') and STRUCTURE('name.or.pattern') operands.

## **Statistics extract**

A Statistics Extract is created as a delimited text file for the purpose of importing CICS statistics into PC spreadsheet or database tools for further detailed analysis and reporting. When transferred to a workstation file the extracted CICS statistics are available to PC applications such as Lotus 1-2-3.

A Recap report containing processing statistics is always printed at the end of extract processing.

To request the extract, enter line action **S** against the **Statistics** Extract on the Report Set panel. If extracts have been previously specified, the list of Statistics Extracts is displayed. Otherwise, the Statistics Extract panel is displayed for you to define your first one.

```

Figure 151. Statistics Extracts

This panel displays the list of Statistics Extracts in this Report Set. You can select (edit), delete, or include/exclude any extract, insert new ones, or rearrange them (move/copy).

The options and line actions are the same as on the Cross-System Work Extracts panel (see “Cross-System Work extract” on page 246), except that there are no selection criteria, and that, here, you specify a prefix for the output data set name, rather than the complete name.

To display the Statistics Extract panel, enter line action **S** against the **Statistics** Extract on the Report Set panel, then if the list of previously specified extracts is displayed, enter line action **S** against a particular extract in the list.

```

Figure 152. Statistics Extract

Use this panel to specify extract options and interval types for the Statistics extract. The mandatory options are the prefix and disposition of the Extract data set, the DDname for the Recap report, and the selection of statistics reports that you want to extract. You can let the other options default.

The format of each extract depends on the statistics reports that you select.

The options are:

### System Selection

Identifies the CICS APPLIDs whose data you want to select for processing.

You can specify any combination of APPLID, Image, or Group, but these must be defined in your System Definitions. If you do not specify System Selection here or in the Global Options, then you are prompted at run time to specify the System Selection. This will apply globally to all reports and extracts without their own System Selection. This is recommended as it allows you to run your Report Sets against any of your defined Systems. Press the Prompt key (F4) to select from a list of defined Systems, Images, or Groups. To modify your System Definitions, select Systems in the action bar.

Specify one of the following:

- A CICS APPLID. An APPLID that matches a defined System's name pattern is also allowed. For example, CICSP1 can be specified if CICSP\* is a defined system.
- An APPLID and an MVS Image. This identifies the MVS Image where your CICS system runs.
- An MVS Image. All CICS systems executing on this MVS Image is selected.
- An APPLID and Image combination plus a Group. This is useful for uniquely identifying a CICS system when there are multiple CICS systems with the same name defined.
- A Group alone. CICS PA will select all CICS APPLIDs defined to the Group. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA uses the System Selection in JCL generation to build the `APPLID(applid1,applid2,applid3,...)` and `INput(SMFIN001,SMFIN002,SMFIN003,...)` operands, and corresponding `//SMFINnnn DD` statements.

System Selection can also be specified either:

- In Global Options. The report-level specification takes precedence over the global.
- At run time. The run-time System Selection overrides the Global Options and optionally the report-level specification.

### Statistics Reports

To specify the statistics reports that you want to extract, enter a non-blank character next to **Select to specify Statistics Reports**. A list panel of CICS statistics report titles appears. Enter line action **A** next to the reports that you want to extract, and then press **Exit** (F3). An asterisk appears next to **Select to specify Statistics Reports**, indicating that you have selected reports.

### Output Data Set Name Prefix

The prefix for the data set names where the extract records are written. If

CICS PA is to create the data set at run time, the default allocation attributes specified on the Reporting Allocation Settings panel are used in generating the JCL. If the data set is already cataloged, then CICS PA will use DISP=OLD or DISP=MOD according to your request to overwrite or append to the existing data set. When generating the JCL:

- CICS PA fully qualifies the extract data set name by appending to this prefix STTSxxxx for CICS Transaction Server (TS) statistics or STTGxxxx for CICS Transaction Gateway (TG) statistics, where xxxx is the statistics ID.
- CICS PA assigns the corresponding default DDname TSxxxxnm or TGxxxxnm, where nm is a 2-digit sequence number that ensures each DDname is unique.

When specifying the data set name prefix, standard TSO conventions apply.

### Disposition

The DISP value that you want the generated JCL to use for the output data set if it is already cataloged:

**OLD** Overwrites the data set contents with the new extract data.

**MOD** Appends the new extract data.

You must specify one of these dispositions regardless of whether the output data set is cataloged. If the output data set is not cataloged when CICS PA generates the JCL, then CICS PA generates the JCL using DISP=(NEW,CATLG) to catalog it.

### Delimiter

The field delimiter used to separate each data field in the extract records. The default is a semicolon (;).

CICS PA JCL generation translates this to DELIMIT('delimiter'). Note that the value is enclosed in quotes in this operand.

### Include Field Labels

Select (/) to include field labels as the first record written to the extract data set. This is the default. CICS PA JCL generation translates this to the LABELS operand.

Blank out the field if you do not want field labels written. CICS PA JCL generation translates this to the NOLABELS operand.

### Filter Criteria

To limit the types of CICS statistics intervals that CICS PA extracts, enter / next to the types you are interested in:

**EOD** End-of-day

**REQ** Requested

**USS** Unsolicited

**INT** Interval

**RRT** Requested reset

---

## Running Report Sets

To produce reports and extracts, submit them for batch processing by entering the RUN command (or SUBmit or JCL) in any of the following ways:

1. As a line action against a Report Set on the Report Sets list panel. See the example in Figure 153 on page 274. This runs the (saved) Report Set.
2. As a command or selecting **File->Run** in the action bar on the Edit/View Report Set panel. See the example in Figure 155 on page 276. This runs the

displayed (not saved) Report Set. That is, runs all the active reports in the active report categories, including any with the RUN line action.

3. As a line action against report categories or reports on the Edit/View Report Set panel. This runs the requested (not saved) report categories and reports.
  - The RUN line action against a report runs the report regardless of its Active status.
  - The RUN line action against a report category runs all active reports in the category regardless of the Active status of the category.
4. As a command or by selecting **File->Run** in the action bar on the individual Report panel. This runs the displayed (not saved) Report.

The **RUN** command (or **SUBmit** or **JCL**) triggers the display of the Run Report Set panel where you can specify run-time options. You can then elect to submit the job immediately (**SUBmit**) or edit the JCL before submit (**JCL**). See Figure 159 on page 286 for an example of the JCL Edit panel.

In the following example, the RUN line action is a request to run the DAILY Report Set. This will run the active reports in active categories with Global Options and any active Selection Criteria.

Figure 157. Run Report Set: setting run-time options

Before CICS PA generates the JCL, you are prompted to supply the following run-time options:

1. The systems to be reported. CICS PA allows you to specify System Selection twice; in the Report Set and here at run time. The Override System Selection option is provided to determine which specification will take precedence in the event of both being specified.
2. Whether to stop reading the SMF file as soon as the first record is encountered that is later than the **To** date and time, or to process all records through to EOF.
3. The date and time range of the SMF data that you want to process. If not specified, CICS PA processes the entire SMF Files. Note that CICS PA always honors any time ranges specified in your Report Selection Criteria, regardless of this setting.
4. Missing SMF Files Option that specifies the remedial action to be taken if you have not defined SMF Files for the systems to be reported.
5. Select to edit the JCL before submission.

You can choose to use either Personal or Shared System Definitions to select the SMF input data sets. Use **Systems** in the action bar to switch between Personal and Shared System Definitions.

The fields on the Run Report Set panel are:

#### System Selection

System Selection on this panel overrides the global System Selection and optionally the report-level specification. By specifying your systems here, CICS PA can proceed with JCL generation without you having to re-edit the Report Set.

Use System Selection to identify the systems you want this Report Set to analyze. They must be defined in System Definitions with the SMF files you want CICS PA to use for reporting. You can type in the system IDs, or

select them from a list by placing the cursor on the field and pressing **Prompt** (F4). To edit your System Definitions, link directly there by selecting **Systems** in the action bar, then on exit you are returned here.

You can specify four types of systems:

1. **CICS APPLID:** The CICS Generic APPLIDs you want reported. Specify either:
  - A unique APPLID.
  - An APPLID for a particular MVS Image. This identifies a particular CICS system when there are multiple CICS systems with the same APPLID.
  - An MVS Image. CICS PA will report on all APPLIDs running on this Image using the SMF files defined for the Image.
  - An APPLID and Image combination plus a Group. This is useful for uniquely identifying CICS systems when there are multiple systems of the same name defined.
  - A Group alone. CICS PA will report on all APPLID and Image combinations in the Group to produce a single consolidated report. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA generates the APPLID(applid1,applid2,applid3,...) and Input(SMFIN001,SMFIN002,SMFIN003,...) operands, and corresponding //SMFINnnn DD statements.

2. **DB2 SSID:** The DB2 Subsystem IDs. This is only used by the DB2 Report and Record Selection Extract. If the CICS APPLID Group contains the DB2 SSIDs, then it can be omitted.

CICS PA generates the SSID(ssid1,ssid2,ssid3,...) operands for the DB2 or RECSEL commands and the DD statements for the associated files.

3. **MQ SSID:** The MQ Subsystem IDs. This is only used by the WebSphere MQ Report and Record Selection Extract.

CICS PA generates the SSID(ssid1,ssid2,ssid3,...) operands for the MQ or RECSEL commands and the DD statements for the associated files.

4. **Logger:** The MVS System Logger. This is only used by the System Logger Report, System Logger Extract, and Record Selection Extract. If the CICS APPLID Group contains the System Loggers, then it can be omitted.

CICS PA generates the DD statements for the associated files.

For more information, see "System selection" on page 280.

### Override System Selections specified in Report Set

This specifies which System Selection specification will take precedence in the event that you have specified System Selection twice; both here at run time and in the Report Set.

- When the override option *is not* selected, the run-time System Selection overrides the Report Set Global options only. It does not override any System Selections specified in the individual reports within the Report Set.
- When the override option *is* selected, the run-time System Selection overrides all System Selections in the Report Set (Global Options and individual reports).

### Read SMF File to EOF

Select this option to force CICS PA to process all records in the SMF file through to EOF. Normally CICS PA stops reading the SMF file as soon as the first record is encountered that is later than the **To** time (SMFSTOP). However, if the file is not in ascending time sequence, reading might end before all records earlier than SMFSTOP have been found.

This option is only effective when the **To** time is specified. Select it when the SMF file has been presorted and you want to ensure that all records within the **From** and **To** time range are processed.

### Start Date/Time, Stop Date/Time

Specify a date/time range or a *time slot* (times only) to filter the SMF input data based on the SMF record time stamp. SMF records with a time stamp within the specified Start/Stop interval are processed by CICS PA, otherwise they are ignored.

#### Note:

1. Do not confuse this with the Selection Criteria From/To report intervals which apply to transaction start and stop times.
2. For the DB2 Report, specify a Stop Time that is at least 5 minutes outside the required time (From/To report interval) if protected threads are in use.

The Start/Stop date and time fields are all optional. They are blank initially (for no filtering), but thereafter display the reporting period that was previously saved.

**Date** is either a calendar date in your preferred format or a relative date. **Time** is a time-of-day. (The same edit rules apply as for the Selection Criteria Report Interval.)

Relative dates are specified as 0, -1, -2,... to signify a date relative to the current date. 0 represents today, -1 yesterday, -2 two days ago, and so on. If both Start and Stop dates are specified, they must be in the same format.

For a date/time range:

- Either From or To can be omitted to indicate that the range is open-ended.
  - If From is omitted, it defaults to the first input record
  - If To is omitted, it defaults to the end of file.
- If From date is specified with no time, the start of day is assumed.
  - If To date is specified with no time, the end of day is assumed.

For a time slot, both times must be present with no dates to signify the same time slot every day. The times can span midnight.

The specified date/time range is included in the generated JCL under the //SYSIN DD statement:

```
CICSPA SMFSTART(-nn|yyy/mm/dd,hh:mm:ss.th),  
        SMFSTOP(-nn|yyy/mm/dd,hh:mm:ss.th)
```

### Missing SMF Files Option

Use this option to control what CICS PA does when there is a problem with JCL generation due to Systems defined without SMF Files.

1. **Issue error message.** CICS PA will cancel JCL generation and report errors in a window titled Report Set JCL Generation Failure. This

window allows you to link to System Definitions and correct the file specifications. See Figure 158 on page 285 for an example.

2. **Leave DSN unresolved in JCL.** CICS PA will proceed with JCL generation creating DD statements with **DSN=<unresolved>** where the files are not known. Regardless of your JCL or SUB request, the JCL is edited to allow you to specify the DSNs before submission.
3. **Disregard offending reports.** CICS PA will proceed with JCL generation. Only reports whose Systems have files specified are included. All other reports are ignored. If there are no error-free reports, then a Report Set JCL Generation Failure message is issued.

#### Edit JCL before submit

Enter / to edit the JCL with command input before submitting the report request. This is the default if you used the **JCL** command to run the Report Set.

Editing JCL before submit will enable you to save the JCL in an external data set for automated job scheduling or ad hoc report requests.

If not selected, the JCL is generated and the job is submitted immediately. This is the default if you used the **SUBmit** command to run the Report Set.

If you used the **RUN** command to run the Report Set, the default setting is what you previously specified.

When the specification is complete, press Enter to proceed.

---

## Report Set JCL generation

At Report Set run time, CICS PA generates the required batch JCL, bringing together information from the following sources within the CICS PA dialog:

1. **Report Set.** The Report Set specifies the reports you want to run and their options.
2. **Report Forms.** When a report requests a Report Form, CICS PA looks for them in the Report Forms data set and constructs the applicable **FIELDS**, **BY**, and **LIMIT** report operands.
3. **Object Lists.** When a report specifies Selection Criteria, Object Lists can be used to identify a predefined list of object names. For example, Transaction IDs that belong to a particular application. CICS PA looks for them in the Object Lists data set and constructs the applicable **SELECT** report operands.
4. **System Definitions.** The System Definitions define the systems that can be reported and their associated SMF files. At run time or inside your Report Set, you must specify System Selection, that is, the systems to be reported. CICS PA matches the System Selection to your System Definitions. The following section describes how CICS PA interprets your System Selection and uses the System Definitions to satisfy your report request.

## System selection

System Selection specifies the systems (CICS APPLIDs, DB2 SSIDs, MQ SSIDs and System Logger systems) to be reported by the Report Set. CICS PA matches these specifications with your System Definitions and constructs the DD statements for the required SMF Files.

The System Selection can be specified:

1. In each report within the Report Set. This specification applies to this report only.

2. In the Global Options of the Report Set. This specification applies to all reports in the Report Set that do not have their own System Selection.
3. At run time. This overrides the Global Option and optionally the report-level specification.

The System Selection specification consists of three parts:

**System name**

The name of the system to be reported. When System name is specified, Image and Group are only used to further qualify the system. For example, report CICS system CICSP1 that runs on Image MVS1, not the one that runs on Image MVS2.

**Image** The MVS Image where the system(s) to be reported run. When specified on its own (without a System name), then all Systems running on the Image are reported. For example, report all CICS systems that run on Image MVS1.

**Group** The group of systems to be reported. When specified without System name, then all Systems defined to the Group are reported as a consolidated group. For example, report all Production MRO CICS systems.

The following sections explain how CICS PA interprets the various System Selections and which SMF files (defined in your System Definitions) are used to process the report requests.

## CICS system selection

Specifies the CICS system(s) to be reported.

**CICS APPLID**

Specifies the CICS system(s) to be reported.

If specified:

1. CICS PA looks for the first exact System Definition match. If found, the files for this CICS System Definition are used.
2. Otherwise, CICS PA looks for the first pattern System Definition match. If found, the files for this System Definition are used. For example, specifying CICSD1 will match CICS System Definition CICSD\*.
3. Otherwise, if the Image is specified, CICS PA looks for an Image System Definition match. If found, the files for the Image System Definition are used.
4. Otherwise, the CICS system is deemed to be undefined and you are prompted to correct your specification.

The APPLID operand identifies the specified CICS system. For example: APPLID(CICSD1).

If CICS APPLID is not specified, then Image or Group must be specified.

**Image** Specifies the MVS Image of the CICS systems to be reported.

1. If specified in conjunction with a CICS APPLID, then Image is only used to further qualify the CICS system to be reported.
2. If specified without a CICS APPLID, then CICS PA looks for an exact Image System Definition match. If found, the files for the Image System Definition are used and CICS PA will report against all APPLIDs with data in these files (by specifying the NOAPPLID operand).
3. Otherwise, the Image is deemed to be undefined and you are prompted to correct your specification.

**Group** Specifies the Group of the CICS system(s) to be reported.

1. If specified in conjunction with a CICS APPLID, then Group is only used to further qualify the CICS system to be reported.
2. If specified without a CICS APPLID, then CICS PA looks for an exact Group System Definition match. If found, the files for all systems in the Group are used and CICS PA will report against all APPLIDs in the Group. The APPLID operand identifies the CICS systems in the specified Group. For example: APPLID(CICSPT0R,CICSPA0R,CICSPF0R).
3. Otherwise, the Group is deemed to be undefined and you are prompted to correct your specification.

When the CICS System Selection specifies a Group, and the DB2 and Logger System Selections are not specified, then CICS PA will report against all DB2 subsystems and Loggers in this Group.

## **DB2 system selection**

Specifies the DB2 subsystem(s) to be reported by the DB2 report.

### **DB2 SSID**

Specifies the DB2 subsystem(s) to be reported by the DB2 reports.

If specified:

1. CICS PA looks for the first exact System Definition match. If found, the files for this DB2 System Definition are used.
2. Otherwise, CICS PA looks for the first pattern System Definition match. If found, the files for this DB2 System Definition are used. For example, specifying DB2P will match DB2 System Definition DB2\*.
3. Otherwise, if the Image is specified, CICS PA looks for an exact Image System Definition match. If found, the files for the Image System Definition are used.
4. Otherwise, the DB2 subsystem is deemed to be undefined and you are prompted to correct your specification.

The SSID operand of the DB2 report identifies the specified DB2 system. For example: DB2(SSID(DB2P),...).

**Image** Specifies the MVS Image of the DB2 subsystems to be reported.

1. If specified in conjunction with a DB2 subsystem ID, then Image is used to further qualify the DB2 subsystem to be reported.
2. If specified without a DB2 subsystem ID, then CICS PA looks for an exact Image System Definition match. If found, the files for the Image System Definition are used and CICS PA will report against all DB2 SSIDs used by the reported CICS systems.
3. Otherwise, the Image is deemed to be undefined and you are prompted to correct your specification.

**Group** Specifies the Group of the CICS system(s) to be reported.

1. If specified in conjunction with a DB2 SSID, then Group is only used to further qualify the DB2 subsystem to be reported.
2. If specified without a DB2 SSID, then CICS PA looks for an exact Group System Definition match. If found, all DB2 subsystems in the Group are reported.
3. Otherwise, the Group is deemed to be undefined and you are prompted to correct your specification.

The SSID operand of the DB2 report identifies the DB2 systems in the group. For example: DB2(SSID(DB2A,DB2B),...).

If you do not specify DB2 System Selection:

1. If your CICS System Selection specifies a Group that contains DB2 systems, then CICS PA will report against all DB2 systems in the Group.
2. Otherwise, the SSID operand is omitted and CICS PA assumes that the DB2 data is contained in the CICS system files and reports against all DB2 subsystems used by the CICS systems.

## **MQ system selection**

Specifies the MQ subsystem(s) to be reported by the WebSphere MQ report.

### **MQ SSID**

Specifies the MQ subsystem(s) to be reported by the WebSphere MQ reports.

If specified:

1. CICS PA looks for the first exact System Definition match. If found, the files for this MQ System Definition are used.
2. Otherwise, CICS PA looks for the first pattern System Definition match. If found, the files for this MQ System Definition are used. For example, specifying MQSX will match MQ System Definition MQ\*.
3. Otherwise, if the Image is specified, CICS PA looks for an exact Image System Definition match. If found, the files for the Image System Definition are used.
4. Otherwise, the MQ subsystem is deemed to be undefined and you are prompted to correct your specification.

The SSID operand of the WebSphere MQ report identifies the specified MQ system. For example: MQ(SSID(MQSX),...).

**Image** Specifies the MVS Image of the MQ subsystems to be reported.

1. If specified in conjunction with a MQ subsystem ID, then Image is used to further qualify the MQ subsystem to be reported.
2. If specified without a MQ subsystem ID, then CICS PA looks for an exact Image System Definition match. If found, the files for the Image System Definition are used and CICS PA will report against all MQ SSIDs used by the reported CICS systems.
3. Otherwise, the Image is deemed to be undefined and you are prompted to correct your specification.

**Group** Specifies the Group of the CICS system(s) to be reported.

1. If specified in conjunction with a MQ SSID, then Group is only used to further qualify the MQ subsystem to be reported.
2. If specified without a MQ SSID, then CICS PA looks for an exact Group System Definition match. If found, all MQ subsystems in the Group are reported.
3. Otherwise, the Group is deemed to be undefined and you are prompted to correct your specification.

The SSID operand of the WebSphere MQ report identifies the MQ systems in the group. For example: MQ(SSID(MQSX,MQSZ),...).

If you do not specify MQ System Selection:

1. If your global CICS System Selection specifies a Group that contains MQ systems, then CICS PA will report against all MQ systems in the Group.
2. Otherwise, you are prompted to specify your MQ System Selection.

### **Logger system selection**

Specifies the Logger system(s) to be reported by the System Logger report.

#### **Logger**

Specifies the Logger system(s) to be reported.

If specified:

1. CICS PA looks for the first exact Logger System Definition match. If found, the files for this Logger System Definition are used.
2. Otherwise, CICS PA looks for the first pattern Logger System Definition match. If found, the files for this Logger System Definition are used.
3. Otherwise, if the Image is specified, CICS PA looks for an exact Image System Definition match. If found, the files for the Image System Definition are used.
4. Otherwise, the Logger system is deemed to be undefined and you are prompted to correct your specification.

If Logger is not specified, then Image or Group must be specified.

**Image** Specifies the MVS Image of the Logger systems to be reported.

1. If specified in conjunction with a Logger system name, then Image is only used to further qualify the Logger system to be reported.
2. If specified without a Logger system name, then CICS PA looks for an exact Image System Definition match. If found, the files for the Image System Definition are used and CICS PA will report against all Logger systems with data in the SMF files.
3. Otherwise, the Image is deemed to be undefined and you are prompted to correct your specification.

**Group** Specifies the Group of the Logger system(s) to be reported.

1. If specified in conjunction with a Logger system name, then Group is only used to further qualify the Logger system to be reported.
2. If specified without a Logger system name, then CICS PA looks for an exact Group System Definition match. If found, all Logger systems in the Group are reported.
3. Otherwise, the Group is deemed to be undefined and you are prompted to correct your specification.

If you do not specify Logger System Selection:

1. If your CICS System Selection specifies a Group that contains Logger systems, then CICS PA will report against all Logger systems in the Group.
2. Otherwise, you are prompted to specify your Logger System Selection.

## **Report Set JCL generation failure**

This panel is displayed when CICS PA is unable to proceed with JCL generation because systems to be reported are either not defined or have no SMF Files. The error messages detail the reasons and the report or extract which has the problem.

```
----- Report Set JCL Generation Failure -----  
  
Command ==> _____  
  
Report Set JCL generation failed with the following error:  
  
CPA1029E Report Set JCL generation failed. System or Group  
        has no SMF files  
CPA1030E System=CICSR2, Report=Record Selection Extract,  
        Output=CICSR2.RECSEL.EXTRACT  
  
Press Enter to edit System Definitions where you can correct  
the error that caused Report Set JCL generation to fail.  
  
Use Exit or Cancel to return.  
  
F1=Help    F3=Exit    F12=Cancel
```

*Figure 158. Report Set JCL generation failure*

To correct the System Definitions details, press Enter to link directly there. Alternatively, to correct the Report Set details, use Exit or Cancel.

This error panel can be avoided by selecting another **Missing SMF Files Option** on the Run Report Set panel.

## Report Set JCL

If you requested to edit the JCL, it is displayed in an ISPF edit session when Report Set JCL generation is complete.

You can modify the JCL and command input as required. You also have the option here to use the Edit **CREATE** command to store the JCL and command deck in your jobs library for later modification and submission independently of the Report Set.

To submit the job from the JCL Edit panel, enter **SUBmit** on the command line.

```

Figure 159. Submitting from JCL Edit

## Processing the output

View or print the generated reports using your normal facilities such as **SDSF** or ISPF option 3.8 **Outlist Utility**.

Process the extract data sets using a method appropriate to each. For example:

- Analyze the Cross-System Work Extract data using CICS PA Performance Reports such as the List, Summary, and Totals reports.
- Analyze the Performance Data Extract data using external programs such as DB2 or PC tools such as Lotus 1-2-3.
- Specify the Record Selection Extract data sets as your SMF Files in System Definitions to make your CICS PA reporting more efficient.

---

## Chapter 9. Report Forms

Report Forms can be used to tailor the format and content of CICS PA reports and extracts. Specifying a Report Form extract is optional. If a Form is not specified, the report or extract is produced using the default format.

There are three report types. Each has different default settings, allowed values, and special requirements. The form types, applicable reports and extracts, and characteristics of each form type are:

- LIST** Can be used for:
- Performance List report
  - Transaction Tracking List report
  - Cross-System Work Extended report
  - Performance Data extract
  - List HDB reports
  - Performance Alert list reporting

The Form defines:

- Report titles
- Column headings and content
- Selection Criteria
- Performance Alert fields and severity levels

The default format of the LIST Report Form is shown in Figure 164 on page 301.

- LISTX** Can be used for:
- Performance List Extended report
  - Cross-System Work Extended report (sort sequence and limit ignored)
  - Performance Data extract (sort sequence and limit ignored)

The Form defines:

- Report titles
- Column headings and content
- Sort sequence (defined by up to three fields)
- Key limit count
- Selection Criteria

The default format of the LISTX Report Form is shown in Figure 166 on page 309.

### **SUMMARY**

- Can be used for:
- Performance Summary report
  - Performance Data extract
  - Transaction Profiling report
  - Transaction Tracking Summary report
  - Summary HDB reports
  - Performance Alert summary reporting

The Form defines:

- Report titles
- Column headings and content
- Up to 8 key fields to summarize by
- Sort sequence
- Alternate sequencing on a numeric field (optional)

- Selection Criteria
- Performance Alert fields and severity levels

The default format of the SUMMARY Report Form is shown in Figure 168 on page 314.

## Maintaining Report Forms

To display the list of Report Forms in the current Report Forms data set, select option 3 **Report Forms** from the CICS PA Primary Option Menu.

**Tip:** To set or change the current Report Forms data set, use the **Options** menu on the action bar or enter **CDS** from the command line.

```

Figure 160. Report Forms

From the list of Report Forms, you can select one at a time to view or modify, or you can create new Report Forms.

You can also add a selection of sample Report Forms by selecting **Samples** in the action bar or entering the **SAMPLES** command. See “Sample Report Forms” on page 290.

The Report Forms are listed with the following user-defined attributes:

**Name** 1-8 character name in ISPF member name format, used to uniquely identify the Report Form within the Report Forms data set. By default, the panel is sorted on the Name field.

**Type** The type of Report Form, either LIST, LISTX or SUMMARY.

### Description

Free format text up to 32 characters that describes the contents and purpose of the Report Form.

### Line Actions:

- /** Display the menu of line actions.
- E** Edit the Report Form.
- S** Select the Report Form (same as Edit).
- V** View the Report Form. This looks like the Edit panel but has no 'hold' on the data and has no Save capability. SAVEAS is available.
- D** Delete the Report Form.
- R** Rename the Report Form.

J        Run the report from the Report Form.

**Primary Commands:** The following primary commands are valid for this panel:

**NEW name type**

This command creates a new Report Form with the specified name. The type is either:

**LIST**    List Report Form

**LISTX or LX**

          List Extended Report Form

**SUMMARY**

          Summary Report Form

**MODEL**

          Model on an existing Report Form

**MODELT**

          Model on an existing HDB Template

It displays the New Report Form window populated with values from your entered command or from the last Report Form you created, and prompts you for further details to define the new Report Form.

Also available from **File** in the action bar or **F6**.

See “Creating new Report Forms” on page 297 for information on how to proceed.

**SELECT name**

This command (or **S**) selects the specified Report Form for editing. If the Report Form does not exist, it is created as if the **NEW** command was used.

Also available from **File** in the action bar.

**SORT Name | Type | Description | Changed | Id**

This command sorts the list of Report Forms on one or two columns. The default sort field is **Name**. The sort disregards upper and lower case, and is ascending for all but the Changed column which is descending. The sort order is retained only until Exit or another **SORT** command is issued.

**LOCATE string**

This command (or **L** or **LOC**) is used to locate an entry in the list based on the primary sort field. By default, **LOCATE** operates on the **Name** field.

The string should be no longer than the primary sort field and not enclosed in quotes. The display will scroll to the entry which matches the string, or the entry preceding it if an exact match is not found.

**CONFIRM ON | OFF**

**CONFIRM ON** (or **CONFIRM**) instructs CICS PA to prompt for confirmation when you request to Delete a Report Form.

With **CONFIRM OFF**, Delete requests are actioned immediately. Deleted Report Forms cannot be reinstated.

This command changes the setting only for the current invocation of the Report Forms panel. On exit, it reverts to the default set by **Delete Confirmation** in CICS PA Settings.

Also available from **Confirm** in the action bar.

**SAMPLES**

This command displays the list of Sample Report Forms. You can select one or more Forms from the list to populate your Report Forms data set.

Also available from **Samples** in the action bar.

### FIND string

This command (or F) looks for the specified character string in all columns of displayed data. The string is not case sensitive. The display scrolls to the row where the string is found and positions the cursor on the matching data.

To find more occurrences, press **RFIND** (F5). If there is no match but the search did not begin at the start of the list, the screen does not change and the message \*Bottom of data reached\* is displayed. Press **RFIND** (F5) to search from the top. If there is no match in the entire list, the screen does not change and a String not found message is displayed.

## Sample Report Forms

A set of sample Report Forms is provided with CICS PA (see Table 6 on page 291). They demonstrate how CICS PA reports can be tailored to reflect the many ways you use and configure your CICS systems. The CICS PA reports and extracts produced using these sample Report Forms will provide a detailed picture of the many aspects affecting CICS system performance.

To add the samples to your Report Forms data set, select **Samples** in the action bar of the Report Forms panel. This lists the sample Report Forms that are available for selection.

Sample Report Forms

Command ==> \_\_\_\_\_ Scroll ==> PAGE

Select one or more sample Report Forms then press EXIT.

Figure 161. Select Sample Report Forms

The sample Report Forms can be added to your Report Forms data set at any time regardless of its current contents. A sample Report Form will not be available for selection if a Report Form of the same name already exists. When you add a sample Report Form to your Report Forms data set, its **Changed** value is set to *yyyy/mm/dd 00:00* (identifying the date when the current set of sample Report Forms was packaged) and its **ID** value is set to **CICSPA**.

- Enter line action **S** (or any non-blank character) to select one or more samples.

- Enter **S \*** on the command line to select all the samples.
- Enter the **RESet** command to clear all line actions.
- Press **Exit** (F3) to complete your selection.
- Use **FIND** and **RFIND** (F5) to search for a character string in any column.

## Available Sample Report Forms

The full selection list of sample Report Forms is shown in the following table.

## Creating new Report Forms

You can create a new Report Form in either of the following ways:

- In the command line, enter **NEW** followed by the name of the new Report Form and initialization details using the following syntax:

```

➤➤—NEW—newname—LIST_____
                        LISTX|LX_____
                        SUMMARY_____
                        MODEL_____
                        MODELX_____

```

- Select **File** from the action bar, then choose **New**.
- Press **New** (F6).

A pop-up dialog window is displayed as shown in Figure 162. This is always displayed to allow you to initially populate your Report Form with fields for a particular CICS System (including any user fields), Version (VRM), or fields in selected categories. Alternatively, you can model the new Report Form on an existing Report Form or HDB Template.

File Systems Options Help

---

New Report Form

Command ==>

Specify new Report Form options.

Name . . . LIST2\_\_ Version (VRM) . . . \_\_ +

System Selection:                      Field Categories:

APPLID . . . . CICS1\_\_ + \_ Select to specify Field Categories

MVS Image . . . \_\_\_\_\_

Form Type or Model:

— 1. List                                      4. Model (Report Form)

   2. List Extended (Sorted)              5. Model (HDB Template)

   3. Summary

Model . . . . . LIST1\_\_ +

Report Forms Data Set . . 'xxxx.CICSPA.FORM' \_\_\_\_\_ +

Repository . . . . . 'CICSPA.XYX.REPOSTRY' \_\_\_\_\_ +

Figure 162. Specifying a New Report Form

This panel prompts you for details of the new Report Form.

The options are:

**Name** The name of the new Report Form. A 1-8 character name in ISPF member name format. The name must be unique within the Report Forms data set.

#### **APPLID, Image, Version (VRM)**

Specify the CICS System or CICS Version (VRM) that this Report Form applies to.

- If you specify the CICS System (APPLID, or APPLID and MVS Image), CICS PA can extract the associated (active) Dictionary entries for that CICS system, including any user fields. If not specified, CICS PA will assume the default Form, and user fields will not be available.

The CICS system must be defined in System Definitions, either Personal or Shared depending on your current setting. To select one from a list, use **Prompt** (F4). To link directly to System Definitions or switch between Personal and Shared Systems, use **Systems** in the action bar.

- Alternatively, if you specify the VRM, CICS PA uses it to populate the Form with fields applicable to that release of CICS. The supported releases are:

<b>640</b>	CICS Transaction Server for z/OS Version 3 Release 1
<b>650</b>	CICS Transaction Server for z/OS Version 3 Release 2
<b>660</b>	CICS Transaction Server for z/OS Version 4 Release 1
<b>670</b>	CICS Transaction Server for z/OS Version 4 Release 2
<b>680</b>	CICS Transaction Server for z/OS Version 5 Release 1

If a CICS system (APPLID/Image) is specified and a VRM can be derived from the MCT load library or SDFHLOAD library, then that VRM is used. If a VRM cannot be derived from the system definition then the VRM value specified in this panel is used.

If you do not specify either a CICS System or a VRM, then CICS PA populates the Form with fields applicable to the latest supported release of CICS.

#### **Field Categories**

Enter / (or press **F11**) to display the selection list of field categories that you can use to initially populate your new Report Form. For example, you can initialize your Form with Task and Terminal Control fields by selecting DFHTASK and DFHTERM from the list. The default is all categories except CROSSYS, DBCTL, and OMCICS.

Within the selected categories, the fields added to your Report Form depend on the specified CICS APPLID or VRM. If APPLID is specified, CICS PA obtains the fields from the CMF Dictionary for that APPLID. Otherwise the VRM is used. If APPLID and VRM are not specified, the default is **680**.

See Figure 163 on page 299 for an example of the Field Categories selection list.

#### **Form Type or Model**

Select the type of Report Form or model which dictates how the new Form is to be initialized (such as the fields, order, sort sequence). Type is important since a Form can only be used by reports and extracts of compatible type:

1. **List** Can be used for:
  - Performance List report
  - Cross-System Work report
  - Performance Data extract
  - List HDB reports

## 2. List Extended (Sorted)

Can be used for:

- Performance List Extended report
- Cross-System Work report (sort sequence and limit ignored)
- Performance Data extract (sort sequence and limit ignored)

## 3. Summary

Can be used for:

- Performance Summary report
- Transaction Profiling report
- Performance Data extract
- Summary HDB reports

Alternatively, you can select **Model** to create a new Report Form modelled on an existing Report Form or HDB Template.

## 4. Model (Report Form)

If the new Report Form is to be modelled on an existing one, specify the name of the model Report Form and data set where it is stored. **Prompt** (F4) is available for both the Report Form data set name and the Report Form member name.

## 5. Model (HDB Template)

If the new Report Form is to be modelled on an existing HDB Template, specify the name of the model HDB Template and Repository where it is stored. **Prompt** (F4) is available for both the Repository data set name and the HDB Template name.

For HDB reporting and extract to CSV, it is useful to model a Report Form on an HDB Template. This ensures that the fields requested in the Form match the fields collected in the HDB.

When you have specified all required details, press Enter to create the Report Form.

## Select field categories

To display the list of available CICS field categories, enter / to select Field Categories or press **F11** from the New Report Form panel.

Select Field Categories

Command ==>>> \_\_\_\_\_

CMF Groups:

- DFHAPPL - Application naming

- DFHBTS - BTS

- DFHCHNL - CHANNEL option

/ DFHCICS - CICS task information

- DFHDATA - Data processing

- DFHDEST - Transient Data

- DFHDOCH - Document Handler

- DFHEJBS - EJB Server

- DFHFEP1 - Front End (FEPI)

- DFHFILE - File Control

- DFHJOUR - Journal

- DFHMAPP - BMS Maps

/ DFHPROG - Program Control

- DFHRMI - Resource Manager (RMI)

- DFHSOCK - Secure Sockets

/ DFHSTOR - Storage Control

- DFHSYNC - Syncpoint processing

/ DFHTASK - Task Control

- DFHTEMP - Temporary Storage

/ DFHTERM - Terminal Control

- DFHWEBB - Web Interface

Region Type:

- AOR - Application-owning

- FOR - File-owning

- TOR - Terminal-owning

- DB2 - AOR with DB2

User Fields:

- DBCTL - IMS DBCTL

- CROSSYS - Cross-System

- OMCICS - OMEGAMON

Figure 163. Select field categories

This panel displays the field categories that you can select to populate a new Report Form. The categories reflect the various ways of using and configuring your CICS systems. You can choose just the ones that you require for your reporting needs. Only categories applicable to the specified CICS version are available for selection. If not specified, **680** is assumed.

Enter **/** to select one or more field categories, then press **Next** (F11) or **Exit** (F3). The fields in the selected categories, and relevant to the specified CICS version, will appear in the new Report Form.

Selecting no categories has the same effect as selecting all categories except DBCTL, CROSSYS, and OMCICS.

To limit the Report Form to fields that are relevant to particular types of CICS region (such as application-owning regions), select one or more region type. Selecting a region type excludes from the Report Form any fields that are not relevant to that region type, as defined in the sample monitoring control tables provided by CICS (in sample library SDFHSAMP members DFHMCTx\$).

***Primary Commands:*** The following primary commands are valid for this panel:

**SELECT**

This command selects all field categories.

**RESET**

This command (or **RES**) resets all field categories by clearing the selection line actions.

---

## Specifying Report Form contents

The Report Form **Edit** panel is displayed when, from the Report Forms panel, you do either of the following:

- Create a new Report Form.  
Use the **NEW** command, select **File->New** in the action bar, or press **New** (F6). Specify the new Report Form options then press Enter.
- Select an existing Report Form.  
Enter line action **E** or **S** against a Report Form, or use the **SELECT** command.

Alternatively, you can enter line action **V** to display the Report Form View panel. Viewing a Report Form works in every way like Edit except there is no exclusive hold on the data and changes cannot be saved. However you can use **SAVEAS**.

There are three different Report Form panels because the contents and processing differs slightly for the different Report Form types: **LIST**, **LISTX**, and **SUMMARY**. However, most of their operation is similar.

---

## LIST Report Form

The LIST Report Form can be used to tailor the format and content of the following reports and extracts:

- Performance List report
- Cross-System Work report
- Performance Data extract
- List HDB reports

The Report Form defines the fields to be included, the order of the columns, and a title for the report.

The Report Form panel has two views as there are too many columns of information to display in a single screen view. When you select a Report Form to Edit or View, the view shown in Figure 164 is displayed by default.

The LIST Report Form consists of the following:

### Form Description

Up to 32 characters of text to describe the purpose of the Report Form. This description is shown on the Report Forms panel to help you identify the Forms in the list. It is initially set to **List Report Form**.

### Version (VRM)

This identifies the CICS release that this Report Form was created for. It determines which CMF fields are available for selection in this Report Form.

### Selection Criteria

Optionally, you can specify Selection Criteria to filter the data on time periods and field values to restrict the reporting to only the data that is of interest to you.

When a report specifies a Report Form and both have Selection Criteria specified, records must match both criteria to be included in the report.

**Line Actions:** The available line actions are:

- /** Display the selection list of line actions.
- S** Select (edit) the Selection Criteria. See "Specifying Selection Criteria" on page 156 for information on specifying Selection Criteria.
- A** Activate the Selection Criteria so they are included for reporting. Selection Criteria can only be activated if you have specified at least one Select Statement and it is not excluded. An asterisk \* indicates they are active.

- D** Deactivate the Selection Criteria. Any you might have specified here will not be used in reporting.

#### **Page Width**

Page width of the report, in the range 80 to 8000. The default is **132**.

When you increase the page width, you can include more fields in the report. Move EOR down the list or move fields above EOR to include the fields of interest. CICS PA automatically adjusts the EOR marker when the fields overflow the page width.

When you view the report output (using SDSF), scroll right to see the additional fields. Note that when you print the report, data that exceeds the maximum printer page width is truncated.

**Title** Title of the report. Specify up to 128 characters of text to describe the report. CICS PA concatenates the two lines of 64 exactly as entered to make one line which prints at the top of each page of the report below the heading. The default is blank (no title).

If the report uses a Report Form, and a title is specified on both, the title on the report takes precedence.

This option generates the TITLE1('left-half') and TITLE2('right-half') operands.

The title is ignored for extracts.

#### **Field rows**

One row for each field. The order of the fields in the Report Form dictates the order of the columns in the report or extract. The fields have the following attributes: Field Name, Type (clock and time stamp fields only), Description, Length, Dictionary Definition, User Field Offset and Length (character user fields only).

#### **Field Name**

One of the following:

- The CICS PA field name. For CICS CMF fields, this is usually the Informal name or similar. The names for user fields are derived from the MCT. Use line action **S** or **Prompt** (F4) to select from a list of fields applicable to this Form type and CICS version.
- The Application Group name. For details, see Chapter 11, "Application Grouping," on page 331.

Type an Application Group name in the Field Name column and **APG** in the Type column, and then press Enter. Otherwise, if you press Enter without APG in the Type column, the panel attempts to interpret the Application Group name as a CMF data field.

When you add an Application Group to a Report Form, CICS PA adjusts the EOR marker to allow for the maximum width of an Application name (32 characters). However, when producing a report, CICS PA adjusts the Application Group column width to fit the longest Application name in the report.

Application Groups are stored in a repository. Report Forms are independent of repositories, so the panel does not validate the Application Group name.

- The special entry **EOR**.

EOR is managed by CICS PA. It signals the end of the report line. The fields listed above EOR fit on the report line and are included in the

report in the same order as they appear in the list. Those below EOR will not be reported and are ignored.

CICS PA automatically sets EOR when the Report Form is created and resets it if necessary when the Form is changed to ensure that the maximum page width of 132 is not exceeded. In positioning EOR, CICS PA allows for one blank separator between each field.

To produce a report line shorter than 132, either move EOR towards the top of the Form, delete unwanted fields, or move them below EOR.

- The special entry **EOX**.

EOX signals the end of the extract record. There are no restrictions on record length so EOX can be positioned anywhere in the list. EOX is initially positioned just below EOR. Fields above EOX are included in the extract, those below EOX are ignored. If EOX is not specified, EOR is used.

### Format Type

Either:

- The value **APG**, indicating that the Field Name refers to the name of an Application Group

or

- The presentation format of the field.

For numeric (A) fields, optionally specify one of the following:

**K** Divide value by 1000, typically for count fields.

**M** Divide value by 1000000, typically for count fields.

**KB** Kilobytes (divide by 1024), typically for storage fields.

**MB** Megabytes (divide by 1024x1024), typically for storage fields.

For clock (S) fields, you must specify either:

**TIME** Accumulation of elapsed time in seconds with requested precision of 0.0001 to 0.000001. Default: TIME with PRECISION(4).

### COUNT

Number of occurrences of the condition.

For time (T) fields START and STOP, you must specify one of:

### **TIMET**

Time in the format *hh:mm:ss.thm* (default)

### **TIMEM**

Time in the format *hh:mm*

### **TIMES**

Time in the format *hh:mm:ss*

### **TIMEP**

Time in one of the following formats, according to the requested precision:

**4 (default)**

*hh:mm:ss.thmi*

**5** *hh:mm:ss.thmij*

**6** *hh:mm:ss.thmiju*

**DATE** Date in the format *mm/dd/yyyy*

### **DATEISO**

Date in the format *yyyy-mm-dd*

### **DATEM**

Date in the format *mm/dd*

### **DATEYR**

Date in the format *mm/dd/yy*

**Fn (Function)**

Field function. Specify **SEV** to indicate that the field is an alert reporting field. That is, the report column will contain the alert severity level when an alert is detected in this transaction field, otherwise this column will contain blanks.

**Note:**

1. SEV is only valid for CMF Clock (type S), Count (type A), and CICS PA derived (type D) fields.
2. If a SEV field is defined in the Form but not in the alert definition, it will always be blank in the report.
3. If an alert field is defined in the alert definition but there is no equivalent SEV field in the Form, no threshold checking will be performed for that field.
4. Report Forms created before the introduction of Performance Alerts are automatically upgraded to include Fn (function). This occurs automatically when the Form is edited using the CICS PA dialog.

Figure 164 on page 301 shows that alerts for fields RESPONSE and CPU(TIME) will be reported in the respective columns in the report.

**Field Description**

This is a short description of the field. Enter line action **H** (Help) to see a more detailed description. See Figure 77 on page 164 for an example of the help details displayed in a pop-up window.

**Length**

The length of the field in the report or extract. This is used to calculate the width of the print line.

**Dictionary Definition**

The description of the CMF data field in the format *informalname owner xnnn* where:

- *informalname* is the CMF field name
- *owner* is the CICS component that 'owns' the field
- *x* indicates the data type:
  - A - 32- or 64-bit count
  - C - character string
  - D - CICS PA derived time
  - P - packed decimal number
  - S - clock (time-count)
  - T - STCK time stamp
  - X - CICS PA calculated count
- *nnn* is the field identifier

Some special fields, such as APPLID and RESPONSE, are not defined in the CMF Dictionary and are given an owner of 'CICSPA'. They are either derived from the fixed section of the CMF record (for example, APPLID), or calculated from two or more other CMF fields (for example, RESPONSE).

**User Field Offset and Length**

This is used for character user fields when only part of the field is to be reported. **Offset** is the position of the first character and **Length** is the number of characters from this position to be reported. For example, if the user field contains the value ABCDEFG, then specifying offset 1 and length

4 gives the output ABCD. Both values are required for character user fields and default to the entire field (offset 1 and maximum length).

CICS PA JCL generation translates these values to  
FIELDS(Character(SUBSTR(offset,length),...

**Line Actions:** The following line actions are valid on this panel:

- /** Display the menu of line actions.
- S** Select a field name from a list of all CMF fields appropriate to the type of Report Form and CICS release. See "Performance field selection" on page 308 for an example of the field selection panel.
- I** Insert a blank row after this row for entry or selection of another field.
- R** Repeat this row.
- RR** Repeat a block of rows bounded by two RRs.
- C** Copy this row.
- CC** Copy a block of rows bounded by two CCs.
- M** Move this row.
- MM** Move a block of rows bounded by two MMs.
- A** Move/Copy after this row.
- B** Move/Copy before this row.
- D** Delete this row.
- DD** Delete a block of rows bounded by two DDs.
- H** Field Help. Display a detailed explanation of the field. This is the same field selection panel displayed by line action **S**: see the example in Figure 77 on page 164.

**Note:**

1. Line operations can span the EOR and EOX rows. CICS PA will reset EOR after the operation has completed to ensure the page width is not exceeded. Only one EOR and one EOX is retained, that closest to the top of the list. If EOX is deleted, EOR is assumed to define the length of the extract.
2. Fields can appear more than once in a Report Form with different types specified. For example: FCWAIT(TIME), FCWAIT(COUNT).
3. Deleted user fields (LIST and SUMMARY Forms) cannot be recovered.

**Primary Commands:** The following primary commands are valid for the LIST, LISTX, and SUMMARY Report Form panels:

**FIND string**

This command (or **F**) looks for the specified character string in all columns of displayed data. The string is not case sensitive. The display scrolls to the row where the string is found and positions the cursor on the matching data.

To find more occurrences, use **F5** or the **RFIND** command repeatedly.

If there is no match but the search did not begin at the start of the list, the screen does not change and the message \*Bottom of data reached\* is

displayed. Use **F5** or **RFIND** to search from the top. If there is no match in the entire list, the screen does not change and a String not found message is displayed.

#### **RUN or JCL**

Specify run-time options before submitting the Report Form JCL.

**SAVE** This command is only available from Edit mode and saves any changes you have made. To save any changes made in View mode, use **SAVEAS**.

Also available from **File** in the action bar.

#### **SAVEAS formname | datasetname(formname)**

This command is available from both Edit and View mode to save the contents of this Report Form under another name, either in the current data set (assumed if no data set name is provided) or in another suitable data set (if the name of a valid PDS is provided).

Also available from **File** in the action bar.

#### **RESET**

This command (or **RES**) removes all outstanding line actions and deletes any blank rows.

Also available from **Edit** in the action bar.

#### **CONFIRM ON | OFF**

**CONFIRM ON** (or **CONFIRM**) instructs CICS PA to prompt for confirmation when you request to Cancel from the Report Form panel when there have been updates.

With **CONFIRM OFF**, Cancel requests are actioned immediately, discarding any changes.

This command changes the setting only for the current Edit/View session. On exit, it reverts to the value set by **Cancel Confirmation** in CICS PA Settings.

Also available from **Confirm** in the action bar.

#### **UPGRADE vrm**

This command is used to upgrade the Report Form to the specified CICS version (vrm) provided it is a later release. CMF Fields for all CICS releases after the current release and up to the specified release are added to the bottom of the Form.

Also available from **Upgrade** in the action bar.

## **Upgrading Report Forms**

Report Forms are release-dependent. When you define a new Report Form you specify the CICS System or CICS Version (VRM) so that CICS PA can initialize the Form with fields appropriate to that release. However, you can later upgrade the Report Form to a later release by using **Upgrade** in the action bar of the Report Form panels. This facility is available for all Report Form types.

- \*. Upgrade to CICS version 640
- 2. Upgrade to CICS version 650
- 3. Upgrade to CICS version 660
- 4. Upgrade to CICS version 670
- 5. Upgrade to CICS version 680

Figure 165. Upgrading your Report Form

Select **Upgrade** in the action bar or enter the **UPGRADE** command to introduce the new CMF fields of a later release of CICS into your Report Form. The new fields are inserted at the bottom of the Form as candidate fields. Upgrading does not affect the fields currently in the Form, nor does it affect the format of reports or extracts that use this Form. To then incorporate a new field into your report or extract, move it above the EOR or EOX marker respectively.

You can upgrade your Report Form to a CICS Version (VRM) that is not marked by an asterisk \*. To do this, select the VRM and press Enter. Otherwise, press Cancel to retain the Report Form at the current level.

## Performance field selection

Performance Field Selection allows you to select a field name from a list of available fields for insertion into your Report Form. This is the same facility as that used when specifying Selection Criteria. For more information, see:

- "Field selection" on page 162
- "Select a field" on page 162
- "Performance field help" on page 164

---

## LISTX Report Form

The LISTX Report Form can be used to tailor the format and content of the following reports and extracts:

- Performance List Extended report
- Cross-System Work report
- Performance Data extract

The Report Form defines the fields to be included, the order of the columns, sort sequence, and a title for the report.

The Report Form panel has two views as there are too many columns of information to display in a single screen view. Scroll **Right** (F11) to toggle between the views.

When you select to Edit or View a Report Form, the first view shown in Figure 166 on page 309 is displayed by default.

Figure 166. LISTX Report Form (with Default Form)

The LISTX Report Form consists of the following:

#### Form Description

Up to 32 characters of text to describe the purpose of the Report Form.

This description is shown on the Report Forms panel to help you identify the Forms in the list. It is initially set to **List Extended Report Form**.

#### **Version (VRM)**

This identifies the CICS release that this Report Form was created for. It determines which CMF fields are available for selection in this Report Form.

#### **Selection Criteria**

Optionally, you can specify Selection Criteria to filter the data on time periods and field values to restrict the reporting to only the data that is of interest to you.

When a report specifies a Report Form and both have Selection Criteria specified, records must match both criteria to be included in the report.

**Line Actions:** The available line actions are:

- /** Display the selection list of line actions.
- S** Select (edit) the Selection Criteria. See "Specifying Selection Criteria" on page 156 for information on specifying Selection Criteria.
- A** Activate the Selection Criteria so they are included for reporting. Selection Criteria can only be activated if you have specified at least one Select Statement and it is not excluded. An asterisk \* indicates they are active.
- D** Deactivate the Selection Criteria. Any you might have specified here will not be used in reporting.

#### **Page Width**

Page width of the report, in the range 80 to 8000. The default is **132**.

When you increase the page width, you can include more fields in the report. Move EOR down the list or move fields above EOR to include the fields of interest. CICS PA automatically adjusts the EOR marker when the fields overflow the page width.

When you view the report output (using SDSF), scroll right to see the additional fields. Note that when you print the report, data that exceeds the maximum printer page width is truncated.

**Title** Title of the report. Specify up to 128 characters of text to describe the report. CICS PA concatenates the two lines of 64 exactly as entered to make one line which prints at the top of each page of the report below the heading. The default is blank (no title).

If the report uses a Report Form, and a title is specified on both, the title on the report takes precedence.

This option generates the TITLE1('left-half') and TITLE2('right-half') operands.

The title is ignored for extracts.

#### **Field rows**

One row for each field. The order of the fields in the rows dictates the order of the columns in the report or extract. The fields have the following attributes: Name, Sort Sequence (only certain fields), Type (only clock and time stamp fields), Limit (only one of the sort fields), Description, Length, Dictionary Definition.

## Field Name

One of the following:

- The CICS PA field name. For CICS CMF fields, this is usually the Informal name or similar. The names for user fields are derived from the MCT. Use line action **S** or **Prompt** (F4) to select from a list of fields applicable to this Form type and CICS version.
- The Application Group name. For details, see Chapter 11, “Application Grouping,” on page 331.

Type an Application Group name in the Field Name column and **APG** in the Type column, and then press Enter. Otherwise, if you press Enter without APG in the Type column, the panel attempts to interpret the Application Group name as a CMF data field.

When you add an Application Group to a Report Form, CICS PA adjusts the EOR marker to allow for the maximum width of an Application name (32 characters). However, when producing a report, CICS PA adjusts the Application Group column width to fit the longest Application name in the report.

Application Groups are stored in a repository. Report Forms are independent of repositories, so the panel does not validate the Application Group name.

- The special entry **EOR**.

EOR is managed by CICS PA. It signals the end of the report line. The fields listed above EOR fit on the report line and are included in the report in the same order as they appear in the list. Those below EOR will not be reported and are ignored.

CICS PA automatically sets EOR when the Report Form is created and resets it if necessary when the Form is changed to ensure that the maximum page width of 132 is not exceeded. In positioning EOR, CICS PA allows for one blank separator between each field.

To produce a report line shorter than 132, either move EOR towards the top of the Form, delete unwanted fields, or move them below EOR.

- The special entry **EOX**.

EOX signals the end of the extract record. There are no restrictions on record length so EOX can be positioned anywhere in the list. EOX is initially positioned just below EOR. Fields above EOX are included in the extract, those below EOX are ignored. If EOX is not specified, EOR is used.

## S (Sort Sequence)

Specify a sort sequence of **A** (ascending) or **D** (descending) for one to three fields listed in the order of the required sort precedence. At least one sort field must be specified. The default is **TRAN ascending**.

Candidate sort fields are indicated by an asterisk \*. To change a candidate sort field to an active sort field, move it above EOR and overwrite the asterisk with an **A** or **D**. To remove a sort field, either move it below EOR, delete it, or overwrite the sort sequence with a blank or asterisk.

For one sort field only, you can specify a limit on the number of records to process at that level in the sort order.

## Format Type

Either:

- The value **APG**, indicating that the Field Name refers to the name of an Application Group

or

- The presentation format of the field.

For numeric (A) fields, optionally specify one of the following:

**K** Divide value by 1000, typically for count fields.

**M** Divide value by 1000000, typically for count fields.

**KB** Kilobytes (divide by 1024), typically for storage fields.

**MB** Megabytes (divide by 1024x1024), typically for storage fields.

For clock (S) fields, you must specify either:

**TIME** Accumulation of elapsed time in seconds with requested precision of 0.0001 to 0.000001. Default: TIME with PRECISION(4).

**COUNT**

Number of occurrences of the condition.

For time (T) fields START and STOP, you must specify one of:

**TIMET** Time in the format *hh:mm:ss.thm* (default)

**TIMEM** Time in the format *hh:mm*

**TIMES** Time in the format *hh:mm:ss*

**TIMEP** Time in one of the following formats, according to the requested precision:

**4 (default)**

*hh:mm:ss.thmi*

**5** *hh:mm:ss.thmij*

**6** *hh:mm:ss.thmiju*

**DATE** Date in the format *mm/dd/yyyy*

**DATEISO** Date in the format *yyyy-mm-dd*

**DATEM** Date in the format *mm/dd*

**DATEYR** Date in the format *mm/dd/yy*

**Limit** For one sort field only, you can specify a limit on the number of records to process at that level in the sort order.

For example, to produce a report of the worst 10 response times for each transaction id, specify the following at the top of the Form:

```

Figure 167. LISTX Report Form (showing Sort Sequence and Limit)

### Field Description

This is a short description of the field. Enter line action **H** (Help) for a more detailed description as shown in the example in Figure 77 on page 164.

### Length

The length of the field in the report or extract. This is used to calculate the width of the report line.

### Dictionary Definition

The description of the CMF data field in terms of the CMF informal name, CICS owner, data type, and field identifier. See “LIST Report Form” on page 300 for further information.

**Line Actions:** For the list of valid line actions for the LISTX Report Form panel, see “LIST Report Form” on page 300.

**Primary Commands:** For the list of valid primary commands for the LISTX Report Form panel, see “LIST Report Form” on page 300.

## SUMMARY Report Form

The SUMMARY Report Form defines the format and content of the Performance Summary Report and Extract, and also helps define the format and content of the Transaction Profiling report.

The Report Form defines the fields to be included, the order of the columns, sort sequence, statistical functions, and a title for the report.

The Report Form panel has three views as there are too many columns of information to display in a single screen view. Scroll **Right** (F11) to toggle between the views.

When you select to Edit or View a Report Form, the first view shown in Figure 168 on page 314 is displayed by default. This first view displays field descriptions. The second view displays data dictionary information for each field. The third view is relevant only when you use the RNG (Range) function.

The SUMMARY Report Form consists of the following:

### Form Description

Up to 32 characters of text to describe the purpose of the Report Form.  
This description is shown on the Report Forms panel to help you identify the Forms in the list. It is initially set to **Summary Report Form**.

**Version (VRM)**

This identifies the CICS release that this Report Form was created for. It determines which CMF fields are available for selection in this Report Form.

**Selection Criteria**

Optionally, you can specify Selection Criteria to filter the data on time periods and field values to restrict the reporting to only the data that is of interest to you.

When a report specifies a Report Form and both have Selection Criteria specified, records must match both criteria to be included in the report.

**Line Actions:** The available line actions are:

- /** Display the selection list of line actions.
- S** Select (edit) the Selection Criteria. See "Specifying Selection Criteria" on page 156 for information on specifying Selection Criteria.
- A** Activate the Selection Criteria so they are included for reporting. Selection Criteria can only be activated if you have specified at least one Select Statement and it is not excluded. An asterisk \* indicates they are active.
- D** Deactivate the Selection Criteria. Any you might have specified here will not be used in reporting.

**Page Width**

Page width of the report, in the range 80 to 8000. The default is 132.

When you increase the page width, you can include more fields in the report. Move EOR down the list or move fields above EOR to include the fields of interest. CICS PA automatically adjusts the EOR marker when the fields overflow the page width.

When you view the report output (using SDSF), scroll right to see the additional fields. Note that when you print the report, data that exceeds the maximum printer page width is truncated.

**Title** Title of the report. Specify up to 128 characters of text to describe the report. CICS PA concatenates the two lines of 64 exactly as entered to make one line which prints at the top of each page of the report below the heading. The default is blank (no title).

If the report uses a Report Form, and a title is specified on both, the title on the report takes precedence.

This option generates the TITLE1('left-half') and TITLE2('right-half') operands.

The title is ignored for extracts.

**Field rows**

One row for each field. The order of the fields in the rows dictates the order of the columns in the report or extract. The fields have the following attributes: Name, Sort Sequence (only certain fields), Type (clock and time stamp fields only), Statistical Function (clock and count fields only), Description, Length, Dictionary Definition, Offset and Length (character user fields only).

**Field Name**

One of the following:

- The CICS PA field name. For CICS CMF fields, this is usually the Informal name or similar. The names for user fields are derived from the MCT. Use line action **S** or **Prompt** (F4) to select from a list of fields applicable to this Form type and CICS version.
- The Application Group name. For details, see Chapter 11, “Application Grouping,” on page 331.

Before entering an Application Group name, enter APG in the Type column. Otherwise, the panel attempts to interpret the Application Group name as a CMF data field.

**Note:** When you add an Application Group to a Report Form, CICS PA adjusts the EOR marker to allow for the maximum width of an Application name (32 characters). However, when producing a report, CICS PA adjusts the Application Group column width to fit the longest Application name in the report.

- The special entry **EOR**.

EOR is managed by CICS PA. It signals the end of the report line. The fields listed above EOR fit on the report line and are included in the report in the same order as they appear in the list. Those below EOR will not be reported and are ignored.

CICS PA automatically sets EOR when the Report Form is created and resets it if necessary when the Form is changed to ensure that the maximum page width of 132 is not exceeded. In positioning EOR, CICS PA allows for one blank separator between each field.

To produce a report line shorter than 132, either move EOR towards the top of the Form, delete unwanted fields, or move them below EOR.

- The special entry **EOX**.

EOX signals the end of the extract record. There are no restrictions on record length so EOX can be positioned anywhere in the list. EOX is initially positioned just below EOR. Fields above EOX are included in the extract, those below EOX are ignored. If EOX is not specified, EOR is used.

### Sort Sequence

SUMMARY Sort fields are identified by **K** in the **Sort K** column. The report can be ordered in ascending or descending sequence, as specified in the **Sort O** column, **A** and **D** respectively.

Sort fields identify the grouping required for summarization, and can be START and STOP time, or any character field, including character user fields.

A Sort Order of \* (asterisk) identifies a candidate sort field, and is ignored for reporting purposes.

To activate a candidate sort field, move it to the top of the Form and set Sort Sequence to A or D.

Key fields above EOR must appear first in the list of fields. The only fields that can appear ahead of a key field are TASKCNT or TASKTCNT. Key fields below EOR are ignored. Up to 8 key fields can be specified, and at least one must be specified. The order of the key fields in the list defines the sort and summarization precedence, with the first key field being the major sort field.

If you create a Report Form that consists entirely of key fields, with or without the special fields TASKCNT or TASKTCNT, then reports or

extracts that you create using this Report Form will contain additional default fields. To suppress these default fields, specify at least one other field that is not a key field: for example, the numeric field RESPONSE. For more information, see “Customizing or suppressing default fields” on page 419.

### Alternate Sequencing

In addition to the Sort Key fields, one numeric field can be selected as Ascending or Descending to activate Alternate Sequencing. This will change the order of report lines from Sort Key to numeric field sequence. For example, specify Alternate Sequencing of D for RESPONSE time to see the transactions with the highest response time at the top of the report. Note that grouping by Sort Key for summarization remains unaffected.

### Format Type

Either:

- The value **APG**, indicating that the Field Name refers to the name of an Application Group
- or
- The presentation format of fields.

For numeric (A) fields, optionally specify one of the following:

- K** Divide value by 1000, typically for count fields.
- M** Divide value by 1000000, typically for count fields.
- KB** Kilobytes (divide by 1024), typically for storage fields.
- MB** Megabytes (divide by 1024x1024), typically for storage fields.

For clock (S) fields, you must specify either:

**TIME** Accumulation of elapsed time in seconds with requested precision of 0.0001 to 0.000001. Default: TIME with PRECISION(4).

### COUNT

Number of occurrences of the condition.

For time (T) fields START and STOP, you must specify one of:

### **TIMET**

Time in the format *hh:mm:ss.thm*

### **TIMEM**

Time in the format *hh:mm*

### **TIMES**

Time in the format *hh:mm:ss* (default)

**DATE** Date in the format *mm/dd/yyyy*

### **DATEISO**

Date in the format *yyyy-mm-dd*

### **DATM**

Date in the format *mm/dd*

### **DATEYR**

Date in the format *mm/dd/yy*

### **DATETIM**

Date and Time in the format *yyyy-mm-dd hh:mm:ss*

### Fn (Function)

The required statistical representation of clock and count fields. The valid functions are:

**AVE** Average value (this is the default).

**DEV** Standard deviation.

- MAX** Maximum value.
- MIN** Minimum value.
- TOT** Total.
- nnn* Peak percentile (50-100).
- SEV** Alert severity. Identifies the alert reporting fields, including the ALERT field.

You must also specify the parameters for this function: the alert severity level CRITICAL, WARNING, or INFO, and whether to report COUNT or PERCENT. Press the Right (F11) key until the Alert columns scroll into view:

```

_____ Alert _____
Severity Report
_____

```

**Tip:** If you type SEV in the Fn column and then press Enter, the panel scrolls the Alert columns into view for you.

You can only enter values in the Alert columns if you have entered the SEV function in the Fn column.

Specifying the SEV function with Alert Severity and Report parameters generates the `fieldname(SEV(CRITICAL|WARNING|INFO,COUNT|PERCENT))` operand.

Note: The SEV function is only supported by the Performance Summary report and extract. If a Summary Form containing SEV fields is used in any other report, such as Profiling, the SEV function is ignored and the Field will adopt its default function.

- RNG** Range. This function calculates the number of tasks where the value of a field falls within a specified range or matches a single value. You can display the result in the report either as a count or as a percentage of tasks. You can use this function to produce distribution reports that answer questions such as: How many transactions had a response time between 0.4 and 0.6 seconds? What percentage of transactions had a response time of 1 second or longer?

To specify the parameters for this function, press the Right (F11) key until the Range columns scroll into view:

```

_____ Range _____
From      To      Report
_____

```

**Tip:** If you type RNG in the Fn column and then press Enter, the panel scrolls the Range columns into view for you.

You can only enter values in the Range columns if you have entered the RNG function in the Fn column.

Specifying the RNG function with a Report value of COUNT (the default value) generates the `RNGCOUNT()` operand; a Report value of PERCENT generates the `RNGPERCENT()` operand.

#### From and To (RNG function only)

Specify a range of values or a single value:

- To specify a single value, in the From column enter an equal sign (=) followed immediately by the value you want to match (for example, =0). Leave the To column blank.

- To specify a range with only an upper limit or a lower limit, in the From column enter one of the following comparison operators:

> >= < <=

followed immediately by the limit value (for example, >1.0). Leave the To column blank.

- To specify a range with upper and lower limits, enter the lower limit value in the From column and the upper limit value in the To column, with no comparison operators. To fall within the range, a field value must be greater than or equal to the lower limit, and less than the upper limit:

*lower limit <= field value < upper limit*

For time fields, values with a decimal point (such as 1.0) are interpreted as seconds; integers (such as 1000) are interpreted as milliseconds.

### Report (RNG or SEV function)

Specifies whether to display the result in the report as a count or as a percentage. Valid values are **COUNT** and **PERCENT**. If you leave this column blank, the default value is COUNT for distributions (RNG function) and PERCENT for alerts (SEV function).

#### Tips:

1. If you type C or P and then press Enter, the panel automatically completes the value for you.
2. COUNT and PERCENT generate identical column headings. To distinguish between columns for percentages and counts, check the column values under the headings: percentages appear with a decimal point, whereas counts are integers with no decimal point.

### Alert Severity (SEV function only)

The threshold level for Performance Alert reporting, either **CRITICAL**, **WARNING**, or **INFO**.

### Field Description

This is a short description of the field. Enter line action **H** (Help) for a more detailed description as shown in the example in Figure 77 on page 164.

### Length

The length of the field in the report or extract. This is used to calculate the width of the print line.

### Dictionary Definition

The description of the CMF data field in terms of the CMF informal name, CICS owner, data type, and field identifier. See "LIST Report Form" on page 300 for further information.

### User Field Offset and Length

For character user fields when only part of the field is to be reported.

**Offset** is the position of the first character and **Length** is the number of characters (1-8) to be reported. For example, if the user field contains the value ABCDEFG, then specifying offset 4 and length 3 gives the output DEF. Both values are required for character user fields and default to offset 1 and maximum field length, limited to eight characters for the Performance Summary report.

CICS PA JCL generation translates these values to  
 FIELDS(Character(Substr(offset,length),...

Figure 169. SUMMARY Report Form (with User Fields)

**Line Actions:** For the list of valid line actions for the SUMMARY Report Form panel, see “LIST Report Form” on page 300.

**Primary Commands:** The following primary command is available only on the SUMMARY Report Form panel:

#### PROFILE

Applies only to the Transaction Profiling report. Inserts the special field PROFILE into the Form, immediately below the key fields. The PROFILE field accounts for the width of the headings (such as Report, Baseline, Delta, and Change%) that the Transaction Profiling report inserts after the key fields in the Form.

Also available from **Profiling** in the action bar.

For a list of other valid primary commands for the SUMMARY Report Form panel, see page “LIST Report Form” on page 300.

---

## Chapter 10. Object Lists

An Object List defines a list of field values that can be used when specifying Selection Criteria for filtering the data for your reports and extracts. A typical use might be to define all the transaction IDs that belong to a particular application system. Object Lists enable you to define a group of related values once, then use it in many reports by simply specifying the name of the Object List in your Selection Criteria. This avoids duplicating the same list of values in different reports.

For example, instead of specifying Select Statements that include transactions B001,B002,B003,..., you predefine an Object List called BTRANS that has values B001,B002,B003,... Now when you specify the Select Statement, you simply specify BTRANS to include those transactions.

One Object List must only include values of the same type. They can be one of the following data types:

- Character field values. For example, Transaction IDs or User IDs
- Elapsed time ranges. For example, Response time from 100 to 200 milliseconds
- Count ranges. For example, File Control request count from 10 to 20

---

### Object Lists versus Resource Lists

CICS PA supports two similar types of list: Object Lists and Resource Lists. Both types define lists of field values that you can refer to by name, avoiding duplicating the same list of values in different places. However, they are used for different functions, are defined using different menu options, and are stored in different locations:

*Table 7. Differences between Object Lists and Resource Lists*

Type	Function	Menu option from the CICS PA Primary Option Menu	Storage location
Object Lists	Selection Criteria for filtering the data for reports and extracts	Option 4 <b>Object Lists</b> (see “Maintaining Object Lists” on page 324)	Object Lists data set
Resource Lists	<ul style="list-style-type: none"><li>• Selection Criteria for filtering data to be loaded into an HDB</li><li>• Resource field values for Application Grouping</li><li>• Resource field values for Statistics Alerts</li></ul>	<ul style="list-style-type: none"><li>• Option 5 <b>Historical Database</b> (edit a Template, edit its Selection Criteria, then select <b>Object Lists ► Resource Lists</b> from the action bar of the Performance Select Statement; see “Resource Lists” on page 633)</li><li>• Option 8 <b>Resource Definitions</b> then option 2 <b>Application Grouping</b> (see Chapter 11, “Application Grouping,” on page 331)</li></ul>	Repository

Several panels contain the action bar choice **Lists**: this links directly to the panel for creating and maintaining Object Lists or Resource Lists, as a quicker alternative to navigating via the Primary Option Menu.

You can copy an Object List to a Resource List. For details, see “Maintaining Object Lists” on page 324.

## Maintaining Object Lists

To display the list of Object Lists:

1. Use the **Options** menu on the action bar to nominate the Object Lists data set (if one has not yet been nominated, or you want to change the data set).
2. Select option 4 **Object Lists** from the CICS PA Primary Option Menu.

```

Figure 170. Object Lists

This panel lists all the Object Lists in the current Object Lists data set and allows you to select one at a time to view or modify.

The Object Lists are listed with the following user-defined attributes:

**Name** 1-8 character name in ISPF member name format, used to uniquely identify the Object List within the Object Lists data set. By default, the panel is sorted on the Name field.

**Description**

Free format text up to 32 characters that describes the contents and purpose of the Object List.

**Line Actions:** The following line actions can be entered against an Object List:

- /** Display the menu of line actions.
- E** Edit the Object List.
- S** Select the Object List (same as Edit).
- V** View the Object List. This looks like the Edit panel but has no 'hold' on the data and has no Save capability. SaveAs is available.
- D** Delete the Object List.
- R** Rename the Object List.
- C** Copy the Object List to a Resource List.

Copying an Object List expands and copies the values of any sublists that the Object List refers to. Resource Lists do not support sublists.

You cannot copy an Object List if any of the following conditions is true:

- The Object List refers to a nonexistent sublist.
- The Object List refers to itself as a sublist.
- The Object List specifies a value in the 2nd Value field. Resource Lists do not support ranges.

**Primary Commands:** The following primary commands are valid for this panel:

**NEW name [MODEL dsn(modelname)]**

This command creates an Object List. The new Object List can be modeled

on one of your existing Object Lists or it can be initialized by selecting one of the sample object lists included with CICS PA. If the model is in the current Object Lists data set, specify just the name of the Object List. If it is in another data set, specify the name of the data set and the Object List in the format **datasetname(modelname)**. If you do not specify a model name in the NEW command, the New Object List window is displayed.

Also available from **File** in the action bar.

See “Creating new Object Lists” for information on how to proceed.

**SELECT name**

This command (or **S**) selects the specified Object List for editing. If the Object List does not exist, it is created as if the **NEW** command was used.

Also available from **File** in the action bar.

**SORT Name | Description | Changed | Id**

This command sorts the list of Object Lists on one or two columns. The default sort field is **Name**. The sort disregards upper and lower case, and is ascending for all but the Changed column. The sort order is retained only until Exit or another SORT command is issued.

**LOCATE string**

This command (or **L** or **LOC**) is used to locate an entry in the list based on the primary sort field. By default, LOCATE operates on the **Name** field. The string should be no longer than the primary sort field and not enclosed in quotes. The display will scroll to the entry which matches the string, or the entry preceding it if an exact match is not found.

**CONFIRM ON | OFF**

**CONFIRM ON** (or **CONFIRM**) instructs CICS PA to prompt for confirmation when you request to Delete an Object List.

With **CONFIRM OFF**, Delete requests are actioned immediately. Deleted Object Lists cannot be reinstated.

This command changes the setting only for the current invocation of the Object Lists panel. On exit, it reverts to the default set by **Delete Confirmation** in CICS PA Settings.

Also available from **Confirm** in the action bar.

---

## Creating new Object Lists

To create a new Object List, do either of the following:

- In the command line, enter **NEW** followed by the name of the new Object List and an optional model Object List using the following syntax:

- Select **File** from the action bar, then choose **New..**

If you did not specify a model name in the NEW command, a pop-up dialog window is displayed as shown in Figure 171 on page 326. If you specified a model name, the New Object List panel is bypassed.

New Object List

Command ==> \_\_\_\_\_

Specify the name of the new Object List and optional model.

Name . . . **ASSETS**\_\_\_\_\_

Model . . **STOCK**\_\_\_\_\_

\_ Initialize with a sample object list

Figure 171. Specifying a New Object List

This panel allows you to create a new Object List. You must give the new Object List a name.

The new Object List can be modeled on one of your existing Object Lists or it can be initialized by selecting a sample object list. If you do not specify a model name or a sample, the object list will be initialized empty.

**Name** The name of the new Object List. A 1-8 character name in ISPF member name format. The name must be unique within the Object Lists data set.

**Model**

You can specify the name of an existing Object List as a model so that your new Object List is initialized with its contents. If the model is in the current Object Lists data set, specify just the name of the Object List. If it is in another data set, specify both the data set name and the Object List name in the format *datasetname(modelname)*.

**Initialize with a sample object list**

Enter / to select one of the sample object lists included with CICS PA.

When you have specified the required details, press Enter to create the Object List. You can change or delete any of the values that are copied from the model or sample and add new values.

---

## Specifying values in Object Lists

The Object List Edit panel is displayed when, from the Object Lists panel, you do either of the following:

- Create a new Object List.  
Use the **NEW** command or select **File->New** in the action bar.
- Select an existing Object List.  
Enter line action **E** or **S** against an Object List or use the **SELECT** command.

Alternatively, you can enter line action **V** to display the Object List View panel.

Use this panel to specify values in an Object List. The Object List can then be 'reused' many times in **Selection Criteria** in Report Sets.

You can specify any number of values in an Object List. You can also specify any number of Object Lists as sublists to form a meaningful hierarchical grouping of values. The order of entries in the list is of no consequence to CICS PA reporting.

You must specify separate Object Lists for character field values and numeric field values:

- For a **character field value** you can specify up to eight characters of free text entered in the **1st Value** column. Masking characters % and \* are allowed. Or in the **Sublist** column, specify the name of another Object List containing character values. Character field values are typically names. For example, for USERID, TRAN, or PROGRAM fields. There is no validation by the dialog of Object List character field values. However, at run time they are validated against the fields in the Selection Criteria. If the value length is shorter than the field length, it is padded to the right. If the value length is longer than the field length, a command error occurs.

```

/ 1st Value  2nd Value  Sublist
- BIL1_____
- BIL2_____
- %TRA*_____
- _____
***** End of list *****

```

Figure 172. Specifying Values for Character Fields in an Object List

- For a **numeric field value** you can specify an integer in the range 0 to 999999999. Enter single values in the **1st Value** column. For value ranges (spans), enter the 'From' value as the **1st Value** and the 'To' value as the **2nd Value**. Masking is not supported. Or in the **Sublist** column, specify the name of another Object List containing numeric values. Numeric values are for Decimal, Count, or Clock field types. For example, CPU, RESPONSE, TASKNO, FCAMCT, DISPWAIT fields.

**Note:** A Clock type field has two parts: an elapsed time in units of thousandths of a second, and a count of the number of occurrences of the condition. Integer values are appropriate for both parts.

```

- 100        200        B1RESP
-           B2RESP
-           B2RESP
***** End of list *****

```

Figure 173. Specifying Values for Numeric Fields in an Object List

The field lengths and formats are available in the Performance Select Statement, where Object Lists are used.

The Object List panel consists of the following:

## Description

Up to 32 characters of text to describe the purpose of the Object List. This description is shown on the Object Lists panel to help you distinguish between the Object Lists displayed. It is initially set to **CICS PA Object List**.

## 1st Value

A field value.

- If this is an Object List for **character field values**, the value can be up to eight characters of any nature. Masking characters % and \* are allowed. The percent % is for a single character substitution and the asterisk \* is for many or none. For example, you might specify %%T\* to select all programs which have T as the third character of their name. LETTERS, PETE, KAT, and KAT99 match this pattern.
- If this is an Object List for **numeric field values** for Decimal, Count, or Clock type fields, the value can be up to nine digits. The 1st value represents a single value if the 2nd value is blank, otherwise it represents the 'From' value in a range (span). Masking is not supported for numeric fields.

## 2nd Value

The 'To' value for a range (span) of numeric values for Decimal, Count, or Clock type fields. The value can be up to nine digits.

For character type fields, this value must be blank as value ranges are not supported.

## Sublist

The name of an Object List in the current Object Lists data set. The values in the sublist are inserted at JCL generation time. An Object List and its sublists must contain values for the same type of field, either all character type or all numeric type.

This facility enables reuse of Object Lists and allows you to build up a hierarchy of lists of related values.

When CICS PA generates the Report Set JCL, the values in the sublist are listed in the **SELECT** statements along with the explicitly specified values. The order in which the values are listed in the **SELECT** statement is the same order as they are specified on the Object List panel(s), however this order is of no consequence to the reporting process.

## Line Actions

/	Display the menu of line actions
I	Insert a new row
R	Repeat this row
C	Copy this row
M	Move this row
A	Move/Copy after this row
B	Move/Copy before this row
D	Delete this row

## Primary Commands

**SAVE** This command is only available from Edit mode and saves any changes you have made. To save any changes made in View mode, use **SAVEAS**.

Also available from **File** in the action bar.

**SAVEAS objlname | datasetname(objlname)**

This command is available from both Edit and View mode to save the contents of this Object List under another name, either in the current data set (assumed if no data set name is provided) or in another suitable data set (if the name of a valid PDS is provided). If you then Cancel from this panel, the contents of the current Object List remain unchanged.

Also available from **File** in the action bar.

**RESET**

This command (or **RES**) removes all outstanding line actions and deletes any blank rows.

Also available from **Edit** in the action bar.

**CONFIRM ON | OFF**

**CONFIRM ON** (or **CONFIRM**) instructs CICS PA to prompt for confirmation when you request to Cancel from the Object List panel when there have been updates.

With **CONFIRM OFF**, Cancel requests are actioned immediately, discarding any changes.

This command changes the setting only for the current Edit/View session. On exit, it reverts to the default set by **Cancel Confirmation** in CICS PA Settings.

Also available from **Confirm** in the action bar.

---

## Chapter 11. Application Grouping

Application Grouping enables you to create form-based performance reports or extracts that relate data to logical business units or functions known as *Applications*. In this context, an Application is a name that you associate with a set of performance data field values. For example, you can associate the Application name “Accounting” with the CICS transaction ID (TRAN) field values DEPT, WDRW, and ACC\* (that is, matching any transaction ID beginning with the characters ACC). Then you can create reports or extracts that refer to the performance data for those transaction IDs as belonging to the “Accounting” Application.

To use Application Grouping, you need to follow these steps:

1. **Define an Application Group** using option 8 **Resource Definitions** from the CICS PA Primary Option Menu.

An Application Group consists of one or more Applications that you want to present together, in a single report or extract. Before adding Applications to an Application Group, you must specify a performance data field, such as CICS transaction ID (TRAN), whose values will define the Applications. This is known as the *resource field* for the Application Group. All Applications in an Application Group refer to values of the same resource field. The resource field can be any character user field (defined in an MCT) or one of a limited set of predefined CMF character fields.

Each Application consists of a name and a set of resource field values that you want to associate with that Application name. You can either specify these values individually, or you can refer to a Resource List that contains the values. If you want to define the same Application in several Application Groups, then rather than specifying its field values separately in each Application Group, consider defining and referring to a Resource List.

For more information, see “Defining Application Groups” on page 332.

2. **Add the Application Group to a Report Form** using option 3 **Report Forms** from the CICS PA Primary Option Menu:
  - a. Insert a new field in the Report Form
  - b. In the Field Name column, enter the Application Group name
  - c. In the Type column, enter **APG**

Report Forms are independent of repositories (where Application Groups are stored), so CICS PA does not validate that the Application Group name that you enter has been defined. For details on editing a Report Form, see “Specifying Report Form contents” on page 300.

3. **Use the Report Form to create a report or an extract** using one of the following options from the CICS PA Primary Option Menu:
  - Option 2 **Report Sets**, to create a report or an extract from SMF files. For details, see Chapter 8, “Report Sets,” on page 143.  
or
  - Option 5 **Historical Database**, to create a report or an extract from an HDB. For details, see Chapter 20, “Using the HDB dialog,” on page 613.  
or
  - Option 7 **Profiling**, to create a Transaction Profiling report. For details, see “Transaction Profiling report” on page 183.

The Application Group name appears in the report or extract as a column heading. If a row of data matches a resource field value specified by an Application in the Application Group, the column displays the Application name. For example, you might define an Application Group named CRITICAL that consists of your mission-critical Applications, where each Application is defined by a set of transaction IDs.

Application Grouping is especially useful for summarizing the performance of Applications that involve several transaction IDs. If you specify an Application Group as a key field in a SUMMARY Report Form, the report or extract groups and then summarizes the input records for each Application. If you specify TRAN as a key field after the Application Group, then, after the summary for each Application, the report or extract shows summaries for each transaction ID of that Application. For example, suppose you have associated the Application name "Application A" with transaction IDs matching the masked value A\* (that is, transaction IDs beginning with the character A):

CRITICAL Group	Tran	#Tasks	Avg Response	
			Time	
Application A	A1	4	.0500	
Application A	A2	3	.0200	
Application A	A3	5	.0700	
Application A		12	.0508 <i>(combined summary for A1, A2, and A3)</i>	
Application B	B1 ...			

By contrast, adding an Application Group to a LIST Report Form simply adds a column to the resulting report or extract, annotating each row with the associated Application name, with the same number of report lines as before: it does not perform any grouping or sorting.

Typically, you use Application Grouping to group input records for Applications based on CICS transaction IDs, as shown in the previous example. However, you can also use Application Grouping to group input records for other purposes, based on other performance fields. For example, you could define an Application Group where each "Application" is defined by the set of user IDs in a division of your enterprise. You can use this Application Group to track CICS usage patterns of staff in each division.

For examples of reports that use Application Grouping, see Figure 194 on page 400 and Figure 214 on page 432.

---

## Defining Application Groups

To define an Application Group:

1. Select option 8 **Resource Definitions** from the CICS PA Primary Option Menu. This displays the Resource Definitions Menu, where you can choose to define either Resource Lists, Application Groups or Performance Alerts.

```

File Options Help
-----
Resource Definitions Menu
Command ==> _____

Select an option then press Enter.

2 1. Resource Lists      Define Resource Lists
  2. Application Grouping Define Application Groups
  3. Performance Alerts  Define Performance Alerts

Repository . . . . 'CICSPA.XYX.REPOSTRY' _____ +

```

Figure 174. Resource Definitions Menu

If you have not yet defined a repository, you can do so from here. Specify the name of an existing repository, or if you specify a new data set name, CICS PA prompts you to create a new repository. For details, see “Repository” on page 615.

2. If you already know that you want to refer to Resource Lists when defining Application Groups, use option 1 to define the Resource Lists first. For details on defining Resource Lists, see “Resource Lists” on page 633.

Otherwise, select option 2 **Application Groups** to display the Application Groups panel:

```

File Options Help
-----
Application Groups                               Row 1 to 1 of 1
Command ==> _____ Scroll ==> PAGE

Select to edit Application Group (APG). Enter NEW command to define a new APG.

/ Name          Description          Changed          ID
_ BUSFUNC      Business functions    2008/05/06 12:46 GXH
***** Bottom of data *****

```

Figure 175. Application Groups

3. To define a new Application Group, enter **NEW** on the command line, and then enter a name for the Application Group in the pop-up window.

An Application Group name consists of 1-8 characters. The first character must be an alphabetic character (A-Z) or a national character (@, #, or \$). The remaining characters can be alphabetic, national, or numeric (0-9) characters. Do not specify a name that matches a CMF field name or the leading characters of a CMF field name. For example, do not specify APP, because it matches the leading characters of the CMF field name APPLID, among others. However, APPG is valid.

Report or extracts for this Application Group will contain a column heading consisting of the Application Group name followed by the word “Group”.

To edit an existing Application Group, enter line action **S** next to the Application Group.

```

File Edit Confirm Lists Options Help
-----

***** Bottom of data *****

```

Figure 176. Editing an Application Group

Before adding Applications to an Application Group, you must specify the resource field whose values will define the Applications. All Applications in an Application Group must refer to values of the same resource field, such as the CICS transaction ID (TRAN).

The order of the Applications on this panel is significant. Reports or extracts associate input records with the first matching Application. In the following example, Application B never appears in a report, because input records always match Application A first:

Application Name	Values
Application A	AP*
Application B	APB*

To enable matches with Application B, you would move Application B before Application A in the list. Report rows that do not match any Application contain **\*noapg\*** in the Application Group column. To specify a different label for these rows, insert an Application name such as "No match" at the end of the list, with a single asterisk (\*) as its value:

Application Name	Values
Application B	APB*
Application A	AP*
No match	*

This Application matches any records that have not already matched an Application in the list. If you do not want these rows to appear in a report, then, when requesting the report, specify selection criteria either to only include records that match the Applications or to exclude records that do not match any Application.

The Application Group details are:

#### Description

Free-format text of up to 36 characters describing the Application Group. This description appears on the Application Groups panel to help identify each Application Group, but it does not appear in reports or extracts.

#### Resource field

The name of the CMF character field whose values identify the Applications. For example, to identify Applications by their CICS transaction IDs, specify TRAN as the resource field name. The resource field can be either a user character field (specified in the MCT) or one of a limited set of predefined CMF character fields:

Field name	Description
<b>TRAN</b>	Transaction identifier
<b>TERM</b>	Terminal ID
<b>USERID</b>	User ID
<b>PROGRAM</b>	Program name
<b>APPLID</b>	CICS Generic APPLID
<b>APPLPROG</b>	Application naming Program
<b>APPLTRAN</b>	Application naming Tran ID
<b>FCTY</b>	Transaction Facility name
<b>OTRAN</b>	Originating Transaction identifier
<b>OUSERID</b>	Originating User ID
<b>OAPPLID</b>	Originating CICS APPLID
<b>OFCTY</b>	Originating Transaction Facility name
<b>PHTRAN</b>	Previous Hop Data Transaction ID
<b>PHAPPLID</b>	Previous Hop Data APPLID
<b>PSBNAME</b>	PSB Name
<b>OMEGWORK</b>	OMEGAMON User work area

To select from the list of predefined fields, press **Prompt** (F4). If you specify a user field name, you must also specify an offset and a length, indicating the part of the field you want to compare with the Application values.

#### User field offset and length

If you specify a user field in **Resource field** then you must also specify an offset and a length. These identify the part of the user field that you want to compare with the Application values. The offset is the position of the first character and the length is the number of characters from this position. To compare the entire field, specify offset 1 and the maximum field length. For example, if the user field contains the value ABCDEFG, specifying offset 1 and length 4 gives the output ABCD, which is then compared with the Application values.

If you specify a predefined CMF field in **Resource field** you cannot specify an offset or a length. The entire field value is always compared with the Application values.

#### Application name

Free-format text of up to 32 characters, including mixed-case characters and blanks. This name appears in reports and extracts on rows that match the Application values, under the column heading for the Application Group.

## Values

For each Application, you must specify one or more values of the resource field that identify the performance records belonging to the Application. You can specify these values in either of two ways:

- Refer to a Resource List that contains the values.
- Specify the values individually.

The Values column shows only the first value of an Application. You can edit the first value directly in the Values column. If an Application has more than one value, the number of values appears in parentheses (n) next to the first value. To edit these other values, enter line action **S**. This displays the Value List panel, showing all of the values for the Application:

Command ==> \_\_\_\_\_

Application Name: Statistics collection

Specify Resource Values.

\$\*\_\_\_\_\_

##\*\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

If more than 16 values are required, you must use a Resource List.

Press END (F3) to save the values, CANCEL (F12) to abort.

Figure 177. Editing the resource field values for an Application

Masking characters % (exactly one character) and \* (any number of characters) are allowed. For example, specify TR\* to match all values starting with TR. To specify a null value, type two single quotes ' ' or " ". You can specify up to 16 individual values for an Application. If you need to enter more than 16 values, define a Resource List.

## (Resource) List

A Resource List is a set of values that you can refer to by name. If you want to define the same Application in several Application Groups, then rather than specifying its field values separately in each Application Group, consider defining and referring to a Resource List. If you want to specify more than 16 values for an Application, then you must use a Resource List, even if you do not intend to refer to the Resource List in other Application Groups.

To select a Resource List, press **Prompt** (F4).

To define a Resource List, select **Lists** in the action bar. After defining the Resource List, you return to this Application Group panel, so that you can refer to the newly defined Resource List. For more details, see “Resource Lists” on page 633.

## Note:

- a. Resource Lists and Application Groups are both stored in a repository. An Application Group can only refer to Resource Lists that are stored in the same repository as the Application Group.
- b. Application Groups cannot refer to Object Lists. Object Lists are stored in the Control Data Set specified in your CICS PA Profile. For details, see “Object Lists versus Resource Lists” on page 323.

---

## Chapter 12. Performance alerts

Performance alert reporting provides you with the ability to monitor and report adverse transaction performance conditions based on predefined thresholds. It complements statistics alert reporting to support your requirements for performance compliance and problem detection.

CICS CMF data is measured against user-defined performance thresholds and only transactions that fail alert thresholds are reported or flagged in the report. The Performance List and Summary reports and extracts compare nominated fields in each transaction's resource values against those defined in the alert definition. Only matching transactions are compared against the corresponding threshold values and the non-compliant transactions are reported.

Existing Reports Sets can be used to satisfy both your standard and alert reporting needs, including performance extracts into CSV data sets or loaded into DB2 tables.

Performance alert definitions are stored in the Repository. A performance alert definition is stored as two related parts, a template and a set of threshold values based on the template.

Using a Report Form to format your report is optional. This is because you can also use the performance alert template to format your report.

The performance alert definition allows you to define resource fields and values for transaction filtering. Transaction filtering associates specific threshold values with specific transactions. The resource fields are type character identification fields such as TRAN, APPLID, and USERID, or Application Group. You can specify from 1 to 3 resource fields with a value for each.

Each set of resource fields has an associated set of data fields with severity threshold values. This means that in a single alert definition, you can define different severity threshold values for different resources. This is shown in the following example.

TRAN	APPLID	USERID	Info RESPONSE TIME	Warning RESPONSE TIME	Critical RESPONSE TIME
/					
HR*	PROD*			*1.1	
HRP*	PRODHR	PER*	<0.7	<1.0	>=1.0
HRP*	PRODHR	SYD*	<0.1	<0.5	>=0.5
HRP*	PRODHR	NY*	<0.4	<0.7	>=0.7

*Figure 178. Example: Performance alert definition*

This example shows three different resources each with a different set of threshold values. It also shows an adjustment value for the Response Time Warning column. This is a shortcut method of applying global adjustment to threshold values without editing every value in the definition. The adjustment value is applied to every threshold value in the column.

The structure of the alert definition is based on a template which defines the resource fields, data fields, severities and layout of the alert definition. The

template provides flexibility to construct and modify the alert definition to include the resource and data fields you want. The layout of the template is particularly important as it acts as a pseudo Report Form when no Form is specified in the report, and therefore the field order determines the report layout.

A performance alert definition has the following attributes:

- Template containing a maximum of three resource field names that are used to identify selected transactions for alert comparison. The template must contain at least one resource field, such as TRAN.
- Alert Values definition containing resource field values, such as FINC.
- Template containing at least one CMF data field name, such as RESPONSE. These are the fields for which performance threshold values are specified for transaction comparison.
- For each CMF data field, the Alert Values definition contains the threshold value for at least one of the Critical, Warning and Informational levels.
- Optionally, the template can contain additional CMF report fields if you intend to use the performance alert definition as a Report Form. These optional fields are not displayed in the Alert Values definition.

To create a performance alert report or extract, follow these steps:

1. **Define a performance alert definition.**

To begin:

- a. Select option 8 **Resource Definitions** from the CICS PA Primary Option Menu.
- b. Select option 3 **Performance Alerts** from the Resource Definitions Menu.

For more information, see “Defining performance alerts.”

2. **Use the performance alert definition to create a Performance List or Summary report.**

To create a Performance List or Summary alert report:

- a. Select option 2 **Report Sets** from the CICS PA Primary Option Menu.
- b. Select or create a report set.
- c. Expand the **Performance Reports** category, and then select **List or Summary**.

For more information, see “Performance List report” on page 167 or “Performance Summary report” on page 177.

3. **Use the performance alert definition to create a Performance List or Summary extract.**

To create a Performance List or Summary alert extract file:

- a. Select option 2 **Report Sets** from the CICS PA Primary Option Menu.
- b. Select or create a report set.
- c. Expand the **Extracts** category, and then select **Performance**.

For more information, see “Performance Data extract” on page 253.

For examples of performance alert reports and extracts, see “Performance alert examples” on page 344.

---

## Defining performance alerts

To create a performance alert definition:

1. Select option 8 **Resource Definitions** from the CICS PA Primary Option Menu.
2. On the Resource Definitions Menu, specify the data set name of the Repository, then select option 3 **Performance Alerts**.

This displays the Performance Alert Definitions panel:

```
File Options Help
-----
Performance Alert Definitions Row 1 to 3 of 3

Edit Alert Template (T) or Alert Values (S). Enter NEW command to define a new
Alert Definition.

/ Name Description Changed ID
_ PROD1XCP Production System 1 Alerts 2008/05/01 16:34 AXS
_ PROD2XCP Production System 2 Alerts 2008/05/01 16:34 AXS
_ PROD3XCP Production System 3 Alerts 2008/05/01 16:34 AXS
***** Bottom of data *****
```

Figure 179. Performance Alert Definitions

3. To define a new Alert Definition, enter **NEW** on the command line, and then enter a name for the Alert Definition in the pop-up window. You can bypass the prompt by specifying the name in the command. For example, **NEW PROD4XCP**.

Alternatively, you can create a new Alert Definition modeled on an existing one. Enter line action **C** next to the definition you want to copy. In the pop-up window, enter the name of the new definition and destination repository. If a definition of the same name already exists in the destination repository, it will not be overwritten unless you select the option **Replace Alert Definition if it exists**.

An Alert Definition name consists of 1-8 characters. The first character must be an alphabetic character (A-Z) or a national character (@, #, or \$). The remaining characters can be alphabetic, national, or numeric (0-9) characters.

4. The definition has two parts: the template, which is defined first, and the alert values based on the template.

The following line actions can be entered against an Alert Definition:

```
/      Display the menu of line actions.
S      Select to edit the alert values. Same as E.
T      Edit the alert template. Same as TE.
V      View the alert values.
TV     View the alert template.
D      Delete the alert definition.
C      Copy the alert definition to this or another repository.
```

5. To edit the template of an existing Alert Definition, enter line action **T** next to the Alert Definition. If you do not intend to make and save changes, enter line action **TV** to view the template.

The Alert Template edit panel has four views. To cycle through the views, press **Right** (F11).

Figure 180. Performance Alert Template edit panel - initial view

Enter a description and specify template details:

Description

Free-format text of up to 36 characters describing the alert definition. This description appears on the Performance Alert Definitions panel to help identify each definition, but it does not appear in reports.

The template details are:

Field Name

The name of any CMF field. Fields that do not have SEV nor RESOURCE in the Function field will be treated as normal report fields when the template is used in place of a Report Form when reporting. Fields that have SEV or RESOURCE can also be used for reporting as described below.

Relevant to: List and Summary reports.

List report: Only the first of multiple entries for the same field+type+alert function is reported.

Summary report: Field name **ALERT** provides the total count or percentage of transactions for each alert severity level (Critical, Warning, or Info) for the summary key. If no alerts are specified, the ALERT field name is ignored.

**Sort K** Relevant to: Summary reports. Same function as in a Summary Report Form.

Sort O

Relevant to: List and Summary reports.

List report:

\* Field is excluded from the report.

A, D or blank

Field is included in the report.

Summary report: Same function as in a Summary Report Form.

**Type** Relevant to: List and Summary reports. Same function as in the Report Form.

**Function**

Relevant to: List and Summary reports. Same function as in the Report Form with the following additional values:

**RESOURCE**

Indicates the resource field to be included in the alert values definition. At least one and a maximum of three RESOURCE fields must be specified. If a RESOURCE field is type APG (Application Group), it must be the first RESOURCE field specified.

**SEV** Indicates an alert field to be included in the alert values definition.

**Alert Severity**

Relevant to: Summary reports. Field alert severity, either CRITICAL, WARNING, or INFO.

**Alert Report**

Relevant to: Summary reports. Field alert reporting type:

**COUNT**

Total number of field alerts for the severity.

**PERCENT**

Percentage of field alerts for the severity based on the number of transactions processed.

**Page width**

Relevant to: List and Summary reports. This is a calculated, display-only field showing the width of the report page containing all the fields above the EOR indicator. It is displayed when you press Enter or scroll right (F11) or left (F10). It is automatically adjusted as you add or delete fields above EOR.

Note: The page width automatically adjusts to the calculated total length of the fields above EOR (plus one space between fields). This is in contrast to the way it works in Report Forms where you can specify the page width and EOR automatically moves to fit within the specified width.

The following line actions can be entered against a row in the template:

**/** Display the menu of line actions.

**S** Select a field name from a scrolling prompt list of fields with long descriptions.

**I** Insert a new entry.

**R** Repeat this entry.

**C** Copy this entry.

**M** Move this entry.

**A** Copy/Move after this entry.

**B** Copy/Move before this entry.

**D** Delete this entry. When you delete alert fields from the template, associated alert values are also deleted.

**H** Field help with long description.

**RR, CC, MM, DD**

Block commands: Repeat, Copy, Move, Delete

When the template specification is complete, press F3 to save changes.

6. To specify the threshold values, enter line action **S** or **E** next to the alert definition. If you do not want to make and save changes, enter line action **V** to view the definition.

The Alert Values edit panel might have too many columns to display in a single view. Scroll **Right** (F11) or **Left** (F10) to see all columns.

```

Figure 181. Performance Alert Values edit panel (with filter)

The fields and their order in the panel are determined by the Template and are altered with changes to the Template. Only fields with Function RESOURCE and SEV from the Template are displayed here. Report fields are excluded.

This panel is used to specify the resource and threshold values associated with the resource and alert fields in the Template. In addition, the panel allows for global adjustment of threshold column values for easy alteration of thresholds.

Complete the performance alert definition by specifying threshold values:

- 1 Resource fields.
- 2 Alert fields.
- 3 Field severity specified in the template. Possible values are: **Critical**, **Warning**, **Info**.
- 4 Field type. **TIME** or **COUNT** for **S** type fields, **APG** for Application Group fields, blank for all others. If there are no S type or APG fields specified, this row is not displayed.
- 5 Filter. Optional value used to filter the display to only show matching alert resource values. The filter value is not saved when you exit the panel. If two or three filter values are specified, they are AND'd.
- 6 Resource field value. Used to select the transactions to compare with the associated thresholds. Resource values support wild characters (for example, PRODC\*) and application group names. A blank resource value field will not be checked and is the same as specifying \* (asterisk).

Resource field columns remain fixed while other columns are scrollable left and right. At least one resource value must be specified in each row.

- 7 Threshold adjustment value. This is a number with or without a

preceding operator. It is used to adjust all threshold values in the column. Supported mathematical operators are: + - \* / (add, subtract, multiply, divide). Supported comparison operators are: = < > =< >= <> != .

If you specify a number with a mathematical operator, all threshold values in the column are adjusted by performing the specified mathematical operation. For example, \*2 will double all values in the column. If the adjusted result is negative, it is set to zero.

If you specify a number without a mathematical operator, it replaces all threshold values in the column.

If you specify both a mathematical operator and a comparison operator in the adjustment value, the comparison operator is ignored.

Press Enter to do the adjustment. The adjustment field is then cleared.

Enter **RESET** in the adjustment field to clear all threshold values in the column.

**8** Threshold value for the alert field and severity combination. Attributes are:

- The field can contain numeric characters only and comparison operators = < > =< >= <> != . The default operator is >.
- Supports a decimal point. For example, 0.000001
- The maximum length for the number, including the decimal point, is 9 characters. For example, 999999999 is valid, but 9999999.00 is invalid.
- Storage fields will allow all currently supported unit values: **K, M, G, T, P**. The value specified will be multiplied by the unit using 1024 base. This is the same implementation as statistics alerts.
- Time fields of type seconds and milliseconds will both specify base unit of seconds. That is, a 500 millisecond threshold will be specified as 0.5.

The following line actions can be entered against a row of values:

/	Display the menu of line actions
I	Insert a new row
R	Repeat this row
C	Copy this row
M	Move this row
A	Copy/Move after this row
B	Copy/Move before this row
D	Delete this row

When the definition is complete, press F3 to save changes.

7. The definition can now be used for performance alert reporting in List or Summary reports or extracts.

The EDIT Performance Alert Values panel allows you to specify the actual resource fields values and alert fields thresholds that constitute the alert.

You can specify different thresholds for different resource values, thus allowing you to measure different resources within the same alert report run.

The resource values are AND'd. That is, a transaction's resource values must match ALL the resource values in the alert entry to be eligible for threshold checking.

The order of the resource fields is only important when the alert definition is used in place of a Form in the report. For the List report, the resource fields will be reported in the order and position they are defined in the Template. If printed in the Summary report, they will determine the summary key, hence the summarized data values. The Summary report will generate errors if the resource fields do not conform to summary key rules.

Since you can specify one, two, or three resource fields in the Template, this panel is dynamic in terms of the number of resource field columns.

The order of the alert entries is important since a transaction's field values will only be compared against the thresholds for the first alert entry that matches the transaction's resource values. Once the resource values combination is matched, no other alert entries are checked, regardless of whether the matched entry generates an alert or not. Only when the resource values do not match, then the next entry in the alert definition is checked against the transaction. This makes it extremely important to define the resource values in the correct order when using wild characters in the resource values.

If a row contains all \* (asterisk) resource values, it should be placed last in the list as it will be a catchall for transactions that don't match previous resource values. If it is placed before rows with resource values, it will render the subsequent rows irrelevant as it will match all transactions.

The threshold levels within a single field are hierarchical. That is, Critical severity is checked before Warning, which is checked before Information, with only the first exceeded threshold level reported.

Each alert field is independent of all other fields, with each field checked and reported separately.

The order of the alert fields is only important when the alert definition is used in place of a Form in the report.

---

## Performance alert examples

Performance alerts are shown in the following report examples. Extract data sets can be created with record layouts the same as the report columns.

**Note:** The minimum Severity level selected for reporting is used to report transactions that have at least that level of reporting in *any* of the severity fields. This could result in transactions being reported with severity lower than the specified severity when the transaction also has one or more severity fields that meets the specified severity criteria. For example, if the user specifies SEVERITY(CRITICAL) for the report, only transactions with Critical severity are reported, however, if a transaction also exceeds Warning or Info thresholds, the lower severity will be also reported.

## Chapter 13. Statistics alert reporting

Statistics alert reporting enables you to define conditions, in terms of CICS Transaction Server or CICS Transaction Gateway statistics field values, that interest you. You can then use those conditions to report on CICS statistics stored in SMF files or historical databases.

CICS PA supports specifying an alert definition in the statistics HDB definition. You select the required Statistics reports to be collected in this HDB. When a CICS TS or CICS TG alert report is activated to collect in this HDB, you can use a new line action called AO (Activate Alert-only collection) to collect only the reports that related to this Alert. "Alert only" reports are only collected if Alert is triggered.

You can collect records that trigger alert conditions in the CICS TS and CICS TG Alert reports, or restrict existing reports to only those records which triggered alert conditions, or you can do both.

For each condition, you define an arithmetic formula that uses CICS statistics field names as variables. The formula can be as simple as a single field name, or it can be a combination of field names, arithmetic operators, and numbers. For example, the following formula calculates current active user transactions (statistics field XMGCAT) as a percentage of the maximum task limit (XMGMXT):

```
XMGCAT / XMGMXT * 100
```

(All fields in a formula must belong to the same statistics record.)

You can define up to three thresholds for a formula, indicating the severity of the condition: critical, warning, or information. A threshold consists of a comparison operator and a numeric value. For example, to trigger alerts of increasing severity, you could define the following thresholds:

**Critical**

>95

**Warning**

>80

**Info (Information)**

>50

CICS PA reports only the highest severity for a condition: for example, if the formula value is 85, the report contains only a warning alert, not a critical alert or an information alert.

You define conditions in sets; each set is known as a statistics alert definition. When you request a report, you select which statistics alert definition you want to use. This enables you to create reports that target different types of statistics, such as Java-related statistics, or general performance tuning statistics.

To create a statistics alert report, you need to follow these steps:

1. Define a statistics alert definition:
  - a. Select option 6 **Statistics** from the CICS PA Primary Option Menu.
  - b. Select option 5 **Define Alerts** from the CICS Statistics Reporting Menu.For more information, see "Defining statistics alerts" on page 348.
2. Use the statistics alert definition to create a Statistics Alert report.

To create a Statistics Alert report from SMF files:

- a. Select option 2 **Report Sets** from the CICS PA Primary Option Menu.
- b. Select or create a report set.
- c. Expand the **Statistics Reports** category, and then select **Alert**.

For more information, see “Statistics Alert reports” on page 218.

To create a Statistics Alert report from an HDB, you can use either of two options of the CICS PA Primary Option Menu:

- Via the Historical Database option:
  - a. Select option 5 **Historical Database** from the CICS PA Primary Option Menu.
  - b. Select option 4 **Report** from the Historical Database Menu.  
This displays a list of all HDBs in the Repository, including performance HDBs.
  - c. Select the statistics HDB you want to use.
  - d. Select **Request batch Alert report** from the Statistics HDB Reporting Menu.
- Via the Statistics option:
  - a. Select option 6 **Statistics** from the CICS PA Primary Option Menu.
  - b. Select option 3 **Historical Databases for CICS Statistics** from the CICS Statistics Reporting Menu.  
This displays a list of statistics HDBs in the Repository.
  - c. Select the statistics HDB you want to use.
  - d. Select **Request batch Alert report** from the Statistics HDB Reporting Menu.

For more information, see Chapter 8, “Report Sets,” on page 143.

For examples of Statistics Alert reports, see “STATSALERT examples” on page 483.

---

## Defining statistics alerts

To create a statistics alert definition:

1. Select option 6 **Statistics** from the CICS PA Primary Option Menu.
2. Select option 5 **Alerts** from the CICS Statistics Reporting Menu.

This displays the Statistics Alert Definitions panel:

FileOptionsHelp

Statistics Alert DefinitionsRow 1 to 1 of 1

Command ==>Scroll ==>PAGE

Select to edit a definition. Enter NEW command to create a new definition.

/	Name	Description	Changed	ID
_	SAMPLE	Sample alert definition	2009/02/17 09:10	AXS

\*\*\*\*\* Bottom of data \*\*\*\*\*

Figure 185. Statistics Alert Definitions

3. To define a new Alert Definition, enter **NEW** on the command line, and then enter a name for the Alert Definition in the pop-up window. To populate the new Alert Definition with sample Conditions, select the option **Initialize with sample scenarios**. These samples demonstrate a variety of typical Conditions that you might want in an Alert Definition for general performance reporting. Alternatively, you can create a new Alert Definition modeled on an existing one. Enter line action **C** next to the definition you want to copy. In the pop-up

window, enter the name of the new definition and destination repository. If a definition of the same name already exists in the destination repository, it will not be overwritten unless you select the option **Replace Alert Definition if it exists**.

An Alert Definition name consists of 1-8 characters. The first character must be an alphabetic character (A-Z) or a national character (@, #, or \$). The remaining characters can be alphabetic, national, or numeric (0-9) characters.

4. To edit an existing Alert Definition, enter line action **S** next to the Alert Definition. If you do not want to make and save changes, enter line action **V** to view the Alert Definition.

The Alert Definition edit panel has two views: expanded and compressed. The following figure shows the expanded view. The compressed view is similar, but shows only the alert text that describes each condition. To switch between views, press **Left** (F10) or **Right** (F11).

		List	_____ +

Figure 186. Alert Definition edit panel - expanded view

The details for an Alert Definition consist of a description, and a list of Conditions:

#### Description

Free-format text of up to 36 characters describing the definition. This description appears on the Statistics Alert Definitions panel to help identify each definition, but it does not appear in reports.

The details for each Condition are:

**Alert** Free-format text of up to 50 characters describing the Condition. This text appears in Statistics Alert reports when the Condition occurs (that is, when the Formula value meets a Critical, Warning, or Info threshold).

#### Formula

The expression that you want CICS PA to evaluate and compare with the thresholds (Critical, Warning, and Info).

This expression can be:

- A statistics field name, such as XMGTAMXT

- A combination of statistics field names, numeric values (decimal points allowed), ( ) (parentheses), and the operators + (add), - (subtract), \* (multiply), and / (divide)

For example, the following expression calculates peak in-use IP connection receive sessions as a percentage of the maximum limit:

`ISR_PEAK_RECEIVE_SESSIONS / ISR_RECEIVE_SESSIONS * 100`

All field names in an expression must be from the same statistics report. You can either type field names directly into the expression, or press **Prompt** (F4) to select from a list of fields; selecting a field name appends it to the expression.

If you press **Prompt** (F4) in a Formula field that does not yet contain any field names, CICS PA displays a hierarchical list of CICS Transaction Server and CICS Transaction Gateway statistics reports. Enter line action **S** next to the statistics report containing the fields you want to use; this displays the list of fields in the statistics report.

**Tip:** If you are editing an existing Formula and you are not familiar with the statistics field names it contains, press **Prompt** (F4). This displays a list of field names and short descriptions. To see a longer description for a particular field, move your cursor to the line action field for that field, and then press **Help** (F1).

### Critical, Warning, Info

Specify one to three thresholds for Formula values that will trigger an Alert.

Each threshold represents a different severity level:

#### Critical

A problem has occurred that needs immediate attention

#### Warning

A problem might occur unless action is taken

**Info** Not a problem: reported for reference only

CICS PA reports only the highest matching severity level.

A threshold consists of a numeric value optionally preceded by one of the following comparison operators:

>	Greater than (default)
=	Equal to
<	Less than
<=	Less than or equal to
>=	Greater than or equal to
<>	Not equal to
≠	Not equal to (alternative form)
!=	Not equal to (alternative form)

To specify large values, append one of the following unit symbols: K (kilo), M (mega), G (giga), T (tera), or P (peta); where, for example, 1K = 1024 and 2.5M = 2.5 \* 1024 \* 1024.

For example, to trigger an Alert when the Formula value is greater than or equal to 32768, specify `>=32K`

Specify times in seconds, even for fields stored as milliseconds:

- For a threshold of 500 milliseconds, specify 0.5
- For a threshold of 2 minutes 15 seconds, specify 135

If you specify thresholds with unit symbols, then Statistics Alert reports show actual Formula values with the same unit symbols.

For Info thresholds only: to trigger an Alert regardless of the Formula value, specify a threshold of \*. This information Alert is reported only if neither the critical nor the warning threshold is triggered.

#### **Resource or List**

Optional. Limits the reporting of this Condition to specific CICS resources. CICS PA reports the Condition only if the Resource value, or a value in the selected Resource List, matches the value of an “identification field” (key fields and other record identification fields) in the Statistics report identified by the Formula.

You can specify either a Resource value or a Resource List, but not both. (A Resource List is a set of Resource values that you can refer to by name.)

Masking characters % (exactly one character) and \* (zero or more characters) are allowed in a Resource value.

For example, suppose the Formula contains fields from the Dispatcher TCB Modes report. To report the Condition only for TCB mode names that begin with the letter L, enter L\* in the Resource field. To report the Condition for TCB mode names that begin with either the letter L or the letter J, in the List field you need to specify the name of a Resource List, that you have previously defined, that contains the values L\* and J\*. To define a Resource List, select **Lists** in the action bar. For more details, see “Resource Lists” on page 633.

You can specify a Resource or a Resource List only when the Formula refers to a tabular (multi-record) Statistics report, such as Dispatcher TCB Modes (one record per TCB mode). You cannot specify them for label-based (single-record) reports.

#### **Note:**

- a. Resource Lists and Alert Definitions are both stored in a repository. An Alert Definition can only refer to Resource Lists that are stored in the same repository as the Alert Definition.
- b. Alert Definitions cannot refer to Object Lists. Object Lists are stored in the Control Data Set specified in your CICS PA Profile. For details, see “Object Lists versus Resource Lists” on page 323

#### **APPLID**

Optional. Enter an APPLID to limit the reporting of this Condition to a particular CICS system or systems. Masking characters % (exactly one character) and \* (zero or more characters) are allowed. For example, enter CICS%T to limit the reporting of this Condition to CICS systems with APPLID CICSAT, CICS1T, CICSBT, CICS2T, etc.

CICS PA uses this field to filter statistics records from a Statistics Alert report; it does not use this field to select which SMF files to use as input for the report. This is different to specifying an APPLID in a shared or personal CICS system definition. When you request a Statistics Alert report in a Report Set (that is, using data in SMF files), CICS PA selects SMF files based on the (personal or shared) system definitions that you have specified, including the APPLID of any CICS system definitions. Consequently, any APPLID that you specify in an Alert Definition might already have been filtered out by file selection.

An Alert Definition can contain many Conditions. To find a particular Condition in an Alert Definition, enter the command `FIND string`, where *string* is a character string that appears in one of the Condition field values. If you enter the `FIND` command on the compressed view of the panel, the command searches only the fields displayed on the compressed view.

Each Condition can be either active (the default state) or inactive. When you request a Statistics Alert report, CICS PA ignores any inactive Conditions. If you want to temporarily exclude a Condition from reporting, then rather than deleting it, make it inactive. This allows you to reinstate the Condition later, rather than having to enter its details again. To switch a Condition between active and inactive states, enter line action **X** next to the Condition.

If you request a report sorted by Alert, CICS PA sorts the Alerts in the report according to the order of the Conditions on this panel. Otherwise, the order of the Conditions on this panel is not significant. You can use line actions (described below) to move Conditions into the order that you prefer.

## Line Actions

The following line actions can be entered against a Condition:

- /** Display the menu of line actions.
- S or E** Switch to expanded view, and then scroll the display to this Condition, ready for editing.
- I** Insert a new Condition.
- R** Repeat this Condition.
- C** Copy this Condition.
- M** Move this Condition.
- A** Copy/Move after this Condition.
- B** Copy/Move before this Condition.
- D** Delete this Condition.
- X** Switch this Condition between active and inactive states.

---

## Part 4. Requesting reports using batch commands

These topics provide a description of the command language together with sample JCL to produce many of the reports and extracts.

---

## Chapter 14. JCL for reports and extracts

The CICS PA dialog automatically generates the JCL and batch commands to produce requested reports and extracts within a Report Set using specified SMF input files. The JCL can be directly submitted, or edited before submitting.

You can save the JCL in an external library to edit and submit independently of the CICS PA dialog. Alternatively, you can set up the JCL independently of the dialog, but this bypasses the comprehensive validation provided by the dialog.

---

### JCL generation

The following JCL is an example of the job stream for requesting reports and extracts from CICS PA. The sample library **SCPASAMP** provided with CICS PA includes JCL members to generate all the CICS PA reports and extracts. See Chapter 16, “Sample library,” on page 529 for a complete list of these job streams.

## JOB, EXEC and DD statements

The job stream to generate batch reports and extract data sets consists of the following:

### JOB

**Job Statement Information** from the CICS PA Settings profile options.

**PGM=CPAMAIN,PARM='parameter list'**

Request CICS PA reporting with optional parameters:

### UPPER

**UPPER** translates all report output to upper case. This parameter is generated if you specify YES for **Reports in Upper Case** in the CICS PA Settings profile options. The default is mixed case (**UPPER** not specified).

### STEPLIB DD

This is the library containing the CICS PA modules. It is specified in **CICS PA Load Library** in the CICS PA Settings profile options.

**CMDLIB DD**

This is the optional CICS PA command library containing pre-coded batch commands which can be inserted in the SYSIN command stream using the COPY or INCLUDE command.

**CPAHDBRG DD**

This identifies the Repository data set. The Repository is a VSAM KSDS that is the repository for all definitions associated with an HDB. It is also the repository for shared system definitions and Application Groups. It is required for all HDB command requests, including Load, Report, Extract, and Take-up.

**CPAHBCD DD**

This identifies the Repository container data sets. This DD is written in the context of an HDB load step and is expected to be read by a subsequent DB2 load step.

**CPAHBDL DD**

This identifies the Repository container data sets. This DD is used in the context of a DB2 load step where the HDB container data sets are not required to be kept (that is, the data retention period is 0).

**CPAMANC DD**

This identifies the HDB manifest container data set. The manifest is a catalog of HDBs. It is used by the CICS PA plug-in. This DD is used in the context of a manifest build step.

**MANB0001 DD**

This DD is used in the context of a manifest build step. It lists the HDBs that were included in the manifest.

**SYSPRINT DD**

CICS PA message data set. This DD statement defines the file used by CICS PA for its messages and run time information. It must be specified and should be checked for error messages.

**SYSIN DD**

Command input. This DD statement contains the CICS PA commands.

The CICS PA dialog automatically builds these commands at job submission time, based on the reports and extracts activated in the Report Set.

**Report Output Files DD**

These DD statements define the report output files. These files are specified using the **OUTPUT(ddname)** operand.

If not specified, CICS PA assigns a default DDname xxxnnnnn where nnnn is a sequential number 0001-9999 to uniquely identify the report, and xxxx identifies the type of report:

**LIST** Performance List report

**LSTX** Performance List Extended report

**SUMM**  
Performance Summary report

**TOTL** Performance Totals report

**WAIT** Wait Analysis report

**PROF** Transaction Profiling report

**CROS** Cross-System Work report

**TRGP** Transaction Group report

**CBTS** BTS report

**WKLD** Workload Activity report

**TTLS** Transaction Tracking List

**TTSU** Transaction Tracking Summary

**XLST** Exception List report

**XSUM** Exception Summary report

**FILE** File Usage Summary report

**TEMP** Temporary Storage Usage Summary report

**DPLS** Distributed Program Link Usage Summary report

**RESU** Transaction Resource Usage List report

**STAL** Statistics Alert reports

**STTG** CICS Transaction Gateway Statistics reports

**DB2R** DB2 report

**MQ00** WebSphere MQ report

**OMEG** OMEGAMON reports

**LOGR** System Logger report

**GRTE** Transaction Rate graph report

**GRSP** Transaction Response Time graph report

**CROX** Cross-System Work Extract Recap report

**EXPT** Performance Data Extract Recap report

**RSEL** Record Selection Extract Recap report

**HDBL** HDB Load Recap report

**LOEX** System Logger Extract Recap report

**STEX** Statistics Extract Recap report

For example, if two LIST reports were requested without the OUTPUT operand specified, CICS PA writes the output to files with ddnames LIST0001 and LIST0002.

If a Report Output File is not specified in the JCL, CICS PA will dynamically allocate it with the same attributes as SYSPRINT, regardless of whether the OUTPUT operand was specified or not.

#### **CPAOxxxx DD**

Extract output data sets. These DD statements define the Extract Data Sets. The Extract Output Files are specified using the **DDNAME(ddname)** operand. CICS PA will accept any ddname via the DDNAME operand; it need not be prefixed by CPAO. However, if the DDNAME operand is omitted, CICS PA expects that the default Extract Output ddname is specified in the JCL. See Table 8 on page 360 for the default ddname for each type of Extract.

The CICS PA dialog automatically generates the DD statements at Report Set run time. When generating the JCL, CICS PA assigns a default ddname

**CPAOxxnn** where nn is a sequential number **01-99** to ensure ddnames are unique, and xx indicates the type of extract data set:

- XS** Cross-System Work Extract data set
- EX** Performance Data Extract data set
- RS** Record Selection Extract data set
- LE** System Logger Extract data set

If the extract data set is not cataloged, CICS PA uses the allocation details specified for **Extract Data Sets** in the Reporting Allocation Settings profile options. If the data set is already cataloged, CICS PA uses **DISP=MOD** or **DISP=OLD** to either append or overwrite the data set contents according to your specification on the Extract panel. Alternatively, you can use a GDG to create a new data set each time the Extract is run.

#### **SMFINnnn DD**

SMF data set. These DD statements define the SMF data sets to be processed by CICS PA. CICSPA commands refer to these DD statements via the **INPUT** operand (see “INput” on page 386). This determines which SMF Files are processed by the reports.

The CICS PA dialog automatically generates these DD statements at job submission time, based on the CICS APPLIDs selected for reporting and their associated SMF Files.

SMF File ddnames need not be prefixed by SMFIN. CICS PA will accept any ddname via the INPUT operand.

#### **CPADICTR DD**

Dictionary data set. These DD statements define the data sets which contain Dictionary records. It is only required if you want to include User Fields in your reporting.

Usually, the SMF File contains a Dictionary record to define the format of its performance records. If the Dictionary record is missing from the file, CICS PA will look in the CPADICTR data sets to find a Dictionary record for the particular CICS system (APPLID or APPLID/MVS) so report processing can proceed. If not present, CICS PA will use the default Dictionary record for the CICS system being processed.

---

## **External sorting**

Some CICS PA reports and extracts sort records to produce their output. CICS PA uses the SORT utility (DFSORT or equivalent product) to perform External Sorting. See Table 8 on page 360 for a list of reports that use SORT.

External Work data sets are used to save records that are to be sorted. If the **EXTERNAL** operand is not specified, CICS PA assigns an External Work File from a pool specified in the JCL. External Work Files in the pool are identified with unique ddnames prefixed by **CPAXW**. Each report that requires an External Work File and does not specify the **EXTERNAL** operand is assigned one from the pool. You must ensure that there are enough External Work Files in the pool to handle all the reports that need one.

The Summary Report can perform either an External Sort or an internal program sort. If the **EXTERNAL** operand is specified, CICS PA performs the External Sort. Otherwise, CICS PA sorts the records in virtual storage. In most cases, an internal program sort can be used. However, if the **SUMMARY** report sort key has too many unique values, an External Sort should be considered. For example:

- **FIELDS(TRAN)** will generate a report line for each Transaction ID and can usually be handled by an internal sort.
- **FIELDS(USERID,TRAN)** will generate a report line for every combination of Userid and Transaction ID. In this case, consider using an External Sort.

Table 8. CICS PA reports, default ddnames, and external sort requirements

Report or Extract	Description	Default Report Output ddname	Default Extract Output ddname	External Sort Required?
LIST	Performance List Report	LISTnnnn	N/A	N
LISTX	Performance List Extended Report	LSTXnnnn	N/A	Y
SUMMARY	Performance Summary Report	SUMMnnnn	N/A	Optional
TOTAL	Performance Totals Report	TOTLnnnn	N/A	N
WAITANALYSIS	Wait Analysis Report	WAITnnnn	N/A	N
PROFILING	Transaction Profiling Report	PROFnnnn	N/A	Optional
CROSS	Cross-System Work Report	CROSnnnn	N/A	Y

The following DD statements are required for External Sorting:

**CPAXWnnn DD**

External Work Files. These DD statements define the External Work Files used by the reports that sort their records. CICS PA commands refer to these DD statements via the **EXTERNAL** operand (see “EXTERNAL” on page 379).

The CICS PA dialog automatically generates these DD statements at job submission time, based on the **External Work Data Sets** specification in the Reporting Allocation Settings profile options.

External Work ddnames need not be prefixed by CPAXW. CICS PA will accept any ddname via the EXTERNAL operand.

**CPASWKnn DD**

Sort Work Data Sets. These DD statements define the Sort Work Files used by DFSORT (or equivalent product) on behalf of the reports that sort their records. **nn** is the Sort Work File sequence number.

The CICS PA dialog automatically generates four DD statements at job submission time, based on the **Sort Work Data Sets** specification in the Reporting Allocation Settings profile options.

**SORTLIB DD**

This is the library in which DFSORT (or equivalent product) is installed, and can be omitted if SORT is installed in the link-list.

**SYSOUT DD**

Sort Message Data Set. This DD statement defines the file used for SORT messages. It is required if DFSORT is used.

---

## Using sysout2pdf to output batch reports as PDF

The sysout2pdf z/OS UNIX utility converts “traditional” plain text z/OS batch reports, such as reports generated by CICS PA, into PDF files. You can write plug-in filters for sysout2pdf to manipulate the report contents, highlight text, or add PDF navigation features such as bookmarks. You can also use sysout2pdf to send the PDF using email.

### Preparing to use sysout2pdf

This topic explains the prerequisites for using sysout2pdf.

- sysout2pdf must be configured as part of the installation of CICS PA and according to the instructions in the *Program Directory*.
- sysout2pdf and Apache Formatting Objects Processor (FOP) must be installed under z/OS UNIX. Read the technote “Installing sysout2pdf and FOP on z/OS UNIX”, which is published on the IBM support web site at the following address:

[www.ibm.com/support/docview.wss?uid=swg21449724](http://www.ibm.com/support/docview.wss?uid=swg21449724)

**Note:** sysout2pdf was developed and tested on z/OS V1.9 using FOP 0.85 and 1.0.

- Your z/OS UNIX system must have a JAVA\_HOME environment variable that refers to a Java™ Runtime Environment (JRE), 1.5.x or later.
- Your TSO user ID (that is, the TSO user ID under whose authority your batch jobs run) must have an OMVS segment defined in RACF®, and must have permission to:
  - Execute the sysout2pdf z/OS UNIX shell script.

- Read the specified z/OS UNIX input file (batch report).
- Write files to the z/OS UNIX file path for the output PDF.
- If you want to use sysout2pdf to send PDF attachments by email, then sendmail must be configured on your z/OS UNIX system.

## Using sysout2pdf

This topic shows how to extend existing JCL that generates a batch report to use sysout2pdf.

Suppose you already have some JCL that generates a batch report. Now you want to use sysout2pdf to send you the report as a PDF using email. You need to make the following two changes to your JCL:

- Replace the parameters of the DD statement for the report data set with parameters that direct the report to a z/OS UNIX file.
- Append a BPXBATCH job step that calls the sysout2pdf z/OS UNIX shell script.

### Example

1. Specify the following DD statement for the batch report:

```
//WAIT0001 DD PATH='/u/myhome/temp/wait analysis.txt',
//          PATHOPTS=(OWRONLY,OCREAT,OTRUNC),FILEDATA=TEXT,
//          PATHMODE=(SIRUSR,SIWUSR,SIRGRP,SIROTH)
```

The PATH parameter must refer to a z/OS UNIX directory that exists, and that you are permitted to write to.

The PATHOPTS parameter specifies the access and status options for the file specified on the PATH operand. If the file exists, it will be overwritten. If it does not exist it one will be created. The file will be opened for writing.

The FILEDATA parameter specifies that the data is to be treated as text.

The PATHMODE parameter specifies the file permissions: in this example, the file owner has read and write permission; other users have read permission only.

2. Append the following job step:

```
//BPXBATCH EXEC PGM=BPXBATCH,REGION=0M
//STDENV DD *
FOP_HOME=/usr/local/fop
/*
//STDPARM DD *
sh /usr/local/sysout2pdf/sysout2pdf
-mailto username@example.com
-subject "CICS PA: Wait Analysis"
-body "PDF attached"
-from "CICS PA"
-mailin
-rmin
-rmpdf
-filter cpa-wait
"/u/myhome/temp/wait analysis.txt"
/*
//STDOUT DD SYSOUT=*
//STDERR DD SYSOUT=*
```

The last argument that you supply to the shell script (in the STDPARM DD statement) must match the z/OS UNIX file path that you specified in the DD statement for the batch report. (Notice that STDPARM allows you to split the command-line arguments across multiple lines.)

The path following the `sh` command refers to the location of the `sysout2pdf` shell script.

The example above sends an email containing both the PDF and (as instructed by the `-mailin` option) the original plain-text input file (the batch report), and then removes both the input file and the generated PDF file (as instructed by the `-rmin` and `-rmpdf` options). The PDF contains bookmarks defined by the filter file `cpa-wait` (in the filters directory next to the `sysout2pdf` shell script). You might prefer not to send the PDF using email, and instead open it directly in a PDF reader application on your PC (say, via an SMB connection to z/OS UNIX).

## Syntax

`sysout2pdf` options can be used to control the name, content, and formatting of the PDF output. The order of the options is not significant but *infile* must be specified after any options. If the `mailto` option is used you can specify the headers and body text for the generated email message.

### `sysout2pdf`

```
[-body email_body_text]  
[-date prefix|suffix]  
[-dateformat string]  
[-filter file]  
[-fold width]  
[-from address]  
[-mailin]  
[-mailto address]  
[-nocc]  
[-nocleanup]  
[-nulltospace]  
[-param name value]  
[-pdf file]  
[-rmin]  
[-rmpdf]  
[-style file]  
[-subject email_subject]  
infile
```

## Options

### **`-body email_body_text`**

Body text of the email (currently supports plain text only).

### **`-date prefix|suffix`**

Prefixes or suffixes the generated PDF file name with the current date. Does not apply if you specify a `-pdf` option (to explicitly specify the PDF file path).

### **`-dateformat string`**

The date format string used by the `-date` option. For allowed values, see the z/OS UNIX **date** command.

Default prefix date format string:

```
"+%Y-%m-%d-"
```

Default suffix date format string:

```
"+-%Y-%m-%d"
```

For example, if you specify `-date suffix`, and the input file is `myreport.txt`, and today is 30 November 2010, then the PDF will be named `myreport-2010-11-30.pdf`

**-filter** *file*

A program (such as a shell script) that reads the input file from stdin, edits it, and then writes it to stdout.

Use this option to customize sysout2pdf for particular reports: for example, to highlight specific string patterns in different colors or to add bookmarks. See the examples in the filters directory.

Initially, sysout2pdf treats the value of this argument as a file path; however, if the file path does not exist, sysout2pdf treats the value as the name of a file in the filters directory next to the sysout2pdf shell script.

For example, if the sysout2pdf shell script is in the directory /bin/sysout2pdf, then the following argument:

```
-filter cpa-wait
```

has the same effect as:

```
-filter /bin/sysout2pdf/filters/cpa-wait
```

**-fold** *width*

If the z/OS batch application produces a report with no record delimiters, use this argument to insert a newline character at the end of each record. (Records must be fixed-length.)

**-from** *address*

The address that you want to appear in the From field of the email. Default is sysout2pdf.

**-mailin**

Attach the input file (the original batch report) to the email, with ISO 8859-1 character encoding (not EBCDIC), and with each line delimited by a carriage return/line feed pair of characters (that is, the default Microsoft Windows \r\n, not just the single-character UNIX \n "newline"). Unless you specify the -nocc option, sysout2pdf removes the first column from the input file before attaching it.

**-mailto** *address*

One or more email addresses to which you want to send the PDF. Separate multiple addresses with commas. The PDF is sent as a base64-encoded MIME attachment.

**-nocc**

Specify this option for batch reports that do not contain carriage control characters in the first byte of each record.

**-nocleanup**

Do not remove temporary file after completing. sysout2pdf creates the temporary file temp\*.xml in the same directory as the output PDF file.

**-nulltospace**

Convert null (\0) characters in the report to spaces. Applications that produce reports containing null characters are typically considered ill-behaved. Try using the -nulltospace option if you get the following error:

```
FSUM9201 input file "[standard input]" is binary
```

**-param** *name value*

Parameter to be passed through to the XSLT stylesheet. You can specify multiple param options, each specifying a parameter name and value. The parameter names that you can specify depends on the XSLT stylesheet that you use. The default XSLT stylesheet supports the following parameters:

Name	Default value
font-size	9pt
line-height	11pt
page-height	8.5in
page-width	11in
margin-top	0.5in
margin-bottom	0.5in
margin-left	0.5in
margin-right	0.5in

**Tip:** To specify a different standard page size, instead of specifying:

```
-param page-width 210mm
-param page-height 297mm
```

use the `-style` option to achieve the same effect:

```
-style a4-portrait
```

**-pdf *file***

Output PDF file path. If omitted, `sysout2pdf` creates a PDF in the same directory as the input batch report, and with the same base file name. For example, if the batch report file name is `batchreport.txt`, the PDF will be called `batchreport.pdf`.

**-rmin**

Remove input file after creating the PDF file.

**-rmpdf**

Remove PDF file after completion (intended for use with the `-mailto` option).

**-style *file***

A custom XSLT stylesheet to use instead of the default file (`styles/default.xml`). Use this option to customize the appearance of your PDF.

Initially, `sysout2pdf` treats the value of this argument as a file path; however, if the file path does not exist, `sysout2pdf` treats the value as the name of an XSLT stylesheet file, without its `.xml` extension, in the `styles` directory next to the `sysout2pdf` shell script.

For example, if the `sysout2pdf` shell script is in the directory `/bin/sysout2pdf`, then the following argument:

```
-style a4-portrait
```

has the same effect as:

```
-style /bin/sysout2pdf/styles/a4-portrait.xml
```

Styles supplied with `sysout2pdf` include:

```
default
letter-landscape (identical to default)
letter-portrait
a4-landscape
a4-portrait
```

**-subject *email\_subject***

Subject line of the email.

***infile***

File path of the batch report. This is the only required argument. It must be the last argument specified.

## Examples

This topic shows examples of using sysout2pdf to create and send PDF output from batch reports. Each example is split over multiple lines for readability and can be issued in this way from a batch job. To run an example directly in a UNIX command shell, you must enter the command on a single line. For other examples, see members CPASPSM1, CPASPSM2, and CPASPWT1 in the sample library SCPASAMP.

### Simplest case: create a PDF file

This example creates the PDF file /u/myid/report.pdf (with a landscape-oriented, letter-sized page, and 9-point text):

```
sysout2pdf  
"/u/myid/report.txt"
```

### Create a PDF file with a date-stamped file name suffix

This example creates the PDF file /u/myid/report-2010-30-11.pdf (assuming today is 30 November 2010):

```
sysout2pdf  
-date suffix  
"/u/myid/report.txt"
```

### Create a PDF file with a wide page size

This example creates a PDF file with a page size that is twice as wide as a landscape-oriented Letter-sized page:

```
sysout2pdf  
-param page-width 22in  
"/u/myid/report.txt"
```

### Create a PDF file using a filter

This example creates a PDF file using a filter that is specifically designed for the CICS PA wait analysis report. This filter creates bookmarks to each transaction code in the Wait Analysis report.

```
sysout2pdf  
-filter cpa-wait  
"/u/myid/wait0001.txt"
```

### Send the PDF file using email

This example creates the PDF file /u/myid/report.pdf, and then sends report.pdf by email to user@example.com:

```
sysout2pdf  
-mailto user@example.com  
"/u/myid/report.txt"
```

### Send the PDF file and input file using email, and then delete them

This example creates the PDF file /u/myid/report.pdf, sends it and the input file by email (-mailin) to user@example.com, and then removes (deletes) both the PDF file (-rmpdf) and the input file (-rmin). Use -rmin and -rmpdf when you only want the report by email, and you do not want to leave any files on z/OS UNIX.

```
sysout2pdf
-mailto user@example.com
-mailin
-rmin
-rmpdf
"/u/myid/report.txt"
```

## Send an email with custom subject line, from address, and body text

This example sends an email with the subject line "My CICS performance report", the from address "CICS PA", and the body text "PDF and plain-text versions attached".

```
sysout2pdf
-mailto user@example.com
-subject "My CICS performance report"
-from "CICS PA"
-body "PDF and plain-text versions attached"
-rmin
-rmpdf
"/u/myid/report.txt"
```

## Customizing the appearance of the PDF

You can use options in both the originating batch application and sysout2pdf to output an appropriate number of records on each page. You can also use a filter to add bookmarks to the generated PDF.

You might need to experiment to make the pages of your batch report fit neatly onto the pages of a PDF. There are several ways you can achieve this.

A typical 133-column-wide report fits neatly onto the default PDF style (landscape letter-size pages, half-inch margins, 9-point text). However, reports can be paginated with more lines per page than will fit using this style. Ideally, batch applications provide a parameter that allows you to adjust this value. For example, CICS Performance Analyzer provides the LINECNT parameter. LINECNT(45) works well with the default sysout2pdf style. Otherwise, you can specify a different page size (using the -style or -param command-line options) and a different font size (using -param).

For further customization, edit a copy of styles/default.xml, and use it via the -style command-line option. Note that styles/default.xml specifies encoding="IBM-1047" (that is, EBCDIC encoding) in the XML declaration.

**Adding bookmarks:** To add a bookmark to the PDF, use a filter to insert the following XML element at the bookmark target:

```
<bookmark id="id">title</bookmark>
```

where *id* is a unique identifier for the bookmark (not visible to users) and title is the title of the bookmark. To nest a bookmark under another bookmark, add a parent-id="id" attribute to the child bookmark, where *id* is the id attribute value of the parent bookmark. For example:

```
<bookmark id="secta">Section A</bookmark>
<bookmark id="subsecta1" parent-id="secta">Section A.1</bookmark>
```

See the supplied filters (in the filters directory) for examples.

## Coding tips for sysoutpdf jobs

These topics provide some tips on troubleshooting and on preparing batch report input and coding sysoutpdf jobs to avoid problems.

## STDPARM cannot have sequence numbers

If you use the ISPF editor to create the STDPARM file or STDPARM inline statements, set sequence numbers off by entering NUMBER OFF on the command line before you begin typing the data. If sequence numbers already exist, enter UNNUM to remove them and set number mode off. Otherwise, you will get an error such as the following in the STDERR job output data set (where *nnnnnnnn* is a line sequence number):

```
... sysout2pdf: Input file not found: nnnnnnnn
```

## Use REGION=0M to allocate memory to the JVM

Note the REGION=0M parameter on the EXEC statement for the BPXBATCH step. You can also specify this on the JOB statement. This parameter ensures that the Java Virtual Machine (JVM) has enough memory. If you omit REGION=0M, or you specify a REGION size that is too small, you will get errors similar to the following:

In the STDOUT job output data set:

```
<JIT: fatal error, failed to allocate 8192 Kb data cache>
```

In the STDERR job output data set:

```
JVMJ9VM015W Initialization error for library ... : cannot initialize JIT  
Could not create the Java virtual machine.
```

## If your report contains null (0) characters, specify the -nulltospace option

Some reporting applications generate reports that contain null characters instead of spaces. This can be problematic.

sysout2pdf uses the z/OS UNIX shell command sed to manipulate report text. If sed detects a null character in its input file, it issues the following message in the STDERR job output data set, and then stops:

```
FSUM9201 input file "[standard input]" is binary
```

To overcome this error, specify the -nulltospace option, which causes sysout2pdf to translate nulls to spaces before calling sed.

## Configure SMTP to accept maximum report size

If an email containing a requested report is not received and there is no error message from sysout2pdf, the problem may be in your sendmail configuration.

sysout2pdf uses the z/OS UNIX command sendmail to send email. sendmail uses the z/OS SMTP server. If an email exceeds the maximum number of bytes that the SMTP server accepts, the SMTP server discards the email, and writes the following error message to the MVS system log (SYSLOG):

```
EZA5501I Mail file too large. Data from username@example.com was discarded.
```

To overcome this error, ask your z/OS system administrator to increase the value specified by the MAXMAILBYTES statement in the SMTP configuration data set (supplied member name SMTPCONF).

## How sysout2pdf works

sysout2pdf is a z/OS UNIX shell script. sysout2pdf reformats a z/OS batch report as XML and then uses Apache FOP (an open-source tool) to output the report as PDF.

sysout2pdf performs the following steps:

1. If requested (by the -fold option), splits the input file into multiple lines by inserting newline characters at regular intervals. This is only necessary if the batch report does not contain end-of-record delimiters (in which case, the resulting z/OS UNIX file consists of a single, and possibly very long, line).
2. Replaces XML-significant characters (< > &) with references to the equivalent XML entities (<lt gt amp).
3. Unless the -nocc ("no carriage control") option was specified, treats the first column of each line as a carriage-control character. Converts some, ignores others (such as overstrike), and then removes the first column. For example, replaces "new page" characters except for the first with the XML tags:  
`</section><section>`

This means "end the current section, and then start another."

4. Applies a filter, if specified (by the -filter option).
5. Adds the following XML to the start of the file:  
`<?xml version="1.0"?>  
<report><section>`
6. Adds the following XML to the end of the file:  
`</section></report>`
7. Calls FOP to transform the XML into XSL-FO (a particular type of XML) according to the XSLT stylesheet, and then convert the XSL-FO to PDF.
8. If requested (by the -mailto option), sends an email containing the PDF.

---

## Chapter 15. Using the CICS PA commands

The CICS PA commands are used to request reports and extracts. If you use the CICS PA dialog to build and submit Report Sets, the commands are generated automatically, but you do have the opportunity to edit them before job submission.

The commands are specified in the **SYSD DD** statement of your CICS PA batch JCL. There are three ways to include the commands in your job stream:

1. You can code the commands directly under **//SYSD DD \***
2. You can precode the commands and store them in a member of a PDS which is then referenced in your JCL using  
`//SYSD DD DSN=pdsname(member),DISP=SHR`
3. You can precode commands and store them for future use in the CICS PA command library referenced by the **CMDLIB DD** statement in your JCL. The precoded commands can then be included in your job stream using the **COPY** or **INCLUDE** instruction under **//SYSD DD \*** (for further information see “COPY instruction” on page 526)

See Chapter 14, “JCL for reports and extracts,” on page 355 for a description and examples of the JCL for producing CICS PA reports and extracts.

---

### General command format

The standard command format for producing reports and extracts is:

Name	Command	Operands	Comments
name in columns 1-8 (or blank)	<b>CICSPA</b>	one or more operands	comments (or blank)

The general format of the command as it appears in the **SYSD DD** statement of your job stream is:

`CICSPA operand[(suboperand)][,operand[(suboperand)],...]`

#### Name

Optional. Identifies the command. It is a label from one to eight characters long and must start in column 1. It must not be a command name or an acceptable abbreviation of a command name.

#### Command

Required. The **CICSPA** command requests CICS PA reports and extracts.

#### Operands

One or more operands are required to specify which reports and extracts you want, and specify options for these.

An operand is either a report operand or a control operand:

1. A **report operand**. Each time one is specified, a new report or extract is created.
2. A **control operand**. When specified as a global operand before report operands, it affects *all* the following reports and extracts until it is next

specified. Each time it is specified, it overrides its previous setting. This is useful if you want to run multiple variations of a number of reports. (Note that **SELECT** is an exception to this rule; new selection criteria are *added* to those previously specified.)

Some control operands, such as **SELECT** and **LINECount**, might be specified as suboperands of report operands. As report-level operands, they apply only to the particular report or extract, and override the global specification.

Operands can be specified as many times as required, separated by commas. They can have suboperands and value lists. The rules for continuations, delimiters, and the formats of the operand values are described in “Rules for operands.”

#### **Comments**

Optional. Separated by at least one blank from the last operand on the line.

## **General conventions**

The format of the commands follows these general conventions:

- Any line with \* (an asterisk) in column 1 is treated as a comment (unless the asterisk is part of a continued quoted string).
- Column 72 is for continuation in some cases.
- Columns 73 through 80 of all lines are ignored.
- Blank lines are ignored.
- A single command can contain a maximum of 8191 characters.

## **Rules for operands**

The **CICSPA** command requires one or more operands, separated by commas, to identify the particular reports and extracts to produce, along with their associated options. Many operands can be abbreviated. They can contain suboperands and a list of values, positionally dependent, and enclosed in parentheses. For example, **ACTIVE(FROM(date,time),TO(date,time))**

### **Continuation rules**

An operand is normally continued by ending the first line with a comma and continuing anywhere on the next line.

You can use any number of continuation lines within the following limits:

- The maximum operand length is 4000 characters
- The maximum length of a character string in single quotation marks is 256 characters
- The maximum number of operands is 1000
- The maximum nesting depth is 254.

It is permissible to extend an operand to column 71, put a nonblank character in column 72, and continue anywhere on the next line. There are no restrictions as to where the operand must be divided when continuing.

A special rule applies to continuation of character strings enclosed in single quotation marks. To continue a quoted string, enter a nonblank character in column 72 and continue the string beginning in column 1 of the next line (this is the only case in which a restriction is placed on the beginning column of the continuation). Comments or blank lines enclosed in single quotation marks are processed as part of the quoted string.

## Delimiters

The following characters are used as operand delimiters:

### Quotation mark

Designates the beginning or ending of a literal, as for example, a heading. When a quoted string contains a quotation mark, use two quotation marks; for example, 'THAT"S ALL FOLKS'. CICS PA replaces each pair of consecutive quotation marks with a single quotation mark before processing the command string. The ending quotation mark of a quoted string can be followed by a comma or a left or right parenthesis. Quoted strings cannot exceed 256 characters.

### Dash or hyphen

Separates a range of values and, except when used in a quoted string, is treated as such. If a dash is followed by another delimiter, the second value is null.

### Parentheses

Enclose suboperands or values. The right parenthesis must be followed by another right parenthesis, a comma, a space, or a left parenthesis.

### Equal sign

Designates that a value follows. For example, A = B is treated as A(B). The equal sign can be used in this way only when followed by a single value. If you assign more than one value, use parentheses. When the equal sign is followed by a left parenthesis, it is ignored.

### Comma

Delimits operands. (Omit the comma when its use is redundant). Consecutive commas cause generation of a null in the scan list, and must be counted toward the maximum number of operands allowed.

## Operand value formats

Certain types of operand values are used in more than one command and have a standard format. These types are:

### Numeric values

In general, numeric values can be up to nine digits. Exceptions and specific maximum values are set by the individual command processors.

### Name values

In general, name values are from one to eight characters. They contain any combination of letters, numbers, and special characters except for blanks and the delimiters described previously.

### Date and Time values

These values are used with **FROM** and **TO** operands to assign a time value, a date value, or both. Specific rules for each are as follows.

#### Time

Time is always expressed as **hhmmss.th** for hours, minutes, seconds, and hundredths of a second. You can use delimiters to separate the time components (for example, **hh.mm.ss.th** or **hh:mm:ss.th**).

When delimiters are not used, the first two digits are assumed to be the hour, unless they exceed 23. In this case, only the first digit is the hour. For example, 55 is 5:50, 257 is 2:57, and 187 is 18:70 (an error).

When delimiters are used, each value component is checked for validity. For example, 35.54 is an error, but 3554 is assumed to be 3:55:40, which is valid.

## Date

A date can be either a calendar date or a relative date. If both the **FROM** and **TO** dates are specified, they must both be calendar dates or both relative dates.

## Calendar dates

A calendar date can be either Gregorian (**yyyy/mm/dd** for year/month/day) or Julian (**yy/ddd** for year/day-of-year). Several formats for each are allowed.

The date is recognized as Gregorian if the slash is used as a delimiter. Allowable formats are:

**yyyy/mm/dd**

**mm/dd** (the current year is assumed)

Leading zeros can be omitted from both month and day.

When the slash is not used, the date is assumed to be Julian. Allowable formats are:

**yy.ddd**

**yyddd**

**ddd** (the current year is assumed and leading zeros can be omitted in this format only)

**Note:** Two digit years provided as input are converted to:

**19yy** if yy is 50–99

**20yy** if yy is 00–49

For example, 99097 is converted to 1999097 (April 7, 1999) whereas 05026 is converted to 2005026 (January 26, 2005).

## Relative dates

A Relative Date can be specified as 0, -1, -2,... to signify a date relative to the current date. 0 represents today, -1 yesterday, -2 two days ago, and so on. If both **FROM** and **TO** dates are specified, they must be in the same format.

## Single Date or Time Values

If you need to specify only the date, use a comma to designate the missing time value. For example:

**TO=(2005/01/13,)**

If you need to specify only the time, it is unnecessary to precede the value with a comma to designate the missing date value. For example:

**TO=1230** or **FROM=510**

## Pairs of Date or Time values

Most commands allow a pair of date and time values. For example:

**FROM(2005/01/16,09:00),TO(2005/01/17,17:30)**

The following default values are provided if the value is not specified:

FROM date: 1973/01/01 (January 1, 1973)

TO date: 2025/12/31 (December 31, 2025)

FROM time: 00:00:00.00

TO time: 23:59:59.99

## CICSPA report operands

A **report operand** requests a report or extract each time it is specified. Report operands can be specified as many times as required.

Table 9 lists all the CICS PA reports and extracts. Each has a default format which you will get if you use only the command shown in the table.

Table 9. CICS PA report operands (default reports and extracts)

Command	Report or extract	Topic
<b>Performance Reports</b>		
CICSPA LIST	Performance List	"LIST - Performance List report" on page 390
CICSPA LISTX	Performance List Extended, Cross-System Work Extended	"LISTX - Performance List Extended report" on page 401
CICSPA SUMMARY	Performance Summary	"SUMMARY - Performance Summary report" on page 413
CICSPA TOTAL	Performance Totals	"TOTAL - Performance Totals report" on page 433
CICSPA WAIT	Wait Analysis	"WAITANALYSIS - Wait Analysis report" on page 435
CICSPA PROFILING	Transaction Profiling	"PROFILING - Transaction Profiling report" on page 438
CICSPA CROSSsystem	Cross-System Work	"CROSSsystem - Cross-System Work report and extract" on page 455
CICSPA TRANGROUP	Transaction Group	"TRANGROUP - Transaction Group report" on page 462
CICSPA BTS	CICS Business Transaction Services	"BTS - BTS report" on page 464
CICSPA WORKLOAD	Workload Activity	"WORKLOAD - Workload Activity report" on page 465
CICSPA TRACKINGLIST	Transaction Tracking List	"TRACKINGLIST - Transaction Tracking List report" on page 467
CICSPA TRACKINGSUMMARY	Transaction Tracking Summary	"TRACKINGSUMMARY - Transaction Tracking Summary report" on page 470
<b>Exception Reports</b>		
CICSPA LISTEXception	Exception List	"LISTEXC - Exception List report" on page 472
CICSPA SUMEXception	Exception Summary	"SUMEXC - Exception Summary report" on page 474
<b>Transaction Resource Usage Reports</b>		
CICSPA RESUSAGE	File Usage Summary, Temporary Storage Usage Summary, Distributed Program Link Usage Summary, Transaction Resource Usage List	"RESUSAGE - Transaction Resource Usage reports" on page 475
<b>Statistics Reports</b>		
CICSPA STATSALERT	Statistics Alert	"STATSALERT - Statistics Alert reports" on page 482
CICSPA CTGSTATISTICS	CICS TG Statistics Reports	"CTGSTATISTICS - CICS TG Statistics reports" on page 485
<b>Subsystem Reports</b>		

Table 9. CICS PA report operands (default reports and extracts) (continued)

Command	Report or extract	Topic
CICSPA DB2	DB2 Activity	"DB2 - DB2 report" on page 486
CICSPA MQ	WebSphere MQ Activity	"MQ - WebSphere MQ report" on page 491
CICSPA OMEGAMON	Adabas, CA-Datcom, CA-IDMS, or Supra Activity (as monitored by OMEGAMON)	"OMEGAMON - OMEGAMON reports" on page 493
<b>System Reports</b>		
CICSPA LOGGER	System Logger	"LOGGER - System Logger report and extract" on page 495
<b>Performance Graph Reports</b>		
CICSPA GRAPH(TRANRATE)	Transaction Rate	"GRAPH - Graph reports" on page 500
CICSPA GRAPH(RESPONSE)	Transaction Response Time	"GRAPH - Graph reports" on page 500
<b>Extracts</b>		
CICSPA CROSSsystem	Cross-System Work	"CROSSsystem - Cross-System Work report and extract" on page 455
CICSPA EXTRACTPERFORMANCE	Performance Data Extract	"EXTRACTPERFORMANCE - Performance data extract" on page 502
CICSPA LIST(DDNAME(xx))	Performance List Extract	"LIST - Performance List report" on page 390
CICSPA SUMMARY(DDNAME(xx))	Performance Summary Extract	"SUMMARY - Performance Summary report" on page 413
CICSPA RECSEL	Record Selection	"RECSEL - Record Selection extract" on page 504
CICSPA HDB(LOAD(hdbname))	HDB Load	"HDB(LOAD - HDB Load" on page 506
CICSPA LOGGER	System Logger	"LOGGER - System Logger report and extract" on page 495
CICSPA EXTRACTSTATISTICS	Statistics Extract	"EXTRACTSTATISTICS - Statistics extract" on page 507

If you want to tailor the reports and extracts to meet your particular information requirements, you must specify additional operands, suboperands, and possibly value lists. For example, **APPLID**, **INput**, and **SELECT** (see "CICSPA control operands" on page 384) are typically required to control the input, so too are **OUTPUT(ddname)** to control report output and **DDNAME(ddname)** to control extract output.

For details on how to use the report operands to request variations of the reports and extracts, turn to the corresponding page reference in Table 9 on page 375. For information on the output produced, see the *CICS Performance Analyzer for z/OS Report Reference*.

Some suboperands are common to many of the reports and extracts. See "Common options" on page 377 for a general discussion of these.

Other suboperands are peculiar to individual reports and extracts. Turn to the page references in Table 9 on page 375 for a discussion of these for each report and extract.

All CICS PA reports and extracts use CMF data as input and can be tailored by choosing which CMF data records and which fields are processed. There are two filtering methods:

1. The most versatile method to use is **SELECT** which allows inclusion (or exclusion) of specific records according to values in the fields of individual CMF records.
2. **FIELDS** can be used for the **LIST**, **LISTX**, and **SUMMARY** reports to specify which CMF fields to report, the order of the fields, and how the fields are summarized.

There are five data types for CICS-defined fields: **character**, **count**, **decimal**, **clock**, **time stamp**. For both filtering methods (**SELECT** and **FIELDS**), you will need to specify additional suboperands for CMF field types of **clock** and **time stamp** (unless defaults are assumed) to identify which of their formats you want.

There are effectively four data types for user fields: **character**, **count**, **clocktime**, **clockcount**. You will need to specify additional suboperands for user fields depending on the data type.

See “Tailoring using FIELDS” on page 380 and “Using SELECT statements” on page 508 for further information and examples.

## Common options

The following suboperands can be specified for many of the CICS PA reports or extracts:

**OUTPUT**  
**DDNAME**  
**EXTERNAL**  
**LINECount**  
**TITLE1** and **TITLE2**

Example:

```
CICSPA LISTX(  
    TITLE1('Report includes all transactions'),  
    TITLE2('**Please check response time in the Response field'),  
    LISTX(OUTPUT(LISTX2),  
        EXTERNAL(LISTXW2),  
        LINEC(50),  
        TITLE1('Report includes just the CPAX transaction'),  
        TITLE2('**Please check response time in the Resp field'),  
        SELECT(PERFORMANCE(INCLUDE(TRAN(CPAX)))))
```

This example will produce two Performance List Extended reports:

1. The first report is routed to the default DDname LSTX0001 with the default line count of 60. The work file used by the external sort will have the default DDname CPAXW001. The title line that will print on each page of the report is:

Report includes all transactions                      \*\*Please check response time in the Response field

2. Since the **SELECT** operand is used in the second report, it will contain records from the CPAX transaction only. It is routed to the DDname LISTX2 with a line count of 50. The work file used by the external sort will have the DDname LISTXW2. The title line that will print on each page of the report is:

Report includes just the CPAX transaction      \*\*Please check response time in the Resp field

## OUTPUT

The syntax is **OUTPUT(ddname)** or **OUTPUT=ddname**.

This provides the DDname of the output data set where a report is to be printed. It is important when you are running more than one report. To interleave multiple reports in a single output data set, specify the same DDname for each report. To direct each report to its own output data set, specify unique DDnames that refer to separate data sets.

If not specified, CICS PA assigns a default DDname xxxnnnnn where nnnn is a sequential number 0001-9999 to uniquely identify the report, and xxxx identifies the type of report:

<b>LIST</b>	Performance List report
<b>LSTX</b>	Performance List Extended report
<b>SUMM</b>	Performance Summary report
<b>TOTL</b>	Performance Totals report
<b>WAIT</b>	Wait Analysis report
<b>PROF</b>	Transaction Profiling report
<b>CROS</b>	Cross-System Work report
<b>TRGP</b>	Transaction Group report
<b>CBTS</b>	BTS report
<b>WKLD</b>	Workload Activity report
<b>TTLS</b>	Transaction Tracking List
<b>TTSU</b>	Transaction Tracking Summary
<b>XLST</b>	Exception List report
<b>XSUM</b>	Exception Summary report
<b>FILE</b>	File Usage Summary report
<b>TEMP</b>	Temporary Storage Usage Summary report
<b>DPLS</b>	Distributed Program Link Usage Summary report
<b>RESU</b>	Transaction Resource Usage List report
<b>STAL</b>	Statistics Alert reports
<b>STTG</b>	CICS Transaction Gateway Statistics reports
<b>DB2R</b>	DB2 report
<b>MQ00</b>	WebSphere MQ report
<b>OMEG</b>	OMEGAMON reports
<b>LOGR</b>	System Logger report
<b>GRTE</b>	Transaction Rate graph report
<b>GRSP</b>	Transaction Response Time graph report

**CROX** Cross-System Work Extract Recap report  
**EXPT** Performance Data Extract Recap report  
**RSEL** Record Selection Extract Recap report  
**HDBL** HDB Load Recap report  
**LOEX** System Logger Extract Recap report  
**STEX** Statistics Extract Recap report

## **DDNAME**

The syntax is **DDNAME(ddname)** or **DDNAME=ddname**.

This provides the DDname of the output data set where extract records are written. If not specified, CICS PA assigns a default DDname **CPAOxxnn** where nn is a sequential number **01-99** to ensure the data sets are uniquely identified, and xx indicates the type of extract:

**XS** Cross-System Work Extract data set  
**EX** Performance Data Extract data set  
**RS** Record Selection Extract data set  
**LE** System Logger Extract data set

## **EXTERNAL**

The syntax is **EXTERNAL(ddname)** or **EXTERNAL=ddname**.

This provides the DDname of the work data set used by the external SORT facility. If not specified, CICS PA assigns an External Work File from a pool of External Work Files with DDnames in the format **CPAXWnnn** where nnn is a sequential number **001-999** to uniquely identify the work file. There must be one External Work File specified in the JCL for each report that needs one. See “External sorting” on page 359 for information on the DD statements for External Work Files.

The following reports and extracts use external sorting:

**LISTX** Performance List Extended report  
**SUMMARY**  
 Performance Summary report (optional)  
**PROFILING**  
 Transaction Profiling report (optional)  
**CROSS**  
 Cross-System report and extract  
**TRANSGROUP**  
 Transaction Group report  
**BTS** BTS report  
**WORKLOAD**  
 Workload Activity report (possibly)  
**TRACKINGLIST**  
 Transaction Tracking List  
**TRACKINGSUMMARY**  
 Transaction Tracking Summary  
**STATSALERT**  
 Statistics Alert reports  
**DB2** DB2 report  
**LOGGER**  
 System Logger report and extract

## EXTRACTPERFORMANCE

Performance Data Extract (optional for Summary Form)

### LINECount

The syntax is **LINEC(nnn)** or **LINEC=nnn**.

Use this to specify the maximum number of lines, including headings, to print on each page of the report. The default is **60**.

LINECount can be specified as a global operand applying to multiple reports, or a suboperand of a particular report. The report-specific value takes precedence over the global for that report only.

This operand does not apply to the Extracts and System Logger report.

### TITLE1 and TITLE2

The syntax is **TITLE1('title\_first\_half')** and **TITLE2('title\_second\_half')**. This allows you to specify a title for your report to print on each page of the report below the report heading (see the example in Figure 189). The maximum length of the title field is **128** characters. Specify the first 64 characters, enclosed in single quotation marks, as **TITLE1**. If your title exceeds 64 characters, specify the remainder of the title, enclosed in single quotation marks, as **TITLE2**.

The **TITLE1** text is aligned with the left margin of the report, and the **TITLE2** text starts in column 65. To produce a centered title, use leading spaces.

```

Figure 189. Example of a report title

## Filtering using SELECT and SELECT2

The **SELECT** and **SELECT2** operands allow inclusion or exclusion of specific records according to values in the fields of individual records. **SELECT** and **SELECT2** provide the same Selection Criteria functionality. **SELECT2** is generated by the CICS PA dialog when the Report Form has Selection Criteria. If both **SELECT** and **SELECT2** are specified, the record must match both for the record to be processed. For a detailed discussion, see “Using **SELECT** statements” on page 508.

## Tailoring using FIELDS

The **FIELDS** operand allows you to tailor reports by requesting which CMF fields are reported, the order of the fields, and how the fields are summarized. **FIELDS** also allows you to insert columns for Application Groups. For details on how to do this for the particular reports:

- For the Performance List report, see “**LIST(FIELDS)**” on page 392.
- For the Performance List Extended report, see “**LISTX(FIELDS)**” on page 404.
- For the Performance Summary report, see “**SUMMARY(FIELDS)**” on page 415.

There are five types of CMF fields. The types are determined by CICS, defined in the CMF Dictionary record, and determine the field data type. The CMF field types are listed in Table 10.

Table 10. CMF field types

CMF field type	Description	Output length
<b>C – Character</b>	Character string	Variable
<b>A – Count</b>	Binary counter	8
<b>P – Decimal</b>	Packed decimal number	8
<b>S – Clock</b>	Accumulation of Clock time:	
<b>Time</b>	Elapsed Time in seconds	8
<b>Count</b>	Number of occurrences	8
<b>T – Time Stamp</b>	STCK Date/Time Stamp	5-12

### Suboperand APG for Application Groups

To include an Application Group in a report, specify the Application Group name with the suboperand APG. For example, to insert a report column for an Application Group named MYAPPGRP:

```
LIST(FIELDS(MYAPPGRP(APG),...))
```

The APG suboperand identifies MYAPPGRP as an Application Group instead of a CMF field.

In the JCL for the report, the DDname CPAHDBRG identifies the repository data set that defines the Application Group.

### Suboperands for Clock type fields

Use the suboperands **TIME** and **COUNT** when specifying a clock type field. Clock type fields contain two parts: one is an accumulation of elapsed time (**TIME**), and the other is a count of the number of times the condition occurred (**COUNT**). You can request one or both types; they are treated as separate fields. For example:

```
LIST(FIELDS(SUSPEND(TIME),SUSPEND(COUNT),DISPATCH(TIME)))
```

Any clock type field specified in **FIELDS** without **TIME** or **COUNT** is assigned the default of **TIME**. However, no default exists when a clock type field is requested in a **SELECT** statement, so in this case you *must* specify either **TIME** or **COUNT**.

The precision of **TIME** fields is 0.0001 to 0.000001 (microseconds) controlled by the global operand **PRECISION(n)** where n represents 4, 5 or 6 decimal places. The default is 4.

### Suboperands for Time Stamp fields

You need to specify the format in which you want time stamp type fields reported. The date and time formats are shown in the following table. Any time stamp field specified in **FIELDS** without a format is assigned the default of **TIMET**.

Table 11. Time stamp field formats

Type	Output format	Output field length
<b>DATE</b>	mm/dd/yyyy	10
<b>DATEISO</b>	yyyy-mm-dd	10
<b>DATETIME</b>	mm/dd	5

Table 11. Time stamp field formats (continued)

Type	Output format	Output field length
DATEYR	mm/dd/yy	8
TIMET	hh:mm:ss.thm	12
TIMEM	hh:mm	5
TIMES	hh:mm:ss	8
DATETIM	yyyy-mm-dd hh:mm:ss	19
TIMEP (output format determined by the PRECISION(n) operand: 4, 5, or 6 decimal places)	hh:mm:ss.thmi	13
	hh:mm:ss.thmij	14
	hh:mm:ss.thmiju	15

These format options are most commonly used with the **START** and **STOP** operands.

The syntax for using these is to list the options separated by commas and enclosed in parentheses, following **START** or **STOP**. For example:

```
CICSPA LIST(FIELDS(TRAN,TERM,USERID,
                  START(DATEYR,TIMET),
                  STOP(TIMEM)))
```

### Suboperands for User fields

CICS PA can access user fields in the CMF performance records. The user fields are defined in the CICS Monitoring Control Table (MCT) as either character type, count type, or clock type. As with CICS-defined clock type fields, user clock type fields have two parts: an elapsed time and a count of the number of times the condition occurred. When specifying user fields to CICS PA, the elapsed time part of clock type fields is called **CLOCKTIME**, and the count part of clock type fields is called **CLOCKCOUNT**. Therefore, CICS PA makes it appear as if there are four types of user fields: **CHARACTER**, **COUNT**, **CLOCKTIME**, **CLOCKCOUNT**.

When specifying user fields in the command stream, certain suboperands must be used to identify the user fields in the CMF performance record. The **OWNER** suboperand is common to all user fields. Use **OWNER** to specify the eight-character owner name of the user field.

The owner of the User Field is the entry name assigned to the User Field in the DFHMCT ID= macro specification. If the entry name is not specified in the ID= parameter, CICS assigns a default entry name or owner of 'USER'. CICS PA does not have a default owner name. Even if the owner name is USER, the **OWNER** suboperand must be specified.

The remaining suboperands are different for CHARACTER type fields versus numeric (COUNT, CLOCKTIME, CLOCKCOUNT)

#### CHARACTER type

Use the **OWNER** suboperand when specifying **CHARACTER** type fields. Only one character user field can be defined for each owner name.

The syntax is:

**CHARACTER(OWNER(owner)[,SUBSTR(offset,length)])**

When printing a character user field on the Performance List or Performance Summary report, CICS PA defaults to using the entire length (up to 8 characters for the Performance Summary report) of the character user field.

Use the **SUBSTR** suboperand to specify that only part of the character user field is to be printed.

The first value (**offset**) is the position of the first character to be printed (starting at 1), and the second value (**length**) is how many characters are to be printed. For example, if the character field value is "1234567", specifying **SUBSTR(1,2)** results in "12", and specifying **SUBSTR(3,3)** results in "345".

When character user fields are used in a SELECT statement, the SUBSTR operand *must* be specified.

### **COUNT, CLOCKTIME, and CLOCKCOUNT types**

Use the **OWNER** and **NUMBER** operands when specifying user field types **COUNT**, **CLOCKTIME**, and **CLOCKCOUNT**. Up to 256 count type fields and up to 256 lock type fields can be defined for each owner. The **OWNER** operand specifies the eight-character name of the user field owner. This is the entry name in the DFHMCT ID= macro specification for the user field, or the CICS-assigned default name of 'USER'. **NUMBER** operand specifies the three-digit number that identifies a specific count or clock type field.

The operand syntax is

```
COUNT(OWNER(owner),NUMBER(nnn))
CLOCKTIME(OWNER(owner),NUMBER(nnn))
CLOCKCOUNT(OWNER(owner),NUMBER(nnn))
```

All **COUNT**, **CLOCKTIME**, and **CLOCKCOUNT** type fields can be summarized in the Performance Summary report. Additional operands are then required to define the type of summarization (see "SUMMARY - Performance Summary report" on page 413).

Example:

Consider a DFHMCT User Fields definition for owner (or group) USEREMP which consists of the following fields:

- Character field FIELD1 with a length of 16
- Count field COUNT1
- Clock field CLOCK1

```
DFHMCT TYPE=EMP,
CLASS=PERFORM,
ID=(USEREMP.1),
CLOCK=(1,CLOCK1),
COUNT=(1,COUNT1),
FIELD=(1,FIELD1),
PERFORM=(SCLOCK(1),
ADDcnt(1,1),
MOVE(1,16))
```

The following command generates a Performance List report that shows the following user field values:

- The first 8 characters of FIELD1
- The last 8 characters of FIELD1
- The counter in COUNT1
- The elapsed time in CLOCK1
- The counter in CLOCK1

```
CICSPA LIST(FIELDS(TRAN,STYPE,USERID,
CHARACTER(OWNER(USEREMP),SUBSTR(1,8)),
CHARACTER(OWNER(USEREMP),SUBSTR(9,8)),
```

```
COUNT(OWNER(USEREMP),NUMBER(001)),
CLOCKTIME(OWNER(USEREMP),NUMBER(001)),
CLOCKCOUNT(OWNER(USEREMP),NUMBER(001)))
```

## CICSPA control operands

Control operands are used to specify factors that affect the content of reports and extracts.

The following table lists all the control operands showing the format of the command and description of the function.

Table 12. CICSPA control operands

Command	Control Function
<b>CICSPA APPLID</b>	Application identifier of the CICS systems from which data is processed. Most reporting occasions will filter on APPLID. However, if reporting on all APPLIDs is required, the command <b>CICSPA NOAPPLID</b> can be used.
<b>CICSPA PRECISION</b>	Precision of numeric fields. Specifies 4, 5, or 6 decimal places to report up to microseconds.
<b>CICSPA FORMAT</b>	Time and date delimiters to use for the reports and extracts.
<b>CICSPA INput</b>	DDnames of the SMF input data set(s). This required operand identifies the source of SMF records for the reports and extracts that follow.
<b>CICSPA LINECount</b>	Number of lines per page for the reports.
<b>CICSPA SELECT SELECT2</b>	Record selection for the reports and extracts. This is a powerful and flexible mechanism for filtering the input data.
<b>CICSPA SMFSTART SMFSTOP</b>	Start/Stop time period to limit the time range of SMF input data processed by CICS PA based on the SMF record time stamp.
<b>CICSPA READ2EOF</b>	Process all records through to EOF. That is, do not stop reading the SMF file as soon as the first record is encountered that is later than SMFSTOP.
<b>CICSPA ZONE</b>	Time zone for all reports and extracts, in number of hours west or east of Greenwich Mean Time (GMT).

Control operands are important for specifying how reports and extracts are created. These operands are normally coded before report operands, allowing them to apply to multiple reports. For example,

```
CICSPA ZONE=-8,TOTAL,SUMEXC
```

causes both the Performance Totals and Exception Summary reports to print as though the data came from time zone -8 (U.S. Pacific time).

If a control operand is specified more than once, the report operands will use the control operand immediately preceding it. This is useful if you want to create variations of one report. For example,

```
CICSPA ZONE=10,TOTAL,SUMEXC,ZONE=-8,TOTAL
```

This example creates two Performance Total reports, with the first printed as though the data came from time zone 10 (for example, Sydney), and the second printed as though from time zone -8. The Exception Summary report is printed as though the data came from time zone 10.

Except for SELECT, values are reset with a new CICSPA command. For example,

```
CICSPA ZONE=-8,TOTAL  
CICSPA TOTAL
```

This example creates two Performance Totals reports, with the first report printed as though the data came from time zone -8, and the second one printed as though from the default of the local time zone.

When a control operand is used, it affects all reports and extracts until a control operand is respecified or a new CICSPA command is issued. Note, however, that the CICSPA command does *not* reset the SELECT operand (see “Using SELECT statements” on page 508).

## APPLID

The syntax for this operand is **APPLID(applid1,...,applidn)** if one or more CICS systems, or **APPLID=applid** if only one. This operand specifies the generic application identifiers of the CICS systems whose data you want to process. When data from two or more systems is combined in one input data set, this operand can be used to select which set of data to process. APPLID can be coded before report operands to apply to multiple reports.

**NOAPPLID** can be used to report all APPLIDs with records in the SMF File.

Example 1:

```
CICSPA APPLID(CICSPROD),LIST,SUMMARY
```

This example shows the Performance List and Performance Summary reports requested for a CICS system identified by APPLID CICSPROD.

Example 2:

```
CICSPA APPLID(CICSP1,CICSP2),LIST  
CICSPA SUMMARY  
CICSPA NOAPPLID,TOTAL
```

This example generates the Performance List and Performance Summary reports for APPLIDs CICSP1 and CICSP2, and the Performance Totals report for *all* APPLIDs with records in the input file.

## PRECISION

The syntax is **PRECISION(n)** or **PRECISION=n**.

The precision of numeric fields, and of time stamp fields that specify the suboperand TIMEP. These fields can be formatted to either 4, 5, or 6 decimal places.

For example, specify PRECISION(6) to report microseconds. The default is 4.

## FORMAT

The **FORMAT** operand specifies the time and date delimiters for the reports and extracts. The syntax for this operand is **FORMAT(t,d)**.

- t** The first operand specifies the separator character for time-of-day displays. The default is a colon (:), which produces time displays such as 08:30:12.321.
- d** The second operand specifies the separator character for the date. The default is a slash (/), which produces date displays such as 2005/01/13.

Any character can be specified, but special characters such as a space, comma, or parenthesis must be enclosed within single quotation marks.

A single quotation mark, which is a special character, can be used as a delimiter. To specify it, use *two* single quotation marks to request the delimiter character, enclosed within the single quotation marks needed with special characters.

Example 1:

```
CICSPA FORMAT(' ',/)
```

specifies a space for the time delimiter and a slash for the date delimiter.

Example 2:

```
CICSPA FORMAT('','',/)
```

specifies a single quotation mark for the time delimiter and a slash for the date delimiter.

Example 3:

```
CICSPA FORMAT(:,/),LIST
```

specifies the default delimiters with a Performance List report.

Example 4:

```
CICSPA FORMAT('.', ' '),LIST
```

specifies a period for the time delimiter and a space for the date delimiter in this Performance List report.

## INput

The syntax for this operand is **INPUT(ddname1,ddname2,...)** if one or more CICS systems, or **INPUT=ddname** if only one. Use this operand to specify the ddnames of the input data sets or log stream for each CICS system to be reported. If not specified, the default ddname is **SMFIN**. The CICS PA dialog, however, assigns ddnames in the format **SMFINnnn** where *nnn* is a sequential number in the range **001-999** to uniquely identify each CICS system's data sets.

Example:

```
CICSPA INPUT(SMFIN004),  
          LIST,  
          SUMMARY
```

The input for the Performance List and Summary reports is taken from SMFIN004.

## Specifying data input

The input data sets to be processed by CICS PA reports and extracts must be specified in your JCL. To do this:

1. Nominate the data sets in the **SMFINnnn DD** statements of your JCL, where nnn is a sequential number **001-999** to uniquely identify the data sets. (CICS PA will accept other DDnames of your choosing.)
2. Code the command **CICSPA IN(ddname)** where ddname is **SMFINnnn** corresponding to the data files to be processed.

Figure 190 shows an example of the JCL.

```
//CICSPA JOB (Job Accounting)
//CPA      EXEC PGM=CPAMAIN
//SYSPRINT DD  SYSOUT=*
//* SMF Files for APPLID=APPL1
//SMFIN001 DD  DSN=CICS.APPL1.FILE1,DISP=SHR
//          DD  DSN=CICS.APPL1.FILE2,DISP=SHR,UNIT=AFF=SMFIN001
//* SMF Files for APPLID=APPL2
//SMFIN002 DD  DSN=CICS.APPL2.FILE1,DISP=SHR,UNIT=AFF=SMFIN001
//          DD  DSN=CICS.APPL2.FILE2,DISP=SHR,UNIT=AFF=SMFIN001
. . .
//SYSIN    DD  *
          CICSPA IN(SMFIN001),APPLID(APPL1),
              LIST(OUTPUT(LIST0001)),
              SUMMARY(OUTPUT(SUMM0001))
          CICSPA IN(SMFIN002),APPLID(APPL2),
              LIST(OUTPUT(LIST0002)),
              SUMMARY(OUTPUT(SUMM0002))
/*
//
```

Figure 190. Sample JCL Specifying Data Input

## LINECount

LINECount is a control operand or suboperand for any report. The syntax is **LINEC(nnn)** or **LINEC=nnn**. Use this operand to specify the maximum number of lines, including headings, to print on each page of the report. The default line count is 60.

Example 1:

```
CICSPA LINEC(40),
      LIST,
      LISTEXC
```

The number of lines per page is 40 for both the Performance List report and the Exception List report.

Example 2:

```
CICSPA LISTEXC,
      LIST(LINEC(40))
```

In this case, the LINECount suboperand only affects the Performance List report.

## SELECT

Use the SELECT operand to filter the input data that is reported. This operand allows you to select specific records for the reports according to values in individual CMF record fields or System Logger record fields.

One or more SELECT operands can be coded to allow control of multiple reports. It can also be used as a suboperand for any particular report or extract. For a detailed discussion on how this important operand works, see “Using SELECT statements” on page 508.

## SELECT2

The SELECT2 operand is the same as SELECT. When Selection Criteria are specified in a Report Form and also in a report that uses that Report Form, both SELECT and SELECT2 operands are used. CICS PA checks both, and both must match for the record to be processed.

## SMFSTART and SMFSTOP

Use these control operands to specify a time period to filter the input data before processing by all commands in the command input. CICS PA processes only those records with within the specified time period. If not specified, the entire input file is processed.

The syntax is:

```
CICSPA SMFSTART(date,time),  
      SMFSTOP(date,time)
```

*Date* is either a calendar date in the format *yyyy/mm/dd* or a relative date specified as 0, -1, -2,... to signify a date relative to the current date. 0 represents today, -1 yesterday, -2 two days ago, and so on.

- If both START and STOP dates are specified, they must be in the same format.
- If STOP date is not specified, it defaults to the end of file.
- If START date is not specified, it defaults to the first record in the data input file.

*Time* is a time-of-day in the format *hh:mm:ss.th*

- If START time is not specified, it defaults to the start of the day.
- If STOP time is not specified, it defaults to the end of the day.
- Times can span midnight.

### Note:

1. When filtering records in an SMF file, SMFSTART and SMFSTOP refer to the SMF record time stamps. When filtering records in a historical database (HDB), SMFSTART and SMFSTOP refer to transaction start times. HDBs do not contain SMF record time stamps.

Do not confuse these operands with the SELECT FROM and TO report interval operands, which refer to transaction start and stop times.

2. For the DB2 report, if protected threads are in use, specify an SMFSTOP time that is at least 5 minutes past the required time (FROM/TO report interval). This is to ensure that no DB2 accounting statistics are excluded that relate to CMF performance records that are included in the report.

Example 1:

```
CICSPA SMFSTART(-1,08:30:00.00),  
      SMFSTOP(0,17:30:00.00)
```

CICS PA will process only the data from 8:30a.m. yesterday until 5:30p.m. today. Data outside this time period is ignored.

Example 2:

```
CICSPA SMFSTART(2005/02/19,)  
      SMFSTOP(,)
```

CICS PA will process the data from February 19, 2005 until the end of file. Data before this date is ignored.

## READ2EOF

This operand forces CICS PA to process all records in the SMF file through to EOF. Normally CICS PA stops reading the SMF file as soon as the first record is encountered that is later than SMFSTOP. However, if the file is not in ascending time sequence, reading might end before all records earlier than SMFSTOP have been found.

This option is only effective when SMFSTOP is specified. Select it when the SMF file has been presorted and you want to ensure that all records within the SMFSTART and SMFSTOP time range are processed.

## ZONE

The syntax is **ZONE(n)** or **ZONE=n**.

This provides a way to override your local CPU time zone setting and convert CMF, DB2, MQ, and System Logger clock fields to a different time zone. It is only useful if the data you are reporting was generated by a system running with a different time zone.

CMF, DB2, MQ, and Logger records have clock fields in STCK format based on Greenwich Mean Time (GMT). CMF records have conversion factors that enable the clock fields to be converted to local time. However, if you are running the DB2, MQ, or System Logger reports against records from a system with a different time zone, then you must specify the time zone option.

Specify the time zone as an integer from -12 to +12 to represent the number of hours that local time is west or east of GMT. For example, specify -5 for New York, 10 for Sydney. CICS PA will then convert GMT STCK values to the required local time for all record types.

CICS PA JCL generation translates this field to the ZONE operand.

The default is blank (not specified). In this case, when the time zone is not specified, CICS PA does the following:

- For CMF records, the conversion factors SMFMNLSO (Leap Second Offset) and SMFMNDTO (Date/Time Offset) in the CMF record are used.
- For DB2, MQ, and Logger records, the conversion factors CVTLSO (Leap Second Offset) and CVTLDTO (Date/Time Offset) in the CVT are used, that is, the reporting system's time zone is used.

Example 1:

```
CICSPA ZONE(-5),  
      LIST,  
      SUMMARY
```

This example shows ZONE applied to multiple reports. Both the Performance List and Performance Summary reports are produced as if the input data came from the zone 5 hours west of GMT (for example, Toronto, New York, Lima).

Example 2:

```
CICSPA ZONE(8),  
      LIST,  
      SUMMARY
```

Both the Performance List and Performance Summary reports are produced as if the input data came from the zone 8 hours east of GMT (for example, Singapore, Perth).

---

## LIST - Performance List report

The **LIST** operand requests the Performance List report or an extract file (see “Performance Data extract” on page 253).

The command format for the Performance List report is:

```
CICSPA LIST(  
  [OUTPUT(ddname),]  
  [ALERTDEF(defname),]  
  [SEVERITY(CRITICAL|WARNING|INFO|ELIGIBLE|ALL),]  
  [FIELDS(field1[(options)],...),]  
  [LINECount(nnn),]  
  [TITLE1('...1st 64 characters of title...'),]  
  [TITLE2('...2nd 64 characters of title...'),]  
  [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...)),]  
  [SELECT2(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...))])
```

The command format for the List Extract is:

```
CICSPA LIST(  
  [OUTPUT(ddname),]  
  [DDNAME(ddname),]  
  [DELIMIT('field-delimiter'),]  
  [LABELS|NOLABELS,  
  [FLOAT,  
  [ALERTDEF(defname),]  
  [SEVERITY(CRITICAL|WARNING|INFO|ELIGIBLE|ALL),]  
  [FIELDS(field1[(options)],...),]  
  [TITLE1('...1st 64 characters of title...'),]  
  [TITLE2('...2nd 64 characters of title...'),]  
  [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...)),]  
  [SELECT2(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...))])
```

The options are:

### OUTPUT

Controls the report output DDname. See “OUTPUT” on page 378 for further information. If not specified, CICS PA assigns a DDname in the format **xxxxnnnn** where nnnn is the report sequence number **0001-9999** to uniquely identify the output, and xxxx is:

**LIST** for the Performance List report.

**EXPT** for the Recap report for the List Extract.

### DDNAME

Specifies the DDname of the extract data set where the extracted data is written. When this operand is specified, instead of producing the report, CICS PA produces the extract file, and a Recap of the extract process is written to the OUTPUT operand report file.

The DDname can be up to 8 alphanumeric characters, with the first non-numeric. The CICS PA dialog assigns DDnames in the format

**CPAOEXnn** where nn is the extract sequence number **01-99**. (See the sample JCL in Figure 187 on page 355).

#### **DELIMIT**

Specifies the field delimiter, enclosed in quotes, to be used to separate each data field in the extract data set. The default is a semicolon **DELIMIT(';')**.

#### **LABELS | NOLABELS**

**LABELS** indicates that the first record to be written to the extract data set is to be a field labels record. This is the default.

**NOLABELS** indicates that CICS PA is not to write a field labels record to the extract data set.

#### **FLOAT**

Write numeric fields in the extract in S390 **FLOAT** format. This only applies to the List Extract when the **FIELDS** operand is specified.

Specify **FLOAT** format if you plan to import the extract into a DB2 table. When the DB2 Load Utility is used, it will interpret all numerical fields reliably and consistently in **FLOAT** format.

If **FLOAT** is not specified, the numeric fields are written in a mixture of integer, real and exponential using character digits. This is the default and is suitable when importing the extract data into a PC spreadsheet tool.

#### **ALERTDEF**

The name of a Performance Alert Definition for alert reporting.

#### **SEVERITY**

Determines the minimum severity level to be reported and type of transactions reported.

##### **CRITICAL**

Only Critical transactions are reported.

##### **WARNING**

Only Critical and Warning transactions are reported.

**INFO** All alerts are reported: Critical, Warning and Informational transactions.

##### **ELIGIBLE**

Only eligible transactions are processed and reported. Eligible transactions are those that have resource values that match resource values specified in the alert definition. The resulting report will include eligible only transactions with and without alerts.

This option provides the means to filter out transactions that would never generate an alert because their resource values do not match resource values specified in the alert definition.

##### **ALL or blank**

All transactions are reported, whether or not they generate an alert and whether or not they are eligible. This is the default.

#### **FIELDS**

Specifies which fields are included in the report or extract, their order, and format. See “**LIST(FIELDS)**” on page 392 for details.

#### **LINECOUNT**

Controls the number of lines per page in the List report. See “**LINECount**” on page 380 for further information.

**TITLE1, TITLE2**

Controls the report title (left and right half of the subheading line) for the List report or the Extract Recap. See "TITLE1 and TITLE2" on page 380 for further information.

**SELECT|SELECT2(PERFORMANCE(INCLUDE|EXCLUDE**

Specifies what data to include or exclude from the report or extract based on data field values. See "Using SELECT statements" on page 508 for an explanation and examples.

**LIST(FIELDS**

The Performance List report can be tailored by modifying which fields and Application Groups are reported and the order in which they appear in the report. This is done with the **FIELDS** operand followed by the field and Application Group names:

```
CICSPA LIST[(FIELDS(field1[(options)][,apgname1(APG)],...))]
```

If FIELDS is not specified, the default is as if the following had been specified:

CICSPA LIST(FIELDS(TRAN,	Transaction ID
STYPE,	Start type of transaction
TERM,	Terminal ID
USERID,	User ID
RSYSID,	Remote System ID
PROGRAM,	Initial program name
TASKNO,	Transaction number
STOP(TIMET),	Stop time (hh:mm:ss.thm)
RESPONSE,	Response time
DISPATCH,	Dispatch time
CPU,	CPU time
SUSPEND,	Suspend time
DISPWAIT,	Dispatch wait time
FCWAIT,	File Control I/O wait time
FCAMCT,	File Control access method calls
IRWAIT))	Inter-Region (MRO) I/O wait time

**Note:**

1. The default report format cannot be changed on an individual field basis. Even if only one field is required to be changed from the default, the entire list of field names must be entered.
2. Some field types require additional operands. These are:
  - "Clock (Time-Count) fields" on page 394.
  - "Time Stamp fields" on page 393.
  - "User fields" on page 394.

CPU, DISPATCH, and FCWAIT are examples of clock type fields. Therefore, they could have been specified as CPU(TIME), DISPATCH(TIME), and FCWAIT(TIME). Instead they are allowed to assume the default TIME.

**Application Groups**

The command format is:

```
CICSPA LIST[(FIELDS(application-group-name(APG),...))]
```

**Character fields**

The command format is:

```
CICSPA LIST[(FIELDS(fieldnames))]
```

The character fields that can be selected for the Performance List report are listed in Chapter 28, “Fields by forms, HDB templates,” on page 757. Refer to the **LIST Report Form** column and the fields with data type **C** in their CMF Field ID.

### Time Stamp fields

The command format is:

```
CICSPA LIST[(FIELDS(START|STOP(date-time-format)))]
```

The time stamp fields are:

#### **START**

Task start time

#### **STOP**

Task stop time

One or more of the following formats can be selected for the time stamp fields for the Performance List report:

**DATE** Date in the format *mm/dd/yyyy*

#### **DATEISO**

Date in the format *yyyy-mm-dd*

#### **DATEM**

Date in the format *mm/dd*

#### **DATEYR**

Date in the format *mm/dd/yy*

#### **TIMET**

Time in the format *hh:mm:ss.thm*. This is the default if **START** or **STOP** is specified without a format.

#### **TIMEM**

Time in the format *hh:mm*

#### **TIMES**

Time in the format *hh:mm:ss*

#### **TIMEP**

Time in one of the following formats, according to the requested precision:

##### **4 (default)**

*hh:mm:ss.thmi*

**5** *hh:mm:ss.thmij*

**6** *hh:mm:ss.thmiju*

For more information on specifying time stamp fields, see “Suboperands for Time Stamp fields” on page 381.

### Count fields

The command format is:

```
CICSPA LIST[(FIELDS(fieldnames))]
```

For performance alert reporting, specify `fieldname(SEV)`.

The count fields that can be selected for the Performance List report are listed in Chapter 28, “Fields by forms, HDB templates,” on page 757. Refer to the **LIST Report Form** column and the fields with data type **A** in their CMF Field ID.

Optionally, numeric values can be converted for reporting by specifying one of the following:

**K** Divide value by 1000, typically for count fields

**M** Divide value by 1000000, typically for count fields

**KB** Kilobytes (divide by 1024), typically for storage fields

**MB** Megabytes (divide by 1024x1024), typically for storage fields

## Clock (Time-Count) fields

The format of the command is:

```
CICSPA LIST[(FIELDS(fieldname1(TIME|COUNT),...))]
```

For performance alert reporting, specify fieldname(SEV).

For clock type fields, you can report the first part of the field (elapsed TIME) or the second part (COUNT of the number of times the condition occurred). If neither is specified, the default is TIME. For more information on specifying clock fields, see "Suboperands for Clock type fields" on page 381.

The clock fields that can be selected for the Performance List report are listed in Chapter 28, "Fields by forms, HDB templates," on page 757. Refer to the **LIST Report Form** column and the fields with data type **S** in their CMF Field ID.

## Special (Time) fields

The command format is:

```
CICSPA LIST[(FIELDS(fieldnames))]
```

For performance alert reporting, specify fieldname(SEV).

Special time fields are accumulations of several CMF time fields.

The special time fields that can be selected for the Performance List report are:

### COMMWAIT

Communications wait time. The total time value of the communications related fields IRWAIT, ISWAIT, SZWAIT, TCWAIT, LU61WAIT, and LU62WAIT.

### IOWAIT

Total I/O wait time. The total time value of FCWAIT, JCWAIT, TDWAIT, and TSWAIT.

**IRESP** Transaction internal response time.

### JVMMTIME

JVM Method time:

JVMTIME - (JVMITIME + JVMRTIME)

### RESPONSE

Transaction response time.

### RMIOTIME

Resource Manager Interface (RMI) Other time:

RMISUSP - (IMSWAIT + DB2RDYQW + DB2CONWT + DB2WAIT)

Before CICS Version 620, RMIOTIME was RMIOOTHER. In CICS Version 620 and later, RMIOOTHER is a CICS CMF Field in the DFHRMI class.

### TOTCPU

Total task CPU time:

CPU + RLSCPU

## User fields

User fields can be one of the following types:

### CHARACTER

Character string

### COUNT

Binary or Packed counter

### CLOCKTIME and CLOCKCOUNT

The two parts of clock type fields:

## CLOCKTIME

The elapsed time part

## CLOCKCOUNT

The count of the number of times the condition occurred

The format of the command for requesting user fields in the Performance List report is:

For character type user fields:

```
CICSPA LIST[(FIELDS(Character(Owner(owner)
                    [,SUBSTR(offset,length)])))]
```

For numeric type user fields:

```
CICSPA LIST[(FIELDS(COUNT|CLOCKTIME|CLOCKCOUNT(
                    Owner(owner),NUMBER(nnn)))]
```

The options are:

### OWNER(owner)

Must be specified for all user field types. It is the 1-8 character owner of the user field, identified by the entry name in the ID= parameter of the TYPE=EMP entry in the MCT, or the CICS-assigned default name of *USER* (no entry name in the ID= parameter).

### SUBSTR(offset,length)

Optional. Applies to character fields only. It specifies that only part of the user field is to be reported; that part starting at the *offset* position (where 1 is the first character in the field) for the number of characters specified by *length*. If SUBSTR is not specified, the default is the entire field (although limited to 8 characters for the Performance Summary report).

### NUMBER(nnn)

Must be specified for all numeric types (COUNT, CLOCKTIME, CLOCKCOUNT). It specifies the three-digit number that identifies a specific count or clock type field. For each owner, up to 256 count type and up to 256 clock type user fields can be defined to CICS, whereas for character user fields, only one can be defined for each owner.

For more information on specifying user fields, see “Suboperands for User fields” on page 382.

## DBCTL fields

The command format is:

```
CICSPA LIST[(FIELDS(DBCTL(field1,field2,...)))]
```

If your MCT collects DBCTL User Data (using the DFH\$MCTD macro in SDFHSAMP), then the FIELDS operand can specify the DBCTL fields. See Chapter 28, “Fields by forms, HDB templates,” on page 757 for a list of these fields. Refer to the **LIST Report Form** column and the fields with owner **DBCTL** in their CMF Field ID.

**Note:** The IMS Performance Analyzer (IMS PA) can provide a comprehensive analysis of IMS DBCTL performance.

## LIST examples

A set of sample Report Forms is provided with CICS PA. See Table 6 on page 291 for the sample LIST Report Forms. You can use these sample Report Forms with

your Performance List report or Performance Data extract. They provide a detailed picture of the many aspects affecting CICS system performance.

Example 1: Default report.

```
CICSPA LIST
```

Example 2:

This example generates a Performance List report where most of the “time spent” fields are requested. For the FCWAIT field, both the TIME part and the COUNT part are requested. The DISPATCH, IOWAIT, IRWAIT, TSWAIT, TCWAIT, and JCWAIT fields default to show the TIME part. The SUSPEND field could also default to TIME.

```
CICSPA LIST(FIELDS(TRAN,RESPONSE,IRESP,DISPATCH,
                  SUSPEND(TIME),IOWAIT,FCWAIT(TIME,COUNT),
                  IRWAIT,TSWAIT,TCWAIT,JCWAIT))
```

Example 3:

This example generates a Performance List report where most of the File Control related fields are requested.

```
CICSPA LIST(FIELDS(TRAN,FCTOTAL,FCADD,FCAMCT,
                  FCBROWSE,FCDELETE,FCGET,FCPUT,
                  FCWAIT(TIME,COUNT)))
```

Example 4:

This example generates a Performance List report that contains user fields.

```
CICSPA LIST(FIELDS(TRAN,STYPE,USERID,
                  CHARACTER(OWNER(USEREMP),SUBSTR(1,8)),
                  CHARACTER(OWNER(USEREMP),SUBSTR(9,8)),
                  COUNT(OWNER(USEREMP),NUMBER(001)),
                  CLOCKTIME(OWNER(USEREMP),NUMBER(001)),
                  CLOCKCOUNT(OWNER(USEREMP),NUMBER(001))))
```

Example 5:

This example generates a Performance List report of only the performance class records with a transaction identifier of ABCD.

```
CICSPA IN(SMFIN002),
          SELECT(PERFORMANCE(INCLUDE(TRAN(ABCD))))),
          LIST
```

Example 6:

Few transaction abends have the value USER. This example generates a Performance List report of only those performance class records with an abend code of USER.

```
CICSPA SELECT(PERFORMANCE(INCLUDE(ABCODEC(USER))))),
          LIST
```

Example 7:

CICSPA LIST(FIELDS(TRAN,	Transaction ID
STYPE,	Start type of transaction
TERM,	Terminal ID
USERID,	User ID
START(TIMES),	Start time (hh:mm:ss)
STOP(TIMES),	Stop time (hh:mm:ss)

RESPONSE,	Response time
IRESP,	Internal response time
DISPATCH,	Dispatch time
CPU,	CPU time
SUSPEND,	Suspend time
DISPWAIT,	Dispatch wait time
RMISUSP,	RMI suspend time
IRWAIT,	Inter-Region (MRO) I/O wait time
FCWAIT,	File Control I/O wait time
FCAMCT))	File Control access method calls

This example produces a Performance List report like that shown in Figure 191.

Figure 191. Performance List report example (using FIELDS)

#### Example 8:

This example shows the Performance List report tailored to present File Control information.

```

CICSPA IN(SMFIN001),
  APPLID(applid1),
  SELECT(PERFORMANCE(INCLUDE(
    FCTOTAL(1-999999999))),
  LIST(
    OUTPUT(LIST0001),
    FIELDS(TRAN,          Transaction identifier
           PROGRAM,       Program name
           STOP(TIMES),   Task stop time
           RESPONSE,      Transaction response time
           DISPATCH(TIME), Dispatch time
           CPU(TIME),     CPU time
           SUSPEND(TIME), Suspend time
           FCWAIT(TIME),  File I/O wait time
           FCAMCT,        File access-method requests
           FCADD,         File ADD requests
           FCBROWSE,      File Browse requests
           FCDELETE,      File DELETE requests

```

FCGET,	File GET requests
FCPUT,	File PUT requests
FCTOTAL))	File Control requests

#### Example 9:

This example shows the Performance List report tailored to present Program Control information.

```

CICSPA IN(SMFIN002),
  APPLID(applid2),
  SELECT(PERFORMANCE(INCLUDE(
    PCLOADTI(1-999999999))),
  LIST(OUTPUT(LIST0002),
    FIELDS(TRAN,      Transaction identifier
            PROGRAM,   Program name
            PCLINK,    Program LINK requests
            PCLOAD,    Program LOAD requests
            PCLOADTM(TIME), Program Library wait time
            PCSTGHWM,  Program Storage HWM above and below 16MB
            PCXCTL,    Program XCTL requests
            PC24BHW,   Program Storage HWM below 16MB
            PC24CHWM,  Program Storage (CDSA) HWM below 16MB
            PC24RHWM,  Program Storage (RDSA) HWM below 16MB
            PC24SHWM,  Program Storage (SDSA) HWM below 16MB
            PC31AHWM,  Program Storage HWM above 16MB
            PC31CHWM,  Program Storage (ECDSA) HWM above 16MB
            PC31RHWM,  Program Storage (ERDSA) HWM above 16MB
            PC31SHWM)) Program Storage (ESDSA) HWM above 16MB

```

#### Example 10:

In this example, the Performance List report lists all transactions that use DBCTL.

```

CICSPA LIST(
  SELECT(PERFORMANCE(EXCLUDE(
    CHARACTER(OWNER(DBCTL), Exclude transaction if no PSB name
    SUBSTR(1,1),VALUE(' '))))),
  FIELDS(TRAN,      Transaction identifier
        PROGRAM,    Program name
        STOP(TIMES), Task stop time
        RESPONSE,    Transaction response time
        DISPATCH(TIME), Dispatch time
        CPU(TIME),   CPU time
        SUSPEND(TIME), Suspend time
        DBCTL(
          PSBNAME,    PSB Name
          DLICALLS,   Total DL/I Database calls
          POOLWAIT,   Elapsed wait time for Pool Space
          INTCWAIT,   Elapsed wait time for Intent Conflict
          SCHTELAP,   Elapsed time for Schedule Process
          DBIOELAP,   Elapsed time for Database I/O
          PILOCKEL,   Elapsed time for PI Locking
          THREDCPU))) Thread TCB CPU time

```

#### Example 11:

```

CICSPA IN(SMFIN004),
  SELECT(PERFORMANCE(EXCLUDE(
    CHARACTER(OWNER(DBCTL), Exclude transaction if no PSB name
    SUBSTR(1,1),VALUE(' '))))),
  LIST(FIELDS(
    TRAN,      Transaction identifier
    DBCTL(PSBNAME), PSB name
    START,     Task start time
    RESPONSE,  Transaction response time
    CPU,       CPU time

```

DISPATCH,	Dispatch time
SUSPEND,	Suspend time
DBCTL(	
POOLWAIT,	Elapsed wait time for Pool Space
INTCWAIT,	Elapsed wait time for Intent Conflict
SCHTELAP,	Elapsed time for Schedule Process
DBIOELAP,	Elapsed time for Database I/O
PILOCKEL,	Elapsed time for PI Locking
DBIOCALL,	Number of Database I/Os
DLICALLS)))	Total DL/I Database calls

This DBCTL example produces a Performance List report like that shown in Figure 192.

**Note:** The IMS Performance Analyzer (IMS PA) can provide a more comprehensive analysis of IMS DBCTL performance.

Figure 195. Performance Alerts List report

See the supplied sample jobs CPAPALST and CPAPAXTL in the SCPASAMP library.

## LISTX - Performance List Extended report

The LISTX operand requests the Performance List Extended report or the Cross-System Work Extended report.

The command format for the Performance List Extended report is:

```
CICSPA LISTX(
    [OUTPUT(ddname),]
    [EXTERNAL(ddname),]
    [BY(by1(ASCEND|DESCEND),
        by2(ASCEND|DESCEND),
        by3(ASCEND|DESCEND)),]
    [LIMIT(fieldname(proclim)),]
    [FIELDS(field1[(options)],...),]
    [LINECount(nnn),]
    [TITLE1('...up to 64 characters...'),]
    [TITLE2('...up to 64 characters...'),]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...)),]
    [SELECT2(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...))])
```

The command format for the Cross-System Work Extended report is:

```
CICSPA LISTX(
    [OUTPUT(ddname),]
    [EXTERNAL(ddname),]
    [BY(UOWID),]
    [PRINTMULTIPLE|NOPRINTMULTIPLE,]
    [PRINTSINGLE|NOPRINTSINGLE,]
    [FIELDS(field1[(options)],...),]
    [LINECount(nnn),]
    [TITLE1('...up to 64 characters...'),]
    [TITLE2('...up to 64 characters...'),]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...)),]
    [SELECT2(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...)),]
    [SELUOW(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...))])
```

The options are:

### OUTPUT

Controls the report output DDname. If not specified, CICS PA assigns a

DDname in the format **LSTXnnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

#### **EXTERNAL**

Specifies the DDname for the work data set used by the external SORT facility. If not specified, CICS PA assigns an External Work File from a pool of External Work Files with DDnames in the format **CPAXWnnn** where nnn is the sequence number **001-999**. See “EXTERNAL” on page 379 for further information.

#### **BY**

- For the Performance List Extended report:
  - BY dictates the summarization order of the report. Up to three fields can be specified, where *by1* is the major sort field, *by2* the intermediate, and *by3* the minor sort field. Not all fields can be sort fields. See “LISTX(BY(field1,field2,field3))” on page 403 for the list of fields which are sort candidates.

The default sort order is ASCEND (ascending). Specify DESCEND if you want a field sorted in descending order.

If BY is not specified, the default is BY(TRAN,TERM).
- For the Cross-System Work Extended report:

**BY(UOWID)** identifies that the CMF records are grouped by network unit-of-work. No other BY fields can be specified.

#### **PRINTMULTIPLE**

Print only the transaction performance records consisting of units-of-work that include multiple CMF records. This is the default for the report.

#### **NOPRINTMULTIPLE**

Do not print the transaction performance records consisting of units-of-work that include multiple CMF records.

#### **PRINTSINGLE**

Print the transaction performance records consisting of units-of-work that include only a single CMF record. To get a listing containing these records only, you must suppress the default PRINTMULTIPLE option by specifying NOPRINTMULTIPLE as well.

#### **LIMIT**

Optional. Limits the number of selected performance class records which are processed. Only one field can be specified. The LIMIT *fieldname* must be the same as one of the field names specified in the BY operand. See “LISTX(LIMIT)” on page 403 for the list of eligible fields.

*proclim* specifies the maximum number of records to be processed at a level corresponding to the location of the field parameter in the BY operand.

#### **FIELDS**

Specifies which fields are reported, the order of the columns, and the format of any time stamp fields. The sort fields specified in the BY operand must also be specified in the FIELDS operand. See “LISTX(FIELDS)” on page 404 for the complete list of fields and their options by field type.

#### **LINECOUNT**

Controls the number of lines per page. See “LINECount” on page 380 for further information.

**TITLE1, TITLE2**

Controls the report title (left and right half of subheading line). See “TITLE1 and TITLE2” on page 380 for further information.

**SELECT|SELECT2(PERFORMANCE(INCLUDE|EXCLUDE**

Specifies what data to include or exclude from the report based on data field values. See “Using SELECT statements” on page 508 for an explanation and examples.

**SELUOW(PERFORMANCE(INCLUDE|EXCLUDE**

Specifies what units-of-work to include or exclude from the Cross-System Work Extended report based on data field values. If one task in a multi-task UOW matches the selection criteria, then all tasks for that UOW are selected.

It can be used in conjunction with SELECT to first filter out those tasks that you know are of no interest and thereby optimize the record sort process.

**LISTX(BY(field1,field2,field3)**

The summarization order of the Performance List Extended report can be modified. This is done with the BY operand followed by one to three field names specified in the order of the required sort precedence:

```
CICSPA LISTX[(BY(field1([APG,]ASCEND|DESCEND),...))]
```

Ascending sequence is the default. Specify DESCEND for descending sequence.

If BY is not specified, the default is **BY(TRAN)**.

The sort fields that can be specified for the Performance List Extended report are Application Groups, user fields, or the CMF fields listed in Chapter 28, “Fields by forms, HDB templates,” on page 757 column and the fields marked S.

If the sort field is an Application Group, you must specify the APG suboperand. For example, to sort by the Application Group named MYAPPGRP, specify:

```
CICSPA LISTX(BY(MYAPPGRP(APG)))
```

**LISTX(BY(UOWID)**

```
CICSPA LISTX[(BY(UOWID))]
```

This requests the Cross-System Work Extended report in which the CMF records are grouped by network unit-of-work in ascending sequence. No other BY fields can be specified.

**LISTX(LIMIT**

The LIMIT operand can be specified for the Performance List Extended report to limit the number of records processed for a particular field. This field must be the same as one of the fields specified in the BY clause.

The format of the command is:

```
CICSPA LISTX[(LIMIT(fieldname([APG,]proclim)))]
```

where *fieldname* is one of the fields selected for “LISTX(BY(field1,field2,field3).” For example, to set a limit of 2 on a user field:

```
CICSPA LISTX(LIMIT(Character(Owner(CCVALIST),SUBSTR(1,16))(2)),...)
```

If the field is an Application Group, then you must specify the suboperand APG. For example, for an Application Group named MYAPPGRP:

```
CICSPA LISTX(LIMIT(MYAPPGRP(APG,20)),...)
```

## LISTX(FIELDS

The Performance List Extended report and Cross-System Work Extended report can be tailored by modifying which fields and Application Groups are reported and the order in which they appear in the report. This is done with the FIELDS operand followed by the field and Application Group names:

```
CICSPA LISTX[(FIELDS(field1[(options)],...))]
```

If the BY and FIELDS operands are not specified, the Performance List Extended report is produced with defaults:

```
CICSPA LISTX(BY(TRAN),
              FIELDS(TRAN,      Transaction ID
                     STYPE,      Start type of transaction
                     USERID,      User ID
                     RSYSID,      Remote System ID
                     PROGRAM,      Initial program name
                     TASKNO,      Transaction number
                     STOP(TIMET),  Stop time (hh:mm:ss.thm)
                     RESPONSE,     Response time
                     DISPATCH,     Dispatch time
                     CPU,          CPU time
                     SUSPEND,      Suspend time
                     DISPWAIT,     Dispatch wait time
                     FCWAIT,       File Control I/O wait time
                     FCAMCT,       File Control access method calls
                     IRWAIT))      Inter-Region (MRO) I/O wait time
```

This produces the default report shown in Figure 196 on page 405.

### Note:

1. The report format cannot be changed on an individual field basis. Even if only one field is required to be changed from the default, the entire list of field names must be entered.
2. Some field types require additional operands:
  - See “Time Stamp Fields” on page 405.
  - See “Clock (Time-Count) Fields” on page 406.

CPU, DISPATCH, and FCWAIT are examples of clock type fields. They could have been specified as CPU(TIME), DISPATCH(TIME), and FCWAIT(TIME). Instead they are allowed to assume the default TIME.

Figure 196. Performance List Extended report (default BY and FIELDS)

## Application Groups

The command format is:

```
CICSPA LISTX[(FIELDS(application-group-name(APG),...))]
```

## Character Fields

The command format is:

```
CICSPA LISTX[(FIELDS(fieldnames))]
```

The character fields that can be selected for the Performance List Extended report are listed in Chapter 28, “Fields by forms, HDB templates,” on page 757. Refer to the **LISTX Report Form** column and the fields with data type **C** in their CMF Field ID.

## Time Stamp Fields

The command format is:

```
CICSPA LISTX[(FIELDS(START|STOP(date-time-format)))]
```

The time stamp fields are:

### START

Task start time

### STOP

Task stop time

One or more of the following formats can be selected for the time stamp fields:

**DATE** Date in the format *mm/dd/yyyy*

**DATEISO**

Date in the format *yyyy-mm-dd*

**DATM**

Date in the format *mm/dd*

**DATEYR**

Date in the format *mm/dd/yy*

### **TIMET**

Time in the format hh:mm:ss.thm. This is the default if START or STOP is specified without a format.

### **TIMEM**

Time in the format hh:mm

### **TIMES**

Time in the format hh:mm:ss

### **TIMEP**

Time in one of the following formats, according to the requested precision:

#### **4 (default)**

*hh:mm:ss.thmi*

#### **5**

*hh:mm:ss.thmij*

#### **6**

*hh:mm:ss.thmiju*

For more information on specifying time stamp fields, see “Suboperands for Time Stamp fields” on page 381.

## **Count Fields**

The command format is:

```
CICSPA LISTX[(FIELDS(...,fieldname,...))]
```

The count fields that can be selected for the Performance List Extended report are listed in Chapter 28, “Fields by forms, HDB templates,” on page 757. Refer to the **LISTX Report Form** column and the fields with data type **A** in their CMF Field ID.

Optionally, numeric values can be converted for reporting by specifying one of the following:

**K** Divide value by 1000, typically for count fields

**M** Divide value by 1000000, typically for count fields

**KB** Kilobytes (divide by 1024), typically for storage fields

**MB** Megabytes (divide by 1024x1024), typically for storage fields

## **Clock (Time-Count) Fields**

The command format is:

```
CICSPA LISTX[(FIELDS(fieldname1(TIME|COUNT),...))]
```

For clock type fields, you can report the first part of the field (elapsed TIME) or the second part (COUNT of the number of times the condition occurred). The default is TIME. For more information on specifying clock fields, see “Suboperands for Clock type fields” on page 381.

The clock fields that can be selected for the Performance List report are listed in Chapter 28, “Fields by forms, HDB templates,” on page 757. Refer to the **LISTX Report Form** column and the fields with data type **S** in their CMF Field ID.

## **Special (Time) Fields**

The command format is:

```
CICSPA LISTX[(FIELDS(fieldnames))]
```

Special time fields are accumulations of several CMF time fields.

The special time fields that can be selected for the Performance List Extended report are:

**COMMWAIT**

Communications wait time. The total time value of the communications related fields IRWAIT, ISWAIT, SZWAIT, TCWAIT, LU61WAIT, and LU62WAIT.

**IOWAIT**

Total I/O wait time. The total time value of FCWAIT, JCWAIT, TDWAIT, and TSWAIT.

**IRESP** Transaction internal response time

**JVMMTIME**

JVM Method time:

$JVMTIME - (JVMITIME + JVMRTIME)$

**RESPONSE**

Transaction response time

**RMIOTIME**

Resource Manager Interface (RMI) Other time:

$RMISUSP - (IMSWAIT + DB2RDYQW + DB2CONWT + DB2WAIT)$

Before CICS Version 620, RMIOTIME was RMIOOTHER. In CICS Version 620 and later, RMIOOTHER is a CICS CMF Field in the DFHRMI class.

**TOTCPU**

Total task CPU time:

$CPU + RLSCPU$

**User fields**

User fields can be one of the following types:

**CHARACTER**

Character string

**COUNT**

Binary or Packed counter

**CLOCKTIME and CLOCKCOUNT**

The two parts of clock type fields:

**CLOCKTIME**

The elapsed time part

**CLOCKCOUNT**

The count of the number of times the condition occurred

The format of the command for requesting user fields in the Performance List Extended report is:

For character type user fields:

```
CICSPA LISTX[(FIELDS(CHARACTER(OWNER(owner)
[,SUBSTR(offset,length)])))]
```

For numeric type user fields:

```
CICSPA LISTX[(FIELDS(COUNT|CLOCKTIME|CLOCKCOUNT(
OWNER(owner),NUMBER(nnn)))]
```

The options are:

**OWNER(owner)**

Must be specified for all user field types. It is the 1-8 character owner of the user field, identified by the entry name in the ID= parameter of the TYPE=EMP entry in the MCT, or the CICS-assigned default name of *USER* (no entry name in the ID= parameter).

**SUBSTR(offset,length)**

Optional. Applies to character fields only. It specifies that only part of the user field is to be reported; that part starting at the *offset* position (where 1 is the first character in the field) for the number of characters specified by *length*. If SUBSTR is not specified, the default is the entire field (although limited to 8 characters for the Performance Summary report).

**NUMBER(nnn)**

Must be specified for all numeric types (COUNT, CLOCKTIME, CLOCKCOUNT). It specifies the three-digit number that identifies a specific count or clock type field. For each owner, up to 256 count type and up to 256 clock type user fields can be defined to CICS, whereas for character user fields, only one can be defined for each owner.

For more information on specifying user fields, see "Suboperands for User fields" on page 382.

**DBCTL fields**

The command format is:

```
CICSPA LISTX[(FIELDS(DBCTL(field1,field2,...)))]
```

If your MCT collects DBCTL User Data (using the DFH\$MCTD macro in SDFHSAMP), then the FIELDS operand can specify the DBCTL fields. See Chapter 28, "Fields by forms, HDB templates," on page 757 for a list of these fields. Refer to the **LISTX Report Form** column and the fields with owner **DBCTL** in their CMF Field ID.

**Note:** The IMS Performance Analyzer (IMS PA) can provide a comprehensive analysis of IMS DBCTL performance.

**LISTX examples**

A set of sample Report Forms is provided with CICS PA. See Table 6 on page 291 for the sample LISTX Report Forms. You can use these sample Report Forms with your Performance List Extended and Cross-System Work Extended reports. They provide a detailed picture of the many aspects affecting CICS system performance.

Example 1: Default report

```
CICSPA LISTX
```

This example generates the default Performance List Extended report.

Example 2: Worst response times (all transactions)

Figure 197 on page 409 shows an example of using the BY, LIMIT, and FIELDS operands to generate a Performance List Extended report sorted in descending order by response time. The LIMIT statement will limit the number of performance records processed to the first 20 and the resulting report will contain the 20 performance class records with the longest response time.

```
CICSPA LISTX(
    BY(RESPONSE(DESCEND)),
    LIMIT(RESPONSE(20)),
    FIELDS(TRAN,      Transaction ID
            TERM,      Terminal ID
            STYPE,      Start type of transaction
            USERID,     User ID
            RSYSID,     Remote System ID
            PROGRAM,    Initial program name
```

TASKNO,	Transaction number
STOP(TIMES),	Stop time (hh:mm:ss)
RESPONSE,	Response time
DISPATCH,	Dispatch time
CPU,	CPU time
SUSPEND,	Suspend time
DISPWAIT,	Dispatch wait time
FCWAIT,	File Control I/O wait time
IRWAIT))	Inter-Region (MRO) I/O wait time

Figure 197. Performance List Extended report (using BY, LIMIT, FIELDS)

### Example 3: Exclude CICS-supplied system transactions

Note that in the Performance List Extended report shown in Figure 197 some of the worst response times are for the CICS-supplied long running system transactions. So the following command can be used to create a more useful Performance List Extended report as shown in Figure 198 on page 410 by excluding those types of transactions.

```
CICSPA LISTX(SELECT(PERFORMANCE(
    EXCLUDE(TRAN(CSHQ,CSNC,CSNE,CSSY,CWXN))),
    BY(RESPONSE(DESCEND)),
    LIMIT(RESPONSE(20)),
    FIELDS(TRAN,
        TERM,
        STYPE,
        USERID,
        RSYSID,
        PROGRAM,
        TASKNO,
        STOP(TIMES),
        RESPONSE,
        DISPATCH,
        CPU,
        SUSPEND,
        DISPWAIT,
        FCWAIT,
        IRWAIT)))
```

TRAN,	Transaction ID
TERM,	Terminal ID
STYPE,	Start type of transaction
USERID,	User ID
RSYSID,	Remote System ID
PROGRAM,	Initial program name
TASKNO,	Transaction number
STOP(TIMES),	Stop time (hh:mm:ss)
RESPONSE,	Response time
DISPATCH,	Dispatch time
CPU,	CPU time
SUSPEND,	Suspend time
DISPWAIT,	Dispatch wait time
FCWAIT,	File Control I/O wait time
IRWAIT))	Inter-Region (MRO) I/O wait time

Figure 198. Performance List Extended report (filtering using SELECT)

## Example 4: Worst internal response time

But now the report is heavily influenced by some of the conversational transactions such as CBAM, CEDA, and CEMT. However, CICS PA provides a solution to this by using a special field name called IRESP (internal response time) which can be used to more easily interpret the actual response time by subtracting the terminal I/O wait time. So the following command will provide a Performance List Extended report sorted in descending order by Internal Response Time as shown in Figure 199 on page 411.

```

CICSPA LISTX(SELECT(PERFORMANCE(
    EXCLUDE(TRAN(CSHQ,CSNC,CSNE,CSSY,CWXN))),
    BY(IRESP(DESCEND)),
    LIMIT(IRESP(20)),
    FIELDS(
        TRAN,           Transaction ID
        TERM,           Terminal ID
        STYPE,          Start type of transaction
        USERID,         User ID
        RSYID,          Remote System ID
        PROGRAM,        Initial program name
        TASKNO,         Transaction number
        STOP(TIMES),    Stop time (hh:mm:ss)
        RESPONSE,       Response time
        IRESP,          Transaction internal response time
        DISPATCH,       Dispatch time
        CPU,            CPU time
        SUSPEND,        Suspend time
        DISPWAIT,       Dispatch wait time
        TCWAIT,         Terminal Control I/O wait time
        IRWAIT))

Figure 199. Performance List Extended report (sort by IRESP)

## Example 5: Worst response times by transaction

Figure 200 on page 412 shows another example of using the BY, LIMIT, and FIELDS operands to generate a Performance List Extended report sorted in descending order by response time within ascending order by transaction ID. The LIMIT statement will limit the performance class records processed to the first 10 records for each unique transaction ID. The resulting report is in ascending order by transaction ID, with a limit of 10 records for each unique transaction ID. These records will represent the longest response times for each transaction ID.

```

CICSPA LISTX(
    BY(TRAN(ASCEND),
        RESPONSE(DESCEND)),
    LIMIT(RESPONSE(10)),
    FIELDS(TRAN,           Transaction ID
            RESPONSE,      Response time
            TERM,           Terminal ID

Figure 200. Performance List Extended report (Top 10 Response Times by Transaction)

## Example 6:

An example of a Cross-System Work Extended report is shown in Figure 201 on page 413.

The commands to request this report are shown in the following example:

```

CICSPA IN(SMFIN001),
LISTX(OUTPUT(CROS0001),
EXTERNAL(CPAXW001),
NOPRINTMULTIPLE,PRINTSINGLE,
BY(UOWID),
FIELDS(TRAN, Transaction ID
RESPONSE, Response time
USERID, User ID
TASKNO, Transaction number
STOP(TIMET), Stop time (hh:mm:ss.thm)
DISPATCH(TIME), Dispatch time
DISPATCH(COUNT), Dispatch count
CPU(TIME), CPU time
SUSPEND(TIME), Suspend time
SUSPEND(COUNT), Suspend count
DISPWAIT(TIME), Dispatch wait time
DISPWAIT(COUNT), Dispatch wait count
IRWAIT(TIME))) Inter-Region (MRO) I/O wait time

```

To use the CICS PA dialog to request this report, specify a LIST or LISTX Report Form for the Cross-System Work report.

Tran	Response	Userid	TaskNo	Stop	Dispatch	Dispatch	User	CPU	Suspend	Suspend	DispWait	DispWait	IR	Wait

Figure 201. Cross-System Work Extended report

## SUMMARY - Performance Summary report

The **SUMMARY** operand requests the Performance Summary report or an Extract file (see “Performance Data extract” on page 253).

The command format for the Performance Summary report is:

```
CICSPA SUMMARY(
    [OUTPUT(ddname),]
    [EXTERNAL(ddname),]
    [NOTOTALS|TOTALS(n),]
    [INTERVAL(hh:mm:ss),]
    [ALERTDEF(alertname),]
    [SEVERITY(ELIGIBLE|ALL),]
    [FIELDS(field1[(options[,SEV(CRITICAL|WARNING|INFO,COUNT|PERCENT)])),...),]
    [LINECount(nnn),]
    [TITLE1('...1st 64 characters of title...'),]
    [TITLE2('...2nd 64 characters of title...'),]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...)),]
    [SELECT2(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...))])
```

The command format for the Summary Extract is:

```
CICSPA SUMMARY(
    [OUTPUT(ddname),]
    DDNAME(ddname),
    [DELIMIT('field-delimiter'),]
    [LABELS|NOLABELS,]
    [FLOAT,]
    [EXTERNAL(ddname),]
    [INTERVAL(hh:mm:ss),]
    [ALERTDEF(alertname),]
    [SEVERITY(ELIGIBLE|ALL),]
    [FIELDS(field1[(options[,SEV(CRITICAL|WARNING|INFO,COUNT|PERCENT)])),...),]
    [TITLE1('...1st 64 characters of title.of Recap...'),]
    [TITLE2('...2nd 64 characters of title.of Recap...'),]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...)),]
    [SELECT2(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...))])
```

The options are:

### OUTPUT

Controls the report output DDname. See “OUTPUT” on page 378 for further information. If not specified, CICS PA assigns a DDname in the format **xxxxnnnn** where **nnnn** is the report sequence number **0001-9999** to uniquely identify the output, and **xxxx** is:

- **SUMM** for the Performance Summary report
- **EXPT** for the Recap report for the Summary Extract

#### **DDNAME**

Specifies the DDname of the extract data set where the extracted performance data is written. When this operand is specified, instead of producing the Summary report, CICS PA writes the Performance Summary data to the extract file and a Recap of the extract process is written to the OUTPUT operand report file.

The DDname can be up to 8 alphanumeric characters, with the first non-numeric. The CICS PA dialog assigns DDnames in the format **CPAOEXnn** where nn is the extract sequence number **01-99**. (See the sample JCL in Figure 187 on page 355).

#### **DELIMIT**

Specifies the field delimiter, enclosed in quotes, to be used to separate each data field in the extract data set. The default is a semicolon **DELIMIT(';')**.

#### **LABELS|NOLABELS**

**LABELS** indicates that the first record to be written to the extract data set is to be a field labels record. This is the default.

**NOLABELS** indicates that CICS PA is not to write a field labels record to the extract data set.

#### **FLOAT**

Write numeric fields in the extract in S390 FLOAT format. This only applies to the Summary Extract when the FIELDS operand is specified.

Specify FLOAT format if you plan to import the extract into a DB2 table. When the DB2 Load Utility is used, it will interpret all numerical fields reliably and consistently in FLOAT format.

If FLOAT is not specified, the numeric fields are written in a mixture of integer, real and exponential using character digits. This is the default and is suitable when importing the extract data into a PC spreadsheet tool.

#### **EXTERNAL**

Specifies the DDname for the work data set used by the external SORT facility. This is optional for the Summary report and Extract. If specified, CICS PA performs an external sort. If not specified, CICS PA performs an internal sort where the records are sorted in storage by CICS PA. The CICS PA dialog always generates the EXTERNAL operand with a DDname in the format **CPAXWnnn** where nnn is the sequence number **001-999**. See "EXTERNAL" on page 379 for further information.

#### **NOTOTALS|TOTALS(n)**

The totals level applies only to the Summary report.

Specify TOTALS(1) to TOTALS(8) to accumulate subtotals for up to 8 sort fields, print the subtotals when the sort field changes, and print a grand total at the end of the report. Default: **TOTALS(8)**

Specify TOTALS(0) for no subtotals, but print only the grand total.

Specify NOTOTALS for neither subtotals nor grand total.

#### **INTERVAL**

Specifies a time interval when the report summarizes transaction activity over time. The interval is in the range 1 second to 24 hours in the format *hh:mm:ss* for hours, minutes, and seconds.

This operand applies only when any of START, STOP, or OSTART is specified in the FIELDS operand. For reporting, data is accumulated for each interval in the report period and a report line or extract record is written for each interval. If INTERVAL is not specified, the default is 00:01:00 (1 minute).

A time interval of less than one hour must fit evenly into the hour. CICS PA will round it down to the nearest interval that aligns to the hour. For example, 1.35 is reduced to 00:01:30 minutes which will produce 40 interval report lines for each hour of data.

A time interval of more than one hour must fit evenly into the day. CICS PA will round it down to the nearest interval that aligns to the day. For example, 10.30.23 is reduced to 08:00:00 hours which will produce 3 interval report lines for each day of data.

Minutes take precedence for an abbreviated entry. For example:

1 becomes 00:01:00

1.1 becomes 00:01:00 (rounded down from 00:01:01)

1.1.1 becomes 01:00:00 (rounded down from 01:01:01)

#### **ALERTDEF**

The name of a Performance Alert Definition for alert reporting.

#### **SEVERITY(ELIGIBLE)**

Only include alert eligible transactions.

#### **FIELDS**

Specifies which fields are reported, the order in which they appear in the report or extract, and their summarization presentation. See "SUMMARY(FIELDS" for further information and the complete list of fields and their options by field type.

**SEV** Specifies the field alert column.

#### **CRITICAL | WARNING | INFORMATIONAL**

Alert severity level for the column.

#### **COUNT | PERCENT**

Specifies whether the alert data should be reported as the total count or as a percentage of the total transactions for the summary key.

#### **LINECount**

Controls the number of lines per page in the Summary report. See "LINECount" on page 380 for further information.

#### **TITLE1, TITLE2**

Controls the report title (left and right half of subheading line) for the Performance Summary report or the Extract Recap. See "TITLE1 and TITLE2" on page 380 for further information.

#### **SELECT | SELECT2(PERFORMANCE(INCLUDE | EXCLUDE**

Specifies what data to include or exclude from the report or extract based on data field values. See "Using SELECT statements" on page 508 for an explanation and examples.

## **SUMMARY(FIELDS**

The Performance Summary report can be tailored by specifying which fields and Application Groups are reported, the order in which they appear in the report, and

the statistical functions used to summarize the data. This is done with the **FIELDS** operand followed by the field names, and for numeric fields, the function(s), and ordering sequence.

Up to 8 sort key fields can be specified, and at least one must be specified. The order of the key fields in the list defines the sort precedence, with the first key field being the major sort field. For each key field, the report can be ordered in ascending (**ASCEND**) or descending (**DESCEND**) sequence. The default is ascending. Sort key fields identify the grouping required for summarization, and can be any time stamp field, such as START and STOP time, any Application Group, or any character field, including character user fields.

The sort key fields must be specified first in the list ahead of the numeric fields. The only fields that can appear ahead of a key field are TASKCNT or TASKTCNT.

In addition to the sort key fields, one numeric field can be selected as ascending or descending to activate **Alternate Sequencing**. This will change the order of report lines from sort key to numeric field sequence. For example, specify RESPONSE(DESCEND) to see the transactions with the highest response time at the top of the report. Note that grouping by sort key remains unaffected by alternate sequencing.

The format of the command is:

- For Application Groups (see “Application Groups” on page 419):  

```
CICSPA SUMMARY(
    FIELDS(application-group-name(APG,ASCEND|DESCEND),...)
```
- For CICS-defined character fields (see “Character fields” on page 419):  

```
CICSPA SUMMARY(
    FIELDS(field1,field2,...))
```
- For CICS-defined count fields (see “Count fields” on page 420):  

```
CICSPA SUMMARY(
    FIELDS(field1(AVE|DEV|MAX|MIN|TOT|SEV|nn
        |RNGCOUNT(range)|RNGPERCENT(range)
        |SEV(CRITICAL|WARNING|INFO,COUNT|PERCENT)),
        ASCEND|DESCEND,K|M|KB|MB,...),...))
```
- For CICS-defined clock fields (see “Clock (Time-Count) fields” on page 420):  

```
CICSPA SUMMARY(
    FIELDS(field1(TIME|COUNT(AVE|DEV|MAX|MIN|TOT|SEV|nn
        |RNGCOUNT(range)|RNGPERCENT(range)
        |SEV(CRITICAL|WARNING|INFO,COUNT|PERCENT)),
        ASCEND|DESCEND,...),...))
```
- For character type user fields (see “User fields” on page 421):  

```
CICSPA SUMMARY(
    FIELDS(Character(OWNER(owner)[,SUBSTR(offset,length)]),...))
```
- For count and clock type user fields (see “User fields” on page 421):  

```
CICSPA SUMMARY(
    FIELDS(COUNT|CLOCKTIME|CLOCKCOUNT(
        OWNER(owner),NUMBER(nnn),AVE|DEV|MAX|MIN|TOT|nn,
        ASCEND|DESCEND),...))
```

**TASKCNT** and **TASKTCNT** are special fields that are computed by CICS PA.

- **TASKCNT** reports the number of performance records that are included in each summary line. TASKCNT can be reported anywhere on the print line by including it in the FIELDS specification.
- **TASKTCNT** gives the total number of CMF task termination records processed.

Specify whether to use TASKCNT or TASKCNT for the summary statistical calculations. If both are specified, the first one is used in the calculations.

If character type fields are specified in the FIELDS list, they must be specified first (except for TASKCNT or TASKCNT which can be ahead or amongst them).

All numeric fields (except TASKCNT and TASKCNT) are summarized using any number of the following statistical functions:

- AVE** Average (this is the default if a field is specified without a function).
- DEV** Standard deviation.
- MAX** Maximum value.
- MIN** Minimum value.
- TOT** Totals.
- SEV** Severity level totals.
- nn** nn% peak percentile, for example, 95%. To calculate peak percentiles, CICS PA accumulates the summarized data and then provides a statistical estimate that assumes the data is normally distributed. If the data is not normally distributed, then the peak percentiles will not be accurate: consider using the Range (RNGCOUNT or RNGPERCENT) function to show the exact number or percentage of records that fall within a specified range of values. The Range function provides exact figures that do not assume that the data is normally distributed.

#### **RNGCOUNT(range) or RNGPERCENT(range)**

Range. These functions calculate the number of tasks where the value of a field falls within a specified range or matches a single value. RNGCOUNT displays the result as a count; RNGPERCENT displays the result as a percentage of tasks.

The range can be one of:

- *lower limit - upper limit*

For example, RNGCOUNT(0.1-0.2)

To fall within the range, a field value must be greater than or equal to the lower limit, and less than the upper limit:

*lower limit <= field value < upper limit*

- *operator value*

That is, one of the following comparison operators followed by a value:

= > >= < <=

For example, RNGPERCENT(<50)

For time fields, values with a decimal place (such as 1.0) are interpreted as seconds; integers (such as 1000) are interpreted as milliseconds.

You cannot use RNGCOUNT or RNGPERCENT to report from an HDB.

**Tip:** RNGCOUNT and RNGPERCENT generate identical column headings. To distinguish between columns for percentages and counts, check the column values under the headings: percentages appear with a decimal point, whereas counts are integers, and hence have no decimal point.

Here are some example uses of RNGCOUNT and RNGPERCENT:

**RESPONSE(RNGCOUNT(<0.9))**

Count of tasks with response time less than 0.9 seconds.

**RESPONSE(RNGPERCENT(0.5-1.0))**

Percentage of tasks with response time  $\geq 0.5$  and  $< 1$  seconds.

**FCAMCT(RNGCOUNT( $\geq 10$ ))**

Count of tasks with 10 or more file access-method requests.

**CPU(TIME(RNGCOUNT( $>0.5$ )))**

Count of tasks with CPU time greater than 0.5 CPU seconds.

**SUSPEND(TIME(RNGCOUNT( $>800$ )))**

Count of tasks with suspend time greater than 800 milliseconds (0.8 seconds).

**SUSPEND(COUNT(RNGPERCENT( $>5$ )))**

Percentage of tasks suspended more than 5 times.

**EJBTOTAL(RNGCOUNT( $=0$ ))**

Count of tasks with no EJB activity.

**EJBTOTAL(RNGCOUNT( $>0$ ))**

Count of tasks with EJB activity.

For performance alert reporting, specify

**SEV(CRITICAL | WARNING | INFO,COUNT | PERCENT).**

Optionally, count values can be converted for reporting by specifying one of the following:

<b>K</b>	Divide value by 1000, typically for count fields
<b>M</b>	Divide value by 1000000, typically for count fields
<b>KB</b>	Kilobytes (divide by 1024), typically for storage fields
<b>MB</b>	Megabytes (divide by 1024x1024), typically for storage fields

If the FIELDS operand is omitted, the default is:

CICSPA SUMMARY(	
FIELDS(TRAN(ASCEND),	Transaction ID
TASKCNT,	Number of CMF Records
RESPONSE(AVE,MAX),	Avg/Max Response Time
DISPATCH,	Avg Dispatch Time
CPU,	Avg CPU Time
SUSPEND(AVE,MAX),	Avg/Max Suspend Time
DISPWAIT,	Avg Dispatch Wait Time
FCWAIT,	Avg File Control I/O Wait Time
FCAMCT,	Avg FC Access Method Calls
IRWAIT,	Avg Inter-Region I/O Wait Time
SC24UHW,	Avg User Storage HWM below 16MB
SC31UHW))	Avg User Storage HWM above 16MB

**Note:**

1. CPU, DISPATCH, SUSPEND, DISPWAIT, IRWAIT, and FCWAIT are clock type fields. They are allowed to default to TIME(AVE), but equally you could specify CPU(TIME) or CPU(TIME(AVE)), DISPATCH(TIME) or DISPATCH(TIME(AVE)).
2. Two statistical functions are selected for the RESPONSE field. Specifying FIELDS(RESPONSE(AVE,MAX)) is the same as specifying FIELDS(RESPONSE,RESPONSE(MAX)) or FIELDS(RESPONSE(AVE),RESPONSE(MAX)).

## Customizing or suppressing default fields

If you specify a FIELDS operand that contains only sort key fields with or without the special TASKCNT or TASKTCNT fields, then the report contains those explicitly specified fields instead of the default sort key field TRAN, followed by the remaining default fields. This enables you to customize the sort order of the default report without explicitly specifying all of the fields in the report.

To suppress the default fields, so that the report contains only the fields explicitly specified by the FIELDS operand, you must specify at least one field that is not a sort key, and that is not TASKCNT or TASKTCNT.

For example, if you specify  
FIELDS(APPLID,TRAN,ABCODEO,PROGRAM,TASKCNT), then the report contains those explicitly specified fields, followed by the default fields, except for the default sort key field TRAN. In this example, if you append to the FIELDS operand a numeric field such as RESPONSE, then the report contains only the fields explicitly specified by the FIELDS operand.

## Application Groups

The command format is:

```
CICSPA SUMMARY(FIELDS(application-group-name(APG,ASCEND|DESCEND),...))
```

## Character fields

Up to eight character fields are allowed in the FIELDS list. The format of the command is:

- For CICS-defined fields:

```
CICSPA SUMMARY(FIELDS(field1,field2,...))
```

The CICS-defined character fields that can be selected for the Performance Summary report are listed in Chapter 28, “Fields by forms, HDB templates,” on page 757. Refer to the **SUMMARY Report Form** column and the fields with data type C in their CMF Field ID.

- For character type user fields:

```
CICSPA SUMMARY(FIELDS(...,CHARACTER(OWNER(owner)[,SUBSTR(offset,length)]),...))
```

### OWNER

The eight-character name of the owner of the user field. This is the entry name in the DFHMCT ID= macro specification for the user field, or the CICS-assigned default name of *USER*.

### SUBSTR(offset,length)

This is used to report only part of the user field, up to 8 characters from the specified offset in the field. If SUBSTR is omitted, the entire field, limited to the first eight (8) characters, is reported.

## Time Stamp fields

The format of the command is:

```
CICSPA SUMMARY(FIELDS([START(TIMES)],[STOP(TIMES)],[OSTART(TIMES)],...))
```

If specified, the Performance Summary report summarizes transaction activity over time, in specified intervals of time (default 1 minute).

The time stamp fields are:

### START

Task start time

### STOP

Task stop time

## OSTART

Originating task start time

One or more of the following formats can be selected for the time stamp fields:

**DATE** Date in the format *mm/dd/yyyy*

## DATEISO

Date in the format *yyyy-mm-dd*

## DATEM

Date in the format *mm/dd*

## DATEYR

Date in the format *mm/dd/yy*

## TIMET

Time in the format *hh:mm:ss.thm*

## TIMEM

Time in the format *hh:mm*

## TIMES

Time in the format *hh:mm:ss*. This is the default if START or STOP is specified without a format.

## DATETIM

Date and time in the format *yyyy-mm-dd hh:mm:ss*

For more information on specifying time stamp fields, see “Suboperands for Time Stamp fields” on page 381.

## Count fields

The format of the command is:

```
CICSPA SUMMARY(  
    FIELDS(fieldname(AVE|DEV|MAX|MIN|TOT|SEV|nn,  
                     ASCEND|DESCEND,K|KB|M|MB,...),...))
```

The count fields that can be selected for the Performance Summary report are listed in Chapter 28, “Fields by forms, HDB templates,” on page 757. Refer to the **SUMMARY Report Form** column and the fields with data type **A** in their CMF Field ID.

## Clock (Time-Count) fields

The format of the command is:

```
CICSPA SUMMARY(  
    FIELDS(field1(TIME|COUNT(AVE|DEV|MAX|MIN|TOT|SEV|nn,  
                           ASCEND|DESCEND,...)),...))
```

For clock type fields, you can report the first part of the field (elapsed TIME) or the second part (COUNT of the number of times the condition occurred).

The default is to present the average elapsed time (**TIME(AVE)**). If only COUNT is specified, the average (**AVE**) is the default. If another function (other than the average) is required for either TIME or COUNT parts, both parameters must be specified. For example:

```
CICSPA SUMMARY(FIELDS(...,  
    SUSPEND,                average elapsed suspend time  
    SUSPEND(COUNT),         average number of times the transaction was suspended  
    SUSPEND(TIME(DEV)))    standard deviation of the elapsed suspend time
```

For more information on using clock fields, see “Suboperands for Clock type fields” on page 381.

The clock fields that can be selected for the Performance Summary report are listed in Chapter 28, “Fields by forms, HDB templates,” on page 757. Refer to the **SUMMARY Report Form** column and the fields with data type **S** in their CMF Field ID.

## Special (Time) Fields

The command format is:

```
CICSPA SUMMARY(
    FIELDS(fieldname(AVE|DEV|MAX|MIN|TOT|SEV|nn,ASCEND|DESCEND,...),...))
```

Special time fields are derived from several CMF time fields. Those that can be selected for the Performance Summary report are:

**IRESP** Transaction internal response time

**JVMMTIME**

JVM Method time:

JVMTIME - (JVMITIME + JVMRTIME)

**RESPONSE**

Transaction response time

**RMIOTIME**

Resource Manager Interface (RMI) Other time:

RMISUSP - (IMSWAIT + DB2RDYQW + DB2CONWT + DB2WAIT)

Before CICS Version 620, RMIOTIME was RMIOOTHER. In CICS Version 620 and later, RMIOOTHER is a CICS CMF Field in the DFHRMI class.

**TOTCPU**

Total task CPU time:

CPU + RLSCPU

## User fields

User fields can be one of the following types:

**CHARACTER**

Character string

**COUNT**

Binary or packed counter

**CLOCKTIME and CLOCKCOUNT**

The two parts of clock type fields are:

**CLOCKTIME**

The elapsed time part

**CLOCKCOUNT**

The count of the number of times the condition occurred

All types of user fields can be specified in the Performance Summary report. The format of the command is:

- For character type user fields:

```
CICSPA SUMMARY(
    FIELDS(CHARACTER(OWNER(owner)[,SUBSTR(offset,length)]),...))
```

- For count and clock type user fields:

```
CICSPA SUMMARY(
    FIELDS(COUNT|CLOCKTIME|CLOCKCOUNT(
        OWNER(owner),NUMBER(nnn),AVE|DEV|MAX|MIN|TOT|nn,
        ASCEND|DESCEND,k|KB|M|MB),...))
```

The options are:

**OWNER(owner)**

Must be specified for all user field types. It is the 1-8 character owner of the user field, identified by the entry name in the ID= parameter of the TYPE=EMP entry in the MCT, or the CICS-assigned default name of *USER*.

**SUBSTR(offset,length)**

Optional. Applies to CHARACTER fields only. SUBSTR specifies that only part of the user field is to be reported. *Offset* is the starting position (from 1) in the character field, and *length* is the number of characters from that position to include. If SUBSTR is not specified, the default is the entire field up to a limit of 8 characters for this report.

**NUMBER(nnn)**

Must be specified for all numeric types (COUNT, CLOCKTIME, CLOCKCOUNT). It specifies the three-digit number that identifies a specific count or clock type field. For each owner, up to 256 count type and up to 256 clock type user fields can be defined to CICS, whereas only one character field can be defined for each owner.

**AVE | DEV | MAX | MIN | TOT | nn | RNGCOUNT(range) | RNGPERCENT(range)**

All count and clock type fields are summarized and can be presented using the same statistical functions available to CICS-defined fields.

However, unlike CICS-defined fields, you can specify only one function per user field. If more than one function is to be used, the entire specification must be repeated. For example, the following command generates a Performance Summary report summarized by transaction and terminal, and displaying the maximum, minimum, and average elapsed times.

```
CICSPA SUMMARY(
    FIELDS (TRAN,TERM,TASKCNT,
            CLOCKTIME(OWNER(USER),NUMBER(001),MAX),
            CLOCKTIME(OWNER(USER),NUMBER(001),MIN),
            CLOCKTIME(OWNER(USER),NUMBER(001))) )
```

For more information on specifying user fields, see “Suboperands for User fields” on page 382.

**DBCTL fields**

The command format is:

```
CICSPA SUMMARY(FIELDS(DBCTL(field1(func,order),field2(func,order),...)))
```

where *func* is one of the functions AVE, DEV, MAX, MIN, TOT, nn, and *order* is ASCEND or DESCEND. The default is **(AVE,ASCEND)**.

If your MCT collects DBCTL User Data (using the DFH\$MCTD macro in SDFHSAMP), then the FIELDS operand can specify DBCTL fields. These are listed in Chapter 28, “Fields by forms, HDB templates,” on page 757. Refer to the **SUMMARY Report Form** column and the fields with owner **DBCTL** in the CMF Field ID.

**Note:** The IMS Performance Analyzer (IMS PA) can provide a comprehensive analysis of IMS DBCTL performance.

## SUMMARY examples

A set of sample Report Forms is provided with CICS PA. See Table 6 on page 291 for the sample SUMMARY Report Forms. You can use these sample Report Forms with your Performance Summary reports and extracts. They provide a detailed picture of the many aspects affecting CICS system performance.

Example 1: Default report

```
CICSPA SUMMARY
```

Example 2: External sort

This example produces the default Performance Summary report using an external sort. CPAXW001 is the DDname of the External Work File.

```
CICSPA SUMMARY(EXTERNAL(CPAXW001))
```

Example 3: Summarize by user ID and terminal ID

This example shows how to request a Performance Summary report summarized by USERID and TERM. The IRESP field will default to AVE. The RESPONSE field is displayed in three formats: AVE, MAX, and MIN. The CPU field will default to TIME with AVE. The MAX value of user clock number 1 will also be displayed.

```
CICSPA SUMMARY(
    FIELDS(USERID,
            TERM,
            IRESP,
            RESPONSE(AVE,MAX,MIN),
            CPU,
            SUSPEND(COUNT(AVE,MAX)),
            CLOCKTIME(OWNER(USER),NUMBER(1),MAX)))
```

Example 4: Summarize by user ID

This example uses the FIELDS operand to generate a report summarized by USERID like that shown in Figure 202.

```
CICSPA SUMMARY(
    FIELDS(USERID,
            TASKCNT,
            RESPONSE(AVE,MAX),
            DISPATCH(TIME(AVE,MAX),COUNT),
            CPU(TIME(AVE,MAX,DEV)),
            SUSPEND(TIME(AVE,MAX)),
            DISPWAIT(TIME(AVE,MAX))))
```

Figure 212. Performance Summary extract (Recap report)

#### Example 18: Summarize response times by range

Figure 213 shows a Performance Summary report that uses the RNGCOUNT and RNGPERCENT functions to show the distribution of transaction response times in ranges of 0.2 seconds. You can use this report to answer questions such as: How many transactions had a response time between 0.4 and 0.6 seconds? What percentage of transactions had a response time of 1 second or longer?

```

CICSPA SUMMARY(
    FIELDS(TRAN(ASCEND),
           TASKCNT,
           RESPONSE(AVE,MAX),
           RESPONSE(RNGCOUNT(<0.2)),
           RESPONSE(RNGPERCENT(<0.2)),
           RESPONSE(RNGCOUNT(0.2-0.4)),
           RESPONSE(RNGPERCENT(0.2-0.4)),
           RESPONSE(RNGCOUNT(0.4-0.6)),
           RESPONSE(RNGPERCENT(0.4-0.6)),
           RESPONSE(RNGCOUNT(0.6-0.8)),
           RESPONSE(RNGPERCENT(0.6-0.8)),
           RESPONSE(RNGCOUNT(0.8-1.0)),
           RESPONSE(RNGPERCENT(0.8-1.0)),
           RESPONSE(RNGCOUNT(>=1.0)),
           RESPONSE(RNGPERCENT(>=1.0))))

```

Figure 215. Performance Alerts Summary report

See the sample jobs CPAPASUM and CPAPAXTS in the SCPASAMP library.

## TOTAL - Performance Totals report

The **TOTAL** operand requests the Performance Totals report.

The command format is:

```

CICSPA TOTAL(
    [OUTPUT(ddname),]
    [LINECount(nnn),]
    [TITLE1('...up to 64 characters...'),]
    [TITLE2('...up to 64 characters...'),]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),
        ...))])

```

The options are:

### OUTPUT

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **TOTLnnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

### LINECOUNT

Controls the number of lines per page. See “LINECount” on page 380 for further information.

### TITLE1, TITLE2

Controls the report title (left and right half of subheading line). See “TITLE1 and TITLE2” on page 380 for further information.

## SELECT(PERFORMANCE(INCLUDE|EXCLUDE

Specifies what data to include or exclude from the report based on data field values. See “Using SELECT statements” on page 508 for an explanation and examples.

## TOTAL examples

Example 1: Default report

```
CICSPA TOTAL
```

Example 2: Report interval

This example shows the TOTAL operand combined with SELECT(PERFORMANCE. The SELECT statement will restrict the input data to be that of the specified day, January 12, 2005.

```
CICSPA TOTAL(SELECT(PERFORMANCE(INCLUDE(  
    START(FROM(2005/01/12,),TO(2005/01/13,))))))
```

Example 3: Exclude CICS-supplied transactions

The following command generates a Performance Totals report for the data from September 25, 2004.

```
CICSPA APPLID(IYK2Z1V3),  
    TOTAL(OUTPUT(TOTL0002),  
        SELECT(PERFORMANCE(  
            EXCLUDE(TRAN(CSHQ,CSNC,CSNE,CSOL,CSSY,CWXN)),  
            INCLUDE(ACTIVE(FROM(2004/09/25,))))))
```

Figure 216 on page 435 shows an example of the output.

The Performance Totals report has four parts:

1. **CICS System Statistics.** Statistics about the CICS system as a whole, including:
  - CPU and Dispatch times
  - Performance Record and Task counts
2. **CPU and Dispatch Statistics.** Breakdown of CPU, Dispatch, and Suspend counts and elapsed time.
3. **Resource Utilization Statistics.** Each field in the performance record is summarized:
  - For Clock fields, the count and time components are broken down.
  - For Count fields, the count values are reported.
4. **User Field Statistics.** Statistics for the User Fields defined in the CMF performance class records.

	Dispatched Time		CPU Time

## WAITANALYSIS - Wait Analysis report

The WAITANALYSIS or WAIT operand requests the Wait Analysis report.

The command format is:

```
CICSPA WAITANALYSIS(
    [OUTPUT(ddname),]
    [BY(by1[,by2][,by3]),]
    [INTERVAL(hh:mm:ss),]
    [LINECount(nnn),]
    [TITLE1('...sub-heading left ...'),]
    [TITLE2('...sub-heading right...'),]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),
        ...))])
```

The options are:

#### **OUTPUT**

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **WAITnnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

#### **INTERVAL**

Specifies a time interval when the report summarizes transaction activity over time. The interval is in the range 1 second to 24 hours in the format *hh:mm:ss* for hours, minutes, and seconds.

This operand applies only when the report or extract is sorted by transaction Start or Stop time; that is, when the BY operand specifies START or STOP. For reporting, data is accumulated for each interval in the report period and a report line or extract record is written for each interval. If INTERVAL is not specified, the default is **00:01:00** (1 minute).

A time interval of less than one hour must fit evenly into the hour. CICS PA will round it down to the nearest interval that aligns to the hour. For example, 1.35 is reduced to 00:01:30 minutes which will produce 40 interval report lines for each hour of data.

A time interval of more than one hour must fit evenly into the day. CICS PA will round it down to the nearest interval that aligns to the day. For example, 10.30.23 is reduced to 08:00:00 hours which will produce 3 interval report lines for each day of data.

Minutes take precedence for an abbreviated entry. For example:

**1** becomes 00:01:00

**1.1** becomes 00:01:00 (rounded down from 00:01:01)

**1.1.1** becomes 01:00:00 (rounded down from 01:01:01)

**BY** Controls the summarization order of the report. Up to three fields can be specified, and the order in which they are specified dictates the sort precedence. Only fields of type T (Time Stamp) and C (Character) can be sort fields. See “WAITANALYSIS(BY)” for further information and the list of fields which are sort candidates.

#### **LINECOUNT**

Controls the number of lines per page. See “LINECount” on page 380 for further information.

#### **TITLE1, TITLE2**

Controls the report title (left and right half of subheading line). See “TITLE1 and TITLE2” on page 380 for further information.

#### **SELECT(PERFORMANCE(INCLUDE|EXCLUDE**

Specifies what data to include or exclude from the report based on data field values. See “Using SELECT statements” on page 508 for an explanation and examples.

## **WAITANALYSIS(BY**

The summarization order of the Wait Analysis report can be modified. This is done with the BY operand followed by one to three field names specified in the order of the intended sort precedence. The data is collated in ascending sequence.

If BY is omitted, the default is **BY(TRAN)**.

The format of the command is:

CICSPA WAITANALYSIS(BY(by1[,by2][,by3]))

The CICS-defined character fields that can be selected for the Wait Analysis report are:

**TRAN** Transaction identifier  
**APPLID**  
CICS Generic APPLID  
**PROGRAM**  
Program name  
**TERM** Terminal identifier  
**USERID**  
User ID  
**APPLPROG**  
Application naming Program name  
**APPLTRAN**  
Application naming Transaction ID  
**FCTY** Transaction Facility name  
**LUNAME**  
VTAM<sup>®</sup> logical unit name  
**RLUNAME**  
VTAM LUALIAS logical unit name  
**RPTCLASS**  
Workload Manager (WLM) Report Class  
**SRVCLASS**  
Workload Manager (WLM) Service Class  
**TCLASSNM**  
Transaction Class name  
**TCPSRVCE**  
TCP/IP Service Name  
**TERMCNNM**  
Terminal session Connection name  
**ISIPICNM**  
Name of IPCONN definition that attached the task  
**WBATMSNM**  
Web ATOMSERVICE resource definition  
**WBPIPLNM**  
Web PIPELINE resource definition  
**WBPROGNM**  
Web program in URIMAP resource definition  
**WBSVCENM**  
Web WEBSERVICE resource definition  
**WBSVOPNM**  
Web WEBSERVICE operation name  
**WBURIMNM**  
Web URIMAP resource definition

To summarize wait activity over time, select one or both of the time stamp fields:

**START**  
Task start time  
**STOP** Task stop time

## WAITANALYSIS examples

Example 1: Default report

CICSPA WAITANAL

The report is sorted by TRAN.

Figure 217. Wait Analysis report

## Example 2: Report interval

This example shows the WAITANALYSIS operand combined with SELECT(PERFORMANCE. The SELECT statement will restrict the input data to be that of the specified day, January 12, 2005.

```
CICSPA WAITANAL(SELECT(PERFORMANCE(INCLUDE(
    START(FROM(2005/01/12, ) , TO(2005/01/13, ))))))
```

## PROFILING - Transaction Profiling report

The **PROFILING** operand requests the Transaction Profiling report.

The command format for the Transaction Profiling report is:

```
CICSPA PROFILING([ID(profile#)],REPORT(SMF|hdbname),
    [SMFSTART(date,time),]
    [SMFSTOP(date,time),]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...),)]
    [SELECT2(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...),)]
    [FIELDS(field1[(options)],...),]
    [INTERVAL(hh:mm:ss),]
    [PRINT(REPORT,BASELINE,DELTA,CHANGE,
        FULL|EXCEPTIONSONLY,NOBLANKLINES|BLANKLINES),]
    [THRESHOLD(%abovebaseline,%belowbaseline),]
    [OUTPUT(ddname),]
    [EXTERNAL(ddname),]
    [NOTOTALS|TOTALS(n),]
    [LINECount(nnn),]
    [TITLE1('...1st 64 characters of title... '),]
    [TITLE2('...2nd 64 characters of title... '),])

PROFILING([ID(profile#)],BASELINE(SMF|hdbname),
    [SMFSTART(date,time),]
    [SMFSTOP(date,time),]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...),)]
    [SELECT2(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...),)]
    [FIELDS(field1[(options)],...),]
    [INTERVAL(hh:mm:ss)])
```

You must specify two PROFILING operands for each Transaction Profiling report:

- One with a REPORT suboperand that defines the source of the report data
- One with a BASELINE suboperand that defines the source of the baseline data

You can specify CICS PA control operands between the two PROFILING operands, allowing you to specify different control operand values for processing the report data and the baseline data. However, only the following control operands affect the processing of the baseline data: APPLID|NOAPPLID, INPUT, SELECT, SELECT2, SMFSTART, SMFSTOP, and ZONE. For other control operands, if you specify different values for the report data and the baseline data, the Transaction Profiling report uses the values in effect for the report data; that is, the PROFILING(REPORT(...)) operand.

For details on how the APPLID|NOAPPLID, INPUT, and ZONE control operands affect the processing of the baseline data, see the description of the BASELINE operand.

The following options apply to both PROFILING operands:

#### **ID(profile#)**

Explicitly matches the two PROFILING operands for each Transaction Profiling report by an integer value, profile#.

If you only request a single Transaction Profiling report in a batch job, so you have only one PROFILING(REPORT(...)) operand and one PROFILING(BASELINE(...)) operand, then an ID is unnecessary, and you can specify the two PROFILING operands in either order.

The ID operand is always optional, even when you request more than one Transaction Profiling report in the same batch job.

If you omit IDs, the order of the PROFILING operands is significant: CICS PA counts the PROFILING(REPORT(...)) operands and the PROFILING(BASELINE(...)) operands, and then matches the first PROFILING(REPORT(...)) operand with the first PROFILING(BASELINE(...)) operand, the second with the second, and so on.

If you specify IDs, the order of PROFILING operands is not significant:

```
CICS PA ...
        PROFILING(ID(1),REPORT(...)),
        ...
        PROFILING(ID(2),REPORT(...)),
        ...
        PROFILING(ID(2),BASELINE(...))
        ...
        PROFILING(ID(1),BASELINE(...))
```

Never specify a mix of PROFILING operands with and without IDs. To improve the readability of your batch commands, specify IDs and keep each REPORT and BASELINE pair together.

#### **REPORT|BASELINE(SMF|hdbname)**

**REPORT** indicates that this PROFILING operand defines the report data and other Transaction Profiling report options.

**BASELINE** indicates that this PROFILING operand defines the baseline data.

The values of BASELINE and REPORT define the source of the baseline data and the report data. For example:

- REPORT(SMF) defines the source of the report data as the SMF files identified by either the most recent INPUT operand, if specified, or the DDname SMFIN, if no INPUT operand is specified.
- BASELINE(PROD) defines the source of the baseline data as the HDB named PROD that is defined in the Repository identified by the DDname CPAHDBRG.

**Note:** Do not name a performance HDB “SMF” if you plan to use it for a Transaction Profiling report.

If the report data and the baseline data both reside in HDBs, then the HDBs must exist in the same Repository.

If the report data and the baseline data both reside in the same set of SMF files, then you only need to specify a single INPUT operand or the DDname SMFIN:

```
CICSPA ...
      INPUT(SMFIN001),
      PROFILING(REPORT(SMF), ...),
      PROFILING(BASELINE(SMF), ...)
```

If the report data and the baseline data reside in different sets of SMF files, then you need to specify an INPUT operand before the PROFILING operand for the baseline data. In the following example, the report data resides in the SMF files identified by the DDname SMFIN001, and the baseline data resides in the SMF files identified by the DDname SMFIN002:

```
CICSPA ...
      INPUT(SMFIN001),
      PROFILING(REPORT(SMF), ...),
      INPUT(SMFIN002),
      PROFILING(BASELINE(SMF), ...)
```

### SMFSTART, SMFSTOP

Filter the input records of the report data or the baseline data according to the specified time period. For input records in SMF files, SMFSTART and SMFSTOP refer to SMF record time stamps. For input records in HDBs, SMFSTART and SMFSTOP refer to transaction start times. (HDBs do not contain SMF record time stamps.)

For details on specifying values for SMFSTART and SMFSTOP, see “SMFSTART and SMFSTOP” on page 388.

When specified as control operands of the CICSPA command, rather than as suboperands of the PROFILING operand, SMFSTART and SMFSTOP apply to all of the reports that follow them, including the Transaction Profiling report. When specified “locally”, as suboperands of the PROFILING operand, SMFSTART and SMFSTOP override the “global” control operands, but only for that PROFILING operand.

Typically, when running the Transaction Profiling report in a Report Set with other reports, you only specify local SMFSTART and SMFSTOP values for the baseline data (in the PROFILING operand that contains the BASELINE suboperand). The report data uses the global values specified by the SMFSTART and SMFSTOP CICSPA control operands:

```
CICSPA ...
      SMFSTART(...),SMFSTOP(...), 1
      PROFILING(
```

```

        BASELINE(PROD),
        SMFSTART(...),SMFSTOP(...), 2
        ...),
    PROFILING(REPORT(SMF), ...)

```

- 1** “Global” control operands whose values apply to all reports that follow.
- 2** “Local” values that apply only to this PROFILING operand for the baseline data, overriding the global values.

## INTERVAL

Specifies a time interval for summarizing transaction activity over time. The interval is in the range 1 second to 24 hours in the format *hh:mm:ss* for hours, minutes, and seconds.

This operand applies only when the FIELDS operand specifies a time stamp key field, such as START or STOP (transaction start or stop time). For each time interval covered by the report period, CICS PA accumulates input records, and creates a line of summarized data. If INTERVAL is not specified, the default is **00:01:00** (1 minute).

**Summary HDBs only:** Data in a Summary HDB is already summarized by the interval that was used to load the data into the HDB. To further summarize the data, specify a multiple of the interval that was used to load the data. If you specify an interval that is equal to or less than the interval used to load the data, the report uses the data as-is, without further summarization.

Typically, you specify the same time interval for the report data, in PROFILING(REPORT(...)), and for the baseline data, in PROFILING(BASELINE(...)), so that the Transaction Profiling report compares data summarized over time intervals of the same length. In this case, you must explicitly specify INTERVAL in both PROFILING operands; the baseline data will not default to the same interval value as the report data.

Time intervals begin at the start of the day (00:00:00), not from the start of the report period. This ensures that the time stamp key field values in the summarized report data and the summarized baseline data are synchronized.

If you want to summarize report data at time intervals, and compare each time interval with a single, common set of summarized baseline data, then omit the time stamp key field from the FIELDS operand for the baseline data. For example, you could compare hourly performance data with a single set of performance data for the entire day.

In rare cases, you might want to specify different time intervals for the report data and the baseline data. The Transaction Profiling report matches each report data interval with the baseline data interval that covers the start of the report data interval. For example, suppose you summarize report data using an interval of 15 minutes and baseline data using an interval of 30 minutes. The Transaction Profiling report matches each consecutive pair of 15-minute report data intervals with the same single 30-minute baseline data interval, because the 30-minute baseline data interval covers the start of both 15-minute report data intervals. That is, the Transaction Profiling report matches 15 minutes of report data with 30 minutes of baseline data, and then matches the next 15 minutes of report data with the same 30 minutes of baseline data. The time interval you specify for the baseline data should be greater than or equal to the time

interval for the report data. Otherwise, some baseline data intervals will not match the start of any report data intervals, and so that baseline data will not appear in the report.

A time interval of less than one hour must fit evenly into the hour. CICS PA will round it down to the nearest interval that aligns to the hour. For example, 1.35 is reduced to 00:01:30 minutes which will produce 40 interval report lines for each hour of data.

A time interval of more than one hour must fit evenly into the day. CICS PA will round it down to the nearest interval that aligns to the day. For example, 10.30.23 is reduced to 08:00:00 hours which will produce 3 interval report lines for each day of data.

Minutes take precedence for an abbreviated entry. For example:

1 becomes 00:01:00  
1.1 becomes 00:01:00 (rounded down from 00:01:01)  
1.1.1 becomes 01:00:00 (rounded down from 01:01:01)

## FIELDS

Specifies the key fields that you want report data and baseline data records to be grouped and sorted by, the “non-key” fields whose values you want to compare, and the functions for summarizing the non-key field values (for example, as an average or a total).

To understand how the Transaction Profiling report uses the FIELDS operand, it is useful to think of it as a comparison of two Performance Summary reports:

- One for the report data, as specified by the PROFILING(REPORT(...), FIELDS(...)) operand
- One for the baseline data, as specified by the PROFILING(BASELINE(...), FIELDS(...)) operand

See “Transaction Profiling report compares two Performance Summary reports” on page 192.

For details on specifying the FIELDS operand, see the description of the FIELDS operand for the Performance Summary report, “SUMMARY(FIELDS” on page 415. The values that you can specify for the FIELDS operand in the Transaction Profiling report and the Performance Summary report are identical.

The FIELDS operand in the Transaction Profiling report involves the following additional considerations:

- In the PROFILING(REPORT(...)) operand, FIELDS defines the Report Form. The Report Form specifies how the Transaction Profiling report summarizes the report data, and also which fields appear on the Transaction Profiling report. The following FIELDS operand defines a Report Form with two key fields, transaction start time and transaction ID, and two non-key fields, task count and response time:  
FIELDS(START,TRAN,TASKCNT,RESPONSE)
- If you do not specify a Report Form, the Transaction Profiling report creates one:
  - If the report data resides in SMF files, the Transaction Profiling report uses a default form.
  - If the report data resides in an HDB, the Transaction Profiling report uses the HDB Template as the Report Form.

For a List HDB Template, the Transaction Profiling report treats all character and date fields as key fields, and uses the average function to summarize the other, non-key, fields. The key fields must precede the non-key fields in the Template: otherwise, CICS PA reports an error.

- In the PROFILING(BASELINE(...)) operand, FIELDS defines the Baseline Form. The Baseline Form and the Report Form together specify how the Transaction Profiling report summarizes the baseline data:
  - The Transaction Profiling report ignores any fields in the Baseline Form that are not in the Report Form. For example, if the Baseline Form contains key fields that are not in the Report Form, then these key fields are ignored when summarizing the baseline data. Similarly, any non-key fields that appear in the Baseline Form but not the Report Form are ignored.
  - The Transaction Profiling report ignores the order of the fields in the Baseline Form. For example, when summarizing the baseline data, the Transaction Profiling report uses the key fields in the Baseline Form that also appear in the Report Form, but according to the order of those key fields in the Report Form.
  - If you do not specify a Baseline Form, the Transaction Profiling report creates one:
    - If the baseline data resides in an HDB, the Transaction Profiling report uses the HDB Template as the Baseline Form. As for any Baseline Form, the Transaction Profiling report ignores any fields in the HDB Template that are not in the Report Form, and also ignores the order of the fields in the HDB Template.

For a List HDB Template, the Transaction Profiling report treats character and date fields as key fields, and uses the average function to summarize the other, non-key, fields.
    - If the baseline data resides in SMF files, the Transaction Profiling report uses the Report Form as the Baseline Form.
- When summarizing baseline data, the Transaction Profiling report uses only the time-of-day part of any START or STOP key field (transaction start or stop), ignoring the date part. The summarized baseline data for a time-of-day interval matches the summarized report data for that time-of-day interval on any date. For example, if you specify a report data interval of five days and a baseline data interval of five days, then the Transaction Profiling report summarizes each day of report data separately, but summarizes the five days of baseline data together. The Transaction Profiling report compares each daily set of summarized report data with the same set of summarized baseline data. To compare each weekday of the previous week with the same weekday from a week one year ago (compare Monday with another Monday, Tuesday with another Tuesday, etc.), you must run five separate Transaction Profiling reports.
- In a Performance Summary report, in addition to key fields, you can select one numeric field as Ascending or Descending to activate **Alternate Sequencing**. This changes the order of report lines from Sort Key to numeric field sequence. The Transaction Profiling report ignores any Alternate Sequencing.

Typically, you only need to specify a Report Form, not a Baseline Form: this ensures matching fields in the two sets of summarized data (assuming

that the report data and the baseline data actually contain the fields specified in the form). However, a different Baseline Form is useful in the following cases:

- To specify selection criteria that apply only to the baseline data (you can specify selection criteria inside a form).
- To group the baseline data using fewer key fields than the Report Form uses to group the report data.

If you omit key fields from the Baseline Form that appear in the Report Form, then the Transaction Profiling report matches rows in the two sets of summarized data based on their common key fields. The typical effect is that several rows of summarized report data (with more key fields) match one row of baseline data.

- To limit which non-key fields show values in the Baseline, Delta, and Change lines.

If the Baseline Form omits some of the non-key fields specified by the Report Form, then the Transaction Profiling report shows blanks for these missing fields in the Baseline, Delta, and Change lines.

#### **SELECT | SELECT2(PERFORMANCE(INCLUDE | EXCLUDE**

Specifies what data to include or exclude from the report or extract based on data field values. See “Using SELECT statements” on page 508 for an explanation and examples.

The following options apply only to the PROFILING operand that contains the REPORT suboperand (if you specify these options in the PROFILING operand that contains the BASELINE suboperand, they are ignored):

#### **LINECount**

Controls the number of lines per page in the Transaction Profiling report. See “LINECount” on page 380 for further information.

#### **TITLE1, TITLE2**

Controls the report title (left and right half of subheading line) for the Transaction Profiling report. See “TITLE1 and TITLE2” on page 380 for further information.

#### **OUTPUT**

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **PROFnnnn** where nnnn is the report sequence number **0001-9999** to uniquely identify the output. See “OUTPUT” on page 378 for further information.

#### **EXTERNAL**

Specifies the optional DDname for the work data set used by the external SORT facility. If specified, CICS PA performs an external sort. If not specified, CICS PA performs an internal sort where the records are sorted in storage by CICS PA. The CICS PA dialog always generates the EXTERNAL operand with a DDname in the format **CPAXWnnn** where nnn is the sequence number **001-999**. See “EXTERNAL” on page 379 for further information.

#### **NOTOTALS | TOTALS(n)**

The totals level applies only to the Summary report.

Specify TOTALS(1) to TOTALS(8) to accumulate subtotals for up to 8 sort fields, print the subtotals when the sort field changes, and print a grand total at the end of the report. Default: **TOTALS(8)**

Specify TOTALS(0) for no subtotals, but print only the grand total.

Specify NOTOTALS for neither subtotals nor grand total.

**THRESHOLD(%abovebaseline,%belowbaseline)**

Specifies minimum thresholds for the Change values that you want the report to include. Change values are the percentage difference between the report data and the baseline data (for details, see the PRINT operand):

- If a Change value is within the thresholds, the report excludes the Change value and its corresponding Delta value (shows them as blanks).
- If all values on a Change line are within the thresholds, and you have also specified the NOWITHINTHRESHOLD operand, then the report excludes that entire Change line, its corresponding Report, Baseline, and Delta lines, and its key field values.

You can specify either or both of the following thresholds:

**%abovebaseline**

This threshold applies only to positive Change values; that is, where the Report value is greater than the Baseline value. The allowed values for this threshold are integers in the range 0-999.

For example, a threshold of 150 excludes Change values smaller than +150%.

**%belowbaseline**

This threshold applies only to negative Change values. The allowed values for this threshold are integers in the range 0-100.

For example, a threshold of 80 excludes Change values smaller than -80%.

For example, THRESHOLD(150,80) excludes Change values within +150% and -80%.

If you omit both thresholds or you specify both thresholds as 0, the report includes all Change values.

If you specify a value for **%abovebaseline** but you omit **%belowbaseline**, then the report:

- Applies the threshold to positive Change values
- Excludes all negative Change values

If you specify a value for **%belowbaseline** but you leave **%abovebaseline** blank, then the report:

- Applies the threshold to negative Change values
- Excludes all positive Change values

**PRINT(REPORT,BASELINE,DELTA,CHANGE,  
FULL | EXCEPTIONSONLY,NOBLANKLINES | BLANKLINES)**

The values REPORT, BASELINE, DELTA, and CHANGE specify the lines of data that you want the Transaction Profiling report to show for each non-key field in the Report Form:

**Report**

Summarized report data value. This line is always implicitly specified.

**Baseline**

Summarized baseline data value.

**Delta** Report minus Baseline.

**Change**

Percentage difference between **Report** and **Baseline**. For example:

Report	1.0	0.1
Baseline	0.4	0.5
Change%	+150.00	-80.00

This option generates the REPORT, BASELINE, DELTA, and CHANGE values of the PRINT operand.

If you do not specify any lines, the Transaction Profiling report shows all lines. Otherwise, the Transaction Profiling report shows only the specified lines, except for the Report line, which is always implicitly specified, regardless of whether the value REPORT is explicitly specified in the PRINT operand. For example, to show only the Report line, specify PRINT(REPORT). To show the Report line and the Change line, specify either of these equivalent operands: PRINT(REPORT,CHANGE) or PRINT(CHANGE).

The remaining values of the PRINT operand specify conditions for including or excluding lines:

#### **FULL | EXCEPTIONSONLY**

FULL includes lines in the report even when the difference between the report data and the baseline data is within the thresholds specified by the THRESHOLDS operand. This is the default. Specifying FULL ensures that the Report line is always included, regardless of thresholds. However, specifying FULL does not necessarily mean that the report always includes all lines specified by the PRINT operand. If you also specify NOBLANKLINES, the report excludes any blank Baseline, Delta, or Change lines.

EXCEPTIONSONLY excludes all lines, including the Report line, where the difference between every non-key field in a row of summarized baseline data and the same fields in the matching row of summarized report data are all within the thresholds.

The Baseline Form can specify a subset of the non-key fields in the Report Form, leaving the summarized baseline data with fewer non-key fields than the summarized report data. Specifying EXCEPTIONSONLY, together with a Baseline Form that contains only one non-key field, enables you to produce a Transaction Profiling report that only shows data where that field is not within thresholds. For example, if you specify a Baseline Form where the only non-key field is average response time, then you can produce a Transaction Profiling report that shows only the transactions that are not within an acceptable percentage difference of a baseline average response time.

#### **NOBLANKLINES | BLANKLINES**

NOBLANKLINES excludes any Baseline, Delta, or Change lines whose data consists entirely of blank values. Blank values on these lines indicate either fields with no baseline data or, on the Delta and Change lines, fields where the difference between the report data and the baseline data is within the thresholds specified by the THRESHOLDS operand. NOBLANKLINES has no effect on the Report line, which shows the summarized report data even when NOBLANKLINES excludes all other lines. To exclude all lines, including the Report line, when the difference between the report data and the baseline data is within the thresholds, specify EXCEPTIONSONLY.

BLANKLINES includes all specified lines, even when their data consists entirely of blank values.

Omitting the PRINT operand or specifying PRINT() is equivalent to specifying PRINT(REPORT,BASELINE,DELTA,CHANGE,FULL,NOBLANKLINES).

## PROFILING examples

A set of sample Report Forms is provided with CICS PA. See Table 6 on page 291 for the sample SUMMARY Report Forms. You can use these sample Report Forms with your Transaction Profiling reports to provide detailed comparisons of the many aspects affecting CICS system performance.

The following examples show progressively more complex uses for the Transaction Profiling report.

### Example 1: Comparing data using the default form

This example compares data from two sets of SMF files. The report data resides in the SMF files identified by the DDname SMFIN001, and the baseline data resides in the SMF files identified by SMFIN002. This example contains no FIELDS operands, so, to summarize the data, the report uses the default SUMMARY Report Form shown in Figure 164 on page 301.

```
CICSPA IN(SMFIN001),
        PROFILING(REPORT(SMF)),
        IN(SMFIN002),
        PROFILING(BASELINE(SMF),
                  NOTOTALS)
```

Figure 218. Transaction Profiling report (comparing data using the default form)

The row headings Report, Baseline, Delta, and Change% appear between the column for the last key field (in this case, there is only one), TRAN, represented by the column heading Tran, and the first non-key field, TASKCNT, represented by the column heading #Tasks. For a cross-reference between field names and column headings, see Chapter 26, "CMF Field IDs by CICS version," on page 737.

For each line of summarized report data, the report contains a block of lines followed by a blank line. This example report contains three blocks of lines, one for each unique key field value (transaction ID) in the report data. The NOTOTALS operand suppresses the block of lines for the grand total that would otherwise appear at the bottom of the report (with the heading "Total" instead a key field value).

Notice that, in the blocks for transaction IDs DB2D and GLCT, the key field value appears twice. The top value is the key field from the report data; this always appears on the top line of each block, next to the Report line heading. The bottom value is the key field from the matching baseline data; this only appears if there is matching baseline data, and then only if the block would normally contain at least one other line in addition to the Report line. The block for transaction ID DC01 shows no baseline key field value, for two reasons:

- There is no matching baseline data for DC01
- The block contains only the Report line; the other lines have been suppressed by the default NOBLANKLINES option (for the same reason: no matching baseline data). If this example had specified BLANKLINES, then the block of lines for DC01 would have looked like this:

DC01	Report	560	.0598	.0011	.0005	.0587	.0059	.0000	0	.0000	976	1296
	Baseline											
	Delta											
	Change%											

That is, with blank lines, but still no key field value for baseline data.

## Example 2: Comparing data using a specified form

This example compares data using a Report Form specified by the FIELDS operand. In this example, the Report Form is the sample form CPUSUM1 provided with CICS PA.

```

CICSPA INPUT(SMFIN001),
        PROFILING(REPORT(SMF),

Figure 219. Transaction Profiling report (comparing data using a specified form)

**Example 3: Comparing a subset of fields in the report data**

Suppose that you are interested in the values of several fields of report data, but you are only interested in comparing one, or a few, of these fields with baseline data. To do this, you specify a Baseline Form with the same key fields as the Report Form, but fewer non-key fields, as shown in this example.

```

CICSPA INPUT(SMFIN001),
        PROFILING(REPORT(SMF),
                   FIELDS(TRAN(ASCEND),
                          TASKCNT,
                          RESPONSE(AVE),
                          RESPONSE(MAX),
                          DISPATCH(TIME(AVE)),
                          CPU(TIME(AVE)),
                          SUSPEND(TIME(AVE)),
                          DISPWAIT(TIME(AVE)),
                          QRCPU(TIME(AVE)),
                          MSCPU(TIME(AVE)),
                          ROCPU(TIME(AVE)),
                          KY8CPU(TIME(AVE)),
                          KY9CPU(TIME(AVE)))))
INPUT(SMFIN002),
        PROFILING(BASELINE(SMF),
                   FIELDS(TRAN(ASCEND),
                          RESPONSE(AVE)))

```

In this example, the Transaction Profiling report groups and summarizes the report data and the baseline data using the same single key field, TRAN, but only includes baseline data values for the average response times.

Tran		#Tasks	Avg Response Time	Max Response Time	Avg Dispatch Time	Avg User Time	Avg CPU Time	Avg Suspend Time	Avg DispWait Time	Avg QR CPU Time	Avg MS CPU Time	Avg RO CPU Time	Avg KY8 CPU Time	Avg KY9 CPU Time

	Baseline		.0424											
	Delta		+ .0124											
	Change%		+29.21											

Figure 220. Transaction Profiling report (comparing a subset of fields in the report data)

### Example 4: Excluding changes that are insignificant to you

This is identical to the previous example, except that this example introduces the operands THRESHOLD(30) and PRINT(EXCEPTIONSONLY).

THRESHOLD(30) sets the minimum threshold for changes (report data values greater than baseline data values) at +30%. PRINT(EXCEPTIONSONLY) excludes from the report any blocks of report data where all of the change values are within the threshold. THRESHOLD(30) does not contain a second value, for negative changes, so any negative change values are also considered to be within this specified threshold, and would be excluded.

```

CICSPA INPUT(SMFIN001),
        PROFILING(REPORT(SMF),
                   THRESHOLD(30),
                   PRINT(EXCEPTIONSONLY),
                   FIELDS(TRAN(ASCEND),
                          TASKCNT,
                          RESPONSE(AVE),
                          RESPONSE(MAX),
                          DISPATCH(TIME(AVE)),
                          CPU(TIME(AVE)),
                          SUSPEND(TIME(AVE)),
                          DISPWAIT(TIME(AVE)),
                          QRCPU(TIME(AVE)),
                          MSCPU(TIME(AVE)),
                          ROCPU(TIME(AVE)),
                          KY8CPU(TIME(AVE)),
                          KY9CPU(TIME(AVE)))),
        INPUT(SMFIN002),
        PROFILING(BASELINE(SMF),
                   FIELDS(TRAN(ASCEND),
                          RESPONSE(AVE)))

```

Notice that, in addition to excluding blocks of summarized data for unique key field value, leaving only the block for transaction ID DB2D), the PRINT(EXCEPTIONSONLY) operand has also excluded the Total block. If the overall change value for average response time had been +30% or greater, then the report would have shown the Total.

Figure 221. Transaction Profiling report (excluding changes that are insignificant to you)

**Example 5: Comparing data summarized by time interval**

This example uses a Report Form, sample form TRTODSUM, that includes a time stamp key field, transaction stop time (STOP). When a form includes a time stamp key field, the INTERVAL operand specifies a time interval for summarizing input records based on their time stamp values. In this example, the INTERVAL(00:05:00) operand summarizes input records, based on their transaction stop times, at intervals of five minutes.

The TOTALS(2) operand instructs the report to print subtotals for each group of values for sort key field 2 that share the same higher-level key field values. In this example, the effect is to show subtotals for each five-minute time interval.

```

CICSPA INPUT(SMFIN001),
        PROFILING(REPORT(SMF),
                    INTERVAL(00:05:00),
                    TOTALS(2),
                    FIELDS(STOP(TIMES,ASCEND),
                           TRAN(ASCEND),
                           TASKCNT,
                           RESPONSE(AVE),
                           RESPONSE(MAX),
                           DISPATCH(TIME(AVE)),
                           CPU(TIME(AVE)),
                           SUSPEND(TIME(AVE)),
                           DISPWAIT(TIME(AVE)),
                           FCWAIT(TIME(AVE)),
                           FCAMCT(AVE),
                           IRWAIT(TIME(AVE)),
                           SC24UHW(M(AVE)),
                           SC31UHW(M(AVE))),
        INPUT(SMFIN002),
        PROFILING(BASELINE(SMF),
                    INTERVAL(00:05:00))

```

For brevity, this example report shows only a single time interval. Typically, such a report would cover more time intervals: 17:30:00, 17:35:00, etc.

Figure 222. Transaction Profiling report (comparing data summarized by time interval)

As shown in this example, the subtotals and grand total in the Transaction Profiling report might appear to be inconsistent with each other, and also with the blocks of data for each unique key value. This is because the subtotals and grand totals in the Transaction Profiling report are based on the subtotals and grand totals of the separately summarized report data and the baseline data, not just the consolidated data with matching key field values printed in the Transaction Profiling report. So the subtotals and grand totals for the baseline data represent all rows of summarized baseline data, not just those rows whose key field values match rows of report data.

### Example 6: Comparing several time intervals of report data with a single set of baseline data

This example uses a Report Form with a time stamp key field summarized over intervals of five minutes, and a Baseline Form without a time stamp key field, so that the baseline data is summarized without time intervals.

You can use this technique to compare time intervals within a day with a single set of data representing the average for an entire day. As shown in this example, the report data and the baseline data can have the same source (notice that there is only one INPUT operand), so you can compare time intervals within a day with the average across the same day.

Figure 223. Transaction Profiling report (comparing several time intervals of report data with a single set of baseline data)

## Example 7: Identifying poorly performing transactions by time of day

This example identifies poorly performing transactions by comparing report data from SMF files with baseline data in an HDB that contains ideal, or expected, response times for each transaction ID.

As in the previous example, this Transaction Profiling report summarizes report data over time intervals, but summarizes the baseline data without time intervals. For each time interval of summarized report data, the Transaction Profiling report compares the average response time of each transaction ID with an average response time for that transaction ID from the summarized baseline data. The summarized baseline data consists only of two fields: the transaction IDs and their corresponding average response times, independent of any time intervals.

In this example, the baseline data is stored in an HDB named EXAMPLE. This HDB was loaded with data selected from a “good” day; its only purpose is to provide the expected results for this Transaction Profiling report.

The REPORT and CHANGE values of the PRINT operand instruct the report to print only the Report and Change% lines. THRESHOLD(25) sets the minimum threshold for changes at +25%. The EXCEPTIONSONLY value of the PRINT operand excludes from the report any blocks of report data where all of the change values are within the threshold. The Baseline Form specifies only a single non-key field, average response time, so EXCEPTIONSONLY causes the report to show blocks of report data only where the average response time is at least 25% higher than the expected value.

```
CICSPA IN(SMFIN001),
      PROFILING(REPORT(SMF),
                PRINT(REPORT,CHANGE,EXCEPTIONSONLY),
                INTERVAL(00:15:00),
                THRESHOLD(25),
                TITLE('Performance exceptions against saved baseline'),
                FIELDS(STOP(TIMES,ASCEND),
                      TRAN(ASCEND),
                      TASKCNT,
                      RESPONSE(AVE),
                      RESPONSE(MAX),
                      DISPATCH(TIME(AVE)),
                      CPU(TIME(AVE)),
                      SUSPEND(TIME(AVE)),
                      DISPWAIT(TIME(AVE)),
                      FCWAIT(TIME(AVE)),
                      FCAMCT(AVE),
                      IRWAIT(TIME(AVE)),
                      SC24UHWM(AVE),
                      SC31UHWM(AVE))),
      PROFILING(BASELINE(EXAMPLE),
                FIELDS(TRAN(ASCEND),
                      RESPONSE(AVE)))
```

Comparing report data and baseline data using a single non-key field enables you to produce a Transaction Profiling report that identifies a particular symptom, such as excessive response time. You can then examine the values of other fields in the report data to begin diagnosing the cause of the problem.

Figure 224. Transaction Profiling report (comparing exceptions with saved baseline data)

---

## CROSSsystem - Cross-System Work report and extract

The **CROSSsystem** operand requests the Cross-System Work report, the Cross-System Work extract, or both.

If the Extract is requested, a Recap report containing processing statistics is always printed at the end of extract processing.

The command format is:

```
CICSPA CROSSsystem(  
  Report options:  
    [PRINTMULTIPLE,]  
    [NOPRINTMULTIPLE,]  
    [PRINTSINGLE,]  
    [NOWRITE,]  
    [LINECount(nnn),]  
    [TITLE1('...up to 64 characters...'),]  
    [TITLE2('...up to 64 characters...'),]  
    TASKORDER(START|STOP)  
  Extract options:  
    [DDNAME(ddname),]  
    [SYSID(applid,mvsid),]  
    [WRITEMultiple,]  
    [NOWRITEMultiple,]  
    [WRITESingle,]  
    [NOPRINT,]  
    [CHARACTER(OWNER(owner),LENGTH(nnn),HEADER(header)),]  
    [CLOCK(OWNER(owner),NUMBER(nnn),HEADER(header)),]  
    [COMPRESS|NOCOMPRESS,]  
    [COUNT(OWNER(owner),NUMBER(nnn),HEADER(header)),]  
  Report and Extract options:  
    [OUTPUT(ddname),]  
    [EXTERNAL(ddname),]  
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...)),]  
    [SELUOW(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...))])
```

The Cross-System Work report can be tailored using the **LISTX** operand. This produces the Cross-System Work Extended report. For more information, see “LISTX - Performance List Extended report” on page 401.

### Report options

Options applicable to the Cross-System Work report (and not the extract) are:

#### **PRINTMULTIPLE**

Print only the transaction performance records consisting of units-of-work that include multiple CMF records. This is the default for the report.

#### **NOPRINTMULTIPLE**

Do not print the transaction performance records consisting of units-of-work that include multiple CMF records.

#### **PRINTSINGLE**

Print the transaction performance records consisting of units-of-work that include only a single CMF record. To get a listing containing these records only, you must suppress the default **PRINTMULTIPLE** option by specifying **NOPRINTMULTIPLE** as well.

#### **NOWRITE**

Do not produce an extract data set. This operand can be used to create the report without the extract.

**LINECOUNT**

Controls the number of lines per page for the Cross-System Work report. See “LINECount” on page 380 for further information.

**TITLE1, TITLE2**

Controls the title (left and right half of subheading line) of the Cross-System Work report. See “TITLE1 and TITLE2” on page 380 for further information.

**TASKORDER(START|STOP)**

Sorts tasks within each UOW in either descending order of stop time (the default) or ascending order of start time.

## Extract options

Options applicable to the Cross-System Work extract (and not the report) are:

**DDNAME**

This operand specifies the DDname of the output data set where the Cross-System Work extract is written. If not specified, CICS PA assigns the default DDname **CPAOXSYS**. The CICS PA dialog, however, assigns DDnames in the format **CPAOXSnn** where nn is the extract sequence number **01-99**. (See the sample JCL in Figure 187 on page 355).

**SYSID**

This operand specifies the APPLID and MVS ID to be written in each record of the extract data set. If not specified, CICS PA uses the default APPLID **MULTIPLE** and default MVS ID **CICS**.

**WRITEMultiple**

Write only the transaction performance records consisting of units-of-work that include multiple CMF records. This is the default for the extract.

**NOWRITEMultiple**

Do not write the transaction performance records consisting of units-of-work that include multiple CMF records.

**WRITESingle**

Write the transaction performance records consisting of units-of-work that include only a single CMF record. To get an extract containing these records only, you must suppress the default **WRITEMultiple** option by specifying **NOWRITEMultiple** as well.

**NOPRINT**

Do not print a Cross-System Work report. This operand can be used to create the Cross-System Work extract without the report.

**COMPRESS|NOCOMPRESS**

Determines whether CICS PA writes CICS SMF records to the extract file in compressed or uncompressed format. This option applies whether the records in the input SMF file are compressed or not.

If you specify **COMPRESS**, CICS PA writes compressed CICS SMF records, regardless of the CICS release level that created the input records. Although CICS only introduced support for writing compressed SMF records in CICS Transaction Server Version 3.2, you can use CICS PA to create an extract file of compressed CICS SMF records for any CICS release supported by CICS PA. You can use extract files containing compressed SMF records as input to CICS PA, just like any other SMF file, even though the CICS product level that originally created those SMF records cannot write them in compressed format.

**CHARACTER(OWNER(owner), LENGTH(nnn), HEADER(ufldname))**  
**CLOCK(OWNER(owner), NUMBER(nnn), HEADER(ufldname))**  
**COUNT(OWNER(owner), NUMBER(nnn), HEADER(ufldname))**

Each user field to be included in the extract must be specified separately.

**CHARACTER**

A character type user field to be included in the extract.

**CLOCK**

A clock type user field to be included in the extract.

**Note:** A clock type field in a CMF record consists of two parts: elapsed time and a count of the number of times the condition occurred. When creating the Cross-System Work extract, **CLOCK** applies to both parts of the field.

**COUNT**

A count type user field to be included in the extract.

**OWNER**

The 1-8 character owner of the user field. This is the entry name in the DFHMCT ID= macro specification for the user field, or the CICS-assigned default name of 'USER'. CICS PA does not have a default owner name. Even if the owner name is USER, the OWNER operand must be specified.

**LENGTH**

Required with the CHARACTER operand. It specifies the length of the character user field on the Cross-System Work extract. If LENGTH is missing, the character user field will not be written. If the specified cross-system length is shorter than the original length, the value is truncated. If the cross-system length is longer than the original length, the value is padded with binary zeros. The maximum length that can be specified is 256.

**NUMBER**

The clock or count to be included in the extract (of the 256 clocks and 256 counts that can be defined for this owner).

**HEADER**

The eight-character informal field name. If not specified, CICS PA uses the default value *USER*. This is placed in the CMF dictionary of the Cross-System Work extract and can be used in subsequent reporting. For example, if you produce the CICS PA Performance List, Performance List Extended and Performance Summary reports from the Cross-System Work extract data set, *ufldname* is used as the column heading for the user fields in the reports.

## Report and extract options

Options that apply to both the Cross-System Work report and extract are:

**OUTPUT**

Controls the report output DDname. See "OUTPUT" on page 378 for further information. If not specified, CICS PA assigns a DDname in the format **xxxxnnnn** where nnnn is the report sequence number **0001-9999** to uniquely identify the output, and xxxx is:

- **CROS** for the Cross-System Work report
- **CROX** for the Recap report for the Cross-System Work extract

## EXTERNAL

Specifies the DDname for the work data set used by the external SORT facility. If not specified, CICS PA assigns an External Work File from a pool of External Work Files with DDnames in the format **CPAXWnnn** where nnn is the sequence number **001-999**. See "EXTERNAL" on page 379 for further information.

## SELECT(PERFORMANCE(INCLUDE|EXCLUDE

Specifies what data to include or exclude from the report or extract based on data field values. See "Using SELECT statements" on page 508 for an explanation and examples.

If used in conjunction with SELUOW, it does not impact reporting but rather is a first-level pre-sort filter. The purpose of SELECT in this case is to exclude the records that you know are of no interest and thereby reduce the volume of records to be sorted for reporting. It is suitable, for example, for time range checking and selecting all possible transaction IDs of interest.

## SELUOW(PERFORMANCE(INCLUDE|EXCLUDE

Specifies what units-of-work to include or exclude from the report or extract based on data field values. If one task in a multi-task UOW matches the selection criteria, then all tasks for that UOW are selected.

It can be used in conjunction with SELECT to first filter out those tasks that you know are of no interest and thereby optimize the record sort process.

See "CROSSsystem examples" for an example using SELECT and SELUOW.

## CROSSsystem examples

Example 1: Default report and extract

```
CICSPA CROSS
```

Example 2:

The report and extract data sets generated in this example contain all performance records, both from network units of work consisting of multiple CMF records and from units of work consisting of a single CMF record. The specified CHARACTER-type and CLOCK-type user fields are added to the output record.

The extract is written to DDname CPAOXSYS. The report is written to CROS0001, if this is the first Cross-System Work report, and the Recap is written to CROX0001.

```
CICSPA CROSS(PRINTM,PRINTS,WRITE,WRITES,  
             CHARACTER(OWNER(USER),LENGTH(8),HEADER(MINE)),  
             CLOCK(OWNER(USER),NUMBER(2),HEADER(CLOCK2)))
```

Example 3:

To print records from a network unit-of-work containing single and multiple records, use the following command:

```
CICSPA CROSS(PRINTM,PRINTS,NOWRITE,OUTPUT(CROS0001))
```

This produces a report containing information like that shown in Figure 225 on page 459.

Figure 226. Cross-System Work report (UOWs with a single record)

#### Example 5:

The following command creates the Cross-System Work extract while the Cross-System Work report is suppressed. The extract is created using all the performance records. The performance records contained in a network

unit-of-work that includes only a single record, as well as multiple records, are written to the extract data set specified in the default DD statement **CPAOXSYS**.

```
CICSPA CROSS(NOPRINT,WRITEM,WRITES)
```

Example 6:

The following command is an example of how to include user fields from the input data set in the output extract data set.

```
CICSPA CROSS(  
    COUNT(OWNER(USER),NUMBER(001),HEADER(MYCOUNT1)),  
    CHARACTER(OWNER(USER),LENGTH(40)))
```

Example 7:

It can be very useful to analyze the performance data from the Cross-System Work extract. This data can provide an insight into the total resources used by a transaction and shows information such as the accumulated dispatch, CPU, and wait times as well as the five user fields added by CICS PA.

Figure 227 on page 461 shows a Performance List report created from a Cross-System Work extract data set. To create a similar report, use the following command:

```
CICSPA LIST(FIELDS(TRAN,TASKNO,STOP(TIMES),RESPONSE,  
    DISPATCH,CPU,SUSPEND,DISPWAIT,  
    IRWAIT(COUNT),RMISUSP(COUNT),  
    COUNT(OWNER(CICSPA),NUMBER(1)),  
    COUNT(OWNER(CICSPA),NUMBER(2)),  
    COUNT(OWNER(CICSPA),NUMBER(3)),  
    COUNT(OWNER(CICSPA),NUMBER(4)),  
    COUNT(OWNER(CICSPA),NUMBER(5))))
```

Figure 227. Example of a Performance List report from a Cross-System Work extract data set

## Example 8:

Consider that when investigating a problem you know that a transaction had poor response time. You then want to investigate all the activity for units-of-work that involve this poor performing transaction. By specifying selection criteria using SELUOW, the Cross-System Work report can give you all transactions associated with the UOWs that the particular transaction was a part of.

In this example, SELECT is used to provide first-level pre-sort filtering of records. Then SELUOW provides second-level post-sort filtering of units-of-work.

```

CICSPA IN(SMFIN001),
        LINECOUNT(58),
        SELECT(PERFORMANCE(INCL(
            TRAN(STOK,CSMI),
            START(FROM(09:30),TO(09:45))))),
        CROSS(PRINTM,NOWITEM,
            SELUOW(PERFORMANCE(INCL(
                RESP(>0.5),
                TRAN(STOK)))))

```

SELECT will pre-filter the performance records (tasks). Only tasks with a transaction ID of STOK or CSMI that started between 9:30 and 9:45 are included. Note that this first SELECT does not impact reporting. Its purpose is to exclude records you know will never be required for reporting, ensuring that the record sort process is optimized.

SELUOW will post-filter the UOWs. Entire UOWs are reported only when one of the tasks in the UOW has a transaction ID of STOK and a response time greater than 0.5 seconds.

---

## TRANGROUP - Transaction Group report

The **TRANGROUP** operand requests the Transaction Group report.

The command format is:

```
CICSPA TRANGROUP(
    [OUTPUT(ddname),]
    [EXTERNAL(ddname),]
    [PRINTMULTIPLE,]
    [NOPRINTMULTIPLE,]
    [PRINTSINGLE,]
    [LINECount(nnn),]
    [TITLE1('...up to 64 characters...'),]
    [TITLE2('...up to 64 characters...'),]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),
        ...))])
```

The options are:

### OUTPUT

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **TRGPnnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

### EXTERNAL

Specifies the DDname for the work data set used by the external SORT facility. If not specified, CICS PA assigns an External Work File from a pool of External Work Files with DDnames in the format **CPAXWnnn** where nnn is the sequence number **001-999**. See “EXTERNAL” on page 379 for further information.

### PRINTMULTIPLE

Print only the transaction performance records consisting of units-of-work that include multiple CMF records. This is the default condition when creating the report.

### NOPRINTMULTIPLE

Do not print the transaction performance records consisting of units-of-work that include multiple CMF records.

### PRINTSINGLE

Print the transaction performance records consisting of units-of-work that include only a single CMF record. To get a listing containing these records only, you must suppress the default PRINTMULTIPLE option by specifying NOPRINTMULTIPLE as well.

### LINECOUNT

Controls the number of lines per page. See “LINECount” on page 380 for further information.

### TITLE1, TITLE2

Controls the report title (left and right half of subheading line). See “TITLE1 and TITLE2” on page 380 for further information.

## SELECT(PERFORMANCE(INCLUDE|EXCLUDE

Specifies what data to include or exclude from the report based on data field values. See "Using SELECT statements" on page 508 for a detailed explanation and examples.

## TRANGROUP examples

### Example 1: Default report (PRINTM only)

The default is to report task performance records contained in a transaction group that includes multiple CMF records.

CICSPA TRANGROUP

### Example 2: All (both PRINTM and PRINTS)

This example shows how to generate a Transaction Group report containing all performance class records, both from transaction groups consisting of multiple CMF records and from transaction groups consisting of a single CMF record.

CICSPA TRANGROUP(PRINTM,PRINTS)

This creates a report like that shown in Figure 228.

Figure 228. Transaction Group report (using PRINTS,PRINTM)

---

## BTS - BTS report

The **BTS** operand requests the CICS Business Transaction Services report.

The command format is:

```
CICSPA BTS(  
    [OUTPUT(ddname),]  
    [EXTERNAL(ddname),]  
    [LINECount(nnn),]  
    [TITLE1('...up to 64 characters...'),]  
    [TITLE2('...up to 64 characters...'),]  
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),  
        ...))])
```

The options are:

### OUTPUT

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **CBTSnnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

### EXTERNAL

Specifies the DDname for the work data set used by the external SORT facility. If not specified, CICS PA assigns an External Work File from a pool of External Work Files with DDnames in the format **CPAXWnnn** where nnn is the sequence number **001-999**. See “EXTERNAL” on page 379 for further information.

### LINECOUNT

Controls the number of lines per page. See “LINECount” on page 380 for further information.

### TITLE1, TITLE2

Controls the report title (left and right half of subheading line). See “TITLE1 and TITLE2” on page 380 for further information.

### SELECT(PERFORMANCE(INCLUDE|EXCLUDE

Specifies what data to include or exclude from the report based on data field values. See “Using SELECT statements” on page 508 for a detailed explanation and examples.

## BTS examples

Example 1: Default report

```
CICSPA BTS
```

Figure 229. BTS report

## WORKLOAD - Workload Activity report

The **WORKLOAD** or **WLM** operand requests the Workload Activity report.

The command format is:

```
CICSPA WORKLOAD(
    [OUTPUT(ddname),]
    [EXTERNAL(ddname),]
    [SUMMARY[(EXE)],]
    [LIST,]
    [PEAK(percentile),]
    TASKORDER(START|STOP)
    [LINECount(nnn),]
    [TITLE1('...up to 64 characters...'),]
    [TITLE2('...up to 64 characters...'),]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),
        ...))])
```

The options are:

### OUTPUT

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **WKLDnnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

### EXTERNAL

Specifies the DDname for the work data set used by the external sort facility. If not specified, CICS PA assigns an External Work File from a pool

of External Work Files with DDnames in the format **CPAXWnnn** where nnn is the sequence number **001-999**. See “EXTERNAL” on page 379 for further information.

An external sort is not required when only a summary report of BTE transactions is requested.

#### **SUMMARY**

Requests the Workload Manager Activity Summary report.

Specify **EXE** to summarize transactions in both EXE (execution) Y and BTE (begin-to-end) phases, otherwise only BTE transactions are listed.

**LIST** Requests the Workload Manager Activity List report, a detailed list of BTE, EXE Y and EXE N transaction activity.

#### **PEAK(percentile)**

Applies to transaction response times in the Workload Activity Summary report and is useful for monitoring service levels. Specify a number between 50 and 100 to report the response time within which that percentage of transactions completed. Computations assume a normal distribution. For example, specify 95 to determine the response time that 95% of transactions completed within. The default is **90**.

#### **TASKORDER(START|STOP)**

In the Workload Manager Activity List report, sorts tasks within each UOW in either descending order of stop time (the default) or ascending order of start time.

#### **LINECOUNT**

Controls the number of lines per page. See “LINECount” on page 380 for further information.

#### **TITLE1, TITLE2**

Controls the report title (left and right half of subheading line). See “TITLE1 and TITLE2” on page 380 for further information.

#### **SELECT(PERFORMANCE(INCLUDE|EXCLUDE**

Specifies what data to include or exclude from the report based on data field values. See “Using SELECT statements” on page 508 for a detailed explanation and examples.

## **WORKLOAD examples**

### Example 1: Default report

This is the Summary report showing BTE work only.

CICSPA WORKLOAD

The following command achieves the same:

CICSPA WORKLOAD(SUMMARY)

### Example 2: Both BTE and EXE transactions

This example produces a Summary report showing both BTE and EXE transactions like that shown in Figure 230 on page 467.

CICSPA WORKLOAD(SUMMARY(EXE)

Figure 231. Workload Activity report (List report)

## TRACKINGLIST - Transaction Tracking List report

The **TRACKINGLIST** operand requests the Transaction Tracking List report. This report combines CMF records for each originating transaction and its subordinate (group) transactions. Group transactions are identified by sharing the same transaction group ID with other transactions or by having a PHCOUNT > 0.

The command format is:

```

CICSPA TRACKINGLIST(
    [OUTPUT(ddname),]
    [EXTERNAL(ddname),]
    [OFIELDS(field1[(options)],...),]
    [GFIELDS(field1[(options)],...),]
    [PRINTMULTIPLE|NOPRINTMULTIPLE,]
    [PRINTSINGLE|NOPRINTSINGLE,]
    [LINECount(nnn),]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...),)]
    [SELGRP(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...),)]
    [TITLE1('...up to 64 characters...'),]
    [TITLE2('...up to 64 characters...'),])

```

The options are:

#### OUTPUT

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **TTLsnnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

#### EXTERNAL

Specifies the DDname for the work data set used by the external SORT facility. If not specified, CICS PA assigns an External Work File from a pool of External Work Files with DDnames in the format **CPAXWnnn** where nnn is the sequence number **001-999**. See “EXTERNAL” on page 379 for further information.

#### PRINTMULTIPLE

Print only group transactions. This is the default condition when creating the report.

#### NOPRINTMULTIPLE

Do not print group transactions.

#### PRINTSINGLE

Print only transactions that do not belong to a group.

#### NOPRINTSINGLE

Do not print transactions that do not belong to a group.

#### LINECOUNT

Controls the number of lines per page. See “LINECount” on page 380 for further information.

#### OFIELDS

Specifies which fields are included in the origin section of the report and their format.

If the OFIELDS operand is not specified, the default is:

CICSPA TRACKINGLIST(OFIELDS(OTRAN,	Originating Transaction ID
OUSERID,	Originating User ID
OAPPLID,	Originating CICS Application ID
OTASKNO,	Originating Transaction number
OSTART(TIMET),	Originating Task Start time
OORIGIN,	Originating Transaction Origin type
OFCTY,	Originating Transaction Facility name
OTCPSRVC,	Originating TCP/IP Service name
OCLI6ADR,	Originating Client or Telnet IP address
OCLIPORT))	Originating Client IP port number

#### GFIELDS

Specifies which fields are included in the group section of the report and their format.

If the GFIELDS operand is not specified, the default is:

CICSPA TRACKINGLIST(GFIELDS(TRAN,	Transaction ID
USERID,	User ID
APPLID,	CICS Application ID
TASKNO,	Transaction number
START(TIMET),	Task Start time
RTYPE,	Record type
ORIGIN,	Transaction origin
RESPONSE,	Response time
CPU,	User CPU
PHTRAN,	Previous Hop transaction ID
PHTASKNO,	Previous Hop task number
PHAPPLID,	Previous Hop application ID
PHSTART,	Previous Hop start time
PHCOUNT))	Previous Hop count

#### **TITLE1, TITLE2**

Controls the report title (left and right half of subheading line). See “TITLE1 and TITLE2” on page 380 for further information.

#### **SELECT(PERFORMANCE(INCLUDE|EXCLUDE**

Specifies what records to include or exclude from report processing based on data field values. See “Using SELECT statements” on page 508 for a detailed explanation and examples.

#### **SELGRP(PERFORMANCE(INCLUDE|EXCLUDE**

Specifies what records and groups to include or exclude after report processing based on data field values. See “Using SELECT statements” on page 508 for a detailed explanation and examples.

This set of selection criteria is applied as a post-processing step. This is a second level of filtering that determines which Groups are to be included in the report. Only when all of the records in the Group fail this set of selection criteria will the whole group and its associated Origin record be excluded from the report.

**Note:** The combination of PRINTMULTIPLE and PRINTSINGLE results in a report containing all transactions. Conversely, specifying NOPRINTMULTIPLE and NOPRINTSINGLE results in an empty report.

## **TRACKINGLIST examples**

Example 1:

```
CICSPA IN(SMFIN001),
      NOAPPLID,
      LINECNT(60),
      FORMAT(':', '/' ),
      PRECISION(4),
      TRACKINGLIST(OUTPUT(TTLS0001),
      EXTERNAL(CPAXW001),
      PRINTMULTIPLE,NOPRINTSINGLE)
```

Figure 232. Transaction Tracking List report

## TRACKINGSUMMARY - Transaction Tracking Summary report

The **TRACKINGSUMMARY** operand requests the Transaction Tracking Summary report. The report combines CMF records for each originating transaction and its subordinate (group) transactions. Group transactions are identified by sharing the same transaction group ID with other transactions or by having a PHCOUNT > 0.

The command format is:

```
CICSPA TRACKINGSUMMARY(
    [OUTPUT(ddname),]
    [EXTERNAL(ddname),]
    [PRINTMULTIPLE|NOPRINTMULTIPLE,]
    [PRINTSINGLE|NOPRINTSINGLE,]
    [LINECount(nnn),]
    [FIELDS(field1[(options)],...),]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...)),]
    [SELGRP(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...)),]
    [TITLE1('...up to 64 characters...'),]
    [TITLE2('...up to 64 characters...'),])
```

The options are:

### OUTPUT

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **TTSUnnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

## EXTERNAL

Specifies the DDname for the work data set used by the external SORT facility. If not specified, CICS PA assigns an External Work File from a pool of External Work Files with DDnames in the format **CPAXWnnn** where nnn is the sequence number **001-999**. See “EXTERNAL” on page 379 for further information.

## PRINTMULTIPLE

Print only group transactions. This is the default condition when creating the report.

## NOPRINTMULTIPLE

Do not print group transactions.

## PRINTSINGLE

Print only transactions that do not belong to a group.

## NOPRINTSINGLE

Do not print transactions that do not belong to a group.

## LINECOUNT

Controls the number of lines per page. See “LINECount” on page 380 for further information.

## FIELDS

Specifies which fields are included in the report or extract, their order, and format. If the FIELDS operand is not specified, the default is:

```
CICSPA TRACKINGSUMMARY(FIELDS(
    PHAPPLID,      Previous Hop application ID
    PHTRAN,        Previous Hop transaction ID
    PHCOUNT,      Previous Hop count
    APPLID,        CICS Application ID
    TRAN,          Transaction ID
    TASKCNT,       Task count
    Avg Response,  Average Response time
    Max Response,  Maximum Response time
    Avg Dispatch,  Average Dispatch time
    Avg CPU,       Average CPU time
    Avg Suspend,   Average Suspend time
    Max Suspend,   Maximum Suspend time
    Avg DispWait,  Average Dispatch Wait time
    Avg FCWAIT,    Average File I/O Wait time
    Avg FCAMCT,    Average File Access Method requests
    Avg IRWAIT,    Average MRO link wait time
    Avg SC24UHWM,  Average UDSA HWM below 16MB
    Avg SC31UHWM)) Average EUDSA HWM above 16MB
```

## TITLE1, TITLE2

Controls the report title (left and right half of subheading line). See “TITLE1 and TITLE2” on page 380 for further information.

## SELECT(PERFORMANCE(INCLUDE|EXCLUDE

Specifies what records to include or exclude from report processing based on data field values. See “Using SELECT statements” on page 508 for a detailed explanation and examples.

## SELGRP(PERFORMANCE(INCLUDE|EXCLUDE

Specifies what records and groups to include or exclude after report processing based on data field values. See “Using SELECT statements” on page 508 for a detailed explanation and examples.

This set of selection criteria is applied as a post-processing step. This is a second level of filtering that determines which Groups are to be included

in the report. Only when all of the records in the Group fail this set of selection criteria will the whole group and its associated Origin record be excluded from the report.

**Note:** The combination of PRINTMULTIPLE and PRINTSINGLE results in a report containing all transactions. Conversely, specifying NOPRINTMULTIPLE and NOPRINTSINGLE results in an empty report.

## TRACKINGSUMMARY examples

Example 1:

```
CICSPA IN(SMFIN001),
      NOAPPLID,
      LINECNT(60),
      FORMAT(':', '/'),
      PRECISION(4),
      TRACKINGSUMMARY(OUTPUT(TTSU0001),
      EXTERNAL(CPAXW001),
      PRINTMULTIPLE,PRINTSINGLE,
      FIELDS(PHAPPLID,
      PHTRAN,
      PHCOUNT,
      APPLID,
      TRAN))
```

Figure 233. Transaction Tracking Summary report

## LISTEXC - Exception List report

The LISTEXCception operand requests the Exception List report.

The command format is:

```
CICSPA LISTEXC(
                [OUTPUT(ddname),]
                [LINECount(nnn),])
```

```
[TITLE1('...up to 64 characters...'),]
[TITLE2('...up to 64 characters...'),]
[SELECT(EXCEPTION(INCLUDE|EXCLUDE(field1(values1),...),
...)))]
```

The options are:

#### **OUTPUT**

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **XLSTnnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

#### **LINECOUNT**

Controls the number of lines per page. See “LINECount” on page 380 for further information.

#### **TITLE1, TITLE2**

Controls the report title (left and right half of subheading line). See “TITLE1 and TITLE2” on page 380 for further information.

#### **SELECT(EXCEPTION(INCLUDE|EXCLUDE**

Specifies what CMF exception data to include or exclude from the report based on data field values. See “Using SELECT statements” on page 508 for a detailed explanation and examples.

## **LISTEXC examples**

Example 1: Default report

```
CICSPA LISTEXC
```

Example 2: Exceptions for a particular transaction

In this example, the report only contains exception records for transaction ROLE.

```
CICSPA LISTEXC(SELECT(EXCEPTION(INCLUDE(TRAN(ROLE)))))
```

Example 3: Exceptions for a specified report interval

This example lists the exception data for January 16, 2005.

```
CICSPA IN(SMFIN001),
LISTEXC(SELECT(EXCEPTION(
INCLUDE(ACTIVE(FROM(2005/01/16,),TO(2005/01/17,)))))
```

Example 4: Particular types of exception

You can use SELECT to report only those exception records for transactions that incurred a particular type of CICS resource shortage. For example, the following command generates an Exception List report of only the exception class records for transactions that incurred a storage wait in either the CDSA or ECDSA.

```
CICSPA IN(SMFIN002),
LISTEXC(SELECT(EXCEPTION(
INCLUDE(STORAGEW(CDSA,ECDSA)))))
```

Figure 235. Exception List report

#### Example 6: Exceptions for LSRPOOL and FILE resources

This example generates an Exception List report for the exception records for resource types LSRPOOL and FILE.

```
CICSPA LISTEXC(SELECT(EXCEPTION(
INCLUDE(RESOURCETYPE(LSRPOOL,FILE)))))
```

#### Example 7: Exceptions for STORAGE resources

This examples produces an Exception List report that includes only the exception records for a specific resource type of STORAGE.

```
CICSPA LISTEXC(SELECT(EXCEPTION(INCLUDE(RESOURCETYPE(STORAGE)))))
```

#### Example 8: Exceptions for a particular transaction ID

This example produces an Exception List report that only includes the exception records for specific transaction identifiers.

```
CICS LISTEXC(SELECT(EXCEPTION(INCLUDE(TRAN(ABRW)))))
```

## SUMEXC - Exception Summary report

The SUMEXCception operand requests the Exception Summary report.

The command format is:

```

CICSPA SUMEXC(
    [OUTPUT(ddname),]
    [LINECount(nnn),]
    [TITLE1('...up to 64 characters...'),]
    [TITLE2('...up to 64 characters...'),]
    [SELECT(EXCEPTION(INCLUDE|EXCLUDE(field1(values1),...),
        ...))])

```

The options are:

#### OUTPUT

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **XSUMnnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

#### LINECOUNT

Controls the number of lines per page. See “LINECount” on page 380 for further information.

#### TITLE1, TITLE2

Controls the report title (left and right half of subheading line). See “TITLE1 and TITLE2” on page 380 for further information.

#### SELECT(EXCEPTION(INCLUDE|EXCLUDE

Specifies what CMF exception data to include or exclude from the report based on data field values. See “Using SELECT statements” on page 508 for a detailed explanation and examples.

## SUMEXception examples

Example 1: Default report

```
CICSPA SUMEXC
```

Example 2: VSTRINGW exceptions on a particular file

This example shows the SUMEXception operand combined with a SELECT statement. This report will only contain the exception class records that are generated because of a VSAM string wait on file FILEA.

```
CICSPA SUMEXC(SELECT(EXCEPTION(INCLUDE(VSTRINGW(FILEA)))))
```

Figure 236. Exception Summary report

## RESUSAGE - Transaction Resource Usage reports

The **RESUSAGE** operand requests the Transaction Resource Usage reports.

The command format is:

```

CICSPA RESUSAGE(
    [OUTPUT(ddname),]
    [TRANLIST(FILE,TEMPSTOR,DPL),]
    [TRANSummary(FILE,TEMPSTOR,DPL),]

```

```
[FILESUMmary(BYTRAN,TOTAL),]
[TEMPSTORSUMmary(BYTRAN,TOTAL),]
[DPLSUMmary(BYTRAN,TOTAL),]
[LINECount(nnn),]
[TITLE1('...up to 64 characters...'),]
[TITLE2('...up to 64 characters...'),]
[SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),
...))]]
```

The default report produces all the Summaries.

The options are:

#### OUTPUT

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **RESUnnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

#### TRANLIST

Requests the Transaction Resource Usage List report, a detailed list of all transactions with CMF transaction resource class data.

Specify **FILE** to report File usage statistics, **TEMPSTOR** to report Temporary Storage usage statistics, and **DPL** to report DPL usage statistics.

Currently these are the only resource types available. The default is **TRANLIST(FILE,TEMPSTOR,DPL)**.

#### TRANSUMMARY

Specify **FILE** to request the Transaction File Usage Summary report, a summary (averages and maximums) of File activity for each Transaction ID.

Specify **TEMPSTOR** to request the Transaction Temporary Storage Usage Summary report, a summary (averages and maximums) of Temporary Storage activity for each Transaction ID.

Specify **DPL** to request the Transaction Distributed Program Link (DPL) Usage Summary report, a summary (averages and maximums) of DPL activity for each Transaction ID.

Currently these are the only resource types available. The default is **TRANSUMMARY(FILE,TEMPSTOR,DPL)**.

#### FILESUMMARY

Requests the File Usage Summary report, a summary (averages and maximums) of File usage for each File.

Specify **BYTRAN** to break down the File usage statistics by Transaction ID.

Specify **TOTAL** to give total usage statistics for each File.

The default is **FILESUMMARY(BYTRAN,TOTAL)**.

#### TEMPSTORSUMMARY

Requests the Temporary Storage Usage Summary report, a summary (averages and maximums) of Temporary Storage usage for each Temporary Storage Queue.

Specify **BYTRAN** to break down the Temporary Storage usage statistics by Transaction ID.

Specify **TOTAL** to give total usage statistics for each Temporary Storage Queue.

The default is **TEMPSTORSUMMARY(BYTRAN,TOTAL)**.

#### **DPLSUMMARY**

Requests the DPL Usage Summary report, a summary (averages and maximums) of usage for each DPL.

Specify **BYTRAN** to break down the DPL usage statistics by Transaction ID.

Specify **TOTAL** to give total usage statistics for each DPL.

The default is **DPLSUMMARY(BYTRAN,TOTAL)**.

#### **LINECOUNT**

Controls the number of lines per page. See “LINECount” on page 380 for further information.

#### **TITLE1, TITLE2**

Controls the report title (left and right half of subheading line). See “TITLE1 and TITLE2” on page 380 for further information.

#### **SELECT(PERFORMANCE(INCLUDE|EXCLUDE**

Specifies what data to include or exclude from the report based on data field values. See “Using SELECT statements” on page 508 for a detailed explanation and examples.

The Transaction Resource Usage report processes transaction resource class and performance class data, and uses Performance Selection Criteria to filter both. For more information, see “Performance Selection Criteria” on page 218.

## **RESUSAGE examples**

### **Example 1: Default report**

The default produces all the Summary reports:

1. Transaction File Usage Summary report
2. Transaction Temporary Storage Usage Summary report
3. Transaction DPL Usage Summary report
4. File Usage Summary report with individual and total Transaction statistics
5. Temporary Storage Usage Summary report with individual and total Transaction statistics
6. DPL Usage Summary report with individual and total Transaction statistics

**CICSPA RESUSAGE**

The following command achieves the same:

```
CICSPA RESUSAGE(TRANSUMM(FILE,TEMPSTOR,DPL),  
                FILESUMM(BYTRAN,TOTAL),  
                TEMPSTORSUMM(BYTRAN,TOTAL),  
                DPLSUMM(BYTRAN,TOTAL))
```

### **Example 2:**

This example produces a Transaction Resource Usage List report showing File Usage, Temporary Storage Usage, and DPL Usage details as shown in Figure 237 on page 478.

**CICSPA RESUSAGE(TRANLIST(FILE,TEMPSTOR,DPL))**

## STATSALERT - Statistics Alert reports

The **STATSALERT** operand requests a Statistics Alert report.

The command format for a Statistics Alert report is:

```
CICSPA STATSALERT([OUTPUT(ddname),]
                  [EXTERNAL(ddname),]
                  STALTDEF(statistics-alert-definition),
                  [BY(APPLID[(LIST,SUMMARY)] |
                    ALERT[(LIST,SUMMARY)] |
                    COLLECT |
                    INTERVAL |
                    RESOURCE),]
                  [TYPE(EOD,INT,USS,REQ,RRT),]
                  [LINECount(nnn),]
                  [TITLE1('...up to 64 characters...'),]
                  [TITLE2('...up to 64 characters...')])
```

The options are:

### STALTDEF(statistics-alert-definition)

The name of the Statistics Alert Definition that you want to use for this report. For details, see Chapter 13, “Statistics alert reporting,” on page 347.

In the JCL for the report, the DDname CPAHDBRG identifies the Repository data set that defines the Alert Definition.

**BY(...)** The sort order of the report. For reports sorted by APPLID or Alert, you can specify a report type: List (the default), Summary, or both. Other sorting options are available only as List reports.

List reports show each instance of an Alert on a separate row, with details such as the threshold value and the Formula value that triggered the Alert.

Summary reports show the number of Alerts for the report period, rather than the details of each instance.

**TYPE(...)**

The types of statistics intervals to include in the report.

**LINECount**

Controls the number of lines per page in the report. See “LINECount” on page 380 for further information.

**TITLE1, TITLE2**

Controls the report title (left and right half of subheading line) for the report. See “TITLE1 and TITLE2” on page 380 for further information.

**OUTPUT**

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **STALnnnn** where nnnn is the report sequence number **0001-9999** to uniquely identify the output. See “OUTPUT” on page 378 for further information.

**EXTERNAL**

Specifies the DDname for the work data set used by the external SORT facility. If not specified, CICS PA assigns an External Work File from a pool of External Work Files with DDnames in the format **CPAXWnnn** where nnn is the sequence number **001-999**. See “EXTERNAL” on page 379 for further information.

## STATSALERT examples

Example: List and Summary by APPLID

This example produces a “List by APPLID” report followed by a “Summary by APPLID” report in the same output data set, STAL0001, as shown in Figure 244 on page 484 and Figure 245 on page 484:

```
CICSPA STATSALERT(OUTPUT(STAL0001),
                  EXTERNAL(CPAXW001),
                  STALDEF(SAMPLE2),
                  BY(APPLID(LIST,SUMMARY)),
                  TYPE(EOD,REQ,RRT,INT,USS))
```

Figure 245. Statistics Alerts - Summary by APPLID report

## CTGSTATISTICS - CICS TG Statistics reports

The **CTGSTATISTICS** operand requests the CICS Transaction Gateway statistics reports.

The command format is:

```
CICSPA CTGSTATISTICS[(  
    [OUTPUT(ddname|STTG0001),]  
    [LINECNT(nnn),]  
    [ACTIVITY,]  
    [USAGE(RATIO(90),]  
    [TITLE1('...sub-heading left ...'),]  
    [TITLE2('...sub-heading right...')]])]
```

The options are:

### OUTPUT

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **STTGnnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

### LINECount

Controls the number of lines per page. See “LINECount” on page 380 for further information.

### ACTIVITY

Requests the Activity Summary report.

### USAGE

Requests the Usage and Capacity report.

### RATIO

This option applies only to the Usage and Capacity report. A warning indicator is inserted against the EXCI pipes or IPIC sessions columns when the Num/Max or Num/Avail ratio exceeds the specified value. The default is 90.

### TITLE1, TITLE2

Controls the report title (left and right half of subheading line). See “TITLE1 and TITLE2” on page 380 for further information.

## CTGSTATISTICS examples

The following command produces the Activity Summary report and the Usage and Capacity report. The capacity ratio in the Usage and Capacity report is specified as 30.

```
CICSPA CTGSTATISTICS(OUTPUT(STTG0001),  
    ACTIVITY,  
    USAGE(RATIO(30)))
```

V5R1M0

### CICS Performance Analyzer CICS Transaction Gateway - Activity Summary

Figure 247. CICS Transaction Gateway - Usage and Capacity report

## DB2 - DB2 report

The **DB2** operand requests the DB2 report.

**Note:** To maximize the DB2 details available for reporting, define your CICS-DB2 resources with ACCOUNTREC(TASK) or ACCOUNTREC(UOW). See the *CICS DB2 Guide* for more information on accounting for DB2 resources and the setup required.

The command format is:

```
CICSPA DB2(
    [OUTPUT(ddname),]
    [EXTERNAL(ddname),]
    [LIST(
        CLASS1,CLASS2,CLASS3,BUFFER,LOCKING,DML1,DML2|ALL),]
    [LONGSUMMARY(
        CLASS1,CLASS2,CLASS3,BUFFER,LOCKING,DML1,DML2|ALL),]
    [SHORTSUMMARY,]
    [SSID(id1,id2,...),]
    [CMFONLY,]
    [LISTZERO,]
    [MAXLONGSUM|NOMAXLONGSUM,]
    [LINECOUNT(nnn),]
    [TITLE1('...sub-heading left ...'),]
    [TITLE2('...sub-heading right...'),]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),
        ...))])
```

The options are:

### OUTPUT

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **DB2Rnnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

### EXTERNAL

Specifies the DDname for the work data set used by the external sort facility. If not specified, CICS PA assigns an External Work File from a pool of External Work Files with DDnames in the format **CPAXWnnn** where nnn is the sequence number **001-999**. See “EXTERNAL” on page 379 for further information.

**LIST** Requests the DB2 List report, a detailed list of all network units-of-work with DB2 activity. This report consolidates CICS CMF performance class records and DB2 accounting statistics from a single or multiple CICS systems. Each line on the report is a single CMF performance or DB2 accounting record.

Specify one or more of the following operands (or **ALL**) to control which DB2 accounting details are to be reported.

**Note: Thread Identification** is always reported.

**CLASS1**

Thread Time

**CLASS2**

In-DB2 Time

**CLASS3**

Suspend Time

**BUFFER**

Buffer Manager Summary

**LOCKING**

Locking Summary

**DML1** SQL DML Query/Update

**DML2** SQL DML 'Other'

If LIST is specified without operands, the default is **LIST(CLASS1,CLASS2,BUFFER,LOCKING)**.

**LONGSUMmary**

Requests the DB2 Long Summary report which summarizes these details by transaction and program (CMF performance data) and SSID and plan (DB2 accounting data) within APPLID. For each, average and maximum values are reported. CMF performance data is presented in columns across the page and associated DB2 accounting data is presented in rows down the page.

Specify one or more of the following operands (or **ALL**) to control which of the DB2 accounting details to include in the report.

**Note: Thread Utilization** is always reported.

**CLASS1**

Thread Time

**CLASS2**

In-DB2 Time

**CLASS3**

Suspend Time

**BUFFER**

Buffer Manager Summary

**LOCKING**

Locking Summary

**DML1** SQL DML Query/Update

**DML2** SQL DML 'Other'

If LONGSUM is specified without operands, the default is **LONGSUM(CLASS1,CLASS2,BUFFER,LOCKING)**.

**SHORTSUMmary**

Requests the DB2 Short Summary report, an abridged version of the DB2 Long Summary report, giving averages only (no maximums). This is the default report.

**SSID** Requests reporting to be limited to the DB2 Subsystem IDs that match the specified IDs or patterns. Masking characters are supported: % for one and only one character, and \* for many or none.

**CMFONLY**

Requests CICS PA to process only CMF performance (SMF 110) records and not DB2 accounting records. If not specified, CICS PA will also process associated DB2 accounting (SMF 101) records. The default is to process both.

**LISTZERO**

Applies to the DB2 List report. Specify this option to report CMF performance records with DB2REQCT=0 provided they are part of a network unit-of-work that has some DB2 activity. The default is to omit the CMF performance records with no DB2 activity.

**MAXLONGSUM | NOMAXLONGSUM**

Applies to the DB2 Long Summary report.

**MAXLONGSUM** requests that both average and maximum values are to be reported in the DB2 accounting detail lines. This is the default.

**NOMAXLONGSUM** requests that only the averages are to be reported (maximum values omitted).

**LINECount**

Controls the number of lines per page. See "LINECount" on page 380 for further information.

**TITLE1, TITLE2**

Controls the report title (left and right half of subheading line). See "TITLE1 and TITLE2" on page 380 for further information.

**SELECT(PERFORMANCE(INCLUDE | EXCLUDE**

Specifies what data to include or exclude from the report based on data field values. See "Using SELECT statements" on page 508 for a detailed explanation and examples.

## DB2 examples

**Example 1: Default report (DB2 Short Summary)**

This example produces the default report like that shown in Figure 248 on page 489. The default is the Short Summary report with both CMF performance records (SMF 110) and DB2 accounting (SMF 101) records reported. CMF performance records with DB2REQCT=0 are not included.

CICSPA DB2

The following command achieves the same:

CICSPA DB2(SHORTSUM)

V5R1M0		CICS Performance Analyzer DB2 - Short Summary

Figure 251. DB2 report (Recap)

## MQ - WebSphere MQ report

The **MQ** operand requests the WebSphere MQ report.

**Note:** WebSphere MQ accounting records are produced when the Accounting Trace component of WebSphere MQ is activated. If the MQ accounting trace is active, CLASS(1) subtype 0 records are always produced, but subtypes 1 and 2 are only produced if CLASS(3) is specified when the trace is activated.

See the *WebSphere MQ for z/OS System Setup Guide* for more information on accounting for WebSphere MQ resources and the setup required.

The command format is:

```
CICSPA MQ(
    [OUTPUT(ddname),]
    [LIST,]
    [SUMMARY,]
    [CLASS1|CLASS3,]
    [SORT([TRAN,][QUEUE]),]
    [QNAME(name),]
    [SSID(id1,id2,...),]
    [LINECount(nnn),]
    [TITLE1('...sub-heading left ...'),]
    [TITLE2('...sub-heading right...'),]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),
        ....))])
```

The options are:

**OUTPUT**

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **MQ00nnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

**LIST** Requests the WebSphere MQ List report.

**SUMMARY**

Requests the WebSphere MQ Summary report.

**CLASS1|CLASS3**

CLASS1 requests the reports to process MQ Class 1 records. This is the default.

CLASS3 requests the reports to process MQ Class 3 records.

If the List report is requested, CLASS1 and CLASS3 cannot both be specified because of the different report formats.

**SORT** Specifies the required sorting sequence of the Class 3 Summary report. The choices are:

1. SORT(TRAN) sorts by Transaction ID. This is the default.
2. SORT(QUEUE) sorts by WebSphere Queue name.
3. SORT(TRAN,QUEUE) sorts by Transaction ID, then Queue name.
4. SORT(QUEUE,TRAN) sorts by Queue name, then Transaction ID.

**QNAME**

Selects records for a particular WebSphere MQ queue name. You can specify a pattern such as CICS<sup>SM</sup>MQ\* to include more than one queue name. The queue name is case-sensitive.

**SSID** Requests reporting to be limited to the MQ Subsystem IDs that match the specified IDs or patterns. Masking characters are supported: % for one and only one character, and \* for many or none.

**LINECount**

Controls the number of lines per page. See “LINECount” on page 380 for further information.

**TITLE1, TITLE2**

Controls the report title (left and right half of subheading line). See “TITLE1 and TITLE2” on page 380 for further information.

**SELECT(PERFORMANCE(INCLUDE|EXCLUDE**

Specifies what data to include or exclude from the report based on data field values. See “Using SELECT statements” on page 508 for a detailed explanation and examples.

The fields that can be specified in Selection Criteria for filtering MQ accounting (SMF 116) records are:

**APPLID**

CICS APPLID

**TRAN** CICS Transaction ID

**TASKNO**

CICS Task ID

**START**

Thread Start Time

**STOP** Thread End Time

**ACTIVE**

Thread Begin-End Time

## MQ examples

Example 1: Default report (MQ Class 1 Summary)

This example produces the default report like that shown in Figure 252. The default is the Summary report for Class 1 data.

CICSPA MQ

The following command achieves the same:

CICSPA MQ(SUMMARY,CLASS1)

V5R1M0

CICS Performance Analyzer  
WebSphere MQ Class 1 Summary

MQ000001 Printed at 12:03:45 10/15/2012 Data from 14:50:34 1/13/2004 to 14:51:24 1/13/2004 Page 1

Figure 252. MQ Summary report (Class 1)

## OMEGAMON - OMEGAMON reports

The OMEGAMON operand requests the OMEGAMON reports.

The command format is:

```
CICSPA OMEGAMON[(  
    [OUTPUT(ddname|OMEG0001),]  
    [LINECNT(nnn),]  
    [DBMS(ADABAS,DATACOM,IDMS,SUPRA),]  
    [LIST,]  
    [SUMMARY(TRAN,DATABASE,AVG,MAX,MIN,TOT,DEV,PEAK(percentile)),]  
    [PRINT(TOTALS,DB),]  
    [TITLE1('...sub-heading left ...'),]  
    [TITLE2('...sub-heading right...')]  
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),  
        ...)))]
```

The options are:

### OUTPUT

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **OMEGnnnn** where nnnn is the report sequence number **0001-9999**. See “OUTPUT” on page 378 for further information.

### LINECount

Controls the number of lines per page. See “LINECount” on page 380 for further information.

### DBMS

The types of DBMS for which you want to produce reports.

**LIST** Requests the OMEGAMON List report.

### SUMMARY

Requests the OMEGAMON Transaction Summary report (**TRAN**), the Database Summary report (**DATABASE**), and also the statistical functions that these reports use to summarize transaction data:

**AVG** Average  
**MAX** Maximum

**MIN** Minimum  
**TOT** Total  
**DEV** Standard deviation  
**PEAK** Peak percentile. Specify a percentile value between 50 and 100 to report the value for that percentage of transactions. Computations assume a normal distribution. For example, specify **PEAK(95)** to report the value for 95% of transactions.

Each statistical function that you specify produces additional rows in the reports, with the function name as the row heading.

## **PRINT**

Each OMEGAMON XE for CICS (SMF 112) record contains database usage details for a single transaction. A transaction might use one database, or it might use multiple databases from different types of DBMS. For each type of DBMS used by the transaction, the record contains a “totals” segment. For each database used by the transaction, the record contains a “detail” segment.

### **PRINT(TOTALS)**

Includes totals sections in a report, using information from totals segments in the input records.

### **PRINT(DB)**

Includes database sections in a report, using information from detail segments in the input records.

The **PRINT** operand is relevant only to the List report and the Transaction Summary report; it has no effect on the Database Summary report.

## **TITLE1, TITLE2**

Controls the report title (left and right half of subheading line). See “TITLE1 and TITLE2” on page 380 for further information.

## **SELECT(PERFORMANCE(INCLUDE|EXCLUDE**

Specifies what data to include or exclude from the report based on data field values. See “Using SELECT statements” on page 508 for a detailed explanation and examples.

CICS PA checks only the following Performance Selection Criteria fields when filtering OMEGAMON records:

### **APPLID**

CICS APPLID

### **FILENAME**

Database (or file) name

### **NETUOWPX**

Originating System VTAM network name

### **START**

Task start time.

**Note:** Report Interval-based selection for OMEGAMON XE for CICS records is limited to the Attach (START) time; the STOP and ACTIVE options are ignored.

### **TASKNO**

Transaction identification number

### **TRAN** CICS transaction ID

## UOWID

Unit of work ID

All other fields are ignored.

## OMEGAMON examples

Example 1: Default report (both summary reports)

The default is the Database Summary report and Transaction Summary report for all types of DBMS. The following example shows a Transaction Summary report.

CICSPA OMEGAMON

V5R1M0		CICS Performance Analyzer												
		OMEGAMON - CA-DATACOM Transaction Summary

Figure 253. OMEGAMON CA-Datcom Transaction Summary report

## LOGGER - System Logger report and extract

The **LOGGER** operand requests the System Logger report or extract.

The command format for the System Logger report is:

```
CICSPA LOGGER(  
    [OUTPUT(ddname),]  
    [EXTERNAL(ddname),]  
    [SUMMARY[(SUMMARYINTERVAL(hh:mm))],]  
    [LIST[(ALTER,TIMESEQ)],]  
    [INTERVAL(minutes),]  
    [SORT(LOGSTREAM|STRUCTURE),]  
    [TITLE1('...up to 64 characters...'),]  
    [TITLE2('...up to 64 characters...'),]  
    [SELECT(LOGGER(INCLUDE|EXCLUDE(field1(values1),...), ...))]  
    [LOGSTREAM('name.or.pattern'),]  
    [STRUCTURE('name.or.pattern'),])
```

The command format for the System Logger extract is:

```
CICSPA LOGGER(  
    [OUTPUT(ddname),]  
    [DDNAME(ddname),]  
    [DELIMIT('field-delimiter'),]  
    [LABELS|NOLABELS,]  
    [FLOAT,]  
    [SELECT(LOGGER(INCLUDE|EXCLUDE(field1(values1),...), ...))]  
    [LOGSTREAM('name.or.pattern'),]  
    [STRUCTURE('name.or.pattern'),])
```

The options are:

#### OUTPUT

Controls the report output DDname. See “OUTPUT” on page 378 for further information. If not specified, CICS PA assigns a DDname in the format **xxxxnnnn** where **nnnn** is the report sequence number **0001-9999** to uniquely identify the output, and **xxxx** is:

**LOGR** for the System Logger report.

**LOEX** for the Recap report for the System Logger extract.

#### DDNAME

Specifies the DDname of the extract data set where the extracted data is written. When this operand is specified, instead of producing the report, CICS PA produces the extract file, and a Recap of the extract process is written to the OUTPUT operand report file.

The DDname can be up to 8 alphanumeric characters, with the first non-numeric. The CICS PA dialog assigns DDnames in the format **CPAOEXnn** where **nn** is the extract sequence number **01-99**. (See the sample JCL in Figure 187 on page 355).

#### DELIMIT

Specifies the field delimiter, enclosed in quotes, to be used to separate each data field in the extract data set. The default is a semicolon **DELIMIT(';')**.

#### LABELS|NOLABELS

**LABELS** indicates that the first record to be written to the extract data set is to be a field labels record. This is the default.

**NOLABELS** indicates that CICS PA is not to write a field labels record to the extract data set.

#### FLOAT

Write numeric fields in the extract in S390 FLOAT format.

Specify FLOAT format if you plan to import the extract into a DB2 table. When the DB2 Load Utility is used, it will interpret all numerical fields reliably and consistently in FLOAT format.

If FLOAT is not specified, the numeric fields are written in a mixture of integer, real and exponential using character digits. This is the default and is suitable when importing the extract data into a PC spreadsheet tool.

#### EXTERNAL

Specifies the DDname for the work data set used by the external sort facility. If not specified, CICS PA assigns an External Work File from a pool of External Work Files with DDnames in the format **CPAXWnnn** where **nnn** is the sequence number **001-999**. See “EXTERNAL” on page 379 for further information.

## **SUMMARY**

Requests the System Logger Logstream Summary and Structure Summary reports. This is the default.

To present a single summary of records for the entire reporting period, omit the optional **SUMMARYINTERVAL** suboperand (this is the default). To summarize records at intervals within the reporting period, specify **SUMMARYINTERVAL** with a multiple of the SMF reporting interval, from 00:01 to 23:59. For example, if the SMF reporting interval was 5 minutes at the time that the logger records were written, then you can generate a System Logger Summary report that summarizes the logger records at any multiple of 5 minutes: 05:00, 10:00, 15:00 etc.

If you specify **SUMMARYINTERVAL**, then ensure that the value you specify is an exact multiple of the SMF reporting interval. Otherwise, each of the summaries in the report might not be calculated from the same number of records.

**LIST** Requests the System Logger List report, a detailed list of Logstream writes, Logstream deletes, and Logstream events.

Specify **ALTER** to also report Structure Alter events. These apply to Structures, not individual Logstreams, and are reported with a Logstream name of \*ALTER\*.

By default, the List report entries are printed in Logstream or Structure name sequence according to the **SORT** operand. However, by specifying **TIMESEQ**, the entries are printed in Logstream or Structure name sequence within each Interval expiry period.

## **INTERVAL**

Specifies the SMF global recording interval as specified in the INTVAL parameter of the SMFPRMnn PARMLIB member.

Specify an interval from 1 to 60 minutes. If not specified, CICS PA uses the recording interval in effect on the reporting system. The interval value is used by CICS PA for rate per second calculations in the System Logger Summary reports. If the interval used by CICS PA does not match the data, the total interval and rate calculations will be incorrect.

**SORT** Specifies the sort sequence for the List and Summary reports.

Specify **LOGSTREAM** to sort by Logstream name, MVS ID, Structure name, then time stamp. This is the default.

Specify **STRUCTURE** to sort by Structure name, Logstream name, MVS ID, then time stamp.

## **LOGSTREAM**

Optional filter on Logstream name. Specify a name or pattern enclosed in quotes. Masking characters % and \* are allowed. The percent (%) is for a single character substitution and the asterisk (\*) is for many or none. For example:

**LOGSTREAM('TEST.DFHLOG')**

must match exactly

**LOGSTREAM('PROD.\*')**

can match PROD.DFHLOG

**LOGSTREAM('PROD.MVSA%')**

can match PROD.MVSA1, but not PROD.MVSA1LOG

## STRUCTURE

Optional filter on Structure name. Specify a name or pattern enclosed in quotes. Masking characters % and \* are allowed. For example:

**STRUCTURE('TEST.DFHLOG')**

must match exactly

**STRUCTURE('PROD.\*')**

can match PROD.DFHLOG

**STRUCTURE('PROD.MVSA%')**

can match PROD.MVS1, but not PROD.MVS1LOG

## TITLE1, TITLE2

Controls the report title (left and right half of subheading line). See "TITLE1 and TITLE2" on page 380 for further information.

## SELECT(LOGGER(INCLUDE|EXCLUDE

Specifies what data to include or exclude from the report or extract based on data field values. See "Using SELECT statements" on page 508 for an explanation and examples.

## LOGGER examples

Example 1: Default report

The default is the System Logger Summary report like that shown in Figure 254 on page 499, sorted by Logstream name, without Alter events, and using the system default interval.

CICSPA LOGGER

The following command achieves the same:

CICSPA LOGGER(SUMMARY),SORT(LOGSTREAMNAME)

Figure 255. System Logger report (List report)

## GRAPH - Graph reports

The **GRAPH** operand requests either of two graph reports:

1. The Transaction Response Time Graph report. This report produces two graphs:
  - a. The Average Response Time (in seconds).
  - b. The Maximum Response Time (in seconds).
2. The Transaction Rate Graph report. This report produces two graphs:
  - a. The Average Response Time (in seconds).
  - b. The Number of Transactions Completed.

The Transaction Rate Graph report produces two graphs:

The command format is:

```

CICSPA GRAPH(RESPONSE|TRANRATE,
              [OUTPUT(ddname),]
              [RANGE1(nnnnn),]
              [RANGE2(nnnnn),]
              [INTERVAL(hh:mm:ss),]
              [LINECount(nnn),]
              [TITLE1('...up to 64 characters...'),]
              [TITLE2('...up to 64 characters...'),]
              [SELECT(PERFORMANCE|INCLUDE|EXCLUDE(field1(values1),...),
                      ...))])

```

The options are:

## **RESPONSE|TRANRATE**

Specify **RESPONSE** to request the Transaction Response Time Graph. This is the default.

Specify **TRANRATE** to request the Transaction Rate Graph.

Only one can be specified per **GRAPH** operand.

## **OUTPUT**

Controls the report output DDname. If not specified, CICS PA assigns a DDname in the format **xxxxnnnn** where **nnnn** is the report sequence number **0001-9999** and **xxxx** is the type of graph:

**GRSP** Transaction Response Time Graph

**GRTE** Transaction Rate Graph

See "OUTPUT" on page 378 for further information.

## **RANGE1**

Specifies the high end of the horizontal axis of the first graph. This is the **Average Response Time** in seconds.

If not specified, CICS PA sets the scale of the horizontal axis to fit the highest recorded values.

## **RANGE2**

Specifies the high end of the horizontal axis of the second graph.

- For the Transaction Response Time Graph, this is the **Maximum Response Time** in seconds.
- For the Transaction Rate Graph, this is the **Number of Transactions Completed**.

If not specified, CICS PA sets the scale of the horizontal axis to fit the highest recorded values.

## **INTERVAL**

Specifies the time interval (in hours, minutes, and seconds) for the scale of the vertical axis of the graphs. The default is **00:05:00** (5 minutes).

A time interval of less than one hour must fit evenly into the hour. CICS PA will round it down to the nearest interval that aligns to the hour. For example, 1.35 is reduced to 00:01:30 minutes which will produce 40 interval report lines for each hour of data.

A time interval of more than one hour must fit evenly into the day. CICS PA will round it down to the nearest interval that aligns to the day. For example, 10.30.23 is reduced to 08:00:00 hours which will produce 3 interval report lines for each day of data.

Minutes take precedence for an abbreviated entry. For example:

**1** becomes 00:01:00

**1.1** becomes 00:01:00 (rounded down from 00:01:01)

**1.1.1** becomes 01:00:00 (rounded down from 01:01:01)

## **LINECOUNT**

Controls the number of lines per page. See "LINECount" on page 380 for further information.

## **TITLE1, TITLE2**

Controls the report title (left and right half of subheading line). See "TITLE1 and TITLE2" on page 380 for further information.

**SELECT(PERFORMANCE(INCLUDE|EXCLUDE**  
Specifies what CMF performance data to include or exclude from the report based on data field values. See “Using SELECT statements” on page 508 for a detailed explanation and examples.

**GRAPH examples**

Example 1: Response Times at minute intervals

This example produces the Transaction Response Time Graph like that shown in Figure 256. Each line of the graph represents those transactions that completed during that 1 minute interval.

CICSPA GRAPH(RESPONSE,INTERVAL(1))

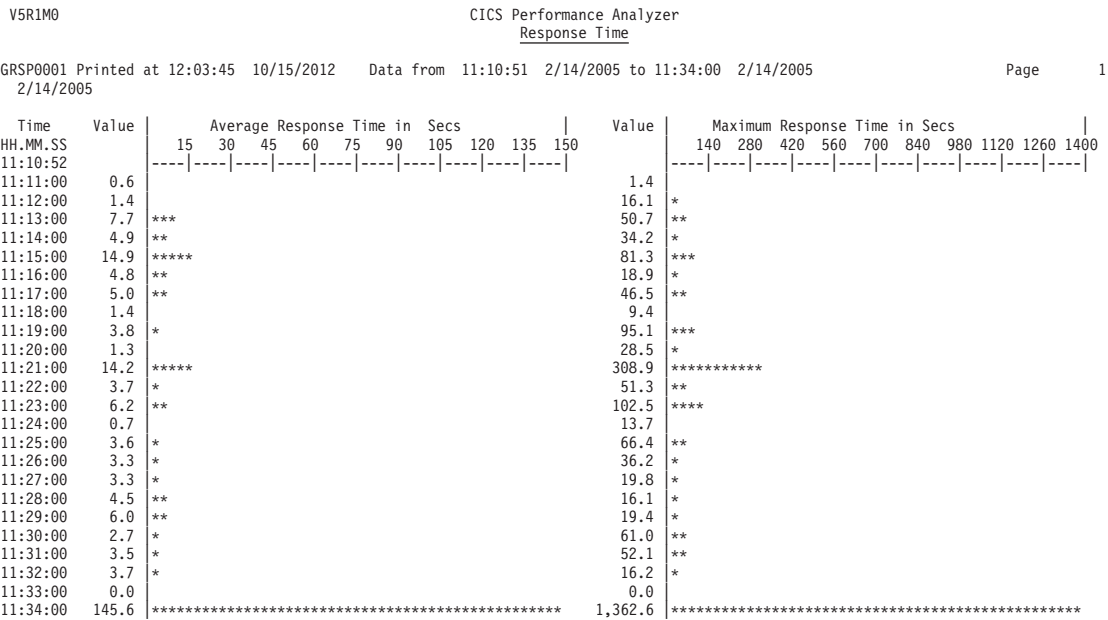

Figure 256. Transaction Response Time Graph report

Example 2: Transaction Rates at 15 minute intervals

This example generates a Transaction Rate Graph with the interval set to 15 minutes.

CICSPA GRAPH(TRANRATE,INTERVAL(15))

**EXTRACTPERFORMANCE - Performance data extract**

The **EXTRACTPERFORMANCE** operand requests that a performance extract data set is to be created as a delimited text file from the CMF performance class data.

A more flexible alternative is the extract capability provided by the **LIST** and **SUMMARY** operands. For more information, see “LIST - Performance List report” on page 390 and “SUMMARY - Performance Summary report” on page 413.

A Recap report containing processing statistics is always printed at the end of extract processing.

The command format for the Performance Data extract is:

```

CICSPA EXTRACTPERFORMANCE(
    [OUTPUT(ddname),]
    [DDNAME(ddname),]
    [DELIMIT('field-delimiter'),]
    [LABELS|NOLABELS,]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),
        ...))])

```

The options are:

#### OUTPUT

Controls the report output DDname for the Recap report. If not specified, CICS PA assigns a DDname in the format **EXPTnnnn** where nnnn is the report sequence number **0001-9999**

#### DDNAME

Specifies the DDname of the output data set where the performance extract is written. If not specified, the default DDname is **CPAOEXPT**. The CICS PA dialog, however, assigns DDnames in the format **CPAOEXnn** where nn is the extract sequence number **01-99**. (See the sample JCL in Figure 187 on page 355).

#### DELIMIT

Specifies the field delimiter, enclosed in quotes, to be used to separate each data field in the performance extract data set. The default is a semicolon **DELIMIT(';')**.

#### LABELS|NOLABELS

**LABELS** indicates that the first record to be written to the performance extract data set is to be a field labels record. This is the default.

**NOLABELS** indicates that CICS PA is not to write a field labels record to the performance extract data set.

#### SELECT(PERFORMANCE(INCLUDE|EXCLUDE

Specifies what CMF performance data to include or exclude from the extract based on data field values. See “Using SELECT statements” on page 508 for an explanation and examples.

## EXTRACTPERFORMANCE examples

Example 1: Default extract

In this example, the extract records are written to the extract data set specified in the default DD statement **CPAOEXPT** and the Recap report is written to **EXPT0001**.

```

CICSPA EXTRACTPERFORMANCE

```

Example 2:

```

CICSPA EXTRACTPERFORMANCE(OUTPUT(EXPT0002),
    DDNAME(CPAOEX02),
    DELIMIT(','))

```

In this example, a comma is specified for the field delimiter. The extract records are written to the data set specified in the DD statement **CPAOEX02** and the Recap report is written to **EXPT0002**.

---

## RECSEL - Record Selection extract

The **RECSEL** or **RECORDSELECTION** operand requests that a subset of CMF records be extracted from a larger SMF file. Optionally, DB2 and MQ accounting records and MVS System Logger records can also be extracted. This smaller file containing only those records of interest to you can then be used for more efficient CICS PA reporting.

A Recap report containing processing statistics is always printed at the end of extract processing.

The command format for the Record Selection extract is:

```
[CICSPA APPLID(applid1,applid2,...)]
CICSPA RECSEL(
    [OUTPUT(ddname),]
    [DDNAME(ddname),]
    [PERFORMANCE,]
    [EXCEPTION,]
    [RESOURCE,]
    [IDENTITY,]
    [STATISTICS,]
    [LOGGER,]
    [OMEGAMON,]
    [DB2,]
    [MQ,]
    [SSID(id1,id2,...),]
    [COMPRESS|NOCOMPRESS,]
    [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(value1),...),...),)]
    [SELECT(EXCEPTION(INCLUDE|EXCLUDE(field1(value1),...),...))]
    [SELECT(LOGGER(INCLUDE|EXCLUDE(field1(values1),...), ...))]
    [LOGSTREAM('name.or.pattern'),]
    [STRUCTURE('name.or.pattern'),])
```

The options are:

### OUTPUT

Controls the report output DDname for the Recap report. If not specified, CICS PA assigns a DDname in the format **RSELnnnn** where nnnn is the report sequence number **0001-9999**.

### DDNAME

Specifies the DDname of the output data set where the Record Selection extract is written. If not specified, the default DDname is **CPAORSEL**. The CICS PA dialog, however, assigns DDnames in the format **CPAORSnn** where nn is the extract sequence number **01-99**. See the sample JCL in Figure 187 on page 355.

### PERFORMANCE

Include CMF Performance class records in the extract. This is the default.

### EXCEPTION

Include CMF Exception class records in the extract.

### RESOURCE

Include CMF Transaction Resource class records in the extract.

### IDENTITY

Include CMF Identity class data records in the extract.

### STATISTICS

Include CICS Statistics and Server statistics class records in the extract.

**LOGGER**

Include MVS System Logger records in the extract.

**OMEGAMON**

Include OMEGAMON XE for CICS records in the extract.

**DB2** Include DB2 accounting records in the extract.

**MQ** Include WebSphere MQ accounting records in the extract.

**SSID** Requests that the Record Selection extract include DB2 accounting (SMF 101) records for the specified DB2 Subsystem IDs, and MQ accounting (SMF 116) records for the specified MQ Subsystem IDs. Masking characters are supported: % for one and only one character, and \* for many or none. If no DB2 SSIDs are specified, then no DB2 accounting records are extracted. If no MQ SSIDs are specified, then no MQ accounting records are extracted.

**COMPRESS | NOCOMPRESS**

Determines whether CICS PA writes CICS SMF records to the extract file in compressed or uncompressed format. This option applies whether the records in the input SMF file are compressed or not.

If you specify **COMPRESS**, CICS PA writes compressed CICS SMF records, regardless of the CICS release level that created the input records. Although CICS only introduced support for writing compressed SMF records in CICS Transaction Server Version 3.2, you can use CICS PA to create an extract file of compressed CICS SMF records for any CICS release supported by CICS PA. You can use extract files containing compressed SMF records as input to CICS PA, just like any other SMF file, even though the CICS product level that originally created those SMF records cannot write them in compressed format.

**SELECT(PERFORMANCE | EXCEPTION | LOGGER(INCLUDE | EXCLUDE**

Specifies what CMF performance data, CMF exception data, or System Logger data to include or exclude from the extract based on data field values. See “Using SELECT statements” on page 508 for an explanation and examples.

**RECSEL examples**

Example 1:

Extract only those CMF performance records with Transaction ID starting with R.

```
CICSPA RECSEL(SELECT(PERFORMANCE(INC(TRAN(R*))))))
```

Example 2:

This example produces a Record Selection extract data set and a Recap report like that in Figure 257 on page 506. The APPLID operand provides a filter on CICS generic APPLIDs, and the SSID operand provides a filter on DB2 Subsystem ID. You can see the effect of the filtering by comparing the DB2 accounting numbers in the End of File Record Counts and the Extract Recap.

```
CICSPA APPLID(CICS53A%),
      RECSEL(OUTPUT(RSEL0009),
            DDNAME(CPAORS09),
            SSID(DB2P))
```

```
CPA0RS01 Extract has completed successfully
Data Set Name . . . . . CICS.PA.RECSEL.EXTRACT
Record Counts:
Performance Dictionary . . . . . 8
Performance Class . . . . . 573
Exception Class . . . . . 0
Resource Class . . . . . 0
Statistics . . . . . 0
DB2 Accounting . . . . . 172
MQ Accounting . . . . . 0
Logger . . . . . 0
SMF Records . . . . . 20
```

Figure 257. Performance Record Selection extract (Recap report)

---

## HDB(LOAD - HDB Load

The **HDB(LOAD** operand requests CICS PA to load historical performance data (List or Summary) or Statistics data from SMF data sets into an HDB.

A Recap report containing processing statistics is always printed at the end of extract processing.

The command format is:

```
CICS.PA HDB(LOAD(hdbname)
           [,OUTPUT(ddname)])
```

The options are:

### LOAD

Specifies the name of the HDB to be loaded. The HDB must be defined in the Repository (DDname **CPAHDBRG**).

### OUTPUT

DDname for the Recap report output. CICS PA records the results of the Load operation in this File. If not specified, CICS PA assigns a DDname of **HDBLn** where **n** is the numerical sequence number **0001-9999**.

## HDB(LOAD examples

The following job is provided as member CPAHDB in the sample library SCPASAMP. This JCL runs the SMF Dump process, followed by Shared System Take-up from an SMF file, HDB Load, and selected reports. By combining take-up, HDB load and reporting into a single job step, all CICS PA functions can be performed by a single pass of the SMF data.

```
//CPAHDB JOB ,CLASS=A,NOTIFY=&SYSUID
//* SMF Dump
//SMFDUMP EXEC PGM=IFASMFDP
//INDD DD DSN=SYS1.MAN1,DISP=SHR
//OUTDD1 DD DISP=(NEW,CATLG),DSN=CICSPROD.SMFDAI1(+1)
//SYSPRINT DD SYSOUT=A
//SYSIN DD *
INDD(INDD,OPTIONS(ALL))
OUTDD(OUTDD1,TYPE(110))
/*
/*
/* CICS PA Take-up, HDB Load, and selected reports
//CICSPA EXEC PGM=CPAMAIN,REGION=4M,PARM=NOSTAE
//STEPLIB DD DSN=CPA.V5R1M0.SCPALINK,DISP=SHR
//SYSPRINT DD SYSOUT=*
```

```

/* SMF Input Files
//SMFIN001 DD DISP=(SHR,KEEP),DSN=CICSPROD.SMFDAILY(+1)
/* Repository
//CPAHDBRG DD DISP=SHR,DSN=USER.CICSPA.XYX.REPOSTRY
/*
/* CICS PA command requests
//SYSIN DD *
    CICSPA IN(SMFIN001),
        APPLID(*),

* Take-up from SMF into Shared System Definitions
HDB(TAKEUP,SYSTEMS,FILESYSTEM,OUTPUT(TAKEUP)),

* HDB Load requests
HDB(LOAD(WEEKLY),OUTPUT(WEEKLY)),
HDB(LOAD(DAILY),OUTPUT(DAILY)),
HDB(LOAD(STATS),OUTPUT(STATS)),

* CMF Performance Report requests
SUMMARY(FIELDS(TRAN),OUTPUT(SUMM0001)),
WAITANAL(BY(TRAN),OUTPUT(WAIT0001))
/*

```

Successful completion of the Load request generates a Recap report that provides information about the HDB Load, including a list of container data sets created by the Load process.

```

V5R1M0                                CICS Performance Analyzer
                                       HDB Load Recap Report

WEEKLY  Printed at 9:28:48 8/08/2004  Data from 09:02:00 8/07/2004 to 16:29:00 8/07/2004  Page 1

LOAD requested for HDB: WEEKLY  Repository DSN: USER.CICSPA.XYX.REPOSTRY

The following Containers were created and loaded:
Container DSN: CPA.WEEKLY.D03219.T092846.HDB  No of Records: 54,567
Start Time Stamp: 2004-08-07-09.00.00  End Time Stamp: 2004-08-07-16.00.00

LOAD process complete.

```

*Figure 258. HDB Load Recap report*

In this example, CICS PA created container data set CPA.WEEKLY.D03219.T092846.HDB for HDB WEEKLY. It contains 54,567 records for the period 9:00am to 4:00pm on August 7, 2004.

---

## EXTRACTSTATISTICS - Statistics extract

The **EXTRACTSTATISTICS** operand requests that one or more statistics extract data sets are to be created as delimited text files from CICS statistics.

A Recap report containing processing statistics is always printed at the end of extract processing.

The command format for the statistics extract is:

```

CICSPA EXTRACTSTATISTICS(
    [OUTPUT(ddname),]
    [DELIMIT('field-delimiter'),]
    [LABELS|NOLABELS,]
    [TYPE(EOD,INT,USS,REQ,RR),]
    STTSxxxx(ddname)|STTGxxxx(ddname),...)

```

The options are:

## OUTPUT

Controls the report output DDname for the Recap report. If not specified, CICS PA assigns a DDname in the format **STEX***nnnn* where *nnnn* is the sequence number **0001-9999**

## DELIMIT

Specifies the field delimiter, enclosed in quotes, to be used to separate each data field in the extract data set. The default is a semicolon **DELIMIT(';')**.

## LABELS | NOLABELS

**LABELS** indicates that the first record to be written to the extract is to be a field labels record. This is the default.

**NOLABELS** indicates that CICS PA is not to write a field labels record to the extract data set.

## TYPE(...)

The types of statistics intervals to extract.

## STTS*xxxx* | STTG*xxxx*

Specifies the DDname of the output data set where each statistics extract is written: STTS*xxxx* for CICS Transaction Server (TS) statistics or STTG*xxxx* for CICS Transaction Gateway (TG) statistics, where *xxxx* is the statistics ID. The CICS PA dialog defines DDnames in the format TS*xxxxnn* or TG*xxxxnn*, respectively, where *nn* is a 2-digit sequence number that ensures each DDname is unique.

## EXTRACTSTATISTICS examples

Example 1: Extract Transaction Manager and Domain Subpools statistics

```
CICSPA EXTRACTSTATISTICS(OUTPUT(STEX0001),
                           DELIMIT(','),
                           LABELS,
                           TYPE(EOD,INT),
                           STTS010A(TS010A01),
                           STTS005A(TS005A01))
```

This example creates two extract data sets: it writes Transaction Manager statistics (ID: 010A) to the extract data set specified in the DD statement TS010A01, and Domain Subpools statistics (ID: 005A) to the extract data set specified in the DD statement TS005A01.

Commas delimit the statistics field values in the extracts. The first record of each extract contains field headings. The extracts contain end-of-day (EOD) and interval (INT) statistics. The Recap report is written to STEX0001.

---

## Using SELECT statements

**SELECT** statements are optionally specified for report and extract processing to filter CMF records or System Logger records based on the values in particular fields.

The **SELECT** statement is used to **INCLUDE** or **EXCLUDE** data for the requested reports and extracts. Data is selected according to the type of record (CMF **PERFORMANCE**, CMF **EXCEPTION**, **LOGGER**) and within that, the values in certain fields.

The format of the statement is:

```

SELECT(PERFORMANCE|EXCEPTION|LOGGER(
    INCLUDE|EXCLUDE(field1(values1),...),
    INCLUDE|EXCLUDE(field2(values2),...),
    ...))

```

For the complete list of operands which can be used with SELECT to control the selection of records, see “SELECT(PERFORMANCE” on page 515 and “SELECT(EXCEPTION” on page 516.

SELECT(PERFORMANCE and SELECT(EXCEPTION can be used as a *global* operand to control multiple reports and extracts, or as a *report-level* operand to control an individual report or extract. Any number of global or report-level SELECT statements can be used together in a command stream. SELECT(LOGGER can be used only to control an individual report or extract.

**Note:** The global SELECT criteria is not reset with the next CICS PA command, however:

- A report-level SELECT takes precedence over global selection criteria for that specific report or extract only, after which the selection criteria specified on the global SELECT again takes effect.
- The next global SELECT statement *adds* the new selection criteria to the previous selection criteria (it does not replace it).

## Specifying Selection Criteria in Report Forms

When Selection Criteria are specified both in a Report Form and in a report that uses the Report Form, two operands **SELECT2** and **SELECT** are required, one for the Form and one for the report. If both SELECT and SELECT2 are specified, the record must match both for the record to be processed.

## PERFORMANCE|EXCEPTION|LOGGER record types

A separate SELECT statement is used for each CMF record type.

**SELECT(PERFORMANCE** is used when requesting any of the reports, graphs, and extracts that process:

- CMF performance class records
- CMF transaction resource class records
- DB2 accounting records
- MQ accounting records

For more information, see “Selecting DB2 accounting records” on page 165, “Selecting MQ accounting records” on page 165 and Transaction Resource Class “Performance Selection Criteria” on page 218.

**SELECT(EXCEPTION** is used when requesting reports that process CMF exception class records.

No error occurs if a CMF record type is specified but is not otherwise used in the report operands. This allows all SELECTs to be specified as global operands and then used by CICS PA where appropriate.

**SELECT(LOGGER** is used when requesting reports or extracts that process System Logger records.

## INCLUDE/EXCLUDE actions

INCLUDE and EXCLUDE are used with SELECT to specify criteria for including or excluding certain records in a report.

INCLUDE issues an order to *include* records that match the specified criteria.

EXCLUDE issues an order to *exclude* records that match the specified criteria.

CICS PA examines each SELECT statement, comparing its specified criteria against the data in the input record, until this results in one of three outcomes:

1. The record is *included* (and no more SELECT statements will affect it).
2. The record is *excluded* (and no more SELECT statements will affect it).
3. The record is *passed forward* for checking against the next SELECT statement. If there are no more SELECT statements, either of two things can happen:
  - a. If SELECT statements (global and local) specified INCLUDEs, the record is *excluded*.
  - b. If SELECT statements (global and local) specified EXCLUDEs, the record is *included*.

A single SELECT statement can contain multiple INCLUDE/EXCLUDE clauses, each specifying a list of fields and values for these fields. The data in the input record is compared against the specified values for each field in the INCLUDE/EXCLUDE list. The record must match *all* the criteria coded under one INCLUDE or EXCLUDE, for the record to be accordingly included or excluded.

If there are multiple INCLUDE operands in one SELECT statement, the record must match *all* the INCLUDEs for the record to be included. Similarly, if there are multiple EXCLUDE operands in one SELECT statement, the record must match *all* the EXCLUDEs for the record to be excluded. If there are both INCLUDEs and EXCLUDEs in one SELECT statement, the final outcome depends on which of the criteria the record matches.

The decision matrix in Table 13 shows which action is taken after examining a **single** SELECT statement against a record.

Table 13. SELECT Decision Table

SELECT Statement Contains...	Result of Examination Against Record	Outcome
INCLUDEs only	All fields matched	Record included
INCLUDEs only	Not all fields matched	Record passed to next SELECT
EXCLUDEs only	All fields matched	Record excluded
EXCLUDEs only	Not all fields matched	Record passed to next SELECT
INCLUDEs and EXCLUDEs	All INCLUDE fields matched, but not all EXCLUDE fields matched	Record included
INCLUDEs and EXCLUDEs	All EXCLUDE fields matched	Record excluded
INCLUDEs and EXCLUDEs	Not all INCLUDE fields matched and not all EXCLUDE fields matched	Record passed to next SELECT

Within a *single* SELECT statement, the order of the INCLUDEs and EXCLUDEs and the order of the fields specified within them does not matter, as each is analyzed to determine the outcome. However, the order of the INCLUDEs and EXCLUDEs can make a difference with *multiple* SELECT statements. For some examples, see “Examples: INCLUDE and EXCLUDE sensitivity” on page 519.

## Specifying values for different field types

The CMF record data fields are defined as specific types:

- For CICS-defined fields, the field types are:
  - character
  - time stamp
  - count
  - clock, containing two parts:
    - elapsed time (TIME)
    - number of times condition occurred (COUNT)
- For user fields, the field types are:
  - CHARACTER
  - COUNT
  - clock, containing two parts:
    - elapsed time (CLOCKTIME)
    - number of times condition occurred (CLOCKCOUNT)

System Logger record data fields, the field types are:

- character
- time stamp
- count
- flag (1 to indicate yes, 0 to indicate no)

Each field type has a particular format for specifying in SELECT statements. User fields also require the additional operand: **VALUE**.

The following sections discuss the field types and how their values must be specified. For the format of the command for specifying each field type, and the relevant field names, see “SELECT(PERFORMANCE” on page 515, “SELECT(EXCEPTION” on page 516, and “SELECT(LOGGER” on page 517.

## Character fields

The command format is:

```
SELECT(PERFORMANCE|EXCEPTION(  
    INCLUDE|EXCLUDE(charfld1(values1),...),...))
```

The syntax of the values for these fields is a series of words separated by commas. The length of the words is determined by the field lengths. If the word is too short, it is padded with blanks at the end. If it is too long, a command error occurs. For each character field name, a maximum of 200 characters is allowed.

For example, the following command includes the performance records for transactions TR01, TR02, and TR03 on terminal TM01.

```
SELECT(PERFORMANCE(  
    INCLUDE(TRAN(TR01,TR02,TR03),  
        TERM(TM01))))
```

CICS PA recognizes generic values. The masking characters % and \* are supported. The percent (%) is for a single character substitution and the asterisk (\*) is for many or none.

For example, to exclude all performance records from all 50 terminals whose terminal IDs start with PR, you could specify all 50 terminal ID values, or instead you could specify the pattern PR\* as follows:

```
SELECT(PERFORMANCE(EXCLUDE(TERM(PR*))))
```

## Time Stamp fields

The command format is:

```
SELECT(PERFORMANCE|EXCEPTION|LOGGER(  
    INCLUDE|EXCLUDE(  
        START|STOP|ACTIVE(FROM(date,time),TO(date,time)),...),...))
```

Three time stamp fields can be specified with the **SELECT(PERFORMANCE** and **SELECT(EXCEPTION** operands:

### START

Refers to when the transaction was attached or when processing continued from a conversational transaction.

**STOP** Refers to when the transaction was detached or a conversational transaction waited for terminal input.

### ACTIVE

Refers to the entire time span between the Start and Stop times. **ACTIVE** can be used to make sure long-running transactions are included when their Start or Stop times fall out of the selection range.

Only the **STOP** time stamp field can be specified with the **SELECT(LOGGER** operand.

**FROM** and **TO** together specify the report interval, and represent either a *date/time range* or a *time slot* (times only). The operands are positional, with **FROM** preceding **TO**. Up to 14 report intervals can be specified.

The *date* is either a calendar date in the format *yyyy/mm/dd* or a relative date. Relative dates are specified as 0, -1, -2,... to signify a date relative to the current date. 0 represents today, -1 yesterday, -2 two days ago, and so on. If both **FROM** and **TO** dates are specified, they must be in the same format.

The *time* is a time-of-day in the format *hh:mm:ss.th*.

For a date/time range:

- Either **FROM** or **TO** can be omitted to indicate that the range is open-ended. If **FROM** is omitted, it defaults to the first input record. If **TO** is omitted, it defaults to the end of file.
- If the **FROM** date is specified with no time, a time of zero is assumed (start of day)
- If the **TO** date is specified with no time, a time of 23:59:59.99 is assumed (end of day).

For a time slot, both times must be specified with no dates to signify the same time slot every day. The times can span midnight.

For example, the following command includes performance records for transactions running between 8:00 in the morning and 6:00 in the evening:

```
SELECT(PERFORMANCE(INCLUDE(ACTIVE(FROM(08:00),TO(18:00)))))
```

To specify both date and time, the format is:

Calendar date: FROM(yyyy/mm/dd,hh:mm:ss.th)

Relative date: FROM(-n,hh:mm:ss.th)

To specify a date only, the format is:

Calendar date: FROM(yyyy/mm/dd,)

Relative date: FROM(-n,)

**Note:** The comma following the date is required to designate the missing time value.

To specify a time only, the format is FROM(,hh:mm:ss.th) or FROM(hh:mm:ss.th). The comma preceding the time is optional.

For further information on specifying date and time values, see “Operand value formats” on page 373.

### Count fields

The command format is:

```
SELECT(PERFORMANCE|EXCEPTION(INCLUDE|EXCLUDE(countfld1(values1),...),...))
```

The syntax is a string of 1 to 30 decimal ranges, separated by commas. A single number is valid. It is treated as a range that only includes itself. The acceptable values of the numbers in the ranges are the positive integers from 0 to 999999999. This allows selection on all the values that the count fields in the monitoring data can hold.

For example, the following command includes all performance records for transactions that issued 1 to 20 File Control ADD functions:

```
SELECT(PERFORMANCE(INCLUDE(FCADD(1-20))))
```

### Clock (Time-Count) fields

The command format is:

```
SELECT(PERFORMANCE|EXCEPTION(
    INCLUDE|EXCLUDE(clockfld1(TIME|COUNT(values1),...
```

The Clock type fields contain two parts: an elapsed time and a count of the number of times a condition occurred. When specified in the SELECT operand, the part being referenced must be identified by using the **TIME** or **COUNT** operands. Unlike references in the FIELDS operand, there is no default.

The TIME part of clock fields is a count in units of thousandths of a second. Therefore, the rules for specifying the value are the same for both TIME and COUNT parts of clock type fields.

Specify a value, or a list of up to 30 ranges of values, separated by commas. A single number is valid (it is treated as a range that only includes itself). Specify the values in the range as positive integers from 0 to 999999999. This allows selection on all the values that the clock type fields in the monitor data can hold.

Alternatively you can precede the From value with a comparison operator. For example, specify >=1 for a comparison of greater than or equal to 1. Allowed operators are:

= > >= < <=

Specify time values in seconds (using a decimal point) or milliseconds. For example, we can request RESPONSE in the range 1.12 to 1.25 seconds or the equivalent 1120 to 1250 milliseconds.

For example:

- The following command identifies transactions whose elapsed suspend time is between 0 and 3 seconds:  

```
SELECT(PERFORMANCE(INCLUDE(SUSPEND(TIME(0-3000)))))
```
- The following command identifies transactions that have been suspended no more than 3000 times:  

```
SELECT(PERFORMANCE(INCLUDE(SUSPEND(COUNT(0-3000)))))
```

## Flag fields

Flag fields occur only in System Logger selection criteria. The command format is:

```
SELECT(LOGGER(INCLUDE|EXCLUDE(flagfld1(0|1),...),...))
```

where 0 indicates “no” and 1 indicates “yes”.

## User fields

CICS PA can access user fields in the CMF performance records. The user fields are defined in the CICS Monitoring Control Table (MCT) as either character type, count type, or clock type.

The command format is:

```
SELECT(PERFORMANCE(EXCLUDE|INCLUDE(  
    CHARACTER(  
        OWNER(owner),  
        SUBSTR(offset,length),  
        VALUE(value list)),  
    COUNT|CLOCKTIME|CLOCKCOUNT(  
        OWNER(owner),  
        NUMBER(nnn),  
        VALUE(value list)))))
```

All the FIELDS operands documented in “Suboperands for User fields” on page 382 are required with SELECT. These are:

- For character user fields: **OWNER**, **SUBSTR** and **VALUE**
- For numeric user fields: **OWNER**, **NUMBER** and **VALUE**

### OWNER

The 1-8 character name of the owner of the user field. This is the entry name in the DFHMCT ID= macro specification for the user field, or the CICS-assigned default name of *USER*.

### SUBSTR

Specifies that only part of the field is to be checked, from the *offset* position for the given *length*. For example, if the character user field contains ANIMALS, then SUBSTR(4,3) is MAL.

### NUMBER

The three-digit integer that identifies a specific count or clock type field.

### VALUE

Identifies the value used in the selection criteria. The syntax for the values for user fields is the same as that for character, clock, and count fields.

Example:

If user fields are defined in the MCT, consider a user character field that is set to INQUIRY whenever an INQUIRY function of the TEST transaction is run. The following command then generates a Performance List report containing only data for the TEST transaction INQUIRY function where:

- Count 1 has a value between 1 and 10
- Clock 1 has an elapsed time greater than 1 second
- Clock 1 was stopped and restarted at least once

```
CICSPA SELECT(PERFORMANCE(INCLUDE(
    TRAN(TEST),
    CHARACTER(OWNER(USEREMP),SUBSTR(1,7),VALUE(INQUIRY)),
    COUNT(OWNER(USEREMP),
        NUMBER(001),
        VALUE(1-10)),
    CLOCKTIME(OWNER(USEREMP),
        NUMBER(001),
        VALUE(1000-999999999)),
    CLOCKCOUNT(OWNER(USEREMP),
        NUMBER(001),
        VALUE(2-999999999)))))
LIST
```

## SELECT(PERFORMANCE

The general format of the SELECT statement for CMF performance class records is:

```
SELECT(PERFORMANCE(EXCLUDE|INCLUDE(
    [ACTIVE|START|STOP(FROM(date,time),TO(date,time)),]
    [char-fieldname(text string),]
    [count-fieldname(value list),]
    [clock-fieldname(TIME|COUNT(value list)),]
    [CHARACTER(
        OWNER(owner),SUBSTR(offset,length),VALUE(value list)),]
    [CLOCKTIME|CLOCKCOUNT|COUNT(
        OWNER(owner),NUMBER(nnn),VALUE(value list))]))))
```

CMF record data fields are defined as specific types. Each field type has a particular format in the SELECT statement:

1. ACTIVE, START, STOP time stamp fields require at least one FROM or TO operand. The format of *(date,time)* can be either:  
*(yyyy/mm/dd,hh:mm:ss.th)* or *(-n,hh:mm:ss.th)* or  
*(yyyy/mm/dd,)* or *(-n,)* or  
*(hh:mm:ss.th)*

If both FROM and TO dates are specified, they must be in the same format; both must be calendar dates or both must be relative dates.

2. Values for character fields are specified as *text strings*.

For each character field, a maximum of 200 characters can be specified. A text string can be entered either alone or in a list:

*(text)* or  
*(text1,text2,text3)*

3. Values for count and time fields are specified as *value lists*.

For count fields, specify positive integers from 0 to 999999999. For time fields, specify values as thousandths of a second (or seconds if you specify the number with a decimal point).

A value list can be made up of individual values, ranges, or both. Up to 30 values or ranges can be specified. For example:

*(value)*  
*(value1-value2)*  
*(value1,value2,value3)*  
*(value1-value2,value3-value4,value5-value6)*

*(value1,value2-value3,value4)*

Alternatively you can precede the From value in the range with a comparison operator. For example, specify  $\geq 1$  for a comparison of greater than or equal to 1. Allowed operators are:

`= > >= < <=`

Specify time values in seconds (using a decimal point) or milliseconds. For example, we can request RESPONSE in the range 1.12 to 1.25 seconds or the equivalent 1120 to 1250 milliseconds.

4. CICS-defined clock type fields require either the TIME or COUNT operand.
5. CHARACTER user fields require the OWNER, SUBSTR, and VALUE operands.
6. CLOCKTIME, CLOCKCOUNT, COUNT user fields require the OWNER, NUMBER, and VALUE operands.
7. See Chapter 28, "Fields by forms, HDB templates," on page 757 for the name and format of the CICS-defined fields that can be specified in **SELECT(PERFORMANCE)** statements.

## SELECT(EXCEPTION)

The general format of the SELECT statement for CMF exception class records is:

```
SELECT(EXCEPTION(EXCLUDE|INCLUDE(  
    [ACTIVE|START|STOP(FROM(date,time),TO(date,time)),]  
    [char-fieldname(text string),]  
    [numeric-fieldname(value list)])))
```

CMF record data fields are defined as specific types. Each field type has a particular format in the SELECT statement:

1. ACTIVE, START, STOP time stamp fields require at least one FROM or TO operand. The format of *(date,time)* can be either:  
*(yyyy/mm/dd,hh:mm:ss.th)* or *(-n,hh:mm:ss.th)* or  
*(yyyy/mm/dd,)* or *(-n,)* or  
*(hh:mm:ss.th)*

If both FROM and TO dates are specified, they must be in the same format; both must be calendar dates or both must be relative dates.

2. Values for character fields are specified as *text strings*.

For each character field, a maximum of 200 characters can be specified. A text string can be entered either alone or in a list:

*(text)* or  
*(text1,text2,text3)*

3. Values for count and time fields are specified as *value lists*.

For count fields, specify positive integers from 0 to 999999999. For time fields, specify values as thousandths of a second (or seconds if you specify the number with a decimal point).

A value list can be made up of individual values, ranges, or both. Up to 30 values or ranges can be specified. For example:

*(value)*  
*(value1-value2)*  
*(value1,value2,value3)*  
*(value1-value2,value3-value4,value5-value6)*  
*(value1,value2-value3,value4)*

Alternatively you can precede the From value with a comparison operator. For example, specify  $\geq 1$  for a comparison of greater than or equal to 1. Allowed operators are:

= > >= < <=

Specify time values in seconds (using a decimal point) or milliseconds. For example, we can request RESPONSE in the range 1.12 to 1.25 seconds or the equivalent 1120 to 1250 milliseconds.

## **SELECT(EXCEPTION fields**

The name and format of the fields that can be specified in **SELECT(EXCEPTION** statements are:

### **CFDTSLOT(text)**

Coupling facility data table name that incurred a wait for a locking or non-locking request slot

### **FSTRINGW(text)**

File name that waited for a string

### **LUNAME(text)**

VTAM logical unit name

### **RESOURCE(text)**

Type of resource that caused the wait exception (CFDTLRSW, CFDTPPOOL, STORAGE, TEMPSTOR, LSRPOOL, or FILE)

### **RESPONSE(values)**

Response time

### **STORAGEW(text)**

DSA (Dynamic Storage Area) that caused a wait (CDSA, RDSA, SDSA, UDSA, ECDSA, ERDSA, ESDSA, or EUDSA)

### **TASKNO(values)**

Task number

### **TCLASS(text)**

Transaction Class name

### **TERM(text)**

Terminal ID

### **PRTY(values)**

Transaction priority

### **TRAN(text)**

Transaction ID

### **TSBUFFER(text)**

Temporary Storage queue name that waited for a buffer

### **TSSTRING(text)**

Temporary Storage queue name that waited for a string

### **USERID(text)**

User ID

### **VBUFFERW(text)**

File name that incurred a wait for a VSAM buffer

### **VSTRINGW(text)**

File name that incurred a wait for a VSAM string

## **SELECT(LOGGER**

The general format of the **SELECT** statement for System Logger records is:

```

SELECT(LOGGER(EXCLUDE|INCLUDE(
    [STOP(FROM(date,time),TO(date,time)),]
    [char-fieldname(text string),]
    [count-fieldname(value list),]
    [flag-fieldname(0|1),]

```

CMF record data fields are defined as specific types. Each field type has a particular format in the SELECT statement:

1. STOP time stamp fields require at least one FROM or TO operand. The format of *(date,time)* can be either:  
*(yyyy/mm/dd,hh:mm:ss.th)* or *(-n,hh:mm:ss.th)* or  
*(yyyy/mm/dd,)* or *(-n,)* or  
*(hh:mm:ss.th)*

If both FROM and TO dates are specified, they must be in the same format; both must be calendar dates or both must be relative dates.

2. Values for character fields are specified as *text strings*.

For each character field, a maximum of 200 characters can be specified. A text string can be entered either alone or in a list:

*(text)* or  
*(text1,text2,text3)*

3. Values for count fields are specified as *value lists*.

Specify positive integers from 0 to 999999999.

A value list can be made up of individual values, ranges, or both. Up to 30 values or ranges can be specified. For example:

*(value)*  
*(value1-value2)*  
*(value1,value2,value3)*  
*(value1-value2,value3-value4,value5-value6)*  
*(value1,value2-value3,value4)*

Alternatively you can precede the From value in the range with a comparison operator. For example, specify *>=1* for a comparison of greater than or equal to 1.

1. Allowed operators are:

*= > >= < <=*

4. For the name and format of the System Logger fields that can be specified in **SELECT(LOGGER** statements, see the prompt list in the CICS PA online dialog. For details, see "Specifying Selection Criteria" on page 156.

## SELECT examples

This section illustrates various ways of using SELECT.

### Examples: Using SELECT as a global operand

The following examples illustrate the use of SELECT as a global operand applying to all reports and extracts that follow it.

1. In this example, the performance class records from transactions that were active between 08:00 and 16:00 are included in both the Performance List and Performance Summary reports.

```

CICSPA SELECT(PERFORMANCE(INCLUDE(
    ACTIVE(FROM(08:00:00),TO(16:00:00))))),
    LIST,
    SUMMARY

```

2. In this example, the Performance List report will only contain the performance class records from transactions with file (FC) wait time between 1 and 1000 seconds, except transactions that are attached from terminal TRM1.

```
CICSPA SELECT(PERFORMANCE(
    EXCLUDE(TERM(TRM1)),
    INCLUDE(FCWAIT(TIME(1000-1000000))))),
LIST
```

3. In this example, the exception class records from transactions that were active between 08:00 and 16:00 are included in both the Exception List and Exception Summary reports.

```
CICSPA SELECT(EXCEPTION(INCLUDE(
    ACTIVE(FROM(08:00:00),TO(16:00:00))))) ,
LISTEXC,
SUMEXC
```

### Examples: Using SELECT as a report or extract suboperand

The following examples illustrate the use of SELECT as a report-level operand associated only with the particular report or extract it is coded with. Report-level SELECT statements take precedence over any global SELECT statements.

1. This example shows SELECT used as a suboperand to the LIST operand. The Performance List report will only contain performance class records from transactions TRA1 and TRA2 that were attached from terminal TRM1.
2. This example shows SELECT used as a suboperand to the LIST operand. The Performance List report will only contain performance class records which have the value ADD in the character user field TESTFUNC.

```
CICSPA LIST(SELECT(PERFORMANCE(INCLUDE(TERM(TRM1),TRANS(TRA1,TRA2)))))
```

```
CICSPA LIST(SELECT(PERFORMANCE(INCLUDE(
    CHARACTER(OWNER(TESTFUNC),SUBSTR(1,3),
    VALUE(ADD)))))
```

3. This example shows SELECT used as a suboperand to LISTEXCException. The Exception List report will only contain the exception class records from transactions TRA1 and TRA2 that were attached from terminal TRM1.

```
CICSPA LISTEXC(SELECT(EXCEPTION(INCLUDE(
    TERM(TRM1),TRANS(TRA1,TRA2)))))
```

### Examples: INCLUDE and EXCLUDE sensitivity

The following report examples show how slight variations to SELECT statements can change report content.

1. This command generates a Performance Summary report for all records except those with terminal TM01.

```
CICSPA IN(SMFIN001),
SELECT(PERFORMANCE(EXCLUDE(TERM(TM01)))),
SUMMARY
```

2. This command generates a Performance Summary report with data from performance class records for terminals TM01 and TM02.

```
CICSPA IN(SMFIN003),
SELECT(PERFORMANCE(INCLUDE(TERM(TM01)))),
SELECT(PERFORMANCE(INCLUDE(TERM(TM02)))),
SUMMARY
```

The two SELECT statements could have been combined as  
SELECT(PERFORMANCE(INCLUDE(TERM(TM01,TM02)))). However, this command shows a method that can be used if more values need to be listed than CICS PA will allow for one character field.

Be careful, as all selection criteria stay in effect when specifying more than one SELECT statement for a single field.

The following command generates a Performance Summary report for only transaction XXXX on terminal TM01 and for all transactions on terminal TM02.

```

CICSPA IN(SMFIN004),
      SELECT(PERFORMANCE(INCLUDE(TRAN(XXXX),
                                TERM(TM01)))),
      SELECT(PERFORMANCE(INCLUDE(TRAN(XXXX),
                                TERM(TM02)))),
      SUMMARY

```

The following command generates a Performance Summary report for transaction XXXX on all terminals, and all other transactions on terminals TM01 and TM02.

```

CICSPA IN(SMFIN004),
      SELECT(PERFORMANCE(INCLUDE(TRAN(XXXX)))),
      SELECT(PERFORMANCE(INCLUDE(TRAN(XXXX),
                                TERM(TM01)))),
      SELECT(PERFORMANCE(INCLUDE(TRAN(XXXX),
                                TERM(TM02)))),
      SUMMARY

```

The following command generates a Performance Summary report for transaction XXXX on terminals TM01 and TM02.

```

CICSPA IN(SMFIN004),
      SELECT(PERFORMANCE(INCLUDE(TRAN(XXXX),
                                TERM(TM01)))),
      SELECT(PERFORMANCE(INCLUDE(TRAN(XXXX),
                                TERM(TM02)))),
      SUMMARY

```

3. INCLUDE and EXCLUDE parameters can be specified in any order within one SELECT statement. However, with multiple SELECT statements, the order is important.

- The following two commands generate the same Performance Summary report.

```

CICSPA IN(SMFIN005),
      SELECT(PERFORMANCE(INCLUDE(TRAN(XXXX),
                                EXCLUDE(TRAN(XXXX),
                                TERM(TM01)))),
      SUMMARY

```

```

CICSPA IN(SMFIN005),
      SELECT(PERFORMANCE(EXCLUDE(TRAN(XXXX),
                                INCLUDE(TRAN(XXXX),
                                TERM(TM01)))),
      SUMMARY

```

- The following command also generates the same Performance Summary report

```

CICSPA IN(SMFIN005),
      SELECT(PERFORMANCE(EXCLUDE(TRAN(XXXX),
                                EXCLUDE(TRAN(XXXX),
                                TERM(TM01)))),
      SELECT(PERFORMANCE(INCLUDE(TRAN(XXXX),
                                TERM(TM01)))),
      SUMMARY

```

- However, the following command generates a different Performance Summary report. This one includes all transactions for terminal TM01, including transaction XXXX.

```

CICSPA IN(SMFIN005),
      SELECT(PERFORMANCE(INCLUDE(TRAN(XXXX),
                                TERM(TM01)))),
      SELECT(PERFORMANCE(EXCLUDE(TRAN(XXXX),
                                EXCLUDE(TRAN(XXXX),
                                TERM(TM01)))),
      SUMMARY

```

4. Remember that global SELECT operands cannot be removed. The following commands generate three Performance List reports:

- a. The first report contains data for transaction XXXX on terminal TM01
- b. The second report contains the same data as the first report as well as data for transaction YYYY on terminal TM02
- c. The third report contains the same data as the second report as well as data for transaction ZZZZ on terminal TM03

```

CICSPA IN(SMFIN006),
      SELECT(PERFORMANCE(INCLUDE(TRAN(XXXX),
                                TERM(TM01)))),
      SELECT(PERFORMANCE(INCLUDE(TRAN(YYYY),
                                TERM(TM02)))),
      SELECT(PERFORMANCE(INCLUDE(TRAN(ZZZZ),
                                TERM(TM03)))),
      SUMMARY

```

```

LIST,
SELECT (PERFORMANCE (INCLUDE (TERM (TM02),
                                TRAN (YYYY))))),
LIST
CICSPA IN (SMFIN006),
SELECT (PERFORMANCE (INCLUDE (TERM (TM03),
                                TRAN (ZZZZ))))),
LIST

```

If three exclusive reports are wanted, specify the SELECT statements as operands. The following command generates three Performance List reports:

- a. The first report contains data for transaction XXXX on terminal TM01
- b. The second report contains data for transaction YYYY on terminal TM02
- c. The third report contains data for transaction ZZZZ on terminal TM03

```

CICSPA IN (SMFIN006),
LIST (SELECT (PERFORMANCE (INCLUDE (TERM (TM01),
                                    TRAN (XXXX))))),
LIST (SELECT (PERFORMANCE (INCLUDE (TERM (TM02),
                                    TRAN (YYYY))))),
LIST (SELECT (PERFORMANCE (INCLUDE (TERM (TM03),
                                    TRAN (ZZZZ))))))

```

### Example: Specifying a time period

1. The following command generates a Performance List report like that shown in Figure 259 on page 522. It includes transactions that both started and stopped within the specified time period. It does *not* include any long-running transactions that started before the interval or stopped after the interval.

```

CICSPA LIST (SELECT (PERFORMANCE (INCLUDE (
                                START (FROM (11:15:00), TO (11:20:00)),
                                STOP (FROM (11:15:00), TO (11:20:00)))))

```

2. However, the following command generates a Performance List report that includes transactions that either:
  - a. Started before and ended during or after the time period selected, or
  - b. Started during and ended during or after the time period selected

```

CICSPA LIST (SELECT (PERFORMANCE (INCLUDE (
                                ACTIVE (FROM (11:15:00), TO (11:20:00)))))

```

Figure 259. Sample report using SELECT (List transactions in a specified period)

**Example: Including specified transactions only**

The following command produces a Performance List report like that shown in Figure 260 on page 523 that only includes the performance records for specific transaction identifiers.

```
CICSPA LIST(SELECT(PERFORMANCE(INCLUDE(
TRAN(ABRW,AMNU,AUPD))))))
```

Figure 260. Sample report using SELECT (list specified transactions only)

**Example: Satisfying combined criteria (“AND”)**

The following command produces a Performance List report like that shown in Figure 261 on page 524. It shows how to combine fields under the same INCLUDE statement. The performance data included contains the terminal ID S23D and also has a userid of BRENNER.

```
CICSPA LIST(SELECT(PERFORMANCE(
INCLUDE(TERM(S23D),USERID(BRENNER)))))
```

Figure 261. Sample report Using SELECT (List Transactions for Specified TERM and USERID)

**Example: Satisfying either criteria ("OR")**

The following command produces a Performance List report like that shown in Figure 262 on page 525: It shows how data can be included in a report based on records that satisfy at least one of a number of conditions. In this example, a record is included in the report if it either shows a response time greater than 30 seconds or shows a terminal ID of P056.

```
CICSPA LIST(SELECT(PERFORMANCE(
    INCLUDE(RESPONSE(>30.0))),
    SELECT(PERFORMANCE(
    INCLUDE(TERM(P056)))))
```

Figure 262. Sample report using SELECT (list transactions for specified RESPONSE or TERM)

### Example: Excluding data

You can use the EXCLUDE operand to omit the data that you are not interested in. The following command produces a Performance List report like that shown in Figure 263 on page 526. In this example, transactions associated with terminal ID P052 and S028 are not reported.

```
CICSPA LIST(SELECT(PERFORMANCE(EXCLUDE(TERM(P052,S028)))))
```

LIST0001 Printed at 12:03:45 10/15/2012 Data from 11:10:51 2/14/2005

Figure 263. Sample report using SELECT (EXCLUDE)

## COPY instruction

You can use **COPY** or **INCLUDE** to instruct CICS PA at run time to obtain precoded commands from a command library and include them in your CICS PA job stream as command input. In this way, often-used sequences of commands can be readily reused. The command library is identified in the **CMDLIB DD** statement in your JCL.

The format of the COPY instruction is:

Name	Command	Operands	Comments
name (or blank)	<b>COPY</b> or <b>INCLUDE</b>	member[,member1,...,membern]	comments (or blank)

Figure 264 on page 527 shows an example of the COPY command. In this example, precoded commands necessary to produce a Performance List report and

Performance Summary report are obtained from the two command library members and placed in the job stream.

```
//CICSPA JOB (Job Accounting)
//CPA      EXEC PGM=CPAMAIN
//CMDLIB   DD  DSN=CICSPA.CMDLIB,DISP=SHR
           .
           .
           .
//SYSIN    DD  *
COPY LISTTPRF
COPY SUMMTPRF
/*
//
```

*Figure 264. Sample JCL using COPY*

---

## Chapter 16. Sample library

The CICS PA Sample Library (SCPASAMP) contains sample members to demonstrate CICS PA features, such as JCL to generate most of the CICS PA reports and extracts.

Member Name	Description
CPAAOR	Runs the Performance List and Summary reports for an AOR (Application-Owning Region).
CPACTGRP	Runs the CICS Transaction Gateway Statistics Activity Summary and Usage and Capacity reports.
CPADBCTL	Runs the Performance List and Summary reports for IMS (DBCTL).
CPADB2	Runs the DB2 reports (list, short summary, long summary).
CPADB2#	Runs the Performance List and Summary reports for a region using DB2.
CPADB2AD	Runs the DB2 utility to delete a row from the Statistics Alerts DB2 table.
CPADB2HK	Runs the DB2 utility to delete DB2 table rows based on relative date and time.
CPADB2PD	Runs the DB2 utility to delete a block of rows from the Performance Summary table using start and end date and time.
CPADB2SD	Runs the DB2 utility to delete all rows in the Dispatcher TCB Modes DB2 table for a specific TCB Mode Name and APPLID.
CPAFOR	Runs the Performance List and Summary reports for an FOR (File-Owning Region).
CPAHDB	<p>Runs the SMF Dump process, followed by Take-up, HDB Load, and selected reports. By combining take-up, HDB load and reporting into a single job step, all CICS PA functions can be performed by a single pass of the SMF data.</p> <p>For more information on this process, see “Take-up from SMF File” on page 131.</p>
CPALGDDL	Runs the DDL to define a DB2 table for the system logger extract data.
CPALGLOD	Runs the DB2 Load Utility statements to load the system logger extract data into a predefined DB2 table.
CPALOGR	Runs the System Logger reports (list and summary).
CPAMQ	Runs the WebSphere MQ List and Summary reports for accounting classes 1 and 3.
CPAOMEGA	<p>Runs the OMEGAMON List and Summary reports for all supported DBMS types.</p> <ol style="list-style-type: none"><li>1. OMEGAMON List report of Total and Database segments</li><li>2. OMEGAMON List report of Total segment</li><li>3. OMEGAMON List report of Database segment for transaction codes starting with FNL*</li><li>4. OMEGAMON Transaction Summary report with Average and Maximum statistics for Total and Database segments</li><li>5. OMEGAMON Database Summary report with Average and Maximum statistics for Total and Database segments</li><li>6. OMEGAMON Transaction and Database Summary reports with Total, Maximum and 90% Peak Percentile for Database segments</li></ol>

Member Name	Description
CPAPALST	Runs the Performance Alerts list report: <ol style="list-style-type: none"> <li>1. Using a FORM to generate the FIELDS. SEVERITY(ALL) indicates that all transactions are reported regardless of whether they are eligible or not and whether they generate an alert or not.</li> <li>2. Using the Alert Template to specify the fields in the report instead of a FORM. Operand SEVERITY(CRITICAL) indicates that only transactions with severity of Critical are reported.</li> <li>3. Using the Alert Template to specify the fields in the report instead of a FORM. Operand SEVERITY(WARNING) indicates that only transactions with severity of Warning or Critical are reported.</li> <li>4. Using the Alert Template to specify the fields in the report instead of a FORM. SEVERITY(INFO) indicates that only transactions with severity of Informational, Warning and Critical are reported.</li> <li>5. Using the Alert Template to specify the fields in the report instead of a FORM. SEVERITY(ELIGIBLE) indicates that only transactions that are eligible for alert processing are reported. Eligible transactions are those that have field values that match the Resource values defined in the Alert definition. Eligible transactions with and without alerts are reported.</li> </ol>
CPAPASUM	Runs the Performance Alerts summary report: <ol style="list-style-type: none"> <li>1. Using a FORM to generate the FIELDS.</li> <li>2. Specifying SEVERITY(ELIGIBLE) to include only transactions that are eligible for alert processing. Eligible transactions are those that have field values that match the resource values defined in the alert definition. Eligible transactions with and without alerts are reported.</li> </ol>
CPAPAXTI	Runs the Performance Alerts list extract using a FORM to generate the FIELDS operand. SEVERITY(ALL) indicates that all transactions will be included in the extract.
CPAPAXTS	Runs the Performance Alerts summary extract using a Form to generate the FIELDS operand. SEVERITY(ELIGIBLE) indicates that only transactions that are eligible for alert processing are reported. Eligible transactions are those that have field values that match the resource values defined in the alert definition. All eligible transactions with and without alerts are reported.
CPAPCBTS	Runs the BTS (CICS Business Transaction services) report.
CPAPEXP	Runs the Performance data extract.
CPAPGRPH	Runs the Performance graph reports.
CPAPLIST	Runs the Performance List report with default FIELDS settings.
CPAPLSFC	Runs the Performance List and Summary reports, tailored to present file control information.
CPAPLSPC	Runs the Performance List and Summary reports, tailored to present program control information.
CPAPLSTX	Runs the Performance List extended report with default FIELDS settings.
CPAPROFH	Runs the Transaction Profiling report comparing SMF report data against HDB baseline data.
CPAPROFS	Runs the Transaction Profiling report comparing SMF report data against SMF baseline data.
CPAPSUM	Runs the Performance Summary report with default FIELDS settings and sorted by Transaction ID and User ID.
CPAPTOT	Runs the Performance Totals report with default FIELDS settings.

Member Name	Description
CPAPTRGP	Runs the Transaction Group report.
CPAPWAIT	Runs the Performance Wait Analysis report.
CPAPWLM	Runs the Workload Activity reports (list, summary by service class, and summary by report class).
CPAPXSYS	Runs the Cross-System report and extract. The second job step (STEP2) runs the Performance List report against the extract created in the first job step.
CPASAHDB	Runs the Statistics HDB Alert report in various sort orders.
CPASASMF	Runs the Statistics Alert report (from SMF data) in various sort orders.
CPASPSM1	Uses sysout2pdf, to convert the Performance Summary report to PDF and save file in a z/OS UNIX directory.
CPASPSM2	Uses sysout2pdf, to convert a Performance Summary report containing many fields to a PDF with a custom page size. The report is sent as PDF and text attachments by email.
CPASPWT1	Uses sysout2pdf, to convert a Wait Analysis report to PDF, using a wait analysis report-specific filter that creates a bookmark for each transaction code. The report is sent as PDF and text attachments by e-mail.
CPATOD	Runs the Performance Summary report analyzing transaction activity by Time of Day.
CPATOR	Runs the Performance List and Summary reports for a TOR (Terminal-Owning Region).
CPATRU	Runs the Transaction Resource Usage reports (list and summary) for files and temporary storage.
CPATTLST	Runs the Transaction Tracking List report.
CPATTSUM	Runs the Transaction Tracking Summary report.
CPAWEB	Runs the Performance List and Summary reports showing web activity.
CPAXCEPT	Runs the Exception List and Summary reports.

CICS PA has a powerful command language to request reports. This language allows you to tailor your report requests to address the many aspects of measuring CICS performance. The JCL samples demonstrate reporting for some of the more common CICS facilities.

In addition, the CICS PA dialog provides a comprehensive set of sample report forms for formatting your reports and extracts. See Table 6 on page 291 for the list of sample report forms provided by CICS PA.

---

## Part 5. Statistics reporting using the dialog

These topics show how to use the interactive Statistics Reporting facilities to produce reports from CICS statistics and server statistics, and also CICS Transaction Gateway statistics.

For a brief description of each field in the reports, see the CICS PA ISPF dialog online help. For more information on understanding and interpreting the CICS statistics data in the reports, see “Using CICS statistics” in the *CICS Transaction Server for z/OS Performance Guide*. For more information on understanding and interpreting the CICS Transaction Gateway statistics data in the reports, see “Monitoring and Statistics” in *CICS Transaction Gateway: z/OS Administration*.

---

## Chapter 17. Using the Statistics reporting dialog

The CICS PA dialog provides comprehensive reporting for the following types of statistics:

- CICS statistics and server statistics in SMF 110 records with the following subtypes:
  - 2 CICS Statistics
  - 3 Shared Temporary Storage Server Statistics
  - 4 Coupling Facility Data Table Server Statistics
  - 5 Named Counter Sequence Number Server Statistics
- CICS Transaction Gateway statistics in SMF 111 records

Short-term in-depth analysis or long-term trend analysis for your CICS statistics is available via the CICS PA Historical Database (HDB) and Statistics Reporting facilities.

The CICS PA statistics reporting complements the CICS utilities DFH0STAT and DFHSTUP. CICS PA presents CICS statistics in a similar way to DFH0STAT, the CICS sample statistics program. It does not accumulate and report statistics intervals like DFHSTUP.

All statistics reporting is available from the dialog. The procedure is:

1. Specify an SMF File or HDB. A list of CICS statistics intervals for all systems is displayed.
2. Select the interval. A menu of statistics categories and reports is displayed.
3. Select the report. The statistics report is displayed. There are two types of reports: label reports or tabular reports:
  - In label-based reports, fields are reported vertically. This is used when there is only one record for the report, typically an overview report.
  - In tabular reports, fields are reported horizontally. This format is displayed when there can be multiple records in the report, typically for CICS resources.
4. Sort on any column in the report, ascending or descending, using point-and-shoot column heading underlines.
5. Hyperlink to related reports using point-and-shoot field values.
6. Press Help (F1) to display descriptions of all fields in the report, together with their CICS field name and DB2 column name.
7. Press Form (F6) to edit the Report Form which controls the fields that are displayed in the report.

For more information on understanding and interpreting the CICS statistics data in the reports, see “Using CICS statistics” in the *CICS Transaction Server for z/OS Performance Guide*. For more information on understanding and interpreting the CICS Transaction Gateway statistics data in the reports, see “Monitoring and Statistics” in *CICS Transaction Gateway: z/OS Administration*.

In addition to reporting statistics using the dialog, you can also process statistics in Statistics Alert batch reports and extract statistics to delimited text files. For details, see Chapter 13, “Statistics alert reporting,” on page 347 and “Statistics extract” on page 270.

## CICS Statistics Reporting Menu

CICS PA provides a flexible and powerful interactive viewer for CICS statistics, either directly from SMF files or from historical data collected in an HDB.

To invoke the Statistics reporting dialog, select option 6 **Statistics** from the Primary Option Menu. Alternatively, you can enter **STATS** from the command line anywhere in the CICS PA dialog. The CICS Statistics Reporting Menu is displayed.

```
File Options Help
-----
CICS Statistics Reporting Menu

Command ==> _____

Select an option then press Enter.

- 1. SMF Files defined in Personal System Definitions
  2. SMF Files defined in Shared System Definitions
  3. Historical Databases for CICS Statistics
  4. Process SMF File
    _____ +
  5. Define Alerts

Filter Criteria:
APPLID . . . . _____ Start . . _____ YYYY/MM/DD HH:MM:SS
Image . . . . _____ Stop . . _____
Type . . . . _ EOD _ INT _ USS _ REQ _ RRT

Options 2, 3 and 5:
Repository . . . . 'CICSPA.XYX.REPOSTRY' _____ +

F1=Help F3=Exit F4=Prompt F6=Resize F10=Actions F12=Cancel
```

Figure 265. CICS Statistics Reporting Menu

The statistics reporting interface is the same, regardless of whether the data source is an SMF file or an HDB. Select from the following options to display a list of eligible SMF files or HDBs:

1. The list of SMF files in your Personal System Definitions.
2. The list of Daily SMF Files and log streams defined in Shared System Definitions.
3. The list of Statistics HDBs defined in the Repository.
4. An SMF File, whose data set name you specify in the accompanying field.

Option 5 **Define Alerts** allows you to create and maintain Alert Definitions for Statistics Alert reports.

### Notes:

- For options 1 - 4 you can specify filter criteria to limit the CICS statistics intervals that are displayed.  
You can activate, deactivate, or change the filter later, when CICS PA displays the list of CICS statistics intervals. For details, see “Set Filter” on page 540.
- For options 1 and 2, only the SMF files that meet the APPLID and Image filter criteria are selected. Then when you browse the file, the remaining filter criteria are applied to limit the statistics intervals.
- For options 2, 3, and 5, specify the **Repository** data set name that contains the Shared System Definitions or Statistics HDB definitions.

---

## SMF File list

You can display a list of SMF Files from either your Personal or Shared System Definitions. Similarly, you can display a list of container data sets from Statistics HDBs.

Option 1 from the Statistics Reporting Menu displays the list of SMF Files in your Personal System Definitions.

```

Figure 269. Run Statistics HDB report

This panel shows the time period spanned by the data in the HDB and lists the container data sets.

Select one of the methods of reporting:

1. By report interval.
2. By data set name.

Then specify the report interval or enter line action **S** (or any non-blank character) to select an HDB data set for reporting.

When you have completed your selection, press Enter to continue with the report request. A list of all the statistics collection intervals in the selected data set is displayed. See Figure 270 on page 539.

## Statistics intervals

CICS PA scans the specified SMF Files for statistics intervals and presents the list of intervals for further analysis.

```

Figure 270. CICS Statistics Intervals

**Note:** The Type column indicates both the *system* type, such as TS for CICS Transaction Server or TG for CICS Transaction Gateway, and the *collection* type, such as INT or EOD. For a CICS TG system, the VRM column indicates the CICS TG VRM.

Enter line action **S** to select the required interval to start reporting.

### Line Actions

**/** Display the menu of line actions  
**S** View statistics reports  
**P** Print statistics reports  
**D** Delete the collection interval (from the display only)

### Primary Commands

#### RESET

This command (or **RES**) removes all unprocessed line actions and reinstates deleted intervals.

Also available from **Edit** in the action bar.

#### **SORT SYSTEM|TYPE|COLLECT**

This command sorts the list of CICS Statistics intervals:

##### **SYSTEM**

Sorts intervals by system name (the System column). Intervals for

the same system name are sorted by collection time in reverse chronological order (most recent first). This is the default sort order.

**TYPE** Sorts intervals by the Type column: the *system* type, such as TS for CICS Transaction Server or TG for CICS Transaction Gateway, then the *collection* type, such as INT or EOD. Intervals for the same system type and collection type are sorted by collection time in reverse chronological order.

#### **COLLECT**

Sorts intervals by collection time in reverse chronological order.

You can also sort by selecting a point-and-shoot column heading.

#### **FILTER [ON | OFF]**

Filters allow you to control the information displayed. When filtering is in effect **Filter Mode - More:** is displayed in the top right corner after the panel title.

There are three forms of the command:

- **FILTER** displays the active Filter where you can view or change the filtering criteria. See Figure 271.
- **FILTER OFF** suspends filtering and displays all the intervals.
- **FILTER ON** resumes filtering.

Also available from **Filter** in the action bar.

## **Set Filter**

The following panel is displayed when you select **Filter->Set filter** in the action bar of the Statistics Intervals panel or enter the **FILTER** command.

```
----- Set Filter -----
Command ==> _____

Specify filtering criteria then press Enter.

APPLID . . . _____ (Blank or pattern)
Image . . . _____ (Blank or pattern)

Type . . . . / EOD / INT / USS / REQ / RRT

                YYYY/MM/DD HH:MM:SS
Start . . . _____
Stop . . . . _____
```

Figure 271. Statistics Intervals: Set Filter

This facility allows you to filter the intervals displayed in the current view.

Specify the filtering criteria, then press Enter to set the filter.

A statistics interval will only be displayed in the filtered view when all the specified filtering options are matched. All others are hidden (they are not deleted).

When filtering is in effect, **Filter Mode - More:** is displayed in the top right corner after the panel title. On initial entry to Statistics Intervals, no filtering is in effect, except when reporting from HDB with Report Interval specified.

To reset the filter and redisplay all intervals and the row count, select **Filter->Set filter off** in the action bar. The filtering criteria will remain dormant in the Set Filter panel.

You can use the **FILTER ON** and **FILTER OFF** commands to swap between the filtered view and the full view of the data.

## Statistics categories and reports

For a selected interval, CICS Statistics are displayed in a tree structure of categories and reports. The menu is release-specific. There are slight differences between the reports that are available in each CICS release.

Table 14. Statistics categories and reports

Category	Subcategory or Report	ID	Minimum CICS TS VRM (640, unless otherwise stated)

	Gateway Daemon	003	
	Protocol Handler	004	
	Worker Thread	005	
	System Environment	006	

**1** The Alert report is only available for Statistics HDB reporting, not when processing SMF files. It displays the statistics collected in the HDB that complied with the conditions in the Alert definition. For similar batch reporting from the original SMF files, use the Statistics Alert report available in the Report Sets facility.

**2** Statistics record ID 002 applies only to CICS version 640 and earlier.  
 Statistics record ID 014 applies only to CICS version 650 and 660.  
 Statistics record ID 005 applies only to CICS version 660 and earlier.  
 Statistics record ID 006 applies only to CICS version 660 and earlier.

Statistics record ID 060 applies only to CICS version 670 and earlier.

**3** Statistics record IDs 111, 114, 115, 117, and 118 apply only to CICS version 670 and earlier.

**4** The Library Data Set Names statistics report appears in the tree structure only when you are selecting the reports you want to collect in an HDB or export to DB2. This report does not appear in the tree structure for viewing or printing reports. To view this report:

1. View the LIBRARY Resources report.
2. Move the cursor to a library name, and then press Enter (the library name is a point-and-shoot field). The report displays the data set names in the concatenation for that library.

**5** CICS Transaction Gateway statistics were introduced in CICS TG V7.1. Selecting an interval from the Statistics Intervals list panel displays the Statistics Reports list panel, showing the appropriate reports for the system type: CICS TS or CICS TG.

When defining or maintaining a statistics HDB, the Statistics Reports list panel shows both CICS TS and CICS TG reports, enabling you to specify whether the HDB collects CICS TS statistics, CICS TG statistics, or both. Similarly, when exporting or extracting from a statistics HDB, this panel shows reports for both system types, so that you can export or extract data for both system types in a single pass.

---

## Statistics report tree

The reports for one statistics interval are presented in a tree structure (folder style) where the reports are grouped by category.

There are two tree structures: one for CICS Transaction Server statistics intervals, another for CICS Transaction Gateway intervals. The tree structure displayed depends on the system type of the selected interval.

```

Figure 272. Statistics report menu tree for CICS Transaction Server

The Size column indicates the number of records in each report.

Enter line action **S** to select a report to display it, or print using the **P** line action.

## Line Actions

- /** Display the selection list of line actions
- S** Depends on the position in the tree:
  - \*\* Reports \*\***
    - Expand all categories, or collapse all categories if already expanded
  - Category**
    - Expand/Collapse the category
  - Report**
    - Display the report. You can use a Form to dynamically change the format of the report according to your requirements.
- I** Display information about the report
- P** Print the report, or all reports in the category. You are prompted for print options.
- D** Delete the category or report. The **RESET** command reinstates them.

## Primary Commands

### RESET

This command (or **RES**) clears outstanding line actions. It also expands all categories and reinstates deleted reports.

Also available from **Edit** in the action bar.

### VIEW [INClude | EXClude]

This command allows you to exclude from the tree structure any categories and reports that contain no data (indicated by a Size column value of 0).

To toggle between including and excluding these categories and reports, enter **VIEW** without a parameter.

Also available from **View** in the action bar.

## Expand and collapse the report tree

The reports for one Statistics Interval are presented in a tree structure (folder style) where the reports are grouped by category. This is similar to the way in which some PC tools display folders and their contents. The categories can be expanded (to show) or collapsed (to hide) the reports contained within them.

**Tip:** If your terminal emulation software permits, it is recommended that you configure your Mouse Options to activate the Lightpen function. Then you can flip the display status of report categories by (left button) clicking the + (to expand) and - (to collapse) characters with your mouse. Use of your mouse as a lightpen might vary depending on your terminal emulation software.

Use your mouse or enter line action **S** to collapse one or all categories.

```

Figure 274. Statistics report menu tree for CICS Transaction Server: partially expanded

Enter line action **S** to select a report to display it, or print using the **P** line action. For more information on printed reports, see “Printing Statistics reports” on page 553.

## Display report information

Enter line action **I** to display report information.

Three levels of information about the report are provided:

1. **Interval Identification.** Identifies the Statistics interval from control information contained in the SMF statistics record.
2. **Report Identification.** Identifies the category and report name from the Statistics report tree.
3. **CICS Identification.** Identifies the CICS Domain that generated the data. Additional information ties the report back to the CICS macro that maps the Statistics data.

```

## Display tabular reports for resource statistics

In tabular reports, fields are reported horizontally. This format is displayed when there can be multiple records in the report, typically for CICS resources.

REPORT Domain Subpools				Line 00000001 Col 002 008 >

Figure 277. Statistics report for CICS Transaction Server: Domain Subpools (tabular format)

Scroll **Right** (F11) to display the remaining field columns in the report, or scroll **Left** (F10) to display the previous.

## Sorting

In Statistics tabular reports, you can sort on any column. To sort on a column, tab to the point-and-shoot underline of the column heading and press Enter. Repeated point-and-shoot sorting flips the sequencing between ascending and descending.

To reset the report to the original sort order, select **Edit->Reset** in the action bar or enter the **RESET** or **RES** command.

## Hyperlink

You can hyperlink from one report to another. Selected fields in the report will hyperlink to a related report. The hyperlink candidate fields are point-and-shoot fields. Position your cursor on the field value of interest and press Enter to link to that value in the related report.

Here is an example of how you can use hyperlink to trace data values.

1. Select DSAs to display the list of DSA types.

```

Figure 282. Statistics Report Form (tabular format): TCPIPSERVICE Resources

The order of the fields in the Form dictates the order of the fields in the report. You can move the fields to the required position. You can **OMIT** fields that you do not want reported. You can also **FIX** fields at the start of the report so that they remain in view when you scroll right. For long character fields in tabular reports, you can truncate the field in the report by specifying a **column width**.

When you save the Form (F3), the report changes to reflect the current Form.

## Statistics field help

Field descriptions are available for all statistics reports.

Field Descriptions for Statistics Report

Category : Files and Databases	Macro . . : DFHA17DS
Report . : Files	DSECT . . : DFHA17DS

---

More: +

File Name

CICS field name: A17FNAM                      DB2 column name: FILE\_NAME

The name you specified in the DEFINE FILE command of resource definition online.

Reset characteristic: Not reset

---

File Location

CICS field name: A17FLOC                      DB2 column name: FILE\_LOCATION

The file is defined as being local to this CICS system, or resides on a remote CICS system. The field is one byte long, and is set to "R" if remote.

Reset characteristic: Not reset

---

Data Table Fields

CICS field name: A17DT                      DB2 column name: DATA\_TABLE\_FIELDS

A one-byte field that contains the value R, S, T, L, K, or X, if data table statistics fields are present in the record. The values indicate:

R    This is a remote file for which table read and source read statistics are present.

S    The resource was not opened as a table but was able to access data from a table associated with the same data set.

T    The resource is a shared data table.

L    The resource is a coupling facility data table (locking model).

K    The resource is a coupling facility data table (contention model).

X    The resource has been opened with a source data set which has an associated CICS maintained data table and the resource has been updated which has caused the data table to also be updated.

Reset characteristic: Not reset

*Figure 283. Statistics field help: Files (Statistics ID 067A)*

The field help provides a description of each statistic, together with the CICS field name and the CICS PA DB2 column name.

## Printing Statistics reports

Statistics reports can be printed, either to a DASD data set or SYSOUT file. Printed reports honor your current Form.

To print a statistics report, enter line action **P** against the report in the menu tree.

Print Statistics Report

Command ==> \_\_\_\_\_

Specify Statistics Report print options.

Report Destination:  
1 1. Data Set    2. SYSOUT

Output Data Set:  
 Data Set Name . . STATS.REPORT \_\_\_\_\_  
 Disposition . . . 1 1. OLD    2. MOD    (If cataloged)

Enter "/" to select option  
/ Browse output data set

Report Output:  
 SYSOUT Class . . A    Print Lines per Page . . 60\_ (0-255)

F1=Help    F3=Exit    F6=Resize    F12=Cancel

Figure 284. Print Statistics report

The data set can be PDS (with member) or PS (including GDG).

DCB information: RECFM=VBM LRECL=1024 BLKSIZE=6160

## **Part 6. Using the Historical Database (HDB)**

These topics tell you how to use the CICS PA Historical Database (HDB) facility for performance trend analysis.

---

## Chapter 18. Guided Tour: Performance HDB

CICS PA Historical Database is a repository of statistics and performance related data for your CICS systems.

CICS PA Historical Database uses SMF records to build a history of statistics and performance-related data that can be customized to meet your various reporting requirements. Your Historical Database environment is controlled from the CICS PA ISPF dialog. It provides a fully managed environment from where you can control all aspects of CICS statistics and performance data, including collection and reporting.

Implementing a statistics and performance data warehouse requires a considerable investment. Careful planning is required to ensure that the data you collect today is useful in the long term to measure CICS performance trends and workloads to help you plan for the future. Therefore it is important that you are familiar with the features and capabilities of the CICS PA Historical Database before embarking on implementation.

This chapter introduces the CICS PA Historical Database (HDB) facility and describes the concepts. It then takes you on a Guided Tour to show you how to use the CICS PA dialog to define and maintain your Performance HDBs, produce reports and export the HDB data to DB2 tables.

---

### What is an HDB?

An HDB (Historical Database) is a definition that allows you to collect, report and manage CICS statistics and transaction performance data. In the CICS PA Historical Database environment, you can create as many HDBs as required.

An HDB has the following components:

- Options that allow you to tailor the HDB to meet your requirements.
- A Template that defines the CICS performance data to be included in the HDB. Templates allow you to customize what information is to be contained in the HDB. They are similar to Report Forms. Templates are relevant only to Performance HDBs (List and Summary), they are not required for Statistics HDBs.
- Selection Criteria that allow you to filter the CMF Performance Class data used to build the HDB.
- Container data sets that contain either the HDB performance data or the HDB statistics data.

There are two types of Performance HDB, List and Summary, where the HDB type is determined by the Template. There is a third type of HDB, Statistics, for CICS Statistics and Server statistics data and CICS Transaction Gateway statistics data. For a Statistics HDB, instead of a Template, you select from a menu the statistics categories and reports that identify the data that you want collected.

### List HDB

Records in a List HDB represent single events. For example, the execution of a single transaction with its associated performance characteristics. Typically, one

CMF Performance record creates one List record. The List HDB is analogous to the CICS PA Performance List report (see “Performance List report” on page 167).

The following figure shows an example of a List HDB:

---

Start Time	Tran ID	Userid	Response Time	CPU Time	Dispatch Time	Dispatch Count	Suspend Time	Suspend Count	File Calls
2002-05-31-12.56.47.9763	MENU	JOHN	0.9956	0.1020	0.7567	2	0.2012	1	7
2002-05-31-12.56.49.1223	STOK	CHRIS	1.5464	0.4943	1.1028	3	0.4376	2	12

---

Figure 286. Example of a List HDB

List HDBs typically have a short lifespan and are used to provide detailed ad-hoc reporting or to diagnose performance problems.

## Summary HDB

Records in a Summary HDB represent a summarization (or average) of one or more events over time. For example, the performance characteristics of a Transaction ID over a 15 minute interval. Typically, many CMF Performance records create one Summary record. The Summary HDB is analogous to the CICS PA Performance Summary report (see “Performance Summary report” on page 177).

The following figure shows an example of a Summary HDB:

---

Start Time	Tran ID	Task Count	Average Response Time	Average CPU Time	Average Dispatch Time	Average Dispatch Count	Average Suspend Time	Average Suspend Count	Average File Calls
2002-05-31-12.00.00	MENU	12	0.9956	0.1020	0.7567	2	0.2012	1	7
2002-05-31-12.00.00	STOK	17	1.5464	0.4943	1.1028	3	0.4376	2	12

---

Figure 287. Example of a Summary HDB

Summary HDBs typically have a longer lifespan and are built up over time to provide historical reporting and trend analysis.

## Statistics HDB

A Statistics HDB provides the ability to warehouse and analyze CICS statistics data via powerful online viewing and reporting facilities. Short-term in-depth analysis or long-term trend analysis for your CICS statistics is possible.

The following figure shows an example of a Statistics HDB:

Statistics Reports		Line 1 of 87

Figure 290. Example of a Statistics HDB report

## HDB data

An HDB keeps its data in sequential data sets called containers. A new data set is created every time a request is submitted to load data into the HDB.

Saving data in small data sets rather than one monolithic table or data set makes management of the environment simpler:

- You can start using an HDB immediately without worrying whether enough DASD space is available to hold many year's worth of data.
- DFHSM can migrate old data, ensuring only the most recent or required data is retained online for immediate reporting, saving expensive DASD resources.
- ABENDX37 conditions are avoided. In the event of a data set full condition, CICS PA simply closes the full data set and continues loading into a new one.
- Individual data sets can be loaded directly into a DB2 table or CSV extract data set for further analysis.

## How to analyze HDB data

Three facilities are provided to help you analyze HDB data:

### 1. Reporting.

The HDB Reporting facility provides flexible reporting of HDBs via Report Forms.

You can also use the Transaction Profiling report to compare data in a Performance HDB with data in SMF files, data in the same HDB, or data in another Performance HDB.

### 2. Exporting to DB2.

HDB data can be loaded directly into a DB2 table for further analysis. HDB data is saved in a format that is suitable for direct load. The HDB Export facility automates this process for you.

### 3. Extracting to CSV.

HDB data can be exported into an extract data set in CSV format (comma separated values) for further analysis by PC spreadsheet tools.

## HDB tour outline

Every aspect of the CICS PA Historical Database is controlled via the ISPF dialog.

This section takes you through the process of defining and using an HDB for CMF performance class data.

**Setup.** Initially, your HDB environment requires a minimal one-time setup. HDB definitions are saved in the Repository, a VSAM KSDS. CICS PA automatically defines the repository for you when you first try to use it.

Then the required steps are:

1. **Template.**

Defining an HDB is a two-step process: first define a Template and then define an HDB based on that Template. The Template identifies which CMF performance fields are to be kept in the HDB.

2. **Definition.**

After the Template is defined, then define the HDB and its options, such as the characteristics of the HDB data sets and the retention period of the data.

3. **Load.**

Loading data into the HDB is performed by the standard CICS PA batch reporting utility. The command that requests the utility to load an HDB is:

```
HDB(LOAD(...
```

CICS PA reads the CMF performance class data and builds the HDB data sets. Because the HDB Load process is part of the normal batch reporting process, you can run CICS PA reports and load HDBs together with a single pass of the SMF data.

4. **Report.**

Reporting against an HDB is performed by the standard CICS PA batch reporting utility. The command that requests the utility to report against an HDB is:

```
HDB(REPORT(...
```

You can tailor HDB reporting by using a Report Form. This allows you to select which fields in the HDB are reported and how they are presented.

5. **Export.**

Export allows you to load HDB data into a DB2 table. CICS PA automates this process with two simple steps:

- a. First define the DB2 table to house the data. CICS PA generates JCL to do this for you by creating the necessary DDL to define the table.
- b. Then load the data into the table. CICS PA generates JCL to do this for you by creating the necessary DB2 Load Utility statements to load the data.

6. **Extract.**

The HDB Extract facility allows you to export data from your HDB data sets to an extract data set in CSV format, suitable for import into PC-based spreadsheet applications for further analysis.

7. **Maintain.**

HDB maintenance allows you to change your HDB definition and manage the HDB container data sets.

8. **Housekeeping.**

HDB housekeeping should be run periodically to clean up your HDB environment. Housekeeping performs these tasks:

- a. Deletes HDB container data sets that have expired or have delete pending.
- b. Deletes expired DB2 table rows.
- c. Removes definitions from the Repository that are no longer required.

For more information, see “Housekeeping” on page 668.

---

## Historical Database Menu

Option 5 **Historical Database** from the CICS PA Primary Option Menu takes you to the Historical Database Menu. The HDB menu is presented in typical processing sequence.

```
File  Options  Help

```

Figure 291. Historical Database (HDB) Menu

Specify the repository data set name. Remember that you might want to share this repository with other users. This will ensure that HDB data can be generated once and made available to everyone.

---

## Repository

Your HDB environment is controlled by the Repository. The Repository is a VSAM KSDS that acts as a repository for all definitions associated with your HDB environment:

- Templates (Performance HDBs only)
- HDB Definitions
- Selection Criteria (Performance HDBs only)
- Container data set information
- Audit information about Load requests

The Repository is also a repository for the following definitions that are not associated with HDBs:

- Shared System Definitions
- Application Groups
- Statistics Alert Definitions
- Resource Lists
- Performance Alert Definitions

It is recommended that you share the repository with other CICS PA users so that you only need to generate history data once, allowing multiple users to report against it. There is no limit to the number of repositories you can define.

If your repository is not cataloged, the dialog will first prompt you to define it when you select an option from the menu.

```

Define Repository
Command ==> _____

Enter "/" to select option
_ Edit IDCAMS command
_ Browse errors only

Repository Name . . . 'CICSPROD.CICSPA.XYZ.REPOSTRY' _____

Cluster Level Information:

Space Units . . . . . 1 1. Cylinders Primary Quantity . . . 1 _____
                        2. Tracks Secondary Quantity . . 1 _____
                        3. Records
                        4. Kilobytes
                        5. Megabytes
Volume . . . . . _____
Data Class . . . . . _____
Management Class . . . _____
Storage Class . . . . . _____

F1=Help F3=Exit F6=Resize F12=Cancel

```

Figure 292. Define Repository

Specify the required allocation settings and then press **Enter** to define the repository data set. Typically a space allocation of 1 primary cylinder and 1 secondary cylinder is sufficient.

When the repository is defined, you are ready to start using HDB.

## HDB Templates

Templates specify the performance information that is to be contained in an HDB. Templates are used by List and Summary HDBs. They are not required for Statistics HDBs which instead use a menu-selection facility.

Customize the Templates to specify the data that you want to be contained in the HDB. Templates are similar to Report Forms which are used to customize reports.

Select option 1 **Templates** from the HDB menu to define (or update) Templates.

```

File Options Help

F10=Actions F11=Right  F12=Cancel

```

Figure 295. Edit Summary Template

Templates are similar to Report Forms. Where Report Forms define the fields to be included in a report or extract, Templates define the fields to be included in an HDB.

When you define a new Template, the default fields list is initially displayed. Edit the Template to include the required fields.

The **EOD** marker in the Template signifies the end of fields that is included in the HDB. Fields after the EOD marker will not be included in the HDB. You can move required fields above the EOD marker to include them in the HDB.

The example in Figure 295 on page 564 displays the default Summary Template. Key fields are positioned at the top and the most common performance indicators like response, dispatch and suspend times are included.

Edit the Template to meet your reporting requirements. In the example above, FCAMCT is deleted and TSWAIT is inserted.

Specify Performance Selection Criteria and the Report Interval to control the data you want in your HDBs:

#### **Selection Criteria**

Templates have optional Selection Criteria that allows you to filter the CMF performance class records used to build the HDB. For example, the HDB only includes data for transactions that use File Control services (FCTOTAL>0).

Select Performance to specify Selection Criteria.

#### **Report Interval**

Summary Templates specify a recording time interval. The default is 1 minute which indicates that summary data is accumulated and recorded in 1 minute intervals. Select the interval carefully because it will impact on HDB processing as follows:

1. **Loading.** Shorter recording intervals write more records, increasing the size of your HDB data sets.
2. **Reporting.** Longer recording intervals restrict reporting. For example, if you specify a recording interval of 1 hour then you can only report on 1 hour (or higher) intervals, and 15 minute interval reporting is not possible.

Therefore selecting the correct interval is a balance between not loading too much data and not restricting reporting. In the example above the interval has been changed to 15 minutes.

**Exit** (F3) to save the Template. You are now ready to define an HDB that uses this Template.

**Attention:** After the Template has been initially saved, you are permitted to edit the Template to change its field list. However if the Template is already being used to load data into a HDB, then changing the Template can potentially cause reporting problems in the future. CICS PA supports the alteration of Template fields, but a few simple rules will ensure that HDB processing is not compromised:

1. Do not change the key fields of a Summary Template.
2. Do not change the focus of a Template. For example, if the Template includes Temporary Storage fields only, do not delete those fields and insert File Control fields in their place. You should create another Template with a focus on File Control.

---

## **Defining a Performance HDB**

Defining a Performance HDB allows you to collect (load) and report historical performance data. The definition alone does not cause any action by CICS PA.

Select option 2 **Define** from the HDB menu to define a new HDB. Then when prompted, select option 1 to create a Performance HDB.

New HDB Definition Menu

Select an HDB type then press Enter.

-

1. Performance - CMF List or Summary

-

2. Statistics - CICS Statistics

Figure 296. New HDB Definition Menu

In the following example, we have given the HDB a name of CICSP1H and a description of Summary HDB for CICSP1.

File Systems Options Help

-----

F1=Help F3=Exit F4=Prompt F7=Backward F8=Forward F10=Actions F12=Cancel

Figure 297. New HDB Definition

The other options are:

**APPLID**

APPLID is optional and specifies the CICS system that the HDB applies to. You can use **Prompt** (F4) to select from a list of CICS systems defined in your System Definitions.

Specify APPLID to ensure that only data for this CICS system is loaded into the HDB. At Load time, CICS PA will generate JCL that includes this APPLID in the command deck and DD statements for this system's SMF Files.

**Qualifier**

If Qualifier is specified, the value is used as the DB2 schema in place of the Database as specified in DB2 Settings. It is also incorporated into the DB2 table name:

*qualifier.CPA\_hdbname*

Qualifier is mandatory if Explorer is selected, and optional otherwise. If Qualifier and Explorer are both entered then details of this HDB will be included in the manifest for the CICS PA plug-in the next time it is rebuilt for this qualifier.

### Explorer

Select the Explorer option to make this HDB eligible for inclusion in the manifest for the CICS PA plug-in.

### Template

The format and type of the HDB is determined by the Template.

In Figure 297 on page 566 we have specified PRODSUM, the Template created in the previous step. You can use **Prompt** (F4) to select from a list of defined Templates. PRODSUM is a Summary Template and HDB CICSP1H inherits its attributes.

If you have selected the Explorer option, you must choose an internal template that has been predefined for use with the CICS PA plug-in.

### Selection Criteria

HDBs have optional Selection Criteria that allows you to filter the CMF performance class records used to build the HDB. For example, the HDB only includes data for a particular application's transaction ids, such as TRAN=MY\*. Select Performance to specify Selection Criteria.

Templates can also specify Selection Criteria. If the Template and HDB both have active Selection Criteria then both are checked and *both* must match for the record to be processed.

**Template Selection Criteria** typically focuses on the type of data being recorded. For example, if your Template is monitoring File Control activity then its Selection Criteria can specify FCTOTAL>0 to include only transactions that used File Control services.

**HDB Selection Criteria** typically focuses on the application targeted by the HDB. For example, if the HDB is for MY application then its Selection Criteria can specify TRAN = MY\* to include only transactions in MY application.

The resultant HDB will include data for transactions matching MY\* that use File Control services.

### Data Retention Period

These fields separately specify the length of time that HDB data sets and associated DB2 table rows are kept before they expire. Typically:

- Summary HDBs need to keep their container data sets for many years for long-term trend analysis.
- List HDBs used for ad hoc reporting might only need to keep their container data sets for a couple of hours or days.

Specify each retention period as a whole number of years, months, weeks, days, or hours. Only one choice is allowed.

If the HDB container data sets are no longer required after their data has been exported to DB2, you can specify a retention period of 0 in any of the HDB periods to make the HDB data sets expire immediately.

Container data sets and DB2 data are deleted by **HDB Housekeeping** after they have passed their expiry date. If you do not specify a retention period, the corresponding HDB data sets or DB2 data will never expire.

Use **HDB Maintenance** to check container data set status or to alter the HDB or DB2 retention period.

### Data Set Allocation Settings

Data Set Allocation Settings specify the allocation attributes of the data sets that contain data for this HDB. CICS PA dynamically allocates container data sets at load time.

The format of the data set name is:

*DSN-prefix.HDB-name.Dyyddd.Thhmmss.HDB*

where the DSN prefix is the data set name high level qualifier.

Specify allocation settings that satisfy your installation requirements. The size of container data sets is not critical. Typically you would specify a size that accommodates a single load request. For example, if you load data into the HDB daily, then 10 cylinders might be sufficient. However if CICS PA encounters an out-of-space condition (ABENDx37) during load, then it simply closes the data set and recommences loading in a new data set. You can decide to specify a larger size initially and adjust it later using **HDB Maintenance**.

Exit (F3) to save the HDB. You are now ready to use this HDB.

---

## Loading data into a Performance HDB

After defining the HDB, you can start to collect (load) the historical performance data.

Select option 3 **Load** from the HDB menu to generate JCL to load an HDB.

FileOptionsHelp

-----

Load HDBsRow 1 to 1 of 1

```

Figure 299. Load Summary HDB

The options are:

### System Selection

System Selection specifies the CICS system(s) whose data is to be loaded into the HDB. It is initialized to the CICS system APPLID that you specified during HDB definition.

In Figure 299, CICS PA generates an APPLID(CICSP1) operand in the command deck and includes DD statements for the SMF Files defined in System Definitions for CICSP1.

### Report Interval

Specify the time range of data to be included in the HDB. You can specify an explicit date, such as 2004-12-05, or a relative date to indicate today (0), yesterday (-1), two days ago (-2), and so on. We have used a relative date of zero (0) to indicate that we are processing today's SMF data, from 9:00am to 4:30pm.

It is recommended that you specify relative dates if you want to use an automated job scheduler to run the load HDB JCL regularly. The JCL can be set up once and run daily without needing to change it.

### DB2 Export Options

To export the data to DB2 directly after loading it into the HDB, select the Load DB2 Table option. For details of the JCL that this option generates, see "Load JCL" on page 643. (The remaining DB2 export options are only relevant if you select the Load DB2 Table option.)

The DB2 table to which you are exporting must already be defined.

To define a DB2 table, see "Creating DDL to define a DB2 table" on page 655.

If you select **2. Replace** for Table Load Options and the HDB load fails, then the result is an empty DB2 table.

When you have specified your Load options, you are prompted to **Press ENTER to proceed with request**. This provides a last opportunity to review and change your load request.

If you selected **Edit JCL before submit** then the Load HDB JCL is displayed in an edit session. Specify this option if you want to save the JCL in an automated job scheduler JCL library.

```

000023 /*

```

Figure 300. Edit JCL for Load Summary HDB

The SMF file data set name for system CICSP1 is unresolved. This indicates that the System Definition for CICSP1 does not have SMF files specified. Substitute the required SMF file data set name into the JCL.

The command deck specifies operands to load HDB CICSP1H:  
HDB(OUTPUT(HDBL0001),LOAD(CICSP1H))

Enter **SUBmit** in the command line to submit the job to run the load.

Successful completion of the Load request will generate a Recap report like the following.

```

V5R1M0                      CICS Performance Analyzer
                             HDB Load Recap Report

LOAD requested for HDB: CICSP1H Repository DSN: CICSPROD.CICSPA.HDB.REPOSTRY
The following Container(s) were created and loaded:
  Container DSN: JCH.CICSP1H.D03219.T092846.HDB          No of Records: 54,567
  Start Time Stamp: 2004-12-07-09.00.00              End Time Stamp: 2004-12-07-16.00.00
LOAD process complete.

```

Figure 301. HDB Load Recap report

The Recap report provides a list of the Container data sets created by the Load process. In this example, CICS PA created Container data set JCH.CICSP1H.D03219.T092846.HDB. It contains 54,567 records for the period 9:00am to 4:00pm on December 7, 2004.

## HDB Load Audit

HDB load requests create an audit record that includes:

- Date/time range of the data used to create the containers
- Status indicator, OK or Failed

The purpose of the HDB Load Audit is two-fold:

- Verify that all load requests have completed successfully
- Highlight gaps in the data due to Load requests not being run

The Load Audit records can be viewed and maintained from the dialog. For more information, see “HDB Load Audit” on page 664.

---

## Performance HDB Reporting

After you have loaded data into an HDB it is then eligible for reporting.

Select option 4 **Report** from the HDB menu to submit a report request.

```
File Options Help
-----

F1=Help  F3=Exit  F4=Prompt  F6=Resize  F10=Actions  F12=Cancel
```

Figure 303. Run Summary HDB Report

The options are:

**Report Form**

Specify a Report Form to tailor the format of the report output. If you do not specify a Form, CICS PA will report all fields in the HDB, in default sequence, up to the maximum 8000 characters.

**Report Interval**

Specify the reporting time range. You can specify an explicit date, such as 2004/12/07, or a relative date to indicate today (0), yesterday (-1), two days ago (-2), and so on. At the bottom of the display is the time range of data contained in this HDB. If you specify a Report Interval, then it must be within this range otherwise the report request will fail.

**Time Interval**

Specify an optional Time Interval when reporting Summary HDBs. The default is the Time Interval used to create the data (as defined in the Template). The example template PRODSUM that was used to create the HDB data specified 15 minutes.

You can specify any interval greater than or equal to the Template Interval. For example, if you are reviewing many days worth of data then you might specify 24:00:00 (24 hours) so that you can view the daily trend. In Figure 303 on page 571, the Interval has been changed to 1 hour.

**Totals Level**

This option applies only to the Summary report. Leave blank if you do not want to include total lines in the report. This generates the NOTOTALS operand.

Specify a number between 1 and 8 to accumulate subtotals for up to 8 sort fields, print the subtotals when the sort field changes, and print a grand total at the end of the report. This generates the TOTALS(n) operand where n is a value between 1 and 8. Default: 8

Specify 0 for no subtotals, but print only the grand total. This generates the TOTALS(0) operand.

**Precision**

Specify the precision for numeric fields: 4, 5, or 6 decimal places to report up to microseconds. This generates the PRECISION(n) operand for n between 4 and 6. Default: 4

When you have specified your Report options, you are prompted to **Press ENTER to proceed with request**. This provides a last opportunity to review and change your report request.

If you selected **Edit JCL before submit** then the Report HDB JCL is displayed in an edit session.

```

***** ***** Bottom of Data *****

```

Figure 304. Edit JCL for Summary HDB report

The HDB container data sets are listed at the end of the JCL. They are not required here because the CICS PA batch reporting utility will dynamically allocate the data sets when they are required. CICS PA adds the data sets into the JCL primarily for the purpose of DFHSM recall, if required. It is more efficient to recall data sets in the JCL (where job initiation can recall migrated data sets en masse) rather than one at a time when dynamically allocated.

The command deck specifies operands to report against HDB CICSP1H:  
HDB(OUTPUT(HDBR0001),REPORT(CICSP1H))

Enter **SUBmit** in the command line to submit the job to run the report.

Successful completion of the Report request will generate an HDB Summary report.

Figure 305. HDB Summary report

## Tailoring the HDB report format

To change the format of the report or to report additional information from the HDB then you need to use a Report Form. Report Forms are defined outside the HDB menu using option 3 **Report Forms** from the CICS PA Primary Option Menu.

In the following example we have created a Summary Report Form called HDBFORM1.

```

File Edit Confirm Upgrade Profiling Options Help
-----
                        EDIT SUMMARY Report Form - HDBFORM1                      More: >
Command ===> _____ Scroll ===> CSR_

Description . . . Summary Report Form_____ Version (VRM): 680

Selection Criteria:
_ Performance                                     Page width . . 132_

Field      Sort
/ Name +   K  O Type   Fn Description
---
TRAN_____ K  A _____ Transaction identifier
TASKCNT_____ Total Task count
RESPONSE_____ AVE Transaction response time
RESPONSE_____ DEV Transaction response time
DISPATCH_____ TIME AVE Dispatch time
DISPATCH_____ COUNT AVE Dispatch time
CPU_____ TIME AVE CPU time
SUSPEND_____ TIME AVE Suspend time
SUSPEND_____ COUNT AVE Suspend time

FCWAIT_____ TIME AVE File I/O wait time
FCWAIT_____ COUNT AVE File I/O wait time
IRWAIT_____ TIME AVE MRO link wait time
IRWAIT_____ COUNT AVE MRO link wait time
EOR_____
----- End of Report -----

```

Figure 306. Edit Summary Report Form

This Form will change the default HDB report in a number of ways:

1. The Form does not specify a time stamp key. This will cause the report to be summarized by Transaction ID only. The interval records of the HDB is accumulated for each Transaction ID.
2. The count components of the Clock fields have been included. By default the HDB Summary report only displays the average of the time components.
3. Response time is also to be reported as a Standard Deviation. This will provide an indication of how response time varies. The higher the standard deviation the more that response time varies.

When you next report against the HDB, you can use this Report Form. On the Run Report panel, press **Prompt** (F4) to select from a list of Report Forms.

```

Figure 309. HDB Summary report formatted using a Report Form

The Report Form (and resultant FIELDS operand) changes the report to show a summary by Transaction ID over the entire reporting interval. Compare this report output to Figure 305 on page 573.

## Exporting Performance HDB data to DB2

After you have loaded data into an HDB it is then eligible for export to DB2.

**Summary HDB** data is the most commonly used for performance reporting. It is already summarized by time.

**List HDB** data is typically used to drill down to isolate performance problems or for ad-hoc reporting. Take care when exporting List HDBs into DB2. The volume of data can be high, resulting in a table that is too large to manage.

**Statistics HDB** data is used for both short-term problem analysis and long-term trend analysis. Like List HDBs, take care when exporting Statistics HDBs into DB2. The volume of data can be high, resulting in a table that is too large to manage.

Select option 5 **Export** from the HDB menu to export HDB data into DB2.

Figure 312. Export HDB Data Set

Exporting HDB data into DB2 is a two-step process, controlled by the **Select Option**.

1. Create the DDL to define the DB2 table. See “Creating DDL to define a DB2 table.”
2. Load the data. “Loading data into the DB2 table” on page 580

You can then use your favorite DB2 query tool to analyze the data. Chapter 22, “Analyzing HDB DB2 Export data,” on page 679

## Creating DDL to define a DB2 table

CICS PA uses DSNTIAD, the sample Dynamic SQL program to run the DDL that defines the DB2 table.

CICS PA builds the JCL that contains the CREATE TABLE statement required to define the DB2 table for this HDB data set. The HDB name is used as the table name, however you can change this by editing the JCL.

The options are:

#### Create Options

Select **Create Database** if you want the CREATE TABLE statement to be preceded by a CREATE DATABASE statement to define the DB2 database. You might need to ask your DB2 administrator to do this for you if you do not have sufficient authority.

Select **Create Storage Group** if you want the CREATE TABLE statement to be preceded by a CREATE STOGROUP statement to define the DB2 Storage Group.

#### DB2 Settings

Specify the required DB2 settings for your environment. CICS PA only provides a basic facility to load data into DB2. It does not provide any management or reporting capabilities when the data is in DB2.

If you omit any DB2 settings, CICS PA will insert parameter markers such as <setting> in the JCL stream.

#### Include Clock Field Components

CMF performance class Clock fields accumulate data for both their count and time components in the HDB. You have a choice as to which components to load into DB2. For example, selecting **Time only** will load the time component but not the count component. Time only is sufficient for most analysis requirements.

#### Summary Options

Specify **Include Sums of Squares** to load sum-of-square values into the DB2 Table. CICS PA always loads the Total. This allows you to calculate averages. Sums of Squares are required to calculate standard deviation and peak percentiles. Totals (and not Sums of Squares) is sufficient for most analysis requirements.

**Note:** The storage space for indexes is set to a default arbitrary value. For information on how to calculate the space required for an index, see the *DB2 UDB for z/OS Administration Guide*.

Review the JCL then submit to create the DB2 table:

```

*Figure 313. Edit JCL for HDB Export: Define DB2 table*

Review the job output in SDSF to verify that the table was created successfully.

## Loading data into the DB2 table

CICS PA uses the DB2 Load Utility to load data into the DB2 table.

CICS PA builds the JCL that contains the DB2 Load Utility statement required to load the HDB data set into the DB2 table that was defined in the previous step.

The options are:

### Load Options

Select **Resume** if you want the DB2 Load Utility to resume loading data into the table. Typically, this is appropriate for Summary HDBs.

Select **Replace** if you want the DB2 Load Utility to replace data already loaded in the table. Typically, this is appropriate for List HDBs.

Review the JCL then submit to load the DB2 table:

```

F1=Help  F3=Exit  F4=Prompt  F6=Resize  F12=Cancel
```

Figure 316. Run Summary HDB Extract

The options are:

### Report Interval

Specify the reporting time range. You can specify an explicit date, such as 2004/12/15, or a relative date to indicate today (0), yesterday (-1), two days ago (-2), and so on. Adjacent is the time range of data contained in this HDB. If you specify a Report Interval, then it must be within this range otherwise the extract request will fail.

### Extract Recap DDname

The DDname for the Recap report which prints at the end of extract processing to provide processing statistics. The DDname is mandatory.

CICS PA assigns a default DDname **HXTS0001**.

This option generates the OUTPUT(ddname) operand.

### Output Data Set

The name of the data set where the extract records are written. When specifying the data set name, standard TSO conventions apply.

If CICS PA is to create the data set at run time, the default allocation attributes specified on the Reporting Allocation Settings panel are used in generating the JCL. If the data set is already cataloged, then CICS PA will use DISP=OLD or DISP=MOD according to your request to overwrite or append to the existing data set.

CICS PA generates the DDNAME(ddname) operand and assigns a default DDname **HDBX0001**.

### Disposition

This option applies if the extract data set you specified is already cataloged.

Select option **1 - OLD** to overwrite the data set contents with the new extract data.

Select option **2 - MOD** to append the new extract data.

### Report Form

Specify a Report Form to tailor the format of the extract records. If you do not specify a Form, CICS PA will write all the fields in the HDB in order.

### Delimiter

Specify the field delimiter to be used to separate each data field in the extract data set. The default is a semicolon and generates the DELIMIT(';') operand.

### Include Field Labels

Select this option to indicate that the first record to be written to the extract data set is to be a field labels record. This is the default and generates the LABELS operand.

Leave blank if you do not want a field labels record written to the extract data set. This generates the NOLABELS operand.

### Numeric Fields in Float format

Select this option if you want CICS PA to write numeric fields to the extract data set in S390 FLOAT format. This generates the FLOAT operand. Specify FLOAT format if you plan to import the extract into a DB2 table. When the DB2 Load Utility is used, it will interpret all numerical fields reliably and consistently in FLOAT format.

If you do not select this option, the numeric fields are written in a mixture of integer, real and exponential using character digits. This is the default and is suitable when importing the extract data into a PC spreadsheet tool. This generates the NOFLOAT operand.

### Time Interval

Specify an optional Time Interval when extracting Summary HDBs. The default is the Time Interval used to create the data (as defined in the Template). The example template PRODSUM that was used to create the HDB data specified 15 minutes.

You can specify any interval greater than or equal to the Template Interval. For example, if you are reviewing many days worth of data then you might specify 24:00:00 (24 hours) so that you can view the daily trend. In Figure 316 on page 582, the Interval has been changed to 1 hour.

When you have specified your Extract options, you are prompted to **Press ENTER to proceed with request**. This provides a last opportunity to review and change your request details.

If you selected **Edit JCL before submit** then the Extract HDB JCL is displayed in an edit session.

```

***** ***** Bottom of Data *****

```

Figure 317. Edit JCL for Summary HDB Extract

The HDB container data sets are listed at the end of the JCL. They are not required here because the CICS PA batch utility will dynamically allocate the data sets when they are required. CICS PA adds the data sets into the JCL primarily for the purpose of DFHSM recall, if required. It is more efficient to recall data sets in the JCL (where job initiation can recall migrated data sets en masse) rather than one at a time when dynamically allocated.

The command deck specifies operands to extract records from HDB CICSP1H, write them to the extract data set with DDname HDBX0001, and write the Recap report output to the DDname HXTS0001:

```
HDB(DDNAME(HDBX0001),EXTRACT(CICSP1H),OUTPUT(HXTS0001),...)
```

Enter **SUBmit** in the command line to submit the job to run the report.

Successful completion of the Extract request will generate an HDB Summary Extract Recap report.

Figure 319. HDB Summary Extract record format

## Tailoring the HDB extract format

The format of the extract records can be changed by specifying a Report Form. The process for HDB Extract is the same as applying a Report Form to an HDB Report. For more information, see “Tailoring the HDB report format” on page 574.

## Analyzing the extract data

After HDB data has been loaded into an extract data set in CSV format, you can use your favorite PC analysis tools, such as Lotus 1-2-3 or Excel, to analyze the data. See Chapter 23, “Analyzing CSV extract data,” on page 685 for examples of how to use such tools to analyze the data.

## Maintaining Performance HDBs

Select option 7 **Maintenance** from the HDB menu to maintain your HDB environment.

File Options Help

HDB Maintenance

## Chapter 19. Guided Tour: Statistics HDB

Every aspect of the CICS PA Historical Database is controlled using the ISPF dialog.

This section takes you through the process of defining and using a Statistics HDB.

**Setup.** Initially, your HDB environment requires a minimal one-time setup. HDB definitions are saved in the repository, a VSAM KSDS. CICS PA automatically defines the repository for you when you first try to use it.

Then the required steps are:

1. **Definition.**

Unlike Performance HDBs, Statistics HDBs do not require a Template, so you can immediately define the HDB and its options, such as the characteristics of the HDB data sets and the retention period of the data.

2. **Load.**

Loading data into the HDB is performed by the standard CICS PA batch reporting utility. The command that requests the utility to load an HDB is:

```
HDB(LOAD(...
```

CICS PA reads the CICS statistics and server statistics data and builds the HDB data sets. Because the HDB Load process is part of the normal batch reporting process, you can run CICS PA reports and load HDBs together with a single pass of the SMF data.

3. **Report.**

Unlike Performance HDBs that are reported in batch, Statistics HDBs are reported in the dialog.

You can also use Statistics HDBs to generate batch Statistics HDB Alert reports. These reports show any statistics that meet the conditions you have specified in a Statistics Alert definition. For details, see Chapter 13, "Statistics alert reporting," on page 347.

4. **Export.**

Export allows you to load HDB data into a DB2 table. CICS PA automates this process with two simple steps:

- a. First define the DB2 table to house the data. CICS PA generates JCL to do this for you by creating the necessary DDL to define the table.
- b. Then load the data into the table. CICS PA generates JCL to do this for you by creating the necessary DB2 Load Utility statements to load the data.

5. **Extract.**

Extract allows you to extract HDB data into a CSV (comma separated variable) file, suitable for importing into a PC-based spreadsheet application.

6. **Maintain.**

HDB maintenance allows you to change your HDB definition and manage the HDB container data sets.

7. **Housekeeping.**

HDB housekeeping should be run periodically to clean up your HDB environment. Housekeeping performs these tasks:

- a. Deletes HDB container data sets that have expired or have delete pending.
- b. Deletes expired DB2 table rows.
- c. Removes definitions from the Repository that are no longer required.

## Historical Database Menu

Option 5 **Historical Database** from the CICS PA Primary Option Menu takes you to the Historical Database Menu. The HDB menu is presented in the order that reflects the seven steps to using Statistics HDB.

```

F1=Help    F3=Exit    F4=Prompt    F10=Actions    F12=Cancel

```

Figure 325. Historical Database (HDB) Menu

Specify the repository data set name. Remember that you might want to share this repository with other users. This will ensure that HDB data can be generated once and made available to everyone.

## Repository

Your HDB environment is controlled by the Repository. The Repository is a VSAM KSDS that acts as a repository for all definitions associated with your HDB environment:

- Templates (Performance HDBs only)
- HDB Definitions
- Selection Criteria (Performance HDBs only)
- Container data set information
- Audit information about Load requests

The Repository is also a repository for the following definitions that are not associated with HDBs:

- Shared System Definitions
- Application Groups
- Statistics Alert Definitions
- Resource Lists
- Performance Alert Definitions

It is recommended that you share the repository with other CICS PA users so that you only need to generate history data once, allowing multiple users to report against it. There is no limit to the number of repositories you can define.

If your repository is not cataloged, the dialog will first prompt you to define it when you select an option from the menu.

## Defining a Statistics HDB

Defining a Statistics HDB allows you to collect (load) and report historical CICS statistics and server statistics data and CICS Transaction Gateway statistics data. The definition alone does not cause any action by CICS PA.

Select option 2 **Define** from the HDB menu to define a new HDB. Then when prompted, select option 2 to create a Statistics HDB.

Figure 326. New HDB Definition Menu

In the following example, we have given the HDB a name of CICSP1S and a description of Statistics HDB for CICSP1.

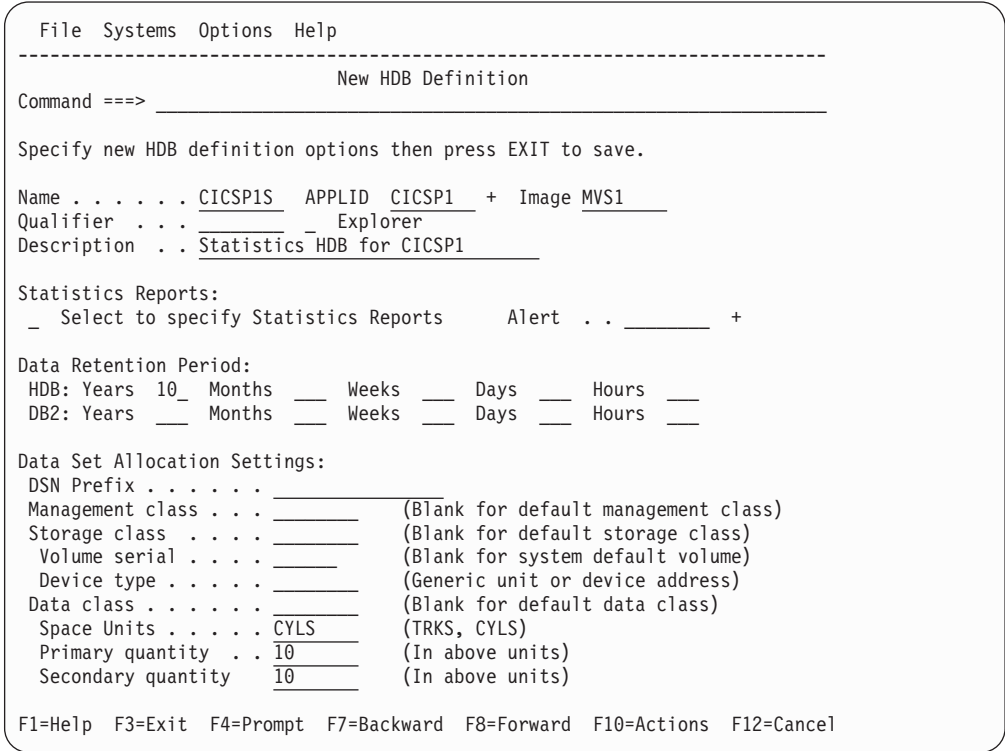

Figure 327. New HDB Definition

The other options are:

### APPLID

APPLID is optional and specifies the CICS system that the HDB applies to. You can use **Prompt** (F4) to select from a list of CICS systems defined in your System Definitions.

Specify APPLID to ensure that only data for this CICS system is loaded into the HDB. At Load time, CICS PA will generate JCL that includes this APPLID in the command deck and DD statements for this system's SMF Files.

### Qualifier

If Qualifier is specified, the value is used as the DB2 schema in place of the Database as specified in DB2 Settings. It is also incorporated into the DB2 table name:

*qualifier.CPA\_statid*

Qualifier is mandatory if Explorer is selected, and optional otherwise. If Qualifier and Explorer are both entered then details of this HDB will be included in the manifest for the CICS PA plug-in the next time it is rebuilt for this qualifier.

### Explorer

Select the Explorer option to make this HDB eligible for inclusion in the manifest for the CICS PA plug-in.

### Data Retention Period

These fields separately specify the length of time that HDB data sets and associated DB2 table rows are kept before they expire. Typically:

- Summary HDBs need to keep their container data sets for many years for long-term trend analysis.
- List HDBs used for ad hoc reporting might only need to keep their container data sets for a couple of hours or days.

Specify each retention period as a whole number of years, months, weeks, days, or hours. Only one choice is allowed.

If the HDB container data sets are no longer required after their data has been exported to DB2, you can specify a retention period of 0 in any of the HDB periods to make the HDB data sets expire immediately.

Container data sets and DB2 data are deleted by **HDB Housekeeping** after they have passed their expiry date. If you do not specify a retention period, the corresponding HDB data sets or DB2 data will never expire.

Use **HDB Maintenance** to check container data set status or to alter the HDB or DB2 retention period.

### Data Set Allocation Settings

Data Set Allocation Settings specify the allocation attributes of the data sets that contain data for this HDB. CICS PA dynamically allocates container data sets at load time.

The format of the data set name is

*DSN-prefix.HDB-name.Dyyddd.Thmmss.HDB*

where the DSN prefix is the data set name high level qualifier.

Specify allocation settings that satisfy your installation requirements. The size of container data sets is not critical. Typically you would specify a size that accommodates a single load request. For example, if you load data into the HDB daily, then 10 cylinders might be sufficient. However if CICS PA encounters an out-of-space condition (ABENDx37) during load, then it simply closes the data set and recommences loading in a new data set. You can decide to specify a larger size initially and adjust it later using **HDB Maintenance**.

## Statistics Reports

Statistics HDBs, by default, do not collect any statistics. You must select **Select to specify Statistics Reports** to activate the types of statistics (reports) that you want to collect.

In the following example, we have activated collection for three CICS Dispatcher reports and all four CICS Storage reports.

```
File Edit Options View Help
-----
Command ==> Statistics Reports Line 1 of 25

F1=Help  F3=Exit  F4=Prompt  F6=Resize  F10=Actions  F12=Cancel

```

Figure 330. Load Statistics HDB

The options are:

### System Selection

System Selection specifies the CICS system(s) whose data is to be loaded into the HDB. It is initialized to the CICS system APPLID that you specified during HDB definition.

In this example, CICS PA generates an APPLID(CICSP1) operand in the command deck and includes DD statements for the SMF Files defined in System Definitions for CICSP1.

### Report Interval

Specify the time range of data to be included in the HDB. You can specify an explicit date, such as 2004-12-05, or a relative date to indicate today (0), yesterday (-1), two days ago (-2), and so on. We have used a relative date of zero (0) to indicate that we are processing today's SMF data, from 9:00am to 4:30pm.

Note that EOD statistics are often cut at midnight, so would not be included in this HDB.

It is recommended that you specify relative dates if you want to use an automated job scheduler to run the load HDB JCL regularly. The JCL can be set up once and run daily without needing to change it.

## DB2 Export Options

To export the data to DB2 directly after loading it into the HDB, select the Load DB2 Table option. For details of the JCL that this option generates, see “Load JCL” on page 643. (The remaining DB2 export options are only relevant if you select the Load DB2 Table option.)

The DB2 table to which you are exporting must already be defined.

To define a DB2 table, see “Creating DDL to define a DB2 table” on page 655.

If you select **2. Replace** for Table Load Options and the HDB load fails, then the result is an empty DB2 table.

When you have specified your Load options, you are prompted to **Press ENTER to proceed with request**. This provides a last opportunity to review and change your load request.

If you selected **Edit JCL before submit** then the Load HDB JCL is displayed in an edit session. Specify this option if you want to save the JCL in an automated job scheduler JCL library.

```

000023 /*
```

Figure 331. Edit JCL for Load Summary HDB

The SMF file data set name for system CICSP1 might be unresolved. This indicates that the System Definition for CICSP1 does not have SMF files specified. Substitute the required SMF file data set name into the JCL.

The command deck specifies operands to load HDB CICSP1S:  
HDB(OUTPUT(HDBL0001),LOAD(CICSP1S))

Enter **SUBmit** in the command line to submit the job to run the load.

Successful completion of the Load request will generate a Recap report like the following example.

```

V5R1M0
CICS Performance Analyzer
HDB Load Recap Report

HDBL0001 Printed at 9:28:48 15/03/2005 Data from 09:00:00 15/03/2005 to 16:30:00 15/03/2005
Page 1

LOAD requested for HDB: CICSP1S Repository DSN: CICSPROD.CICSPA.XYZ.REPOSTRY

The following Container(s) were created and loaded:
Container DSN: CICSPA.CICSP1S.D03219.T092846.HDB No of Records: 54,567
Start Time Stamp: 2005-03-15-09.00.00 End Time Stamp: 2005-03-15-16.00.00

LOAD process complete.

```

Figure 332. HDB Load Recap report

The Recap report provides a list of the Container data sets created by the Load process. In this example, CICS PA created Container data set CICSPA.CICSP1S.D03219.T092846.HDB. It contains 54,567 records for the period 9:00 am to 4:00 pm on March 15, 2005.

## HDB Load Audit

HDB load requests create an audit record that includes:

- Date/time range of the data used to create the containers
- Status indicator, OK or Failed

The purpose of the HDB Load Audit is two-fold:

- Verify that all load requests have completed successfully
- Highlight gaps in the data due to Load requests not being run

The audit records can be viewed and maintained from the dialog. For more information, see “HDB Load Audit” on page 664.

## Statistics HDB Reporting

After you have loaded data into an HDB it is then eligible for reporting.

Select option 4 **Report** from the HDB menu to display the list of Statistics HDBs.

File Options Help

Report HDBs
Row 1 to 1 of 1

Command ==>
Scroll ==> CSR\_

Select to run report.

Name	Type	Description	Changed	ID

```

Figure 334. Run Statistics HDB Report

The list of container data sets is displayed. You can select report data by either:

1. Specifying a Report Interval, in which case, CICS PA will automatically select the required container data sets.
2. Explicitly selecting the required container data sets as shown in Figure 334.

The list of statistics intervals is then displayed.

```

Scroll **Right** (F11) and **Left** (F10) to view all the columns in the report.

Statistics reporting has several features that help you tailor the display to meet your needs. The following sections introduce these features.

## Sorting

Use the Tab key to position the cursor on the point-and-shoot separator line that underlines the name of the column you want to sort. Press Enter to sort the report by that column in ascending sequence. Press Enter again to sort in descending sequence.

The following example is sorted in descending Peak DSA Size sequence.

File Edit Form Options Help

Figure 340. Statistics report: FORM ON

You can enter the **FORM OFF** command to view the default report format, then enter **FORM ON** to reapply the Form.

## Hyperlink

Hyperlinks allow you to link to other statistics reports related to the current report. Certain fields in some statistics reports are hyperlink fields. Hyperlink fields are point-and-shoot fields.

**Note:** Ensure that your ISPF Settings distinguish point-and-shoot fields (see “CUA attribute settings” on page 27) and that you can Tab to them (see “Point-and-Shoot fields” on page 27).

In our DSAs report in Figure 340 on page 600, the DSA Name field is a hyperlink field. Tab to ESDSA and press Enter to hyperlink to the report of Domain Subpools belonging to ESDSA.

Exit (F3) to return to the previous report.

## Statistics Field Help

Extensive help is available for each column in the report. Press **Help** (F1) when the cursor is positioned in the body of the report to display help for the report fields.

Field Descriptions for Statistics Report

Category : Regions

Macro . . : DFHMSDS

Report . : DSAs

DSECT . . : SMSBODY

-----

DSA Name

CICS field name: SMSDSANAME

DB2 column name: DSA\_NAME

The name of the DSA that this record represents.  
Values can be: CDSA, UDSA, SDSA, RDSA, ECDSA, EUDSA, ESDSA, or ERDSA.

Reset characteristic: Not reset

-----

DSA Location

CICS field name: SMSLOCN

DB2 column name: LOCATION

The location of the DSA, either ABOVE or BELOW the 16MB line.

-----

Access

CICS field name: SMSACCESS

DB2 column name: ACCESS

The type of access of the DSA, either:

CICS        Access is CICS key

USER        Access is USER key

READONLY    Read-only protection

If storage protection is not active, all storage areas will revert to CICS except those in the ERDSA.

Reset characteristic: Not reset

-----

More: +

Figure 342. Statistics report: Field Help

Field Help is also available from the Extended Help (F1 from the command line). Tab to **Field Descriptions** and press F1.

Note that the DB2 column names are also shown. These are used by CICS PA when exporting data to DB2.

Print

All statistics reports can be printed to a DASD data set or SYSOUT file. The **P** line action is available from both the list of Statistics Intervals panel (where the entire interval can be printed) or the list of Statistics Reports panel (where individual categories and reports can be printed). In this example, the report is printed to a data set, and then browsed.

```

Print Statistics Report
Command ==> _____

Specify Statistics Report print options.

Report Destination:
1 1. Data Set  2. SYSOUT

Output Data Set:
Data Set Name . . 'JCH.CICSP1.STATS.REPORT'
Disposition . . . 1 1. OLD  2. MOD  (If cataloged)

Enter "/" to select option
/ Browse output data set

Report Output:
SYSOUT Class . . A      Print Lines per Page . . 60_ (0-255)

```

Figure 343. Statistics report: Print

Browsing the data set provides an alternative way of viewing the same report, as shown in the following example.

```

BROWSE      JCH.CICSP1.STATS.REPORT                      Line 00000000 Col 001 080

Figure 344. Statistics report: Browse print data set

When a report is printed, it can be viewed as an output file attached to your current TSO session, using SDSF for example. Note that when you print a report, the active Form is honored.

## Exporting Statistics HDB data to DB2

Select option 5 **Export** from the HDB menu to export HDB data into DB2.

Unlike Performance HDBs, Statistics HDBs do not have a common record format. The records for each statistics report (or type, as identified by its CICS domain and statistics ID) have a different record format. Therefore one DB2 table must be defined for each type of statistics record to be exported.

```

Figure 347. Select Statistics reports for export to DB2

Enter line action **S** to select the reports that you want to export to DB2.

Only the reports that you select are exported to DB2. The DB2 Load column is ignored: this column is only used when loading the HDB with the Load DB2 Table option selected.

In the following example, we have selected the DSAs report.

### Step 1. Create the DB2 table

Exporting HDB data into DB2 is a two-step process. The first step creates the DB2 table.

File Options Help	
-----	
Export HDB Data Set	
Command ==> _____	
Select option	
1	1. Create DDL to define table
2	2. Load data into table
Create Options	
1	1. Resume
2	2. Replace
DB2 Settings:	
DB2 Subsystem ID . . .	DB2P
DSNTIAD Plan Name . . .	DSNTIA91
DB2 Load Library . . .	'DB2.V910.SDSNLOAD'
DB2 Exit Library . . .	'DB2.V910.SDSNEXIT'
DB2 RUNLIB Library . . .	'DB2.V910.RUNLIB.LOAD'
Database . . . . .	CICSPA
VCAT Catalog name . . .	USER
Allocation: Primary	20
Secondary	. . . . 20

Figure 348. Export Step 1. Create DB2 table

Select option 1 **Create DDL to define table.**

The create table JCL is generated and displayed in an edit session for review and submission.

EDIT JCH.SPFTEMP3.CNTL		Columns 00001 00072
Command ==>	SUB	Scroll ==> PAGE
***** Top of Data *****		
000001	//JCH#CPA JOB ,NOTIFY=&SYSUID	
000002	//* CICSPA V5R1 HDB - DDL TO DEFINE DB2 TABLE	
000003	//RUNTIAD EXEC PGM=IKJEFT01,DYNAMNBR=20	
000004	//SYSTSPRT DD SYSOUT=*	
000005	//SYSTSIN DD *

000029	DSA_LOCATION	CHAR(8),
000030	ACCESS	CHAR(8),
000031	DSA_INDEX	CHAR,

Figure 349. Edit JCL to create DB2 table

Note the DB2 table name “CICSPA.HST014B”. This name reflects the statistics ID of the selected report, in this case 014 for DSAs. The B suffix is appended to distinguish this report from the Storage Overview report that shares the same 014 ID.

CICS PA exports CICS Transaction Gateway statistics to DB2 table names ending with the SQL identifier “HSTGnnnn” (note the letter G). This distinguishes them from the “HSTnnnn” DB2 table names for CICS Transaction Server statistics.

You can change this name to something more meaningful to you, for example CICSPA.CICSP1\_DSAS.

Submit the JCL to create the table.

## Step 2. Load the DB2 table

The second step loads the DB2 table.

File Options Help

Export HDB Data Set

```

Figure 355. Edit JCL for Statistics HDB Extract

Multiple statistics reports can be extracted in a single request.

Note that, like DB2 tables, CICS PA appends the statistics ID suffix to the extract data set name. Data set JCH.SDS.STAT014B can now be file transferred to your workstation for importing into a spreadsheet application.

CICS PA extracts CICS TG statistics to data set names with the low-level qualifier "HSTGnnnn". This distinguishes them from CICS TS statistics, which CICS PA extracts to data set names with the low-level qualifier "STATnnnn".

## Maintaining Statistics HDBs

Statistics and Performance HDBs are maintained in the same way. You can alter any of the HDB characteristics, such as container data set name and allocation size.

Select option 7 **Maintenance** from the HDB menu to maintain your HDB environment.

Figure 357. Activate Statistics report for data collection

Note that either activating new reports, or deactivating reports already collecting data does not change the data already collected. All the existing data can still be reported, regardless of whether collection is still active or not.

---

## Chapter 20. Using the HDB dialog

CICS PA provides a menu-driven facility for managing your Historical Databases. A CICS PA Historical Database (HDB) is a repository of performance related data for your CICS systems. The type of information and level of detail contained in an HDB is determined by user-defined templates.

This chapter describes the CICS PA dialog for defining templates, defining and maintaining your HDBs, producing reports from the HDB data, and exporting the HDB data to DB2 tables.

---

### Historical Database Menu

Select option 5 **Historical Database** from the CICS PA Primary Option Menu to invoke the Historical Database Menu.

Every aspect of the CICS PA Historical Database is controlled via the ISPF dialog. The Historical Database Menu contains the functions to manage the Historical Database environment.

```
File Options Help
-----
Historical Database Menu
Option ==> _____
1 Templates      Design HDB Templates
2 Define         Define a new HDB
3 Load          Load data into the HDBs
4 Report         Submit HDB report requests
5 Export         Export HDB data sets to DB2
6 Extract        Extract HDB data sets to CSV
7 Maintenance    Maintain HDB definitions and data sets
8 Housekeeping   Perform HDB housekeeping

```

Figure 358. Historical Database (HDB) Menu

The menu provides a pathway to the eight steps for defining and using HDBs:

1. **Template.** (Performance HDBs only, not Statistics HDBs)  
Defining an HDB is a two step process: first define a Template and then define an HDB based on that Template. The Template identifies which CMF performance fields are to be kept in the HDB. For more information, see “HDB Templates” on page 617.
2. **Definition.**  
After the Template is defined, then define the HDB and its options, such as the characteristics of the HDB data sets and the retention period of the data. For more information, see “Define a Performance HDB” on page 636.
3. **Load.**

Loading data into the HDB is performed by the standard CICS PA batch reporting utility. The command that requests the utility to load an HDB is:  
HDB(LOAD(...

CICS PA reads the CMF performance class data (and also, for Statistics HDBs, CICS Transaction Gateway statistics) and builds the HDB data sets. Because the HDB Load process is part of the normal batch reporting process, you can run CICS PA reports and load HDBs together with a single pass of the SMF data. For more information, see “Load HDBs” on page 641.

#### 4. **Report.**

Performance HDB reporting is performed by the standard CICS PA batch reporting utility. The command that requests the utility to report against a Performance HDB is:

HDB(REPORT(...

You can tailor Performance HDB reporting by using a Report Form. This allows you to select which fields in the HDB are reported and how they are presented. Statistics HDB reporting is done interactively using the CICS PA dialog.

Statistics Alert reporting, which alerts you when statistics field values meet specified conditions, is performed by the batch reporting utility. The command that requests the utility to generate a Statistics Alert report against a Statistics HDB is:

HDB(STATSALERT(...

Before requesting a Statistics Alert report, you must create a Statistics Alert Definition. For details, see Chapter 13, “Statistics alert reporting,” on page 347.

#### 5. **Export.**

Export allows you to load HDB data into a DB2 table. CICS PA automates this process with two simple steps:

- a. First define the DB2 table to house the data. CICS PA generates JCL to do this for you by creating the necessary DDL to define the table.
- b. Then load the data into the table. CICS PA generates JCL to do this for you by creating the necessary DB2 Load Utility statements to load the data.

For more information, see “HDB Export to DB2 tables” on page 654

#### 6. **Extract.**

The HDB Extract facility allows you to export data from your HDB data sets to an extract data set in CSV (comma separated values) format, suitable as input into PC-based spreadsheet applications.

#### 7. **Maintain.**

HDB maintenance allows you to change your HDB definition and manage the HDB container data sets. For more information, see “HDB Maintenance” on page 661.

#### 8. **Housekeeping.**

HDB housekeeping should be run periodically to clean up your HDB environment. Housekeeping performs these tasks:

- a. Deletes HDB container data sets that have expired or have delete pending.
- b. Deletes expired DB2 table rows.
- c. Removes definitions from the Repository that are no longer required.

For more information, see “Housekeeping” on page 668.

Initially, your HDB environment requires a minimal one-time setup. On the Historical Database Menu, specify the name of the **Repository**. This is a VSAM KSDS where HDB definitions are saved.

You can define as many repositories as required; however only one repository can be used at a time and each repository acts independently. Information cannot be shared between repositories. It is recommended that one global repository is defined and made available to all users. In this way, all Historical Databases are available to users.

The default name is 'CICSPA.HDB.REPOSTRY'. You can change this by overtyping or pressing **Prompt** (F4) to select from a list of previously used repositories. Normal ISPF data set conventions apply when specifying the name of the data set.

If the Repository data set is not cataloged, CICS PA will prompt you to define it when you attempt to use it.

---

## Repository

Your HDB environment is controlled by the Repository. The Repository is a VSAM KSDS that acts as a repository for all definitions associated with your HDB environment:

- Templates (Performance HDBs only)
- HDB Definitions
- Selection Criteria (Performance HDBs only)
- Container data set information
- Audit information about Load requests

The Repository is also a repository for the following definitions that are not associated with HDBs:

- Shared System Definitions
- Application Groups
- Statistics Alert Definitions
- Resource Lists
- Performance Alert Definitions

On the Historical Database Menu, specify the Repository data set name. If the Repository data set is not cataloged, the dialog will prompt you to define it when you select an option from the menu.

Define Repository

Command ==>
\_\_\_\_\_

Repository Name . . . 'CICSPROD.CICSPA.XYX.REPOSTRY' \_\_\_\_\_

Enter "/" to select option  
- Edit IDCAMS command  
- Browse errors only

Cluster Level Information:

Space Units . . . . . 1 \_\_\_\_\_  
. . . . . 2. Tracks \_\_\_\_\_  
. . . . . 3. Records \_\_\_\_\_  
. . . . . 4. Kilobytes \_\_\_\_\_  
. . . . . 5. Megabytes \_\_\_\_\_

Primary Quantity . . . 1 \_\_\_\_\_  
Secondary Quantity . . 1 \_\_\_\_\_

Volume . . . . . \_\_\_\_\_  
Data Class . . . . . \_\_\_\_\_  
Management Class . . . \_\_\_\_\_  
Storage Class . . . . . \_\_\_\_\_

F1=Help
F3=Exit
F6=Resize
F12=Cancel

Figure 359. Define Repository

Specify the required allocation settings and then press **Enter** to define the Repository data set.

The allocation settings are:

#### Edit IDCAMS command

Select this option to edit the IDCAMS command that CICS PA generates to define the Repository. If this option is not selected, the IDCAMS command is issued immediately.

#### Browse errors only

Select this option to browse the output from IDCAMS only when a non-zero return code is returned by IDCAMS. If this option is not selected, the output from IDCAMS will always be presented.

#### Repository Name

Specify the name of the Repository data set to be defined.

Normal ISPF data set conventions apply. Enclose a fully qualified data set name in quotes, otherwise the TSO prefix is used as a high level qualifier.

#### Cluster Level Information

##### Space Units

Select one of the following in which to express the data set size:

1. cylinders
2. tracks
3. records
4. kilobytes
5. megabytes

##### Space Quantities

Specify the Primary and Secondary allocation quantities in cylinders, tracks, records, kilobytes or megabytes as indicated in the Space Units field. Express all quantities in decimal, not hexadecimal.

Typically a space allocation of 1 primary and 1 secondary cylinder is sufficient.

**Volume**

The volume serial name of the DASD volume to contain the data set.

**Data Class**

Specify the name of the data class for the data set. The data class provides the allocation attributes for the data set. The storage administrator at your installation defines the data class. However, you can override the parameters defined for a data class by explicitly specifying other attributes.

**Management Class**

For an SMS-managed data set, specify the name of the management class for a new data set. The storage administrator at your installation defines the names of the management classes you can specify.

If management class is not specified, but storage class is specified or defaulted, management class is derived from automatic class selection (ACS).

If management class is specified and storage class is not specified or derived, the DEFINE will fail. Note that if SMS is inactive and management class is specified, the DEFINE will fail.

**Storage Class**

For an SMS-managed data set, specify the name of the storage class. The storage class replaces the storage attributes that are specified on the UNIT and VOLUME operand for non-SMS-managed data set. Use the storage class to specify the storage service level to be used by SMS for storage of the data set. The storage administrator at your installation defines the names of the storage classes you can specify. A storage class is assigned when either you specify a storage class, or an ACS routine selects a storage class for the new data set. Note that if SMS is inactive and storage class is specified, the DEFINE will fail.

When the repository is defined, you are ready to start using HDB.

---

## HDB Templates

Templates define the type and format of data in the Historical Databases. Templates are similar to Report Forms. Where Report Forms define the fields to be included in a report or extract, Templates define the fields to be included in an HDB. Templates provide HDBs with:

- Flexibility. You decide exactly what information is recorded in the HDB.
- Ease of use. The editor provides a simple way of tailoring the template.
- Transparency. You can see at a glance exactly what information is recorded in the HDB.

The Template contains the following definition information about the HDB:

- Type of HDB: List or Summary.
- Fields names and associated field attributes.

## List of Templates

Select option 1 **Templates** from the Historical Database Menu to display the list of defined Templates, allowing you to define new Templates or update existing ones.

File Options Help

HDB Templates

Command ==> NEW Scroll ==> CSR\_

Select to edit Template. Enter NEW command to define a new Template.

/	Name	Type	Description	Changed	ID

Figure 360. HDB Templates

You can manage your Templates using the following line actions and primary commands.

## Line Actions

- /** Display the selection list of line actions
- E** Edit the Template. Care should be taken when updating a template if an HDB is already using it. Data loaded before the update will remain unchanged and will therefore be different to any new data loaded in the future.
- S** Select the Template (same as Edit).
- V** View the Template. This looks like the Edit panel but has no hold on the data and has no Save capability.
- C** Copy the Template to the same or another Repository.
- D** Delete the Template.

**Note:** You cannot delete a Template if it used by an HDB. You might need to run Housekeeping before the Delete is allowed.

## Primary Commands

### NEW name

This command creates a new Template. The New Template window is displayed to allow you to specify the name, type and other attributes of the new Template. See “Creating new Templates” on page 619 for information on how to proceed.

Also available from **File** in the action bar.

### SELECT name

This command (or **S**) selects the specified Template for editing. If the Template does not exist, it is created as if the **NEW** command was used.

### Sort Name | Type | Description | Changed | Id

This command sorts the list of Templates on the specified column. The default sort field is **Name**. The sort sequence is ascending for all except the Changed column which is descending. The sort order is retained only until Exit or another SORT command is issued.

## LOCATE string

This command (or **L** or **LOC**) is used to locate an entry in the list based on the primary sort field. By default, LOCATE operates on the **Name** field. The string should be no longer than the primary sort field and not enclosed in quotes. The display will scroll to the entry which matches the string, or the entry preceding it if an exact match is not found.

## Creating new Templates

The **NEW** command is used to define a new Template. New Templates are created by specifying their initial attributes and then tailoring the data fields using the Template editor.

```
File Systems Options Help
-----
New HDB Template
Command ==> _____
Specify new Template options.
Name . . . . . PRODSUM_ Version (VRM) . . . ____ +
System Selection:      Field Categories:
APPLID . . . . ____ +  _ Select to specify Field Categories
MVS Image . . ____
Template Type:
2 1. List
  2. Summary
```

Figure 361. New HDB Template

You need to specify the Template name and type. In this example, a Summary Template called PRODSUM is created. Other options affect which CMF Fields the Template will initially be defined with. They can be used to reduce the amount of fields contained in the Template.

The options are:

**Name** The name of the new Template. A 1-8 character name in ISPF member name format. The name must be unique within the Repository.

### APPLID, MVS Image, Version (VRM)

Optionally specify the CICS System (APPLID/Image) or CICS Version (VRM). This ensures that the Template is populated only with Performance Class fields that are applicable.

- Specify CICS System (APPLID, or APPLID and MVS Image) to populate the Template with fields applicable to that CICS system. When available, CICS PA uses the CICS version and Dictionary record for that system to determine which fields to include in the Template. The CICS system must be defined in System Definitions. Press **Prompt** (F4) from APPLID to select one from a list (see “Select a system (CICS APPLID)” on page 620). To link directly to System Definitions, use **Systems** in the action bar.
- Alternatively, specify VRM to populate the Template with fields for that CICS version only. Press **Prompt** (F4) to select from a list of supported versions (see “Select a version (VRM)” on page 621).

If a CICS system (APPLID/Image) is specified and a VRM can be derived from the MCT load library or SDFHLOAD library, then that VRM is used. If a VRM cannot be derived from the system definition then the VRM value specified in this panel is used.

If you do not specify either a CICS System or a VRM, then CICS PA populates the Template with fields applicable to the latest supported release of CICS.

**Field Categories**

Enter line action **S** or **/** to select the field categories to use to initially populate your new Template. For example, you can initialize your Template with Task and Terminal Control fields by selecting DFHTASK and DFHTERM from the list. The default is all categories, except CROSSYS, DBCTL, and OMCICS. See Figure 363 on page 621 for an example of the Field Categories selection list.

Within the selected categories, the fields added to your Template depend on the specified CICS APPLID or VRM. If APPLID is specified, CICS PA obtains the fields from the CMF Dictionary for that APPLID. Otherwise the VRM is used (the default is **680**).

**Type of Template**

The type of HDB is determined by the type of Template:

- 1. **List**  
A List HDB contains data records for individual transactions. Typically, List HDBs are used for the detailed analysis of recent transaction events and have a short life span (retention).
- 2. **Summary**  
A Summary HDB contains data records that summarize transaction activity over a specified time interval. Typically, Summary HDBs are used for long term trend analysis and capacity planning.

When specification is complete, press **Enter** to proceed with defining the Template.

**Select a system (CICS APPLID)**

To build an HDB Template for a particular CICS system, you can select one from a list of available CICS APPLIDs (APPLID/IMAGE) by pressing **Prompt** (F4) from the New Template APPLID field.

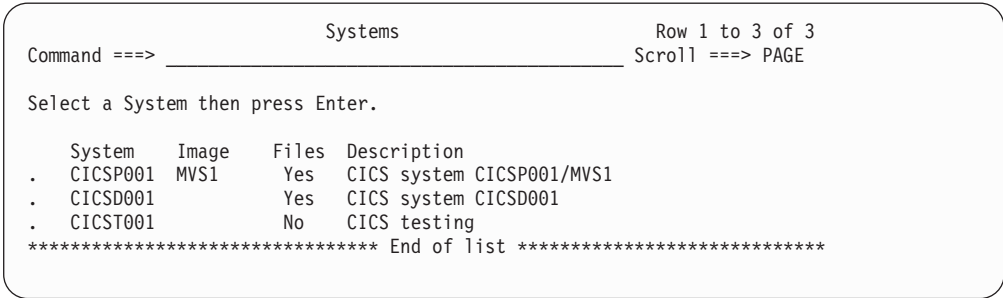

Figure 362. Select a system (CICS APPLID)

This is a list of the CICS Systems defined in System Definitions. To select a system from the list, enter line action **S** (or point-and-shoot).

## Select a version (VRM)

To display the list of supported CICS versions, press **Prompt** (F4) from the New Template Version (VRM) field.

This is a list of CICS Version Release Modification (VRM) levels supported by CICS PA:

640 CICS Transaction Server for z/OS Version 3 Release 1  
650 CICS Transaction Server for z/OS Version 3 Release 2  
660 CICS Transaction Server for z/OS Version 4 Release 1  
670 CICS Transaction Server for z/OS Version 4 Release 2  
680 CICS Transaction Server for z/OS Version 5 Release 1

To select a CICS version from the list, enter line action **S** (or point-and-shoot).

## Select field categories

To display the list of available CICS field categories, enter **S** or **/** to select Field Categories from the New Template panel.

Command ==>

Select Field Categories

CMF Groups:

- DFHAPPL - Application naming

- DFHBTS - BTS

- DFHCHNL - CHANNEL option

/ DFHCICS - CICS task information

- DFHDATA - Data processing

- DFHDEST - Transient Data

- DFHDOCH - Document Handler

- DFHEJBS - EJB Server

- DFHFEPI - Front End (FEPI)

- DFHFILE - File Control

- DFHJOUR - Journal

- DFHMAPP - BMS Maps

/ DFHPROG - Program Control

- DFHRMI - Resource Manager (RMI)

- DFHSOCK - Secure Sockets

/ DFHSTOR - Storage Control

- DFHSYNC - Syncpoint processing

/ DFHTASK - Task Control

- DFHTEMP - Temporary Storage

/ DFHTERM - Terminal Control

- DFHWEBB - Web Interface

Region Type:

- AOR - Application-owning

- FOR - File-owning

- TOR - Terminal-owning

- DB2 - AOR with DB2

User Fields:

- DBCTL - IMS DBCTL

- CROSSYS - Cross-System

- OMCICS - OMEGAMON

Figure 363. Select field categories

This panel displays the field categories that you can select to populate a new Template. The categories reflect the various ways of using and configuring your CICS systems. You can choose just the ones that you require for your HDB. Only categories applicable to the specified CICS version are available for selection. If not specified, **680** is assumed.

Enter **/** to select one or more field categories, then press **Next** (F11) or **Exit** (F3). The fields in the selected categories, and relevant to the specified CICS version, will appear in the new Template.

Selecting no categories has the same effect as selecting all categories except DBCTL, CROSSYS, and OMCICS.

To limit the Template to fields that are relevant to particular types of CICS region (such as application-owning regions), select one or more region type. Selecting a region type excludes from the Template any fields that are not relevant to that region type, as defined in the sample monitoring control tables provided by CICS (in sample library SDFHSAMP members DFHMCTx\$).

## Primary Commands

### SELECT

This command selects all field categories.

### RESET

This command (or **RES**) resets all field categories by clearing the selection line actions.

## List Template

A List Template defines the fields to be included in a List HDB. A List HDB contains data records for individual transactions. Typically, List HDBs are used for the detailed analysis of recent transaction events and have a short life span (retention).

The Template editor is very similar to the Report Forms editor. You can manipulate the Template to suit your needs.

Figure 365. Edit List Template (View 2 of 2)

When editing is complete, press **Exit** (F3) to save your Template.

The List Template consists of the following:

#### Description

Up to 32 characters of text to describe the purpose of the Template. This description is shown on the Templates panel to help you identify the Templates in the list. It is initially set to **List HDB Template**.

#### Version (VRM)

This identifies the CICS release that this Template was created for. It determines which CMF fields are available for selection in this Template.

#### Selection Criteria

Optionally, you can specify Selection Criteria to filter the data on time periods and field values. Thereby you can restrict the HDB to only the data that is of interest to you.

The available line actions are:

- / Display the selection list of line actions.
- S Select (edit) the Selection Criteria. See “Performance Selection Criteria” on page 632 for information on specifying Selection Criteria.
- A Activate the Selection Criteria so they is included for HDB processing. Selection Criteria can only be activated if you have specified at least one Select Statement and it is not excluded. An asterisk \* indicates they are active.
- D Deactivate the Selection Criteria. Any you might have specified here will not be used in HDB processing.

### Field rows

One row for each field. The order of the fields in the Template dictates the order of the fields in the HDB records. This order is important because it determines the default sequence of fields when reporting. **START** or **STOP** must be the first field positioned at the top of the Template. The fields have the following attributes: Field Name, Key, Description, Length, Dictionary Definition, User Field Offset and Length (character user fields only).

### Field Name

The CICS PA field name. To select from a list of fields applicable to this type of HDB Template and CICS version, enter line action **S** (see "Field selection" on page 626) or from the field name, press **Prompt** (F4) (see "Select a performance field" on page 627). The names for user fields are derived from the MCT of the specified CICS system.

**EOD** is a special entry managed by CICS PA. It signals the end of the HDB record. The fields listed above EOD are included in the record in the same order as they appear in the list. The fields below EOD are ignored.

CICS PA automatically sets EOD when the Template is created and resets it if necessary when the Template is changed to ensure it is maintained in a valid position.

**K** Key field indicator for DB2 Export (see "HDB Export to DB2 tables" on page 654). A value of **A** (ascending) identifies this as a key field if it is above EOD, or a key field candidate if it is below EOD. The allowed key fields are character or time stamp fields. Any number of key fields can be specified, but at least one must be specified. Either **START** or **STOP** must be specified as the first field at the top of the Template.

The Key field indicator is used only when exporting to DB2. CICS PA generates DDL to create an index for all key fields. Blank the K field if you do not need a DB2 index for this field.

HDB Load and Report requests treat all time stamp and character fields as key fields, regardless of their Key field indicator setting.

### Description

This is a short description of the field. Enter line action **H** (Help) to see a more detailed description. See "Performance field help" on page 629 for an example of the help details displayed in a pop-up window.

### Length

The length of the field in the HDB record.

### Dictionary Definition

The description of the CMF data field in the format *informalname owner xnnn* where:

- *informalname* is the CMF field name
- *owner* is the CICS component that 'owns' the field
- *x* indicates the data type:
  - A** - 32- or 64-bit count
  - C** - character string
  - D** - CICS PA derived time
  - P** - packed decimal number
  - S** - clock (time-count)
  - T** - STCK time stamp
  - X** - CICS PA calculated count

- *nnn* is the field identifier

Some special fields, such as APPLID and RESPONSE, are not defined in the CMF Dictionary and are given an owner of 'CICSPA'. They are either derived from the fixed section of the CMF record (for example, APPLID), or calculated from two or more other CMF fields (for example, RESPONSE).

### User Field Offset and Length

This is used for character user fields when only part of the field is to be included in the HDB record. **Offset** is the position of the first character and **Length** is the number of characters from this position to be included. For example, if the user field contains the value ABCDEFG, then specifying offset 1 and length 4 gives the output ABCD. Both values are required for character user fields and default to the entire field (offset 1 and maximum length).

CICS PA JCL generation translates these values to  
 FIELDS(Character(SUBSTR(offset,length),...

### Line Actions

- / Display the selection list of line actions.
- S Select a field name from a list of available CMF fields. See “Field selection” on page 626 for an example of the field selection panel.
- I Insert a blank row after this row for entry or selection of another field.
- R Repeat this row.
- RR Repeat a block of rows bounded by two RRs.
- C Copy this row.
- CC Copy a block of rows bounded by two CCs.
- M Move this row.
- MM Move a block of rows bounded by two MMs.
- A Move/Copy after this row.
- B Move/Copy before this row.
- D Delete this row.
- DD Delete a block of rows bounded by two DDs.
- H Field Help. Display a detailed explanation of the field. See “Performance field help” on page 629 for an example of the field help panel.

### Note:

1. Line operations can span the EOD row. CICS PA will reset EOD after the operation has completed to ensure it is validly positioned. Only one EOD is retained, that closest to the top of the list. EOD cannot be deleted.
2. Deleted user fields cannot be recovered.
3. In a Summary Template:
  - Key fields must be together at the top of the Template.
  - **TASKCNT** is a required field and must be after the key fields.

## Primary Commands

### **FIND** string

This command (or **F**) looks for the specified character string in all columns of displayed data. The string is not case sensitive. The display scrolls to the row where the string is found and positions the cursor on the matching data.

To find more occurrences, use **F5** (RFIND) repeatedly.

If there is no match but the search did not begin at the start of the list, the screen does not change and the message \*Bottom of data reached\* is displayed. Use **F5** (RFIND) to search from the top. If there is no match in the entire list, the screen does not change and a String not found message is displayed.

**SAVE** This command is only available from Edit mode and saves any changes you have made. You cannot save changes made in View mode.

Also available from **File** in the action bar.

### **RESET**

This command (or **RES**) removes all outstanding line actions and deletes any blank rows.

Also available from **Edit** in the action bar.

### **CONFIRM ON|OFF**

**CONFIRM ON** (or **CONFIRM**) instructs CICS PA to prompt for confirmation when you request to Cancel from the Template panel when there have been updates.

With **CONFIRM OFF**, Cancel requests are actioned immediately, discarding any changes.

This command changes the setting only for the current Edit session. On exit, it reverts to the value set by **Cancel Confirmation** in CICS PA Settings.

Also available from **Confirm** in the action bar.

### **UPGRADE vrm**

This command is used to upgrade the Template to the specified CICS version (VRM) provided it is a later release. CMF Fields for all CICS releases after the current release and up to the specified release are added to the bottom of the Template.

Also available from **Upgrade** in the action bar.

## Field selection

Field Selection allows you to view expanded field descriptions and select a field name for insertion into your Template. The panel cycles through all CMF performance fields applicable to the type of Template and CICS version. To display the Field Selection panel, enter line action **S** against a field or blank line on the Template panel where you want to insert the selected field name.

Figure 366. Field selection

This panel cycles through all the CMF data fields available for selection. Each field is displayed in turn with its expanded description like that provided by Template line action **H** (see “Performance field help” on page 629). Details are only available for CICS-defined fields, not user fields.

To cycle through the list of fields, press **F11** and **F10** to move Forward or Backward through the list. You can restart anywhere in the cycle by entering a valid field name then moving Forward or Backward from that point.

You can press **Prompt** (F4) from the Name field to display a selection list of fields (see “Select a performance field”).

When the required field is displayed in the Name field, press **Exit** (F3) to select it.

### Select a performance field

Select a Performance Field allows you to select a field name from a list of available CMF performance fields. To display the selection list, press **Prompt** (F4) from the Field Name field on the Template panel or the Field Selection panel.

Figure 367. Select a field

This panel lists all the CMF data fields available for selection. Enter line action **S** to select a field name from the list.

To help locate a particular field, you can use the **FIND** (or **RFIND**) command which will search in all the displayed fields for a specified string. For further information on any field, use the **H** line action.

To leave without selecting, use Exit or Cancel.

#### Field Name

The CICS PA name for the CMF data field.

Line action **/** or **S** will insert the field name into the previous panel in the row where the cursor was positioned.

#### Description

This is a short description of the field. Enter line action **H** (Help) for a more detailed description. See Figure 368 on page 629 for an example of the help details displayed in a pop-up window.

## Dictionary Definition

The description of the CMF data field in terms of the CMF informal name, CICS owner, data type, and field identifier. See “List Template” on page 622 for further information.

**Line Actions:** The available line actions are:

- /** Display the menu of line actions.
- S** Select a field name.
- H** Field Help. Display a detailed explanation of the field.

**Primary Commands:** To help locate a particular field, you can use the **FIND** (or **RFIND**) command which will search in all columns of data for a specified string.

## Performance field help

On the Template panel, if you enter the line action **H** against a field, a pop-up window will display a more detailed explanation of the field.

TASKNO Explanation

Row 1 to 11 of 11

Scroll ==> PAGE

Name . . . . : TASKNO

CMF ID . . . : TRANNUM DFHTASK P031

Description . : Transaction identification number

-----

Transaction identification number.

Note: The transaction number field is normally a 4-byte packed decimal number. However, some CICS system tasks are identified by special character 'transaction numbers', as follows:  
' III' for system initialization task  
' TCP' for terminal control.

These special identifiers are placed in bytes 2 through 4. Byte 1 is a blank (X'40') before the terminal control TCP identifier, and a null value (X'00') before the others.

\*\*\*\*\* End of list \*\*\*\*\*

F1=Help F3=Exit F6=Resize F7=Backward F8=Forward  
F10=Actions F12=Cancel

Figure 368. Performance field help

This panel provides a more detailed description of the field. It is only available for CICS-defined fields, not user fields.

The details are:

**Name** The name of the field as it is known to CICS PA.

### CMF ID

The Dictionary description of the CMF data field (see “List Template” on page 622).

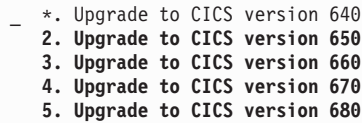

### Description

A short description of the field followed by the expanded description.

## Template upgrade

Templates are release-dependent. When you define a new Template you specify the CICS System or CICS Version (VRM) so that CICS PA can initialize the Template with fields appropriate to that release. However, you can later upgrade the Template to a later release by using **Upgrade** in the action bar of the Template

panel. This facility is available for all Template types.

- 
- \*. Upgrade to CICS version 640
  - 2. Upgrade to CICS version 650
  - 3. Upgrade to CICS version 660
  - 4. Upgrade to CICS version 670
  - 5. Upgrade to CICS version 680

*Figure 369. Upgrading your Template*

The Upgrade action bar choice (or **UPGRADE vrm** command) introduces the new CMF fields of a later release of CICS into your Template. The new fields are inserted at the bottom of the Template as candidate fields. Upgrading does not affect the fields currently in the Template, nor does it affect the format of HDB container data sets that have already been loaded based on this Template. To then incorporate a new field into your HDB from hereon, move the new field above the EOD marker.

You can upgrade your Template to a CICS Version (VRM) that is not marked by an asterisk \*. To do this, select the VRM and press **Enter**. Otherwise, press **Cancel** to retain the Template at the current level.

## Summary Template

A Summary Template defines the fields to be included in one or more Summary HDBs. A Summary HDB contains data records that summarize transaction activity over a specified time interval. Typically, Summary HDBs are used for long term trend analysis and capacity planning.

Edit the Template to meet your reporting requirements. In this example, FCAMCT is deleted and TSWAIT is inserted.

```

```

Figure 370. Edit Summary Template

A Summary Template operates in a similar manner to a List Template. Like the List Template (see “List Template” on page 622), the following features apply to the Summary Template:

- Scroll **Right** (F11) for more information.
- Specify the following details. Where these differ with the List Template, the differences are noted.
  - **Description.** The default description is **Summary HDB Template**.
  - **Version (VRM).**
  - **Selection Criteria.** For example, the HDB only includes data for transactions that use File Control services (FCTOTAL>0).
  - **Time Interval.** Summary Templates specify a recording time interval in the range 00:00:01 (1 second) to 24:00:00 (24 hours). The default is **00:01:00** (1 minute) which indicates that summary data is accumulated and recorded in 1 minute intervals. Select the interval carefully because it will impact on HDB processing as follows:
    1. **Loading.** Shorter recording intervals write more records, increasing the size of your HDB data sets.
    2. **Reporting.** Longer recording intervals restrict reporting. For example, if you specify a recording interval of 1 hour then you can only report on 1 hour (or higher) intervals, and 15 minute interval reporting is not possible.

Therefore selecting the correct interval is a balance between not loading too much data and not restricting reporting. Specify an interval that is both small

enough so that data set size is kept to a minimum yet large enough to meet your reporting requirements. In Figure 370 on page 631, the interval has been changed to 15 minutes.

A time interval of less than one hour must fit evenly into the hour. CICS PA will round it down to the nearest interval that aligns to the hour. For example, 1.35 is reduced to 00:01:30 minutes which will produce 40 interval report lines for each hour of data.

A time interval of more than one hour must fit evenly into the day. CICS PA will round it down to the nearest interval that aligns to the day. For example, 10.30.23 is reduced to 08:00:00 hours which will produce 3 interval report lines for each day of data.

Minutes take precedence for an abbreviated entry. For example:

**1** becomes 00:01:00

**1.1** becomes 00:01:00 (rounded down from 00:01:01)

**1.1.1** becomes 01:00:00 (rounded down from 01:01:01)

This option generates the INTERVAL(hh:mm:ss) operand.

- **Field rows.** A Summary Template has the following additional features:
  1. Key fields must be together at the top of the Template.
  2. The allowed key fields are: START, STOP, MVSID, APPLID, TRAN, TERM, APPLTRAN, APPLPROG, JOBNAME, PRCSTYPE, RPTCLASS, SRVCLASS, TCLASSNM, TCPSRVCE, USERID. Up to six key fields can be specified, but at least one must be specified. Either **START** or **STOP** must be specified as the first field at the top of the Template.
  3. **TASKCNT** is a required field immediately after the key fields.
- “Field selection” on page 626
- “Select a performance field” on page 627
- “Performance field help” on page 629
- “Template upgrade” on page 629

When editing is complete, press **Exit** (F3) to save your Template.

**Attention:** After a Template has been initially saved, you are permitted to edit the Template to change its field list. However if the Template is already being used to load data into a HDB, then changing the Template can potentially cause reporting problems in the future. CICS PA supports the alteration of Template fields, but a few simple rules will ensure that HDB processing is not compromised:

1. Do not change the key fields of a Summary Template.
2. Do not change the focus of a Template. For example, if the Template includes Temporary Storage fields only, do not delete those fields and insert File Control fields in their place. You should create another Template with a focus on File Control.

## Performance Selection Criteria

Optionally, you can specify Selection Criteria in an HDB Template. When the associated HDB is loaded, the Selection Criteria filter the CMF performance class records based on time and field values.

To specify Selection Criteria, enter line action **S** against Performance Selection Criteria on the Template panel.

The operation of Selection Criteria for HDBs is the same as that for Report Sets, only the available fields might differ. For more information, see:

- “Specifying Selection Criteria” on page 156
- “Specifying Select Statements” on page 157

Resource Lists can be used in Performance Select Statements as a convenient way to specify a list of values. This is similar to the concept of Object Lists in Report Sets. However, Object Lists and Resource Lists are stored in different data sets. For details, see “Object Lists versus Resource Lists” on page 323.

## Resource Lists

Resource Lists are stored in the Repository.

A Resource List defines a list of field values that can be used when specifying:

- Selection Criteria for filtering the data for your HDB Load.
- Application Groups. For details, see Chapter 11, “Application Grouping,” on page 331.
- Statistics Alert definitions. For details, see Chapter 13, “Statistics alert reporting,” on page 347.

A typical use might be to define all the transaction IDs that belong to a particular application system. Resource Lists enable you to define a group of related values once, then use it in many HDBs by simply specifying the name of the Resource List in your Selection Criteria. This avoids duplicating the same list of values in different HDBs.

For example, instead of specifying Select Statements that include transactions B001,B002,B003,..., you predefine a Resource List called BTRANS that has values B001,B002,B003,... Now when you specify the Select Statement, you simply specify BTRANS to include those transactions. To select a valid name from a list of predefined Resource Lists, press **Prompt** (F4) from the List field in the Select Statement.

\*\*\*\*\* End of list \*\*\*\*\*

Figure 372. Resource Lists

This panel lists all the Resource Lists in the Repository and allows you to select one at a time to view or modify.

**Line Actions:** The following line actions can be entered against a Resource List:

- /** Display the selection list of line actions.
- E** Edit the Resource List.
- S** Select the Resource List (same as Edit).
- V** View the Resource List. This looks like the Edit panel but has no 'hold' on the data and has no Save capability.
- D** Delete the Resource List.

**Primary Commands:** The following primary commands are valid for this panel:

### NEW name

This command displays the New Resource List window, where you have the option to initialize the resource list by selecting one of the sample resource lists included with CICS PA. See "Creating new Resource Lists" on page 635 for information on how to proceed.

Also available from **File** in the action bar.

### SELECT name

This command (or **S**) selects the specified Resource List for editing. If the Resource List does not exist, it is created as if the **NEW** command was used.

### SORT Name | Description | Changed | Id

This command sorts the list of Resource Lists on the specified column. The default sort field is **Name**. The sort disregards upper and lower case, and is ascending for all but the Changed column. The sort order is retained only until Exit or another SORT command is issued.

### LOCATE string

This command (or **L** or **LOC**) is used to locate an entry in the list based on the primary sort field. By default, LOCATE operates on the **Name** field. The string should be no longer than the primary sort field and not enclosed in quotes. The display will scroll to the entry which matches the string, or the entry preceding it if an exact match is not found.

## Creating new Resource Lists

The **NEW** command is used to define a new Resource List.

```

New Resource List
Command ==> _____
Specify the name of the new Resource List.
Name . . . ASSETS__
/ Initialize with a sample resource list
```

Figure 373. Specifying a new Resource List

Specify the name of the new Resource List then press **Enter** to edit. A Resource List name is 1-8 characters in ISPF member name format. The name must be unique within the Repository.

The new Resource List can be initialized by selecting one of the sample resource lists included with CICS PA. If you do not specify a sample name the resource list will be initialized empty.

## Specifying values in Resource Lists

The Resource List edit panel is displayed when, from the Resource Lists panel, you either:

- Create a new Resource List.  
Use the **NEW** command or action bar choice **File - New**.
- Select an existing Resource List.  
Enter line action **E** or **S** against a Resource List or use the **SELECT name** command.

Alternatively, you can enter line action **V** to display the Resource List view panel. Viewing a Resource List works in every way like Edit except there is no exclusive hold on the data and changes cannot be saved.

```

File Edit Confirm Options Help
-----
EDIT Resource List - BILLING          Row 1 to 2 of 2
Command ==> _____ Scroll ==> PAGE
Description . . . Billing Transactions_____
Specify the Resource List values:
/
_ B001_____ B002_____ B003_____
- _____
***** End of list *****
```

Figure 374. Specifying Resource List values

Use this panel to specify values in a Resource List. The Resource List can then be reused many times in **Selection Criteria** in HDB Templates and Definitions.

Specify a description for your Resource List, up to 32 characters of text to describe its purpose. The description is initially set to **Resource List**.

Specify any number of values to be used in Include/Exclude statements in Selection Criteria. The values are free-format, typically names such as Transaction Codes, User IDs, and IMS Subsystem IDs. Masking characters are supported: % for one and only one character and \* for many or none. The order of entries in the list is of no consequence to HDB processing.

Each input field is a separate value. Blank values are ignored.

It is usual to define Resource Lists that are homogenous. That is, a Resource List should specify values for testing the contents of one particular field. Define one Resource List for Transaction Codes, another for User IDs, and so on.

**Line Actions:** The following line actions are valid on this panel:

/	Display the menu of line actions
I	Insert a new row
R	Repeat this row
C	Copy this row
M	Move this row
A	Move/Copy after this row
B	Move/Copy before this row
D	Delete this row

**Primary Commands:** The following primary commands are valid for this panel:

**SAVE** This command is only available from Edit mode and saves any changes you have made.

Also available from **File** in the action bar.

**RESET**

This command (or **RES**) removes all outstanding line actions and deletes any blank rows.

Also available from **Edit** in the action bar.

**CONFIRM ON|OFF**

**CONFIRM ON** (or **CONFIRM**) instructs CICS PA to prompt for confirmation when you request to Cancel from the Resource List panel when there have been updates.

With **CONFIRM OFF**, Cancel requests are actioned immediately, discarding any changes.

This command changes the setting only for the current Edit/View session. On exit, it reverts to the default set by **Cancel Confirmation** in CICS PA Settings.

Also available from **Confirm** in the action bar.

---

## Define a Performance HDB

Defining an HDB allows you to collect (load) and report historical performance data. The definition alone does not cause any action by CICS PA.

Select option 2 **Define** from the HDB menu to define a new HDB.

Figure 375. New HDB Definition

Specify the details of your new HDB:

**Name** The name of the HDB. A 1-8 character name in ISPF member name format. The name is unique within the Repository.

#### APPLID, Image

The optional CICS System (APPLID/Image) that owns the HDB.

HDB LOAD requests use this APPLID and associated SMF files (defined in System Definitions) to build the JCL deck. If not specified, you are prompted at submit time to specify the system.

The CICS System must be defined in System Definitions. To select one from a list, use **Prompt** (F4). See “Select a system (CICS APPLID)” on page 620 for an example of the list of systems. To link directly to System Definitions, use **Systems** in the action bar.

#### Qualifier

If Qualifier is specified, the value is used as the DB2 schema in place of the Database as specified in DB2 Settings. It is also incorporated into the DB2 table names:

*qualifier.CPA\_hdbname* for Performance HDBs

*qualifier.CPA\_statid* for Statistics HDBs

Qualifier is mandatory if Explorer is selected, and optional otherwise. If Qualifier and Explorer are both entered then details of this HDB will be included in the manifest the next time it is rebuilt for this qualifier.

You should rebuild the manifest when you add an eligible HDB, and also whenever the HDB is changed in a way that affects its eligibility for inclusion in the manifest. See “Maintain manifest” on page 666.

#### Explorer

Select the Explorer option to make this HDB eligible for inclusion in the

manifest. If you do this you must also specify a qualifier and, for a Performance HDB, a template that is valid for the CICS PA plug-in for CICS Explorer. Details of the DB2 associated with this HDB will be included in the manifest the next time it is rebuilt.

A manifest is a proprietary DB2 table that contains all the information required by the CICS PA plug-in to access and use historical data. It is a catalog of all the HDB DB2 tables that have the same qualifier and for which the Explorer indicator is set.

You should rebuild the manifest when you add an eligible HDB, and also whenever the HDB is changed in a way that affects its eligibility for inclusion in the manifest. See “Maintain manifest” on page 666.

### Description

The HDB description is free-format text that you can specify to help identify the purpose of the HDB.

### Template

The Template defines the type and format of the HDB. Before defining an HDB, you must first design a Template that defines the required information to be kept in the HDB data sets. In Figure 375 on page 637 we have specified a Summary Template WEEKSUM and HDB CICSWEEK inherits its attributes.

If you have selected the Explorer option, you must choose an internal template that has been predefined for use with the CICS PA-plug-in.

To select a Template from a list of defined Templates, use **Prompt** (F4). See “Select a Template” on page 640 for an example of the prompt list.

### Selection Criteria

HDBs have optional Selection Criteria that allows you to filter the CMF performance class records used to build the HDB. For example, the HDB only includes data for a particular application's transaction ids, such as TRAN=MY\*. Select to specify Selection Criteria.

Templates can also specify Selection Criteria. If the Template and HDB both have active Selection Criteria then both are checked and *both* must match for the record to be processed.

- **Template Selection Criteria** typically focuses on the type of data being recorded. For example, if your Template is monitoring File Control activity then its Selection Criteria can specify FCTOTAL>0 to include only transactions that used File Control services.
- **HDB Selection Criteria** typically focuses on the application targeted by the HDB. For example, if the HDB is for MY application then its Selection Criteria can specify TRAN = MY\* to include only transactions in MY application.

The resultant HDB will include data for transactions matching MY\* that uses File Control services.

#### *Line Actions:*

- /      Display the selection list of line actions.
- S      Select (edit) the Selection Criteria. See “Performance Selection Criteria” on page 632 for information on specifying Selection Criteria.
- A      Activate the Selection Criteria so they are included for HDB

processing. Selection Criteria can only be activated if you have specified at least one Select Statement and it is not excluded. An asterisk \* indicates they are active.

- D** Deactivate the Selection Criteria. Any you might have specified here will not be used in HDB processing.

### Data Retention Period

These fields separately specify the length of time that HDB data sets and associated DB2 table rows are kept before they expire. Typically:

- Summary HDBs need to keep their container data sets for many years for long-term trend analysis.
- List HDBs used for ad hoc reporting might only need to keep their container data sets for a couple of hours or days.

Specify each retention period as a whole number of years, months, weeks, days, or hours. Only one choice is allowed.

If the HDB container data sets are no longer required after their data has been exported to DB2, you can specify a retention period of 0 in any of the HDB periods to make the HDB data sets expire immediately.

Container data sets and DB2 data are deleted by **HDB Housekeeping** after they have passed their expiry date. If you do not specify a retention period, the corresponding HDB data sets or DB2 data will never expire.

Use **HDB Maintenance** to check container data set status or to alter the HDB or DB2 retention period.

### Data Set Allocation Settings

Data Set Allocation Settings specify the allocation attributes of the data sets that contain data for this HDB. CICS PA dynamically allocates container data sets at load time.

The settings are:

#### DSN Prefix

Specify the high level qualifier of the data sets that are dynamically allocated by the HDB LOAD process to contain the data. The format of the data set name is:

*DSN-prefix.HDB-name.Dyyddd.Thhmmss.HDB*

where the DSN-prefix is the data set name high level qualifier. For example, CICS.PA.HISTORY.CICS.WEEK.D03123.T103821.HDB

#### Management class

For an SMS-managed data set, specify the name of the management class for a new data set. The storage administrator at your installation defines the names of the management classes you can specify.

If management class is not specified, but storage class is specified or defaulted, management class is derived from automatic class selection (ACS).

If management class is specified and storage class is not specified or derived, the DEFINE will fail. Note that if SMS is inactive and management class is specified, the DEFINE will fail.

#### Storage class

For an SMS-managed data set, specify the name of the storage

class. The storage class replaces the storage attributes that are specified on the UNIT and VOLUME operand for non-SMS-managed data set. Use the storage class to specify the storage service level to be used by SMS for storage of the data set. The storage administrator at your installation defines the names of the storage classes you can specify. A storage class is assigned when either you specify a storage class, or an ACS routine selects a storage class for the new data set. Note that if SMS is inactive and storage class is specified, the DEFINE will fail.

**Volume serial**

The volume serial name of the DASD volume to contain the data set.

**Device type**

The generic or esoteric DASD device type of the data set, such as 3390 or SYSDA. This must represent a device type that is defined in the Eligible Device Table of the current processor as DASD.

**Data class**

Specify the name of the data class for the data set. The data class provides the allocation attributes for the data set. The storage administrator at your installation defines the data class. However, you can override the parameters defined for a data class by explicitly specifying other attributes.

**Space Units**

Select one of the following:

**TRKS** Express data set size in tracks

**CYLS** Express data set size in cylinders

**Space quantities**

Specify the **Primary** and **Secondary** allocation quantities in tracks or cylinders as indicated in the Space Units field. Express all quantities in decimal, not hexadecimal.

Specify allocation settings that satisfy your installation requirements. The size of container data sets is not critical. Typically you would specify a size that accommodates a single load request. For example, if you load data into the HDB daily, then 10 cylinders might be sufficient. However if CICS PA encounters an out-of-space condition (ABENDx37) during load, then it simply closes the data set and recommences loading in a new data set. You can decide to specify a larger size initially and adjust it later using **HDB Maintenance**.

## Select a Template

To specify the Template on which to define the HDB, press **Prompt** (F4) from the Template field to select from a list of predefined Templates.

```

                                HDB Templates                Row 1 to 4 of 4
Command ==> _____ Scroll ==> PAGE

Select a Template then press Enter.

```

Figure 377. Load HDBs

Enter line action **S** to select an HDB for Load processing. You are prompted to specify run-time options, then CICS PA will build the JCL to load data into your HDB.

You can select multiple HDBs to load in succession.

**SORT** and **LOCATE** commands are available to help you work with the list of HDBs.

Load creates the JCL that builds the HDBs. The Load process is handled via normal CICS PA command input. This allows multiple reports, extracts and HDBs to be created via a single pass of the SMF data.

Select the required HDB from the list to display the Load panel which is the same for a Load or a Summary HDB.

```

Figure 378. Load Summary HDB

Specify the run-time options:

### System Selection

System Selection specifies the CICS system(s) whose data is to be loaded into the HDB. It is initialized to the CICS system APPLID that you specified during HDB definition.

You can specify any combination of APPLID, Image, or Group, but these must be defined in your System Definitions. If you do not specify System Selection here or in the Global Options, then you are prompted at run time to specify the System Selection. This will apply globally to all reports and extracts without their own System Selection. This is recommended as it allows you to run your Report Sets against any of your defined Systems. Press the **Prompt** key (F4) to select from a list of defined Systems, Images, or Groups. To modify your System Definitions, select **Systems** in the action bar.

Specify one of the following:

- A CICS APPLID. An APPLID that matches a defined System's name pattern is also allowed. For example, CICS\* can be specified if CICS\* is a defined system.
- An APPLID and an MVS Image. This identifies the MVS Image where your CICS system runs.
- An MVS Image. All CICS systems executing on this MVS Image is selected.
- An APPLID and Image combination plus a Group. This is useful for uniquely identifying a CICS system when there are multiple CICS systems with the same name defined.
- A Group alone. CICS PA will select all CICS APPLIDs defined to the Group. For example, for transaction grouping, or for systems that connect via IRC/MRO, ISC/APPC, or IPIC.

CICS PA uses the System Selection in JCL generation to build the `APPLID(applid1,applid2,applid3,...)` and `Input(SMFIN001,SMFIN002,SMFIN003,...)` operands, and corresponding `//SMFINnnn DD` statements.

System Selection can also be specified either:

- In Global Options. The report-level specification takes precedence over the global.
- At run time. The run-time System Selection overrides the Global Options and optionally the report-level specification.

In the example above, CICS PA generates an `APPLID(CICSPROD)` operand in the command deck and includes DD statements for the SMF Files defined in System Definitions for CICSPROD.

### Report Interval

Specify the time range of data to be included in the HDB. You can specify an explicit date, such as 2004-12-05, or a relative date to indicate today (0), yesterday (-1), two days ago (-2), and so on. In Figure 378 on page 642 we have used a relative date of zero (0) to indicate that we are processing today's SMF data, from 9:00am to 4:30pm.

It is recommended that you specify relative dates if you want to use an automated job scheduler to run the load HDB JCL regularly. The JCL can be set up once and run daily without needing to change it.

### DB2 Export Options

To export the data to DB2 directly after loading it into the HDB, select the Load DB2 Table option. For details of the JCL that this option generates, see "Load JCL." (The remaining DB2 export options are only relevant if you select the Load DB2 Table option.)

The DB2 table to which you are exporting must already be defined.

To define a DB2 table, see "Creating DDL to define a DB2 table" on page 655.

If you select **2. Replace** for Table Load Options and the HDB load fails, then the result is an empty DB2 table.

### Edit JCL before submit

Select with a / to edit the JCL before submit. CICS PA will generate the JCL and display it in an ISPF Edit session. You can review or modify the JCL using the usual ISPF Edit commands and actions, or you can use the CREATE command to save the JCL in an external data set.

Then to submit the job, enter **SUBmit** in the Edit command line.

If this option is not selected, the generated JCL is not displayed and the job is submitted immediately.

After you have specified your Load options, press **Enter**. You are prompted to **Press ENTER to proceed with request**. This provides a last opportunity to review and change your load request.

## Load JCL

If you selected **Edit JCL before submit** then the Load HDB JCL is displayed in an edit session. Specify this option if you want to save the JCL in an automated job scheduler JCL library.

```

EDIT          JOHN.SPFTMP1.CNTL                      Columns 00001 00072

000023 /*

```

Figure 379. Edit JCL for Load Summary HDB

The SMF file data set name for system CICSPROD is unresolved. This indicates that the System Definition for CICSPROD does not have SMF files specified. Substitute the required SMF file data set name into the JCL.

The command deck specifies operands to load HDB CICSWEEK:  
HDB(OUTPUT(HDBL0001),LOAD(CICSWEEK))

Enter **SUBmit** in the command line to submit the job to run the load.

If you selected the **Load DB2 Table** option, then the JCL contains additional statements to export the data to DB2 after loading the HDB. If successful, the HDB load step writes the list of created HDB containers to a PDS member. After the HDB load step, an IEBGENER step copies the contents of the PDS member in-stream to the DB2 load utility DSNUTILB skeleton JCL. The following figure shows an example of this JCL.

```

//CICSPAHD JOB (ACCOUNT),'CICS PA HDB LOAD'

Figure 380. JCL for HDB load followed by export to DB2

- 1** To ensure integrity of the data loaded into DB2, the data set to which the HDB Load writes HDB container data set names is deleted at the start of every HDB Load job that includes the DB2 table load.

- 2** The HDB Load step writes the list of created HDB container data set names (formatted as DD cards) to a member in the partitioned data set '&SYSUID.CICSPA.HDB.CONTDSN', where &SYSUID is the user ID of the user generating the JCL and the member name is the name of the HDB being loaded.

If the HDB Load fails to create containers (due to an error, or because no records were selected), then this PDS member will contain the single DD card:

```
//SYSREC DD DUMMY
```

This card is used as input to the DB2 Load Utility. If the DB2 table load option REPLACE is selected, then the result is an empty DB2 table. This DUMMY card is required to avoid the IEBGENER job step error failing the whole job. This is particularly important in cases where the job loads multiple DB2 tables.

- 3** The IEBGENER job step inserts the contents of the PDS member (generated by the earlier HDB Load step) in-stream, for use by the DB2 Load Utility (DSNUTILB).

The IEBGENER job step will not be submitted if the HDB Load step (ddname CICSPA) terminates with a return code greater than 8. This ensures that DB2 table loads are submitted in cases where one or more HDB Loads were successful while others were not. A return code greater than 8 indicates a serious error that is likely to affect the whole job.

## Load Recap report

Successful completion of the Load request will generate a Recap report. The Recap report provides details about the HDB Load including a list of the

V5R1M0

CICS Performance Analyzer  
HDB Load Recap Report

```

Figure 383. Run List HDB report

This panel is displayed before CICS PA generates the JCL to run the report and shows the time period spanned by the data in the HDB.

Optionally, specify the following run-time options:

### Report Form

The name of a Report Form to be used to tailor the format and content of

the HDB report. The Report Form must be a compatible type to the HDB. For a List HDB, either a LIST or LISTX Report Form. To select the name from a list of compatible Report Forms, press **Prompt** (F4).

CICS PA JCL generation translates the Report Form specification into the `FIELDS` operand.

If a Report Form is not specified, a report showing all fields in the HDB is produced.

### Precision

The precision of numeric fields. Numeric fields can be formatted to either 4, 5, or 6 decimal places. The default is 4.

- 4 decimal places is 0.0001 precision
- 5 decimal places is 0.00001 precision
- 6 decimal places is 0.000001 microsecond precision

This option generates the `PRECISION(n)` global operand.

### Report Interval

Specify a date/time range or a *time slot* (times only) to filter the HDB input data based on the SMF record time stamp. HDB records with a time stamp within the specified From–To interval are processed by CICS PA, otherwise they are ignored.

**Note:** Do not confuse this with the Selection Criteria From–To report intervals which apply to transaction start and stop times.

The From–To date and time fields are all optional. They are blank initially (for no filtering), but thereafter display the reporting period that was previously saved.

**Date** is either a calendar date in your preferred format or a relative date. **Time** is a time-of-day. (The same edit rules apply as for the Selection Criteria Report Interval.)

Relative dates are specified as 0, -1, -2,... to signify a date relative to the current date. 0 represents today, -1 yesterday, -2 two days ago, and so on. If both Start and Stop dates are specified, they must be in the same format.

For a date/time range:

- Either From or To can be omitted to indicate that the range is open-ended.
  - If From is omitted, it defaults to the first input record
  - If To is omitted, it defaults to the end of file.
- If From date is specified with no time, the start of day is assumed.
  - If To date is specified with no time, the end of day is assumed.

For a time slot, both times must be present with no dates to signify the same time slot every day. The times can span midnight.

The specified date/time range is included in the generated JCL under the `//SYSIN DD` statement:

```
CICSPA SMFSTART(-nn|yyy/mm/dd,hh:mm:ss.th),  
        SMFSTOP(-nn|yyy/mm/dd,hh:mm:ss.th)
```

### Edit JCL before submit

Select with a / to edit the JCL before submit. CICS PA will generate the JCL and display it in an ISPF Edit session. You can review or modify the JCL using the usual ISPF Edit commands and actions, or you can use the `CREATE` command to save the JCL in an external data set.

Then to submit the job, enter **SUBmit** in the Edit command line.

If this option is not selected, the generated JCL is not displayed and the job is submitted immediately.

When you have specified your report options, press **Enter** to continue submit. You are prompted to **Press ENTER to proceed with request**. This provides a last opportunity to review and change your report request.

## Select a Report Form

To tailor the format of the HDB report, select a Report Form. Press **Prompt** (F4) from the Form field on the Run Report panel. Only Forms of compatible type are listed. The following example shows a list of available List Report Forms for a List HDB report.

```
File Help
-----
Report Forms          Row 1 to 3 of 3
Command ==>          Scroll ==> PAGE

Select a Report Form then press Enter.

  Name      Type      Description
. LISTFRM1  LIST      List Report Form
. RESPLIST  LIST      List Report Form
S TRANLIST  LIST      List Report Form
***** End of list *****
```

Figure 384. Select a Report Form (LIST Example)

This panel displays the Report Forms defined in the current Report Forms data set. Only Report Forms of a compatible type to the type of HDB are presented:

List HDB - LIST Form  
Summary HDB - SUMMARY Form

To select a Report Form, enter line action **S** (or point-and-shoot).

## Run Performance Summary HDB report

Select the required HDB for reporting and the run-time prompt panel is displayed. This is an example of a request for a Summary HDB report.

```

```

Figure 385. Run Summary HDB report

This panel is displayed before CICS PA generates the JCL to run the report and shows the time period spanned by the data in the HDB.

The run-time options are the same as those that apply to the List HDB report (see “Run List HDB report” on page 647), with the following additional options:

#### Time Interval

Specify an optional Time Interval when reporting Summary HDBs. If you leave it blank, the default is the Time Interval used to create the data (as defined in the Template). You can specify any interval greater than or equal to the Template Interval. For example, if you are reviewing many days worth of data then you might specify 24:00:00 (24 hours) so that you can view the daily trend. In this example the Interval has been changed to 1 hour.

A time interval of less than one hour must fit evenly into the hour. CICS PA will round it down to the nearest interval that aligns to the hour. For example, 1.35 is reduced to 00:01:30 minutes which will produce 40 interval report lines for each hour of data.

A time interval of more than one hour must fit evenly into the day. CICS PA will round it down to the nearest interval that aligns to the day. For example, 10.30.23 is reduced to 08:00:00 hours which will produce 3 interval report lines for each day of data.

Minutes take precedence for an abbreviated entry. For example:

1 becomes 00:01:00  
1.1 becomes 00:01:00 (rounded down from 00:01:01)  
1.1.1 becomes 01:00:00 (rounded down from 01:01:01)

This option generates the INTERVAL(hh:mm:ss) operand.

#### Totals Level

This option applies only to the Summary report. Leave blank if you do not want to include total lines in the report. This generates the NOTOTALS operand.

Specify a number between 1 and 8 to accumulate subtotals for up to 8 sort fields, print the subtotals when the sort field changes, and print a grand

total at the end of the report. This generates the TOTALS(n) operand where n is a value between 1 and 8. Default: 8

Specify 0 for no subtotals, but print only the grand total. This generates the TOTALS(0) operand.

### Precision

The precision of numeric fields. Numeric fields can be formatted to either 4, 5, or 6 decimal places. The default is 4.

- 4 decimal places is 0.0001 precision
- 5 decimal places is 0.00001 precision
- 6 decimal places is 0.000001 microsecond precision

This option generates the PRECISION(n) global operand.

When you have specified your Report options, press **Enter** to continue submit. You are prompted to **Press ENTER to proceed with request**. This provides a last opportunity to review and change your report request.

## Performance HDB report JCL

If you selected **Edit JCL before submit** then the Report HDB JCL is displayed in an edit session.

```

***** ***** Bottom of Data *****
```

Figure 386. Edit JCL for Summary HDB report

The HDB container data sets are listed at the end of the JCL. They are not required here because the CICS PA batch reporting utility will dynamically allocate the data sets when they are required. CICS PA adds the data sets into the JCL primarily for the purpose of DFHSM recall, if required. It is more efficient to recall data sets in the JCL (where job initiation can recall migrated data sets en masse) rather than one at a time when dynamically allocated.

The command deck specifies operands to report against HDB CICSWEEK:

HDB(OUTPUT(HDBR0001),REPORT(CICSWEEK))

Enter **SUBmit** in the command line to submit the job to run the report.

## Performance HDB report output

Successful completion of the Report request will generate an HDB Summary report.

V5R1M0				CICS Performance Analyzer Historical Database Summary

To 2004/12/07 16:00:00.00

Report Sorted By:Filter Criteria:  
- APPLIDType . . EOD - USS - RRT  
- List - Summary- INT - REQ  
- Alert  
- List - SummaryEnter "/" to select option  
- Collection Time/ Edit JCL before submit  
- Statistics Interval  
- Resource

HDB contains data from 2004/12/07 09:00 to 2004/12/07 16:00.

Figure 388. Run Statistics HDB Alerts report

This panel is displayed before CICS PA generates the JCL to run the report and shows the time period spanned by the data in the HDB.

The Statistics HDB and Statistics Alert definition that you use for this report must be stored in the same Repository (an HDB reporting job can specify only one Repository).

Most of the options are similar to the equivalent panel for requesting a Statistics Alert report in a Report Set, against SMF files. For details, see “Statistics Alert reports” on page 218.

The **Report Sorted By** option offers the same choices as the corresponding option in a Report Set, except that here you can select more than one choice: each selection generates a separate report. In a Report Set, you can request multiple Statistics Alert reports, but each request can specify only a single sort order.

The other options are:

#### Report Interval

Specify a date/time range or a *time slot* (times only) to filter the HDB input data based on the SMF record time stamp. HDB records with a time stamp within the specified From–To interval are processed by CICS PA, otherwise they are ignored.

The From–To date and time fields are all optional. They are blank initially (for no filtering), but thereafter display the reporting period that was previously saved.

**Date** is either a calendar date in your preferred format or a relative date.

**Time** is a time-of-day.

Relative dates are specified as 0, -1, -2,... to signify a date relative to the current date. 0 represents today, -1 yesterday, -2 two days ago, and so on. If both Start and Stop dates are specified, they must be in the same format.

For a date/time range:

- Either From or To can be omitted to indicate that the range is open-ended.
  - If From is omitted, it defaults to the first input record
  - If To is omitted, it defaults to the end of file.
- If From date is specified with no time, the start of day is assumed.
  - If To date is specified with no time, the end of day is assumed.

For a time slot, both times must be present with no dates to signify the same time slot every day. The times can span midnight.

The specified date/time range is included in the generated JCL under the //SYSIN DD statement:

```
CICSPA SMFSTART(-nn|yyy/mm/dd, hh:mm:ss.th),  
        SMFSTOP(-nn|yyy/mm/dd, hh:mm:ss.th)
```

#### Edit JCL before submit

Select with a / to edit the JCL before submit. CICS PA will generate the JCL and display it in an ISPF Edit session. You can review or modify the JCL using the usual ISPF Edit commands and actions, or you can use the CREATE command to save the JCL in an external data set.

Then to submit the job, enter **SUBmit** in the Edit command line.

If this option is not selected, the generated JCL is not displayed and the job is submitted immediately.

When you have specified your Report options, press **Enter** to continue submit. You are prompted to **Press ENTER to proceed with request**. This provides a last opportunity to review and change your report request.

## HDB Export to DB2 tables

After you have loaded data into an HDB it is then eligible for export to DB2.

**Summary HDB** data is the most commonly used for performance reporting. It is already summarized by time.

**List HDB** data is typically used to drill down to isolate performance problems or for ad-hoc reporting. Take care when exporting List HDBs into DB2. The volume of data can be high, resulting in a table that is too large to manage.

Select option 5 **Export** from the HDB menu to export HDB data into a DB2 table.

```
File Explorer Options Help
-----

3. Count only

F1=Help F3=Exit F7=Backward F8=Forward F10=Actions F12=Cancel

Figure 391. Export HDB Data Set

Exporting HDB data into DB2 is a two-step process, controlled by the **Select Option**.

1. Create the DDL to define the DB2 table. See “Creating DDL to define a DB2 table.”
2. Load the data. “Loading data into the DB2 table” on page 657.

You can then use your favorite DB2 query tool to analyze the data. Chapter 22, “Analyzing HDB DB2 Export data,” on page 679

### Creating DDL to define a DB2 table

JCL is built that contains the CREATE TABLE statement required to define the DB2 table for this HDB data set. The HDB name is used as the table name, however you can change this by editing the JCL.

The options are:

#### Create Options

Select **Create Database** if you want the CREATE TABLE statement to be preceded by a CREATE DATABASE statement to define the DB2 database. You might need to ask your DB2 administrator to do this for you if you do not have sufficient authority.

Select **Create Storage Group** if you want the CREATE TABLE statement to be preceded by a CREATE STOGROUP statement to define the DB2 Storage Group.

## **DB2 Settings**

Specify the required DB2 settings for your environment. CICS PA only provides a basic facility to load data into DB2. It does not provide any management or reporting capabilities once the data is in DB2.

If you omit any DB2 settings, CICS PA will insert parameter markers such as **<setting>** in the JCL stream.

CICS PA uses DSNTIAD, the sample Dynamic SQL program to run the DDL that defines the table.

The options are:

### **DB2 Subsystem ID**

The DB2 Subsystem ID to be used to for the Export function.

### **DSNTIAD Plan Name**

The Plan name for the dynamic SQL program (DSNTIAD), for example DSNTIA91.

### **DB2 Load Library**

The DB2 SDSNLOAD Load Library data set name.

### **DB2 Exit Library**

The DB2 SDSNEXIT Exit Library data set name.

### **DB2 RUNLIB Library**

The DB2 RUNLIB.LOAD Application Load Library data set name.

### **Database**

The DB2 Database name that is to contain the tables.

**Note:** The Database name will be replaced by the qualifier if a Qualifier has been specified in the HDB definition.

### **Storage Group**

The DB2 Storage Group name for the DB2 Table Spaces.

### **VCAT Catalog name**

Identifies the integrated catalog facility catalog for the storage group.

### **Volume**

Defines the volume of the storage group.

### **Primary Allocation**

Specifies the minimum primary space allocation (PRIQTY) for DB2-managed data sets.

### **Secondary Allocation**

Specifies the minimum secondary space allocation (SECQTY) for DB2-managed data sets.

## **Include Clock Field Components**

CMF performance class Clock fields accumulate data for both their count and time components in the HDB. You have a choice as to which components to load into DB2. For example, selecting **Time only** will load the time component but not the count component. Time only is sufficient for most analysis requirements.

For an HDB that is intended to be used in the CICS PA plug-in for CICS Explorer, this option must be set to "1. Time and Count".

### Summary Options

Specify **Include Sums of Squares** to load sum-of-square values into the DB2 Table. CICS PA always loads the Total. This allows you to calculate averages. Sums of Squares are required to calculate standard deviation and peak percentiles. Totals (and not Sums of Squares) is sufficient for most analysis requirements.

This option must not be selected for an HDB that is intended to be used in the CICS PA plug-in.

Review the JCL and then submit it to create the DB2 table.

Review the job output in SDSF to verify that the table was created successfully.

### Loading data into the DB2 table

JCL is built that contains the DB2 Load Utility statement required to load the HDB data set into the DB2 table that was defined in the previous step.

CICS PA uses the DB2 Load Utility to load data into the table.

The options are:

#### Load Options

Select **Resume** if you want the DB2 Load Utility to resume loading data into the table. Typically, this is appropriate for Summary HDBs.

Select **Replace** if you want the DB2 Load Utility to replace data already loaded in the table. Typically, this is appropriate for List HDBs.

Review the JCL and then submit it to load the DB2 table.

Review the job output in SDSF to verify that the table was created successfully.

---

## HDB Extract to CSV

After you have loaded data into an HDB it is then eligible for extract to CSV data sets.

Select option 6 **Extract** from the HDB menu to request an HDB extract..

```
File Options Help
-----

F1=Help    F3=Exit    F4=Prompt    F6=Resize    F12=Cancel

Figure 393. Run Summary HDB Extract

The options are:

#### Report Interval

Specify the reporting time range. You can specify an explicit date, such as 2004/12/15, or a relative date to indicate today (0), yesterday (-1), two days ago (-2), and so on. Adjacent is the time range of data contained in this HDB. If you specify a Report Interval, then it must be within this range otherwise the extract request will fail.

#### Extract Recap DDname

The DDname for the Recap report which prints at the end of extract processing to provide processing statistics. The DDname is mandatory.

CICS PA assigns a default DDname **HXTS0001**.

This option generates the OUTPUT(ddname) operand.

#### Output Data Set

The name of the data set where the extract records are written. When specifying the data set name, standard TSO conventions apply.

If CICS PA is to create the data set at run time, the default allocation attributes specified on the Reporting Allocation Settings panel are used in generating the JCL. If the data set is already cataloged, then CICS PA will use DISP=OLD or DISP=MOD according to your request to overwrite or append to the existing data set.

CICS PA generates the DDNAME(ddname) operand and assigns a default DDname **HDBX0001**.

#### Disposition

This option applies if the extract data set you specified is already cataloged.

Select option **1 - OLD** to overwrite the data set contents with the new extract data.

Select option **2 - MOD** to append the new extract data.

**Report Form**

Specify a Report Form to tailor the format of the extract records. If you do not specify a Form, CICS PA will write all the fields in the HDB in order.

**Delimiter**

Specify the field delimiter to be used to separate each data field in the extract data set. The default is a semicolon and generates the DELIMIT(';') operand.

**Include Field Labels**

Select this option to indicate that the first record to be written to the extract data set is to be a field labels record. This is the default and generates the LABELS operand.

Leave blank if you do not want a field labels record written to the extract data set. This generates the NOLABELS operand.

**Numeric Fields in Float format**

Select this option if you want CICS PA to write numeric fields to the extract data set in S390 FLOAT format. This generates the FLOAT operand. Specify FLOAT format if you plan to import the extract into a DB2 table. When the DB2 Load Utility is used, it will interpret all numerical fields reliably and consistently in FLOAT format.

If you do not select this option, the numeric fields are written in a mixture of integer, real and exponential using character digits. This is the default and is suitable when importing the extract data into a PC spreadsheet tool. This generates the NOFLOAT operand.

**Time Interval**

Specify an optional Time Interval when extracting Summary HDBs. The default is the Time Interval used to create the data (as defined in the Template). In our example, Template PRODSUM that was used to create the HDB data specified 15 minutes.

You can specify any interval greater than or equal to the Template Interval. For example, if you are reviewing many days worth of data then you might specify 24:00:00 (24 hours) so that you can view the daily trend. In the example panel in this topic, the Interval has been changed to 1 hour.

**Precision**

The precision of numeric fields. Numeric fields can be formatted to either 4, 5, or 6 decimal places. The default is 4.

- 4 decimal places is 0.0001 precision
- 5 decimal places is 0.00001 precision
- 6 decimal places is 0.000001 microsecond precision

This option generates the PRECISION(n) global operand.

When you have specified your Extract options, you are prompted to **Press ENTER to proceed with request**. This provides a last opportunity to review and change your request details.

If you selected **Edit JCL before submit** then the Extract HDB JCL is displayed in an edit session.

```

***** ***** Bottom of Data *****

```

Figure 394. Edit JCL for Summary HDB Extract

The HDB container data sets are listed at the end of the JCL. They are not required here because the CICS PA batch utility will dynamically allocate the data sets when they are required. CICS PA adds the data sets into the JCL primarily for the purpose of DFHSM recall, if required. It is more efficient to recall data sets in the JCL (where job initiation can recall migrated data sets en masse) rather than one at a time when dynamically allocated.

The command deck specifies operands to extract records from HDB CICSP1H, write them to the extract data set with DDname HDBX0001, and write the Recap report output to the DDname HXTS0001:

```
HDB(DDNAME(HDBX0001),EXTRACT(CICSP1H),OUTPUT(HXTS0001),...)
```

Enter **SUBmit** in the command line to submit the job to run the report.

Successful completion of the Extract request will generate an HDB Summary Extract Recap report.

```

Figure 396. HDB Summary Extract record format

## Tailoring the HDB extract format

The format of the extract records can be changed by specifying a Report Form. The process for HDB Extract is the same as applying a Report Form to an HDB Report. For more information, see “SUMMARY Report Form” on page 313.

## Analyzing the extract data

After HDB data has been loaded into an extract data set in CSV format, you can use your favorite PC analysis tools, such as Lotus 1-2-3 or Excel, to analyze the data. See Chapter 23, “Analyzing CSV extract data,” on page 685 for examples of how to use such tools to analyze the data.

## HDB Maintenance

Select option 7 **Maintenance** from the HDB menu to list defined HDBs and maintain your HDB environment. You can delete an HDB or change its options. You can maintain a manifest, which is used by the CICS PA plug-in to access historical performance data for related HDBs from CICS Explorer.

Figure 399. Maintain HDB data sets

The HDB container data set details shown here are:

- The name of the data set.
- The time stamp of the first record in the data set.
- The status of the HDB container data set:
  - If delete pending, it is marked **Del**.
  - If the HDB retention period has been exceeded, it is marked **Exp** (expired).
  - If neither delete pending nor expired, it is marked **Act** (active).
- The status of DB2 table data associated with the HDB container data set:
  - If the DB2 retention period has been exceeded, it is marked **Exp** (expired).
  - If not all data has expired, it is marked **Pxp** (partially expired).
  - If neither delete pending nor expired, it is marked **Act** (active).
  - If the status is unavailable (because the DB2 retention period is not specified), it is marked **n/a**.

Data sets and DB2 data marked Del or Exp are physically deleted when Housekeeping is next run.

Scroll **Right** (F11) to view the VOLSER where the data set resides, if active.

## Line Actions

- / Display the selection list of line actions.
- S Select the HDB data set to view status information, as shown in Figure 400 on page 664.
- B Browse the data set using ISPF Browse.
- D Delete the HDB data set. The data set is deleted in the HDB now, and physically deleted when HDB Housekeeping is next run.
- U Undo. Reverse an earlier Delete action and reinstate the data set as active in this HDB. Undo is only available on a Deleted data set until Housekeeping is run.

## View HDB data set statistics

The HDB Data Set panel displays details about the HDB container data set:

- The name of the data set and VOLSER where it resides.
- The status of the data set: either Active, Expired, or Deleted.
- The date the Load HDB was run and the data set was created.
- The expiry date of the HDB data set determined by the HDB retention period. The expiry date is blank if the data set is deleted.

- The time period spanned by the records in the data set.
- The number of records in the data set.
- The status of the DB2 data: either Active, Expired, Pexpired (partially expired), or n/a.
- The expiry date of the DB2 data determined by the DB2 retention period.

## HDB Load Audit

From the Maintain HDBs list, enter line action A to display the audit details for a particular HDB.

The Load Audit Trail lists the SMF Files used to load data into the HDB, and the status of those requests.

File   Edit   Options   Help

HDB Load Audit Trail

Row 1 to 2 of 2

Command ===> \_\_\_\_\_ Scroll ===> PAGE

SMF Data Set Name	----- Start -----	Status
S CPPX.CICS620.PMR52938.SMFDATA	2004/11/17 09:05:27	OK
- CPPX.V140.SMF0818	0000/00/00 00:00:00	FAILED

\*\*\*\*\* Bottom of data \*\*\*\*\*

Figure 401. HDB Load Audit Trail

The Audit details include:

### SMF Data Set Name

The data set name of the SMF Input File used for the Load request.

**Start** The time stamp of the first record in the SMF File.

**Status** The status of the Load request, either OK (successful) or FAILED.

## Reusing an SMF File that has been successfully loaded

When you load data from an SMF File into an HDB, CICS PA updates the load audit trail for that HDB, setting the status of the SMF File to OK ("data from this SMF File was successfully loaded into this HDB"). When the status is OK, CICS PA denies any subsequent requests to load data from the SMF File into the HDB. This protects you from loading duplicate data into the HDB. However,

### First SMF Record

The first 64 bytes of the first SMF record in the file. CICS PA uses this record to ensure that only one successful load request is run for this SMF File.

## Maintain manifest

A manifest is a proprietary DB2 table that contains all the information required by the CICS PA plug-in for CICS Explorer to access and use historical data. The manifest is a catalog of DB2 tables for HDBs that are associated with the same qualifier and for which the Explorer indicator is set. The manifest for a given qualifier can be rebuilt at any time.

### About this task

The manifest definition specifies the qualifier and the settings for the DB2 table that will contain the manifest.

Rebuild the manifest whenever you add or change an HDB in a way that affects its eligibility for inclusion in that manifest. For example, if an HDB is currently included in a manifest and you clear the Explorer option, it is no longer eligible for inclusion in that manifest. If you change the qualifier for an eligible HDB, you should rebuild both the manifest for the old qualifier and the manifest for the new qualifier.

In addition, the manifest will only contain entries for statistics reports with a status of Collect=Yes or Alt and DB2 Load=Yes. If these indicators are not set, the report will not be included in the manifest and therefore will not be accessible through the CICS PA plug-in. Therefore you should rebuild the manifest whenever any changes are made to the status of a report in an eligible Statistics HDB.

Figure 403. Manifest Maintenance

## Procedure

1. Select **Explorer -> Manifest Maintenance** in the action bar on the HDB Export or Maintenance panel to create or update a manifest for a specified qualifier.
2. Type the name of a qualifier. The manifest table will be named *qualifier.CPA\_MANIFEST*. HDBs that have the same qualifier and which are otherwise eligible will be included in this manifest.
3. When creating the first manifest, select Create Tablespace. The tablespace name is MANIFEST. On subsequent uses of Manifest Maintenance (either when creating a manifest for a new qualifier or recreating a manifest to add or delete HDBs) do not select Create Tablespace if it already exists in the specified DB2 Database.
4. Specify the settings for the DB2 table that will be used to store the manifest. For details, see “Creating DDL to define a DB2 table” on page 655.
5. Perform the following steps to create the manifest:
  - a. Press Enter. The panel prompts you to press Enter again to proceed.
  - b. Press Enter again. An edit panel appears, containing JCL to create the required DB2 table for the manifest.
  - c. Enter **sub** to submit the JCL. If you selected Create Tablespace, the DB2 tablespace (named MANIFEST) and the Database and Storage Group are created first.
6. Press the Exit key (F3) to save the manifest definition and return to the CICS PA panel.

## Create DB2 table

JCL is built that defines the DB2 table. If the selected HDB definition contains a qualifier, it will be used instead of the Database value to prefix the table name.

## About this task

This task explains how to create the DB2 table for an HDB Select option **5 Export** or option **7 Maintenance** from the HDB menu to list the defined HDBs. Specify the T line action against one of the HDBs to specify the DB2 Table details:

Figure 404. Create DB2 Table

### Procedure

1. Specify settings for exporting data from historical databases (HDBs) to DB2. For details of how to specify the Create Options, DB2 Settings, Include Clock Field Components, and Summary Options fields, see “Creating DDL to define a DB2 table” on page 655.
2. Review the JCL and then submit it to create the DB2 table.
3. Review the job output in SDSF to verify that the table was created successfully.

### What to do next

Once the HDB data has been exported you can access it using the CICS PA plug-in or through DB2 SQL.

## Housekeeping

Housekeeping for Statistics and Performance HDBs is performed in the same way.

Select option 8 **Housekeeping** from the HDB menu to reorganize and clean up your HDB environment.

```

                                HDB Housekeeping
Command ==> _____

Repository . : CICSPROD.CICSPA.XYX.REPOSTRY

Select one of the following options
1  1. Submit HDB Housekeeping JCL
-  2. Repair Repository using VERIFY command

Enter "/" to select option
/  Edit JCL before submit

F1=Help    F3=Exit    F6=Resize    F12=Cancel

```

*Figure 405. HDB Housekeeping*

Use HDB Housekeeping to perform the following tasks:

**1. Submit HDB Housekeeping JCL.**

Run HDB Housekeeping periodically to delete expired HDB data sets and DB2 table rows and to reorganize the Repository.

**2. Repair Repository using VERIFY command.**

The IDCAMS VERIFY command is used to repair the end-of-data-set information in the VSAM Catalog for the Repository. Use repair if message IEC161I is being issued repeatedly. This condition is usually caused by an earlier HDB dialog or batch request that failed.

---

## Chapter 21. Using the HDB commands

The Historical Database (HDB) facility is driven from the CICS PA dialog, but has associated batch processes:

1. Load HDB
2. HDB reporting
3. HDB extract to CSV
4. HDB export to DB2
5. HDB housekeeping

For these batch processes, CICS PA dialog generates the JCL and commands automatically, but you are given the opportunity to edit them before job submission. The jobs can also be run at a later time independent of the dialog.

The HDB commands are specified in the SYSIN DD statement. The format of the commands is consistent with other CICS PA commands. For more information, see “General command format” on page 371.

---

### JCL for HDB load, report, extract

The following JCL is an example of the job stream for requesting HDB load or report processing. This is the same as the JCL for generating reports and extracts (see Figure 187 on page 355), but has the following additional statement specific to HDB processing:

#### CPAHDBRG DD

This DD statement identifies the Repository data set. The Repository is a VSAM KSDS that is the repository for all definitions associated with the HDB.

```
//CPAHDBP JOB (Job Accounting)
//*
//CICSPA EXEC PGM=CPAMAIN,PARM='UPPER'
//STEPLIB DD DSN=CICSPA.V5R1M0.SCPALINK,DISP=SHR
//CPAHDBRG DD DSN=USER.CICSPA.XYX.REPOSTRY,DISP=SHR

/*
//* Dictionary records
//CPADICTR DD DISP=SHR,DSN=CICSPA.CICSP1.DICT
```

*Figure 406. JCL for HDB load and report processing*

---

## HDB Loading

The **HDB(LOAD...)** operand requests CICS PA to load CMF performance data from SMF data sets into an HDB.

The command format is:

```
CICSPA HDB(LOAD(hdbname),  
          [OUTPUT(ddname)])
```

The options are:

### LOAD

Specifies the name of the HDB to be loaded. The HDB must be defined in the Repository (DDname **CPAHDBRG**).

### OUTPUT

Recap report output file name. CICS PA records the results of the Load operation in this File. If not specified, CICS PA assigns a DDname of **HDBLnnnn** where nnnn is the numerical sequence number **0001-9999**.

**Note:** LOAD ignores any additional HDB request operands, including FIELDS and SELECT. Load processing uses:

1. The Template to determine which fields are contained in the HDB. It does not use the FIELDS operand.
2. Selection Criteria specified in the HDB definition and its Template. It does not use the SELECT operand.

---

## HDB Reporting

The **HDB(REPORT)** operand requests CICS PA to generate reports from performance HDB data.

The command format is:

```
CICSPA HDB(REPORT(hdbname),  
          [OUTPUT(ddname),]  
          [NOTOTALS|TOTALS(n),]  
          [INTERVAL(hh:mm:ss),]  
          [FIELDS(field1[(options)],...),]  
          [LINECount(nnn),]  
          [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...),]  
          [SELECT2(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...))])
```

The options are:

### REPORT

Specifies the name of the performance HDB to report against. The HDB must be defined in the Repository (DDname **CPAHDBRG**).

### OUTPUT

Report output file name. See "OUTPUT" on page 378 for further information. If not specified, CICS PA assigns a DDname in the format **HDBRnnnn** where nnnn is the report sequence number **0001-9999** to uniquely identify the output.

### NOTOTALS|TOTALS(n)

The totals level applies only to the Summary report.

Specify TOTALS(1) to TOTALS(8) to accumulate subtotals for up to 8 sort fields, print the subtotals when the sort field changes, and print a grand total at the end of the report. Default: **TOTALS(8)**

Specify TOTALS(0) for no subtotals, but print only the grand total.

Specify NOTOTALS for neither subtotals nor grand total.

## INTERVAL

This operand applies to Summary HDBs. It specifies a time interval when the report summarizes transaction activity over time. The interval is in the range 1 second to 24 hours in the format *hh:mm:ss* for hours, minutes, and seconds. The HDB Summary data is already summarized by time. You can omit the INTERVAL operand to use the data's interval, or specify an interval that is longer than the data interval. For example, specify 00:15:00 if you want to summarize transaction activity over 15 minute intervals.

A time interval of less than one hour must fit evenly into the hour. CICS PA will round it down to the nearest interval that aligns to the hour. For example, 1.35 is reduced to 00:01:30 minutes which will produce 40 interval report lines for each hour of data.

A time interval of more than one hour must fit evenly into the day. CICS PA will round it down to the nearest interval that aligns to the day. For example, 10.30.23 is reduced to 08:00:00 hours which will produce 3 interval report lines for each day of data.

Minutes take precedence for an abbreviated entry. For example:

**1** becomes 00:01:00

**1.1** becomes 00:01:00 (rounded down from 00:01:01)

**1.1.1** becomes 01:00:00 (rounded down from 01:01:01)

## FIELDS

Specifies which fields are reported, the order in which they appear in the report, and their summarization presentation. Only fields that are specified in the HDB Template can be specified. Fields not contained in the HDB are reported as **Missing**.

When reporting from a Summary HDB, the options for specifying fields are similar to the options for a Performance Summary report. For details, see "SUMMARY(FIELDS" on page 415.

When reporting from a List HDB, the options for specifying fields are similar to the options for a Performance List report. For details, see "LIST(FIELDS" on page 392.

## LINECount

Controls the number of lines per page in the HDB report. See "LINECount" on page 380 for further information.

## SELECT, SELECT2

Specifies what data to include or exclude from the report based on data field values. See "Using SELECT statements" on page 508 for an explanation and examples.

Only fields that are specified in the HDB Template can be specified. Select Fields not contained in the HDB will cause selection to fail and reporting will skip the record. SELECT and SELECT2 can both be specified to perform record filtering. The CICS PA dialog generates SELECT2 statements in the command deck when you use a Report Form that has

active Selection Criteria. If both SELECT and SELECT2 are specified, then the record must pass selection by both specifications for it to be included in the report.

---

## Statistics HDB Alerts Reporting

The **HDB(STATSALERT)** operand requests CICS PA to generate Statistics Alert reports from statistics HDB data.

The command format is:

```
CICSPA HDB(STATSALERT(hdbname),  
          [OUTPUT(ddname),]  
          [EXTERNAL(ddname),]  
          STALTDEF(statistics-alert-definition),  
          [BY(APPLID[(LIST,SUMMARY)] |  
            ALERT[(LIST,SUMMARY)] |  
            COLLECT |  
            INTERVAL |  
            RESOURCE),]  
          [TYPE(EOD,INT,USS,REQ,RRT)])
```

The Statistics HDB and Statistics Alert definition that you use for this report must be stored in the same Repository (an HDB reporting job can specify only one Repository).

Except for the STATSALERT operand itself (which specifies the Statistics HDB to be used), the options are the same as the options for the CICS PA STATSALERT operand to generate Statistics Alert reports from SMF data. For details, see “STATSALERT - Statistics Alert reports” on page 482.

---

## HDB Extract to CSV

The **HDB(EXTRACT)** operand requests CICS PA to generate CSV extracts from HDB data.

The command format is:

```
CICSPA HDB(EXTRACT(hdbname),  
          [OUTPUT(ddname),]  
          [DDNAME(ddname),]  
          [STATnnnn(ddname),]  
          [HSTGnnnn(ddname),]  
          [DELIMIT('field-delimiter'),]  
          [LABELS|NOLABELS,]  
          [FLOAT,]  
          [INTERVAL(hh:mm:ss),]  
          [FIELDS(field1[(options)],...),]  
          [SELECT(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...)),]  
          [SELECT2(PERFORMANCE(INCLUDE|EXCLUDE(field1(values1),...),...))])
```

The options are:

### EXTRACT

Specifies the name of the HDB from which to extract data. The HDB must be defined in the Repository (DDname **CPAHDBRG**).

### OUTPUT

Specifies the DDname for the Recap report output. If not specified, the CICS PA dialog assigns a DDname in the format **HXTS0001** to uniquely identify the output.

**DDNAME (performance HDBs only)**

Specifies the DDname for the performance extract data set. Dialog default: **HDBX0001**

**STATnnnn, HSTGnnnn (statistics HDBs only)**

Specifies the DDname for the extract data set for each statistics report that you want to extract, where nnnn is the statistics ID. STATnnnn identifies a CICS Transaction Server statistics report; HSTGnnnn identifies a CICS Transaction Gateway statistics report. For example, HSTG000A(TGCMCSV) instructs CICS PA to extract CICS Transaction Gateway Connection Manager statistics report data to the extract data set identified by the DDname TGCMCSV. Dialog default: DDname matches keyword; for example, **STAT010A(STAT010A)**.

**DELIMIT**

Specifies the field delimiter, enclosed in quotes, to be used to separate each data field in the extract data set. The default is a semicolon DELIMIT(';').

**LABELS | NOLABELS**

**LABELS** indicates that the first record to be written to the extract data set is to be a field labels record. This is the default.

**NOLABELS** indicates that CICS PA is not to write a field labels record to the extract data set.

**FLOAT (performance HDBs only)**

Write numeric fields in the extract in S390 FLOAT format.

Specify FLOAT format if you plan to import the extract into a DB2 table. When the DB2 Load Utility is used, it will interpret all numerical fields reliably and consistently in FLOAT format.

If FLOAT is not specified, the numeric fields are written in a mixture of integer, real and exponential using character digits. This is the default and is suitable when importing the extract data into a PC spreadsheet tool.

**INTERVAL**

This operand applies to Summary HDBs. It specifies a time interval when the extract summarizes transaction activity over time. The interval is in the range 1 second to 24 hours in the format *hh:mm:ss* for hours, minutes, and seconds. The HDB Summary data is already summarized by time. You can omit the INTERVAL operand to use the data's interval, or specify an interval that is longer than the data interval. For example, specify 00:15:00 if you want to summarize transaction activity over 15 minute intervals.

A time interval of less than one hour must fit evenly into the hour. CICS PA will round it down to the nearest interval that aligns to the hour. For example, 1.35 is reduced to 00:01:30 minutes which will produce 40 interval report lines for each hour of data.

A time interval of more than one hour must fit evenly into the day. CICS PA will round it down to the nearest interval that aligns to the day. For example, 10.30.23 is reduced to 08:00:00 hours which will produce 3 interval report lines for each day of data.

Minutes take precedence for an abbreviated entry. For example:

**1** becomes 00:01:00

**1.1** becomes 00:01:00 (rounded down from 00:01:01)

**1.1.1** becomes 01:00:00 (rounded down from 01:01:01)

**FIELDS**

Specifies which fields are extracted, the order in which they appear in the

extract, and their summarization presentation. Only fields that are specified in the HDB Template can be specified. Fields not contained in the HDB are written as **Missing**.

#### **SELECT, SELECT2**

Specifies what data to include or exclude from the extract based on data field values. See “Using SELECT statements” on page 508 for an explanation and examples.

Only fields that are specified in the HDB Template can be specified. Select Fields not contained in the HDB will cause selection to fail and extract will skip the record. SELECT and SELECT2 can both be specified to perform record filtering. The CICS PA dialog generates SELECT2 statements in the command deck when you use a Report Form that has active Selection Criteria. If both SELECT and SELECT2 are specified, then the record must pass selection by both specifications for it to be included in the extract.

---

## **HDB Export to DB2**

The CICS PA dialog can generate JCL to define DB2 tables and then export HDBs to those tables. This JCL uses utilities supplied with DB2: DSNUTIAD to define tables, and DSNUTILB to load tables.

You can export an HDB to DB2 either:

- In the same job in which you load the HDB with SMF data  
or
- In an export-only job, some time after loading the HDB

For an example of JCL that loads an HDB and exports to DB2 in the same job, see Figure 380 on page 645.

---

## **HDB Housekeeping**

The **HDB(HKEEP)** operand requests CICS PA to perform housekeeping on the Repository (DDname **CPAHDBRG**). Housekeeping deletes expired HDB container data sets and DB2 data and removes definitions from the Repository that are no longer required.

The command format is:

CICSPA HDB(HKEEP)

**Note:** There is a second function available in HDB housekeeping, **Repair Repository using VERIFY command**. This is available only from the CICS PA dialog.

### **JCL for HDB housekeeping**

The following JCL is an example of the job stream for requesting HDB housekeeping.

```

//CPAHDBK JOB (Job Accounting)
//*
//CICSPA EXEC PGM=CPAMAIN,PARM='UPPER'
//STEPLIB DD DSN=CICSPA.V5R1M0.SCPALINK,DISP=SHR
//CPAHDBRG DD DSN=USER.CICSPA.XYX.REPOSTRY,DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
        CICSPA HDB(HKEEP)
/*
//CPAHKDEL DD DSN=&CPAHKDEL,DISP=(NEW,PASS),
//          UNIT=DASD,
//          SPACE=(CYL,(1,1))
/*
//DELETE EXEC PGM=IDCAMS,COND=(0,NE,HKEEP)
//SYSPRINT DD SYSOUT=*
//SYSIN DD DSN=&CPAHKDEL,DISP=(OLD,DELETE)
/*
//* DELETE EXPIRED DB2 TABLE ROWS
//RUNTIAD EXEC PGM=IKJEFT01,DYNAMNBR=20
//STEPLIB DD DISP=SHR,DSN=DB2.SDSNLOAD
//          DD DISP=SHR,DSN=DB2.SDSNEXIT
//SYSTSPRT DD SYSOUT=*
//SYSTSIN DD *
        DSN SYSTEM(DB2P)
        RUN PROGRAM(DSNTIAD) -
          LIB('DB2.RUNLIB.LOAD') PLAN(DSNTIAD)
/*
//SYSPRINT DD SYSOUT=*
//SYSUDUMP DD SYSOUT=*
//SYSIN DD *
DELETE FROM CPAX.CPA_TRANTLST
WHERE
        START_DATE < '2012-12-29' or
        (START_DATE = '2012-12-29' AND START_TIME <= '12.00.00');
COMMIT;
/*

```

Figure 407. JCL for HDB housekeeping

Note that the data sets and DB2 data are deleted by subsequent job steps.

## HDB examples

This example shows you how to use one command to request a List HDB load and report, and a Summary HDB load and report. Sample output is also shown.

```

CICSPA IN(SMFIN001),
        HDB(OUTPUT(HDBL0001),LOAD(LIST01)),
        HDB(OUTPUT(HDBR0001),REPORT(LIST01)),
        HDB(OUTPUT(HDBL0002),LOAD(SUMMARY2)),
        HDB(OUTPUT(HDBR0002),REPORT(SUMMARY2))

```

```

---

## Chapter 22. Analyzing HDB DB2 Export data

After HDB data has been loaded into DB2, you can use your favorite DB2 query tool to analyze the data.

This chapter describes the format of the HDB data fields and gives examples that show you how to use QMF™ SQL queries to analyze the data.

For more information on working with DB2, see the *DB2 UDB for z/OS Administration Guide*.

---

### Field formats

CICS PA saves data in its container data sets in a format suitable for loading directly into DB2 tables. Field data saved in the container data set depends on its CMF data type and the HDB type.

The following tables outline the various data types and how data is saved for each type of HDB.

#### List HDB fields

*Table 15. Format of List HDB fields*

CMF Data Type	DB2 Data Type	Field Length
T – Time stamp (see note 1)	TIMESTAMP 'YYYY-MM-DD-HH.MM.SS.THMIJU'	26
C – Character	CHAR(n)	Same as CMF field length. For example, TRAN has length 4.
A – Counter	INT	4
P – Packed	INT	4
S – Clock	TIME component is FLOAT COUNT component is INT	8 4
Other Clocks (see note 2)	FLOAT	8

#### Summary HDB fields

*Table 16. Format of Summary HDB fields*

CMF Data Type	DB2 Data Type	Field Length
T – Time stamp (see note 1)	Date component is DATE: 'YYYY-MM-DD' One-byte separator is '-' Time component is TIME: 'HH.MM.SS'	10 1 8
C – Character	CHAR(n)	Same as CMF field length. For example, TRAN has length 4.
A – Counter (see note 3)	Two FLOAT numbers: Total Sum of Squares	8 8

Table 16. Format of Summary HDB fields (continued)

CMF Data Type	DB2 Data Type	Field Length
P – Packed (see note 3)	Two FLOAT numbers:	
	Total	8
	Sum of Squares	8
S – Clock	TIME is two FLOAT numbers:	
	Total	8
	Sum of Squares	8
	COUNT is two FLOAT numbers:	
	Total	8
	Sum of Squares	8
Other Clocks (see note 2)	Two FLOAT numbers:	
	Total	8
	Sum of Squares	8
TASKCNT TASKTCNT (see note 4)	FLOAT	8

**Note:**

1. Time stamp fields are loaded differently for List and Summary HDBs. List HDB time stamps are loaded as a full **TIMESTAMP**. Summary HDB time stamps are broken down into their **DATE** and **TIME** components. This provides more flexibility to summarize data over time.
2. “Other Clocks” include special fields like **RESPONSE** (response time) which are derived from other fields (**RESPONSE** = **STOP** minus **START**).
3. For summary HDBs, CICS PA keeps 2 accumulators for count and clock fields; **Total** and **Sum of Squares**. **Total** is used to calculate average. **Sum of Squares** is used to calculate standard deviation and peak percentiles.
4. **TASKCNT** and **TASKTCNT** are special counters in the Summary HDB. **TASKCNT** is the number of transactions (tasks) that were accumulated to build this summary record. **TASKTCNT** is the number of Task Termination records. Either **TASKCNT** or **TASKTCNT** is used to calculate the average of count and clock fields.

## Time precision

CICS PA stores time fields in **FLOAT** format in units of seconds and a precision of micro-seconds. For example, if the accumulated response time total in a Summary HDB is 10.202122 and the task count (**TASKCNT** field) for this interval is 20, then the average response time is  $10.202122/20=0.510106$  seconds.

## SQL queries for Summary HDB

Summary tables contain data exported from a Summary HDB. Summary tables are the most commonly used for performance reporting.

### Simple query

Summary tables are already summarized (by time), so a basic query does not require any scalar functions. The following query lists selected fields in the summary table:

```

SELECT TRAN,
       INT(TASKCNT)           AS TASKCNT,
       DEC(RESPONSE_TIME,8,2) AS RESPONSE_TIME,
       DEC(CPU_TIME,8,2)      AS CPU_TIME,
       DEC(SUSPEND_TIME,8,2)  AS SUSPEND_TIME,
       DEC(DISPATCH_TIME,8,2) AS DISPATCH_TIME
FROM CICSPA.CICSP1H

```

This query produces output like the following:

TRAN	TASKCNT	RESPONSE TIME	CPU TIME	SUSPEND TIME	DISPATCH TIME
CSOL	1	1887.43	16.00	9.00	16.00
CSMT	1	1887.22	16.00	9.00	16.00
FICX	1	0.00	1.00	1.00	1.00
SU4B	1	0.07	625.00	625.00	625.00
CWBG	1	0.00	1.00	1.00	1.00
BIC2	1	0.00	1.00	1.00	1.00
BIC2	1	0.00	1.00	1.00	1.00
AP77	1	1.17	3969.00	3969.00	3969.00
CAMA	1	0.01	25.00	25.00	25.00
CKPT	4	0.56	2313.00	2313.00	2313.00
CM99	1	0.01	1.00	1.00	1.00
CNA7	9	0.47	180.00	180.00	180.00
CNB0	3	0.17	891.00	891.00	891.00

Figure 412. Simple SQL query against Summary DB2 table

## Grouping by APPLID

The following query summarizes all transactions that ran yesterday, grouping by APPLID.

```

SELECT APPLID,
       INT(SUM(TASKCNT))           AS TASK_COUNT,
       DEC(SUM(CPU_TIME),16,4)     AS TOTAL_CPU,
       DEC(SUM(CPU_TIME)/SUM(TASKCNT),5,4) AS AVE_CPU,
       DEC(SUM(RESPONSE_TIME)/SUM(TASKCNT),5,4) AS AVE_RESPONSE
FROM CICSPA.CICSPX
WHERE START_DATE = CURRENT_DATE - 1 DAY
GROUP BY APPLID
ORDER BY APPLID

```

This query produces output like the following:

APPLID	TASK COUNT	TOTAL CPU	AVE CPU	AVE RESPONSE
CICSP1	900	10.1467	0.0112	0.1520
CICSP2	520	1.0163	0.0019	0.1647
CICSP3	972	6.4394	0.0066	0.0882
CICSP4	36	0.6607	0.0183	0.2049
CICSP5	504	5.7875	0.0114	0.1400
CICSP6	504	5.6444	0.0111	0.1202
CICSP7	504	5.7117	0.0113	0.1021
CICSP8	540	6.1050	0.0113	0.1508
CICSP9	540	5.9684	0.0110	0.1515
CICSP10	180	1.6885	0.0093	0.1451

Figure 413. SQL query grouping yesterday's transactions by APPLID

## Calculating averages

Averages are calculated by dividing the field value by the task count (TASKCNT).

The following query calculates the average response time.

```
SELECT TRAN,
       INT(SUM(TASKCNT))                AS "Task Cnt",
       DEC(SUM(RESPONSE_TIME),8,4)      AS "Response Time Tot",
       DEC(SUM(RESPONSE_TIME)/SUM(TASKCNT),8,4) AS "Response Time Ave"
FROM CICS.PA.CICSP1H
GROUP BY TRAN
ORDER BY TRAN
```

This query produces output like the following:

TRAN	Task Cnt	Response Time Tot	Response Time Ave
----	-----	-----	-----
APN8	3	2.1231	0.7077
AP01	27	0.9987	0.0369
AP02	42	10.3802	0.2471
AP04	4	1.2992	0.3248
CATA	19	0.5517	0.0290
CATD	19	0.4133	0.0217
CKBP	1297	148.2471	0.1143
CMNE	2	1.3765	0.6882
CMNK	2	0.5178	0.2589
CMN1	2	0.4091	0.2045
CMOB	8	2.7378	0.3422

Figure 414. SQL query calculating average response time

## Calculating standard deviation

Standard Deviation is a statistical estimate of the amount of variation in numerical values. The higher the standard deviation the more variation in the values.

CICS PA requires the Sum of Squares to be loaded into the DB2 table to calculate standard deviation.

The following example calculates the standard deviation of response time. The CASE statement shows the function required to calculate standard deviation.

```
SELECT TRAN,
       INT(SUM(TASKCNT))                AS TASKCNT,
       DEC(SUM(RESPONSE_TIME),8,6)      AS RESPONSE_TIME_TOT,
       DEC(SUM(RESPONSE_TIME)/SUM(TASKCNT),8,6) AS RESPONSE_TIME_AVG,
       CASE WHEN (SUM(TASKCNT) > 1) THEN
         DEC(SQRT(((SUM(TASKCNT)*SUM(RESPONSE_TIME_SSQ))
                   -POWER(SUM(RESPONSE_TIME),2))
                /(SUM(TASKCNT)*(SUM(TASKCNT)-1))),10,4)
       ELSE 0
       END                               AS RESPONSE_TIME_DEV
FROM CICS.PA.CICSP1H
GROUP BY TRAN
```

This query produces output like that shown in Figure 415 on page 683

TRAN	TASKCNT	RESPONSE TIME TOT	RESPONSE TIME AVG	RESPONSE TIME DEV	
-----	-----	-----	-----	-----	\$
SGM	1	0.418736	0.418736	0.0000	
ABAL	3	0.002592	0.000864	0.0000	
ATRN	7	0.007104	0.001014	0.0001	
AUTS	1	0.000752	0.000752	0.0000	
BALA	4	0.004016	0.001004	0.0004	
CATA	2	0.006336	0.003168	0.0000	
CRSR	5	0.001696	0.000339	0.0000	
CSGM	1	0.000528	0.000528	0.0000	
CSMI	11	0.009120	0.000829	0.0004	
CSSN	2	0.001232	0.000616	0.0000	
DESC	2	0.001280	0.000640	0.0000	

Figure 415. SQL query calculating standard deviation of response time

## Calculating peak percentile

Peak Percentile is a statistical estimate (based on the Normal Distribution) that provides an upper limit value of when nn% of tasks completed processing. For example 90% of transactions had a response time of 1 second or less. Peak Percentile allows you to measure whether workload targets are being met.

The following query calculates the 90% peak percentile of response time. The CASE statement shows the function required to calculate peak percentile.

```

SELECT TRAN,
       INT(SUM(TASKCNT))                AS TASK_COUNT,
       DEC(SUM(RESPONSE_TIME),8,6)      AS RESPONSE_TIME_TOT,
       DEC(SUM(RESPONSE_TIME)/SUM(TASKCNT),8,6) AS RESPONSE_TIME_AVE,
       CASE WHEN (SUM(TASKCNT) > 1) THEN
         DEC((1.282*SQRT(((SUM(TASKCNT)*SUM(RESPONSE_TIME_SSQ))
          -POWER(SUM(RESPONSE_TIME),2))
          / (SUM(TASKCNT)*(SUM(TASKCNT)-1))))
          +SUM(RESPONSE_TIME)/SUM(TASKCNT),10,8)
       ELSE DEC(SUM(RESPONSE_TIME)/SUM(TASKCNT),10,8)
       END                               AS "RESPONSE_PEAK_90%"
FROM CICSPA.CICSPIH
GROUP BY TRAN
ORDER BY TRAN

```

This query produces output like the following:

TRAN	TASK COUNT	RESPONSE TIME TOT	RESPONSE TIME AVE	RESPONSE PEAK 90%
-----	-----	-----	-----	-----
ABAL	3	0.002592	0.000864	0.00095340
APOS	4	0.003392	0.000848	0.00094987
ASUM	4	0.003488	0.000872	0.00092082
AUTS	1	0.000752	0.000752	0.00075200
BALA	4	0.004016	0.001004	0.00163763
BDEP	1	0.000704	0.000704	0.00070400
CATA	2	0.006336	0.003168	0.00316800
CSMI	11	0.009120	0.000829	0.00138661
EORE	3	0.004272	0.001424	0.00215297
ERLE	2	0.002336	0.001168	0.00148709
MBOX	1	0.000816	0.000816	0.00081600
NEWS	2	0.001952	0.000976	0.00138211

Figure 416. SQL query calculating 90% peak percentile of response time

Peak Percentiles are calculated using the formula:

Factor\*Standard Deviation+Average

In the example, the Factor for 90% is 1.282. The following table shows the Factors for each 5 percentile above 50% (the average):

0.126	55%
0.253	60%
0.385	65%
0.524	70%
0.674	75%
0.842	80%
1.036	85%
1.282	90%
1.645	95%

---

## SQL queries for List HDB

List HDB data is typically used to drill down to isolate performance problems or for ad-hoc reporting.

Take care when exporting List HDBs into DB2. The volume of data can be high, resulting in a table that is too large to manage.

### Top ten worst transaction times

The following query reports the top 10 worst response times:

```
SELECT TRAN,
       TIME(START)           AS "Start Time",
       DEC(RESPONSE_TIME,10,4) AS "Response Time",
       DEC(CPU_TIME,10,4)     AS "CPU Time",
       DEC(SUSPEND_TIME,10,4) AS "Suspend Time",
       DEC(DISPATCH_TIME,10,4) AS "Dispatch Time"
FROM CPADB.AORLIST
ORDER BY RESPONSE_TIME DESC
FETCH FIRST 10 ROWS ONLY
OPTIMIZE FOR 10 ROWS
```

This query produces output like the following:

TRAN	Start Time	Response Time	CPU Time	Suspend Time	Dispatch Time
----	-----	-----	-----	-----	-----
CSOL	13.14.34	1887.6433	0.0004	1887.6428	0.0005
CQRY	14.26.57	11.1696	0.0008	11.1636	0.0060
MV02	14.09.45	10.8949	0.0176	10.8724	0.0225
TANS	13.47.03	9.1463	0.3634	8.6515	0.4948
TANS	14.16.50	7.6264	0.3534	7.1469	0.4795
MV14	14.25.33	6.0772	0.0216	6.0395	0.0377
ADBQ	12.00:40	4.0492	0.0023	0.0011	0.0012
CDAA	14.25.33	3.0232	0.0153	0.0120	0.0129
BINS	11.12.54	2.0112	0.0022	0.0221	0.0177
CFIM	12.11.31	1.0938	0.0153	0.0122	0.0032

*Figure 417. SQL query listing top 10 worst response times*

---

## Chapter 23. Analyzing CSV extract data

An extract data file such as an HDB extract or Performance Data extract is a delimited text file that can be imported into PC spreadsheet or database tools such as Lotus 1-2-3 or Lotus Approach® for further reporting and analysis.

---

### Importing into Lotus 1-2-3

To import the extracted data into Lotus 1-2-3, follow these steps:

1. In 1-2-3, click the **Import** SmartIcon or choose **File - New**. 1-2-3 opens the File dialog box.
2. Select a text type of **Text - Delimited (\*.TXT)**.
3. Select the file to be opened. You might have to go to another folder or drive to find it.
4. Click **Open**. 1-2-3 displays the Text File Options dialog box.
5. Either click the option button **start a new column at each Semicolon** to indicate the character that separates the data fields, or type the separator character in the **Other characters** text box.
6. Click **OK**. After a few seconds of processing, 1-2-3 imports the data into records in the worksheet.

---

### Importing into Lotus Approach

To import the extracted text file performance data set into Lotus Approach, switch to the Approach Browse environment, and follow these steps:

1. In Approach, click the **Import** SmartIcon or choose **File - Import Data**. Approach opens the Import Data dialog box.
2. Select a text type of **Text - Delimited (\*.TXT)**.
3. Select the file to be imported. You might have to go to another folder or drive to find it.
4. Click **Import**. Approach displays the Text File Options dialog box.
5. Either click the option button to indicate the character that separates the data fields or type the separator character in the **Other** text box.
6. Place a checkmark in the **First Row Contains Field Names** checkbox. A checked checkbox is the default.
7. Click **OK**. Approach opens the Import Setup dialog box.
8. Drag the fields on the right side of the dialog box to match the related fields on the left side.
9. Click **OK**. After a few seconds of processing, Approach imports the data into records at the end of the file.
10. Edit the new records as needed.

---

## Part 7. Reference

The chapters in this part provide reference information about CICS PA:

- The “Messages” chapter lists the error messages and descriptions.
- The “Problem Determination” chapter provides advice to avoid user errors and help diagnose problems.
- There are three cross-reference tables to help you more easily use CICS PA and understand the data it is reporting. They apply to CMF performance class and transaction resource class data:
  - The “CMF Field IDs by CICS version” chapter contains a cross-reference table relating the CICS monitoring facility (CMF) fields with the corresponding CICS PA field names and CICS version.
  - The “CICS PA field names by CICS version” chapter contains a cross-reference table relating the CICS PA field names with the corresponding CICS CMF fields and CICS version.
  - The “Fields by forms, HDB templates” chapter contains a cross-reference table relating the CICS PA field names with the Report Forms and HDB Templates where they can be specified.

---

## Chapter 24. Messages

This section lists all the messages issued by CICS PA, a brief description of each, the action the system takes when the message is issued, and the action you should take when you get the message. The return codes set at the completion of batch processing are also listed.

The types of messages and their format are described, followed by the messages in numerical order.

The types of CICS PA messages are:

### Number

### Type

#### 0001–0999

**Batch processing.** These messages are issued during CICS PA report processing due to command errors, I/O and file errors, to give the status of job execution, and so on.

#### 1000–1099

**CICS PA dialog.** These messages are issued by the CICS PA dialog during JCL generation, or when creating Report Sets, Report Forms, Object Lists, and so on. For other CICS PA dialog messages, refer to the Online Help.

#### 2000–2099

**Data take-up.** These messages are issued during take-up processing. See “Personal Take-Up from SMF File” on page 104.

#### 3000–3099

**HDB.** These messages are issued during HDB processing. See Chapter 20, “Using the HDB dialog,” on page 613.

#### 4000–4099

**HDB SMF Statistics.** These messages are issued during HDB Statistics report processing. See Chapter 17, “Using the Statistics reporting dialog,” on page 535.

---

## Return codes

The following return codes are set by CICS PA at the completion of batch processing:

### RC

### Meaning

- |    |   |
|----|---|
| 0  | Batch processing completed successfully.  |
| 4  | Batch processing completed successfully, but a warning message was issued.                          |
| 8  | Batch processing completed, but an error message was issued. Some reports might not have completed. |
| 16 | Batch processing failed because of a command error.   |

---

## Message format

The CICS PA messages begin with a unique message identifier, followed by message text which might contain variable information to identify the particular circumstance which caused the message.

The message identifier has the format **CPAnnnnx** where:

- CPA** The **program identifier** identifies the message as a CICS PA message. All CICS PA messages begin with CPA.
- nnnn** The **message identification number** is a four-digit number that uniquely identifies each message.
- x** The **severity level** is a letter that indicates the return code (see “Return codes” on page 689), the purpose of the message, and the type of response required.

The severity levels, from least to most severe, are:

- I** Information. No action is required.
- W** Warning. CICS PA has detected a possible error condition that the user should evaluate.
- E** Error. User action is required before CICS PA can continue processing.
- S** Severe. CICS PA processing is suspended until action has been taken.

All batch command processing error messages have the same general format for the **Message Text** as follows:

Severity Prefix	Operand Data	General Error Text	Specific Error Text	Source Text
Warning or Severe	Operand in error	General error description	Specific error description	User input in error

The parts of the message are printed in the order shown in the diagram. Not all parts are present in every message. At least the general or specific text is present to describe the error.

### Severity Prefix

The first part of the message indicates whether the message is a warning message or a message which denotes a severe error. A warning is indicated by:

**\*\* Possible Error \*\***

A warning is issued for conditions that do not prevent report program execution. However, you should analyze all warning messages to determine if the conditions cited affect the expected results. Warning messages are not printed if PARM NOINFOMSGS has been specified.

A severe command error is indicated by one of two prefixes:

**\*\* Command Error \*\*\***

**\*\* Error During Scan \*\*\***

These messages are printed even if PARM NOINFOMSGS was specified. Most severe command errors cause a severe error flag to be set. At the end of command input processing, this flag is tested. If the flag tests true, no

record processors are run. CICS PA terminates at this point with a condition code of 16. To continue processing, you must correct the commands in error and resubmit the job.

#### **Operand Data**

If the error is associated with a recognizable operand, the operand is printed after the prefix. This part of the message is usually present. It is omitted when a recognizable operand cannot be associated with the error.

#### **General Error Text**

This describes the general nature of the error. It includes descriptive text appropriate for errors that can occur on any command; for example, a missing operand or label. This part of the message is usually present. It is omitted when the error is unique to the command being processed.

#### **Specific Error Text**

This is inserted by the individual command processor. It describes a condition unique to the command in error. Specific text might be provided in addition to the general text described previously to further clarify the error description. It can also be provided without general text, when the error condition is unique and the general text is inappropriate.

#### **Source Text**

This identifies the portion of the command input found to be in error during analysis. This part of the message is usually present.

Example:

If **CICSPA LIST(PUTPUT(LIST0001)** was coded when **CICSPA LIST(OUTPUT(LIST0001)** was intended, CICS PA provides the following message:

```
CPA0015E ** Command Error *** LIST Operand not recognized -  
valid values are: listed in the User's Guide.  
The suboperand is: PUTPUT(
```

This message indicates a severe error that must be corrected to continue report processing. The command contains a suboperand (PUTPUT) that is not recognized by the CICS PA command processor as a valid LIST operand. Correct the command by supplying valid values as defined by the specific error text. In this case, the specific error text directs you to this book. See Chapter 15, "Using the CICS PA commands," on page 371 which describes all the commands and operands.

The example message CPA0015E contains all five message parts:

#### **Message Part Text**

##### **Severity prefix**

\*\* Command Error \*\*\*

##### **Operand data**

LIST

##### **General error text**

Operand not recognized - valid values are:

##### **Specific error text**

listed in the User's Guide. The suboperand is:

##### **Source text**

PUTPUT(

## 0000–0999 Batch processing messages

These messages are issued during CICS PA report processing due to command errors, I/O and file errors, to give the status of job execution, and so on.

---

### CPA0000E Invalid Error Code – *CPAxxxx*

**Explanation:** A CICS PA module attempted to issue an error message using a message ID that is not defined. This is an internal logic error.

**System action:** Processing continues.

**User response:** Determine the issuing module and contact your IBM representative for help.

---

### CPA0001E NAME operand invalid – exceeds max allowable length

**Explanation:** A character string representing a name was flagged by CICS PA as being too long. Any name field associated with a DDNAME has a maximum length of 8.

**System action:** Processing is terminated.

**User response:** See “Operand value formats” on page 373 for syntax rules and restrictions on operands for the command in error. Correct the command input and resubmit the job.

---

### CPA0002E Operand has been previously used – this use overrides prior use

**Explanation:** The specified operand has been used previously in a command.

**System action:** The specified operand has been used previously in a command.

**User response:** Either be sure this override is intended or correct the command input to use the operand only once, and resubmit the job.

---

### CPA0003E DDname is missing or is DD DUMMY – use is ignored

**Explanation:** A command was entered using a DDNAME operand. However, the DD statement definition was not in the JCL stream. Execution proceeds, but could terminate at a later point if the DDNAME is for an input file or a required output file.

**System action:** Processing continues, but the report requiring this DDname might fail.

**User response:** Check for a spelling error on the DDNAME or OUTPUT operand, or supply the missing JCL statements, then resubmit the job.

---

### CPA0004E Operand is not recognized – skipping to next operand

**Explanation:** During command analysis, an operand

was expected but unrecognizable input was encountered.

**System action:** Processing is terminated after all commands are validated.

**User response:** Correct the command input and resubmit the job.

---

### CPA0005E \*\*\* Processing stopped on this command due to errors listed above

**Explanation:** One or more severe errors were encountered while processing the command input. No record processors are run. This message is preceded by additional command error messages describing the specific command input errors.

**System action:** Processing is terminated.

**User response:** Correct the command input and resubmit the job.

---

### CPA0006E Operand requires a value – none found

**Explanation:** The specified operand requires a value specified in parentheses. For example, the DDNAME operand was specified without a DDname value.

**System action:** The operand is skipped and command processing continues at the next operand. Processing is terminated after all commands are validated.

**User response:** Correct the command input by specifying the operand value and resubmit the job.

---

### CPA0007E Operand syntax invalid – skipping to next operand

**Explanation:** The specified operand has invalid syntax and is ignored by CICS PA.

**System action:** The operand is ignored and command processing continues at the next operand. Processing is terminated after all commands are validated.

**User response:** Correct the operand syntax and resubmit the job.

---

### CPA0009E Syntax invalid or not recognized

**Explanation:** The command or operand syntax is not supported by CICS PA.

**System action:** The command or operand is skipped and command processing continues. Processing is terminated after all commands are validated.

**User response:** Correct the command or operand syntax and resubmit the job.

---

**CPA0010E    Range specification invalid – first value exceeds second**

---

**Explanation:** A range was specified with a lower range value greater than the upper range value.

**System action:** The range specification is skipped and command processing continues. Processing is terminated after all commands are validated.

**User response:** Correct the range specification and resubmit the job.

---

**CPA0011E    Maximum specification exceeded**

---

**Explanation:** The maximum allowed value for an operand has been exceeded.

**System action:** The maximum accepted value is printed and is substituted for the specified input value. Processing continues.

**User response:** If the maximum value produces unsatisfactory results, correct the command input and resubmit the job.

---

**CPA0012E    Command requires a Label**

---

**Explanation:** The specified command requires an identifying label starting in column 1. The label can be 1 to 8 characters long.

**System action:** The command is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** Specify a label and resubmit the job.

---

**CPA0013E    Processing continues for diagnostics**

---

**Explanation:** CICS PA has previously encountered an unrecoverable error and diagnostic processing is activated.

**System action:** Diagnostic messages are issued and processing terminates.

**User response:** Look for previous error messages to determine the reason for the problem. If unresolved, contact your IBM representative for help.

---

**CPA0014E    Operand required but not found**

---

**Explanation:** CICS PA determined that a required operand was not specified in the command input.

**System action:** The command is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** Specify the required operand and resubmit the job.

---

**CPA0015E    Operand not recognized – valid values are:**

---

**Explanation:** An invalid operand was specified. A list of allowed operand values accompanies this message.

**System action:** The operand is ignored and command processing continues.

**User response:** Remove or correct the operand and resubmit the job.

---

**CPA0100S    STAE Exit invoked**

---

**Explanation:** An abend occurred when PARM STAE was specified or accepted as a default. This message might occur with another message for the error condition that triggered the abend. See “Batch Abends U1000, U1001, U1002” on page 732 for more information on STAE exits.

**System action:** Processing is terminated.

**User response:** Look for previous error messages to determine the reason for the problem. If unresolved, contact your IBM representative for help.

---

**CPA0114E    Attempting to free MQ entry not on queue**

---

**Explanation:** This is an internal logic error.

**System action:** The operation is ignored.

**User response:** Contact your IBM representative for help.

---

**CPA0115E    Invalid use of program – Dup use or no Prescan. Program deleted**

---

**Explanation:** This is an internal logic error.

**System action:** The record processor is deleted and execution continues.

**User response:** Contact your IBM representative for help.

---

**CPA0116E    xxxxxxxx Report Processor deleted – Requires Control Table**

---

**Explanation:** The report processor initialization could not find the control table for the indicated report processor. This is an internal logic error.

**System action:** The report processor is deleted, the request skipped, and execution continues.

**User response:** Contact your IBM representative for help.

---

---

**CPA0117E Invalid use of CAIDCOMD**

**Explanation:** Used for IBM debugging purposes.

**System action:** The execute command is ignored and processing continues.

**User response:** Contact your IBM representative for help.

---

**CPA0118E Invalid Operand Sublist Structure**

**Explanation:** The operand sublists are specified incorrectly. This is an internal logic error.

**System action:** The operand is skipped.

**User response:** Contact your IBM representative for help.

---

**CPA0119W Three fields max under SUMMARY(BY(\*\*,\*\*,\*\*)). Extras ignored.**

**Explanation:** More than three fields were specified for summarizing the data on the Performance Summary Report.

**System action:** Extra fields are ignored.

**User response:** The command stream must contain three or fewer SUMMARY(BY fields. Make corrections by eliminating the extra fields and resubmit the job.

---

**CPA0120S Error on some queue – Internal Logic Error**

**Explanation:** This is an internal logic error.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA0121S Error in Prescan – Reprocess buffer full**

**Explanation:** This is an internal logic error.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA0122E Length is a valid Suboperand only for CHARACTER**

**Explanation:** The LENGTH suboperand specified with the CROSSsystem report operand can be used with the character user field only. It is not valid with COUNT, CLOCKTIME, or CLOCKCOUNT user fields.

**System action:** The suboperand is ignored and processing continues.

**User response:** Examine the command stream, make the necessary corrections, and resubmit the job.

---

---

**CPA0123E Number not a valid suboperand for CHARACTER**

**Explanation:** The NUMBER suboperand specified with the CROSSsystem report operand is not valid for character user fields. It is used with COUNT, CLOCKTIME, or CLOCKCOUNT user fields.

**System action:** The suboperand is ignored and processing continues.

**User response:** Examine the command stream, make the necessary corrections, and resubmit the job.

---

**CPA0124E Invalid length specified for CHARACTER (LENGTH)**

**Explanation:** The length of the character user fields on the Cross-System Work report must be between 1 and 256.

**System action:** The suboperand is ignored and processing continues.

**User response:** Examine the command stream, make the necessary corrections, and resubmit the job.

---

**CPA0125E More than 50 user fields requested**

**Explanation:** A maximum of 50 user fields can be requested for generating a Cross-System Work Extract.

**System action:** The extra user fields are ignored and processing continues.

**User response:** Examine the command stream and make the necessary changes to reduce the number of user fields.

---

**CPA0126E Only one type of data record allowed under a SELECT operand**

**Explanation:** When using the SELECT operand, only one type of data record can be selected, such as PERFORMANCE or EXCEPTION. A separate SELECT operand must be used for each type of data record chosen.

**System action:** When using the SELECT operand, only one type of data record can be selected, such as PERFORMANCE or EXCEPTION. A separate SELECT operand must be used for each type of data record chosen.

**User response:** Examine the command stream, make the necessary corrections, and resubmit the job.

---

**CPA0127E Must have a VALUE operand for Selection**

**Explanation:** The VALUE suboperand, and its necessary operands, must be specified with the SELECT operand to determine selection criteria.

**System action:** Processing continues, but the results

---

from selection are unpredictable.

**User response:** Examine the command stream, make the necessary corrections, and resubmit the job.

---

**CPA0129W Three fields max under LISTX(BY(\*\*,\*\*,\*\*)). Extras ignored.**

**Explanation:** More than three fields were specified for sorting the data on the Performance List Extended Report.

**System action:** The extra fields are ignored.

**User response:** The command stream must contain three or fewer LISTX(BY fields. Make corrections by eliminating the extra fields and resubmit the job.

---

**CPA0131E PROFILING request, ID(nnnn), without matching BASELINE/REPORT**

**Explanation:** A PROFILING request has been found without matching BASELINE and REPORT commands.

**System action:** Request is terminated.

**User response:** Rerun request with matching commands.

---

**CPA0202E Data set open failed – Report Processors skipped, DDname=xxxxxxx**

**Explanation:** The indicated input data set could not be opened.

**System action:** All commands specifying reports using that input data set are skipped, and processing continues.

**User response:** Correct the JCL for the data set and resubmit the job.

---

**CPA0204E No DD card supplied; Routine deleted**

**Explanation:** The record processor indicated in the associated dump list has one specific input data set that must be included.

**System action:** The record processor is skipped and processing continues.

**User response:** Include a JCL statement for the data set to be used by the indicated record processor and resubmit the job.

---

**CPA0205E SORT Error – Permanent I/O Error, DDname=xxxxxxx**

**Explanation:** The sort module encountered a SYNAD error while attempting to perform an I/O operation on the data set referenced by data set xxxxxxx.

**System action:** Control returns to the module that issued the sort request.

**User response:** Look for any system message that

might be related to this error. Check the JCL and data set space allocation. The space requirements vary by application and by volume of input. The data set should be a temporary sequential data set. Do not specify the record format, logical record length, or block size in the JCL. Refer to the sample JCL specification in Figure 187 on page 355 for the correct JCL specification of the sort work data sets.

---

**CPA0206E SORT Error – INIT requested for open DCB, DDname=xxxxxxx**

**Explanation:** The CICS PA sort module has received a request from a record processor to reinitialize a data set, referenced by xxxxxxx, that is already in use. This might be an internal logic error.

**System action:** Control returns to the module that issued the INIT request.

**User response:** Check the JCL and command input stream. A sort work data set cannot be used by more than one application. If the data set appears to be defined correctly, contact your IBM representative for help.

---

**CPA0207E SORT Error – Key length exceeds 255, DDname=xxxxxxx**

**Explanation:** The combined length of all Key fields exceeds the maximum SORT key limit of 255 characters.

**System action:** Report processing stops.

**User response:** Remove Key fields to reduce the combined key length to no more than 255 characters.

---

**CPA0208E SORT Error – Data length exceeds 4095, DDname=xxxxxxx**

**Explanation:** This is an internal logic error. xxxxxxx is the name of the work data set associated with the sort error.

**System action:** Control returns to the module that issued the sort request.

**User response:** Contact your IBM representative for help.

---

**CPA0209E SORT Error – Key+Data length less than 1, DDname=xxxxxxx**

**Explanation:** This is an internal logic error. xxxxxxx is the name of the work data set associated with the sort error.

**System action:** Control returns to the module that issued the sort request.

**User response:** Contact your IBM representative for help.

---

**CPA0210E    SORT Error – Data Set open failed,  
DDname=xxxxxxx**

**Explanation:** The CICS PA sort module was unable to open the data set referenced by xxxxxxx.

**System action:** Control returns to the module that issued the sort request.

**User response:** Look for any system message that might be related to this error. Check the JCL and data set space allocation. The space requirements varies by application and by volume of input. The data set should be a temporary sequential data set. Do not specify the record format, logical record length, or block size in the JCL. Refer to the sample JCL specification in Figure 187 on page 355 for the correct JCL specification of the sort work data sets.

---

**CPA0211E    SORT Error – ADD attempted before  
INIT, DDname=xxxxxxx**

**Explanation:** The application is trying to add records to the data set before it has been initialized by the CICS PA sort module. This is an internal logic error.

**System action:** Control returns to the module that issued the sort request.

**User response:** Contact your IBM representative for help.

---

**CPA0212E    SORT Error – bad Return Code from  
SORT, DDname=xxxxxxx**

**Explanation:** The CICS PA sort module received a nonzero return code from the system sort routine attempting to sort the file xxxxxxx.

**System action:** Control returns to the module that issued the sort request.

**User response:** Look for any system message that might be related to this error. Ensure that the SYSOUT DD statement was specified. If so, look for SORT error messages in SYSOUT. Check the JCL and data set space allocation. The space requirements vary by application and by volume of input. The data set should be a temporary sequential data set. Do not specify the record format, logical record length, or block size in the JCL. Refer to the sample JCL specification in Figure 187 on page 355 for the correct JCL specification of the sort work data sets.

---

**CPA0213E    SORT Error – no records in file to read  
or sort, DDname=xxxxxxx**

**Explanation:** No input data was received. The probable cause is an empty data set or an input data set that does not contain the record IDs being selected.

**System action:** Control returns to the module that issued the sort request.

**User response:** Check the input data set for the record types required on the requested report. If the data set appears to be in order, contact your IBM representative for help.

---

**CPA0214E    SORT Error – SORT/Read running, 2nd  
request ignored, DDname=xxxxxxx**

**Explanation:** The CICS PA sort module received a request for a SORT or READ on a data set that has already processed a SORT or READ request. This might be an internal logic error.

**System action:** Control returns to the module that issued the sort request.

**User response:** A unique SORT work data set must be specified for each unique report using the sort facility. The names must match the PARMNAME of the reports. If the sort work data sets appear to be defined correctly, contact your IBM representative for help.

---

**CPA0215E    SORT Error – File failed to close,  
DDname=xxxxxxx**

**Explanation:** The CICS PA sort module received a nonzero return code after issuing a close macro on the data set xxxxxxx.

**System action:** Control returns to the module that issued the sort request.

**User response:** Contact your IBM representative for help.

---

**CPA0216E    Times out of sequence in Graph queue**

**Explanation:** The graph queue entries are not ordered by time. This problem might result from bad input data from the CICS Monitoring Facility (CMF) or from an internal logic error.

**System action:** The job abends with a user abend code.

**User response:** Review the input; if it appears to be correct, contact your IBM representative for help.

---

**CPA0217E    OFFSET value too large – exceeds queue  
size**

**Explanation:** This is an internal logic error.

**System action:** The job abends with a user abend code.

**User response:** Contact your IBM representative for help.

---

---

**CPA0218I    Record processing for SMF File *xxxxxxx* has started**

**Explanation:** CICS PA has commenced reading SMF records from the specified SMF File. SMF records are passed to the Report Processors to build the reports and extracts.

**System action:** Processing continues.

**User response:** None required.

---

**CPA0219I    End of File processing for SMF File *xxxxxxx+* has started**

**Explanation:** CICS PA has commenced End of File processing for the specified SMF File(s). A + (plus sign) after the DDname indicates that more than one SMF File was specified in the INPUT operand. The Report Processors are called to create the final reports or extracts.

**System action:** Processing continues.

**User response:** None required.

---

**CPA0220I    SMF records for System *xxxx* start at *mm/dd/yyyy hh.mm.ss.th***

**Explanation:** CICS PA has detected the first SMF record to process in the current SMF File. The specified system identifies the System ID of the SMF records.

**System action:** Processing continues.

**User response:** None required.

---

**CPA0221I    Dictionary Record read from SMF File  
DDname=*xxxxxxxxx*, +*nnn*,  
APPLID=*xxxxxxxxx*, SID=*xxxx*,  
Release=*v.r.m*, Record Date=*mm/dd/yyyy*,  
Time=*hh:mm:dd***

**Explanation:** CICS PA has detected a Dictionary record in the current SMF File, at concatenation +*nnn* if applicable, for the specified CICS APPLID and MVS system ID. CICS PA cannot start processing CMF performance records for an APPLID until the Dictionary record is read. The second line of this message details the date and time of the record, along with the CICS version.

**System action:** Performance reporting can commence for the specified APPLID.

**User response:** None required.

---

**CPA0222I    SMF records for System *xxxx* end at *mm/dd/yyyy hh.mm.ss.th***

**Explanation:** CICS PA has processed the last SMF record in the current SMF File. This message signifies that End of File for the current SMF File has been reached.

**System action:** Processing continues.

**User response:** None required.

---

**CPA0223W    SMF File *xxxxxxx* has no records to process**

**Explanation:** CICS PA has detected that there were no SMF records to process in the current SMF File. The reports and extracts will contain no data.

**System action:** Processing continues.

**User response:** Ensure that the CICS monitor is active during the time period that reporting is required.

---

**CPA0225E    *xxxxxxx* DCB failed to open**

**Explanation:** The data control block (DCB) for the indicated data set could not be opened.

**System action:** The function which uses that data set is not performed.

**User response:** Ensure that the data set was included in the JCL. If it was, correct the necessary parameters and resubmit the job.

---

**CPA0226I    Reporting started at *mm/dd/yyyy hh.mm.ss.th***

**Explanation:** CICS PA has detected the first CMF record within the specified SMFSTART/SMFSTOP time range.

**System action:** Reporting starts for the current SMF File.

**User response:** None required.

---

**CPA0227I    Reporting stopped at *mm/dd/yyyy hh.mm.ss.th***

**Explanation:** CICS PA has detected the first CMF record outside the specified SMFSTART/SMFSTOP time range.

**System action:** Reporting stops for the current SMF File.

**User response:** None required.

---

**CPA0228I    Dictionary Record from Dialog is being used, DDname=CPADICTR +*nnn*,  
APPLID=*xxxxxxxxx*, SID=*xxxx*,  
Release=*v.r.m*, Record Date=*mm/dd/yyyy*,  
Time=*hh:mm:dd***

**Explanation:** CICS PA has read a Dictionary record from the CPADICTR File, at concatenation +*nnn* if applicable, for the specified CICS APPLID. CICS PA needs to use it because a Performance record was encountered in the SMF File without a preceding Dictionary record. The third line of this message details

the date and time of the record, along with the CICS version.

**System action:** Performance reporting commences for the specified APPLID.

**User response:** None required.

**CPA0229I CICS PA has completed processing, RC=nn**

**Explanation:** CICS PA has completed reporting with the specified return code. If the return code is not zero, then CICS PA encountered a problem while producing the reports.

**System action:** CICS PA terminates.

**User response:** None required.

**CPA0230I Dictionary Record default is being used, APPLID=xxxxxxx, Release=v.r.m**

**Explanation:** CICS PA is using the CICS default Dictionary record. CICS PA needs to use it because a Performance record was encountered in the SMF File without a preceding Dictionary record, and the Dictionary record for this APPLID could not be located in the CPADICTR File.

**System action:** Performance reporting commences for the specified APPLID.

**User response:** None required.

**CPA0231W Dictionary Record default cannot be used, APPLID=xxxxxxx, Release=v.r.m**

**Explanation:** CICS PA has tried to use the CICS default Dictionary record for the specified APPLID, but was unable to do so. The field connectors in the Performance records do not match the Dictionary record. CICS PA needs to use it because a Performance record was encountered in the SMF File without a preceding Dictionary record, and the Dictionary record could not be located in the CPADICTR File. The most likely cause of this problem is your MCT definition which might have removed some CMF fields.

**System action:** Performance records are ignored until a Dictionary record is encountered in the SMF file.

**User response:** Use the CICS PA dialog to create a Dictionary record for the offending APPLID. Then re-generate the report JCL, which will now include a CPADICTR DD statement containing the APPLID's Dictionary record. See "CICS System (APPLID) definition" on page 82 to see how to create a Dictionary DSN.

**CPA0233E Dynamic Allocation failed. RC=xx  
Error=xxxx Info=xxxx**

**Explanation:** CICS PA attempted to allocate an Object dynamically and was unsuccessful. The Return Code (RC) from the attempt as well as the Error and Information codes are provided to aid diagnosis.

**System action:** Further messages from the Dynamic Allocation request might be printed following this message. Processing of the CICS PA command is halted.

**User response:** Analyze the error, rectify the problem(s) causing the Request to fail and retry the CICS PA command.

**CPA0301E ID Selection checked was invalid – record ignored**

**Explanation:** This error message is issued from the selection module when the dictionary processor was unable to find the field being used in selection.

**System action:** The record is ignored and control returns for further record processing.

**User response:** Selection might have been specified using a field that was not collected in the CICS Monitoring Facility (CMF) record. Check the field selections in the command input stream against the fields collected in the CMF record. If the selected fields are being collected, contact your IBM representative for help.

**CPA0302E Missing xxxxx time in xxxxxxxxxx record – record ignored**

**Explanation:** The start or stop time was missing in the indicated record class.

**System action:** The record is ignored and control returns for further record processing.

**User response:** This might be a problem with the CICS Monitoring Facility (CMF) data. Analyze the data by using the CICS sample program DFH\$MOLS. Incorrect data in the CMF records is normally caused by not selecting a field for inclusion in the data.

If the data appears to be correct, this might be a problem with CICS PA. Contact your IBM representative for help.

**CPA0303E Number of Key fields exceed maximum of 8**

**Explanation:** CICS PA supports up to 8 Key fields.

**System action:** Report processing stops.

**User response:** Reduce the number of Key fields to 8 or less.

---

**CPA0310E    Summary Key error - Key sequence error detected at field xxxxxxxx**

**Explanation:** The field named in xxxxxxxx was included in the Key fields sequence but is not a valid Key field. Key fields must be specified contiguously.

**System action:** Report processing stops.

**User response:** Delete the named field from the Key sequence or move it after the Key fields.

---

**CPA0311E    Field ID xxxxxxxxxxxx is not defined to Dictionary – field ignored**

**Explanation:** The dictionary processor was unable to locate a CMF field required for the requested report. For CICS defined fields this may be due to the required field having been excluded from the performance class record by a user defined Monitoring Control Table (MCT). For user-defined fields this may be due to CICS PA not having processed the required dictionary before encountering the first data record.

**System action:** The requested field and all subsequent fields on the report are ignored.

**User response:** Analyze the CMF data using DFH\$MOLS for assistance in checking that the field ID required for the report is actually collected in the CMF record. If a user-defined Monitoring Control Table (MCT) is being used, then check that the requested field id has not been excluded from the performance record. The CICS journal utility program DFHJUP can be also used to further analyze the content of the CMF record the structure and format of which can be found in the *CICS Customization Guide*. If the necessary field ids are present in both the dictionary record and the performance class records, contact your IBM representative for help.

---

**CPA0312E    Unknown type of field – all further fields ignored**

**Explanation:** An invalid type of field (the CICS 12-byte ID) was set up by the command processor. This is an internal logic error.

**System action:** The Performance List, Performance List Extended and Performance Summary reports are printed with the data to the left of the field in question on the print line. The field in question and all the fields to the right of it are ignored.

**User response:** Contact your IBM representative for help.

---

**CPA0313W    EOF reached before STOP record encountered**

**Explanation:** During the processing of history or alert monitor summary collections, end-of-file was reached on the input data set without encountering a stop record. The missing stop record might imply that part

of the summary collection was lost or that the file is continued on another data set.

**System action:** A stop record is assumed. The data is summarized and the report printed.

**User response:** None required.

---

**CPA0314W    START record encountered after DETAIL record with no STOP record**

**Explanation:** A start record was encountered when a stop record was expected. A stop record, indicating the end of summary collection, was not written to the journal data set.

**System action:** When a start record follows a detail record, a stop record is implied. At that point, the summary portion of the report is printed. A new report is started for the start record and the following detail records.

**User response:** None required.

---

**CPA0316E    Report in xxxxxxxx has too many fields to print – extra fields ignored**

**Explanation:** CICS PA found that the number of fields requested for either the Performance List, Performance List Extended, or Performance Summary Reports could not fit on the print line. xxxxxxxx is the DDname of the report output for the particular report in error. The fields for these reports are requested using the FIELDS operand.

**System action:** The fields are truncated to show as much data as fits on the print line.

**User response:** Recode the FIELDS operand to request fewer fields. You might also consider running multiple reports if more data is needed than can fit on one line.

---

**CPA0317W    Truncated Monitor record encountered**

**Explanation:** CICS PA found that the record length was less than the record length that CICS wrote at the front of the record.

**System action:** CICS PA runs with the shorter record length. This might allow the program to complete normally. A fetch protection or other abends might occur due to the invalid data. All data on the report is in doubt.

**User response:** You should be sure that you have not copied the CICS CMF data with a utility that truncates without warning. These records can easily be truncated since they are in undefined record format and do not give length errors. You should consider increasing the block size of the output data set. Care must also be taken when concatenating the input data sets. The first data set must not have a smaller block size than the succeeding data sets. The data set with the largest

block size must be at the beginning of the concatenation.

---

**CPA0318W Padded Monitor record encountered**

**Explanation:** CICS PA found that the record length was longer than the record length that CICS wrote at the front of the record.

**System action:** CICS PA runs normally. You should be aware of this problem since it might be due to invalid data. You might also have caused this problem by copying the data from one unit to another with a utility that padded the record. If the record was padded, it will not use space efficiently and might affect the processing time of CICS PA.

**User response:** Determine why the record was padded and correct the problem.

---

**CPA0319E Error in number of or offset to data fields**

**Explanation:** See "CPA0322E."

---

**CPA0320E Processing beyond end of SMF record attempted**

**Explanation:** See "CPA0322E."

---

**CPA0321E Data section length error**

**Explanation:** See "CPA0322E."

---

**CPA0322E Error in number of or offset to Field Identifiers**

**Explanation:** One or more of the messages CPA0319E, CPA0320E, CPA0321E, or CPA0322E is issued when an incorrect record length, section length, or data field pointer is encountered during processing of the CICS Data Section in the SMF record. The error is in one of the following fields:

- Data Section Length
- Offset to field connectors (SMFMNDCA)
- Number of field connectors (SMFMNDCN)
- Offset to data records (SMFMNDRA)
- Number of data records (SMFMNDRN)

These fields are contained in the SMF Product Section, which precedes the CMF data records.

The format and description of the SMF Header, SMF Product Section, and CMF data records can be found in the *CICS Customization Guide*.

**System action:** CICS PA skips the record in error and continues processing the remaining records. The error record is printed along with a 4-byte field containing the displacement of the error record in the physical record. Only the first 256 bytes of the record are printed. If more than 256 bytes is required, you might

specify the amount of data printed by using the command PARM MAXDUMP(*nnnn*).

**User response:** Determine the fields in error and contact your IBM representative for help.

---

**CPA0323E Invalid SMF record type encountered**

**Explanation:** An invalid SMF record type was encountered by CICS PA.

**System action:** CICS PA skips the record in error and continues processing the remaining records. The error record is printed along with a 4-byte field containing the displacement of the error record in the physical record. Only the first 256 bytes of the record are printed. If more than 256 bytes is required, you might specify the amount of data printed by using the command PARM MAXDUMP(*nnnn*).

**User response:** Determine the fields in error and contact your IBM representative for help.

---

**CPA0324S Error threshold count reached...Job terminated**

**Explanation:** CICS PA has reached the maximum number of errors allowed. When ten errors (described in messages CPA0319E through CPA0322E) occur, CICS PA ends the job.

**System action:** CICS PA terminates the job.

**User response:** Determine the fields in error and contact your IBM representative for help.

---

**CPA0325I Prescan Reprocessing Table filled – TABLEnnnn allocated**

**Explanation:** This is an informational message only. CICS PA uses an internal table to deblock the data from the monitor data record. The table was not large enough to contain all the data that had to be deblocked so space for an additional table was acquired. The additional table is concatenated to the original. The value *nnnn* in the message tells how many tables have been acquired at the time of the message.

**System action:** CICS PA continues to run normally but the processing time is increased by the need to obtain additional storage requests.

**User response:** Verify that there is no bad data causing CICS PA to incorrectly deblock the monitor data. If the blocksize of the monitor data set is large, this message can be ignored.

---

**CPA0327W SUMMARY key field not specified**

**Explanation:** The Summary report requires at least one key field to be specified but none were detected.

**System action:** Request is terminated.

**User response:** Specify a key field in the Summary

| Form or FIELDS operand and rerun.

---

**CPA0329E Dictionary returned error on Field ID**  
xxxxxxxxxxxx

**Explanation:** The dictionary processor was unable to find the data associated with the 12-byte FIELD ID.

**System action:** The data fields on the report are printed as Missing.

**User response:** Verify that the CMF data required for the requested report was collected in the CMF records. The DFH\$MOLS sample program can be used to analyze the contents of the dictionary records.

---

**CPA0330W Dictionary called by Prescan with unknown record type**

**Explanation:** The record encountered was not a performance, exception, or dictionary record. This is an internal logic error.

**System action:** The data record is ignored and processing continues.

**User response:** Obtain a dump of the records and contact your IBM representative for help.

---

**CPA0331E Performance data encountered before Dictionary, APPLID=xxxxxxx. Data lost!**

**Explanation:** A performance record was read for the specified APPLID, but a dictionary record for that APPLID has not been read yet. CICS PA cannot process the CMF performance data records without first processing the dictionary record for the same APPLID. CICS PA only issues one CPA0331E message per APPLID. More data records might have been ignored.

The cause of a missing dictionary record might include:

1. The switch of an SMF MANx data set while the monitor is running. CICS only writes a dictionary record when the monitor commences.
2. Multi-volume input files are not specified in time sequence.
3. Merged SMF files have records in incorrect sequence.

**System action:** The data record is ignored and processing continues.

**User response:** If the SMF input file specification is correct, and the missing dictionary record is unavoidable, then use the dictionary record creation facility in the dialog. A dictionary record can be created from the CICS system definition for the offending APPLID. See "CICS System (APPLID) definition" on page 82. When CICS PA generates report JCL, the CPADICTR DD statement will include the required dictionary records. You can also use the Monitoring Dictionary Utility Program DFHMNDUP to create the dictionary records required.

Data sets containing required dictionary records can be specified in two places in the JCL:

1. At the top of the SMF input file concatenation. CICS PA will read and use the dictionary record until another is read in the SMF File.
2. In the CPADICTR DD statement. CICS PA will only read and use the dictionary record if one is not found in the SMF File.

If you are unsure about the SMF data validity, analyze the CMF data using DFH\$MOLS.

---

**CPA0332W xxxxxxxxx Data length may be incorrect**

**Explanation:** CICS PA does an internal calculation of the length of the CMF record. The calculated length does not match the record length field in the record itself.

**System action:** Processing continues, however data from that record might be invalid.

**User response:** None required.

---

**CPA0333E Connector ID X'xxxx' not mapped by**  
xxxxxxxxxxxx **Dictionary for APPLID**  
xxxxxxxx

**Explanation:** A field in the data record is not mapped by the performance record dictionary data. There is either an error in the CICS Monitoring Facility (CMF) data, or the dictionary record that you created in the CICS PA dialog or via DFHMNDUP is not compatible with the data records.

**System action:** The remainder of the data record is ignored and processing continues.

**User response:** If CICS PA read and used a dictionary record that you created, then ensure that the CICS SDFHLOAD library and MCT specification were valid. If CICS PA read and used a dictionary record from the SMF File, then analyze the CMF data using DFH\$MOLS for assistance in determining the source of the error. Contact your IBM representative for help.

---

**CPA0334E A type "A" field (Counter) requested but length not 4 or 8**

**Explanation:** The CMF record indicated an incorrect length for a counter field. Length must be 4 or 8

**System action:** The return code is set and control is returned to the module that requested the data. A nonzero return code tells the requesting module the data is either invalid or can't be found.

**User response:** There is an error in the CICS Monitoring Facility (CMF) data. Analyze the CMF data using DFH\$MOLS for assistance in analyzing the source of error. Contact your IBM representative for help.

---

**CPA0335E    An unknown type of field was requested: "xxxxxxxxxxxx"**

**Explanation:** The CICS 12-byte ID requested by a report processor and found by the dictionary processor is invalid. The field type (for example, A=COUNTER, S=CLOCK/COUNT) is unrecognizable and can't be processed by the dictionary processor.

**System action:** The return code is set and control is returned to the module that requested the data. A nonzero return code tells the requesting module the data is either invalid or can't be found.

**User response:** This was most likely a user error caused by incorrect definition of user fields. The data type (ninth character position in the CICS 12-byte ID) must be a valid CICS data type. Review the *CICS Customization Guide* for the valid data types in the CICS Monitoring Facility. Verify that all user fields are defined correctly before contacting your IBM representative for help.

---

**CPA0336W    Dictionary called by Report Processor with unknown record type**

**Explanation:** The record encountered was not a performance class record.

**System action:** The record is ignored and processing continues.

**User response:** This is a CMF data error. Obtain a dump of the records and contact your IBM representative for help.

---

**CPA0338E    STOP time earlier than START time**

**Explanation:** The transaction stop appeared to happen before the transaction start.

**System action:** The record is ignored and processing continues.

**User response:** This is probably due to merging data improperly or to multi-volume data sets processed in the wrong order. Analyze the CMF data using DFH\$MOLS for assistance in correcting the error.

---

**CPA0340E    Dictionary unable to find required CMF data for xxxxxxxxxxxx Graph**

**Explanation:** While processing the indicated graph, the Dictionary Processor was unable to find any of the required fields in the CMF data.

**System action:** The graph requested is ignored and processing continues normally.

**User response:** Verify that the necessary CMF data is being collected in the records before requesting the graph. Also, verify that there are records being processed. If no records are selected or the input file

does not contain performance class records, the graph cannot be processed.

---

**CPA0341E    Dictionary flagged required Graph data missing on nnnnnnnnn accesses**

**Explanation:** While processing the graph preceding this message, the dictionary processor was unable to find the required CMF data the number of times indicated.

**System action:** Zeros are used where actual data cannot be found. The graph is printed but it is inaccurate due to the zeroed data.

**User response:** Analyze the CMF records using DFH\$MOLS and verify that the required data is collected on all records. If it appears that the data is all there, there is an internal logic error. Contact your IBM representative for help.

---

**CPA0342W    No Performance records found. Number of tasks set to 1.**

**Explanation:** If no performance records were found by the Performance Totals report processor, the number of tasks is set to 1.

**System action:** Processing continues normally.

**User response:** None required.

---

**CPA0346E    No records were selected from input for processing**

**Explanation:** The issuing report processor had no input records to process. Either the input data set did not contain any of the necessary type of records or the user's SELECT specification caused no records to be included.

**System action:** The report header is printed along with the error message. Processing continues.

**User response:** Determine that the necessary record types are present on the input data set. If using the SELECT operand, correct the operands to eliminate the exclusion of all records.

---

**CPA0347I    Cross-System Data Set successfully generated, record count=nnnnnnnn**

**Explanation:** The Cross-System Work Extract data set was successfully generated. The record count shows how many records were written to the data set.

**System action:** Processing continues normally.

**User response:** None required.

---

---

**CPA0348W    Unsupported CMF records encountered – records ignored**

---

**Explanation:** CICS SMF 110 records were encountered in the input data set, but they were from a version not supported by this release of CICS PA.

**System action:** The record is ignored and processing continues.

**User response:** None, or remove the input data set containing unsupported CMF records.

---

**CPA0351E    GETMAIN failed – Report terminated**

---

**Explanation:** A GETMAIN request for storage failed.

**System action:** The report processor terminates.

**User response:** Specify a larger REGION parameter in the JCL.

---

**CPA0352I    Cross-System Data Set was not generated**

---

**Explanation:** The Cross-System Work Extract failed to generate the extract data set. A preceding error message details the reason why the extract has failed.

**System action:** Processing continues normally.

**User response:** Refer to the preceding error message to determine the cause of the problem.

---

**CPA0355I    Exported Data Set successfully generated**

---

**Explanation:** The Export Extract successfully generated the extract data set.

**System action:** Processing continues normally.

**User response:** None required.

---

**CPA0356W    Export record is missing data – missing fields contain blanks**

---

**Explanation:** The Export Extract records contain fields that were not available in the performance data records. The missing fields contain blank values. The Export Extract record contains all CICS Transaction Server VRM 680 performance clock fields, but you might be running an earlier release of CICS or excluded some fields in the MCT.

**System action:** Processing continues normally.

**User response:** Verify that the missing (blank) field values are not being collected in the CMF Performance records. Otherwise, contact your IBM representative.

---

---

**CPA0357I    LIST reports share output file xxxxxxxx, report lines may be interleaved**

---

**Explanation:** Multiple Performance List Reports were requested with the same OUTPUT file name. This can cause the report lines to be interleaved if the reports process the same APPLIDs or the CMF data is not sorted by APPLID.

**System action:** Processing continues normally.

**User response:** It is recommended that:

1. Each Performance List report specify a unique OUTPUT DDname. This will ensure that each LIST report has contiguous output, and not interleaved with other LIST reports.
  2. Each Performance List report specify a single APPLID in the APPLID operand, or specify APPLID in the FIELDS list, or the CMF data is sorted by APPLID. This will ensure that the report does not page break too often. The LIST report performs a page break each time the APPLID changes in the data, except when APPLID is specified in the FIELDS list.
- 

**CPA0359W    Connector ID X'xxxx' not mapped by Performance Dictionary record**

---

**Explanation:** There is an incompatibility between the CMF Performance records and their associated Dictionary record for the specified CICS APPLID. The CMF Performance records contain data for the specified Connector ID, however their Dictionary record did not include a CMF field definition for this Connector ID. When the Field ID in error is a "CMF field", then this might be a serious problem. It might be caused by the Dictionary and Performance records being generated by different versions of CICS. When the Field ID in error is a "User Field", then this might indicate that the Dictionary record does not contain the User Fields defined in the MCT for this CICS APPLID.

**System action:** Processing continues for this CICS APPLID, however only CMF fields with Connector IDs resolved before the problem occurred are available for reporting.

**User response:** Your response will depend on the source of the Dictionary record. There are three possible sources from where CICS PA can obtain the Dictionary record:

1. CICS PA found the Dictionary record in the SMF File. Message CPA0221I was issued previously to indicate this. If the Dictionary record was written by CICS when the Monitor started, then a serious problem has occurred. Use the CICS DFH\$MOLS utility to analyze your CMF data. This will help you determine the source of the error. In this case, you might need to contact your IBM representative for help.

If you created the Dictionary record (using the CICS DFHMNDUP utility) and concatenated it ahead of

your SMF File DD specification, then verify that the Dictionary record is for the correct version of CICS, or that your MCT specification matches the one used by CICS.

2. The Dictionary record was created from the CICS PA dialog and CICS PA read it from the CPADICTR File. Message CPA0228I was issued previously to indicate this. If the Field ID in error is a "user field", then you probably created your Dictionary record with an incorrect MCT specification. Return to the dialog and ensure that your MCT specification matches the one used by CICS.
3. CICS PA used the default Dictionary record for your version of CICS. Message CPA0230I was issued previously to indicate this. If the Field ID in error is a "user field", then your CICS APPLID probably uses an MCT with user fields defined. If you want to report against the user fields, then create a Dictionary record using the CICS PA dialog.

---

**CPA0360E    System Logger report initialization failed**

**Explanation:** This is an internal system error.

**System action:** System Logger report processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA0361I    Logger reports share output file  
xxxxxxxx, reports may be interleaved**

**Explanation:** Multiple System Logger reports were requested with the same OUTPUT file name. This can cause the reports to be interleaved.

**System action:** Processing continues normally.

**User response:** It is recommended that every CICS PA report specifies a unique OUTPUT DDname. This will ensure that reports are not interleaved with other reports.

---

**CPA0362I    Invalid data in Type 88 SMF record,  
reason code=x**

**Explanation:** The SMF Type 88 record was bypassed because it had missing or incomplete data.

**System action:** Processing continues, but this record is bypassed. The record is dumped for analysis.

**User response:** Determine the cause of the invalid record(s).

---

**CPA0363I    Additional sections in Type 88 SMF  
record, reason code=xx**

**Explanation:** CICS PA SMF Type 88 record processing assumes that only one section of each type is present.

**System action:** Processing continues, but this record is bypassed. The record is dumped for analysis.

**User response:** Contact your IBM representative for help.

---

**CPA0364I    Non-CICS logstream *logstreamname*  
bypassed**

**Explanation:** CICS PA processes only CICS-related System Logger records.

**System action:** Processing continues.

**User response:** None required.

---

**CPA0365W    Logger SMF recording interval  
specification may be invalid**

**Explanation:** Message CPA0366W is a continuation of this message.

The specified interval, or system interval if one is not specified, is compared with the calculated interval, based on the SMF records, and was found to be different. This might result in invalid data in the System Logger Summary report.

**System action:** Processing continues.

**User response:** Verify that the specified interval, or system interval, is correct for the SMF records being processed.

---

**CPA0366W    INTERVAL Calculated=xxmins,  
Specified=xxmins, Output=xxxxxxxx**

**Explanation:** This message is a continuation of message CPA0365W.

---

**CPA0370E    Logic Error - DB2 Report Processor  
routine xxxxxxxx, Reason=xxx**

**Explanation:** This is an internal system error.

**System action:** DB2 report processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA0371W    DB2 Version x Release x record  
encountered - records ignored**

**Explanation:** A DB2 Accounting record for a DB2 release that is not supported by CICS PA has been encountered. All records for this DB2 release are ignored.

**System action:** Processing continues.

**User response:** None required.

---

**CPA0372W Invalid DB2 record encountered - records ignored**

**Explanation:** Message CPA0373I is a continuation of this message.

At least one DB2 Accounting record with an invalid format has been encountered. All DB2 Accounting records with invalid format are ignored.

**System action:** Processing continues.

**User response:** Check that the input SMF file contains valid SMF Type 101 (X'65') records.

---

**CPA0373I DB2 release *v.r* Reason=*xxx*  
Info=*xxxxxxxx***

**Explanation:** This message is a continuation of message CPA0372W.

---

**CPA0374W DB2 Report Processor missing required field - records ignored**

**Explanation:** At least one CMF Performance record selected by the DB2 Report Processor was found to be missing a required field.

**System action:** The record is ignored and processing continues.

**User response:** Verify that the specified Field ID is in the CMF record. You might have excluded this field in your MCT. If the necessary Field IDs are present in the records, contact your IBM representative for help.

---

**CPA0375W Transaction *xxxx* has used additional object and exceeded the object Limit of *nn***

**Explanation:** A resource limit has been exceeded for one of two object types: Files or TSQueues.

**System action:** Processing continues.

**User response:** For Files:

Ensure that the File Resource Limit specified in the DFHMCT TYPE=INITIAL macro via the FILE= keyword is high enough to support your transactions' File Usage.

For TSQueues:

Ensure that the TSQueue Resource Limit specified in the DFHMCT TYPE=INITIAL macro via the TSQUEUE= keyword is high enough to support your transactions' Temporary Storage Usage.

For more information, see "Transaction Resource Class data" on page 55.

---

**CPA0380E Logic Error - MQ Report Processor routine *xxxxxxxx*, Reason=*xxx***

**Explanation:** This is an internal system error.

**System action:** WebSphere MQ Reporting processing is terminated.

**User response:** Contact your IBM support representative for assistance.

---

**CPA0381W MQ Version *v* Release *r* record encountered - records ignored**

**Explanation:** A WebSphere MQ Accounting record for a WebSphere MQ release that is not supported by CICS PA has been encountered. All records for this WebSphere MQ release are ignored.

**System action:** The record is ignored and processing continues.

**User response:** None required.

---

**CPA0382W Invalid MQ record encountered - records ignored**

**Explanation:** Message CPA0383I is a continuation of this message.

At least one WebSphere MQ Accounting record with an invalid format has been encountered. All WebSphere MQ Accounting records with an invalid format are ignored.

**System action:** The record is ignored and processing continues.

**User response:** This message can be ignored if it was displayed during Systems Take-up as it does not affect the take-up processing. Otherwise, check that the input SMF file contains valid SMF Type 116 (X'74') records.

---

**CPA0383I MQ release *v.r* Reason=*xxx*  
Info=*xxxxxxxx***

**Explanation:** This message is a continuation of message CPA0382W.

---

**CPA0386I Field ID=*xxxxxxxx*, SYSID=*xxx*,  
Release=*v.r.m***

**Explanation:** This error message is issued from the selection module when the field specified in the selection is not valid for the z/OS release of the system that created the Logger record.

**System action:** The record is ignored and control returns for further processing.

**User response:** Selection has been specified using a field that is not applicable for the z/OS release of the system that created the Logger record. Check the field selections in the command input stream against the Logger fields valid for the z/OS release. If the selected

field is valid, contact your IBM representative for help.

---

**CPA0387E    Stats HDB cannot be used in Profiling request. HDB Name=xxxxxxx**

**Explanation:** A Statistics HDB has been requested for a Transaction Profiling report. You can only use Performance HDBs for a Transaction Profiling report.

**System action:** Request is terminated.

**User response:** None.

---

**CPA0388E    Summary Key error - Field xxxxxxxx invalid as key field.**

**Explanation:** This field cannot be used as a key field to summarize data.

**System action:** Field is ignored.

**User response:** Exclude this field from the requested form.

---

**CPA0389E    Application Group xxxxxxxx not defined.**

**Explanation:** Either the Application Group specified in the FIELDS operand is not defined in the Repository, or the resource field specified in the Application Group is not defined in the Dictionary record.

**System action:** Field is ignored or reported as Missing.

**User response:** Do one of the following:

- Ensure that the Application Group is defined in the specified Repository
- Specify the Repository that contains the Application Group definition
- Delete the Application Group from the Form
- Ensure the correct Dictionary record is used

---

**CPA0390E    Alert Definition xxxxxxxx not defined in Repository**

**Explanation:** The Alert Definition suboperand specifies an Alert Definition name that is either invalid, does not exist in the repository, or has no Performance Alert Values defined.

**System action:** The report processing is terminated.

**User response:** Take whichever of the following actions is appropriate:

- Specify a valid Alert Definition name
- Specify the Repository that contains the Alert Definition
- If it is a Performance Alert Definition, ensure that associated Alert Values have been defined

---

**CPA0391E    Alert Definition xxxxxxxx contains nonexistent Resource List(s)**

**Explanation:** One or more Resource Lists specified in the Statistics Alert Definition do not exist.

**System action:** The report processing is terminated.

**User response:** Specify valid Resource List names in the Alert Definition, and then rerun the report.

---

**CPA0392E    Alert Definition xxxxxxxx contains invalid threshold**

**Explanation:** The Alert Definition contains an invalid threshold.

**System action:** The report processing is terminated.

**User response:** Correct the invalid threshold value in the specified Alert Definition, and then rerun the report.

---

**CPA0393E    Logic Error - Alert Definition xxxxxxxx**

**Explanation:** This is an internal error, possibly caused by Repository access problems.

**System action:** The report processing is terminated.

**User response:** Contact your IBM support representative for assistance.

---

**CPA0394E    Alert Definition xxxxxxxx contains an invalid Formula**

**Explanation:** A Formula in the Alert Definition contains an invalid expression.

**System action:** The report processing is terminated.

**User response:** Correct the Formula in the specified Alert Definition, and then rerun the report.

---

**CPA0395E    Alert Definition xxxxxxxx contains no active conditions**

**Explanation:** There are no active conditions in the specified Alert Definition.

**System action:** The report processing is terminated.

**User response:** Activate one or more conditions in the specified Alert Definition, and then rerun the report.

---

**CPA0396I    No HDBs match the specified Qualifier**

**Explanation:** No HDBs in the Repository have this Qualifier value and also have the Explorer option selected.

**System action:** No HDBs are added to the manifest.

**User response:** Ensure that the Qualifier field is specified correctly. Ensure that any HDBs that are intended to be included in this manifest have the same

qualifier and have the Explorer option selected.

---

**CPA0397E Transaction Tracking Summary report required fields missing**

**Explanation:** The FIELDS operand of the TRACKINGSUMMARY command is missing one or more of the required fields PHAPPLID, PHTRAN, or PHCOUNT. At least one of PHAPPLID and PHTRAN must be specified. PHCOUNT is required.

**System action:** The report processing is terminated.

**User response:** Ensure that the first fields specified in the TRACKINGSUMMARY FIELDS operand are PHAPPLID or PHTRAN or both, followed by PHCOUNT.

---

**CPA0400E Field ID xxxxxxxx xxxxxxxxxxxx not defined in HDB, field ignored**

**Explanation:** The specified field was requested for reporting but is not a defined field for this HDB. The Template whose name is specified in the HDB Definition defines fields in an HDB.

**System action:** The field is not reported. Character fields are printed as blank whilst numeric fields are printed as **missing**.

**User response:** Ensure that your Report Form only requests fields that are defined to the HDB Template.

---

**CPA0401E Field name xxxxxxxx is not supported, reporting is stopped**

**Explanation:** The specified field was requested for reporting but is not a field that is known to CICS PA.

**System action:** HDB report processing is terminated.

**User response:** Ensure that your FIELDS operand only specifies fields that are supported by CICS PA.

---

**CPA0402E Key field xxxxxxxx is not supported, HDB load processing is stopped**

**Explanation:** The specified field was requested for load processing but is not a field that is known to CICS PA.

**System action:** HDB load processing is terminated.

**User response:** Ensure that your FIELDS operand only specifies fields that are supported by CICS PA.

---

**CPA0403W Template Field xxxxxxxx (xxxxxxxxxxxx) is not defined to Dictionary – ignored**

**Explanation:** The named field was specified in the Template associated with the container data set being LOADED, but the field is not defined to the Dictionary.

**System action:** The field is not loaded into the container data set.

**User response:** None required.

---

**CPA0404E Internal Processing Error. RC=xx  
INFO=xxxxxx ID=xxxxxxxx**

**Explanation:** Whilst LOADING an HDB, an internal processing request returned an unacceptable return code.

**System action:** The LOAD request is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA0405E Duplicate HDB LOAD request aborted.  
HDB=xxxxxxxx**

**Explanation:** LOAD requests are serialized to ensure the integrity of the Repository. That request failed.

**System action:** The LOAD request is terminated.

**User response:** Ensure that no more than one LOAD is concurrently active for a specific Repository.

---

**CPA0406E No Containers in HDB xxxxxxxx eligible for processing**

**Explanation:** An HDB REPORT request was issued against the specified HDB. However, no Containers were available for processing. Either no Containers have been created for the HDB, or the time stamp criteria specified via the SMFSTART/SMFSTOP keyword(s) exclude all available Containers.

**System action:** The REPORT request is terminated.

**User response:** Either create Containers for the HDB or specify a time span that matches those of the Containers in the HDB.

---

**CPA0407W Field xxxxxxxx (xxxxxxxxxxxx) not present in HDB Container Data Set – ignored**

**Explanation:** The specified field was specified in a FORMDEF (or a FIELDS statement) but the field was not present in the HDB Container data set.

**System action:** The field is not included in the Report.

**User response:** None required.

---

**CPA0408E Unable to serialize HDB Housekeeping**

**Explanation:** HDB Housekeeping can make large changes to the repository and therefore only one Housekeeping job might be active against a repository data set at any one time. In this case, another Housekeeping job was already active against the repository.

**System action:** The Housekeeping job is terminated.

**User response:** Ensure that no more than one

Housekeeping job is concurrently active for a specific Repository.

---

**CPA0409E HDB is unusable - Control Record Missing**

**Explanation:** During the running of HDB Housekeeping, it was determined that a mandatory Control Record was missing from the Repository data set.

**System action:** The Housekeeping job is terminated.

**User response:** Recreate the Repository or recover it from a Backup. If the problem reoccurs, contact your IBM representative for help.

---

**CPA0410W User-specified Selection Criteria ignored**

**Explanation:** The User has specified Selection Criteria when LOADING an HDB. HDB Selection Criteria are specified when defining an HDB or defining the associated Template and only those Selection Criteria are honored during the LOAD (all Selection Criteria specified by the user via JCL are ignored).

**System action:** The user-specified Selection Criteria are ignored.

**User response:** None required.

---

**CPA0411W Statistics HDB Load request issued warning/error messages; Recap=xxxxxxx**

**Explanation:** CICS PA statistics processing has issued warning or error messages. DDname xxxxxxxx contains the messages.

**System action:** Processing continues.

**User response:** Review the CICS PA statistics messages in DDname xxxxxxxx and take action as advised.

---

**CPA0412E FILEIMAGE and FILESYSTEM have both been specified, only one can be specified**

**Explanation:** The FILEIMAGE and FILESYSTEM parameters are mutually exclusive, only one of them can be specified.

**System action:** The report is ignored and command processing continues.

**User response:** Specify one parameter, either FILEIMAGE or FILESYSTEM, but not both.

---

**CPA0501E Invalid Command Error Code**

**Explanation:** A CICS PA module attempted to issue an error message using a message ID that is not defined. This is an internal logic error.

**System action:** Command processing continues.

Processing is terminated after all commands are validated.

**User response:** Contact your IBM representative for help.

---

**CPA0502E No delimiters in date – Julian format assumed (YYDDD)**

**Explanation:** A date specified in the command input had no delimiters and CICS PA could not determine the format.

**System action:** Julian format is assumed and processing continues.

**User response:** If the Julian format produces unsatisfactory results, correct the command input and resubmit the job.

---

**CPA0503E Time field has invalid format, digit, or value**

**Explanation:** A time field specified in the command input cannot be processed by CICS PA.

**System action:** The time field is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** Correct the command input and resubmit the job.

---

**CPA0504E Number invalid – too many digits or contains non-numeric value**

**Explanation:** A number specified in the command input cannot be processed by CICS PA.

**System action:** The operand is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** Correct the command input and resubmit the job.

---

**CPA0505E FROM-TO range is invalid – TO not later than FROM**

**Explanation:** A FROM-TO range was specified such that the FROM value was greater than the TO value.

**System action:** The operand is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** Correct the range specification and resubmit the job.

---

**CPA0506E FORMAT operand requires a single character per value**

**Explanation:** The FORMAT operand specifies the characters to be used for delimiters when formatting

date and time fields. Each delimiter must be a single character.

**System action:** The operand is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** See "FORMAT" on page 386 for the correct usage of the FORMAT operand. Correct the command input using a single character for each delimiter, and resubmit the job.

---

**CPA0507E INPUT operand requires a 1-8 character name**

**Explanation:** A valid DDname was not specified with the INPUT operand.

**System action:** The operand is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** See "INput" on page 386 for the correct usage of the INPUT operand. Correct the command input and resubmit the job.

---

**CPA0508E APPLID operand requires an 8 character name**

**Explanation:** A valid CICS generic APPLID was not specified with the APPLID operand.

**System action:** The operand is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** See "APPLID" on page 385 for the correct usage of the APPLID operand. Correct the command input and resubmit the job.

---

**CPA0509E SUMMARY(BY fields not specified in FIELDS suboperand or out of sequence**

**Explanation:** The field names specified in the BY operand were not properly specified in the FIELDS operand. Whenever the BY operand is specified, the FIELDS operand must be specified and it must contain the field names, in the same sequence as specified on the BY operand.

**System action:** The operand is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** Ensure that the FIELDS operand is specified and that it contains the field names specified on the BY operand. See "SUMMARY - Performance Summary report" on page 413 for the correct usage of the SUMMARY operands. Correct the command input and resubmit the job.

---

**CPA0511E DELIMIT operand requires a single character value**

**Explanation:** The DELIMIT operand did not specify a single character value. The field delimiter for the EXPORT file must be a single character.

**System action:** The operand is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** See "EXTRACTPERFORMANCE - Performance data extract" on page 502 for the correct usage of the DELIMIT operand. Correct the command input using a single character for the delimiter, and resubmit the job.

---

**CPA0513E Only one Graph can be requested per GRAPH operand**

**Explanation:** Only one graph (RESPONSE or TRANRATE) can be requested for each GRAPH report request. If you want to produce two graphs, specify the GRAPH operand twice with the required graph type (for example, GRAPH(RESPONSE),GRAPH(TRANRATE)).

**System action:** The operand is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** Correct the command input and resubmit job.

---

**CPA0518E UOWID Select Field must specify 12 hexadecimal digits**

**Explanation:** The UOWID Field in the Selection Criteria did not specify 12 hexadecimal digits. CICS PA checks this specification against the first 6 bytes of the NETUOWSX CMF field, as this is the Network UOW ID. The last 2 bytes are not checked, as they are the period or syncpoint count within a Network UOW.

**System action:** The field value is ignored and command processing continues.

**User response:** Correct the command input and resubmit the job.

---

**CPA0521E START/STOP field format is not TIMET, TIMES, TIMEM, DATE, DATEISO, DATEM or DATEYR**

**Explanation:** The START/STOP field format in the FIELDS operand is invalid. Allowed values are TIMET, TIMES, TIMEM, DATE, DATEISO, DATEM and DATEYR.

**System action:** The field is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** See "Suboperands for Time Stamp

fields” on page 381. Correct the command input and resubmit the job.

---

**CPA0522E    User field specification is invalid. Field is ignored**

**Explanation:** The user field was incorrectly specified.

**System action:** The user field is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** See “Suboperands for User fields” on page 382 for operand format and usage when specifying user fields. Correct the command input and resubmit the job.

---

**CPA0523E    Clock field format is not TIME or COUNT. Field is ignored**

**Explanation:** The Clock field format in the FIELDS operand is invalid. Allowed values are TIME and COUNT.

**System action:** The field is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** See “Suboperands for Clock type fields” on page 381. Correct the command input and resubmit the job.

---

**CPA0524E    \*\*\*\*\* Run terminated by errors listed above \*\*\*\*\***

**Explanation:** The job was terminated due to severe command error conditions.

**System action:** Processing is terminated.

**User response:** Correct the command input errors, which are indicated by command error messages that precede this message, and resubmit the job.

---

**CPA0525E    LISTX(BY field UOWID must be specified on its own**

**Explanation:** The LISTX report BY operand can only specify field UOWID on its own. For example, LISTX(BY(UOWID),FIELDS(...)).

**System action:** The field is ignored and command processing continues.

**User response:** Correct the command input and resubmit the job.

---

**CPA0526E    LISTX(BY fields not specified in FIELDS operand or out of sequence**

**Explanation:** The field names specified in the BY operand were not properly specified in the FIELDS operand. Whenever the BY operand is specified, the FIELDS operand must be specified and it must contain

the field names, in the same sequence as specified on the BY operand.

**System action:** The LISTX report is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** Ensure that the FIELDS operand is specified and that it contains the field names specified on the BY operand. See “LISTX - Performance List Extended report” on page 401 for the correct usage of the LISTX operands. Correct the command input and resubmit the job.

---

**CPA0527E    LIMIT field not specified in LISTX(BY fields**

**Explanation:** The field name specified in the LIMIT operand was not properly specified in LISTX(BY. Whenever LIMIT is specified, the field must be the same as one of the field names specified in the LISTX(BY operand.

**System action:** The LISTX report is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** Ensure that the LIMIT operand contains the same field name as one of the field names specified in the LISTX(BY operand. See “LISTX(BY(field1,field2,field3)” on page 403 for the list of fields.

---

**CPA0528E    Only one field can be requested per LIMIT operand**

**Explanation:** Only one LIMIT operand (for example, RESPONSE or FCAMCT) can be specified with the LISTX operand. If you want two reports, specify the LIMIT operand separately with each LISTX operand.

**System action:** The LISTX report is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** See “LISTX(LIMIT” on page 403 for the LIMIT operand and its usage. Correct the command input and resubmit the job.

---

**CPA0529E    LISTX(BY sort sequence is not ASCEND or DESCEND**

**Explanation:** The sorting sequence specified in the BY operand is invalid. If specified, it must be ASCEND or DESCEND. If not specified, the default is ASCEND.

**System action:** The field is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** See “LISTX - Performance List Extended report” on page 401 for the format of the LISTX operand. Correct the command input and resubmit the job.

---

**CPA0530E    SELECT operand has too many field values specified**

**Explanation:** The SELECT operand specified too many field values. The restrictions are:

1. Maximum of 14 START/STOP/ACTIVE time ranges.
2. Maximum of 28 time/count values or ranges.
3. Maximum of 56 four (4) character values. For example, Transaction IDs.
4. Maximum of 28 eight (8) character values. For example, User IDs.

**System action:** Field values specified after the maximum number is reached are ignored and not used in selection processing.

**User response:** See "Using SELECT statements" on page 508. Correct the command input and resubmit the job.

---

**CPA0531E    SELECT given without correct Selection Criteria**

**Explanation:** Selection criteria were not specified, or were incorrectly specified for the selected field name.

**System action:** The SELECT statement is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** See "Using SELECT statements" on page 508 for the SELECT operand and its usage. Correct the command input and resubmit the job.

---

**CPA0537E    Date field has invalid format, digit, or value**

**Explanation:** CICS PA was unable to recognize a date field because of an invalid format, digit, or value.

**System action:** Processing is terminated.

**User response:** See "Suboperands for Time Stamp fields" on page 381 for the correct date formats. Correct the command input and resubmit the job.

---

**CPA0539E    A maximum of two chain names are allowed, this one ignored**

**Explanation:** This is an internal logic error.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA0540E    Value previously used in another sublist**

**Explanation:** This is an internal logic error.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA0542E    \*\*\* Routines specified exceed maximum of 511**

**Explanation:** Internal capacity exceeded. The cumulative number of routines specified for execution exceeds capacity. This might occur if an unusually large amount of command input is specified in one CICS PA batch job.

**System action:** Processing is terminated.

**User response:** Split the command input into two or more batch jobs.

---

**CPA0543E    cannot be found as chained DISPLIST**

**Explanation:** This is an internal logic error.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA0544E    No input DDnames found from names on EXECUTE commands**

**Explanation:** This is an internal logic error.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA0545E    Error on BLDL**

**Explanation:** A BLDL SVC completed unsuccessfully. This can be caused by a load module that is in error, or not enough virtual storage was available to complete the request.

**System action:** Processing is terminated.

**User response:** Ensure that the load module library does not have a problem. If necessary, contact your IBM representative for help.

---

**CPA0546E    BLDL failed for Exit Routine module**

**Explanation:** A BLDL SVC completed unsuccessfully for an Exit Routine module. This can be caused by a load module that is in error, or not enough virtual storage was available to complete the request.

**System action:** Processing is terminated.

**User response:** Ensure that the load module library does not have a problem. If necessary, contact your IBM representative for help.

---

**CPA0547E    Header name invalid or not specified**

**Explanation:** This is an internal logic error.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA0548E TO-time prior to FROM-time**

**Explanation:** The TO date/time specification is before the FROM date/time specification.

**System action:** No records are selected for processing.

**User response:** Correct the command input and resubmit the job.

---

**CPA0549E Parms should not be enclosed in parentheses**

**Explanation:** Parameters specified under the PARM command should not be enclosed in parentheses.

**System action:** Processing is terminated.

**User response:** Remove the parentheses from the PARM command input and resubmit the job.

---

**CPA0553E STAE request ignored. Once STAE is turned off, it will not be reinstated**

**Explanation:** PARM NOSTAE was specified in the command input cancelling the effective environment. After NOSTAE is specified, the affected environment cannot be restored. The subsequent PARM command specifying STAE is ignored, and processing continues.

**System action:** Processing continues without a STAE environment.

**User response:** Delete the PARM NOSTAE command from the command input and resubmit the job.

---

**CPA0554E End of command stream encountered when not expected**

**Explanation:** The CICS PA scan routine reached the end of the command stream in the middle of processing a command.

**System action:** Processing is terminated.

**User response:** Verify that all necessary parts of the last command (for example, closing parentheses and commas) are present and that the format is correct. Correct the command input and resubmit the job.

---

**CPA0555E DCB has already been processed – will ABEND to prevent loop**

**Explanation:** Internal logic error.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA0556E Invalid syntax – cannot find command**

**Explanation:** The CICS PA scan routine was unable to process the command input.

**System action:** Processing is terminated.

**User response:** Correct the command input and resubmit the job.

---

**CPA0557E Unmatched quotes detected in data string**

**Explanation:** The CICS PA scan routine found that a quotation mark was missing in a data string.

**System action:** The string is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** Check the command input to ensure that all quotation marks are matched. Correct the command input and resubmit the job.

---

**CPA0558E Too much data to process – Work Buffer full**

**Explanation:** CICS PA had too much command input data to process. The CICS PA scan routine can handle only 8192 bytes of input per command.

**System action:** Processing is terminated.

**User response:** Reduce the command input size. You might have to break the command stream into two separate commands.

---

**CPA0559E Input ends in a range indicator – dummy field generated**

**Explanation:** The CICS PA scan routine found that the command input ended in the middle of a range indicator. For example, in ID(90-., the upper range value and closing parenthesis are missing.

**System action:** The range is treated as a single value and command processing continues.

**User response:** Correct the command input and resubmit the job.

---

**CPA0560E Invalid character after quote string – not “,” or “(” or “)”**

**Explanation:** The three listed characters are the only allowable characters that can follow a data string in quotes.

**System action:** Command processing continues at the next operand. Processing is terminated after all commands are validated.

**User response:** Correct the command input and resubmit the job.

---

**CPA0561E Syntax error or unrecognizable format in field**

**Explanation:** CICS PA was unable to recognize the input indicated in the error message.

**System action:** Processing is terminated.

**User response:** See “General command format” on page 371 for the command formats and check the syntax rules. Correct the command input and resubmit the job.

---

**CPA0562E Unpaired parentheses detected**

**Explanation:** CICS PA found an unpaired parenthesis. Either one parenthesis is missing or there is an extra parenthesis.

**System action:** CICS PA ignores the unpaired parenthesis and command processing continues. Processing is terminated after all commands are validated.

**User response:** Check the command input for unmatched parentheses. Correct the command input and resubmit the job.

---

**CPA0563E Exceeded maximum depth of parentheses nesting – 254**

**Explanation:** When specifying operands and sub-operands, the maximum number of parenthesis nesting levels is 254.

**System action:** Command processing continues at the next operand. Processing is terminated after all commands are validated.

**User response:** Correct the command input to eliminate extra parenthesis nesting and resubmit the job.

---

**CPA0564E Data string processed – unpaired quote detected**

**Explanation:** CICS PA found a data string with unpaired quotation marks.

**System action:** Command processing continues at the next operand. Processing is terminated after all commands are validated.

**User response:** Check the command input for unmatched quotation marks. Insert the missing quotation mark or remove the extra one, and resubmit the job.

---

**CPA0566E Right parenthesis inserted at end of string**

**Explanation:** An ending right parenthesis is missing in the command input.

**System action:** CICS PA inserts the missing

parenthesis and command processing continues.

**User response:** Correct the command input to avoid getting this message, then resubmit the job.

---

**CPA0567E Exceeded maximum number of fields – 1022**

**Explanation:** Only 1022 fields and operands are allowed in the command input.

**System action:** Extra fields are ignored and command processing continues.

**User response:** Correct the command input to eliminate the extra fields and resubmit the job.

---

**CPA0568E Command not found in command list – ignored**

**Explanation:** CICS PA did not recognize the command indicated in the error message.

**System action:** The command is ignored and command processing continues. Processing is terminated after all commands are validated.

**User response:** Correct the command input and resubmit the job.

---

**CPA0580E CMDLIB DD card is missing or DD DUMMY – unable to process command**

**Explanation:** A COPY or INCLUDE instruction is specified with one or more member names to be copied in the command input. These members must reside on a PDS defined by the CMDLIB DD statement.

**System action:** Processing is terminated.

**User response:** Check the JCL for proper specification of the CMDLIB DD statement and resubmit the job.

---

**CPA0581E No member name specified – command ignored**

**Explanation:** A COPY or INCLUDE instruction was encountered with no operands specifying member names to be copied.

**System action:** Processing is terminated.

**User response:** Add the PDS or library member names, or delete the COPY/INCLUDE instruction from the command input and resubmit the job.

---

**CPA0582E Operand must be a single list of names**

**Explanation:** The COPY or INCLUDE instruction did not specify a list of valid member names.

**System action:** Processing is terminated.

**User response:** Correct the COPY or INCLUDE instruction to make the operand a member name or a list of member names and resubmit the job.

---

**CPA0583E** is a member already copied – this entry skipped

---

**Explanation:** A second copy request for the member named in this error message has been encountered. It was copied from a previous member or specified twice under the COPY or INCLUDE instruction. To prevent any possible loops, the second copy is ignored.

**System action:** Processing is terminated.

**User response:** Correct the command input and resubmit the job.

---

**CPA0584E** not found in Command Library

---

**Explanation:** A member name specified on the COPY or INCLUDE instruction does not reside in the library defined by the CMDLIB DD statement.

**System action:** Processing is terminated.

**User response:** Correct the command input and resubmit the job.

---

**CPA0587E** PEAK percentile must be in the range 50% to 100%

---

**Explanation:** The PEAK operand was outside the range of 50 to 100 percent.

**System action:** The operand is ignored and command processing continues.

**User response:** Correct the PEAK specification and resubmit the job.

---

**CPA0593E** EXTERNAL operand is missing and External Work File not specified in JCL

---

**Explanation:** The specified report did not specify an EXTERNAL operand and no External Work File is available in the JCL to satisfy the request. This report requires an External Work File to sort its records.

**System action:** The report is ignored and command processing continues.

**User response:** Specify an External Work File in the JCL with a DDname prefixed by CPAXW. Optionally specify this DDname in the EXTERNAL operand to associate the report with this file. If the EXTERNAL operand is not specified, CICS PA will assign the next available External Work File in the pool until they are exhausted. See “External sorting” on page 359 for information on the DD statements for External Work Files.

---

**CPA0594E** GRAPH type not specified – default RESPONSE used

---

**Explanation:** The GRAPH report did not specify a type. Valid GRAPH types are RESPONSE and TRANRATE.

**System action:** The default RESPONSE is used and processing continues.

**User response:** See “GRAPH - Graph reports” on page 500 for information on the command format. Correct the GRAPH operand and resubmit the job.

---

**CPA0595E** SUBSTR specification invalid – must be SUBSTR(Start,Length)

---

**Explanation:** Character User Field SUBSTR operand is not specified correctly.

- The first suboperand is the starting position and must have a value in the range 1 to 256.
- The second suboperand is the length.
- The length must be in the range 1 to 256 for the LIST report, or in the range 1 to 8 for the SUMMARY report.
- The length when added to the starting position should not exceed the length of the Character User Field.

**System action:** SUBSTR is ignored and command processing continues.

**User response:** Correct the SUBSTR specification and resubmit the job.

---

**CPA0596E** INTERVAL specification invalid – must be HH:MM:SS (00:00:01 to 24:00:00)

---

**Explanation:** The Performance Summary report time interval is not specified correctly. INTERVAL must specify a time interval between 1 second and 24 hours in the format *hh:mm:ss* where hh is the number of hours, mm is the number of minutes and ss is the number of seconds.

INTERVAL represents the time interval when the Summary report or extract is sorted by transaction Start or Stop time.

**System action:** INTERVAL is ignored and command processing continues.

**User response:** Correct the INTERVAL specification and resubmit the job.

---

**CPA0597E** SYSID specification invalid – must be SYSID(applid,mvsid)

---

**Explanation:** The Cross-System Extract SYSID operand is not specified correctly. The first suboperand is the APPLID that is set in the SMFMNPRN, SMFMNSPN and SMFMNJBN fields of the CMF records written to the Extract data set. The second suboperand is the MVS ID that is set in the SMFSID field of the CMF records written to the Extract data set.

**System action:** SYSID is ignored and command processing continues.

**User response:** Correct the SYSID specification and resubmit the job.

---

**CPA0598E SSID operand requires a 4 character name**

**Explanation:** A valid DB2 Subsystem ID was not specified with the SSID operand.

**System action:** The operand is ignored and command processing continues.

**User response:** Correct the SSID specification and resubmit the job.

---

**CPA0599E LOGGER INTERVAL must be in the range 1 to 60 minutes**

**Explanation:** The System Logger report INTERVAL operand was not in the range 1 to 60 minutes. The INTERVAL operand specifies the SMF Global Reporting Interval as defined in the SMFPRMnn PARMLIB member.

**System action:** The operand is ignored and command processing continues.

**User response:** Correct the INTERVAL specification and resubmit the job.

---

**CPA0601E Field exceeds maximum, value set to mmmmmmm**

**Explanation:** A value was specified in the command input that exceeded the allowable maximum.

**System action:** Processing is terminated.

**User response:** The value is set as indicated in the error message. If this default value produces unsatisfactory results, correct the command and resubmit the job.

---

**CPA0604E BLDL failed for Prescan module xxxxxxxx in Dispatch Set xxxxxxxx**

**Explanation:** The CICS PA Prescan module cannot be found in the load library. This message should not occur and indicates a problem with the CICS PA load library.

**System action:** Processing is terminated.

**User response:** Ensure that the CICS PA Prescan module name is CPAPRSMF and that it resides in the CICS PA load library. Otherwise, contact your IBM representative for help.

---

**CPA0605E BLDL failed for program module xxxxxxxx**

**Explanation:** The specified CICS PA module cannot be found in the load library. This message should not

occur and indicates a problem with the CICS PA load library.

**System action:** Processing is terminated.

**User response:** Ensure that the CICS PA module resides in the CICS PA load library. Otherwise, contact your IBM representative for help.

---

**CPA0606E xxxxxxxx program in Dispatch Set xxxxxxxx has no record codes to process**

**Explanation:** The specified CICS PA record processing module does not have a list of record codes to process. This message should not occur and indicates a problem with CICS PA.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA0607E Dispatch Set xxxxxxxx has no routines to execute**

**Explanation:** The command input for the specified Dispatch Set (INPUT DDname) does not have any reports to process. This message should not occur and indicates a problem with CICS PA.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA0608E First command module to signal an error was xxxxxxxx**

**Explanation:** This error message is issued at the completion of command processing when errors have been encountered. It identifies the CICS PA module that issued the first error message.

**System action:** Processing is terminated.

**User response:** Look for error messages before this message that might indicate a command error. Correct the command input and resubmit the job.

---

**CPA0609E Field is longer than maximum (nnnn chars) – possibly misplaced quote**

**Explanation:** A field in the command input, indicated in the error message, is longer than the maximum nnnn characters.

**System action:** Processing is terminated.

**User response:** Correct the command input so that the field is within the maximum, and resubmit the job.

---

**CPA0611E INPUT DDname xxxxxxxx is missing from JCL**

**Explanation:** The INPUT operand specified a DDname that is not defined in the JCL.

**System action:** The reports that use this input file cannot run. Command processing continues.

**User response:** See "INput" on page 386 for more information on this operand. Specify the Input File in the JCL and resubmit the job.

---

**CPA0612E EXTERNAL DDname xxxxxxxx can only be used by a single report**

**Explanation:** The EXTERNAL operand specified a DDname that is used by a previously requested report. An External Work File can only be used by a single report.

**System action:** The report is ignored and command processing continues.

**User response:** Ensure that each report requiring an External Work File has either a unique EXTERNAL specification, or enough External Work Files files are defined in the pool. The External Work File pool consists of all DD statements in the JCL prefixed by CPAXW. See "External sorting" on page 359 for information on the DD statements for External Work Files.

---

**CPA0613E**

**Explanation:** The EXTERNAL operand specified a DDname that is not defined in the JCL.

**System action:** The report is ignored and command processing continues.

**User response:** Specify the missing External Work File in the JCL. See "External sorting" on page 359 for information on the DD statements for External Work Files.

---

**CPA0614E EXTERNAL DDname xxxxxxxx is not a DASD or Tape file**

**Explanation:** The EXTERNAL operand specified a DDname that does not have a device type of DASD or Tape.

**System action:** The report is ignored and command processing continues.

**User response:** Correct the External Work File DD statement to specify a DASD or Tape data set. See "External sorting" on page 359 for information on the DD statements for External Work Files.

---

**CPA0615E Extract DDname xxxxxxxx is missing from JCL**

**Explanation:** The DDNAME operand specified a DDname that is not defined in the JCL.

**System action:** The extract is ignored and command processing continues.

**User response:** Specify the missing Extract data set in the JCL. For more information on the command format and JCL for CICS PA extracts, see:

- "CROSSsystem - Cross-System Work report and extract" on page 455
- "EXTRACTPERFORMANCE - Performance data extract" on page 502

---

**CPA0620E HDB name is missing or invalid**

**Explanation:** The REPORT or LOAD operand does not specify a valid HDB name sub-operand.

**System action:** The report is request is ignored and command processing continues.

**User response:** Specify a valid HDB name with the REPORT or LOAD operand. For example: REPORT(MYHDB) or LOAD(MYHDB)

---

**CPA0621E BY Field name xxxxxxxx is invalid**

**Explanation:** The WAITANALYSIS BY operand specified an invalid CMF Field name. Only character and time stamp fields can be specified.

**System action:** The report request is ignored and command processing continues.

**User response:** Specify correct field name(s) in the BY operand.

---

**CPA0622E Field name xxxxxxxx is invalid**

**Explanation:** The FIELDS operand for an HDB REPORT request specified an invalid field name.

**System action:** The REPORT request is terminated and command processing continues.

**User response:** Correct the FIELD names specification.

---

**CPA0623E First Field name xxxxxxxx is not a valid Sort Field**

**Explanation:** The FIELDS operand for an HDB REPORT request did not specify a valid Sort field as the first field. Only Character (for example, TRAN) and Time Stamp (for example, START) fields can be Sort fields.

**System action:** The report request is ignored and command processing continues.

**User response:** Specify a valid Sort Field as the first field in the FIELDS operand.

**CPA0624E** Field xxxxxxxx specified an invalid Type or Function xxxxxxxx

**Explanation:** The specified Field requested an invalid Field Type or Function. Allowed Field Types are: TIME, COUNT, TIMET, TIMEM, TIMES, DATE, DATEISO, DATUM, DATEYR. Allowed Field Functions are: AVE, TOTAL, DEV.

**System action:** The report request is ignored and command processing continues.

**User response:** Correct the FIELD Type or Function.

CPA0625E Field xxxxxxxx is not a valid CMF Field name

**Explanation:** The specified Field is not a known CMF Performance Class Field name.

**System action:** The report request is ignored and command processing continues.

**User response:** Correct or remove the Field name.

**CPA0626E** Field ignored due to invalid Format.  
Valid Formats are K, KB, M, and MB

**Explanation:** The specified COUNT field format is invalid.

**System action:** The field is ignored and command processing continues.

**User response:** Specify a valid COUNT field format.

CPA0627W Field ignored due to invalid Format 12.  
Valid Formats are K, KB, M, and MB

**Explanation:** The COUNT field format specified is invalid.

**System action:** The field is ignored and command processing continues.

**User response:** Specify a valid COUNT field format.

CPA0628E	Invalid combination of BASELINE and REPORT parameters for ID(nnnnn).
----------	--

**Explanation:** Either both or neither BASELINE and REPORT operands have been specified on a PROFILING request.

**System action:** The report is ignored and command processing continues.

**User response:** Specify either BASELINE or REPORT on each PROFILING request.

CPA0629E Duplicate BASELINE/REPORT have been specified for ID(nnnn)

**Explanation:** Two commands for the same ID have been specified for a PROFILING report.

**System action:** The report is ignored and command processing continues.

**User response:** Specify only one BASELINE and one REPORT command for each ID.

[illegible]

**Explanation:** Value given for ID is zero or too large.

**System action:** The report is ignored and command processing continues.

**User response:** Specify correct ID.

CPA0631W More than one Statistics report requested. Extra reports ignored.

**Explanation:** The STATSALERT operand contained more than one report type. Only one report per STATSALERT operand is allowed.

**System action:** The second and subsequent reports are ignored and command processing continues.

**User response:** Create a separate STATSALERT operand for each required report, and then rerun.

CPA0632E STATSALERT suboperand STALTDEF  
missing

**Explanation:** The STATSALERT operand does not specify a valid STALTDEF suboperand.

**System action:** The report is ignored and command processing continues.

**User response:** Specify a STALTDEF suboperand.

## 1000–1099 Dialog messages

These messages are issued by the CICS PA dialog during JCL generation, or when creating Report Sets, Report Forms, Object Lists, and so on. For other CICS PA dialog messages, refer to the Online Help.

---

### CPA1001E Parameter list error; Module=xxxxxxx

**Explanation:** A CICS PA dialog module was passed an invalid parameter.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

### CPA1002E File not allocated; DDname=xxxxxxx

**Explanation:** A CICS PA dialog module has detected that the specified DDname was not allocated.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

### CPA1003E DFHMNDUP has abended; Abend Code=xxxxxxx, Reason Code=xxxxxxx, APPLID=xxxxxxx

**Explanation:** CICS PA could not create a new Report Form because the CICS Monitoring utility DFHMNDUP has abended.

**System action:** Processing is terminated.

**User response:** If the abend code is S806-04, then verify that either the SDFHAUTH and SDFHLINK data sets contain the DFHMNDUP module and the Monitoring Control Table (MCT) module, if the MCT suffix was specified. The SDFHAUTH and SDFHLINK data sets and the MCT suffix are specified in the CICS system definition. Otherwise, contact your IBM representative for help.

---

### CPA1004E DFHMNDUP failed to generate CMF Performance Dictionary record; Reason=EOD

**Explanation:** CICS PA could not create a new Report Form because the CICS Monitoring utility DFHMNDUP failed to create a CMF Dictionary record.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

### CPA1005E ATTACH macro error; Ret=xx

**Explanation:** CICS PA could not create a new Report Form because the ATTACH macro failed.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

### CPA1006E DFHMNDUP has failed; RC=xx

**Explanation:** CICS PA could not create a new Report Form because the CICS Monitoring utility DFHMNDUP completed with a non-zero return code.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

### CPA1020E Table Library not available; DDname=xxxxxxx

**Explanation:** A CICS PA dialog module has detected that the specified DDname for the Table library was not allocated.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

### CPA1021E System Definition Table for CICS PA xxxx has a format error

**Explanation:** CICS PA determined that the Table containing your CICS System and SMF File definitions is not in the correct format.

- If the CICS PA version is V1R1, then CICS PA was attempting to upgrade your CICS PA V1R1 definitions to V1R2 or later, but failed to do so.
- If the CICS PA version is V1R2 or later, then CICS PA failed to read your saved System Definitions.

The System Definitions Table is a member in your Permanent ISPF Table Library, which is specified in your CICS PA Settings.

- For CICS PA V1R1, the member name is CPASMF1.
- For CICS PA V1R2 or later, the member name is CPASMF12.

**System action:** Processing is terminated.

**User response:** Try one of the following:

- If the problem occurred during an upgrade from CICS PA V1R1 to V1R2 or later, then you can retry you request. When prompted to upgrade your CICS PA V1R1 System Definitions, reply Exit or Cancel.

- For CICS PA V1R2 or later, delete member CPASMF12 from your Permanent ISPF Table Library, then retry your request.

**Note:** In both cases, you will lose your saved System Definitions and you will not be able to recover them. If this problem is occurring regularly, or you do not want to delete your saved System Definitions, then contact your IBM representative for help.

---

**CPA1022E Member xxxxxxxx is not a Report Form**

**Explanation:** CICS PA determined that the specified member is not in the correct format for a Report Form.

**System action:** Processing is terminated.

**User response:** Verify that the specified member in the Report Form library is a Report Form. Otherwise, contact your IBM representative for help.

---

**CPA1023E Report Form data set not available; DDname=xxxxxxx**

**Explanation:** A CICS PA dialog module has detected that the specified DDname for the Report Form library was not allocated.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA1024E Member xxxxxxxx is not a Report Set**

**Explanation:** CICS PA determined that the specified member is not in the correct format for a Report Set.

**System action:** Processing is terminated.

**User response:** Verify that the specified member in the Report Set library is a Report Set. Otherwise, contact your IBM representative for help.

---

**CPA1025E Report Set data set not available; DDname=xxxxxxx**

**Explanation:** A CICS PA dialog module has detected that the specified DDname for the Report Set library was not allocated.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA1026E No systems are defined**

**Explanation:** No systems have been defined in System Definitions.

**System action:** Processing is terminated.

**User response:** From **System Definitions**, define the CICS systems, DB2 subsystems and System Loggers

that you want to report against.

---

**CPA1027E Report Set JCL generation failed. System or Group is not defined**

**Explanation:** CICS PA has detected that your System Definitions do not contain the System or Group of systems that were requested for report processing. Message CPA1030E is issued in conjunction with this message to identify the offending System or Group, as well as the report that is causing the failure.

**System action:** Processing is terminated.

**User response:** Either from **System Definitions**, define the System or Group that you want to report against, or alter the report to specify a System or Group that is eligible for report processing.

---

**CPA1028E Report Set JCL generation failed. System or Group not specified**

**Explanation:** You have not specified the System or Group of systems to be reported. System or Group can be specified at the following System Definition points:

1. In the individual reports or extracts of the Report Set
2. At submission time in the Run Report Set panel
3. In the Global Options of the Report Set

The order of this list also reflects the precedence of selecting systems for reporting.

**System action:** Processing is terminated.

**User response:** Specify the System or Group that you want to report against.

---

**CPA1029E Report Set JCL generation failed. System or Group has no SMF files**

**Explanation:** CICS PA has detected that the System or Group requested for report processing has no SMF Files specified. Message CPA1030E is issued in conjunction with this message to identify the offending System or Group, as well as the report that is causing the failure.

**System action:** Processing is terminated.

**User response:** From **System Definitions**, define SMF Files for the offending System or Group.

---

**CPA1030E aaaaaa=system, Report=report, Output=output**

**Explanation:** This message details failure information and is issued in conjunction with a previous error message (1027-1029).

- *aaaaaa=system* is the offending System or Group name.
- *report* is the Report that specified the offending System or Group name.

- *output* is the Report Output DDname or Extract Data Set name that further identifies the report or extract.

**System action:** Action is determined by the previously issued error message.

**User response:** Response is determined from the previously issued error message. Use this message to determine which report or extract is causing the failure.

**CPA1031E Report Set JCL generation failed. No reports are active**

**Explanation:** CICS PA has detected that no reports are active in the Report Set.

**System action:** Processing is terminated.

**User response:** Activate the required reports in the Report Set.

**CPA1032E Report Set JCL generation failed. Report Form is not defined**

**Explanation:** CICS PA has detected that a Report Form specified in a report is not in the Report Form library. Message CPA1034E is issued in conjunction with this message to identify the offending Report Form, as well as the report that is causing the failure.

**System action:** Processing is terminated.

**User response:** From **Report Forms**, define the required Report Form, or alter the report to specify a Report Form that is defined.

**CPA1033E Report Set JCL generation failed. Report Form not in correct format**

**Explanation:** CICS PA determined that the specified member is not in the correct format for a Report Form. Message CPA1034E is issued in conjunction with this message to identify the offending Report Form, as well as the report that is causing the failure.

**System action:** Processing is terminated.

**User response:** Verify that the specified member in the Report Form library is a Report Form. Otherwise, contact your IBM representative for help.

**CPA1034E Form=*formname* Report=*report*, Output=*output***

**Explanation:** This message details failure information, and is issued in conjunction with a previous error message.

- *formname* is the offending Report Form.
- *report* is the Report that specified the offending Report Form.
- *output* is the Report Output DDname that further identifies the report.

**System action:** Action is determined by the previously issued error message.

**User response:** Response is determined from the previously issued error message. Use this message to determine which report is causing the failure.

**CPA1035E Object List data set not available; DDname=*xxxxxxx***

**Explanation:** A CICS PA dialog module has detected that the specified DDname for the Object List library was not allocated.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

**CPA1036E Report Set JCL generation failed. Object List is not defined**

**Explanation:** CICS PA has detected that an Object List specified in a report is not in the Object List library. Message CPA1038E is issued in conjunction with this message to identify the offending Object List, as well as the report that is causing the failure.

**System action:** Processing is terminated.

**User response:** Either:

- From the CICS PA Primary Option Menu, select **Object Lists** a define the required Object List or
- Alter the report to specify an Object List that is defined.

**CPA1037E Report Set JCL generation failed. Object List not in correct format**

**Explanation:** CICS PA determined that the specified member is not in the correct format for an Object List. Message CPA1038E is issued in conjunction with this message to identify the offending Object List, as well as the report that is causing the failure.

**System action:** Processing is terminated.

**User response:** Verify that the specified member in the Object List library is an Object List. Otherwise, contact your IBM representative for help.

**CPA1038E Object List=*objlist*, Report=*report*, Output=*output***

**Explanation:** This message details failure information, and is issued in conjunction with a previous error message.

- *objlist* is the offending Object List.
- *report* is the report or extract that specified the offending Object List.
- *output* is the Report Output DDname or Extract Data Set name that further identifies the report or extract.

**System action:** Action is determined for the previously issued error message.

**User response:** Response is determined from the previously issued error message. Use this message to determine which report or extract is causing the failure.

---

**CPA1039E    System Definitions are corrupted**

**Explanation:** CICS PA has detected that your System Definitions are corrupted. The System Definitions are stored in your CICS PA Table Library, member CPASMF1 for V1R1 and CPASMF12 for V1R2 or later.

**System action:** System validation processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA1040E    Report Set JCL generation failed.  
Systems to be reported have no SMF  
Files specified**

**Explanation:** CICS PA has detected that all Systems and Groups to be reported do not have any SMF Files specified.

**System action:** Processing is terminated.

**User response:** From **System Definitions**, define SMF Files for the Systems or Groups that you want to report against. Alternatively, change the Missing SMF File option on the Run Report Set panel from 3 (Disregard offending reports) to either:

1. Issue error message. CICS PA will inform you which System or Group does not have SMF Files specified, or
2. Leave DSN unresolved in JCL. CICS PA will generate the report JCL, but leave the SMF File data set name(s) unresolved in the JCL.

---

**CPA1041E    Reason=*reason* Member=*membername*  
DSN=*datasetname***

**Explanation:** CICS PA could not SAVE your currently active EDIT session. The reasons why your SAVE request might have failed are:

- **ABEND** - Save request has abended
- **PDS Directory Full** - The PDS directory is full
- **BLDL or STOW error** - Unsupported return code from BLDL/STOW SVC

**System action:** The SAVE request is aborted.

**User response:** For ABENDSx37 conditions, compress the data set or re-allocate the data set with a larger primary/secondary space allocation.

For Directory Full or ABENDSB14-0000000C conditions, re-allocate the data set with a larger directory block allocation.

For all other conditions, contact your IBM representative for help.

---

**CPA1042E    Dictionary data set is not RECFM=V**

**Explanation:** The specified data set cannot be used as a Dictionary data set because the record format is not Variable (RECFM=V).

**System action:** Processing is terminated.

**User response:** Ensure that the Dictionary data set is allocated with a variable record format. Alternatively, specify a new Dictionary data set name. CICS PA will allocate it with the correct attributes.

---

**CPA1043E    Dictionary data set is a PDS but  
member name is not specified**

**Explanation:** The specified Dictionary data set is Partitioned (PDS) but a member name is not specified.

**System action:** Processing is terminated.

**User response:** Specify a member name and retry your request.

---

**CPA1044E    Report Set JCL generation failed. HDB  
has no data within specified time range.**

**Explanation:** CICS PA has detected that the HDB is empty or has no container data sets in the specified time range. Message CPA1045E, issued after this message, identifies the HDB and report that are causing the failure.

**System action:** Processing is terminated.

**User response:** See the message CPA1045E following this message to identify the HDB and report. Either specify a different HDB or a different time range, and then retry your request.

---

**CPA1045E    HDB=*hdb-name*, Report=*report-name*,  
Output=*ddname*, From=*yyyy/mm/dd*  
*hh:mm:ss*, To=*yyyy/mm/dd***

**Explanation:** This message provides additional details for the previous message. The From value only contains *hh:mm:ss* if the From and To dates are the same. The Output value identifies the *ddname* of the report output or extract data set.

**System action:** See the action for the previous message.

**User response:** Use this message to identify the report that caused the failure described by the previous message. For more information, see the response for the previous message.

---

**CPA1046E    Report Set JCL generation failed.  
*condition* Report=*report-name*,  
Output=*ddname***

**Explanation:** CICS PA has detected one of the following conditions:

**HDB not specified.**

The required HDB was not specified in the indicated report.

**Unable to access Repository.**

The required repository could not be accessed either because it was not specified or it was not allocated.

This message identifies the report that caused the failure and the output ddname.

**System action:** Processing is terminated.

**User response:** Specify the required HDB in the failing report or ensure that the repository is specified in the Historical Database function and has been allocated.

---

**CPA1047E Report Set JCL generation failed. Form=*form-type* type is invalid for Report=*report-name***

**Explanation:** CICS PA has detected that the Report Form specified in a report is not the right type of form for this report.

**System action:** Processing is terminated.

**User response:** Specify a compatible form type:

- For the Transaction Tracking List Report: specify a List Form.
- For Transaction Tracking Summary Report: specify a Summary Form.

---

**CPA1048E Report Set JCL generation failed. No Statistics reports selected for Statistics Extracts.**

**Explanation:** CICS PA has detected that no Statistics reports have been selected for processing.

**System action:** Processing is terminated.

**User response:** Specify one or more Statistics reports for processing.

---

**CPA1049E Transaction Profiling JCL generation failed. Log Stream is not valid for Baseline reporting.**

**Explanation:** The data source corresponding to the specified APPLIDs includes a log stream. Baseline data for transaction profiling can only be sourced from SMF files or performance HDBs, not log streams.

**System action:** Processing is terminated.

**User response:** Ensure that a log stream is not selected for Baseline processing by making one of the following updates:

- Change the report interval.

- Remove the log stream from the selected system definition.
- Select a different system.
- Clear the **Use Log Streams when available** setting in the File Selection profile options.

---

**CPA1050E Report Set JCL generation failed. Group contains more than one Log Stream for the same System type.**

**Explanation:** The group requested for report processing has more than one log stream for the same type of system. Message CPA1030E is issued with this message to identify the group and the report that caused the failure.

**System action:** Processing is terminated.

**User response:** In the system definition, ensure the group contains systems with no more than one distinct log stream for each type.

---

**CPA1051E Report Set JCL generation failed. No Image in the System for DASD-only Log Stream.**

**Explanation:** The system requested for report processing has no image specified. The DASDONLY Log stream option is selected in your profile options, indicating that all log streams will be treated as DASD-only and require an image name to execute.

Message CPA1030E is issued with this message to identify the system and the report that caused the failure.

**System action:** Processing is terminated.

**User response:** In the system definition, define an image for this system.

---

**CPA1052E Report Set JCL generation failed. Report Interval must be specified when using a Log Stream.**

**Explanation:** A log stream was selected for report processing but no report interval or an incomplete report interval was specified. The log stream retention period (RETPD) specified in the system definition is used to indicate the period of data it covers. You must provide a complete report interval so that CICS PA can both determine whether the log stream has all the data required for reporting and limit the amount of data that needs to be processed.

**System action:** Processing is terminated.

**User response:** Define a complete report interval with From and To dates and times.

## 2000–2099 Data Take-up messages

These messages are issued during take-up processing. See “Personal Take-Up from SMF File” on page 104.

---

### CPA2000I    Take-up processing has completed, RC=*nn*

**Explanation:** Take-up processing completed with the specified return code. If the return code is not zero, then Take-up processing encountered a problem.

**System action:** Take-up terminates.

**User response:** None required.

---

### CPA2001E    SYSPRINT IS MISSING FROM THE JCL - RUN ABORTED

**Explanation:** The required SYSPRINT DD card is missing from the JCL.

**System action:** Processing is terminated, RC=16.

**User response:** Correct the JCL and resubmit.

---

### CPA2002E    Take-up aborted due to an unrecoverable error - RSN=*nnnn* INFO=*xxxxxxxx*

**Explanation:** CICS PA could not complete take-up due to an unrecoverable error. RSN is the reason code. For some reason codes, INFO provides additional information.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

### CPA2003E    Dialog table DD CPATABL is missing from the JCL

**Explanation:** No CPATABL DD card is present in the JCL but it is required.

**System action:** Processing is terminated.

**User response:** Correct the JCL and resubmit.

---

### CPA2004E    Dialog table data set (CPATABL) is unavailable

**Explanation:** The data set associated with the CPATABL DD was unavailable when Take-up attempted to save. This is likely to be due to a conflict with a CICS PA Dialog user, or another Take-up job running concurrently.

**System action:** Processing is terminated.

**User response:** Resubmit the job.

---

### CPA2005W    Dialog Take-up member is invalid and will be replaced

**Explanation:** The existing dialog Take-up member (CPASMTU) was found to be in error and is replaced, correcting the member.

**System action:** Processing continues.

**User response:** None required.

---

### CPA2006E    Concatenated data sets are not supported, ignored DD SMFIN*xxx*

**Explanation:** An SMFIN DD was found to contain concatenated data sets, which are not supported by Take-up. The Dialog associates Systems with SMF Files. Take-up must be able to identify the Systems present within each SMF data set.

**System action:** Processing continues, however the SMFIN DD(s) with concatenated data sets is ignored.

**User response:** If the ignored SMFIN DD's data sets are required, then modify the JCL for the given SMF files so that each of the concatenated data sets is assigned a unique SMF file name (SMFIN) and resubmit.

---

### CPA2007E    SMF input files (SMFIN) missing from the JCL

**Explanation:** No SMF input files were found in the JCL. SMF input files have a DDname prefix of SMFIN.

**System action:** Processing is terminated.

**User response:** Correct the JCL and resubmit.

---

### CPA2008W    Unable to determine Unit Name for SMF file SMFIN*xxx*

**Explanation:** Take-up processing is unable to determine the Unit Name associated with the given SMF file's data set.

**System action:** Processing continues but the SMF file will not be assigned a Unit Name.

**User response:** After Take-up has been applied, manually specify the Unit Name for this SMF file in **System Definitions**.

---

### CPA2009E    Unsupported device type for SMF file SMFIN*xxx*

**Explanation:** The given SMF file's data set has a device type that is not supported. Only DASD or Tape devices are supported by CICS PA.

**System action:** Processing is terminated.

**User response:** Ensure that the SMF file resides on a

DASD or Tape volume then resubmit the job.

---

**CPA2010E**    **Unable to obtain information for SMF file** *SMFINxxx - RC=nn RSN=nnn*  
**INFO=xxxxxxxx**

**Explanation:** Take-up processing is unable to obtain some required information for the given SMF file. RC is the return code, RSN is the reason code, and INFO is either UNIT or DSN indicating the type of information that could not be obtained.

**System action:** Processing is terminated.

**User response:** Contact your IBM representative for help.

---

**CPA2011E**    **Dialog limit of 16 VOLSERs exceeded for SMF file** *SMFINxxx*

**Explanation:** The given SMF file has specified an uncataloged data set of more than 16 volumes, which is the Dialog limit. The CICS PA Dialog only supports data sets with more than 16 volumes if they are cataloged.

**System action:** Processing is terminated.

**User response:** Specify cataloged data sets, or uncataloged data sets with no more than 16 volumes.

---

**CPA2012I**    **Processing started for SMF file** *SMFINxxx*

**Explanation:** Take-up processing has begun for the specified SMF file.

**System action:** Processing continues.

**User response:** None required.

---

**CPA2013I**    **Processing ended for SMF file** *SMFINxxx - nnn system(s) found*

**Explanation:** Take-up processing has ended for the specified SMF file, and the number of systems identified by Take-up is given.

**System action:** Processing continues.

**User response:** None required.

---

**CPA2014I**    **CMF record for CICS system found,** *APPLID=xxxxxxx Release=v.r.m*

**Explanation:** Take-up processing has encountered a new CICS system, or a higher release level for a CICS system already listed.

**System action:** Processing continues.

**User response:** None required.

---

**CPA2015I**    **DB2 Accounting record found, DB2**  
**SSID=xxxx Release=v.r**

**Explanation:** Take-up processing has encountered a new DB2 subsystem or a higher release level for a DB2 subsystem already listed.

**System action:** Processing continues.

**User response:** None required.

---

**CPA2016I**    **MVS System Logger record found,**  
**System=xxxxLOGR**

**Explanation:** Take-up processing has encountered a new MVS System Logger system.

**System action:** Processing continues.

**User response:** None required.

---

**CPA2017I**    **SMF records for System xxxx start at**  
*mm/dd/yyyy hh:mm:ss.th*

**Explanation:** Take-up processing found SMF records for the given system, starting at the nominated date-time.

**System action:** Processing continues.

**User response:** None required.

---

**CPA2018I**    **DB2 subsystem ignored as Accounting**  
**Tokens not set, SSID=xxxx**

**Explanation:** Take-up processing has encountered records for a DB2 subsystem with CICS Attach activity, however the Accounting Token field is not set in any of these records, that is, ACCOUNTREC(TASK) or ACCOUNTREC(UOW) was not in use. As such the records are not suitable for CICS PA reporting and the DB2 subsystem name will not be included in Take-up.

**System action:** Processing continues.

**User response:** None required.

---

**CPA2019W**    **CMF record with unsupported release**  
**encountered - records ignored**  
**APPLID=xxxxxxx Release=v.r.m**

**Explanation:** A CMF record for a CICS release that is not supported by CICS PA has been encountered. All records for this CICS release are ignored.

**System action:** Processing continues.

**User response:** None required.

---

**CPA2020W**    **DB2 accounting record with**  
**unsupported release encountered -**  
**records ignored SSID=xxxx Release=v.r**

**Explanation:** A DB2 accounting record for a DB2 release that is not supported by CICS PA has been

**User response:** Updates should complete very quickly, so retry your save request.

---

**CPA3005E ENQ macro failed, RC=xx**

**Explanation:** The ENQ macro has failed with an unsupported Return Code.

**System action:** CICS PA immediately stops processing.

**User response:** Exit ISPF to free the ENQ and then retry your request. If the problem reoccurs, contact IBM.

---

**CPA3007W object already exists, Name=name**

**Explanation:** The specified object already exists in the Repository. You cannot create a new object with the same name. The object can be an HDB Definition, a Template, or a Resource List.

**System action:** CICS PA immediately stops processing.

**User response:** Select another name for the object and retry your request.

---

**CPA3008W object is required, Name=name**

**Explanation:** The specified object cannot be deleted from the Repository because another object references it.

**System action:** CICS PA immediately stops processing.

**User response:** None required. The object cannot be deleted at present. In some cases, running a Housekeeping job will resolve this issue because Housekeeping deletes objects from the Repository that are no longer needed.

---

**CPA3009C HDB - failing component and action**

**Explanation:** CICS PA has suffered a catastrophic failure in the specified component.

**System action:** CICS PA immediately stops processing.

**User response:** If the problem reoccurs, contact your IBM representative.

---

**CPA3010W HDB Definition is using an undefined Template, HDB=xxxxxxx, Template=xxxxxxx**

**Explanation:** There was an attempt to save an HDB

definition that references an undefined Template Name.

**System action:** The request is rejected.

**User response:** Create the Template and retry the request, or change the name of the Template to one that exists in the Repository and retry the request.

---

**CPA3011E HDB Template/System/Group not found, Name/Token=xxxxxxx**

**Explanation:** The required template, system definition, or group could not be found, possible due to an integrity problem in the repository.

**System action:** CICS PA immediately stops processing.

**User response:** Contact your IBM representative for help.

---

**CPA3012E HDB has already been loaded for the current SMF input, Name=xxxxxxx**

**Explanation:** The HDB load failed due to the same SMF file being used to load the HDB for the same time interval. This restriction is applied to prevent duplicate data being loaded into the same HDB by multiple loads.

**System action:** CICS PA immediately stops processing.

**User response:** Rerun the HDB load either with a different SMF input file or specify a time interval that does not overlap previous loads.

---

**CPA3013E Repository is not allocated in JCL, missing DDname=xxxxxxx**

**Explanation:** The Repository DD was not specified in the JCL.

**System action:** CICS PA immediately stops processing.

**User response:** Add the Repository DD card for the associated HDB in the JCL and then rerun.

---

**CPA3014E HDB Template Name=xxxxxxx is reserved.**

**Explanation:** The specified HDB Template name is a CICS PA internal Template name that cannot be specified by the user.

**System action:** CICS PA immediately stops processing.

**User response:** Select another template name and retry your request.

---

## 4000–4099 HDB SMF Statistics messages

These messages are issued during HDB SMF Statistics processing. See Chapter 17, "Using the Statistics reporting dialog," on page 535.

---

**CPA4001E**    **PDS Member does not exist;**  
**Name=xxxxxxx, BLDL RC=xxxx-xxxx**

**Explanation:** The SMF input file is a PDS but the specified member name does not exist. The BLDL return and reason codes indicate the failure reason.

**System action:** SMF file processing stops.

**User response:** Verify that the member exists in the SMF file PDS:

- If it does not exist, then specify a member name that exists and retry your request.
- If it does exist, then check the BLDL return and reason codes to determine the failure reason.

---

**CPA4002E**    **CICS Statistics not found in SMF File**  
*filename*

**Explanation:** CICS PA did not find any CICS Statistics records in the SMF File.

**System action:** CICS PA stops processing the specified SMF File.

**User response:** If CICS Statistics records were expected for this file, review your CICS Statistics settings and SMF Dump options.

---

**CPA4003E**    **CICS Version xxx is not supported**

**Explanation:** CICS PA cannot process the CICS statistics because they were generated by an unsupported version of CICS Transaction Server. CICS PA supports CICS TS V3R1 (640) and later versions.

**System action:** CICS PA stops processing the specified SMF File.

**User response:** You cannot use CICS PA to report Statistics for this version of CICS Transaction Server.

---

**CPA4004W**    **Attention Interrupt has stopped SMF**  
**File processing**

**Explanation:** CICS PA has stopped reading the SMF Input file because an Attention Interrupt was received.

**System action:** CICS PA stops reading the SMF file and displays only data read to this point.

**User response:** Press Enter to resume SMF Input file processing.

---

**CPA4005E**    **SMF input file is not available.**  
**DDname ddname allocation error;**  
**RDJFCB RC=rc**

**Explanation:** The RDJFCB system service determined that the SMF input file is not allocated to the specified DDname.

**System action:** SMF file processing stops.

**User response:** Verify that the SMF file data set name is specified correctly. The data set must reside on an online DASD volume. If the data set is cataloged, it must reside on the cataloged VOLSER. If the data set is not cataloged, it must reside on the specified VOLSER.

---

**CPA4006E**    **SMF input file does not reside on the**  
**specified volume; VOLSER=volser,**  
**OBTAIN RC=rc**

**Explanation:** The DADSM OBTAIN system service determined that the SMF input file does not reside on the required volume, as indicated in the Catalog or the specified VOLSER.

**System action:** SMF file processing stops.

**User response:** Verify that the SMF file data set name is specified correctly. The data set must reside on an online DASD volume. If the data set is cataloged, it must reside on the cataloged VOLSER. If the data set is not cataloged, it must reside on the specified VOLSER.

---

**CPA4007E**    **CICS Statistics ID is not supported;**  
**STID=stid, Domain=xx, VRM=yyy,**  
**BlkID=zz**

**Explanation:** The specified CICS Statistics ID (STID as defined in macro DFHSTIDS) is not supported by CICS PA. CICS PA supports all types of CICS statistics records and this error should not occur.

**System action:** The CICS Statistics record is ignored by CICS PA and SMF file processing continues.

**User response:** If the specified Stats ID is a valid ID defined in DFHSTIDS, then contact IBM. Support for this ID might need to be added via the service process.

If the specified ID is not a valid Stats ID, then contact IBM. CICS PA might have incorrectly interpreted the statistics record.

---

**CPA4008E**    **SMF File Open request failed;**  
**ABEND=xxxxxxx-yyy-yyyyy**

**Explanation:** The requested SMF File could not be opened. The OPEN request failed with the specified ABEND Code. The most common reason is ABENDS913 because access was denied due to an authorization failure.

**System action:** CICS PA processing stops.

**User response:** Check the OPEN SVC messages for the failure reason. Correct the problem and retry your request.

---

**CPA4009E**    **SMF input file is not DSORG=PS;**  
**DS1DSORG=xxxx**

**Explanation:** The SMF input file does not have a Data Set Organization (DSORG) of PS. CICS PA only supports SMF files with DSORG=PS. DS1DSORG is the

unsupported DSORG from the DSCB.

**System action:** SMF file processing stops.

**User response:** Ensure that the specified SMF input file is a valid SMF data set with DSORG=PS.

---

**CPA4010E CICS Statistics for the selected interval are no longer available**

**Explanation:** The CICS statistics interval that you selected is no longer available in the SMF File. The SMF File must have been updated after CICS PA first identified all the statistics intervals.

**System action:** SMF file processing stops.

**User response:** Refresh the statistics intervals. Exit from processing this data set then reprocess it to rebuild the statistics intervals.

---

**CPA4011E CICS Domain is not supported; Domain=xx, VRM=yyy**

**Explanation:** The specified Statistics Domain ID (SMFSTDID in macro DFHSMFDS) is not supported by CICS PA. CICS PA supports all types of CICS statistics records and this error should not occur.

**System action:** The CICS Statistics record is ignored by CICS PA. SMF file processing continues.

**User response:** If the Domain ID is a valid Domain for the specified release of CICS Transaction Server, then contact IBM. Support for this Domain ID might need to be added via the service process.

If the specified Domain ID is not a valid Domain, then contact IBM. CICS PA might have incorrectly interpreted the statistics record.

---

**CPA4012E CICS Statistics record processing failed; Domain=xx, VRM=yyy**

**Explanation:** CICS PA could not interpret a Statistics record because its format is not supported.

**System action:** The CICS Statistics record is ignored by CICS PA. SMF file processing continues.

**User response:** Verify that the record can be reported by the CICS Statistics utility program (DFHSTUP). If DFHSTUP processes the record successfully, then contact IBM. CICS PA might have incorrectly interpreted the statistics record.

---

**CPA4013E SMF input file is not RECFM=VB or VBS; DS1RECFM=xx**

**Explanation:** The SMF input file format is not valid.

**System action:** SMF file processing stops.

**User response:** Ensure that the specified SMF input file is a valid SMF data set.

---

**CPA4014W CICS xx Version yyy is not supported**

**Explanation:** CICS PA cannot process the CICS statistics because they were generated by an unsupported version of CICS Transaction Server or CICS Transaction Gateway.

**System action:** CICS PA continues processing the specified SMF File.

**User response:** You cannot use CICS PA to report Statistics for this version of CICS Transaction Server or CICS Transaction Gateway.

---

## Chapter 25. Problem determination

This chapter contains information about CICS PA problem determination.

- “Eliminating user errors”

This section gives you a general idea of how to do CICS PA problem determination. It describes the preliminary steps you can take to be sure that the problem you are experiencing is a CICS PA problem and discusses some common user errors that you might be able to resolve without IBM assistance.

- “Diagnosis” on page 733

This section describes the steps you need to follow to gather the information needed to work with IBM support.

For the list and explanation of CICS PA messages, see Chapter 24, “Messages,” on page 689.

---

### Eliminating user errors

This section explains how to diagnose problems or failures quickly by identifying the failing program component – a CICS PA error, an error in other components of the system on which CICS PA is running, or a user error. The following information is discussed:

- How to collect diagnostic information
- How to identify types of CICS PA problems
- Common causes of CICS PA problems.

### Collecting helpful diagnostic information

Perform the following steps to determine the source of a problem:

1. Describe the symptoms.
2. List the following items:
  - Error message data
  - Program termination message data.
3. Analyze the failure as described in the following section.

### Identifying types of problems

After collecting the information described in the preceding paragraph, determine the type of problem you have found. Problems might be caused by:

- The way you are using CICS PA
  - CICS PA command language or Job Control language (JCL) errors
  - Data-related errors
  - Improper installation.
- Failure with other software components, such as CICS or DFSORT
- CICS PA program errors.

The first step toward solving your problem might be to ask yourself and others in your area if this is the first time that this function or request has been made, or if this function or request worked in the past and has started failing recently. If the function worked before, find out as much as possible about what has changed in your system. There is a good chance that the change has directly or indirectly

caused your problem. If this is the first time the function has been attempted, the problem is most likely the way you are using the function, or that the function is in error.

With CICS PA, problems might be caused either by the way you are using the product, by another component of your operating system, or by a combination of these factors. The next section tells you how to identify common causes of these types of problems.

For information on program errors that are caused by the CICS PA program product, see “Diagnosis” on page 733.

## Common causes of CICS PA problems

### JCL and batch command errors

When CICS PA detects a JCL error or batch command coding error, it issues messages to help you determine the cause. Many of these messages contain all the information you need to find and fix the problem. See Chapter 24, “Messages,” on page 689 for a complete listing of CICS PA messages. The text of each entry explains the message and tells you the following:

- What action CICS PA takes when it issues the message, and
- What action you should take to eliminate the error condition.

### Data-related problems

Before assuming that an error is caused by a defect in CICS PA, ensure that the input data CICS PA is trying to process is valid. Three types of data problems might occur that prevent CICS PA from accurately processing data collected by the CICS Monitoring Facility (CMF). These data problems are:

1. Absence of data dictionaries
2. Absence of data within a particular record type
3. Invalid data values

**Absence of data dictionaries:** Two symptoms occur when data dictionaries are absent.

The first, and most common, symptom is a message indicating that data records were encountered before dictionary records. This might be due either to an error in the CMF data or a user-related error. You can cause this error when copying CMF records from one data set to another. When copying CMF records, make sure that the dictionary records are copied along with the data records and appear *before* their associated data records. If the data set was not copied, the missing or misplaced dictionaries might be caused by an error in CMF.

**Note:** When CICS writes to an MVS SMF data set, CICS does not get notified that a data set switch has occurred and cannot write the dictionaries at the beginning of the new data set. It is necessary that SMF data sets be processed in the same order in which they were created.

The second symptom is the occurrence of numerous error messages. These messages tell you that CICS PA was unable to find the indicated data field. This happens when the dictionaries are lost and is due to improper link edit of the dictionary processor, ECPDICMF.

**Missing fields:** The second problem, absence of data within a particular record type, might be a CMF data error or a user interpretation error. Because many of the fields collected by CMF are optional, you can exclude the data from a

particular record. CICS PA issues a message indicating that the field is **Missing** from the record. Although this is not a severe error, the report might not provide an accurate account of the data. This is especially true on Summary reports. If a data field in the summation is missing for any part of the summarization interval, then the field is marked Missing.

**Invalid data values:** The final data-related problem concerns invalid data values. If CICS PA is having trouble processing some of the CMF data fields, check for errors by validating the data in the following way:

- Run the CICS batch program DFH\$MOLS. For information on using DFH\$MOLS, see the *CICS Operation and Utilities Guide*. DFH\$MOLS can print every field in each of the CMF record types and if it cannot process the data correctly, then the problem is with the data.

**Note:** DFH\$MOLS generates a page or more of output for each CMF record that you select for processing. Be very careful when specifying how much data you want printed.

### Absence of data records

A good way to determine whether or not you are processing proper data is to examine the Dispatcher Tables Summary (see Figure 418) and End of File Record Counts (see Figure 419 on page 732).

These two summaries are automatically produced at the end of report and extract processing. They provide a good starting point for problem determination when it is expected that some or all of the input data is missing.

V5R1M0 08:48:05 10/22/2012		CICS Performance Analyzer Dispatcher Tables Summary					
SMF DD or Log Stream name	Off	PreScan	Routine	Output	EOF	ParmName	Codes

Figure 419. Example of the End of File Record Counts report

## Batch Abends U1000, U1001, U1002

When the batch report processor encounters a severe error condition in STAE environments, it issues user abends 1000, 1001, or 1002. Analyzing the problem with the following factors in mind might help you identify the cause of the problem and its solution.

- User 1000 abend indicates that CICS PA encountered an error after command processing and before reading any data.
- User 1001 abend indicates that CICS PA encountered an error after reading in all the data and reaching end-of-file on the input file.
- User 1002 abend indicates that CICS PA encountered an error while reading and processing data.

CICS PA also issues a message indicating that a STAE exit was invoked.

**Note:** The STAE environment allows you to signal a logical end-of-file to record processors when an unexpected error occurs. The data accumulated up to the point of the error is then available for reports. Without logical end-of-file, the data would be lost.

User abends issued by the STAE exit processing frequently mask the real problem. When CICS PA encounters an error condition, such as a protection exception, it tries to recover and produce as many reports as possible, without reading any more data. It then abnormally terminates with one of these user abends.

Logic errors are generally easier to diagnose if processing stops immediately. When a STAE exit runs, memory and register values change, making the cause of the abend harder to identify. If you need a dump for analysis by IBM support, be sure to specify **PARM=NOSTAE** on the EXEC statement of your JCL.

If you specify NOSTAE and still get user abends, check the error messages. Some severe CICS PA messages cause user abends 1000, 1001, or 1002 after they are issued. NOSTAE does not affect these user abends. If you need to call IBM support, make sure you know which message causes you to stop processing.

---

## Diagnosis

If you are experiencing difficulty using CICS PA, your first step should be to make sure the problem is not due to the way you are using the product. Before going through the procedures described here, you should eliminate user error as a cause of your problem. If you have turned to this section without reviewing “Eliminating user errors” on page 729, you might save yourself some time and trouble by making sure that your problem is not discussed there.

If you have determined that CICS PA is the cause of your problem, you need to gather information to help isolate the problem and find a solution. The information required is:

- Type of failure
- Function that failed
- Release level
- Maintenance level

Some of the information (for example, program number or service level), is independent of the particular problem and does not require you to make a judgement. For other information, you must choose one of several possibilities. Your choice depends on the specific symptoms of the problem.

For reporting the problem to IBM, you need to be prepared to provide supporting materials and evidence such as sample inputs and outputs, and a description of the circumstances in which the problem occurred.

### Types of failure

The following descriptions should help you determine which condition best describes the type of failure that has occurred. If you do not know which condition to select, choose one that best describes the failure. You should consult the *CICS Problem Determination Guide* for additional information on abends, waits, loops, and incorrect output.

#### Abend

This type of failure occurs when a program terminates prematurely. This condition almost always produces a dump. When an abend occurs, collect the following information before calling IBM:

- The abend code of the dump
- A brief description of what was entered to cause the abend to occur
- If the abend was a program interrupt,
  - The program that abended
  - The displacement within the program where the abend occurred
  - The data which was being referenced when the abend occurred.

#### Documentation

This problem involves online and hardcopy documentation. Report a documentation problem if it falls into one of the following categories:

- Documented descriptions of the CICS PA organization or operation do not match the actual organization or operation.
- Information that is essential to the installation, operation, or service of CICS PA is missing from or incorrect in the documentation.
- Information in the documentation is unclear and prevents the effective use of CICS PA.

**Note:** If you have suggestions, comments, or questions concerning a CICS PA book, use the appropriate Reader's Comment Form at the back of the book.

IBM requires the following information to resolve a documentation problem:

- The complete document number, including the revision number, or the message number or function in error, if the error is in the online help text
- The section and page number of the error
- The sentence or sentences in error
- A brief description of what you think is correct.

#### **Error**

An error condition is normally detected by the presence of an error message. Information required to resolve this type of problem is:

- The message number
- The program that issued the message, if known
- The data that caused the message to appear.

#### **Incorrect output**

This type of problem involves missing, extra and unnecessary, or incorrect data. CICS PA is not likely to recognize that a problem exists; therefore, an error message might not appear. IBM needs the following information to resolve this type of problem:

- The report in error
- The field or fields in error
- Some indication of why you feel the information is incorrect, unnecessary, or needed.

#### **Loop**

A loop condition generally causes an abend to occur. MVS has specific abend codes to indicate loop conditions. These codes can be found in the appropriate books. When a loop occurs, the following information is required:

- The program causing the loop
- As many instructions as can be reasonably determined within the loop
- A brief description of what caused the loop to occur.

#### **Message**

A message error occurs when a message:

- Contains incorrect data
- Is not documented, or is not documented correctly
- Is generated when it shouldn't be
- Is not generated when it should be
- Is not the message which should occur.

The information required to resolve this type of error is:

- The message number
- A brief description of what is wrong with the message
- A brief description of what the message should be.

#### **Performance**

A performance problem is generally one of the hardest problems to resolve. Typically, it does not occur in a batch job. If you feel you are having a performance problem with CICS PA, supply IBM with the following information:

- Your operating environment, that is, the processor, the operating system, and any other factor which you feel might be contributing to the problem.
- The CICS PA function
- The CICS PA module(s), if it can be reasonably determined
- Whether or not the problem always occurs, or only occurs at certain times

- If the problem occurs occasionally, a description of what else was running in the system when the problem occurred.

#### **Wait**

This type of error normally occurs under the following conditions:

- CICS PA is waiting for some condition to be satisfied.
- CICS PA appears to be waiting for some event that is unlikely to occur.
- CICS PA has not recognized the occurrence of an event for which it has suspended processing.

Sometimes a wait error condition generates a dump. You should refer to the appropriate operating system reference books to determine the abend code associated with this type of error condition. The information necessary to resolve this type of problem is:

- The online function or report involved
- A dump, if one was generated.

### **Release level (VRM)**

The release level (Version, Release, Modification) of CICS PA should be stated in all communications with IBM. In addition, you should know the release level of any of the following products that are relevant to the problem:

- z/OS
- CICS (this should be at least CICS Transaction Server for z/OS Version 3.1)
- DFSORT

### **Maintenance level**

The maintenance level of CICS PA corresponds to the latest PTF tape installed on CICS PA, plus any Authorized Program Analysis Reports (APARs) installed on top of the Program Temporary Fix (PTF) tape. If no maintenance has been installed on CICS PA, tell the IBM support representative the date when CICS PA was installed on your system. It is also necessary to know the maintenance level of the products described in the previous section "Release level (VRM)."

### **Problem materials and evidence**

If a problem occurs while using CICS PA, the following information is required:

1. A copy of the input file used for the job
2. A copy of the job stream used for the job, including the Job Control Language (JCL) and commands
3. A listing of the output generated, including:
  - The report listing
  - The messages issued.
4. A written scenario describing what information the user was trying to achieve from the CICS PA report at the time of the error (also state whether the sample jobs were run at the time CICS PA was installed).

## Chapter 26. CMF Field IDs by CICS version

The following cross-reference table relates the CICS monitoring facility (CMF) field IDs for performance class and transaction resource class data with the CICS versions to which they apply.

Some columns in the table require explanation:

### CICS PA field name

The name used in report forms, HDB templates, and selection criteria (and the corresponding batch command operands `FIELDS` and `SELECT`):

- A blank value in this column indicates that the CICS PA field name is the same as the CMF field name.
- “N/A” indicates that the field is not available, typically because it is a very long field, or it is an unprintable field such as a unit-of-work or a flag.

### Column heading

The heading used to identify the field in CICS PA reports and extract data sets.

### CICS version

The CICS versions to which a field applies:

- Yes, the field applies to this CICS version
- No, the field does not apply to this CICS version

The table is sorted by CMF group and CMF field ID.

### Note:

1. DBCTL fields can only be specified if the MCT contains the DBCTL EMP defined in SDFHSAMP member DFH\$MCTD.
2. Some special fields, such as APPLID and RESPONSE, are not defined in the CMF Dictionary and are given a group name of “CICSPA”. These fields are either derived from the fixed section of the CMF record (for example, APPLID), or calculated from two or more other CMF fields (for example, RESPONSE).
3. The FILENAME, TSQNAME, and DPLNAME fields are only available when CMF transaction resource class data is being collected.
4. The DFHAPPL fields are only available when application programs invoke the application naming event monitoring points. See the APPLNAME parameter on the DFHMCT TYPE=INITIAL macro in the *CICS Resource Definition Guide*.

Table 17. Cross-reference: CMF field ID × CICS version

CMF field						CICS version					Description
Group	Type	ID	Name	CICS PA field name	Column heading	6	6	6	6	6

## Chapter 27. CICS PA field names by CICS version

The following cross-reference table relates the CICS PA names for CICS monitoring facility (CMF) performance class and transaction resource class data fields to the corresponding CMF field IDs and the CICS versions to which they apply.

Some columns in the table require explanation:

### CICS PA field name

The name used in report forms, HDB templates, and selection criteria (and their corresponding batch command operands **FIELDS** and **SELECT**).

A blank indicates that the field is not available, typically because it is a very long field, or it is an unprintable field such as a unit-of-work or a flag.

### Column heading

The heading used to identify the field in CICS PA reports and extract data sets.

### CICS version

The CICS versions to which a field applies:

- Yes, the field applies to this CICS version
- No, the field does not apply to this CICS version

The table is sorted by CICS PA field name.

### Note:

1. Some special fields, such as **APPLID** and **RESPONSE**, are not defined in the CMF Dictionary and are given a group name of "CICSPA". These fields are either derived from the fixed section of the CMF record (for example, **APPLID**), or calculated from two or more other CMF fields (for example, **RESPONSE**).
2. The **FILENAME**, **TSQNAME**, and **DPLNAME** fields are only available when CMF transaction resource class data is being collected.
3. The **APPLTRAN** and **APPLPROG** fields are only available when application programs invoke the application naming event monitoring points. See the **APPLNAME** parameter on the **DFHMCT TYPE=INITIAL** macro in the *CICS Resource Definition Guide*.

Table 18. Cross-reference: CICS PA field name × CICS version

		CMF field			CICS version						
CICS PA field name	Column heading	Group	Type	ID	Name	6	6	6	6	6	Description
						4	5	6	7	8	
						0	0	0	0	0	
	BTS Root	DFHCBTS	C	202	PRCSID	•	•	•	•	•	BTS Root Activity identifier
	BTSActID	DFHCBTS	C	203	ACTVTYID	•	•	•	•	•	BTS Activity identifier
	Err Flag	DFHTASK	C	064	TASKFLAG	•	•	•	•	•	Task error flags
	RRMSURID	DFHTASK	C	190	RRMSURID	•	•	•	•	•	RRMS/MVS unit-of-recovery ID (URID)
ABCODEC	ABcu	DFHPROG	C	114	ABCODEC	•	•	•	•	•	Current ABEND code
ABCODEO	ABor	DFHPROG	C	113	ABCODEO	•	•	•	•	•	Original ABEND Code
ACAPPLNM	ACApplNm	DFHTASK	C	451	ACAPPLNM	–	–	–	–	•	Application context application name
ACAPPLVR	ACApplVr	CICSPA	C	933	ACAPPLVR	–	–	–	–	•	Application context application version
ACCMETH	Acc Meth	DFHTERM	A	165	TERMINFO	•	•	•	•	•	Terminal Access Method
ACMAJVER	ACMajVer	DFHTASK	C	453	ACMAJVER	–	–	–	–	•	Application context application major version
ACMICVER	ACMicVer	DFHTASK	C	455	ACMICVER	–	–	–	–	•	Application context application micro version

Table 18. Cross-reference: CICS PA field name × CICS version (continued)

CICS PA field name	Column heading	CMF field				CICS version					Description
		Group	Type	ID	Name	6	6	6	6	6	
						4	5	6	7	8	
						0	0	0	0	0	
ACMINVER	ACMinVer	DFHTASK	C	454	ACMINVER	–	–	–	–	•	Application context application minor version
ACOPERNM	ACOperNm	DFHTASK	C	456	ACOPERNM	–	–	–	–	•	Application context operation name
ACPLATNM	ACPlatNm	DFHTASK	C	452	ACPLATNM	–	–	–	–	•	Application context platform name
ACTVTYNM	BTSActNm	DFHCBTS	C	204	ACTVTYNM	•	•	•	•	•	BTS Activity name
ADABREQ	ADABREQ	OMCICS	S	017	ADABREQ	•	•	•	•	•	OMEGAMON monitored Adabas requests
ADABWARN	ADABWARN	OMCICS	C	005	ADABWARN	•	•	•	•	•	OMEGAMON Adabas Limit Warning
ALERT	ALERT	CICSPA	A	915	ALERT	•	•	•	•	•	Total Alert count or percentage

Table 18. Cross-reference: CICS PA field name × CICS version (continued)

CICS PA field name	Column heading	CMF field				CICS version					Description
		Group	Type	ID	Name	6	6	6	6	6	
						4	5	6	7	8	
						0	0	0	0	0	
JVMITIME	JVMITime	DFHTASK	S	273	JVMITIME	•	•	•	•	•	JVM initialize elapsed time
JVMMTIME	JVM Meth	CICSPA	D	910	JVMMTIME	•	•	•	•	•	JVM Method time
JVMRTIME	JVMRTIME	DFHTASK	S	275	JVMRTIME	•	•	•	•	•	JVM reset elapsed time
JVMSUSP	JVM Susp	DFHTASK	S	254	JVMSUSP	•	•	•	•	•	JVM suspend time
JVMTHDWT	JVMThdWt	DFHTASK	S	401	JVMTHDWT	–	–	•	•	•	JVM server thread wait time
JVMTIME	JVM Elap	DFHTASK	S	253	JVMTIME	•	•	•	•	•	JVM elapsed time
KY8CPU	KY8 CPU	DFHTASK	S	263	KY8CPUT	•	•	•	•	•	CICS Key 8 TCB CPU time
KY8DISPT	KY8 Disp	DFHTASK	S	262	KY8DISPT	•	•	•	•	•	CICS Key 8 TCB dispatch time
KY9CPU	KY9 CPU	DFHTASK	S	265	KY9CPUT	•	•	•	•	•	User task Key 9 Mode CPU time
KY9DISPT	KY9 Disp	DFHTASK	S	264	KY9DISPT	•	•	•	•	•	User task Key 9 Mode Dispatch time
L8CPU	L8 CPU	DFHTASK	S	259	L8CPUT	•	•	•	•	•	CICS L8 TCB CPU time
L9CPU	L9 CPU	DFHTASK	S	266	L9CPUT	•	•	•	•	•	User task L9 CPU time
LOCKDLAY	LM Delay	DFHTASK	S	128	LMDELAY	•	•	•	•	•	Lock Manager (LM) wait time
LOCKSDLY	LocksDly	CICSPA	D	923	LOCKSDLY	–	–	–	–	•	Total Lock wait time and Enqueue delay time
LOCKWAIT	LockWait	CICSPA	D	922	LOCKWAIT	–	–	–	–	•	Total Lock wait time
LOGWRITE	LogWrite	DFHJOUR	A	172	LOGWRTCT	•	•	•	•	•	Log Stream write requests
LU61WAIT	LU61Wait	DFHTERM	S	133	LU61WTT	•	•	•	•	•	LU6.1 wait time
LU62WAIT	LU62Wait	DFHTERM	S	134	LU62WTT	•	•	•	•	•	LU6.2 wait time
LUNAME	LUName	DFHTERM	C	111	LUNAME	•	•	•	•	•	VTAM logical unit name
MAXHTDLY	MaxHTDly	DFHTASK	S	278	MAXHTDLY	–	–	–	–	–	Maximum Hot-Pooling TCB delay time
MAXJTDLY	MaxJTDly	DFHTASK	S	277	MAXJTDLY	•	•	•	•	–	Maximum JVM TCB delay time
MAXOTDLY	MaxOTDly	DFHTASK	S	250	MXTOTDLY	•	•	•	•	•	Maximum Open TCB delay time
MAXSTDLY	MAXSTDLY	DFHTASK	S	281	MAXSTDLY	•	•	•	•	•	Maximum SSL TCB delay time
MAXTASKS	MaxTasks	DFHTASK	C	433	MAXTASKS	–	–	–	–	•	Current MAXTASKS (MXT) value at task start
MAXTTDLY	MAXTTDLY	DFHTASK	S	283	MAXTTDLY	–	–	•	•	•	Maximum JVM server thread TCB delay time
MAXXTDLY	MAXXTDLY	DFHTASK	S	282	MAXXTDLY	•	•	•	•	•	Maximum XPLink TCB delay time
MLXMLTCT	XMLTrans	DFHWEBB	A	413	MLXMLTCT	–	–	•	•	•	Application data TRANSFORM requests
MLXSSCTM	XMLSSCPU	DFHWEBB	S	411	MLXSSCTM	–	–	•	•	–	z/OS XML System Services CPU time
MLXSSTDL	XMLDocLn	DFHWEBB	A	412	MLXSSTDL	–	–	•	•	•	Document length parsed - z/OS System Services
MPRTXCD	PolRulXc	DFHCICS	A	449	MPRTXCD	–	–	–	–	•	Number of policy rule thresholds exceeded
MQWARN	MQWARN	OMCICS	C	004	MQWARN	•	•	•	•	•	OMEGAMON MQ Limit Warning
MSCPU	MS CPU	DFHTASK	S	258	MSCPUT	•	•	•	•	•	CICS TCBs CPU time
MSDISPT	MS Disp	DFHTASK	S	257	MSDISPT	•	•	•	•	•	CICS TCBs dispatch time
MSGIN1	MsgIn1	DFHTERM	A	034	TCMSGIN1	•	•	•	•	•	Messages received count
MSGIN2	MsgIn2	DFHTERM	A	067	TCMSGIN2	•	•	•	•	•	Messages received from LU6.1
MSGOUT1	MsgOut1	DFHTERM	A	035	TCMSGOU1	•	•	•	•	•	Messages sent count
MSGOUT2	MsgOut2	DFHTERM	A	068	TCMSGOU2	•	•	•	•	•	Messages sent to LU6.1
MVSID	MVS ID	CICSPA	C	904	MVSID	•	•	•	•	•	MVS SMF ID
MXTDELAY	MXTDelay	DFHTASK	S	127	MXTDELAY	•	•	•	•	•	First dispatch MXT wait time
NATURE	Nature	DFHTERM	A	165	TERMINFO	•	•	•	•	•	Transaction
NETID	NET ID	DFHTERM	C	197	NETID	•	•	•	•	•	VTAM LUALIAS Network ID
NETNAME	NETName	DFHTASK	C	097	NETUOWPX	•	•	•	•	•	Originating System VTAM network name
NETUOWSX	NETUOWID	DFHTASK	C	098	NETUOWSX	•	•	•	•	•	Network UOW ID
OADATA1	OADData1	DFHCICS	C	352	OADATA1	–	–	–	•	•	Originating Adapter data 1
OADATA2	OADData2	DFHCICS	C	353	OADATA2	–	–	–	•	•	Originating Adapter data 2
OADATA3	OADData3	DFHCICS	C	354	OADATA3	–	–	–	•	•	Originating Adapter data 3
OADID	OADID	DFHCICS	C	351	OADID	–	–	–	•	•	Originating Adapter Identifier
OAPPLID	OAPPLID	DFHCICS	C	360	OAPPLID	–	•	•	•	•	Originating CICS APPLID
OCLi6ADR	OCLi6Adr	DFHCICS	C	372	OCLIPADR	–	–	•	•	•	Originating Client or Telnet IP address
OCLINTIP	OCLintIP	DFHCICS	C	368	OCLIPADR	–	•	–	–	–	Originating Client or Telnet IP address
OCLIPORT	OCLIPORT	DFHCICS	A	369	OCLIPORT	–	•	•	•	•	Originating Client IP Port Number
OFCTY	OFcty	DFHCICS	C	371	OFCTYNME	–	•	•	•	•	Originating Transaction Facility name
OFCTYTYP	OFctyTyp	DFHCICS	C	370	OTRANFLG	–	•	•	•	•	Originating Transaction Facility Type
OMEGWORK	OMEGWORK	OMCICS	C	015	OMEGWORK	•	•	•	•	•	OMEGAMON User work area
OMODDLY	OMModDly	CICSPA	D	928	OMODDLY	–	–	–	–	•	Other CICS TCB Mode redispatch wait time
ONETWKID	ONETWKID	DFHCICS	C	359	ONETWKID	–	•	•	•	•	Originating Network ID

Table 18. Cross-reference: CICS PA field name × CICS version (continued)

CICS PA field name	Column heading	CMF field				CICS version					Description
		Group	Type	ID	Name	6	6	6	6	6	
						4	5	6	7	8	
						0	0	0	0	0	
OORIGIN	OOrigin	DFHCICS	C	370	OTRANFLG	–	•	•	•	•	Originating Transaction Origin type
OPORT	OPORT	DFHCICS	A	367	OPORTNUM	–	•	•	•	•	Originating TCP/IP Port Number
ORIGIN	Origin	DFHTASK	C	164	TRANFLAG	•	•	•	•	•	Transaction origin type
OSLATNCY	OSLatncy	CICSPA	D	920	OSLATNCY	–	•	•	•	•	Task start latency since Origin task start
OSOWAIT	OSO Wait	DFH SOCK	S	299	SOOIOWTT	•	•	•	•	•	Outbound Socket I/O Wait Time
OSTART	OStart	DFHCICS	T	361	OSTART	–	•	•	•	•	Originating Task start time
OTASKNO	OTaskNo	DFHCICS	P	362	OTRANNUM	–	•	•	•	•	Originating Transaction number
OTCPSRVC	OTCPIPSr	DFHCICS	C	366	OTCPSVCE	–	•	•	•	•	Originating TCP/IP Service Name
OTRAN	OTran	DFHCICS	C	363	OTRAN	–	•	•	•	•	Originating Transaction identifier
OTRANFLG	OTranFlg	DFHCICS	A	370	OTRANFLG	–	•	•	•	•	Originating Transaction flags
OTRANTYP	OTranTyp	DFHCICS	C	370	OTRANFLG	–	•	•	•	•	Originating Transaction type
OTSID	OTS ID	DFHTASK	C	194	OTSTID	•	•	•	•	•	OTS Transaction ID
OTSINDWT	OTSIndWt	DFHSYNC	S	199	OTSINDWT	•	•	•	•	•	OTS Indoubt Wait time
OUSERCOR	OUserCor	DFHCICS	C	365	OUSERCOR	–	•	•	•	•	Originating User Correlator
OUSERID	OUserid	DFHCICS	C	364	OUSERID	–	•	•	•	•	Originating User ID
OVFLBFRU	OvflBfrU	DBCTL	A	029	OVFLBFRU	•	•	•	•	•	Number of Overflow Buffers used
PC24BHW	PC24bHWM	DFHSTOR	A	108	PC24BHW	•	•	•	•	•	Program Storage HWM below 16MB
PC24CHWM	PC24CHWM	DFHSTOR	A	143	PC24CHWM	•	•	•	•	•	Program Storage (CDSA) HWM below 16MB
PC24RHWM	PC24RHWM	DFHSTOR	A	162	PC24RHWM	•	•	•	•	•	Program Storage (RDSA) HWM below 16MB
PC24SHWM	PC24SHWM	DFHSTOR	A	160	PC24SHWM	•	•	•	•	•	Program Storage (SDSA) HWM below 16MB
PC31AHWM	PC31aHWM	DFHSTOR	A	139	PC31AHWM	•	•	•	•	•	Program Storage HWM above 16MB
PC31CHWM	PC31CHWM	DFHSTOR	A	142	PC31CHWM	•	•	•	•	•	Program Storage (ECDSA) HWM above 16MB
PC31RHWM	PC31RHWM	DFHSTOR	A	122	PC31RHWM	•	•	•	•	•	Program Storage (ERDSA) HWM above 16MB
PC31SHWM	PC31SHWM	DFHSTOR	A	161	PC31SHWM	•	•	•	•	•	Program Storage (ESDSA) HWM above 16MB
PCDLCRDL	PCDLCRDL	DFHPROG	A	287	PCDLCRDL	•	•	•	•	•	Container data length for DPL RETURN w/ CHANNEL
PCDLCSDL	PCDLCSDL	DFHPROG	A	286	PCDLCSDL	•	•	•	•	•	Container data length for DPL reqs with CHANNEL
PCDPL	PCDPLINK	DFHPROG	A	073	PCDPLCT	•	•	•	•	•	Distributed Program Link (DPL) requests
PCDPLCCT	PCDPLCCT	DFHPROG	A	308	PCDPLCCT	•	•	•	•	•	DPL requests with CHANNEL option
PCLINK	PCLINK	DFHPROG	A	055	PCLINKCT	•	•	•	•	•	Program LINK requests
PCLNKCCT	PCLNKCCT	DFHPROG	A	306	PCLNKCCT	•	•	•	•	•	LINK requests with CHANNEL option
PCLOAD	PCLOAD	DFHPROG	A	057	PCLOADCT	•	•	•	•	•	Program LOAD requests
PCLOADTM	PCLOADWt	DFHPROG	S	115	PCLOADTM	•	•	•	•	•	Program Library wait time
PCLURM	PCLNKURM	DFHPROG	A	072	PCLURMCT	•	•	•	•	•	Program LINK URM requests
PCRTNCCT	PCRTNCCT	DFHPROG	A	309	PCRTNCCT	•	•	•	•	•	Program RETURN requests with CHANNEL option
PCRTNCDL	PCRTNCDL	DFHPROG	A	310	PCRTNCDL	•	•	•	•	•	Container data length for RETURN with CHANNEL
PCSTGHWM	PCStgHWM	DFHSTOR	A	087	PCSTGHWM	•	•	•	•	•	Program Storage HWM above and below 16MB
PCXCLCCT	PCXCLCCT	DFHPROG	A	307	PCXCLCCT	•	•	•	•	•	XCTL requests with CHANNEL option
PCXCTL	PCXCTL	DFHPROG	A	056	PCXCTLCT	•	•	•	•	•	Program XCTL requests
PGBRWCCT	PGBRWCCT	DFHCHNL	A	322	PGBRWCCT	•	•	•	•	•	BROWSE CHANNEL CONTAINER requests
PGCRECCT	PGCRECCT	DFHCHNL	A	328	PGCRECCT	•	•	•	•	•	Number of Containers created
PGCSTHWM	PGCSTHWM	DFHCHNL	A	329	PGCSTHWM	–	•	•	•	•	Maximum Container Storage allocated to task
PGGETCCT	PGGETCCT	DFHCHNL	A	323	PGGETCCT	•	•	•	•	•	GET CHANNEL CONTAINER requests
PGGETCDL	PGGETCDL	DFHCHNL	A	326	PGGETCDL	•	•	•	•	•	GET CHANNEL CONTAINER data length
PGMOVCCT	PGMOVCCT	DFHCHNL	A	325	PGMOVCCT	•	•	•	•	•	MOVE CHANNEL CONTAINER requests
PGPUTCCT	PGPUTCCT	DFHCHNL	A	324	PGPUTCCT	•	•	•	•	•	PUT CHANNEL CONTAINER requests
PGPUTCDL	PGPUTCDL	DFHCHNL	A	327	PGPUTCDL	•	•	•	•	•	PUT CHANNEL CONTAINER data length
PGTOTCCT	PGTOTCCT	DFHCHNL	A	321	PGTOTCCT	•	•	•	•	•	Total number of CHANNEL CONTAINER requests
PHAPPLID	PHAPPLID	DFHCICS	C	374	PHAPPLID	–	–	–	•	•	Previous Hop Data APPLID
PHCOUNT	PHCount	DFHCICS	A	378	PHCOUNT	–	–	–	•	•	Previous Hop Data Count
PHLATNCY	PHLatncy	CICSPA	D	921	PHLATNCY	–	–	–	•	•	Previous Hop latency time
PHNTWKID	PHNTWKID	DFHCICS	C	373	PHNTWKID	–	–	–	•	•	Previous Hop Data Network ID
PHSTART	PHStart	DFHCICS	T	375	PHSTART	–	–	–	•	•	Previous Hop Data Task Start

## Chapter 28. Fields by forms, HDB templates

The following cross-reference table lists the CICS PA field names for CICS monitoring facility (CMF) performance class and transaction resource class data and shows the report forms and HDB templates to which they apply.

Some columns in the table require explanation:

### CICS PA field name

The name used in report forms, HDB templates, and selection criteria (and their corresponding batch command operands **FIELDS** and **SELECT**).

A blank indicates that the field is not available, typically because it is a very long field, or it is an unprintable field such as a unit-of-work or a flag.

### Report form and HDB template

The report forms and HDB templates to which a field applies:

- Yes, the field applies
- S** Yes, the field applies and is an eligible sort field (in a report form) or key field (in an HDB template)
- No, the field does not apply

### Type

Indicates the data type of the field:

- A** 32-bit or 64-bit count
- C** Character string
- D** Time derived by CICS PA
- P** Packed decimal integer
- S** Clock
- T** STCK time stamp
- X** Count calculated by CICS PA

### Length

The default length in the output report or data set.

Clock (S) fields have two components, each of length 8:

#### COUNT

Number of occurrences

**TIME** Elapsed time in seconds with specified precision 0.0001 - 0.000001, default format *sss.thmi*

Time Stamp (T) fields vary in length (5 - 19) depending on the specified format:

#### TIMET

Time in the format *hh:mm:ss.thm*

#### TIMEM

Time in the format *hh:mm*

#### TIMES

Time in the format *hh:mm:ss*

**DATE** Date in the format *mm/dd/yyyy*

#### DATEISO

Date in the format *yyyy-mm-dd*

#### DATM

Date in the format *mm/dd*

#### DATEYR

Date in the format *mm/dd/yy*

## DATETIM

Date and time in the format *yyyy-mm-dd hh:mm:ss*

### Note:

1. Some special fields, such as APPLID and RESPONSE, are not defined in the CMF Dictionary and are given a group name of "CICSPA". These fields are either derived from the fixed section of the CMF record (for example, APPLID), or calculated from two or more other CMF fields (for example, RESPONSE).
2. The FILENAME, TSQNAME, and DPLNAME fields are only available when CMF transaction resource class data is being collected.
3. The APPLTRAN and APPLPROG fields are only available when application programs invoke the application naming event monitoring points.

Table 19. Cross-reference: fields × forms, HDB templates

## Chapter 29. CICS PA-specific fields

CICS PA-specific fields are additional derived fields, such as sums, ratios, and percentages, that are generated by CICS PA based on CMF data. You can use these fields in report forms.

### ACAPPLVR

Application context application version. This character field represents three 4-byte binary values separated by hyphens: ACMAJVER (major version), ACMINVER (minor version), and ACMICVER (micro version).

### ALERT

For Performance Summary alert reporting, the count or percentage total of transactions at the specified alert severity (Critical, Warning, or Info) for the summary key.

### APPLID

CICS generic APPLID.

### APPLRECS

Number of Application records in this Network Unit-of-Work Extract record. All Cross-System Work Extract records include this field.

### CECMTYPE

A concatenation of CECMCHTP (CEC machine type) and CECMDLID (CEC model ID).

### COMMWAIT

Total time value of the communications related fields IRWAIT, ISWAIT, SZWAIT, TCWAIT, LU61WAIT, and LU62WAIT.

### CPUISSPE

The task processor time that was eligible for offload to a specialty processor. It is calculated as:

$\text{CPUONCPE} + (\text{USRCPUT} - \text{CPUONCP})$

### CPUONCPN

The task processor time on a standard processor that was not offload eligible. It is calculated as:

$\text{CPUONCP} - \text{CPUONCPE}$

### CPUONSP

The task processor time that was offloaded to a specialty processor. It is calculated as:

$\text{USRCPUT} - \text{CPUONCP}$

### DPLRECS

Number of Distributed Program Link (DPL) records in this Network Unit-of-Work Extract record. This is a subset of FUNCSHIP, the Function Shipping record count. All Cross-System Work Extract records include this field.

### ENQSDLY

The total elapsed time waiting for a CICS task control local or global enqueue. It is calculated as:

$\text{ENQDELAY} + \text{GNQDELAY}$

**FILENAME**

Transaction resource class data only: VSAM file name.

**FUNCSHIP**

Number of Function Shipping records in this Network Unit-of-Work Extract record. All Cross-System Work Extract records include this field.

**IOWAIT**

Total time value of the I/O wait time fields FCWAIT, JCWAIT, TDWAIT, TSWAIT.

**IRESP** CICS internal response time for the transaction. It is calculated by the difference in the Start and Stop times minus the time spent waiting on the terminal (operator think time).

**JOBNAME**

Jobname of the CICS system.

**JVMTIME**

JVM method time. This is the elapsed time spent in the CICS JVM by the user task, excluding the JVM initialize and reset elapsed times. It is calculated as:

$$\text{JVM elapsed time (JVMTIME)} - \text{JVM init time (JVMITIME)} \\ - \text{JVM reset time (JVMRTIME)}$$
**LOCKSDLY**

The total elapsed time waiting for a CICS task control local enqueue or global enqueue, or waiting to acquire a CICS lock manager (LM) lock on a resource, an intrapartition transient data lock, or an extrapartition transient data lock. It is calculated as:

$$\text{ENQDELAY} + \text{GNQDELAY} + \text{LMDELAY} + \text{TDILWTT} + \text{TDELWTT}$$
**LOCKWAIT**

The total elapsed time that the user task waited to acquire a CICS lock manager (LM) lock on a resource, an intrapartition transient data lock, or an extrapartition transient data lock. It is calculated as:

$$\text{LMDELAY} + \text{TDILWTT} + \text{TDELWTT}$$
**MVSID**

SMF system ID.

**OMODDLY**

(Other Mode Delay) The elapsed time for which the user task waited for redispach on a CICS TCB other than on the CICS QR, RO, and SO mode TCBs. It is calculated as:

$$\text{DISPWT} - (\text{QROMDDLY} + \text{ROMDDLY} + \text{SOMDDLY})$$
**OSLATNCY**

Latency since start of originating transaction. It is calculated as the difference between the Start time of the current transaction and the Start time of the originating transaction.

**PHLATNCY**

Previous hop latency time for the transaction. It is calculated as the difference between the Start time of the current transaction and the Start time of the previous hop transaction.

**QRDSPRTO**

The ratio of QR TCB Dispatch to QR TCB CPU. It is calculated as:

$$(\text{QR CPU/QR Dispatch}) * 100$$

#### **RATEMIN**

The transaction rate per minute.

**Note:** Performance alerts for the RATEMIN and RATESEC fields are not included in the ALERT field count. This is because they are based on the summarised data, not on individual transaction alerts. This could result in the ALERT fields showing zeros while in fact the special derived field generates alerts.

#### **RATESEC**

The transaction rate per second.

**Note:** Performance alerts for the RATEMIN and RATESEC fields are not included in the ALERT field count. This is because they are based on the summarised data, not on individual transaction alerts. This could result in the ALERT fields showing zeros while in fact the special derived field generates alerts.

#### **RELEASE**

CICS release. For example, CICS TS V4.1 is 660.

#### **RESPONSE**

CICS response time for the transaction. It is calculated as the difference between the Start and Stop times.

#### **RMIOTIME**

Elapsed time the task was suspended by the dispatcher while in the Resource Manager Interface (RMI), excluding time waiting for DB2 and IMS. It is calculated as:

$RMISUSP - IMSWAIT - DB2RDYQW - DB2CONWT - DB2WAIT$

(RMI suspend time - IMS wait time - DB2 readyq wait time - DB2 connection wait time - DB2 wait time)

#### **TASKCNT**

For Summary reporting only: the total number of tasks (CMF records).

#### **TASKTCNT**

For Summary reporting only: the total number of completed tasks (CMF termination records).

#### **TOTCPU**

The total task CPU time. This field is calculated as:

User CPU Time (DFHTASK S008) + RLS File Request CPU Time (DFHFILE S175)

#### **TOTRECS**

Total number of records in this Network Unit-of-Work Extract record. All Cross-System Work Extract records include this field. It is calculated as:

$APPLRECS + TRANROUT + FUNCSHIP + DPLRECS$

#### **TRANROUT**

Number of terminal-owning region records in this Network Unit-of-Work Extract record. All Cross-System Work Extract records include this field.

#### **UOWID**

Network unit-of-work ID: the first 6 bytes of NETUOWSX DFHTASK C098 that uniquely identifies this unit of work. This ID is assigned at attach time using either a STCK token (when the task is attached to a local terminal),

or the network unit of work ID passed as part of an ISC APPC or IRC attach header. The system clock will wrap at intervals of several months.

**UOWSEQ**

Network unit-of-work ID sequence number: the last 2 bytes of NETUOWSX DFHTASK C098. This field is the period count, typically incremented at each syncpoint.

---

## **Part 8. Appendixes**
