User Response: Correct the error by specifying a valid value for the keyword in the SIT overrides, then restart CICS.

Refer to the *CICS System Definition Guide* for information on how to do this.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1915 *applid* **INVALID DATA HAS BEEN DETECTED FOR SIT OVERRIDE** *keyword***. RESPECIFY THE OVERRIDE.**

Explanation: This message is displayed if the data specified for a SIT override is syntactically invalid or is a numeric value of 2 gigabytes or greater. It is only displayed if the PARMERR=INTERACT option is specified in the SIT, or as an override.

The insert *keyword* is the keyword for which the value is in error.

Note: PARMERR=INTERACT is the default action for invalid SIT overrides.

System Action: CICS waits for the corrected override to be entered on the console by the operator, and then analyzes this override.

User Response: Enter the corrected SIT override on the console, or bypass by typing '.END', or just supply a blank line.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1916 *applid* **SIT OVERRIDE DATA** *data* **IS OUT OF RANGE FOR KEYWORD** *keyword***. OVERRIDE IS IGNORED.**

Explanation: This message is displayed if the data supplied for a SIT override is out of range, and the PARMERR=IGNORE option is specified in the SIT, or as an override.
keyword is the keyword for which the value is in error.
data is the invalid data.

System Action: The keyword is ignored. CICS will attempt to initialize without the keyword in error.

User Response: Ensure the value specified is correct and update CICS input JCL with the corrected keyword prior to the next initialization of CICS.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPAGP

DFHPA1917 *applid* **SIT OVERRIDE DATA** *data* **IS OUT OF RANGE FOR KEYWORD** *keyword***. CICS IS TERMINATED.**

Explanation: This message is displayed if the data specified for a SIT override is out of range, and the PARMERR=ABEND option is specified in the SIT, or as an override.
keyword is the keyword for which the value is in error.
data is the invalid data.

System Action: CICS terminates abnormally.

User Response: Correct the error by specifying a valid value for the keyword in the SIT overrides, and restart CICS.
Refer to the *CICS System Definition Guide* for information on how to do this.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPAGP

DFHPA1918 *applid* **SIT OVERRIDE DATA** *data* **IS OUT OF RANGE FOR KEYWORD** *keyword***. RESPECIFY THE OVERRIDE.**

Explanation: This message is displayed if the data specified for a SIT override is out of range, and the PARMERR=INTERACT option is specified in the SIT, or as an override.
keyword is the keyword for which the data is in error. *data* is the invalid data.
Note: PARMERR=INTERACT is the default action for invalid SIT overrides.

System Action: CICS waits for the corrected override to be entered on the console by the operator, and analyzes this override.

User Response: Enter the corrected SIT override on the console, or bypass by typing '.END', or just supply a blank line.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPAGP

DFHPA1919I *applid* **SPECIFIED DATA IS INCORRECT. ALL SUBSEQUENT OVERRIDES ON THIS LINE IGNORED.**

Explanation: An invalid value for a keyword has been entered after message DFHPA1912 or DFHPA1915 has been issued. CICS has been unable to analyze the overrides following the invalid one.

During initialization, CICS may not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System Action: CICS continues to prompt for the corrected override using either message DFHPA1912 or message DFHPA1915.

User Response: Enter the corrected SIT override, ensuring that the data is in the valid range for that keyword.

You cannot suppress this message with the system initialization parameter MSGLVL=0.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1920I *applid* **SIT KEYWORD** *keyword* **AND ALL SUBSEQUENT OVERRIDES ON THIS LINE IGNORED.**

Explanation: An invalid keyword has been entered in response to message DFHPA1912 or DFHPA1915. CICS has been unable to analyze the overrides following the invalid one.

The insert *keyword* is the invalid keyword.

During initialization, CICS may not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System Action: CICS continues to prompt for the corrected keyword using message DFHPA1912 or message DFHPA1915.

User Response: Enter the corrected SIT override, ensuring that the keyword is valid.

Refer to the *CICS System Definition Guide* for information on how to do this.

You cannot suppress this message with the SIT parameter, MSGLVL=0.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1921 *applid* **PLEASE SPECIFY THE REQUIRED SIT SUFFIX, OR SPECIFY 'NONE'(UNSUFFIXED).**

Explanation: The System Initialization Table (SIT) holds information needed for CICS to initialize. This is loaded during preinitialization. The user specifies a 1- or 2-character suffix to identify which SIT to load. To use the unsuffixed default SIT, reply with 'SIT=NO'.

During initialization, CICS may not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System Action: The system loads and uses the specified SIT if it can be found. Otherwise the user is prompted to enter a valid suffix.

User Response: Type 'SIT=*xx*' in response to the message, where *xx* represents the SIT suffix to be used. (A suffix of 'NO' causes the system to load an unsuffixed SIT).

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM.

DFHPA1922I *applid* **SPECIAL KEYWORD** *keyword* **HAS BEEN REPEATED AND IS IGNORED.**

Explanation: There are 2 special keywords, each with an abbreviation. The first is SYSIN, which has the abbreviation SI. The second is CONSOLE, which has the abbreviation CN. These keywords direct CICS to read SIT overrides from the SYSIN data stream and from the console respectively.

The system has found a duplication of one of these keywords. The JCL should be amended.

During initialization, CICS may not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System Action: System initialization continues.

User Response: Correct the JCL by removing the second occurrence of the special keyword specified. (Refer to the *CICS Operations and Utilities Guide* for more information on coding CICS system initialization parameters).

You cannot suppress this message with the system initialization parameter MSGLVL=0.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1923I *applid* **SPECIAL KEYWORD** *keyword* **HAS BEEN DEFINED OUT OF CONTEXT.**

Explanation: There are 2 special keywords, each with an abbreviation. The first is SYSIN, which has the abbreviation SI. The second is CONSOLE, which has the abbreviation CN. These keywords direct CICS to read SIT overrides from the SYSIN data stream and from the console respectively.

SYSIN cannot be specified from either the SYSIN data stream, or from the console. CONSOLE cannot be specified from the console.

The system has found the specified keyword *keyword* in one of the situations described above, and so the JCL should be amended.

During initialization, CICS may not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System Action: System initialization continues.

User Response: Correct the JCL by removing the special keyword specified (Refer to the *CICS Operations and Utilities Guide* for more information on coding CICS system initialization parameters).

You cannot suppress this message with the system initialization parameter MSGLVL=0.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1924I *applid* **INITIALIZATION PARAMETER** *parm1* **EXCEEDS** *parm2***. BOTH ARE DEFAULTED. (MODULE** *modname***).**

Explanation: One of two situations may have occurred.
In the first, parameter *parm1* has been set as greater than parameter *parm2* by override.
In the second, parameter *parm1* may have been set to a certain level in the SIT macro, but parameter *parm2* has been changed by override so that it is now less than parameter *parm1*.
In either case, the condition is invalid, and so default values are applied to both parameters.

System Action: Both parameters are set to their default values and system initialization continues.

User Response: The system initialization parameters should be altered so that *parm2* is greater than *parm1* for the next bring up of CICS. (Refer to the *CICS System Definition Guide* for more information. about system initialization parameters.)

CICS initialization continues with the default values. The user can then change the defaulted values using the CICS supplied transaction.

You cannot suppress this message with the system initialization parameter, MSGLVL=0.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHPADM, DFHPAGP

DFHPA1926 *applid* **A MISSING DELIMITER HAS BEEN DETECTED FOR OVERRIDE** *keyword* **(MODULE** *modname***).**

Explanation: The data supplied for a SIT override *keyword* has not been delimited correctly.

System Action: CICS terminates abnormally.

User Response: Correct the specified override in the SYSIN data set by entering the opening or the closing delimiter on its data.

Restart CICS.

Refer to the *CICS System Definition Guide* for the required delimiter for keyword *keyword*.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1927 *applid text*

Explanation: This message is displayed during CICS initialization to show parameters that will override the system intialization parameters coded on the DFHSIT macro. If it is preceded by message DFHPA1100, *text* shows the contents of the PARM parameter from the JCL EXEC statement. If it is preceded by message DFHPA1102, *text* shows the contents of a record read from the SYSIN data set.

During initialization, CICS may not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System Action: System initialization continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPAIO

DFHPA1928 *applid* **IF XRF=YES, THE GENERIC AND SPECIFIC APPLIDS MUST BE DIFFERENT. CICS IS TERMINATED.**

Explanation: In an XRF CICS system, a generic and a specific *applid* must be defined. They must also be unique.

This message is displayed and CICS is terminated if both these *applid*s, which are defined as SIT overrides, are found to be identical in an XRF environment.

This message is also displayed if only the generic *applid* is defined.

System Action: CICS terminates abnormally.

User Response: Correct the error by defining both the generic and the specific *applid*s as SIT overrides. Ensure that they are unique. Refer to the *CICS System Definition Guide* for further information on how to do this.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1929 *applid* **CSDBKUP=DYNAMIC REQUIRES CSDRECOV=ALL. CSDBKUP HAS BEEN DEFAULTED TO STATIC.**

Explanation: When the value DYNAMIC is specified for the CSDBKUP keyword the CSDRECOV keyword must have the value ALL. However, the override parameter stream has overridden the SIT values and this requirement has not been fulfilled.

System Action: To enable initialization to continue, CSDBKUP is set to the default value STATIC. Because CSDBKUP is set to STATIC, the CICS CSD as defined in the input JCL, or by dynamic allocation, is not eligible for backup while open for update.

User Response: Update CICS input JCL with the correct values for CSDBKUP and CSDRECOV keywords prior to the next initialization of CICS.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1930 *applid* **CSDFRLOG=***nn* **HAS BEEN IGNORED AS CSDRECOV=ALL HAS NOT BEEN SPECIFIED.**

Explanation: When a forward recovery log value is specified for the CSDFRLOG keyword, the CSDRECOV keyword must have the value ALL. However, the override parameter stream has overridden the SIT values and this requirement has not been fulfilled.

System Action: To enable initialization to continue, the CSDFRLOG value has been ignored. Because CSDFRLOG is ignored, the CICS CSD as defined in the input JCL, or by dynamic allocation, is not eligible for forward recovery logging.

User Response: Update CICS input JCL with the correct values for the CSDFRLOG and CSDRECOV keywords prior to the next initialization of CICS.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1931 *applid keyword* **IS A SECURITY KEYWORD AND CANNOT BE ENTERED AT THE CONSOLE. THE KEYWORD IS IGNORED.**

Explanation: A SIT override has been entered at the console which is deemed to be a member of the set of security system initialization parameters. Security system initialization parameters cannot be entered at the console.

During initialization, CICS might not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System Action: CICS ignores the security SIT override, and initialization continues.

User Response: Update CICS input JCL so that security keywords are included in the SIT, SYSIN or PARM prior to the next initialization of CICS.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1932 *applid* **A PSDINT VALUE GREATER THAN ZERO WAS SPECIFIED WITH XRF=YES. PSDINT HAS BEEN RESET TO 0.**

Explanation: A conflict of options has been detected. You have requested Persistent Session Support by specifying a nonzero value for the PSDINT system initialization parameter. This parameter is used to set the Persistent Sessions delay interval. However, you have also requested XRF support by specifying XRF=YES. Persistent Sessions Support and XRF are mutually exclusive.

System Action: The PSDINT value defaults to 0. CICS attempts to continue with XRF support.

User Response: Before you next initialize CICS, alter the system initialization parameters so that either PSDINT=0 or XRF=NO. See the *CICS System Definition Guide* for further information.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1934I *applid* **START TYPE CHANGED TO** *type***.**

Explanation: The start type specified in the SIT has been changed to that shown in the message.

System Action: Initialization continues with the new start type.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPAGP

DFHPA1935 *applid keyword* **IS A SECURITY KEYWORD. THIS KEYWORD AND ALL SUBSEQUENT KEYWORDS ON THIS LINE ARE IGNORED.**

Explanation: A SIT override has been entered at the console which is deemed to be a member of the set of security system initialization parameters. Security system initialization parameters cannot be entered at the console. CICS has been unable to analyze the overrides following the security keyword.

During initialization, CICS might not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System Action: CICS ignores the security SIT override and all subsequent overrides entered on this line. Initialization continues.

User Response: Update CICS input JCL so that security keywords are included in the SIT, SYSIN or PARM prior to the next initialization of CICS.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1936 *applid* **A VALUE WAS SPECIFIED FOR GRNAME WITH XRF=YES. GRNAME HAS BEEN RESET TO BLANKS.**

Explanation: A conflict of options has been detected. You have requested generic resource support by specifying a value for the GRNAME system initialization parameter. This parameter is used to register CICS as a VTAM generic resource. However, you have also requested XRF support by specifying XRF=YES. Generic resource support and XRF are mutually exclusive.

System Action: The GRNAME value is reset to blanks. CICS attempts to continue with XRF support but without generic resource support.

User Response: Before you next initialize CICS, alter the system initialization parameters so that either GRNAME is not specified or XRF=NO. See the *CICS System Definition Guide* for further information.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1937 *applid* **GRNAME SPECIFIED WITH SPECIFIC AND GENERIC APPLIDS. THE GENERIC APPLID HAS BEEN SET EQUAL TO THE SPECIFIC.**

Explanation: A conflict of options has been detected. You have requested generic resource support by specifying a value for the GRNAME system initialization parameter. This parameter is used to register CICS as a VTAM generic resource. However, you have also specified different values for the generic and specific applids. Generic resource support requires that only one value should be specified for the APPLID parameter.

System Action: The generic applid is set to the value of the specific. CICS continues and attempts to register as a VTAM generic resource.

User Response: If you intended that CICS should register as a VTAM generic resource, take no action. If you did not, remove the GRNAME parameter before you next initialize the system.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1938 *applid* **GRNAME AND APPLID ARE THE SAME. GRNAME RESET TO BLANKS.**

Explanation: A conflict of options has been detected. You have requested generic resource support by specifying a value for the GRNAME system initialization parameter. This parameter is used to register CICS as a VTAM generic resource. However, the value specified for GRNAME is the same as the CICS applid. VTAM requires that the generic resource name must be different from the CICS applid.

System Action: The generic resource name is set to blanks. CICS will not attempt to register as a VTAM generic resource.

User Response: If you intended that CICS should register as a VTAM generic resource, specify the correct GRNAME when you next initialize the system.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1940 *applid* **CSDINTEG=CONSISTENT AND CSDINTEG=REPEATABLE REQUIRE CSDRLS=YES. CSDINTEG HAS BEEN SET TO UNCOMMITTED.**

Explanation: Read integrity on the CICS system definition (CSD) file has been requested by specifying either CSDINTEG=CONSISTENT or CSDINTEG=REPEATABLE. However, these read integrity options are not available because the CSD has been defined to be opened in non-RLS mode. Read integrity is only available to files defined in RLS mode.

System Action: CICS startup continues. The CSD is read without read integrity.

User Response: Do one of the following to correct the error:

- Specify CSDRLS=YES to make the CSD eligible to be opened in RLS mode.
- Remove the CSDINTEG keyword if you do not wish to open the CSD in RLS mode.

Destination: Console

Module: DFHPADM

XMEOUT Parameter: *applid*

DFHPA1941 *applid* **VTAM=NO HAS BEEN SPECIFIED BUT NO UOWNETQL PARAMETER HAS BEEN SPECIFIED. A DEFAULT UOWNETQL WILL BE USED.**

Explanation: VTAM=NO has been specified as a system initialization parameter but the UOWNETQL system initialization parameter is missing.

On a non-VTAM system, CICS requires the UOWNETQL parameter in order to construct a default qualified LUNAME to be passed to the recovery manager domain. On a VTAM system, the name is obtained at OPEN ACB time. Recovery manager uses the default qualified LUNAME when constructing unit of work (UOW) identifiers.

System Action: If this is an initial start, CICS continues processing using a dummy default UOWNETQL of '9UNKNOWN'. This dummy UOWNETQL is invalid because the first character is a number. UOWNETQL is given this invalid name to highlight the problem.

If this is a cold, warm or emergency start, the name used on the previous run is restored and used.

User Response: Specify a valid UOWNETQL system initialization parameter.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1942 *applid* **CSDRLS=YES BUT RLS=NO. CSDRLS=NO WILL BE USED.**

Explanation: The system initialization parameter CSDRLS=YES has been specified but RLS=YES has not been specified. This means that if initialization were to continue with these parameter settings the open of the CSD in record level sharing (RLS) mode would fail because RLS is not available in the system.

CICS requires that if you specify CSDRLS=YES, RLS must be enabled by specifying RLS=YES.

System Action: CICS continues processing but forces CSDRLS=NO.

User Response: If CSDRLS is required, bring CICS up with RLS=YES.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1943 *applid* **START=COLD OR START=INITIAL MAY NOT BE SPECIFIED WITH OFFSITE=YES. CICS IS TERMINATED.**

Explanation: The system initialization override OFFSITE=YES has been specified but START=COLD or START=INITIAL has also been specified. OFFSITE=YES means that CICS is being restarted in offsite recovery mode, but recovery is not possible on a cold or initial start, so this combination of system initialization parameters is incompatible.

System Action: CICS initialization is terminated.

User Response: You should specify START=AUTO when restarting CICS in OFFSITE recovery mode.

If you intended to perform a cold or initial start, and specified OFFSITE=YES in error, either change the OFFSITE override to NO, or remove it and allow it to default to NO.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1944 *applid* **CSDRECOV=ALL CANNOT BE SPECIFIED WITHOUT A CSDFRLOG IF CSDRLS=NO. CICS IS TERMINATED.**

Explanation: The system initialization parameter CSDRECOV=ALL has been specified together with CSDRLS=NO, but CSDFRLOG has either not been specified, or has been specified as NO.

If the CSD is to be accessed in non-RLS mode (CSDRLS=NO) and forward recovery is specified (CSDRECOV=ALL), a forward recovery log must also be specified using the CSDFRLOG system initialization parameter.

If the CSD is to be accessed in RLS mode (CSDRLS=YES), the recovery attributes are obtained from the VSAM catalog and CSDRECOV and CSDFRLOG are ignored. For this reason, the check for CSDFRLOG when CSDRECOV=ALL is not carried out when CSDRLS=YES.

System Action: CICS initialization is terminated.

User Response: You should specify CSDFRLOG=*nn* when you specify CSDRECOV=ALL together with CSDRLS=NO, where *nn* is a number between 1 and 99.

If you want to access the CSD in non-RLS mode, but also choose to specify the recovery attributes for the CSD in the VSAM catalog, the system initialization parameters relating to CSD recovery attributes are not used. However, you are still required to have a consistent set of these parameters.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPA1945 *applid sitname* **MUST BE LINKEDITED WITH THE NORENT OPTION. CICS IS TERMINATED.**

Explanation: The system initialization table *sitname* has been link-edited with the RENT option, which means CICS will not have write access to it.

System Action: CICS initialization is terminated.

User Response: You should re-link the system initialization table with the NORENT option.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHPADM

DFHPCxxxx messages

DFHPC0401 *applid* **Abend** *abcode* **issued by** *yyy* **task.**

Explanation: A CICS task has abnormally terminated with CICS transaction abend code *abcode*. *yyy* identifies the task, for example TCP (terminal control).

A task abend has been requested for a system task. CICS is abnormally terminated with a system dump.

System Action: CICS terminates abnormally with a dump.

User Response: See the description of abend *abcode* for further guidance.

Destination: Console

Module: DFHABAB

XMEOUT Parameters: *applid, abcode, yyy*

DFHPC0402 *applid* **Error with kernel error code** *errorcode* **has occurred while processing transaction abend** *abcode* **in transaction** *tranid*

Explanation: A program check, abend, loop, or a second transaction abend has occurred while processing a transaction abend and CICS is unable to complete the original transaction abend.

System Action: CICS processing is terminated.

User Response: This is a severe error in CICS internal processing. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHABAB

XMEOUT Parameters: *applid, errorcode, abcode, tranid*

DFHPC0405 *applid* **Abend** *abcode2* **has been issued while processing abend** *abcode1* **for the same task, transaction** *tranid***.**

Explanation: Transaction *tranid* has abnormally terminated with abend code *abcode1*. While CICS was backing out transaction *tranid*, another abend (namely *abcode2*) occurred. CICS was unable to process the original *abcode* abend correctly.

System Action: CICS is terminated with a dump.

User Response: Investigate why abend *abcode1* occurred. It may be due to an error in CICS abend handling.

Destination: Console

Module: DFHABAB

XMEOUT Parameters: *applid, abcode2, abcode1, tranid*

DFHPC0408 *applid* **Abend** *abcode* **has been issued during post commit processing, transaction** *tranid***.**

Explanation: During post commit processing for transaction *tranid*, the transaction issued abend *abcode* An abend during transaction post commit processing implies that a resource manager cannot syncpoint correctly, and thus that data integrity is at risk.

System Action: CICS terminates abnormally with a system dump.

User Response: See the description of abend *abcode* for further guidance.

Destination: Console

Module: DFHABAB

XMEOUT Parameters: *applid, abcode, tranid*

DFHPC0409 *applid* **Abends** *abcode2* **and** *abcode3* **have been issued while processing abend** *abcode1* **for the same task, transaction** *tranid***.**

Explanation: A task has abnormally terminated with abend code *abcode1*. While processing this abend, the task abnormally terminated twice more (in CICS code) with abends *abcode2* and *abcode3* in that sequence. This may be a permanent abend loop.

System Action: CICS terminates abnormally with a system dump.

User Response: See the description of abend *abcode1* for further guidance. You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHABAB

XMEOUT Parameters: *applid, abcode2, abcode3, abcode1, tranid*

DFHPDxxxx messages

DFHPD0101 Pointer to *xxxxxxxx* **at offset** *X'offset'* **is invalid.**

Explanation: A pointer to a block of type *xxxxxxxx*, whose address is at offset *offset* in the block just formatted, is invalid.

System Action: Dump formatting continues after skipping any sections affected by the error.

User Response: Either the pointer to the required area was corrupted, the pointer has not been initialized, or the address was valid but the area was not present in the dump. In the latter case, if the area is essential for diagnosing the problem, a fresh dump which includes the missing area has to be obtained.

It is possible that the storage is present in the dump, and the pointer has been initialized with its address, but the storage has not been referred to by CICS code. You can check this by browsing the storage in the dump at this address.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0102 Pointer to *xxxxxxxx* **at offset** *X'offset'* **is zero.**

Explanation: A pointer to a block of type *xxxxxxxx*, whose address is at offset *offset* in the block just formatted, is zero.

System Action: Dump formatting continues after skipping any sections affected by the error.

User Response: The area may have been corrupted or not set up correctly. It is also possible that the zero value is valid. This depends on the circumstances or timing of the dumps collection; for example, a zero value is valid before the block is initialized.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0103 *xxxxxxxx* **address** *X'address'* **is invalid.**

Explanation: The address *address* of a block of type *xxxxxxxx* is invalid.

System Action: Dump formatting continues after skipping any sections affected by the error.

User Response: Either the pointer to the required area was corrupted, the pointer has not been initialized, or the address was valid but the area was not present in the dump. In the latter case, if the area is essential for diagnosing the problem, a fresh dump which includes the missing area has to be obtained.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0104 Address of *xxxxxxxx* **is zero.**

Explanation: The address of a block of type *xxxxxxxx* is zero.

System Action: Dump formatting continues after skipping any sections affected by the error.

User Response: The area may have been corrupted or not set up correctly. It is also possible that the zero value is valid. This depends on the circumstances or timing of the dumps collection; for example, a zero value is valid before the block is initialized.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0105 A loop has been detected. *xxxxxxxx* **at address** *X'address'* **already encountered.**

Explanation: The formatting program avoids loops resulting from corrupted control block chains by checking for duplicate addresses. The block *xxxxxxxx* at address *address* has already been encountered and may already have been formatted.

System Action: Dump formatting continues after skipping any sections affected by the error.

User Response: Check the chain fields in control blocks of the same type which have already been processed. Otherwise the problem may be caused by the timing of the dumps collection, if for example this occurs before the block is initialized.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0106 An error has occurred while formatting *xxxxxxxx***.**

Explanation: An error has occurred during the formatting of a block of type *xxxxxxxx*.

System Action: Dump formatting continues after skipping any sections affected by the error.

User Response: If no data has been formatted for the block then the block address was probably invalid. In this case see message DFHPD0101.

If part of the block has been successfully formatted then it is possible that the length of the control block is incorrect. The length may have been overwritten which may provide a clue to the problem.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0107 Eyecatcher for *xxxxxxxx* at *X'address'* is invalid.

Explanation: The eyecatcher field of a control block of type *xxxxxxxx* at address *address* has an incorrect value.

System Action: Dump formatting continues after skipping any sections affected by the error.

User Response: Investigate why the eyecatcher has been overwritten or why the control block has not been set up correctly. For more information on how to solve storage overwrite problems, see the *CICS Problem Determination Guide*.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0108 Unable to start browse of *xxxxxxxx*.

Explanation: An error has occurred when attempting to start browsing a table of type *xxxxxxxx*.

System Action: Dump formatting continues after skipping any sections affected by the error.

User Response: This error may be due to the Table Manager Program (TMP) control blocks being invalid. Check the TMP control blocks for the table in question.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0109 Unable to get next entry in *xxxxxxxx* table.

Explanation: An error has occurred when attempting to access the next entry in a table of type *xxxxxxxx*.

System Action: Dump formatting continues after skipping any sections affected by the error.

User Response: This error may be due to the Table Manager Program (TMP) control blocks being invalid. Check the TMP control blocks for the table in question.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0110 Unable to access data for *xxxxxxxx*

Explanation: The Interactive Problem Control System (IPCS) service routine ADPLMEMA was unable to find the requested data for control block *xxxxxxxx* in the dump.

System Action: Dump formatting continues after skipping any sections impacted by the lack of data.

User Response: Either the pointer to the required area was corrupted, which may in itself be a clue to the problem, or the address was valid but the area was not present in the dump. In the latter case, if the area is essential for diagnosing the problem obtain a fresh dump which includes the missing area.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0111I Pointer to *xxxxxxxx* at offset *X'offset'* is zero.

Explanation: A pointer to a block of type *xxxxxxxx*, whose address is at offset *offset* in the block just formatted, is zero.

System Action: Dump formatting continues after skipping any sections affected by the zero pointer.

User Response: The message is informatory, indicating that the area was zero at the time the dump was taken.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0112I Address of *xxxxxxxx* is zero.

Explanation: The address of a block of type *xxxxxxxx* is zero.

System Action: Dump formatting continues after skipping any sections affected by the block.

User Response: The message is informatory, indicating that the area did not contain an address at the time the dump was taken.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0113 This block has already been processed.

Explanation: The block whose heading line has just been printed has already been formatted in this section of the dump.

System Action: The block is formatted again then any sections which may be impacted by the probable control block chain loop are skipped.

User Response: Check the chain fields in the control blocks processed so far. This may provide a clue to the problem.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0114 Invalid keyword *keyword*

Explanation: The keyword *keyword* is not valid for the CICS520 verb.

System Action: The keyword is ignored.

User Response: Correct the keyword and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0115 CICS job not found during ASCB scan.

Explanation: The dump formatting program searched the dump for CICS jobs satisfying the specified JOB criterion (if any), but found none.

System Action: There is only a severe problem when this message is followed by message DFHPD0120.

User Response: If this is a severe error, ensure that the dump is the correct one, that the JOB keyword is correctly specified, and that the dump contains the necessary MVS and CICS data areas.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0116 Cannot access the AFCB.

Explanation: The formatting program was unable to access data for the AFCB.

System Action: No formatting is performed.

User Response: Ensure that the dump is the correct one, and that the dump contains the necessary MVS data areas.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0117 An error has occurred while formatting *xxxxxxxx***.**

Explanation: An error has occurred during the formatting of a block of type *xxxxxxxx*.

Either the user has performed a GETMAIN for the storage, but the storage has not been referenced. Unreferenced storage may not be present in the dump.

Or the block address is invalid,

Or the length of the control block is incorrect.

System Action: Dump formatting continues after skipping any sections affected by the error.

User Response: If no data has been formatted for the block then either the storage has not been referenced, or the block address was invalid. If the block address was invalid, refer to message DFHPD0101.

If part of the block has been successfully formatted then it is possible that the length of the control block is incorrect. The length may have been overwritten which may provide a clue to the problem.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0118 Invalid argument for JOB=, CURRENT assumed

Explanation: The argument for the JOB operand of the CICS520 verb is invalid.

System Action: The keyword is ignored.

User Response: Correct the invalid argument and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFH520

DFHPD0119 Duplicate keyword *keyword* **found. Value** *value* **accepted**

Explanation: The CICS520 keyword *keyword* has already been encountered.

System Action: The value *value* specified in the message overrides any value previously specified for keyword *keyword*. Processing continues with the new value *value*.

User Response: Remove the duplicate keyword specified on the CICS520 verb.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0120 CICS IPCS exit is terminating.

Explanation: The CICS exit is terminating.

System Action: The exit is returning to the Interactive Problem Control System (IPCS) without performing the requested function. A previous message gives the reason for this.

User Response: To determine what action is necessary, refer to the message immediately preceding this one on the dump.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0121I Formatting control blocks for job *jobname*

Explanation: This shows the job name for the CICS system from which the dump was taken.

System Action: Processing continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0122I End of dump for job *jobname*

Explanation: This marks the end of the output from the CICS print dump exit.

System Action: None. The formatting job has just completed.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0123 A program check has occurred while processing keyword *keyword*

Explanation: A program check has occurred during processing of the keyword identified in the message.

System Action: Dump formatting continues after skipping any sections affected by the error.

Note that the maximum possible number of occurrences of this message is five. If a sixth program check occurs, the dump formatting program terminates abnormally with a DFHPD520 abend code.

User Response: A dump should accompany this message, but if no dump is produced, rerun the job with //DFHSNAP DD SYSOUT=A included in the JCL job stream.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0124 Storage violation detected at *X'address'***. Leading SAA is invalid.**

Explanation: The Storage Accounting Area (SAA) in the first eight bytes of the user storage element at address X'*address*' has been found to be invalid. However, the trailing SAA is valid.

System Action: Dump formatting continues after skipping any sections affected by the error.

User Response: Investigate why the storage has been overwritten or has not been set up correctly. For more information on how to solve storage overwrite problems, refer to the *CICS Problem Determination Guide*.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520.

DFHPD0125 Storage violation detected at *X'address'***. Trailing SAA is invalid.**

Explanation: The Storage Accounting Area (SAA) in the first eight bytes of the user storage element at address X'*address*' has been found to be invalid. However, the leading SAA is valid.

System Action: Dump formatting continues after skipping any sections affected by the error.

User Response: Investigate why the storage has been overwritten or has not been set up correctly. For more information on how to solve storage overwrite problems, refer to the *CICS Problem Determination Guide*.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520.

DFHPD0126 Storage violation detected at *X'address'***. Leading and trailing SAAs are invalid.**

Explanation: The Storage Accounting Areas (SAAs) in the first and last eight bytes of the user storage element at address X'*address*' are invalid.

System Action: Dump formatting continues after skipping any sections affected by the error.

User Response: Investigate why the storage has been overwritten or has not been set up correctly. For more information on how to solve storage overwrite problems, refer to the *CICS Problem Determination Guide*.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520.

DFHPD0127 Storage violation detected at *X'address'***. Leading and trailing SAAs differ.**

Explanation: Although the Storage Accounting Areas (SAAs) in the first and last eight bytes of the user storage element at address X'*address*' are valid, they do not match.

System Action: Dump formatting continues after skipping any sections affected by the error.

User Response: Investigate why the storage has been overwritten or has not been set up correctly. For more information on how to solve storage overwrite problems, refer to the *CICS Problem Determination Guide*.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520.

DFHPD0128 Invalid data length *X'length'* **specified for address** *X'address'***.**

Explanation: The offline utility DFHPD520 has detected a request for a block of data of invalid length X'*length*' while formatting a system dump.

System Action: Dump formatting usually continues after skipping any sections affected by this error.

User Response: This message indicates a probable error in CICS code. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0129 CICS Domain Anchor Blocks not found for AFCB. Scan will continue.

Explanation: The dump formatter has attempted to find a CICS dump in a TCB chain but has failed. The scan will continue. This is because DFHPD520 could not find the addresses of the CICS domain anchor blocks in the kernel global storage. Possible causes for this are:

- Scanning the wrong TCB on the TCB chain. The scan will continue.

- The kernel global storage being overwritten or freemained.
- The dump being taken so early on in CICS initialization that the kernel global storage has not yet been set up.

System Action: There is only a severe problem when this message is followed by message DFHPD0120.

User Response: If this is a severe error. Try to recreate the original error and produce a valid system dump against which the dump formatter can be rerun.

If the problem recurs, you will need further assistance from IBM. Collect the sysprint output from the dump formatter and note any relevant messages. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0130 Keyword *keyword1* **is no longer valid. Replace with keyword** *keyword2*

Explanation: In CICS Transaction Server for OS/390 Release 3 the keyword *keyword1* has been replaced by *keyword2* for the CICS520 verb.

For example, the keyword PCP has been replaced by PG.

System Action: The keyword *keyword1* is ignored.

User Response: Correct the keyword and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPD0131 CICS job *jobname* **is for CICS version** *version1***. CICS IPCS exit is for CICS version** *version2***.**

Explanation: The CICS job *jobname* being processed by the dump formatting program was executing under CICS version *version1*, but the dump formatting program was the one distributed with CICS version *version2*.

System Action: Dump formatting terminates for the CICS job.

User Response: Retry dump formatting for the CICS job using the dump formatting program for CICS version *version1*.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHPD520

DFHPGxxxx messages

DFHPG0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHPGAI, DFHPGAQ, DFHPGDD, DFHPGDM, DFHPGEX, DFHPGHM, DFHPGIS, DFHPGLD, DFHPGLK, DFHPGLU, DFHPGPG, DFHPGRP, DFHPGST, DFHPGXM.

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHPG0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHPGAI, DFHPGAQ, DFHPGDD, DFHPGDM, DFHPGEX, DFHPGHM, DFHPGIS, DFHPGLD, DFHPGLK, DFHPGLU, DFHPGPG, DFHPGRP, DFHPGST, DFHPGXM.

XMEOUT Parameters: *applid, X'code', modname*

DFHPG0004 *applid* **A possible loop has been detected at offset** *X'offset'* **in module** *modname***.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

If you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you need to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

XMEOUT Parameters: *applid, X'offset', modname*

DFHPG0101 *date time applid terminal userid tranid* **PPT entry for** *progname* **has been added.**

Explanation: This is an audit log message indicating that program entry *progname* has been added to the PPT using the INSTALL command. Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSPL

Module: DFHPGDD

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, progname*

DFHPG0102 *date time applid terminal userid tranid* **PPT entry for** *progname* **has been deleted.**

Explanation: This is an audit log message indicating that program entry *progname* has been deleted from the PPT using the REMOVE command. Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSPL

Module: DFHPGDD

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, progname*

DFHPG0103 *date time applid terminal userid tranid* **PPT entry for** *progname* **has been replaced.**

Explanation: This is an audit log message indicating that program entry *progname* has been replaced in the PPT using the INSTALL command. Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSPL

Module: DFHPGDD

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, progname*

DFHPG0104 *date time applid* **Program** *progname* **is defined with DATALOCATION(ANY) but is linkedited with AMODE(24).**

Explanation: Program entry *progname* has been loaded. It is defined (using RDO or by program autoinstall) with DATALOCATION(ANY), but was linkedited with AMODE(24). Addresses returned to the program by EXEC CICS commands using the SET option may be above the 16MB line and not accessible by the AMODE(24) program.

The definition is accepted as the program can pass the storage on to another program which is linkedited with AMODE(31). See the description of DATALOCATION in the *CICS Resource Definition Guide*.

This message is issued the first time the program is loaded, linked to or XCTLed to, after being defined.

System Action: The system continues normally.

User Response: None.

Destination: CSPL

Modules: DFHPGLD, DFHPGLE, DFHPGLK, DFHPGLU, DFHPGPG, DFHPGXE, DFHPGEX

XMEOUT Parameters: *date, time, applid, progname*

DFHPG0201 *date time applid terminal userid tranid* **Program autoinstall exit** *urmname* **indicated that program** *progname* **should not be added to the PPT.**

Explanation: An attempt has been made to autoinstall a program during link, XCTL, load or exit processing but the autoinstall exit set a return code indicating that the program should not be installed. Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: Control is returned to the caller with an error response. For EXEC commands, EIBRESP is set to PGMIDERR and EIBRESP2 is set to indicate the cause of the error.

User Response: None

Destination: CSPL

Module: DFHPGAI

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, urmname, progname*

DFHPG0202 *date time applid terminal userid tranid* **Program autoinstall exit** *urmname* **has abended with code** *abcode***. The program autoinstall function has been disabled.**

Explanation: An attempt has been made to autoinstall a program during link, XCTL, load or exit processing but the program autoinstall exit program abended with code *abcode*. Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: Control is returned to the caller with an error response. For EXEC commands, EIBRESP is set to PGMIDERR and EIBRESP2 is set to indicate the cause of the error. The autoinstall function is disabled.

User Response: Continue processing without program autoinstall or correct the error in the autoinstall exit program and reenable the autoinstall function using CEMT or the SPI.

Destination: CSPL

Module: DFHPGAI

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, urmname, abcode*

DFHPG0203 *date time applid terminal userid tranid* **Program autoinstall exit** *urmname* **failed, reason:** *reason***. The program autoinstall function has been disabled.**

Explanation: An attempt has been made to autoinstall a program during link, XCTL, load, or exit processing but the program autoinstall exit program is incorrectly defined or cannot be found on the load libraries. Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.
- *reason* is one of the following:
  - Program not defined
  - Program not enabled
  - Program not loadable
  - Remote program
  - AMODE error
  - Invalid COMMAREA
  - Recursion in autoinstall exit.

System Action: Control is returned to the caller with an error response. For EXEC commands, EIBRESP is set to PGMIDERR and EIBRESP2 is set to indicate the cause of the error. The autoinstall function is disabled.

User Response: Continue processing without program autoinstall or correct the problem and reenable the autoinstall function using CEMT or the SPI. Take the appropriate action to correct the problem:

Program not defined	Install the autoinstall exit program.
Program not enabled	Reset the status of the autoinstall exit program.
Program not loadable	Ensure that the autoinstall exit program is in the load libraries.
Remote program	Ensure that the autoinstall exit program is defined as a local program.
AMODE error	Ensure that the autoinstall exit program is AMODE 31.
Invalid COMMAREA	Ensure that if the program autoinstall exit program passes the COMMAREA to another program, the COMMAREA is correctly passed.

Recursion in autoinstall exit The autoinstall user-replaceable module has attempted to link to XCTL or to load another program which is not defined. Autoinstall cannot be attempted with the autoinstall exit. Ensure that the program being referred to is defined using RDO.

Destination: CSPL

Module: DFHPGAI

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, urmname, reason*

DFHPG0204 *date time applid terminal userid tranid* **Autoinstall for program** *progname* **failed. Program autoinstall model** *modelname* **is not defined.**

Explanation: An attempt has been made to autoinstall a program during link, XCTL, load or exit processing but the model selected for the autoinstall is not defined. Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: Control is returned to the caller with an error response. For EXEC commands, EIBRESP is set to PGMIDERR and EIBRESP2 is set to indicate the cause of the error.

User Response: Ensure that all programs to be used as models for the autoinstall function have been defined.

Destination: CSPL

Module: DFHPGAI

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, progname, modelname*

DFHPG0205 *date time applid terminal userid tranid* **Invalid value:** *value* **returned by program autoinstall exit** *urmname* **for field** *fieldname***.**

Explanation: An attempt has been made to autoinstall a program during link, XCTL, load, or exit processing but the program autoinstall exit returned an invalid value for a program definition field or the return code via the commarea. Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.
- *value* is the returned value. This may be invalid or there may be a conflict between the load attribute specified and the load type of the model program. If the program type is shared, the load attribute must be resident.

System Action: Control is returned to the caller with an error response. For EXEC commands, EIBRESP is set to PGMIDERR and EIBRESP2 is set to indicate the cause of the error.

User Response: Ensure that the data returned by the autoinstall exit program is correct.

Destination: CSPL

Module: DFHPGAI

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, value, urmname, fieldname*

DFHPG0206 *date time applid terminal userid tranid* **Autoinstall for program** *progname* **failed. Programs starting with 'DFH' cannot be defined as remote programs.**

Explanation: An attempt has been made to autoinstall a program during link, XCTL, load, or exit processing with remote attributes but the program starts with the characters 'DFH'. Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: Control is returned to the caller with an error response. For EXEC commands, EIBRESP is set to PGMIDERR and EIBRESP2 is set to indicate the cause of the error.

User Response: Ensure that the autoinstall model program selected for programs starting 'DFH' is defined as a local program and that no remote attributes are specified by the program autoinstall exit program.

Destination: CSPL

Module: DFHPGAI

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, progname*

DFHPG0207 *date time applid terminal userid tranid* **Autoinstall for program** *progname* **failed. The program name is not valid.**

Explanation: An attempt has been made to autoinstall a program during link, XCTL, load or exit processing but the program name includes invalid characters. Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: Control is returned to the caller with an error response. For EXEC commands, EIBRESP is set to PGMIDERR and EIBRESP2 is set to indicate the cause of the error.

User Response: Ensure that the program name is valid.

Destination: CSPL

Module: DFHPGAI

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, progname*

DFHPG0208 *date time applid terminal userid tranid* **Autoinstall for program** *progname* **failed.**

Explanation: An attempt has been made to autoinstall a program during link, XCTL, load, or exit processing but the install of the definition failed. Either the AMODE/RMODE combination is invalid or the load attribute and type combination is invalid. Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: Control is returned to the caller with an error response. For EXEC commands, EIBRESP is set to PGMIDERR and EIBRESP2 is set to indicate the cause of the error.

User Response: Ensure the AMODE and RMODE are compatible and the program attribute is specified as resident if the program type is shared.

Destination: CSPL

Module: DFHPGAI

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, progname*

DFHPG0209 *date time applid terminal userid tranid* **PPT entry for** *progname* **has been autoinstalled using model** *modelname***.**

Explanation: This is an audit log message indicating that program entry *progname* has been added to the PPT by the AUTOINSTALL function using the model *modelname*.

Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSPL

Module: DFHPGAI

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, progname, modelname*

DFHPG0210 *date time applid terminal userid tranid* **PPT entry for** *progname* **has been system autoinstalled.**

Explanation: This is an audit log message indicating that program entry *progname* has been added to the PPT by the system AUTOINSTALL function.

Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSPL

Module: DFHPGAI

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, progname*

DFHPG0211 *date time applid terminal userid tranid* **Autoinstall for program** *progname* **failed. Program autoinstall model** *modelname* **is disabled.**

Explanation: An attempt has been made to autoinstall a program during link, XCTL, load or exit processing but the model selected for the autoinstall is disabled. Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: Control is returned to the caller with an error response. For EXEC commands, EIBRESP is set to PGMIDERR and EIBRESP2 is set to indicate the cause of the error.

User Response: Ensure that all programs to be used as models for the autoinstall function are enabled.

Destination: CSPL

Module: DFHPGAI

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, progname, modelname*

DFHPRxxxx messages

DFHPR0101I *date time applid* **The table entry for partner** *ptnrname* **has been replaced.**

Explanation: This is an informational message indicating that the partner resource manager has replaced the existing table entry for the *ptnrname* partner, with a new table entry.

System Action: The system continues normally.

User Response: None.

Destination: CSRL

Module: DFHPRPT

XMEOUT Parameters: *date, time, applid, ptnrname*

DFHPR0102I *date time applid* **The table entry for partner** *ptnrname* **has been added.**

Explanation: This is an informational message indicating that the partner resource manager has added a new table entry for the *ptnrname* partner.

System Action: The system continues normally.

User Response: None.

Destination: CSRL

Module: DFHPRPT

XMEOUT Parameters: *date, time, applid, ptnrname*

DFHPR0103I *date time applid* **The table entry for partner** *ptnrname* **has been deleted.**

Explanation: This is an informational message indicating that the partner resource manager has deleted the table entry for the *ptnrname* partner.

System Action: The system continues normally.

User Response: None.

Destination: CSRL

Module: DFHPRPT

XMEOUT Parameters: *date, time, applid, ptnrname*

DFHPR0104I *applid* **Partner resource manager initialization has started.**

Explanation: This is an informational message indicating that partner resource manager initialization has started.

System Action: Initialization continues.

User Response: None.

Destination: Console

Module: DFHPRIN1

XMEOUT Parameter: *applid*

DFHPR0105I *applid* **Partner resource manager initialization has ended.**

Explanation: This is an informational message indicating that partner resource manager initialization has completed successfully.

System Action: Initialization continues.

User Response: None. You can suppress this message with SIT parameter, MSGLVL=0.

Destination: Console

Module: DFHPRIN1

XMEOUT Parameter: *applid*

DFHPR0106I *applid* **Partner resource manager initialization has failed.**

Explanation: The partner resource manager has failed to initialize successfully.

System Action: Message DFHSI1522 is issued following this message. CICS terminates or continues initialization depending upon the operator's response to message DFHSI1522. An exception trace entry is written at the time the failure is detected. Other CICS components called by partner resource manager initialization may also issue messages or write trace entries.

User Response: Decide whether CICS can continue execution without the partner resource manager, and respond accordingly to message DFHSI1522. You should also investigate why the partner resource manager failed to initialize, starting from the data contained in the exception trace entry.

Destination: Console

Module: DFHPRIN1

XMEOUT Parameter: *applid*

DFHPSxxxx messages

DFHPS5366 *applid* **The system spooling interface initialization program DFHPSIP is not present.**

Explanation: CICS attempted to link to DFHPSIP but the attempt failed because DFHPSIP was not in the CICS program library.

System Action: CICS terminates system spooler initialization.

User Response: Place DFHPSIP in the CICS program library.

Destination: Console

Module: DFHSIJ1

XMEOUT Parameter: *applid*

DFHPS5393 *date time applid* **Transaction** *tranid* **ended without closing data set on system spool.**

Explanation: The transaction *tranid* did not close a JES interface data set. Since only one transaction at a time can use the JES input interface, other transactions may be unnecessarily delayed.

System Action: CICS executes a default CLOSE with the KEEP option for an INPUT data set or the DELETE option for an output data set.

User Response: Change the program so that the transaction issues a SPOOLCLOSE before it terminates, and preferably immediately after the ENDFILE condition occurs on an input data set.

Destination: CSMT

Module: DFHPSPDW

XMEOUT Parameters: *date, time, applid, tranid*

DFHPS5394 *date time applid* **A storage error has occurred in JES interface subtask, the JES interface has been disabled.**

Explanation: An MVS FREEMAIN macro, issued by the CICS JES interface subtask, has failed. To keep dynamic storage area (DSA) storage usable, CICS has terminated the JES interface subtask with MVS user abend 0170.

System Action: CICS rejects subsequent SPOOL commands with the NOSPOOL response.

User Response: CICS will continue running normally (apart from the rejection of SPOOL commands), and you can let it continue unless your spooling requirements are critical.
To reinitiate the JES interface, shut down CICS and perform a warm restart (START=AUTO in the SIT or as an initialization override).
Use the MVS dump to find the source of the problem. In the dump, register 6 addresses the instruction before the ABEND. Normally, register 2 contains the address and register 0 the length of the area to be released.

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, tcpipservice-name*

DFHRMxxxx messages

DFHRM0001 *applid* **An abend (code** *code***) has occurred at offset** *X'offset'* **in module** *module***.**

Explanation: An unexpected program check or abend occurred with abend code *aaa/bbbb*.

The program status word (PSW) at the time of the program check or abend indicated that CICS was executing at offset X'*offset*' in module *modname*. This may have been caused by corruption of CICS code or control blocks.

System Action: A system dump is taken and the system attempts to continue operation unless otherwise directed by entries in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the cause of the program check or abend using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHRMDM, DFHRMCD, DFHRMCD1

XMEOUT Parameters: *applid, code, X'offset', module*

DFHRM0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *module***.**

Explanation: The recovery manager domain has received an unexpected error response from some other part of CICS. The operation requested by recovery manager is described by code X'*code*'.

For further information about CICS exception trace entries, refer to the *CICS Problem Determination Guide*.

System Action: A system dump is taken and the system attempts to continue operation unless specifically inhibited by dump table entries.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the cause of the problem as follows:

1. Determine if the problem can be explained by any previous messages issued from some other CICS component.
2. Examine the symptom string.
3. Examine the dump.

If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHRMDM, DFHRMCD1, DFHRMCD, DFHRMCI2, DFHRMCI3

XMEOUT Parameters: *applid, X'code', module*

DFHRM0104 *date time applid* **Intersystem communication failure. Resource updates are being committed. Local resources may be out of sync with those on the remote system. Failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been interrupted. The remote system contains the coordinator of this unit of work and the notification of the outcome of the distributed unit of work has not been received.

The unit of work is unilaterally committing the local resource updates rather than waiting for the return of the coordinator system. The unit of work may not shunt for one of the following reasons:

- The transaction definition specifies WAIT(NO).
- The unit of work includes an MRO session to a back-level CICS system which does not support the WAIT(YES) option, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work includes an LU6.1 session, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work involves a task related user exit which is not enabled with the INDOUBTWAIT option.
- The unit of work has updated a recoverable transient data destination, which is defined with WAIT(NO).
- The unit of work involves the installation of CICS resource definitions from the CSD (CICS system definition) file.

Even if the unit of work was shunted, one of the following reasons will cause it to take unilateral action:

- The WAITTIME specified in the transaction definition has expired.
- Resynchronization has been preempted by either:
  - Setting the connection with the remote system NOTPENDING.
  - Setting the connection with the remote system NORECOVDATA.
  - The XLNACTION attribute of the connection definition of the remote system specifying FORCE.
  - Forcing the unit of work.

The local resource updates are being committed since either

- The unit of work has been explicitly forced to commit.
- The ACTION attribute of the definition of the locally executing transaction specified COMMIT.

One system may have committed its resource updates and the other backed out, leaving updates out of synchronization. This is checked for when commuication is re-established, and one of the following messages is issued:

DFHRM0110
DFHRM0111
DFHRM0112
DFHRM0113
DFHRM0114
DFHRM0115
DFHRM0116
DFHRM0117
DFHRM0118
DFHRM0119
DFHRM0120
DFHRM0121
DFHRM0122
DFHRM0123

The original failure information provides correlation between this message and its follow-up.

System Action: The system commits the local resource updates and releases the locks associated with those updates.

User Response: Take user-defined action, if any, to protect data integrity until the remote and the local data can be synchronized.

Destination: CSMT

Module: DFHRMLSO

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0105 *date time applid* **Intersystem communication failure. Resource updates are being backed out. Local resources may be out of sync with those on the remote system. Failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been interrupted. The remote system contains the coordinator of this unit of work and the notification of the outcome of the distributed unit of work has not been received.

The unit of work is unilaterally backing out the local resource updates rather than waiting for the return of the coordinator system. The unit of work may not shunt for one of the following reasons:

- The transaction definition specifies WAIT(NO).
- The unit of work includes an MRO session to a back-level CICS system which does not support the WAIT(YES) option, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work includes an LU6.1 session, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work involves a task related user exit which is not enabled with the INDOUBTWAIT option.
- The unit of work has updated a recoverable transient data destination, which is defined with WAIT(NO).
- The unit of work involves the installation of CICS resource definitions from the CSD (CICS system definition) file.

Even if the unit of work was shunted, one of the following reasons will cause it to take unilateral action:

- The WAITTIME specified in the transaction definition has expired.
- Resynchronization has been preempted by either:
  - Setting the connection with the remote system NOTPENDING.
  - Setting the connection with the remote system NORECOVDATA.
  - The XLNACTION attribute of the connection definition of the remote system specifying FORCE.
  - Forcing the unit of work.

The local resource updates are being backed out since either

- The unit of work has been explicitly forced to backout.
- The ACTION attribute of the definition of the locally executing transaction specified BACKOUT.

One system might have committed its resource updates and the other backed out, leaving updates out of synchronization. This is checked for when communication is re-established, and one of the following messages is issued:

DFHRM0110
DFHRM0111
DFHRM0112
DFHRM0113
DFHRM0114
DFHRM0115
DFHRM0116
DFHRM0117
DFHRM0118
DFHRM0119
DFHRM0120
DFHRM0121
DFHRM0122
DFHRM0123

The original failure information provides correlation between this message and its follow-up.

System Action: The system backs out the local resource updates and releases the locks associated with those updates.

User Response: Take user-defined action, if any, to protect data integrity until the remote and the local data can be synchronized.

Destination: CSMT

Module: DFHRMLSO

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0106 *date time applid* **Intersystem communication failure. Resource updates will not be committed or backed out until session recovery. Failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been interrupted. The remote system that contains the coordinator of this unit of work failed and the notification of the outcome of the distributed unit of work has not been received. The definition if the locally executing transaction specifies WAIT(YES) so the local resource updates are being held locked. When communication with the remote system is re-established, the resource updates will be committed or backed out, according to the actions of the other system, and one of the following messages is issued:

DFHRM0108
DFHRM0109
DFHRM0112
DFHRM0113
DFHRM0115
DFHRM0116
DFHRM0118
DFHRM0119
DFHRM0121
DFHRM0122

If the time specified by the WAITTIME in the transaction definition of the locally executing transaction expires before communication is re-established then the resource updates are committed or backed out in accordance with the ACTION attribute and one of the following messages is issued:

DFHRM0104
DFHRM0105

If a decision to preempt resynchronization activity is taken at the local system by either:

- Setting the connection with the remote system NOTPENDING.
- Setting the connection with the remote system NORECOVDATA.
- The XLNACTION attribute of the connection definition of the remote system specifying FORCE.
- Forcing the unit of work.

then again the resource updates are committed or backed out accordingly and one of the following messages is issued:

DFHRM0125
DFHRM0126

System Action: Processing continues. Locks associated with the resource updates are preserved.

User Response: Re-establish communication with the remote system as soon as possible.

Destination: CSMT

Module: DFHRMLSS

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0107 *date time applid* **Intersystem communication failure. Resource updates may be out of sync. Failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with a remote system has been interrupted. This may be due to the failure of a session to a remote system or the failure of a CFDT server system. The resource updates in the local system are committing or backing out. The notification of the outcome of the distributed unit of work might not reach the remote system or server. One system might commit its resource updates while the other backs them out leaving updates out of synchronization. This is checked for at session or server recovery, and one of the following messages is issued:

DFHRM0110
DFHRM0111
DFHRM0114
DFHRM0117
DFHRM0120
DFHRM0123
DFHRM0135

If a decision to preempt resynchronization activity is taken at the local system by either:

- Setting the connection with the remote system NOTPENDING.
- Setting the connection with the remote system NORECOVDATA.
- The XLNACTION attribute of the connection definition of the remote system specifying FORCE.
- Forcing the unit of work.

then again the resource updates are committed or backed out accordingly and DFHRM0127 is issued.

System Action: The system commits or backs out the local resource updates and releases the locks associated with those updates. Information is retained to enable resynchronization with the remote system.

User Response: Re-establish communication with the remote system as soon as possible.

Destination: CSMT

Module: DFHRMLSO

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0108 *date time applid* **Intersystem communication recovery. Suspended resource updates now being committed. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: This message is issued during intersystem communication recovery as a follow up to message DFHRM0106. Communication with the remote system that is the coordinator of this unit of work has been re-established and resynchronization is taking place. It has now been established that the remote system completed the synchronization point. The local resource updates are being committed accordingly.

System Action: The system commits the local resource updates and releases the locks associated with those updates.

User Response: None.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0109 *date time applid* **Intersystem communication recovery. Suspended resource updates now being backed out. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: This is an informatory message issued during intersystem communication recovery as a follow up to message DFHRM0106. Communication with the remote system that is the coordinator of this unit of work has been re-established and resynchronization is taking place. It has now been established that the remote system did not complete the synchronization point. The local resource updates are being backed out accordingly.

System Action: The system backs out the local resource updates and releases the locks associated with those updates.

User Response: If required, restart the interrupted transaction.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0110 *date time applid* **Intersystem communication recovery. Unit of work found to be synchronized. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Resynchronization with the remote system which is a subordinate in the unit of work has occurred following the resumption of communication, or the unshunting of the unit of work on the local system. It was found either the local or remote system (or both) had already taken a decision for their parts of the distributed unit of work. It has now been established that the decisions in the local and remote systems are synchronized.

System Action: Processing continues.

User Response: None

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0111 *date time applid* **Intersystem communication recovery. Distributed unit of work found to be not synchronized. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Resynchronization with the remote system which is a subordinate in the unit of work has occurred following the resumption of communication, or the unshunting of the unit of work on the local system. It was found either the local or remote system (or both) had already taken a decision for their part of the distributed unit of work. It has now been established that the decisions of the local and remote systems are out of synchronization.

System Action: Processing continues.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0112 *date time applid* **Intersystem communication recovery. The remote system has reinitialized. The local unit of work is committed. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been resumed. Resynchronization with the remote system was attempted. It was found that the remote system has reinitialized and now has no knowledge of the unit of work. The resource updates of the distributed unit of work in the remote system might have committed or backed out.

If the session is an MRO session to a pre-CICS Transaction Server system, this message may be issued even if the remote system was not reinitialized. This can only occur if the session failed during its first unit of work since connection.

The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. This will never be received.

The local unit of work is committed in accordance with the ACTION attribute in the transaction definition.

System Action: The system commits the unit of work and releases the locks associated with any resource updates.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0113 *date time applid* **Intersystem communication recovery. The remote system has reinitialized. The local unit of work is backed out. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been resumed. Resynchronization with the remote system was attempted. It was found that the remote system has reinitialized and now has no knowledge of the unit of work. The resource updates of the distributed unit of work in the remote system might have committed or backed out.

If the session is an MRO session to a pre-CICS Transaction Server system, this message may be issued even if the remote system was not reinitialized. This can only occur if the session failed during its first unit of work since connection.

The unit of work in the local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. This will never be received.

The local unit of work is backed out in accordance with the ACTION attribute in the transaction definition.

System Action: The system backs out the local resource updates and releases the locks associated with those updates.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0114 *date time applid* **Intersystem communication recovery. The remote system has reinitialized. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been resumed. Resynchronization with the remote system was attempted. It was found that the remote system has reinitialized and now has no knowledge of the unit of work. The resource updates of the distributed unit of work in the remote system might have committed or backed out. The unit of work in the local system had previously committed or backed out.

System Action: Processing continues.

User Response: Take user-defined actions to resynchronize resources in local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0115 *date time applid* **Intersystem communication recovery. The remote system sent mixed heuristic outcome. Resource updates will be committed. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been resumed. Resynchronization with the remote system was attempted. It was found that some resource updates in the distributed unit of work committed and some backed out. The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. The notification received does not determine whether to commit or back out the local resource updates. The definition of the locally executing transaction will be used to decide whether to commit or back out the local resource updates. The local resource updates are committed in accordance with the ACTION attribute in the transaction definition.

System Action: The system commits the local resource updates and releases the locks associated with those updates.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0116 *date time applid* **Intersystem communication recovery. The remote system sent mixed heuristic outcome. The unit of work will be backed out. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been resumed. Resynchronization with the remote system was attempted. It was found that some resource updates in the distributed unit of work committed and some backed out. The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. The notification received does not determine whether to commit or back out the resource updates. The local unit of work is backed out in accordance with the ACTION attribute in the transaction definition.

System Action: The system backs out the local resource updates and releases the locks associated with those updates.

User Response: Take user-defined actions to resynchronize resources in local and remote systems, if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0117 *date time applid* **Intersystem communication recovery. The remote system sent mixed heuristic outcome. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been resumed. Resynchronization with the remote system was attempted. It was found that some resource updates in the distributed unit of work committed and some backed out. The resource updates in the local system had previously committed or backed out.

System Action: Processing continues.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0118 *date time applid* **Intersystem communication recovery. Resynchronization information from the remote system was not sufficient to determine the outcome of the unit of work. Resource updates will be committed. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *uowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been resumed. Resynchronization with the remote system was attempted. The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. Information received from the remote system did not determine whether to commit or back out the local resource updates.

The definition of the locally executing transaction is used to decide whether to commit or back out the local resource updates. The local resource updates are committed in accordance with the ACTION attribute in the transaction definition.

System Action: The system commits the local resource updates and releases the locks associated with those updates.

User Response: Take user-defined actions to resynchronize resources in local and remote systems, if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, uowid, X'localuowid'*

DFHRM0119 *date time applid* **Intersystem communication recovery. Resynchronization information from the remote system was not sufficient to determine the outcome of the unit of work. Resource updates will be backed out. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been resumed. Resynchronization with the remote system was attempted. The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. Information received from the remote system did not determine whether to commit or back out the resource updates.

The definition of the locally executing transaction is used to decide whether to commit or back out the local resource updates. The local resource updates are backed out in accordance with the ACTION attribute in the transaction definition.

System Action: The system backs out the local resource updates and releases the locks associated with those updates.

User Response: Take user-defined action to resynchronize resources in local and remote systems, if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0120 *date time applid* **Intersystem communication recovery. Resynchronization information from the remote system was not sufficient to determine the outcome of the unit of work. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been resumed. Resynchronization with the remote system was attempted. Information received from the remote system did not determine whether resource updates in the distributed unit of work committed or backed out. The resource updates in the local system had previously committed or backed out.

System Action: Processing continues.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0121 *date time applid* **Intersystem communication recovery. A protocol violation was detected during resynchronization with the remote system. Resource updates will be committed. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been resumed. Resynchronization with the remote system was attempted. The local system detected a protocol violation during resynchronization. The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. The local system cannot determine whether to commit or back out the resource updates to be consistent other resource changes in the distributed unit of work. The definition of the locally executing transaction will be used to decide whether to commit or back out the local resource updates. The local resource updates are committed in accordance with the ACTION attribute in the transaction definition.

System Action: The system commits the local resource updates and releases the locks associated with those updates.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0122 *date time applid* **Intersystem communication recovery. A protocol violation was detected during resynchronization with the remote system. Resource updates will be backed out. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been resumed. Resynchronization with the remote system was attempted. The local system detected a protocol violation during resynchronization. The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. The local system cannot determine whether to commit or back out the resource updates to be consistent other resource changes in the distributed unit of work. The definition of the locally executing transaction is used to decide whether to commit or back out the local resource updates. The local resource updates are backed out in accordance with the ACTION attribute in the transaction definition.

System Action: The system backs out the local resource updates and releases the locks associated with those updates.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0123 *date time applid* **Intersystem communication recovery. A protocol violation was detected during resynchronization with the remote system. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been resumed. Resynchronization with the remote system was attempted. The local system detected a protocol violation during resynchronization. The resource updates in the local system had previously committed or backed out.

System Action: Processing continues.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0124 *date time applid* **Intersystem communication recovery. Resource updates are out of sync. network UOW** *netuowid* **remote system** *name***.**

Explanation: Intersystem communication recovery is in progress. The remote system has attempted to resynchronize a unit of work but the local system no longer has any knowledge of that unit of work. This is because the last agent or the presumed abort protocol is being used and the local system backed out the resource updates associated with the unit of work. The remote system has sent notification that the resource updates in the remote system did not back out.

System Action: Processing continues.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, netuowid, name*

DFHRM0125 *date time applid* **Clear pending issued. The connection to the remote system has been set NOTPENDING. Resource updates will be committed. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: The connection with the remote system has been set NOTPENDING or NORECOVDATA, or the connection is defined with XLNACTION(FORCE). The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. Setting the connection with the remote system NOTPENDING or NORECOVDATA preempts the notification of the outcome from the remote system. The definition of the locally executing transaction is used to decide whether to commit or back out the local resource updates. The local resource updates are committed in accordance with the ACTION attribute in the transaction definition.

System Action: The system commits the local resource updates and releases the locks associated with those updates.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems.

Destination: CSMT

Module: DFHRMLN,DFHRMLK4,DFHRMLSO,DFHRMLSS

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0126 *date time applid* **Clear pending issued. The connection to the remote system has been set NOTPENDING. Resource updates will be backed out. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: The connection with the remote system has been set NOTPENDING or NORECOVDATA, or the connection is defined with XLNACTION(FORCE). The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. Setting the connection with the remote system NOTPENDING or NORECOVDATA preempts the notification of the outcome from the remote system. The definition of the locally executing transaction is used to decide whether to commit or back out the local resource

updates. The local resource updates are backed out in accordance with the ACTION attribute in the transaction definition.

System Action: The system backs out the local resource updates and releases the locks associated with those updates.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems.

Destination: CSMT

Module: DFHRMLN,DFHRMLK4,DFHRMLSO,DFHRMLSS

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0127 *date time applid* **Clear pending issued. The connection to the remote system has been set NOTPENDING. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication between the systems had previously failed during a syncpoint. Resynchronization between the systems has been preempted. The connection with the remote system has been:

- Set NOTPENDING,
- Set NORECOVDATA,
- Reestablished and is defined with XLNACTION(FORCE).

If the unit of work in the local system was in-doubt about the outcome of the distributed unit of work, local resource updates are committed or backed out in accordance with the ACTION attribute in the transaction definition.

Since no resynchronization with the remote system is attempted, the resource updates in the local and remote systems might be out of synchronization.

System Action: Processing continues.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems.

Destination: CSMT

Module: DFHRMLN,DFHRMLK4,DFHRMLSO,DFHRMLSS

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0129 *date time applid* **Intersystem communication failure. Resource updates may be out of sync. Failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has failed. The resource updates in the local system are committing or backing out. The notification of the outcome of the distributed unit of work might not reach the remote system. One system might commit its resource updates while the other backs them out leaving updates out of synchronization. There will be no resolution message when the local and remote systems resynchronize, because the remote system does not provide the local system with resynchronization information.

System Action: The system commits or backs out the local resource updates and releases the locks associated with those updates. Information is retained to enable resynchronization with the remote system.

User Response: Reestablish communication with the remote system as soon as possible. The local system is the coordinator, and will provide indoubt resolution information for the remote system when communication is reestablished. If the remote system has taken a heuristic decision regarding the unit of work, then it should have provided diagnostic information to indicate this.

Destination: CSMT

Module: DFHRMLSO

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0130 *applid* **Recovery manager has successfully quiesced.**

Explanation: The recovery manager has quiesced.

The warm keypoint has been taken.

System Action: Shutdown continues.

User Response: None.

Destination: Console

Module: DFHRMDM

XMEOUT Parameter: *applid*

DFHRM0131 *applid* **Resynchronization required with** *protocol* **resources.**

Explanation: This system contained unquiesed state when shutdown was performed. The state may consist of units of work or lognames (lognames can exist for communications protocols IRC and APPC only). This system may need to perform resynchronization with other systems to resolve the outcome of any distributed units of work. This can be done as part of the work of a subsequent CICS system.

The systems with which resynchronization is necessary are reported in messages DFHRM0132 or DFHRM0133.

A subsequent CICS start which reinitializes the catalog and system log data would discard the units of work and/or lognames and cause a possible loss of data integrity.

System Action: Shutdown continues.

User Response: To maintain data integrity, perform an AUTO start and enable resynchronization with the appropriate systems.

Destination: Console

Module: DFHRMNS2

XMEOUT Parameters: *applid, protocol*

DFHRM0132 *date time applid* **Resynchronization is required with** *protocol* **system** *system***.**

Explanation: A unit of work active in the system at shutdown requires resynchronization with the named system. The unit of work was part of a distributed unit of work and resynchronization is necessary to resolve the outcome.

Resynchronization occurs after a subsequent start unless catalog and system log information is reinitialized.

System Action: Shutdown continues.

User Response: If necessary, take user-defined action to protect data integrity until the remote and the local data can be synchronized.

Destination: CSMT

Modules: DFHRMLKQ, DFHRMNS2

XMEOUT Parameters: *date, time, applid, protocol, system*

DFHRM0133 *date time applid* **Resynchronization may be required with** *protocol* **system** *system***.**

Explanation: This system exchanged lognames with the remote system and so may require resynchronization with that system.

Resynchronization occurs after a subsequent CICS start unless catalog or system log information is reinitialized.

System Action: Shutdown continues.

User Response: If necessary, take user-defined action to protect data integrity until resynchronization takes place.

Destination: CSMT

Module: DFHRMNS2

XMEOUT Parameters: *date, time, applid, protocol, system*

DFHRM0134 *applid* **Recovery manager domain failed reading the global catalog, or did not find its control record.**

Explanation: The recovery manager domain has failed while reading the global catalog. Either it was trying to establish the status of the system at the termination of the last execution of CICS and the control record was missing or invalid, or else it could not read the catalog successfully.

System Action: CICS terminates abnormally with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the cause of the error using the dump or other diagnostic messages which have been issued (for example, from VSAM or MVS).

If the problem has been caused by an I/O error, see the description of the CICS message already issued from the catalog for guidance.

If the problem has been caused by an invalid data length, see the exception trace entry in the trace table.

If the problem has been caused by a missing control record, the catalog is not suitable for a recoverable start and you should perform an initial start.

Destination: Console

Module: DFHRMDM

XMEOUT Parameter: *applid*

DFHRM0135 *date time applid* **Intersystem communication recovery. Resource updates found to be synchronized. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Resynchronization with the remote system which is a subordinate in the unit of work has occurred following the resumption of communication, or the unshunting of the unit of work on the local system. Either the remote system had already taken a decision for its local resource updates in the distributed unit of work, or the remote system was waiting for the decision from this system. In either case, it has now been established that the resource updates in the local and remote systems are synchronized.

System Action: Processing continues.

User Response: None

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0136 *applid* **The applid has changed from** *old_applid* **to** *new_applid***. Recovery cannot continue.**

Explanation: Recovery is requested, but the applid recovered by the recovery manager domain from the CICS catalog is different from that specified for the system. This implies that the identity of the system on the network has changed. The system must maintain the same identity on the network for resynchronization to be performed with other systems.

System Action: The system is terminated.

User Response: If recovery and resynchronization is required, correct the applid in the SIT and restart the system. Do not reinitialize catalog or system log information unless you wish to change the identity of the CICS system.

Destination: Console

Module: DFHRMDM

XMEOUT Parameters: *applid, old_applid, new_applid*

DFHRM0139 *date time applid* **UOWLINK deleted by user action. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: This message is issued to confirm the deletion of a UOW-link (UOWLINK) by a CEMT or EXEC CICS SET UOWLINK ACTION(DELETE) command. This command is used to delete links that were created by connections that have since been discarded.

System Action: The system continues normally.

User Response: None.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0140 *applid* **Recovery manager autostart override found with value: '***autofield***'.**

Explanation: Recovery manager has located an autostart override record in the global catalog data set which has one of the values AUTOINIT, AUTOCOLD, or AUTOASIS.

System Action: The system continues. If this is an AUTO start, the autostart override value in the message is used to determine the type of start to be performed.

User Response: No action is necessary.

Destination: Console

Module: DFHRMDM

XMEOUT Parameters: *applid, autofield*

DFHRM0141 *applid* **Recovery manager autostart override record is not present. Normal processing continues.**

Explanation: There is no autostart override record in the global catalog data set. If you have not used the utility DFHRMUTL this message is normal for an AUTO start and does not represent a problem.

System Action: The default auto start processing continues. This is equivalent to an AUTOASIS value in an autostart override record.

User Response: No action is necessary.

Destination: Console

Module: DFHRMDM

XMEOUT Parameter: *applid*

DFHRM0142 *applid* **Recovery manager autostart override record found to be: '***autofield***', and this is not a valid value. AUTOASIS is assumed instead.**

Explanation: Recovery manager has located an autostart override record in the global catalog data set which does not have one of the values: AUTOINIT, AUTOCOLD, or AUTOASIS.

System Action: AUTOASIS is assumed, a dump is taken, and the system continues. The override record will be removed at startup as usual.

User Response: No action is necessary. To correctly set the autostart override record the utility DFHRMUTL should be used prior to starting CICS.

Destination: Console

Module: DFHRMDM

XMEOUT Parameters: *applid, autofield*

DFHRM0143 *applid* **Recovery manager autostart override record is invalid. 'AUTOASIS' is assumed.**

Explanation: Recovery manager has found an autostart override record in the global catalog data set, but it has an invalid length or is in the wrong format.

System Action: A dump is taken and the system continues. The autostart override value is assumed to be AUTOASIS. The autostart override record is removed from the catalog at startup as usual.

User Response: Investigate why the global catalog data set should have been incorrectly modified. The DFHRMUTL utility is used to correctly set the autostart override record prior to starting CICS.

Destination: Console

Module: DFHRMDM

XMEOUT Parameter: *applid*

DFHRM0144 *applid* **Recovery manager catalog record indicates that no recovery is possible. An initial start is required.**

Explanation: Recovery manager has read its catalog record from the global catalog data set and this indicates that no recovery is possible. The most likely reason is that CICS detected a corrupted log before the last CICS shutdown. Startup cannot continue with these start parameters.

System Action: CICS terminates abnormally with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Determine whether the CICS startup job correctly identifies the global catalog data set. If it does, the system log may be unusable and you must perform an initial start of CICS.

If the global catalog data set was incorrectly identified, retry the job with the correct global catalog data set.

Destination: Console

Module: DFHRMDM

XMEOUT Parameter: *applid*

DFHRM0145 *applid* **Recovery manager does not recognize the form of start requested by SIT parameters and overrides.**

Explanation: Recovery manager cannot determine what sort of CICS start to perform. The parameters on the SIT and any settings read from the catalog data set are inconsistent with a valid start type.

System Action: CICS terminates abnormally with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This failure is caused by an internal CICS inconsistency. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHRMDM

XMEOUT Parameter: *applid*

DFHRM0146D *applid* **Global catalog data set recovery data not found. System log data will be lost. Reply 'GO' or 'CANCEL'.**

Explanation: A cold start has been requested, and no recovery control record information was found in the global catalog data set. Either this is the first execution of CICS with this global catalog data set, the wrong global catalog data set is being used, or the global catalog data set has been initialized without information necessary for recovery.

System Action: The system waits for a response.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If this is the first time CICS has been run with this global catalog data set, or if it is intended to delete all recovery information from the system log, reply ‘GO’. This forces an initial start with no system log information retained from previous CICS executions. In particular, information used to resynchronize with remote CICS systems is cleared as well as all local recovery information.

If this is not the first time, or if you wish to retain system log information and try with another global catalog data set, reply ‘CANCEL’ to terminate this CICS execution. Nothing is discarded in this case. Check the global catalog data set and try again.

Destination: Console

Module: DFHRMDM

XMEOUT Parameter: *applid*

DFHRM0147 *applid* **Reply CANCEL was received.**

Explanation: A reply of 'CANCEL' was received in response to message DFHRM0146.

System Action: CICS terminates.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: None.

Destination: Console

Module: DFHRMDM

XMEOUT Parameter: *applid*

DFHRM0148 *date time applid* **Intersystem communication recovery. Resource updates are in sync. network UOW id** *netuowid* **remote system** *name***.**

Explanation: Intersystem communication recovery is in progress. The remote system has attempted to resynchronize a unit of work and the local system no longer has any knowledge of that unit of work. This is because the local system was the coodinator, and the last agent or presumed abort protocols were being used. Any local resource updates associated with the unit of work were backed out. The remote system has sent notification that the resource updates in the remote system are still indoubt (and will be backed out following resynchronization) or have already been backed out.

System Action: Processing continues.

User Response: None.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, netuowid, name*

DFHRM0149I *applid* **Recovery manager autostart override record will be deleted.**

Explanation: Recovery manager has found an autostart override record in the global catalog data set. It is deleted after the correct startup type is determined unless this is a diagnostic run. If this is a diagnostic run the recovery manager global catalog records are not altered.

System Action: Unless this is a diagnostic run the record is removed from the global catalog data set and will not influence subsequent starts.

User Response: None.

Destination: Console

Module: DFHRMDM

XMEOUT Parameter: *applid*

DFHRM0150 *applid* **Diagnostic run due to AUTODIAG override is finished. CICS will now terminate.**

Explanation: Recovery manager has performed a diagnostic run and now terminates with a dump. This is a result of an AUTODIAG override in the auto override record.

System Action: The system terminates. A dump is taken.

User Response: No further action is necessary.

Destination: Console

Module: DFHRMDM

XMEOUT Parameter: *applid*

DFHRM0151 *applid* **Diagnostic run is initiated. A simulated AUTO start is performed for diagnostic purposes only.**

Explanation: Recovery manager has detected a diagnostic run override (AUTODIAG) on the global catalog. This run of CICS will not perform any application processing and is for diagnostic purposes only.

System Action: The system continues. A dump is taken later prior to terminating.

User Response: No further action is necessary at this time. See the *CICS Problem Determination Guide* for details of the reasons you might want to perform a diagnostic run, and for other diagnostics you may wish to preserve at the same time.

Destination: Console

Module: DFHRMDM

XMEOUT Parameter: *applid*

DFHRM0152 *applid* **Recovery manager autostart override record is set to AUTODIAG.**

Explanation: The recovery manager auto override record on the global catalog has been set to AUTODIAG to allow a diagnostic run before the next initial start.

System Action: Processing continues.

User Response: No action is necessary. See the *CICS Problem Determination Guide* for information about how to perform a diagnostic run.

Destination: Console

Module: DFHRMDM

XMEOUT Parameter: *applid*

DFHRM0154 *applid* **Uncommitted local resource updates found on the System Log. COLD start is NOT preserving data integrity.**

Explanation: A cold start has been requested, but units of work containing uncommitted local resource updates have been found on the system log. The cold start will ignore this information and so data integrity will not be preserved for the affected resources.

System Action: The cold start continues.

Message DFHME0116 is normally produced containing the symptom string for this problem.

Destination: Console

Module: DFHRMU1E

XMEOUT Parameter: *applid*

DFHRM0156 *applid* **This COLD start will NOT cause any damage to local resources.**

Explanation: The recovery manager established that there were no uncommitted resource updates recorded on the system log from a previous execution of CICS. Thus there is no local recovery necessary.

System Action: System initialization continues.

User Response: None.

Destination: Console

Module: DFHRMU1E

XMEOUT Parameter: *applid*

DFHRM0200 *applid indoubt_uows* **indoubt UOWs were reconstructed.**

Explanation: This message displays the number of indoubt units of work (UOWs), *indoubt_uows*, which were reconstructed on a warm or emergency restart.

It is issued only if there is at least one UOW which is indoubt. It is issued before any of the reconstructed UOWs are unshunted and processed in parallel.

System Action: The system has performed the backwards scan of the system log and is about to start unshunting UOWs which need further processing.

The system commits or backs out UOWs which were indoubt and for which either of the following conditions apply:

- The transaction is defined with WAIT(NO)
- The transaction is defined with WAIT(YES) and the WAITTIME has expired.

  Note: A WAITTIME of zero implies an indefinite wait.

Where communications with the coordinator systems is possible, UOWs are unshunted and updates are committed or backed out on the local system. These updates are synchronized with the updates made on the coordinator system.

Where communications with the coordinator systems is not immediately possible, UOWs are preserved until resynchronization with the coordinator system is possible or until the WAITTIME expires. The suspension of these indoubt UOWs causes updated recoverable resources to remain locked against subsequent updates.

User Response: None.

If further investigation is required, use the CEMT INQUIRE UOW INDOUBT and CEMT INQUIRE UOWENQ RETAINED commands once CICS has initialized. These commands detail the indoubt UOWs and the associated retained enqueues.

Destination: Console

Module: DFHRMU1E.

XMEOUT Parameters: *applid, indoubt_uows*

DFHRM0201 *date time applid bfail_uows* **backout-failed and** *cfail_uows* **commit-failed UOWs were reconstructed.**

Explanation: This message displays the number of backout-failed units of work (UOWs), *bfail_uows*, and the number of commit-failed UOWs, *cfail_uows*, which were reconstructed on a warm or emergency restart.

This message is issued only if there is at least one such UOW. It is issued before any of the reconstructed UOWs are unshunted and processed in parallel.

Note: This message is issued before the commit-failed and backout-failed UOWs are processed. Many of these UOWs are likely to be resolved during CICS initialization. Any true commit-failed or backout-failed UOWs are highlighted by further messages issued during CICS initialization. Also, once CICS is fully initialized, the master terminal transaction (CEMT) can be used to determine whether there are any outstanding commit-failed or backout-failed UOWs.

System Action: The system has performed the backwards scan of the system log and is about to start unshunting UOWs which need further processing.

UOWs which have failed to back out locally or commit locally are retried.

User Response: None.

Destination: CSMT

Module: DFHRMU1E

XMEOUT Parameters: *date, time, applid, bfail_uows, cfail_uows*

DFHRM0202 *date time applid inflight_uows* **inflight UOWs were reconstructed.**

Explanation: This message displays the number of inflight units of work (UOWs), *inflight_uows*, which were reconstructed on an emergency restart.

It is issued only if there is at least one UOW which is inflight. It is issued before any of the reconstructed UOWs are unshunted and processed in parallel.

System Action: The system has performed the backwards scan of the system log and is about to start unshunting UOWs which need further processing.

User Response: None.

Destination: CSMT

Module: DFHRMU1E.

XMEOUT Parameters: *date, time, applid, inflight_uows*

DFHRM0203 *applid* **There are** *indoubt_uows* **indoubt,** *cfail_uows* **commit-failed and** *bfail_uows* **backout-failed UOWs.**

Explanation: This message displays the numbers of indoubt units of work (UOWs) *indoubt_uows*, backout-failed UOWs *bfail_uows*, and commit-failed UOWs *cfail_uows* in the CICS system at the time of the normal shutdown.

It is issued only if there is at least one such UOW. If there are none, message DFHRM0204 is issued instead.

Messages DFHRM0203 and DFHRM0204 can be used to determine whether or not it is safe to cold start CICS following a normal shutdown without losing resynchronization information. See DFHRM0204 for more information.

System Action: Shutdown processing continues.

User Response: None.

Destination: Console

Module: DFHRMU1K

XMEOUT Parameters: *applid, indoubt_uows, cfail_uows, bfail_uows*

DFHRM0204 *applid* **There are no indoubt, commit-failed or backout-failed UOWs.**

Explanation: There are no indoubt, commit-failed, or backout-failed units of work (UOWs) in the CICS system at the time of the normal shutdown.

If there are any such units of work, message DFHRM0203 is issued.

This message indicates that it safe to do a cold start of CICS without losing any resynchronization information.

System Action: Shutdown processing continues.

User Response: None.

Destination: Console

Module: DFHRMU1K

XMEOUT Parameter: *applid*

DFHRM0205 *date time applid* **An activity keypoint has been successfully taken.**

Explanation: CICS has successfully taken an activity keypoint. This message is also issued for the shutdown keypoint.

System Action: Normal processing continues..

User Response: None.

Destination: CSMT

Module: DFHRMR1K

XMEOUT Parameters: *date, time, applid*

DFHRM0208 *date time applid* **Intersystem communication recovery. A unit of work recovered only for remote resynchronization is now being committed. Local resources are not synchronized with the unit of work. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: This message is issued during intersystem communication recovery as a follow up to message DFHRM0106. Communication with the remote system that is the coordinator of this unit of work has been re-established and resynchronization is taking place. It has now been established that the remote system completed the synchronization point. Since this unit of work was recovered as part of a cold start, no local resources were locked pending this resynchronization and local resources are not synchronized with this decision.

System Action: The system allows the unit of work to commit for the purposes of resynchronization with remote systems. No local resources are changed.

User Response: None.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0209 *date time applid* **Intersystem communication recovery. A unit of work recovered only for remote resynchronization is now being backed out. Local resources are not synchronized with the unit of work. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: This message is issued during intersystem communication recovery as a follow up to message DFHRM0106. Communication with the remote system that is the coordinator of this unit of work has been re-established and resynchronization is taking place. It has now been established that the remote system did not complete the synchronization point. Since this unit of work was recovered as part of a cold start, no local resources were locked pending this resynchronization and local resources are not synchronized with this decision.

System Action: The system allows the unit of work to back out for resynchronization with remote systems. No local resources are changed.

User Response: None.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0212 *date time applid* **Intersystem communication recovery. The remote system has reinitialized. The unit of work is treated as committed. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been re-established. Resynchronization with the remote system was attempted. It was found that the remote system has restarted and has no knowledge of the unit of work. The distributed unit of work in the remote system might have committed or backed out.

The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. This will never be received.

Since this unit of work was recovered only for remote resynchronization, no local resources were locked pending this decision and local resources are not synchronized with the distributed unit of work. The unit of work is treated as committed in accordance with the ACTION attribute in the transaction definition.

If communication was via an MRO session to a pre-CICS Transaction Server system, this message may be issued even if the remote system was not restarted. This can only occur if the session failed during its first unit of work since connection.

System Action: The system continues. Further remote resynchronization treats this unit of work as committed.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0213 *date time applid* **Intersystem communication recovery. The remote system has reinitialized. The unit of work is treated as backed out. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been re-established. Resynchronization with the remote system was attempted. It was found that the remote system has restarted and has no knowledge of the unit of work. The distributed unit of work in the remote system might have committed or backed out. The unit of work in the local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. This will never be received.

Since the unit of work was recovered only for remote resynchronization no local resources were locked pending this outcome and local resources are not synchronized with the distributed unit of work.

The local unit of work is treated as backed out in accordance with the ACTION attribute in the local transaction definition.

If communication was via an MRO session to a pre-CICS Transaction Server system, this message may be issued even if the remote system was not reinitialized. This can only occur if the session failed during its first UOW since connection.

System Action: The system continues. Further remote resynchronization treats this unit of work as backed out.

User Response: Take user-defined actions to resynchronize resources in local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0214 *date time applid* **Intersystem communication recovery. The remote system has reinitialized. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been re-established. Resynchronization with the remote system was attempted. It was found that the remote system has restarted and has no knowledge of the unit of work. The distributed unit of work in the remote system might have committed or backed out.

Since this unit of work was recovered only for remote resynchronization, no local resources were locked pending a decision and so local resources are not synchronized with the distributed unit of work.

System Action: Processing continues.

User Response: Take user-defined actions to resynchronize resources in local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0215 *date time applid* **Intersystem communication recovery. The remote system sent mixed heuristic outcome. The unit of work is treated as committed. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been re-established. Resynchronization with the remote system was attempted. It was found that some resource updates in the distributed unit of work committed and some backed out. The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. The notification received does not determine whether the unit of work should be committed or backed out. The unit of work is treated as committed in accordance with the ACTION attribute in the transaction definition.

Since this unit of work was recovered only for remote resynchronization, no local resources were locked pending this outcome and local resources are not synchronized with this decision.

System Action: The system continues. Further remote resynchronization treats this unit of work as committed.

User Response: Take user-defined action to resynchronize resources in local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0216 *date time applid* **Intersystem communication recovery. The remote system sent mixed heuristic outcome. The unit of work is treated as backed out. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been re-established. Resynchronization with the remote system was attempted. It was found that some resource updates in the distributed unit of work committed and some backed out. The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. The notification received does not determine whether to commit or back out the resource updates. The local unit of work is treated as backed out in accordance with the ACTION attribute in the transaction definition.

Since this unit of work was recovered only for remote resynchronization, no local resources were locked pending this decision and local resources are not synchronized with the distributed unit of work.

System Action: The system continues. Further remote resynchronization treats this unit of work as backed out.

User Response: Take user-defined actions to resynchronize resources in local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0218 *date time applid* **Intersystem communication recovery. Resynchronization information from the remote system was not sufficient to determine the outcome of the unit of work. Local resources are not synchronized. The distributed unit of work is committed. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *uowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been re-established. Resynchronization with the remote system was attempted. The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. Information received from the remote system did not determine whether to commit or back out the unit of work.

The unit of work is committed in accordance with the ACTION attribute in the local transaction definition.

Because this unit of work was recovered only for remote resynchronization, no local resources were locked pending resolution of the unit of work, and local resources are not synchronized with this commit.

Any further remote resynchronization treats this unit of work as committed.

System Action: The system commits the unit of work for the purposes of remote resynchronization.

User Response: Take user-defined actions to resynchronize resources in local and remote systems, if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, uowid, X'localuowid'*

DFHRM0219 *date time applid* **Intersystem communication recovery. Resynchronization information from the remote system was not sufficient to determine the outcome of the unit of work. The distributed unit of work is backed out. Local resources are not synchronized. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been re-established. Resynchronization with the remote system was attempted. The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. Information received from the remote system did not determine whether to commit or back out the unit of work.

The unit of work is backed out in accordance with the ACTION attribute in the local transaction definition.

Because this unit of work was recovered only for remote resynchronization, no local resources were locked pending resolution of the unit of work, and local resources are not synchronized with this back out.

Any further remote resynchronization treats this unit of work as backed out.

System Action: The system backs out the unit of work for the purposes of remote resynchronization.

User Response: Take user-defined action to resynchronize resources in local and remote systems, if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0220 *date time applid* **Intersystem communication recovery. Resynchronization information from the remote system was not sufficient to determine the outcome of the unit of work. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been re-established. Resynchronization with the remote system was attempted. Information received from the remote system did not determine whether the distributed unit of work committed or backed out.

Since this unit of work was recovered only for remote resynchronization, no locks on local resources were held pending resolution of this unit of work, and the local resources are not synchronized with the distributed unit of work.

System Action: Processing continues.

User Response: Take user-defined action to resynchronize resources in local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0221 *date time applid* **Intersystem communication recovery. A protocol violation was detected during resynchronization with the remote system. The distributed unit of work is treated as committed. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been re-established. Resynchronization with the remote system was attempted. The local system detected a protocol violation during resynchronization. The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. The local system cannot determine whether the distributed unit of work was committed or backed out.

The distributed unit of work is treated as committed in accordance with the ACTION attribute in the local transaction definition.

Since this unit of work was recovered only for remote resynchronization, no local resources were locked pending resolution and no local resources are synchronized with this decision.

Any further remote resynchronization treats this unit of work as committed.

System Action: The system continues.

User Response: Take user-defined actions to resynchronize resources in local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0222 *date time applid* **Intersystem communication recovery. A protocol violation was detected during resynchronization with the remote system. The distributed unit of work is treated as backed out. Local resources are not synchronized. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been re-established. Resynchronization with the remote system was attempted. The local system detected a protocol violation during resynchronization. The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. The local system cannot determine whether the distributed unit of work committed or backed out.

The distributed unit of work is treated as backed out in accordance with the ACTION attribute in the transaction definition.

System Action: The system continues. Any further remote resynchronization treats this unit of work as backed out.

User Response: Take user-defined action to resynchronize the resources in the local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0223 *date time applid* **Intersystem communication recovery. A protocol violation was detected during resynchronization with the remote system. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system has been re-established. Resynchronization with the remote system was attempted. The local system detected a protocol violation during resynchronization.

Since this unit of work was recovered only for remote resynchronization, local resources are not synchronized and in this case the outcome of the distributed unit of work cannot be determined.

System Action: Processing continues.

User Response: Take user-defined actions to resynchronize resources in local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0225 *date time applid* **Clear pending issued. The connection to the remote system has been set NOTPENDING. The distributed unit of work is treated as committed. Local resources are not synchronized. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: The connection with the remote system has been set NOTPENDING or NORECOVDATA, or the connection is defined with XLNACTION(FORCE). The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. Setting the connection with the remote system NOTPENDING or NORECOVDATA preempts the notification of the outcome from the remote system.

Since this unit of work was recovered only for remote resynchronization, no local resources were locked pending resolution, and local resources are not synchronized with this decision.

The distributed unit of work is treated as committed in accordance with the ACTION attribute in the local transaction definition.

System Action: The system continues. Further remote resynchronization treats the unit of work as committed.

User Response: Take user-defined actions to resynchronize resources in local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLK4

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0226 *date time applid* **Clear pending issued. The connection to the remote system has been set NOTPENDING. The distributed unit of work is treated as backed out. Local resources are not synchronized. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: The connection with the remote system has been set NOTPENDING or NORECOVDATA, or the connection is defined with XLNACTION(FORCE). The local system was in-doubt about the outcome of the distributed unit of work and expected to receive notification of the outcome from the remote system. Setting the connection with the remote system NOTPENDING or NORECOVDATA preempts the notification of the outcome from the remote system.

Since this unit of work was recovered only for remote resynchronization, no local resources were locked pending resolution, and local resources are not synchronized with this decision.

The distributed unit of work is treated as backed out in accordance with the ACTION attribute in the local transaction definition.

System Action: The system continues. Further remote resynchronization treats this unit of work as backed out.

User Response: Take user-defined actions to resynchronize resources in local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLK4

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0227 *date time applid* **Clear pending issued. The connection to the remote system has been set NOTPENDING. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: The connection with the remote system has been set NOTPENDING. The unit of work is recorded as committed or backed out, but since this unit of work was recovered only for remote resynchronization, local resources might not be synchronized with this decision.

The local system did not receive acknowledgment that the remote system had received notification of the outcome of the unit of work.

No further resynchronization with this remote system is attempted and the distributed unit of work in the local and remote systems may not be synchronized.

System Action: Processing continues.

User Response: Take user-defined action to resynchronize resources in local and remote systems if necessary.

Destination: CSMT

Module: DFHRMLK4

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0228 *applid indoubt_uows* **indoubt UOWs have been recovered for the purpose of remote resynchronization. Local resources are not synchronized with these UOWs.**

Explanation: This message displays the number of indoubt units of work (UOWs), *indoubt_uows*, which have been recovered for resynchronization with remote systems. This message is only issued on cold starts. Local resources may not be kept synchronized with remote resources because CICS is cold starting.

It is issued only if there is at least one UOW which is indoubt. It is issued before any of the reconstructed UOWs are unshunted and processed in parallel.

System Action: The system has performed the backwards scan of the system log and is about to start unshunting UOWs where resynchronization is possible.

Where communications with the remote system or systems is not immediately possible, UOWs are preserved until resynchronization is possible or until WAITTIME (defined on the transaction definition) expires.

This message is followed by message DFHRM0208 if the UOW has been committed, or by DFHRM0209 if the UOW has been backed out on the remote system or systems.

User Response: None.

Destination: Console

Module: DFHRMU1E.

XMEOUT Parameters: *applid, indoubt_uows*

DFHRM0229 *date time applid bfail_uows* **backout-failed and** *cfail_uows* **commit-failed UOWs have been recovered for the purpose of remote resynchronization. Local resources are not synchro nized with these UOWs.**

Explanation: This message displays the number of backout-failed units of work (UOWs), *bfail_uows*, and the number of commit-failed UOWs, *cfail_uows*, which have been recovered for resynchronization with remote systems. These UOWs may now be in backout-waiting or commit-waiting states after cold start recovery processing. This message is only issued on cold starts. Local resources may not be kept synchronized with remote resources because CICS is cold starting.

This message is issued only if there is at least one such UOW. It is issued before any of the reconstructed UOWs are processed.

System Action: The system has performed the backwards scan of the system log and is about to start resynchronization for UOWs that require this.

Where communications with the remote system or systems is not immediately possible, UOWs are preserved until resynchronization is possible or until WAITTIME (defined on the transaction definition) expires.

This message is followed by message DFHRM0208 if the UOW has been committed, or by DFHRM0209 if the UOW has been backed out on the remote system or systems.

User Response: None.

Destination: CSMT

Module: DFHRMU1E

XMEOUT Parameters: *date, time, applid, bfail_uows, cfail_uows*

DFHRM0230 *date time applid inflight_uows* **inflight UOWs have been recovered for the purpose of remote resynchronization. Local resources are not synchronized with these UOWs.**

Explanation: This message displays the number of inflight units of work (UOWs), *inflight_uows*, which have been recovered for resynchronization with remote systems. This message is issued only on cold starts. Local resources may not be kept synchronized with remote resources because CICS is cold starting.

It is issued only if there is at least one UOW which is inflight. It is issued before any of the reconstructed UOWs are unshunted and processed in parallel.

System Action: The system has performed the backwards scan of the system log and is about to start unshunting UOWs where resynchronization is possible.

Where communications with the remote system or systems is not immediately possible, UOWs are preserved until resynchronization is possible or until WAITTIME (defined on the transaction definition) expires.

This message is followed by message DFHRM0208 if the UOW has been committed, or by DFHRM0209 if the UOW has been backed out on the remote system or systems.

User Response: None.

Destination: CSMT

Module: DFHRMU1E.

XMEOUT Parameters: *date, time, applid, inflight_uows*

DFHRM0235 *date time applid* **Intersystem communication recovery. Local resources are not synchronized. Original failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *name* **transaction** *tranid* **task number** *trannum* **terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: Communication with the remote system that is a subordinate of this unit of work failed and has been re-established. Resynchronization with the remote system has occurred. Either the remote system has already taken a decision for its local resource updates in the distributed unit of work, or the remote system was waiting for the decision from this system. In either case, since this unit of work was recovered only for remote resynchronization, the local resources are not synchronized.

System Action: Processing continues.

User Response: Take action to resynchronize resources in the local and remote systems, if necessary.

Destination: CSMT

Module: DFHRMLN

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, name, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHRM0300 KEYWORD '*keyword***' IS INVALID OR MISUSED.**

Explanation: The SYSIN data set for DFHRMUTL contains an unrecognized keyword or a keyword which is used incorrectly.

System Action: The DFHRMUTL job terminates.

User Response: Correct the invalid keyword and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHRMUTL

DFHRM0301 *applid* **Force purge of transaction ID** *tranid* **task number** *taskno* **has been deferred because unit of work** *X'uowid'* **is in post commit syncpoint processing.**

Explanation: CICS has received a request to force purge task *taskno*. The unit of work, *uowid*, associated with the target of the force purge request is in a critical phase of syncpoint processing. The target task cannot be purged while it is in this state.

System Action: CICS attempts to defer the purge until the target task is no longer protected against purge.

If the syncpoint occurs at the end of the task, the task is permanently protected against purge.

User Response: Normally the task should remain in this critical phase of syncpoint for only a short time. If the target task still has not ended, investigate why unit of work *uowid* has still to complete syncpoint processing.

See the *CICS Problem Determination Guide* for guidance about diagnosing task waits.

Note: Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Destination: Console

Module: DFHRMU1N

XMEOUT Parameters: *applid, tranid, taskno, X'uowid'*

DFHRM0302 ERROR *{OPENING | READING | WRITING | CLOSING}* **THE** *{DFHGCD | NEWGCD}* **DATA SET RETURN CODE:** *X'vsam_retcode'*, **REASON:** *X'vsam_reason'*.

Explanation: An error occurred when processing a VSAM data set. The VSAM return and reason codes are X'*vsam_retcode*' and X'*vsam_reason*'.

System Action: The DFHRMUTL job terminates.

User Response: See the *DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets* manual for the meaning of the return and reason codes. Check the syslog for associated data services messages.

If the error is in opening the NEWGCD data set, ensure that the VSAM cluster:

- Has the REUSE attribute
- Has a DD card in the JCL
- Does not name the same data set as the DFHGCD DD card
- Is not currently open to another job.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHRMUTL

DFHRM0303 ERROR *{OPENING | READING | WRITING}* **THE** *{SYSIN | SYSPRINT}* **DATA SET.**

Explanation: An error occurred when processing a QSAM data set.

System Action: The DFHRMUTL job terminates.

User Response: Ensure that the data set DD card is properly defined. Look for associated syslog messages to identify the source of the problem.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHRMUTL

DFHRM0304 INVALID OR MISSING SET_AUTO_START PARAMETER.

Explanation: The SET_AUTO_START parameter in the SYSIN data set for DFHRMUTL is missing or incorrectly specified.

System Action: The DFHRMUTL job terminates.

User Response: Ensure that the parameter is in the *first* line of SYSIN, and the keywords are separated by commas without intervening blanks.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHRMUTL

DFHRM0305 SYSIN DATA SET CAN HAVE AT MOST ONE RECORD.

Explanation: The SYSIN data set should contain either no records or else a single record specifying the parameters for DFHRMUTL.

System Action: The DFHRMUTL job terminates.

User Response: Correct the records in the SYSIN data set and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHRMUTL

DFHRM0306 CANNOT COPY A GCD WITH NO CONTROL INFORMATION.

Explanation: The COLD_COPY keyword has been specified for a global catalog data set which has no recovery manager control information in it. It is not possible to create a reduced new catalog from an empty catalog.

System Action: The DFHRMUTL job terminates.

User Response: You should use COLD_COPY only to copy a catalog that has been used by CICS. To initialize a catalog for an initial start, use DFHRMUTL with the SET_AUTO_START=AUTOINIT parameter without attempting to copy it with COLD_COPY.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHRMUTL

DFHRM0307 KEYWORD '*keyword***' IS REPEATED IN THE SYSIN DATA SET.**

Explanation: Keyword *keyword* has been repeated in the first line of the SYSIN data set for DFHRMUTL.

System Action: The DFHRMUTL job terminates.

User Response: Remove the duplicate keyword and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHRMUTL

DFHRM0308 SET_AUTO_START=AUTOASIS INVALID. GCD IS A COLD_COPY AND HAS NOT BEEN USED BY CICS.

Explanation: The keyword SET_AUTO_START specified AUTOASIS, but the global catalog supplied in data set DFHGCD has been copied with the DFHRMUTL COLD_COPY function and has not yet been used by CICS. This change is not allowed because the catalog no longer has the necessary records to allow an emergency or warm start.

System Action: The DFHRMUTL job terminates.

User Response: If you need to perform an emergency or warm start, use a restored copy of the global catalog taken before the run of DFHRMUTL which performed the COLD_COPY. If you do not need an emergency or warm start, change the parameter to AUTOINIT or AUTOCOLD and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHRMUTL

DFHRM0309 GCD HAS NOT BEEN USED BY CICS. YOU MUST SPECIFY SET_AUTO_S TART=AUTOINIT

Explanation: The keyword SET_AUTO_START specified AUTOCOLD or AUTOINIT, but the global catalog supplied in data set DFHGCD has never been used by CICS.

System Action: The DFHRMUTL job terminates.

User Response: Change the SET_AUTO_START parameter to AUTOINIT and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHRMUTL

DFHRM0311 COLD_COPY KEYWORD INVALID WITH SET_AUTO_START=AUTOASIS.

Explanation: The input parameters specified keyword COLD_COPY, but also contained SET_AUTO_START=AUTOASIS. This combination is not supported because CICS can only perform a COLD or INITIAL start using a catalog data set that has been cold-copied, because all definitional records have been removed.

System Action: The DFHRMUTL job terminates.

User Response: Either specify AUTOCOLD or AUTOINIT as the SET_AUTO_START value, or remove the COLD_COPY keyword and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHRMUTL

DFHRM0312 AUTODIAG WITH COLD_COPY NOT ALLOWED.

Explanation: In the parameters for the DFHRMUTL job the option COLD_COPY was specified with SET_AUTO_START=AUTODIAG. This is not allowed.

System Action: The DFHRMUTL job terminates.

User Response: Resubmit the job with the correct parameters.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHRMUTL

DFHRM0313 AUTODIAG CANNOT BE USED.

Explanation: The keyword SET_AUTO_START specified AUTODIAG, but the global catalog supplied in data set DFHGCD has been copied with the DFHRMUTL COLD_COPY function and has not yet been used by CICS. This change is not allowed because the catalog no longer has the necessary records to allow a diagnostic run.

System Action: The DFHRMUTL job terminates.

User Response: If you need to perform a diagnostic run, use a restored copy of the global catalog taken before the run of DFHRMUTL which performed the COLD_COPY. If you do not need a diagnostic run then change the parameter to AUTOINIT or AUTOCOLD and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHRMUTL

DFHRM0400 *applid* **A unit of work was incompletely reconstructed from the system log.**

Explanation: A unit of work has been only partially reconstructed from the log records on the system log.

The first log record that the unit of work wrote to the system log was not browsed during CICS restart although processing of the unit of work has not completed its syncpoint processing.

The probable cause is that the primary system log stream has been truncated incorrectly or that the secondary system log stream has been truncated or deleted incorrectly. Alternatively, the data on either log stream may have been corrupted so that the chain representing the unit of work was not completely processed during CICS restart.

These effects may be due to the log stream being modified between CICS runs, problems in the MVS logger, or problems in CICS itself. The most likely cause is that the logstream was deleted or modified between CICS runs. If it was deleted, the CICS logger will have issued a message during the CICS restart reporting that it was creating the logstream.

System Action: CICS makes an exception trace entry including the unit of work in which the problem was detected, issues this message, takes a dump, and then terminates abnormally.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that the primary and secondary system logstreams are valid. If a problem can be rectified, auto-start CICS again.

If the problem cannot be rectified, you should perform an initial start of CICS.

If you are certain that the system log streams have not been deleted or modified between CICS runs, there may be an error in the MVS logger or in CICS. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. It would be helpful to keep the failing logstream or a report of its contents.

Destination: Console

Module: DFHRMU1E.

XMEOUT Parameter: *applid*

DFHRM0401 *applid* **There is no system log or an empty system log has been detected.**

Explanation: An empty system log has been detected on a CICS restart which requires the log for recovery processing. This is unexpected because there should always be one or more log records on the system log when CICS has started previously. Alternatively, there is no CICS system log because DUMMY has been specified in the definition of the log stream, and a start that requires a valid system log has been requested.

The probable cause is that the primary system log stream has been destroyed or cleared incorrectly. The data on the primary log stream may have been corrupted so that the CICS logger could not find any valid records on it. Alternatively, the system log has been defined as a DUMMY log inappropriately.

These effects may be due to the log stream being modified between CICS runs, problems in the MVS logger, or problems in CICS itself. The most likely cause is that the logstream was deleted or emptied between CICS runs. If it was deleted, the CICS logger will have issued a message during the CICS restart reporting that it was creating the logstream.

System Action: CICS makes an exception trace entry including the unit of work in which the problem was detected, issues this message, takes a dump, and then terminates abnormally.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that the primary system logstream is valid, and that it is not defined as DUMMY. If the problem can be rectified, start CICS again in the same way.

If the problem cannot be rectified, perform an initial start of CICS.

If you are certain that the system log streams have not been deleted or modified between CICS runs, there may be an error in the MVS logger or in CICS. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. It would be helpful to keep the failing logstream or a report of its contents.

Destination: Console

Module: DFHRMSL5

XMEOUT Parameter: *applid*

DFHRPxxxx (CICS ONC RPC) messages

DFHRP0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.
If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHRPRP

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHRP0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID, which gives an indication of the cause of the error:

- 9F49—error in the C environment
- 9F4A—no storage for the RPC caller
- 9F4C—error from **socket** call to TCP/IP for MVS
- 9F4D—error from **gethostid** call to TCP/IP for MVS
- 9F4F—error from **select** call to TCP/IP for MVS
- 9F55—error from **svc_register** call to TCP/IP for MVS
- 9F58—error from **svcudp_create** call to TCP/IP for MVS
- 9F59—error from **svctcp_create** call to TCP/IP for MVS
- 9F5B—error from **svc_sendreply** call to TCP/IP for MVS

- 9F5C—invalid **aup_gids** from client
- 9F5D—machine name from client too long
- 9F5E—error from **svc_getargs** call to TCP/IP for MVS
- 9F5F—error from **svc_freeargs** call to TCP/IP for MVS
- 9F60—error from **getsockopt** call to TCP/IP for MVS
- 9F63—error from **maxdesc** call to TCP/IP for MVS (unknown error)
- 9F64—error from **maxdesc** call to TCP/IP for MVS (not enough sockets)
- 9F65—error from **maxdesc** call to TCP/IP for MVS (EFAULT)
- 9F66—error from **maxdesc** call to TCP/IP for MVS (EALREADY)
- 9F67—error from **maxdesc** call to TCP/IP for MVS (EINVAL)
- 9F68—error from **maxdesc** call to TCP/IP for MVS (EMFILE)
- 9F69—error from **maxdesc** call to TCP/IP for MVS (ENOMEM)
- 9F6A—error from **maxdesc** call to TCP/IP for MVS (EIBMIUCVERR)
- 9F6B—error from **svcerr_auth** call to TCP/IP for MVS
- 9F6C—error from **svcerr_decode** call to TCP/IP for MVS
- 9F6D—error from **svcerr_noproc** call to TCP/IP for MVS
- 9F6E—error from **svcerr_systemerr** call to TCP/IP for MVS
- 9F6F—error from **dfhsvc_getreqset**.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. If a client request is being processed, and the code is 9F4A, no reply is sent to the client.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response:

There are some specific user actions that can be taken for certain values of *code*:

- 9F4A—Retry the current action if possible. If the shortage of storage persists, reduce the number of tasks that can run concurrently, or increase the DSA limits.
- 9F49—Check that the C run-time environment is derived from the same product, version, and release as was used for link-editing at installation time.
- 9F5C—Check the TCP/IP for MVS configuration and release level.
- 9F5D—Check the TCP/IP for MVS configuration and release level.
- 9F6A—Check that TCP/IP for MVS has been started.

For other TCP/IP for MVS problems, look at the TCP/IP for MVS diagnostics.

You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHRPRP

XMEOUT Parameters: *applid, X'code', modname*

DFHRP0102 *date time applid tranid* **A CICS ONC RPC alias has received an incorrect response on a call made to CICS during alias initialization.**

Explanation: The alias has received a response that indicates a logic error in the alias while calling CICS to establish its initialization information.

System Action: The client request is abandoned, and no reply is sent to the client. A system dump is taken. The alias abends with abend code ARPK. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated CICS messages for problem diagnosis.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0103 *date time applid tranid* **A CICS ONC RPC alias has been started incorrectly.**

Explanation: The alias has been invoked by a means other than the server controller, possibly by a user at a terminal.

System Action: There was no client request to process. The alias abends with abend code ARPF.

User Response: Check that the alias was not started by a terminal user.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0104 *date time applid tranid* **A CICS ONC RPC alias has received an incorrect response on a call made to CICS during alias initialization.**

Explanation: The alias has received a response while calling CICS to establish its initialization information that indicates that the alias may not have been started by server controller.

System Action: There is no client request to process. The alias abends with abend code ARPF.

User Response: Check that the alias has not been started by a means other than the server controller.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0105 *date time applid tranid* **A CICS ONC RPC alias has received an incorrect response on a call made to CICS during alias initialization.**

Explanation: The alias has received a response that indicates that CICS has experienced a temporary error while trying to pass the alias its initialization information from temporary storage.

System Action: The client request is abandoned, and no reply is sent to the client. The alias abends with abend code ARPJ.

User Response: See the associated CICS messages for problem diagnosis.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0106 *date time applid tranid* **A CICS ONC RPC alias has received an incorrect response on a call made to CICS during alias initialization.**

Explanation: The alias cannot find its initialization information in CICS temporary storage. This is probably due to the retrieval of data from temporary storage by another application.

System Action: The client request is abandoned, and no reply is sent to the client. The alias abends with abend code ARPF.

User Response: Check that no other application is using the same temporary storage queue as the alias.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0107 *date time applid tranid* **A CICS ONC RPC alias has received an incorrect response on a call made to CICS during alias initialization.**

Explanation: The alias has received a response that indicates a logic error in the alias while calling CICS to establish its initialization information.

System Action: The client request is abandoned, and no reply is sent to the client. A system dump is taken. The alias abends with abend code ARPI. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated CICS messages for problem diagnosis.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0108 *date time applid tranid* **A CICS ONC RPC alias has been started incorrectly.**

Explanation: The alias has detected an error while validating its initialization information. This probably means that the alias has been started by a means other than the server controller.

System Action: There was no client request to process. The alias abends with abend code ARPF.

User Response: Check that the alias was not started by a transient data trigger level or by a CECI user.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0113 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing because the corresponding alias list entry has been deleted. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *X'port'* **Socket:** *X'socket'***.**

Explanation: The alias has attempted to update its alias list entry to indicate that it has successfully started. The alias list component has returned a NOT FOUND response.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPF.

User Response: This situation is almost certainly due to an alias starting after immediate disable of CICS ONC RPC or after its alias list entry has been explicitly deleted by the connection manager.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, X'port', X'socket'*

DFHRP0114 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing because it is unable to update the corresponding alias list entry. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *X'port'* **Socket:** *X'socket'***.**

Explanation: The alias has attempted to update its alias list entry to indicate that it has successfully started. The alias list component has returned an error response other than NOT FOUND. This is due to an error in another component of CICS.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPJ.

User Response: Proceed as indicated in the messages issued by the CICS component in error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, X'port', X'socket'*

DFHRP0118 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has detected that CICS ONC RPC may have been disabled since this client request was scheduled by the server controller. This is indicated by an incorrect reference to the GWA used by CICS ONC RPC.

System Action: The client request is abandoned, and no reply is sent to the client. The alias abends with abend code ARPH.

User Response: Check that CICS ONC RPC has not been disabled since this client request was first scheduled. This problem may arise when long-running CICS programs are being used. It may also occur if CICS ONC RPC is disabled and immediately re-enabled.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0119 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing because it cannot authenticate this client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has detected an error with the response returned from the external security manager while attempting to authenticate this client request.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPJ.

User Response: Check that the external security manager is still available.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0120 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing because this client request is not authenticated. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received a response while authenticating the userid and password associated with this client request which indicates that this client request is not authenticated to CICS.

System Action: An **svcerr_auth** call with a why-value of AUTH_TOOWEAK is used to send a reply to the client. The alias abends with abend code ARPL.

User Response: Check the userid/password combination associated with this client request. See the associated CICS messages relating to the security error for help with problem diagnosis.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0121 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing because it cannot authenticate this client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received a response while authenticating the userid and password associated with this client request which indicates that the external security manager does not recognize the userid.

System Action: An **svcerr_auth** call with a why-value of AUTH_TOOWEAK is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: Check the userid associated with this client request. See the associated CICS messages relating to the security error for help with problem diagnosis.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0122 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has encountered an internal error while authenticating the userid and password associated with this client request.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. A system dump is taken. The alias abends with abend code ARPK. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0123 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has detected a temporary error in the remote CICS region while communicating with the resource checker.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPJ.

User Response: Investigate the error in the remote CICS region.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0124 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has encountered an internal error while trying to link to the resource checker.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. A system dump is taken. The alias abends with abend code ARPI. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0125 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing as it cannot link to the resource checker** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received a response while trying to link to the resource checker which indicates that it is not defined to CICS.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: Check that the resource checker is defined to CICS.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0126 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing as it cannot link to the resource checker** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received a response while trying to link to the resource checker that indicates that the remote system on which the program resides is not defined or available to CICS.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: Ensure that the remote CICS region in which the resource checker resides is defined to CICS. If it is, check that the connection is available for use by CICS.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0127 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has detected a rollback in the resource checker in a remote CICS region.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPJ.

User Response: Investigate the problem in the remote CICS region You should consider changing the resource checker so that it does not update any CICS recoverable resources because this is not its primary design intent. Retry the client request.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0128 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing because it cannot link to the resource checker** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received a response while trying to link to the resource checker that indicates that it is not authorized to do so. This error has occurred because either the local alias transaction has been defined with RESSEC=YES, or the resource checker is in a remote CICS region and the mirror transaction in the remote region is defined with RESSEC=YES.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: If the alias or mirror transaction must run with RESSEC=YES, add a profile to the external security manager that allows users to access the resource checker. If you do not require resource level security in the CICS program, set RESSEC=NO in the alias or mirror transaction definition.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0129 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received an incorrect response from CICS while trying to link to the resource checker.

System Action: An **svcerr_systemerr** call is used to send a

reply to the client. A system dump is taken. The alias abends with abend code ARPK. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0130 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing. The resource checker has rejected this client request. Response:** *response* **Reason:** *reason***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The resource checker has returned the response and reason codes *response* and *reason*. This client request is not authorized to continue.

System Action: An **svcerr_auth** call with a why-value of AUTH_BADCRED is used to send a reply to the client. The alias abends with abend code ARPL.

User Response: Determine from the resource checker the meaning of the response and reason codes, and amend the program if necessary.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, response, reason, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0131 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request as it cannot query the authorization of the CICS program** *program***. EIBRESP2:** *eibresp2* **Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias issued an EXEC CICS QUERY SECURITY command for the CICS program *program*, but received an INVREQ response.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: Use the EIBRESP2 value to determine the exact cause of the problem.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, eibresp2, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0132 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request as it cannot query the authorization of the CICS program** *program***. EIBRESP2:** *eibresp2* **Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias issued an EXEC CICS QUERY SECURITY command for the CICS program *program*, but received a NOTFND response.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: Use the EIBRESP2 value to determine the exact cause of the problem.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, eibresp2, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0133 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received an incorrect response on a call to CICS while trying to test the authorization level of the client.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. A system dump is taken. The alias abends with abend code ARPI. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0134 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request because the client is not authorized to access the CICS program** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has rejected this client request because the client is not authorized to access the CICS program *program*.

System Action: An **svcerr_auth** call with a why-value of AUTH_TOOWEAK is used to send a reply to the client. The alias abends with abend code ARPL.

User Response: None

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0135 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has detected an internal arithmetic error with the parameters passed by the server controller while processing this client request and is unable to link to the CICS program.

System Action: The client request is abandoned, and a SYSTEMERR reply is sent to the client. A system dump is taken. The alias abends with abend code ARPI. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0138 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing as it cannot link to the CICS program** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received a response while trying to link to the CICS program *program* that indicates that the program is not defined to CICS.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: Check that the CICS program is defined to CICS.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0139 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing as it cannot link to the CICS program** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received a response while trying to link to the CICS program *program* that indicates that the remote system in which the program resides is not defined or is not available to CICS.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: Ensure that the remote CICS region in which the server program resides is defined to CICS. If it is, ensure that the connection is available for use by CICS.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0140 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has detected a rollback in the CICS program in the remote CICS region.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPJ.

User Response: Investigate why the CICS program rolled back.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0141 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing as it cannot link to the CICS program** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received a response while trying to link to the CICS program *program* that indicates that it is not authorized to do so.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: If the CICS program must run with resource level security, add a profile to the external security manager that grants access to the CICS program to its clients. If you do not require resource level security in the CICS program, set RESSEC=NO in the alias or mirror transaction definition.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0142 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received an incorrect response from CICS while trying to link to the CICS program.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPK. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0143 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has encountered an internal error and cannot determine how to send a reply to the client. The CICS program has run successfully, and may have updated CICS resources.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. A system dump is taken. The alias abends with abend code ARPI. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0144 *date time applid tranid* **A CICS ONC RPC alias is unable to send a reply to the client because of a length error.**

Explanation: The alias is unable to send a reply to client because the communication area length is zero, but the client was expecting data to be sent in the reply.

System Action: The client request is abandoned, and no reply is sent to the client. A system dump is taken. The alias abends with abend code ARPI. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated CICS messages for problem diagnosis.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0145 *date time applid tranid* **A CICS ONC RPC alias is unable to send a reply to the client due to an error in TCP/IP for MVS svc_sendreply processing. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias cannot send a reply to the client. A problem has occurred in the TCP/IP for MVS **svc_sendreply** processing.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPJ.

User Response: Examine the diagnostics to determine the reason for the error. If message DFHRP0002 was issued to the

console, the explanation of that message might contain more information.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0146 *date time applid tranid* **A CICS ONC RPC alias is unable to send a reply to the client due to an error in send reply processing. The transport handle was invalid or was not found. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias cannot send a reply to the client. A problem has occurred in send reply processing. The transport handle was in error or was not found.

System Action: The client request is abandoned, and no reply is sent to the client. The alias abends with abend code ARPJ.

User Response: Examine the diagnostics to determine the reason for the error. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0147 *date time applid tranid* **A CICS ONC RPC alias is unable to send a reply to the client because CICS ONC RPC is disabling. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias cannot send a reply back to the client because CICS ONC RPC is disabling.

System Action: The client request is abandoned, and no reply is sent to the client. The alias abends with abend code ARPJ.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0148 *date time applid tranid* **A CICS ONC RPC alias is unable to send a reply to the client due to an error in send processing. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias cannot send a reply back to the client. The alias received an unexpected response from the RPC caller.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPI.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0149 *date time applid tranid* **A CICS ONC RPC alias is unable to send a reply to the client. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias cannot send a reply back to the client. The alias received an unexpected response from the RPC caller.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPI.

User Response: If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0150 *date time applid tranid* **A CICS ONC RPC alias is unable to send data to the client.**

Explanation: The alias is unable to send reply to the client. An unexpected response was returned from RPC caller.

System Action: The client request is abandoned, and no reply is sent to the client. The alias abends with abend code ARPJ.

User Response: See the associated CICS messages for problem diagnosis.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0151 *date time applid tranid* **A CICS ONC RPC alias has encountered a severe internal error while processing this client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias is unable to switch TCB modes to allow it to send a reply to the client. The RP TCB is not active.

System Action: The client request is abandoned, and no reply is sent to the client. A system dump is taken. The alias abends with abend code ARPN. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See any associated CICS messages to help with problem diagnosis. If you cannot determine why the TCB mode

could not be switched, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0155 *date time applid tranid* **A CICS ONC RPC alias encountered an error while attempting to access the converter** *converter_program_name***. Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket* **Client IP address:** *clientaddr***.**

Explanation: An error has prevented the alias from accessing the converter *converter_program_name*.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. A system dump is taken. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket, clientaddr*

DFHRP0156 *date time applid tranid* **A CICS ONC RPC alias could not link to converter** *converter_program_name***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias used EXEC CICS LINK for converter *converter_program_name* to perform the **Encode** function, but received a PGMIDERR response.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: Use CEDA to check that you have defined your converter program correctly to CICS.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0157 *date time applid tranid* **A CICS ONC RPC alias could not link to converter** *converter_program_name* **because it is remote. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias cannot work with a converter located in a remote CICS region. Data pointers are passed to and from the converter, and the referenced data can only be used if the converter runs in the local CICS region.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. A system dump is taken.

User Response: Install and define the converter in the same CICS region as CICS ONC RPC.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0159 *date time applid tranid* **A CICS ONC RPC alias is not authorized to link to converter** *converter_program_name***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias cannot access the converter. An authorization error has occurred.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. A system dump is taken.

User Response: Either redefine the alias transaction with RESSEC=NO, or change the external security manager to allow the user to access the converter.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0160 *date time applid tranid* **A CICS ONC RPC alias received an incorrect response from CICS when attempting to access the converter** *converter_program_name***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias received an unexpected response when trying to link to the converter for **Encode** processing.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. A system dump is taken. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated messages issued by CICS for problem diagnosis.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0161 *date time applid tranid* **A CICS ONC RPC alias encountered an error during Encode processing in the converter** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: **Encode** returned URP_EXCEPTION.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0162 *date time applid tranid* **A CICS ONC RPC alias encountered an error during Encode processing in the converter** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: **Encode** returned URP_INVALID.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0163 *date time applid tranid* **A CICS ONC RPC alias encountered an error during Encode processing in the converter** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: **Encode** returned an unexpected return code.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. A system dump is taken. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0164 *date time applid tranid* **A CICS ONC RPC alias is unable to send an error reply to the client due to a logic error. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias cannot send an error reply to the client due to a logic error.

System Action: No reply is sent to the client. A system dump is taken. The alias abends with abend code ARPI. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0166 *date time applid tranid* **A CICS ONC RPC alias is unable to send a reply to the client because the transport handle was invalid or was not found. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias cannot send a reply to the client. The transport handle was invalid or was not found.

System Action: No reply is sent to the client. The alias abends with abend code ARPJ.

User Response: If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0167 *date time applid tranid* **A CICS ONC RPC alias is unable to send an error reply to the client. CICS ONC RPC is disabling. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias cannot send a reply to the client because CICS ONC RPC is disabling.

System Action: No reply is sent to the client. The alias abends with abend code ARPJ.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0168 *date time applid tranid* **A CICS ONC RPC alias is unable to send an error reply to the client. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias cannot send a reply to the client. The alias received an error response from the RPC caller.

System Action: No reply is sent to the client. The alias abends with abend code ARPI.

User Response: If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. Examine the diagnostics to determine the reason for the error. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0169 *date time applid tranid* **A CICS ONC RPC alias encountered an error during Encode processing in the converter** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: **Encode** returned URP_DISASTER.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0170 *date time applid tranid* **A CICS ONC RPC alias has detected an error.**

Explanation: The alias has detected an error.

System Action: A system dump is taken. The alias abends with abend code ARPI. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0171 *date time applid tranid* **A CICS ONC RPC alias has detected a FREEMAIN error.**

Explanation: The alias has detected a FREEMAIN error when freeing the communication area used by the CICS program. This FREEMAIN occurs after **Encode** processing.

System Action: Processing continues.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0172 *date time applid tranid* **A CICS ONC RPC alias has detected a FREEMAIN error.**

Explanation: The alias has detected an error while freeing the data area created by **Encode** processing. The FREEMAIN occurs after outbound XDR processing.

System Action: Processing continues.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0173 *date time applid tranid* **A CICS ONC RPC alias cannot find its alias list entry for deletion at task end. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *X'port'* **Socket:** *X'socket'***.**

Explanation: The alias has attempted to delete its alias list entry at task end. The alias list component has returned a NOT FOUND response. This is because either a connection manager user has started immediate disable processing, or because a connection manager user has deleted the entry.

System Action: The alias abends with abend code ARPJ.

User Response: None.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, X'port', X'socket'*

DFHRP0174 *date time applid tranid* **A CICS ONC RPC alias received an error response while attempting to delete its alias list entry. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *X'port'* **Socket:** *X'socket'***.**

Explanation: The alias has attempted to delete its alias list entry at task end. It received a response that indicated a severe error had occurred.

System Action: The alias abends with abend code ARPJ.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4

of the *CICS Problem Determination Guide* for guidance on how to proceed. response.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, X'port', X'socket'*

DFHRP0175 *date time applid tranid* **A CICS ONC RPC alias sent an error reply to the client, but cannot free storage associated with the error call to the client. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias sent an error reply to the client. After this reply was sent, the alias received an error response when attempting to free storage associated with the error call to the client.

System Action: The alias abends with abend code ARPJ.

User Response: Examine the diagnostics to determine the reason for the error. If the problem persists, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0176 *date time applid tranid* **A CICS ONC RPC alias sent a reply to the client, but cannot free storage associated with the svc_sendreply call. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias sent a reply back to the client. After this reply was sent, the alias received an error response when attempting to free storage associated with the **svc_sendreply** call.

System Action: The alias abends with abend code ARPJ.

User Response: Examine the diagnostics to determine the reason for the error. You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0180 *date time applid tranid* **A CICS ONC RPC alias has detected an abend issued by the resource checker** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has detected an abend by the resource checker.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPO.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0181 *date time applid tranid* **A CICS ONC RPC alias has detected an abend issued by the CICS program** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has detected an abend by the CICS program that was servicing the client request.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPO.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0182 *date time applid tranid* **A CICS ONC RPC alias has detected an abend issued in the Encode function of the converter** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has detected an abend by the converter **Encode** function.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPO.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0183 *date time applid tranid* **A CICS ONC RPC alias has detected an abend. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has detected an abend.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPO.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0184 *date time applid tranid* **A CICS ONC RPC alias has found that the resource checker has rejected this client request. Response:** *response* **Reason:** *reason***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The resource checker has returned the response *response* and reason *reason*. This client request is not authorized to continue.

System Action: An **svcerr_auth** call with a why-value of AUTH_TOOWEAK is used to send a reply to the client. The alias abends with abend code ARPL.

User Response: If you suspect an error in the resource checker, use the response and reason codes to debug it.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, response, reason, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0185 *date time applid tranid* **A CICS ONC RPC alias has detected an error in the resource checker. Response:** *response* **Reason:** *reason***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The resource checker has returned the response *response* and reason *reason*. This client request is not authorized to continue.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPM.

User Response: If you suspect an error in the resource checker, use the response and reason codes to debug it.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, response, reason, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0186 *date time applid tranid* **A CICS ONC RPC alias has detected an error in the resource checker program. Response:** *response* **Reason:** *reason***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The resource checker has returned the response *response* and reason *reason*. This client request is not authorized to continue.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPM.

User Response: If you suspect an error in the resource checker, use the response and reason codes to debug it.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, response, reason, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0187 *date time applid tranid* **A CICS ONC RPC alias detected an error in the resource checker. Response:** *response* **Reason:** *reason***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The resource checker has returned the response *response* and reason *reason*. This client request is not authorized to continue.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPM.

User Response: If you suspect and error in the resource checker, use the response and reason codes to debug it.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, response, reason, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0188 *date time applid tranid* **A CICS ONC RPC alias has detected an error in the resource checker. Response:** *response* **Reason:** *reason***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The resource checker has returned the response *response* and reason *reason*. This client request is not authorized to continue.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. A system dump is taken. The alias abends with code abend ARPM. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If you suspect an error in the resource checker, use the response and reason codes to debug it.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, response, reason, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0189 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request as it cannot load the CICS program** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received an INVREQ response while trying to EXEC CICS LOAD the CICS program *program* for security checking. This indicates that the program manager domain has not yet been initialized and may be due to this request having been made in a first stage PLT.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: Ensure that the program manager domain is initialized.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0190 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request as it cannot load the CICS program** *program***. EIBRESP2:** *eibresp2* **Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received a PGMIDERR response while trying to EXEC CICS LOAD the CICS program *program* for security checking. This indicates that the program cannot be found or cannot be autoinstalled.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: Ensure that the load module is in the DFHRPL concatenation and can be autoinstalled.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, eibresp2, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0191 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request as it cannot load the CICS program** *program***. EIBRESP2:** *eibresp2* **Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received a PGMIDERR response while trying to EXEC CICS LOAD the CICS program *program* for security checking. This indicates that the program autoinstall control program has failed.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPJ.

User Response: Use the EIBRESP2 value to determine why the program autoinstall control program failed and correct the problem.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, eibresp2, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0192 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request as it cannot load the CICS program** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has detected an internal error while trying to load the CICS program *program* for security checking.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. A system dump is taken. The alias abends with abend code ARPI.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0193 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request as it cannot load the CICS program** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received a NOTAUTH response while trying to EXEC CICS LOAD the CICS program *program* for security checking. This indicates that it is not authorized to access this program. This error may have occurred because the local alias transaction has been defined with RESSEC=YES.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. The alias abends with abend code ARPG.

User Response: If the alias transaction must run with RESSEC=YES, add a profile to the external security manager that allows users to access the program. If you do not require resource level security, set RESSEC=NO in the alias transaction definition.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0194 *date time applid tranid* **A CICS ONC RPC alias is unable to continue processing this client request as it cannot load the CICS program** *program***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias has received an incorrect response while trying to load the CICS program *program* for security checking.

System Action: An **svcerr_systemerr** call is used to send a reply to the client. A system dump is taken. The alias abends with abend code ARPI. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid, program, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0500 *date time applid tranid* **CICS ONC RPC enable processing is complete. Host IP address:** *hostaddr***.**

Explanation: The enable process has completed successfully.

System Action: Processing continues.

User Response: None.

Destination: Console and Transient Data Queue CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP0501 *date time applid tranid* **CICS ONC RPC normal disable processing has started. Host IP address:** *hostaddr***.**

Explanation: The server controller has started normal disable processing following a request by a connection manager user.

System Action: Processing continues.

User Response: None.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP0502 *date time applid tranid* **CICS ONC RPC immediate disable processing has started. Host IP address:** *hostaddr***.**

Explanation: The server controller has started immediate disable processing following a request by a connection manager user.

System Action: Processing continues.

User Response: None.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP0503 *date time applid tranid* **CICS ONC RPC disable processing is complete.**

Explanation: The server controller has completed the disable processing.

System Action: Processing continues.

User Response: None.

Destination: Console and Transient Data Queue CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0508 *date time applid tranid* **The CICS ONC RPC task related user exit (DFHRPTRU) has been disabled before the server controller could start.**

Explanation: DFHRPTRU is enabled by the connection manager during enable processing. but DFHRPTRU was found to be disabled when the server controller started. This is probably caused by an operator manually disabling DFHRPTRU.

System Action: The server controller abends with abend code ARP2. CICS ONC RPC remains disabled. A system dump is taken. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Reenable CICS ONC RPC. Consider taking steps to avoid future manual interference with the TRUE.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0509 *date time applid tranid* **CICS ONC RPC has received an incorrect response on a call made to CICS during server controller startup.**

Explanation: CICS ONC RPC has received a response indicating an error in CICS.

System Action: The server controller abends with abend code ARP2. CICS ONC RPC remains disabled. A system dump is taken. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated CICS message or messages for problem diagnosis.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0510 *date time applid tranid* **The CICS ONC RPC task related user exit (DFHRPTRU) has been deleted or disabled before the server controller could start.**

Explanation: DFHRPTRU is enabled by the connection manager during enable processing, but the server controller received an indication that:

- DFHRPTRU is not defined to CICS, or
- it has no load module, or
- the load module is disabled.

This is probably caused by operator intervention.

System Action: The server controller abends with abend code ARPQ. A system dump is taken.

User Response: Reenable CICS ONC RPC. Consider taking steps to prevent future operator interference.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0513 *date time applid tranid* **The CICS ONC RPC server controller could not link to the converter** *converter_program_name***. EIBRESP2:** *resp2val***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The server controller used EXEC CICS LINK for converter *converter_program_name* to perform **Decode**, but received a PGMIDERR response.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: If the converter name is wrong, use the connection manager to unregister and reregister the 4-tuple with the correct converter name.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, resp2val, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0516 *date time applid tranid* **The CICS ONC RPC server controller obtained data length information from the Decode function of converter** *converter_program_name* **that gives a communication area length that is too great. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The communication area length calculated from the **decode_server_data_format**, **decode_server_input_data_len**, and **decode_server_output_data_len** parameters exceeds the permitted maximum. See the *CICS Application Programming Guide* for more information about the **Decode** function and its parameters.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: Correct and replace the erroneous converter.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0517 *date time applid tranid* **The CICS ONC RPC server controller does not have resource-level security authorization to start alias transaction** *alias-tranid***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The server controller cannot start the alias because it does not have the necessary resource-level security authorization.

System Action: An **svcerr_auth** call with a why-value of AUTH_TOOWEAK is used to send a reply to the client.

User Response: You should specify only the alias transaction IDs that server controller has resource-level security authorization to start. When CICS ONC RPC is next disabled, redefine the server controller transaction with RESSEC=NO.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, alias-tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0518 *date time applid tranid* **CICS ONC RPC cannot process a client request because the associated terminal ID** *alias_termid* **is not in the terminal control table. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: A client request has arrived, and the corresponding 4-tuple refers to a terminal ID that is not in the terminal control table.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: Either define the missing terminal, or change the 4-tuple definition to refer to a terminal ID that is in the terminal control table.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, alias_termid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0520 *date time applid tranid* **A CICS ONC RPC internal error has occurred while the server controller was polling for client work. Host IP address:** *hostaddr***.**

Explanation: This is an internal error.

System Action: CICS ONC RPC enters exception disable processing.

User Response: If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP0521 *date time applid tranid* **The CICS ONC RPC server controller detected an internal error while accessing an internal table. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket*

Explanation: An internal error has occurred in the server controller while it was accessing an internal table.

System Action: Processing continues.

User Response: None.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0522 *date time applid tranid* **The CICS ONC RPC server controller detected an internal error while accessing an internal table. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket*

Explanation: An internal error has occurred in the server controller while accessing an internal table.

System Action: Processing continues.

User Response: None.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0528 *date time applid tranid* **The CICS ONC RPC server controller detected an initialization error.**

Explanation: This is an internal error.

System Action: A system dump is taken. The server controller abends with abend code ARP2. CICS ONC RPC remains disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0540 *date time applid* **The CICS ONC RPC server controller received an error response from TCP/IP for MVS after an svc_freeargs call issued for XDR routine:** *xdrname* **Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'progname'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The server controller cannot free storage allocated by the inbound XDR routine. An **svc_freeargs** returned an error response. This may be because the client associated with the call has timed out and the storage has already been freed by TCP/IP for MVS.

System Action: The server controller continues to process this client request. If the message is not a result of client time-out, MVS storage associated with the request will not be freed; if errors of this kind occur frequently, they may lead to storage problems.

User Response: Examine the diagnostics to determine the reason for the error. If a user-written XDR routine is being used, there may be an error in the code associated with the FREE function. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, xdrname, clientaddr, hostaddr, X'progname', X'versnum', X'procnum', protocol, port, socket*

DFHRP0545 *date time applid tranid* **The CICS ONC RPC server controller is unable to send an error reply to the client due to an error in reply processing. The transport handle was invalid or not found. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The server controller cannot send an error reply to the client because the transport handle is not valid.

System Action: The client request is abandoned, and no reply is sent to the client.

User Response: Examine the diagnostics to determine the reason for the error. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPM

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0546 *date time applid tranid* **The CICS ONC RPC server controller is unable to send an error reply to the client because CICS ONC RPC is disabling. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The server controller cannot send an error reply to the client. CICS ONC RPC is disabling.

System Action: The client request is abandoned, and no reply is sent to the client.

User Response: Examine the diagnostics to determine the reason for the disable request.

Destination: CRPO

Module: DFHRPM

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0547 *date time applid tranid* **The CICS ONC RPC server controller is unable to send an error reply to the client. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The server controller cannot send a reply to the client, because it received an error response from the RPC caller.

System Action: The client request is abandoned, and no reply is sent to the client. The server controller attempts to deal with requests from other clients, but may experience further RPC caller errors.

User Response: Examine the exception trace to determine the reason for the error. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPM

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0548 *date time applid tranid* **The CICS ONC RPC server controller sent an error reply to the client but cannot free storage associated with the client call. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The server controller sent an error reply to the client. After this reply was sent, the server controller received an error response when attempting to free storage associated with the client call.

System Action: Processing continues as if the error had not occurred.

User Response: Examine the diagnostics to determine the reason for the error. You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0559 *date time applid tranid* **The CICS ONC RPC server controller has encountered an internal error while trying to disable its task related user exit.**

Explanation: An attempt to disable the task-related user exit during disable processing has failed because of an internal error.

System Action: A system dump is taken. Disable processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0570 *date time applid tranid* **The CICS ONC RPC server controller found that the RP task control block is not available. Host IP address:** *hostaddr***.**

Explanation: The RP TCB is not available.

System Action: A system dump is taken. The server controller abends with abend code ARP2. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP0574 *date time applid tranid* **The CICS ONC RPC server controller has encountered an internal error while waiting for work. Host IP address:** *hostaddr***.**

Explanation: CICS ONC RPC is unable to continue because of an internal error in the server controller.

System Action: In some circumstances, a system dump is taken. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP0589 *date time applid tranid* **The CICS ONC RPC server controller cannot enable CICS ONC RPC because it is not defined with the authority to access the task-related user exit.**

Explanation: The server controller cannot access the task-related user exit. This error can arise only if the supplied definitions for the server controller have been changed.

System Action: The server controller abends with abend code ARP2. CICS ONC RPC remains disabled.

User Response: Ensure that the supplied definitions for the server controller are used, and reenable CICS ONC RPC.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0590 *date time applid tranid* **The CICS ONC RPC server controller has received an unexpected response on a call to CICS during CICS ONC RPC enable processing.**

Explanation: CICS ONC RPC enable processing cannot continue because of an error in CICS.

System Action: A system dump is taken. The server controller abends with abend code ARP2. CICS ONC RPC remains disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0591 *date time applid tranid* **CICS ONC RPC could not be enabled because of an internal error in the server controller.**

Explanation: The server controller cannot start because of an internal error.

System Action: A system dump is taken. The server controller abends with abend code ARP2. CICS ONC RPC remains disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0592 *date time applid tranid* **The CICS ONC RPC server controller detected an error while polling for client work. Host IP address:** *hostaddr***.**

Explanation: The server controller cannot continue because of an internal error.

System Action: CICS ONC RPC is disabled.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP0618 *date time applid tranid* **The CICS ONC RPC server controller cannot link to remote converter** *converter_program_name***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The server controller used EXEC CICS LINK to access the converter for **Decode** processing, but got an error response that indicated that the converter was defined as remote. Data pointers are passed to and from the converter, and the referenced data can only be used if the converter runs in the local CICS region.

System Action: A system dump is taken. An **svcerr_systemerr** call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Install and define the converter program in the same CICS region as CICS ONC RPC.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0620 *date time applid tranid* **The CICS ONC RPC server controller received an unexpected response from CICS when attempting to access converter** *converter_program_name***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: A client request has failed because of an error in CICS.

System Action: A system dump is taken. An **svcerr_systemerr** call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated diagnostics issued by CICS for problem determination.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0621 *date time applid tranid* **The CICS ONC RPC server controller is not authorized to link to converter** *converter_program_name***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The server controller cannot access the converter. This error can arise only if the supplied definitions for the server controller have been changed.

System Action: A system dump is taken. An **svcerr_systemerr** call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that the supplied definitions for the server controller are used, and reenable CICS ONC RPC.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0625 *date time applid tranid* **The CICS ONC RPC server controller encountered an error during Decode processing in converter** *converter_program_name***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: **Decode** returned an unexpected response.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: Correct and replace the converter program in question.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0626 *date time applid tranid* **The CICS ONC RPC server controller encountered an error during Decode processing in converter** *converter_program_name***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: **Decode** returned URP_EXCEPTION with a reason of URP_CORRUPT_CLIENT_DATA.

System Action: An **svcerr_decode** call is used to send a reply to the client.

User Response: Compare the client program and the converter program and change one or the other to make the data formats consistent.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0628 *date time applid tranid* **The CICS ONC RPC server controller encountered an error during Decode processing in converter** *converter_program_name***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: **Decode** returned URP_EXCEPTION with a reason of URP_AUTH_BADCRED.

System Action: An **svcerr_auth** call with a why-value of AUTH_BADCRED is used to send a reply to the client.

User Response: If the client should be authorized to make this request, compare the client program and the converter, and change one or the other so that authentication requirements match.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0629 *date time applid tranid* **The CICS ONC RPC server controller encountered an error during Decode processing in converter** *converter_program_name***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: **Decode** returned URP_EXCEPTION with a reason of URP_AUTH_TOOWEAK.

System Action: An **svcerr_auth** call with a why-value of AUTH_TOOWEAK is used to send a reply to the client.

User Response: If the client should be authorized to make this request. compare the client program and the converter, and change one or the other so that authentication requirements match.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0631 *date time applid tranid* **The CICS ONC RPC server controller encountered an error in Decode processing in converter** *converter_program_name***. The response was URP_EXCEPTION, but the reason** *decode_reason* **was not recognized. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: **Decode** returned URP_EXCEPTION with an unrecognized reason code.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: If the reason code returned has a user-defined meaning act accordingly. If the reason code does not have a user-defined meaning, fix the problem with the converter and replace it.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, decode_reason, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0632 *date time applid tranid* **The CICS ONC RPC server controller encountered an error during Decode processing in converter** *converter_program_name***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: **Decode** returned URP_INVALID.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: The **Decode** parameter area will have been traced. If the values passed were correct, and the error is in the

converter, correct and replace the converter. If the values passed were incorrect, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0635 *date time applid tranid* **The CICS ONC RPC server controller encountered an error during Decode processing in converter** *converter_program_name***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: **Decode** returned URP_DISASTER.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: Correct and replace the converter.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0636 *date time applid tranid* **The CICS ONC RPC server controller was unable to process an incoming client request due to lack of storage. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: An incoming client request could not be processed because there was insufficient storage available.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: If this error occurs persistently, you may need to customize your CICS system to cure the lack of storage.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0637 *date time applid tranid* **The CICS ONC RPC server controller was unable to process an incoming client request due to an internal error.***clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: An internal error has forced CICS ONC RPC to abandon a client request.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: You need further assistance from IBM to resolve this problem.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0638 *date time applid tranid* **The CICS ONC RPC server controller was unable to process an incoming client request due to an unexpected error detected when acquiring storage. eibresp** *eibresp* **eibresp2** *eibresp2* **Client IP address** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: An incoming client request could not be processed because an unexpected error occurred when obtaining storage to process the request.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: You need assistance from IBM to resove this problem.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, eibresp, eibresp2, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0639 *date time applid tranid* **The CICS ONC RPC server controller received an incorrect response on a call made to CICS.**

Explanation: The server controller has received a response that indicates a logic error while calling CICS to establish its initialization information.

System Action: The server controller abends with abend code ARP2. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPAS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0640 *date time applid tranid* **The CICS ONC RPC server controller has been started incorrectly.**

Explanation: The server controller transaction CRPM has been started by a means other than the connection manager program, possibly by a user at a terminal.

System Action: The server controller abends with abend code ARP5.

User Response: Check that the CRPM transaction id was not entered by a terminal user.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0663 *date time applid tranid* **The CICS ONC RPC server controller could not start alias transaction** *alias_tranid***. Host IP address:** *hostaddr* **Program:** *prognum* **Version:** *versnum* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket* **Client IP address:** *clientaddr*

Explanation: An internal error has prevented the server controller from starting the alias transaction.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, alias_tranid, hostaddr, prognum, versnum, protocol, port, socket, clientaddr*

DFHRP0686 *date time applid tranid* **The CICS ONC RPC server controller encountered an internal error while attempting to start an alias transaction. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: An internal error has prevented the server controller from starting an alias transaction.

System Action: A system dump is taken. An **svcerr_systemerr** call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0687 *date time applid tranid* **The CICS ONC RPC server controller could not start alias transaction** *alias_tranid* **because the CICS default temporary storage data set is full. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The server controller cannot start the alias transaction because temporary storage is not available.

System Action: A system dump is taken. An **svcerr_systemerr** call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Determine why the CICS default temporary storage data set is full. Enlarge the data set, or alter your CICS load to free space on it.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, alias_tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0688 *date time applid tranid* **The CICS ONC RPC server controller detected an error while starting alias transaction** *alias_tranid***. The error indicated that the transaction is remote. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias transaction is defined as remote, but aliases must run in the same CICS region as CICS ONC RPC.

System Action: A system dump is taken. An **svcerr_systemerr** call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Define the alias as a local transaction.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, alias_tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0689 *date time applid tranid* **The CICS ONC RPC server controller tried to start alias transaction** *alias-tranid***, but the surrogate user security check failed. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: An attempt by a user ID to access an alias transaction failed because of a security check. This may not be an error as you may wish to prevent the client involved from accessing the alias transaction.

System Action: An **svcerr_auth** call with a why-value of AUTH_TOOWEAK is used to send a reply to the client.

User Response: If you wish the user ID to access the alias, reenable CICS ONC RPC with a different value for CRPM Userid, or alter your surrogate user ID tables.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, alias-tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0690 *date time applid tranid* **The CICS ONC RPC server controller received an unexpected response from CICS while starting alias transaction** *alias-tranid***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: A client request has failed because of an error in CICS.

System Action: A system dump is taken. An **svcerr_systemerr** call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated diagnostics issued by CICS for problem determination.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, alias-tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0691 *date time applid tranid* **The CICS ONC RPC server controller found that the user ID attempting to access alias transaction** *alias-tranid* **is not known to the external security manager. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The server controller could not start the alias with the user ID because the user ID is not known to the external security manager.

System Action: An **svcerr_auth** call with a why-value of AUTH_TOOWEAK is used to send a reply to the client.

User Response: If you wish the alias to run under this user ID, define the userid to the external security manager, and change your surrogate user ID tables.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, alias-tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0692 *date time applid tranid* **The CICS ONC RPC server controller found that the external security manager cannot validate the user ID for alias transaction** *alias-tranid***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: An attempt to start the alias with an alias user ID failed as the external security manager cannot determine whether the user ID is valid.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: Determine the reason why the external security manager was unable to perform the request.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, alias-tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0694 *date time applid tranid* **The CICS ONC RPC server controller could not start alias transaction** *alias_tranid* **because it is not defined. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: The alias transaction *alias_tranid* is missing or is not correctly defined.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: Define the alias transaction correctly, or change the definitions of the 4-tuples that refer to it.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, alias_tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0697 *date time applid tranid* **The CICS ONC RPC server controller has started exception disable of CICS ONC RPC. Host IP address:** *hostaddr***.**

Explanation: The server controller has started an exception disable of CICS ONC RPC following an error during its operation. The error has already been reported.

System Action: Disable processing continues.

User Response: See the associated diagnostics for further information about the error.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP0723 *date time applid tranid* **The CICS ONC RPC server controller has detected an error when attempting to shut down the RPC caller.**

Explanation: During CICS ONC RPC disable processing, the server controller shuts down the RPC Caller, but received an error response.

System Action: Disable processing continues.

User Response: If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0724 *date time applid tranid* **The CICS ONC RPC server controller has detected an error when attempting to issue a FREEMAIN for the RPC caller program.**

Explanation: During CICS ONC RPC disable processing, the server controller issues a FREEMAIN for the RPC caller program to remove it from storage, but received an error response. This could either be as a result of problems with CICS which will probably be reflected in CICS diagnostics, or as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics.

System Action: Disable processing continues.

User Response: It might not be possible to reenable CICS ONC RPC without restarting CICS. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0725 *date time applid tranid* **The CICS ONC RPC server controller has detected an error when attempting to issue a RELEASE for the alias list program.**

Explanation: During CICS ONC RPC disable processing, the server controller releases the alias list program, but received an error response.

System Action: Disable processing continues.

User Response: It might not be possible to reenable CICS ONC RPC without restarting CICS. If this error is not associated with others, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0726 *date time applid tranid* **During disable processing, the CICS ONC RPC server controller found that the task-related user exit was already disabled.**

Explanation: During disable processing, the server controller found that the task-related user exit was already disabled or that it has not been defined as an exit. This is probably the result of operator intervention.

System Action: Disable processing continues.

User Response: Take steps to prevent operator interference with the task-related user exit.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0727 *date time applid tranid* **During disable processing, the CICS ONC RPC server controller found that the task-related user exit is in use by another task.**

Explanation: During disable processing, the server controller found that the task-related user exit is currently invoked by another task. This may be a temporary condition, or it may be that the task related user exit has already been disabled.

System Action: Disable processing continues.

User Response: Investigate whether the operator has disabled the task related user exit DFHRPTRU for any reason.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0728 *date time applid tranid* **The CICS ONC RPC server controller received an unexpected response from CICS while disabling the task-related user exit.**

Explanation: An error occurred in CICS when the server controller tried to disable the task-related user exit during CICS ONC RPC disable processing.

System Action: A system dump is taken. Disable processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated diagnostics issued by CICS for problem determination.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0729 *date time applid tranid* **The CICS ONC RPC server controller has detected an internal error during disable processing.**

Explanation: CICS ONC RPC has detected an internal error during disable processing.

System Action: Disable processing continues.

User Response: If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0730 *date time applid tranid* **The CICS ONC RPC server controller does not have authorization to access the task-related user exit.**

Explanation: During disable processing, the server controller found that it did not have the authorization to access the task-related user exit. This problem arises if the supplied definitions of the server controller are changed. Changes to these definitions are not allowed.

System Action: Disable processing continues.

User Response: Ensure that the supplied definitions for the server controller are used, and reenable CICS ONC RPC.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0731 *date time applid tranid* **The CICS ONC RPC server controller has detected an internal error during disable processing.**

Explanation: CICS ONC RPC has detected an internal error during disable processing.

System Action: Disable processing continues.

User Response: If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0732 *date time applid tranid* **The CICS ONC RPC server controller has detected an internal error during disable processing.**

Explanation: During disable processing, the server controller attempted to unregister for problem determination, but received an error response.

System Action: Disable processing continues.

User Response: If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this

problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0735 *date time applid tranid* **The CICS ONC RPC server controller HANDLE ABEND code was entered as a result of an error in the Decode function in converter** *converter_program_name***. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: An error has occurred in **Decode** in converter *converter_program_name*. Because the converter does not contain HANDLE ABEND logic, the error has percolated to the server controller.

System Action: An **svcerr_systemerr** call is used to send a reply to the client.

User Response: Correct the error in the converter. Add handle abend logic to the converter so that it can handle its own errors, and replace it.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0736 *date time applid tranid* **The CICS ONC RPC server controller has encountered an internal error while processing a client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation: An internal error has forced CICS ONC RPC to abandon a client request.

System Action: A system dump is taken. An **svcerr_systemerr** call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, X'prognum', X'versnum', X'procnum', protocol, port, socket*

DFHRP0737 *date time applid tranid* **The CICS ONC RPC server controller has encountered an internal error. Host IP address:** *hostaddr***.**

Explanation: The server controller has encountered an internal error and cannot continue.

System Action: A system dump is taken. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP0741 *date time applid tranid* **The CICS ONC RPC server controller is abending with abend code ARP4.**

Explanation: The server controller encountered an error and cannot continue.

System Action: CICS ONC RPC is disabled. CICS ONC RPC has already issued other diagnostics giving further information about the error. The server controller abends with abend code ARP4.

User Response: See the associated diagnostics and the description of abend code ARP4 for further guidance.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0746 *date time applid tranid* **The CICS ONC RPC server controller is abending with abend code ARP2.**

Explanation: The server controller encountered an error and cannot continue.

System Action: The server controller abends with abend code ARP2. CICS ONC RPC is disabled.

User Response: See the associated diagnostics and the description of abend code ARP2 for further guidance.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0747 *date time applid tranid* **The CICS ONC RPC server controller is abending with abend code ARP2.**

Explanation: The server controller has encountered an error and cannot continue.

System Action: The server controller abends with abend code ARP2. CICS ONC RPC is disabled.

User Response: See the associated diagnostics and the description of abend code ARP2 for further guidance.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP0749 *date time applid tranid* **The CICS ONC RPC server controller has encountered an internal error when no client request was being processed. Host IP address:** *hostaddr***.**

Explanation: An internal error has occurred in the server controller. No client requests are affected.

System Action: A system dump is taken. The server controller continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPMS

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1000 *date time applid* **The CICS ONC RPC RPC caller is initializing.**

Explanation: The server controller has started initialization of the RPC caller.

System Action: Processing continues.

User Response: None.

Destination: CRPO

Module: DFHRPRP

XMEOUT Parameters: *date, time, applid*

DFHRP1001 *date time applid* **The CICS ONC RPC RPC caller has been initialized successfully.**

Explanation: The RPC caller has been initialized, and it is now ready for use.

System Action: Processing continues.

User Response: None.

Destination: CRPO

Module: DFHRPRP

XMEOUT Parameters: *date, time, applid*

DFHRP1002 *date time applid* **The CICS ONC RPC RPC caller is shutting down.**

Explanation: Termination of the RPC caller has started.

System Action: Processing continues.

User Response: None.

Destination: CRPO

Module: DFHRPRP

XMEOUT Parameters: *date, time, applid*

DFHRP1003 *date time applid* **The CICS ONC RPC RPC caller has successfully shutdown.**

Explanation: Termination of the RPC caller has completed.

System Action: Processing continues.

User Response: None.

Destination: CRPO

Module: DFHRPRP

XMEOUT Parameters: *date, time, applid*

DFHRP1500 *date time applid tranid* **Invalid data has been entered in field** *fieldname***.**

Explanation: Invalid data was entered on a connection manager panel in field *fieldname*.

System Action: The panel is redisplayed and the field in error is highlighted.

User Response: Enter valid data in the field indicated. See the *CICS External Interfaces Guide* for further guidance.

Destination: Terminal End User

Modules: DFHRPC06, DFHRPC10, DFHRPC0A, DFHRPC1B

DFHRP1501 *date time applid tranid* **The value entered in field** *fieldname* **exceeds the maximum allowed.**

Explanation: The value entered on a connection manager panel in field *fieldname* exceeds the maximum allowed.

System Action: The panel is redisplayed and the field in error is highlighted.

User Response: Enter valid data in the field indicated. See the *CICS External Interfaces Guide* for further guidance.

Destination: Terminal End User

Module: DFHRPC0B

DFHRP1505 *date time applid tranid* **The CICS ONC RPC connection manager has not been started correctly.**

Explanation: The connection manager has been started from a non-BMS terminal but is not being used to enable or disable CICS ONC RPC.

System Action: The connection manager terminates.

User Response: The connection manager can be used as follows from a non-BMS terminal:

- If CICS ONC RPC is disabled, the connection manager can be used for automatic enable, either by setting automatic enable to YES on the CICS ONC RPC data set or by entering a fast path command with YES for automatic enable.
- If CICS ONC RPC is enabled, the connection manager can be used for disable by entering a valid disable fast path command.

See the *CICS External Interfaces Guide* for guidance on how to start the connection manager.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1506 *date time applid tranid* **The CICS ONC RPC connection manager detected an error attempting to retrieve any fast path data. EIBRESP:** *eibresp***.**

Explanation: The connection manager was attempting to retrieve any fast path commands that may have been specified when it was initiated. The connection manager issued an EXEC CICS GETMAIN command, but received the response *eibresp*.

System Action: A system dump is taken. The connection manager continues but any fast path commands are ignored. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid, eibresp*

DFHRP1507 *date time applid tranid* **An invalid CICS ONC RPC fast path command has been entered:** *fastpath_command*

Explanation: The connection manager was started by entering a fast path command, but the format of the command was invalid.

System Action: The connection manager is started, but fast path commands are ignored.

User Response: Enter a valid fast path command. See the *CICS External Interfaces Guide* for further guidance.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid, fastpath_command*

DFHRP1508 *date time applid tranid* **The CICS ONC RPC connection manager has not been started correctly.**

Explanation: The connection manager was attempting to retrieve any fast path commands that may have been specified when it was initiated, but detected an invalid STARTCODE indicator.

System Action: The connection manager continues but any fast path commands are ignored.

User Response: See the *CICS External Interfaces Guide* for guidance on how to start the connection manager. If the connection manager was started correctly, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1509 *date time applid tranid* **The CICS ONC RPC connection manager detected an error attempting to retrieve any fast path data. EIBRESP:** *eibresp***.**

Explanation: The connection manager was attempting to retrieve any fast path commands that may have been specified when it was initiated using an EXEC CICS START command. The connection manager issued an EXEC CICS RETRIEVE command, but received the response *eibresp*.

System Action: A system dump is taken. The connection manager continues but any fast path commands are ignored. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid, eibresp*

DFHRP1510 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file** *filename***. EIBRESP:** *eibresp***.**

Explanation: The connection manager could not access the CICS ONC RPC data set, CICS file *filename*. An EXEC CICS READ was issued, but received the response *eibresp*. The data set has not been correctly defined to CICS for one of the following reasons:

- No file definition has been found for *filename*. CICS ONC RPC has therefore not been installed correctly.
- READ operations are not allowed on the file.
- The file is DISABLED, either due to an incorrect file definition, or due to operator intervention.
- The file cannot be opened because it has not been defined correctly, or because it has been closed by operator intervention.
- The connection manager transaction, or the user running it, does not have the necessary level of authority to access the file.

System Action: The requested operation is not performed.

User Response: Use Appendix A of the *Application Programming Reference* manual to find out what the EIBRESP value means, and take appropriate action.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename, eibresp*

DFHRP1511 *date time applid tranid* **The CICS ONC RPC connection manager has detected a logic error accessing the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager received an unexpected error when accessing the CICS ONC RPC data set, CICS file *filename*. This is a logic error. The connection manager has received an unexpected response from CICS following an EXEC CICS command.

System Action: A system dump is taken. The requested operation is not performed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1512 *date time applid tranid* **The CICS ONC RPC connection manager cannot access the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager could not access the CICS ONC RPC data set, CICS file *filename*. The data set has not been correctly defined to CICS for one of the following reasons:

- No file definition has been found for *filename*. CICS ONC RPC has therefore not been installed correctly.
- READ operations are not allowed on the file.
- The file has been disabled, either due to an incorrect data set definition, or due to operator intervention.
- The file cannot be opened because it has not been defined correctly, or because it has been closed by operator intervention.
- The connection manager transaction, or the user running the connection manager, does not have the necessary level of authority to access the file.

System Action: The message is displayed at the terminal.

User Response: Ensure that all the CEDA groups for CICS ONC RPC have been installed correctly.

Investigate whether the operator has changed the status of the file for any reason.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1513 *date time applid tranid* **The CICS ONC RPC connection manager has detected invalid data in the definition record of the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager detected an error in the definition record in the CICS ONC RPC data set.

System Action: A system dump is taken. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that the first record in the data set has been correctly initialized. You can do this by manually updating the record (see the *CICS External Interfaces Guide* for further guidance), or by deleting the first record in the data set, and rerunning the connection manager. This creates a new definition record using the default settings which can then be updated using the connection manager panels.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1514 *date time applid tranid* **The CICS ONC RPC connection manager has detected that the CICS ONC RPC global work area does not have the expected length.**

Explanation: The connection manager detected that the length of the associated global work area is not correct.

System Action: A system dump is taken. CICS ONC RPC is disabled. It is not possible to enable CICS ONC RPC until the problem is resolved. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Make sure that no user-written version of program DFHRPTRU is being used. Only the CICS ONC RPC supplied program can be used with CICS ONC RPC. Similarly, the CICS ONC RPC supplied task-related user exit DFHRPTRU should only be enabled and disabled by the connection manager. It should not be necessary to enable or disable DFHRPTRU in any other way.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1515 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file** *filename***. EIBRESP:** *eibresp***.**

Explanation: The connection manager could not access the CICS ONC RPC data set, CICS file *filename*. An EXEC CICS READ was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- The file is defined as remote, and there is an error on the connection to the owning system.
- VSAM has returned an unexpected response to CICS.
- An I/O error occurred on the READ.

System Action: A system dump is taken. The requested operation is not performed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use Appendix A of the *Application Programming Reference* manual to find out what the EIBRESP value means, and take appropriate action.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename, eibresp*

DFHRP1516 *date time applid tranid* **The CICS ONC RPC connection manager cannot access the feature definition record in the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager found that the CICS ONC RPC definition record is missing from the CICS ONC RPC data set, CICS file *filename*, while processing a request to update this record.

System Action: A system dump is taken. The connection manager panel is redisplayed. The CICS ONC RPC definition record cannot be updated. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the reason why this record does not exist. You must create a new CICS ONC RPC definition record with the connection manager.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1518 *date time applid tranid* **The CICS ONC RPC connection manager cannot find the global work area.**

Explanation: The connection manager cannot access its global work area.

System Action: A system dump is taken. The connection manager continues, but CICS ONC RPC cannot be enabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: End the connection manager. Ensure that all the CEDA groups containing the CICS ONC RPC definitions have been correctly installed. Then try running the connection manager again.

Investigate whether the operator has disabled the task-related user exit DFHRPTRU.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1519 *date time applid tranid* **The CICS ONC RPC connection manager cannot find the task-related user exit.**

Explanation: The connection manager cannot access its task-related user exit for one of the following reasons:

- DFHRPTRU has not been defined to CICS
- DFHRPTRU is not in the CICS load library
- DFHRPTRU has been disabled

System Action: A system dump is taken. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: End the connection manager. Ensure that all the CEDA groups containing CICS ONC RPC definitions have been installed correctly. Then try running the connection manager again.

If CICS ONC RPC has been correctly installed, check that the operator has not disabled DFHRPTRU.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1520 *date time applid tranid* **The CICS ONC RPC connection manager is not authorized to access its task related user exit. EIBRESP2:** *eibresp2***.**

Explanation: The connection manager used EXEC CICS EXTRACT EXIT to find the task-related user exit, but got a NOTAUTH response.

System Action: A system dump is taken. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use the EIBRESP2 value to identify the problem.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid, eibresp2*

DFHRP1521 *date time applid tranid* **The CICS ONC RPC connection manager cannot access its task related user exit.**

Explanation: The connection manager cannot access the task related user exit. It received an unexpected response to an EXEC CICS EXTRACT EXIT call.

System Action: A system dump is taken. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1522 *date time applid tranid* **The CICS ONC RPC connection manager has been started against an invalid terminal.**

Explanation: The connection manager has been started against a terminal that is not supported, for example, an LUTYPE6 terminal.

System Action: The connection manager abends with abend code ARPX.

User Response: Start the connection manager against a valid terminal. See the *CICS External Interfaces Guide* for further guidance on starting the connection manager.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1523 *date time applid tranid* **CICS ONC RPC cannot be enabled because the connection manager cannot access the task-related user exit DFHRPTRU.**

Explanation: The connection manager could not enable CICS ONC RPC because an error occurred accessing the task related user exit DFHRPTRU.

System Action: A system dump is taken. This instance of connection manager can only be used to inquire on, or update the CICS ONC RPC data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response:

See the CRPO transient data queue for messages indicating the nature of the error, and take the appropriate action. Then restart the connection manager transaction and select the enable option again.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1524 *date time applid tranid* **CICS ONC RPC cannot be enabled because the server controller is already running.**

Explanation: The connection manager detected that the task-related user exit DFHRPTRU is disabled, but the server controller transaction is still running.

System Action: A system dump is taken. This instance of connection manager can only be used to inquire on, or update, the CICS ONC RPC data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate why the last attempt to disable CICS ONC RPC did not complete successfully. Investigate the possibility of operator intervention.

Once you have established that it is safe to continue, use CEMT SET TASK or EXEC CICS SET TASK to purge the server controller. Then run the connection manager again to enable CICS ONC RPC.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1525 *date time applid tranid* **The CICS ONC RPC connection manager received an unexpected response from CICS.**

Explanation: The connection manager detected a logic error. It received an unexpected response to a CICS command.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1526 *date time applid tranid* **The CICS ONC RPC connection manager found that the task-related user exit is enabled, but the server controller is not running.**

Explanation: The connection manager has detected that the task-related user exit DFHRPTRU is enabled, but the server controller is not running. This means that CICS ONC RPC is in an indeterminate state.

System Action: This instance of connection manager can only be used to inquire on, or update, the CICS ONC RPC data set.

User Response: Investigate whether the previous attempt to disable CICS ONC RPC completed successfully. Alternatively, the server controller task may have been forcepurged by the operator.

Once you have established that it is safe to continue, try running the connection manager again and enabling CICS ONC RPC.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1527 *date time applid tranid* **CICS ONC RPC cannot be enabled because disable processing has not completed.**

Explanation: CICS ONC RPC is being disabled.

System Action: The current instance of CICS ONC RPC is disabled.

User Response: Wait for disable to complete before attempting to enable the CICS ONC RPC again.

Destination: CRPO and Terminal End User

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1528 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while initializing the RPC caller component during CICS ONC RPC enable processing.**

Explanation: The RPC caller could not be started.

System Action: The enable attempt is abandoned.

User Response: If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO and Terminal End User

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1529 *date time applid tranid* **The CICS ONC RPC connection manager detected an error in enable processing. Host IP address** *hostaddr***.**

Explanation: The connection manager discovered a storage problem while trying to enable CICS ONC RPC.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated diagnostics issued by CICS for problem determination.

See the *CICS Problem Determination Guide* for guidance on dealing with storage problems.

Destination: CRPO and Terminal End User

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1530 *date time applid tranid* **The CICS ONC RPC connection manager detected a CICS short on storage condition during initialization of the RPC caller component. Host IP address** *hostaddr***.**

Explanation: The connection manager detected a short on storage condition.

System Action: The enable attempt is abandoned.

User Response: See the associated diagnostics issued by CICS for problem determination. See the *CICS Problem Determination Guide* for guidance on dealing with storage problems.

When the short on storage problem has been resolved, try to enable CICS ONC RPC again.

Destination: CRPO and Terminal End User

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1531 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file** *filename***. EIBRESP:** *eibresp***.**

Explanation: The connection manager could not access the CICS ONC RPC data set, CICS file *filename*. An EXEC CICS WRITE was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- No file definition has been found for the file, implying that CICS ONC RPC has not been installed correctly.
- Write operations are not allowed, implying that CICS ONC RPC has not been installed correctly.
- The file is DISABLED, either due to an incorrect file definition, or due to operator intervention.
- The file is NOTOPEN, either due to an incorrect file definition or due to operator intervention.
- Write operations are not authorized, implying that security has not been set up correctly.

System Action: The requested operation is not performed.

User Response: Use Appendix A of the *Application Programming Reference* manual to find out what the EIBRESP value means, and take appropriate action.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename, eibresp*

DFHRP1532 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file** *filename***. EIBRESP:** *eibresp***.**

Explanation: The connection manager could not access the CICS ONC RPC data set, CICS file *filename*. An EXEC CICS WRITE was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- The file is defined as remote, and there is an error on the connection to the owning system.
- VSAM has returned an unexpected response to CICS.
- An I/O error occurred on the WRITE.
- There is insufficient space available on the DASD device containing the data set.

System Action: A system dump is taken. The requested operation is not performed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use Appendix A of the *Application Programming Reference* manual to find out what the EIBRESP value means, and take appropriate action.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename, eibresp*

DFHRP1533 *date time applid tranid* **The CICS ONC RPC connection manager has detected a logic error while accessing the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager used EXEC CICS WRITE to update the CICS ONC RPC data set, but received an unexpected response. This is a logic error.

System Action: A system dump is taken. The requested operation is not performed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1534 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file** *filename***. EIBRESP:** *eibresp***.**

Explanation: The connection manager could not access the CICS ONC RPC data set, CICS file *filename*. An EXEC CICS WRITE was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- The file is defined as remote, and there is an error on the connection to the owning system.
- VSAM has returned an unexpected response to CICS.
- An I/O error occurred on the WRITE.
- There is insufficient space available on the DASD device containing this file.

System Action: A system dump is taken. The 4-tuple definition is not saved in the data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use Appendix A of the *Application Programming Reference* manual to find out what the EIBRESP value means, and take appropriate action.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename, eibresp*

DFHRP1536 *date time applid tranid* **There was no entry for this 4-tuple in the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager did not find this 4-tuple in the CICS ONC RPC data set.

System Action: None.

User Response: Enter a 4-tuple that has already been saved in the data set.

Destination: Terminal End User

Module: DFHRPC09

DFHRP1537 *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error while registering 4-tuples from the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager detected an internal error while processing a request to register 4-tuples from the CICS ONC RPC data set.

System Action: A system dump is taken. No 4-tuples are registered. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1538 *date time applid tranid* **The CICS ONC RPC connection manager found no records on the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager was processing a request to register 4-tuples, but found no records on the CICS ONC RPC data set. The CICS ONC RPC definition record is missing.

System Action: A system dump is taken. No 4-tuples are registered. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the reason why there are no records. You must use the connection manager to create a new one.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1539 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file** *filename***, while registering 4-tuples from the data set. EIBRESP:** *eibresp***.**

Explanation: The connection manager could not access the CICS ONC RPC data set.

The error occurred while processing a request to register 4-tuples from the data set. Associated message DFHRP1545 may have been issued to indicate the number of 4-tuples that were registered.

An EXEC CICS STARTBR, EXEC CICS READNEXT, or EXEC CICS ENDBR was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- No file definition has been found for the file, implying that CICS ONC RPC has not been installed correctly.
- BROWSE or READ operations are not allowed, implying that CICS ONC RPC has not been installed correctly.
- The file is DISABLED, either due to an incorrect file definition, or due to operator intervention.
- The file is NOTOPEN, either due to an incorrect file definition, or due to operator intervention.
- BROWSE or READ operations are not authorized, implying that security has not been set up correctly.

System Action: A system dump is taken. The connection manager cannot register 4-tuples from the data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use Appendix A of the *Application Programming Reference* manual to find out what the EIBRESP value means, and take appropriate action.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename, eibresp*

DFHRP1540 *date time applid tranid* **The CICS ONC RPC connection manager detected a logic error.**

Explanation: The connection manager received an unexpected response from CICS following an EXEC CICS command.

System Action: A system dump is taken. The connection manager abends with abend code ARPV. The other components of CICS ONC RPC continue. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1541 *date time applid tranid* **The CICS ONC RPC connection manager detected a logic error.**

Explanation: The connection manager received an unexpected response from CICS following an EXEC CICS command.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1542 *date time applid tranid* **CICS ONC RPC detected an error while accessing the CICS ONC RPC data set, CICS file** *filename***, while registering 4-tuples from the data set. EIBRESP:** *eibresp***.**

Explanation: The connection manager could not access the CICS ONC RPC data set.

The error occurred while processing a request to register 4-tuples from the data set. Associated message DFHRP1545 may have been issued to indicate the number of 4-tuples that were registered.

An EXEC CICS STARTBR, EXEC CICS READNEXT or EXEC CICS ENDBR was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- The file is defined as remote, and there is an error on the connection to the owning system.

- VSAM has returned an unexpected response to CICS.
- An I/O error occurred on the BROWSE or READ command.

System Action: A system dump is taken. The connection manager cannot register 4-tuples from the data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use Appendix A of the *Application Programming Reference* manual to find out what the EIBRESP value means, and take appropriate action. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename, eibresp*

DFHRP1543 *date time applid tranid* **The CICS ONC RPC connection manager detected a logic error while accessing the CICS ONC RPC data set, CICS file** *filename***, while registering 4-tuples from the data set.**

Explanation: The connection manager has detected an error while accessing the CICS ONC RPC data set. This is a logic error since connection manager has received an unexpected response from CICS following an EXEC CICS STARTBR, EXEC CICS READNEXT or EXEC CICS ENDBR command.

The error occurred while processing a request to register 4-tuples from the data set. Associated message DFHRP1545 may have been issued to indicate the number of 4-tuples that were registered.

System Action: A system dump is taken. The connection manager cannot register 4-tuples from the data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1544 *date time applid tranid* **The CICS ONC RPC connection manager found no records in the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager was processing a request to register 4-tuples, but found no records in the CICS ONC RPC data set. This indicates that the CICS ONC RPC definition record is missing.

System Action: A system dump is taken. No 4-tuples are registered. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the reason why there are no records. You must use the connection manager to create a new CICS ONC RPC definition record.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1545 *date time applid tranid* **The CICS ONC RPC connection manager has completed registration of 4-tuples from the CICS ONC RPC data set, CICS file** *filename***. Successful registers:** *count1***. Unsuccessful registers:** *count2***.**

Explanation: The connection manager has finished registering 4-tuples from the CICS ONC RPC data set, CICS file *filename*. *count1* indicates the number of 4-tuples that have been successfully registered. *count2* indicates the number of 4-tuples that were not registered.

System Action: No further action.

User Response: No further action.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename, count1, count2*

DFHRP1546 *date time applid tranid* **The CICS ONC RPC connection manager found no 4-tuple records on the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager was processing a request to register 4-tuples from the CICS ONC RPC data, but found no 4-tuple records in it.

System Action: No 4-tuples are registered.

User Response: Store some 4-tuple definitions in the data set before requesting this option.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1547 *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error while registering 4-tuples from the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager detected an internal error while processing a request to register 4-tuple from the CICS ONC RPC data set. Associated message DFHRP1545 indicates how many 4-tuples were registered.

System Action: A system dump is taken. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1548 *date time applid tranid* **The CICS ONC RPC connection manager detected an error attempting to retrieve any fast path data. EIBRESP:** *eibresp*.

Explanation: The connection manager was attempting to retrieve any fast path commands that may have been specified when it was initiated from a terminal. The connection manager issued an EXEC CICS RECEIVE command, but received a response in field *eibresp*.

System Action: A system dump is taken. Start up of CICS ONC RPC continues but any fast path commands are ignored. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid, eibresp*

DFHRP1549 *date time applid tranid* **The CICS ONC RPC connection manager received an error response while registering with CICS for problem determination.**

Explanation: The connection manager received an unexpected response from CICS when attempting to register for problem determination.

System Action: A system dump is taken. CICS feature tracing and dump formatting cannot be used for CICS ONC RPC. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC01

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1550 *date time applid tranid* **The CICS ONC RPC connection manager received an error response while registering with CICS for problem determination.**

Explanation: The connection manager received an unexpected response from CICS when attempting to register for problem determination.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1551 *date time applid tranid* **The CICS ONC RPC connection manager could not enable CICS ONC RPC because of a CICS short on storage condition.**

Explanation: The connection manager has made a request for storage during enable processing, but has received a reply indicating that CICS is short on storage.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated diagnostics issued by CICS for problem determination. You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1552 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error during enable processing.**

Explanation: An internal error detected during enable processing has prevented the connection manager from enabling CICS ONC RPC.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1554 *date time applid tranid* **The CICS ONC RPC connection manager is not authorized to use the CICS SPI.**

Explanation: The connection manager has not been defined with the authorization necessary to execute CICS system programming interface commands. It cannot function without this authorization.

System Action: A system dump is taken. The enable attempt is abandoned.

User Response: Message DFHME0116 is normally produced containing the symptom string for this problem. Redefine the connection manager transaction and its associated program DFHRPC00 with the appropriate level of security to be able to use the CICS SPI.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1555 *date time applid tranid* **The CICS ONC RPC connection manager is not authorized to use the program DFHRPTRU.**

Explanation: The connection manager used the EXEC CICS ENABLE PROGRAM command for DFHRPTRU, but it has not been defined with the authorization necessary to use DFHRPTRU. It cannot function without this authorization.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Redefine the connection manager and its associated programs with the appropriate level of security to be able to use the CICS ONC RPC supplied task-related user exit DFHRPTRU.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1556 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error during enable processing.**

Explanation: An internal error detected by the connection manager during enable processing has prevented CICS ONC RPC from being enabled.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1557 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error during enable processing.**

Explanation: An internal error detected by the connection manager during enable processing has prevented CICS ONC RPC from being enabled.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1558 *date time applid tranid* **The CICS ONC RPC connection manager could not find the task-related user exit, program DFHRPTRU.**

Explanation: The connection manager cannot find the task-related user exit, DFHRPTRU, for one of the following reasons:

- DFHRPTRU has not been defined to CICS
- DFHRPTRU is not in the CICS load library
- DFHRPTRU has been disabled

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that all the CEDA groups for CICS ONC RPC have been installed correctly, then try the enable request again.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1559 *date time applid tranid* **The CICS ONC RPC connection manager could not enable CICS ONC RPC because of a CICS short on storage condition.**

Explanation: The connection manager has made a request for storage during enable processing, but has received a reply indicating that CICS is short on storage.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated diagnostics issued by CICS for problem determination. See the dfhtm00l. for guidance on dealing with CICS storage problems.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1560 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error during enable processing.**

Explanation: An internal error detected by the connection manager during enable processing has prevented CICS ONC RPC from being enabled.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1561 *date time applid tranid* **The CICS ONC RPC connection manager found that the task-related user exit, program DFHRPTRU, is already enabled.**

Explanation: The connection manager found that the task-related user exit, DFHRPTRU, is already enabled.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Take steps to prevent operator intervention with the task related user exit, then try the enable request again.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1564 *date time applid tranid* **CICS ONC RPC could not be enabled due to an internal error while starting the server controller. Host IP address:** *hostaddr***.**

Explanation: The connection manager attempted to start the server controller by issuing an EXEC CICS START command, but could not determine the response that was returned.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1565 *date time applid tranid* **CICS ONC RPC cannot be enabled because the connection manager is not authorized to start the server controller. EIBRESP:** *eibresp***. Host IP address:** *hostaddr***.**

Explanation: The connection manager attempted to start the server controller by issuing an EXEC CICS START command, but the NOTAUTH response was returned.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the *CICS System Programming Reference* for the meaning of the value returned in *eibresp*. Use CEDA to ensure that the resource definitions for the CICS ONC RPC supplied programs and transactions have been defined with the correct levels of security. The connection manager must have the correct level of authority to start the server controller in order for CICS ONC RPC to be enabled successfully.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid, eibresp, hostaddr*

DFHRP1566 *date time applid tranid* **CICS ONC RPC cannot be enabled due to an error starting the server controller. EIBRESP:** *eibresp***. Host IP address:** *hostaddr***.**

Explanation: The connection manager attempted to start the server controller by issuing an EXEC CICS START command, but the TRANSIDERR response was returned.

See the *CICS System Programming Reference* for the meaning of the value returned in *eibresp*.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use CEDA to ensure that the resource definitions for the CICS ONC RPC supplied programs and transactions have been defined with the correct levels of security. In order to enable CICS ONC RPC, the connection manager must have the correct level of authority to start the server controller.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid, eibresp, hostaddr*

DFHRP1567 *date time applid tranid* **CICS ONC RPC could not be enabled due to a security error starting the server controller. User ID** *userid* **is unknown. Host IP address:** *hostaddr***.**

Explanation: The connection manager attempted to start the server controller by issuing an EXEC CICS START USERID command, but the USERIDERR response was returned.

The user ID specified for the server controller is not known to the external security manager.

System Action: The enable attempt is abandoned.

User Response: Ensure that a valid user ID is specified for CRPM Userid.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid, userid, hostaddr*

DFHRP1568 *date time applid tranid* **CICS ONC RPC could not be enabled due to a security error starting the server controller. Host IP address:** *hostaddr***.**

Explanation: The connection manager attempted to start the server controller by issuing an EXEC CICS START USERID command, but the USERIDERR response was returned.

The external security manager is in a state such that it cannot validate the user ID specified for the server controller.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the reason why the external security manager cannot perform this request.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1569 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error during enable processing.**

Explanation: An internal error detected by the connection manager during enable processing has prevented CICS ONC RPC from being enabled.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1570 *date time applid tranid* **CICS ONC RPC storage subpool token not saved.**

Explanation: The connection manager has detected an error while saving the storage subpool token.

System Action: A system dump is taken. CICS ONC RPC continues normally. However if CICS ONC RPC abends, it may not be possible to reenable CICS ONC RPC without restarting CICS. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated diagnostics issued by CICS for problem determination.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1571 *date time applid tranid* **The CICS ONC RPC connection manager is not authorized to load module** *module***.**

Explanation: The connection manager has not been defined with the authorization necessary to issue an EXEC CICS LOAD command for the named module.

System Action: The enable attempt is abandoned.

User Response: Redefine the connection manager and its associated programs with the appropriate level of security to be able to issue EXEC CICS LOAD commands for the named CICS ONC RPC program.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid, module*

DFHRP1572 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while loading** *module***.**

Explanation: The connection manager tried to load the module, but the response to EXEC CICS LOAD was PGMIDERR.

System Action: The enable attempt is abandoned.

User Response: Use the CEDA transaction to ensure that the connection manager (program DFHRPC00) and the named program are correctly defined. See the *CICS External Interfaces Guide* for the correct program definitions.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid, module*

DFHRP1574 *date time applid tranid* **The CICS ONC RPC connection manager load for** *module* **returned an unexpected response.**

Explanation: The connection manager has not been able to load the module into storage. A response other than NOTAUTH or PGMIDERR was returned to the EXEC CICS LOAD command.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use the system dump to determine why the LOAD could not work.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid, module*

DFHRP1575 *date time applid tranid* **CICS ONC RPC could not be enabled due to an internal error starting the server controller. Host IP address:** *hostaddr***.**

Explanation: The connection manager attempted to start the server controller by issuing an EXEC CICS START command, but received an unexpected response.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1576 *date time applid tranid* **CICS ONC RPC could not be enabled due to an internal error starting the server controller. EIBRESP:** *eibresp***. Host IP address:** *hostaddr***.**

Explanation: The connection manager attempted to start the server controller by issuing an EXEC CICS START command, but the INVREQ response was returned.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid, eibresp, hostaddr*

DFHRP1577 *date time applid tranid* **The CICS ONC RPC connection manager cannot access its task-related user exit DFHRPTRU.**

Explanation: The connection manager was unable to access its task-related user exit DFHRPTRU during enable processing.

System Action: A system dump is taken. The enable attempt is abandoned. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Check that the task-related user exit has not been disabled by operator intervention. See the associated diagnostics issued by CICS for problem determination.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1579 *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error while registering 4-tuples from the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager has detected an internal error while processing a request to register 4-tuples from the CICS ONC RPC data set. Associated message DFHRP1545 may have been issued to indicate the number of 4-tuples that were successfully registered.

System Action: A system dump is taken. Registration of 4-tuples from the data set does not continue. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1580 *date time applid tranid* **The CICS ONC RPC connection manager cannot establish whether security is active or obtain the default CICS user ID. EIBRESP:** *eibresp***.**

Explanation: The connection manager was unable to retrieve status information about CICS, and therefore cannot establish whether security is active, or obtain the default CICS user ID.

An EXEC CICS INQUIRE SYSTEM was issued but received the response shown in the message.

System Action: Processing continues under the assumption that there is no security active.

Panel DFHRP02 is displayed with no user ID in field CRPM Userid, unless a user ID was saved in the CICS ONC RPC data set.

User Response: Ensure that the connection manager has the correct level of security to use CICS system programming interface commands.

Destination: CRPO

Module: DFHRPC42

XMEOUT Parameters: *date, time, applid, tranid, eibresp*

DFHRP1581 *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error while accessing the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager has detected an internal error while accessing the CICS ONC RPC data set.

System Action: A system dump is taken. The panel is redisplayed. No records can be updated. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Modules: DFHRPC03, DFHRPC05

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1582 *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error while accessing the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager has detected an internal error while accessing the CICS ONC RPC data set.

System Action: A system dump is taken. The connection manager panel is redisplayed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Modules: DFHRPC03, DFHRPC05

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1583 *date time applid tranid* **The CICS ONC RPC connection manager found no entry for this 4-tuple in the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager has not found this 4-tuple in the CICS ONC RPC data set *filename*.

System Action: None.

User Response: Enter a 4-tuple that has already been saved in the data set.

Destination: Terminal End User

Module: DFHRPC09

DFHRP1584 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file** *filename***. EIBRESP:** *eibresp***.**

Explanation: The connection manager could not access the CICS ONC RPC data set. An EXEC CICS DELETE was issued, but received the response *eibresp*. The data set has not been correctly defined to CICS for one of the following reasons:

- No file definition has been found for *filename*. CICS ONC RPC has therefore not been installed correctly.
- DELETE operations are not allowed on the file.
- The file has been disabled, either due to an incorrect file definition, or due to operator intervention.
- The file cannot be opened because it has not been defined correctly, or because it has been closed by operator intervention.
- The connection manager, or the user running it, does not have the necessary level of authority to access the file.

System Action: The requested operation is not performed. The connection manager cannot perform any operation requiring access to the data set.

User Response: Use Appendix A of the *Application Programming Reference* manual to find out what the EIBRESP value means, and take appropriate action.

Investigate whether the operator has changed the status of the data set for any reason.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename, eibresp*

DFHRP1585 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file** *filename***. EIBRESP:** *eibresp***.**

Explanation: The connection manager could not access CICS ONC RPC data set, CICS file *filename*. An EXEC CICS DELETE was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- The file is defined as remote, and there is an error on the connection to the owning system.
- VSAM has returned an unexpected response to CICS.
- An I/O error occurred on the DELETE.

System Action: A system dump is taken. The requested operation is not performed. The connection manager cannot perform any function requiring access to the data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use Appendix A of the *Application Programming Reference* manual to find out what the EIBRESP value means, and take appropriate action.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename, eibresp*

DFHRP1586 *date time applid tranid* **The CICS ONC RPC connection manager detected a logic error accessing the CICS ONC RPC data set** *filename***.**

Explanation: The connection manager detected an unexpected error when accessing the CICS ONC RPC data set. This is a logic error. The connection manager has received an unexpected response from CICS following an EXEC CICS command.

System Action: A system dump is taken. The connection manager cannot perform any function requiring access to the CICS ONC RPC data set. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC09

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1596 *date time applid tranid* **The CICS ONC RPC connection manager cannot continue enable processing because it cannot determine the status of CICS ONC RPC.**

Explanation: The connection manager was trying to enable CICS ONC RPC, but detected an invalid global work area address, or found that CICS ONC RPC was enabled.

System Action: The enable attempt is abandoned.

User Response: Investigate whether CICS ONC RPC has been disabled. Investigate whether operator command have been issued against the task-related user DFHRPTRU.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1600 *date time applid tranid* **The CICS ONC RPC connection manager has completed backout of enable processing.**

Explanation: CICS ONC RPC cannot be enabled. This may be the result of an error detected by the connection manager during enable processing or it may be due to CICS shutdown. The connection manager has completed backout of enable processing.

System Action: Processing continues.

User Response: See associated messages for the reason why the enable request failed.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1601 *date time applid tranid* **The CICS ONC RPC connection manager cannot continue enable processing because it has detected that CICS is shutting down.**

Explanation: CICS ONC RPC cannot be enabled when CICS is in shutdown.

System Action: The connection manager initiates backout of enable processing. If this is an immediate CICS shutdown, then transaction CRPC terminates.

User Response: Exit transaction CRPC to enable CICS shutdown to continue.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1602 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error during backout of enable processing.**

Explanation: The connection manager has detected an error attempting to shut down the RPC caller. This is during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

System Action: CICS ONC RPC continues backout of enable processing.

User Response: See associated messages for the reason why the enable request failed. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1603 *date time applid tranid* **The CICS ONC RPC connection manager has detected an error when attempting to issue a FREEMAIN for the RPC caller program.**

Explanation: The connection manager has detected an error issuing a FREEMAIN for the RPC caller program to remove it from storage. This is during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

System Action: CICS ONC RPC continues backout of enable processing.

User Response: See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1604 *date time applid tranid* **The CICS ONC RPC connection manager has detected an error when attempting to issue a RELEASE for the alias list program.**

Explanation: The connection manager has detected an error issuing a release for the alias list program. This is during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

System Action: CICS ONC RPC continues backout of enable processing.

User Response: See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1605 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error during backout of enable processing.**

Explanation: The connection manager has detected an internal error during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

System Action: CICS ONC RPC continues backout of enable processing.

User Response: See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1606 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error during backout of enable processing.**

Explanation: The connection manager has detected an internal error during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS be diagnostics.

System Action: CICS ONC RPC continues backout of enable processing.

User Response: See associated messages for the reason why the enable request failed. If the problem is not a symptom of a

wider problem, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1607 *date time applid tranid* **The CICS ONC RPC connection manager has detected an error when attempting to disable the ONC RPC TRUE (DFHRPTRU).**

Explanation: The connection manager detected an error attempting to disable the task-related user exit (TRUE). This is during backout of enable processing initiated by the connection manager in response to a failed enable request. It may be that the TRUE is already disabled, which may be the result of operator intervention. Alternatively, this could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

System Action: CICS ONC RPC continues backout of enable processing.

User Response: See associated messages for the reason why the enable request failed. Take steps to prevent operator interference with the TRUE.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1608 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error during backout of enable processing.**

Explanation: The connection manager has detected an internal error attempting to disable the task-related user exit (TRUE). This is during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

System Action: CICS ONC RPC continues backout of enable processing.

User Response: See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1609 *date time applid tranid* **The CICS ONC RPC connection manager is not authorized to disable the task-related user exit (DFHRPTRU) during backout of enable processing.**

Explanation: The connection manager transaction does not have the necessary authority to use the CICS system programming interface and cannot disable its task related user exit (TRUE). This is during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

System Action: CICS ONC RPC continues backout of enable processing.

User Response: See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1610 *date time applid tranid* **The CICS ONC RPC connection manager is not authorized to disable the task-related user exit (DFHRPTRU) during backout of enable processing.**

Explanation: The connection manager transaction does not have the necessary authority to disable its task-related user exit (TRUE). This is during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

System Action: CICS ONC RPC continues backout of enable processing.

User Response: See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1611 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error during backout of enable processing.**

Explanation: The connection manager has detected an error attempting to unregister for problem determination. This is during backout of enable processing initiated by the connection manager in response to a failed enable request. This could either be as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics, or as a result of problems with CICS which will probably be reflected in CICS diagnostics.

System Action: CICS ONC RPC continues backout of enable processing.

User Response: See associated messages for the reason why the enable request failed. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC4C

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1650 *date time applid tranid* **The CICS ONC RPC connection manager found that CICS ONC RPC is disabled. Requests to disable CICS ONC RPC are ignored.**

Explanation: A request has been made to disable CICS ONC RPC, but the current status indicates it is already disabled, or in the process of being disabled.

System Action: The request is ignored. The connection manager panel is redisplayed.

User Response: Request another option.

Destination: Terminal End User

Modules: DFHRPC01, DFHRPC04

DFHRP1651 *date time applid tranid* **The CICS ONC RPC connection manager detected a logic error.**

Explanation: The connection manager has received an unexpected response from CICS following an EXEC CICS command.

System Action: A system dump is taken. The connection manager abends with abend code ARPV. The rest of CICS ONC RPC continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC04

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1652 *date time applid tranid* **The CICS ONC RPC connection manager detected a logic error.**

Explanation: The connection manager received an unexpected response from CICS following an EXEC CICS command.

System Action: A system dump is taken. The requested operation is not performed. The connection manager continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Module: DFHRPC06

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1751 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing an internal table. Host IP address:** *hostaddr*

Explanation: The connection manager detected an error whilst accessing the list of 4-tuples registered with CICS ONC RPC.

System Action: The connection manager panel is redisplayed. The requested action is not performed

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC06

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1752 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing an internal table. Host IP address:** *hostaddr*

Explanation: The connection manager has detected an internal error while accessing the list of 4-tuples registered with CICS ONC RPC.

System Action: The connection manager panel is redisplayed.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC06

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1753 *date time applid tranid* **A CICS ONC RPC operation could not be performed because CICS is short on storage. Host IP address:** *hostaddr***.**

Explanation: The connection manager could not to perform an unregister operation because CICS is short on storage.

System Action: The connection manager continues.

User Response: Retry the unregister operation when the CICS storage problem has been resolved.

Destination: CRPO

Module: DFHRPC06

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1754 *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error when unregistering a 4-tuple. Host IP address:** *hostaddr***.**

Explanation: The connection manager detected an internal error when unregistering a 4-tuple.

System Action: A system dump is taken. The connection manager continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC06

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1755 *date time applid tranid* **The CICS ONC RPC connection manager could not perform an unregister operation because CICS ONC RPC is not enabled.** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***.**

Explanation: The connection manager cannot complete the current unregister operation because CICS ONC RPC it is not enabled. It might have been disabled by another connection manager transaction.

System Action: The connection manager continues, but the unregister operation is not completed.

User Response: None.

Destination: CRPO

Module: DFHRPC06

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol*

DFHRP1756 *date time applid tranid* **CICS ONC RPC is being disabled. Requested operation not performed. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager is unable to complete the current unregister operation because CICS ONC RPC is in disable processing.

System Action: The connection manager continues, but the unregister operation currently being performed is not completed.

User Response: None. The unregister will be performed as part of disable processing

Destination: CRPO

Module: DFHRPC06

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1757 *date time applid tranid* **The CICS ONC RPC connection manager cannot unregister the requested 4-tuple because it is not registered. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager is unable to complete the current unregister operation because the requested 4-tuple is not registered.

System Action: The connection manager continues, but the unregister operation currently being performed is not completed.

User Response: If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.

Destination: CRPO

Module: DFHRPC06

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1758 *date time applid tranid* **The CICS ONC RPC connection manager detected an error when freeing storage associated with the requested 4-tuple. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager is unable to complete the current unregister operation because an error occurred freeing storage associated with the 4-tuple.

System Action: The connection manager continues. If the requested 4-tuple was the only instance of a particular program/version/protocol 3-tuple registered with TCP/IP for MVS, then this 3-tuple has been unregistered with TCP/IP for MVS.

User Response: See the associated diagnostics issued by CICS and TCP/IP for MVS for problem determination.

Destination: CRPO

Module: DFHRPC06

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1759 *date time applid tranid* **The CICS ONC RPC connection manager could not perform an unregister operation because an invalid global work area was detected. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***.**

Explanation: The connection manager cannot complete the unregister operation because it has detected an invalid global work area address. CICS ONC RPC might have been disabled by another connection manager transaction.

System Action: The connection manager continues, but the unregister operation is not completed.

User Response: If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.

Destination: CRPO

Module: DFHRPC06

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol*

DFHRP1760 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while unregistering a program-version pair with TCP/IP for MVS. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager detected an error while unregistering a program-version pair with TCP/IP for MVS, and is unable to complete the current unregister operation.

System Action: The connection manager continues, but the unregister operation is not completed.

User Response: See the associated diagnostics issued by CICS and TCP/IP for MVS for problem determination. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.

DFHRP1761 *date time applid tranid* **The CICS ONC RPC connection manger could not unregister a 4-tuple as it was not registered Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The 4-tuple cannot be unregistered as it is not registered.

System Action: Processing continues.

User Response: None.

Destination: CRPO

Module: DFHRPC06

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1762 *date time applid tranid* **Enter the Program Number, Version Number, Procedure Number and Protocol for the 4-tuple to be unregistered.**

Explanation: You have not entered all the information needed to identify the 4-tuple to be unregistered.

System Action: Processing continues.

User Response: Enter the required data.

Destination: Terminal End User

Module: DFHRPC06

DFHRP1763 *date time applid tranid* **The CICS ONC RPC connection manager cannot display the requested 4-tuple because it is not registered with CICS ONC RPC. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The 4-tuple is not displayed.

System Action: Processing continues.

User Response: None.

Destination: CRPO

Module: DFHRPC06

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1764 *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error while processing 4-tuple definitions on the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager detected an internal error while accessing 4-tuples on the data set.

System Action: A system dump is taken. The connection manager panel is redisplayed. The requested operation is not performed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC0A

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1765 *date time applid tranid* **The CICS ONC RPC connection manager found no records in the CICS ONC RPC data set, CICS file** *filename***, when processing a request to access 4-tuple definitions.**

Explanation: The connection manager found no records on the data set while processing a request to access 4-tuple definitions. This indicates that the CICS ONC RPC definition record is missing.

System Action: A system dump is taken. The connection manager panel is displayed. No 4-tuples are displayed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the reason why there are no records. You must use the connection manager to create a new CICS ONC RPC definition record.

Destination: CRPO

Module: DFHRPC0A

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1766 *date time applid tranid* **The CICS ONC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file** *filename***. EIBRESP:** *eibresp***.**

Explanation: The connection manager could not access the CICS ONC RPC data set.

The error occurred while processing a request to display 4-tuple definitions from the data set.

An EXEC CICS STARTBR, EXEC CICS READNEXT or EXEC CICS ENDBR was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- No file definition has been found for DFHRPCD, implying that CICS ONC RPC has not been installed correctly.
- BROWSE or READ operations are not allowed, implying that CICS ONC RPC has not been installed correctly.
- The file is DISABLED, either due to an incorrect file definition, or due to operator intervention.
- The file is NOTOPEN, either due to an incorrect file definition, or due to operator intervention.

- BROWSE or READ operations are not authorized, implying that security has not been set up correctly.

System Action: A system dump is taken. Without access to the data set, CICS ONC RPC cannot display 4-tuple definitions. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use Appendix A of the *Application Programming Reference* manual to find out what the EIBRESP value means, and take appropriate action.

Destination: CRPO

Module: DFHRPC0A

XMEOUT Parameters: *date, time, applid, tranid, filename, eibresp*

DFHRP1767 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file** *filename***. EIBRESP:** *eibresp***.**

Explanation: The connection manager cannot access the CICS ONC RPC data set.

The error occurred while processing a request to display 4-tuple definitions from the data set.

An EXEC CICS STARTBR, EXEC CICS READNEXT or EXEC CICS ENDBR was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- The file is defined as remote, and there is an error on the connection to the owning system.
- VSAM has returned an unexpected response to CICS.
- An I/O error occurred on the BROWSE or READ command.

System Action: A system dump is taken. Without access to the data set, CICS ONC RPC cannot display 4-tuple definitions. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use Appendix A of the *Application Programming Reference* manual to find out what the EIBRESP value means, and take appropriate action.

Destination: CRPO

Module: DFHRPC0A

XMEOUT Parameters: *date, time, applid, tranid, filename, eibresp*

DFHRP1768 *date time applid tranid* **The CICS ONC RPC connection manager detected a logic error while accessing the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager could not access the CICS ONC RPC data set. This is a logic error since the connection manager has received an unexpected response from CICS following an EXEC CICS STARTBR, EXEC CICS READNEXT or EXEC CICS ENDBR command.

The error occurred while processing a request to display 4-tuple definitions from the data set.

Without access to the data set, the connection manager cannot process requests to display information from it.

System Action: A system dump is taken. The connection manager panel is redisplayed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC0A

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1769 *date time applid tranid* **The CICS ONC RPC connection manager found no records on the CICS ONC RPC data set, CICS file** *filename***, when processing a request to access 4-tuple information.**

Explanation: The connection manager has found no records on the CICS ONC RPC data set when processing a request to access 4-tuple definitions.

System Action: A system dump is taken. The connection manager panel is redisplayed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the reason why there are no records. You must use the connection manager to create a new CICS ONC RPC definition record.

Destination: CRPO

Module: DFHRPC0A

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1770 *date time applid tranid* **The CICS ONC RPC connection manager found no 4-tuple definitions in the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager has found no 4-tuple definitions in the CICS ONC RPC data set while processing a request to access 4-tuple definitions.

System Action: The connection manager panel is redisplayed. No 4-tuple definitions are displayed.

User Response: Use the connection manager to save 4-tuple definitions in the data set.

Destination: CRPO

Module: DFHRPC0A

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1771 *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error while accessing 4-tuple definitions in the CICS ONC RPC data set, CICS file** *filename***.**

Explanation: The connection manager has detected an internal error while processing a request to access 4-tuple definitions in the CICS ONC RPC data set.

System Action: A system dump is taken. The connection manager panel is redisplayed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC0A

XMEOUT Parameters: *date, time, applid, tranid, filename*

DFHRP1772 *date time applid tranid* **The CICS ONC RPC connection manager could not complete the requested operation. It could not obtain the required CICS storage.**

Explanation: A GETMAIN issued by the connection manager when attempting to build a list of 4-tuples defined in the CICS ONC RPC data set returned an error response.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: CICS may be temporarily short on storage. Retry the operation. If the condition persists, contact your system administrator to see if there are problems with CICS storage. If CICS is not short on storage, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC0A

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1773 *date time applid tranid* **The CICS ONC RPC connection manager detected an error when freeing storage.**

Explanation: A FREEMAIN issued by connection manager returned an error response. The connection manager was trying to free storage used to build a list of 4-tuples defined in the CICS ONC RPC data set.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC0A

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1774 *date time applid tranid* **The CICS ONC RPC connection manager cannot display the requested 4-tuple because it is not saved to the CICS ONC RPC data set. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***.**

Explanation: The 4-tuple is not displayed.

System Action: Processing continues.

User Response: None.

Destination: CRPO

Module: DFHRPC0A

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol*

DFHRP1775 *date time applid tranid* **The CICS ONC RPC connection manager cannot register 4-tuples because CICS ONC RPC is disabled.**

Explanation: A request to register a 4-tuple cannot be performed because CICS ONC RPC was not enabled when the request was made.

System Action: Processing continues.

User Response: Enable CICS ONC RPC.

Destination: CRPO

Module: DFHRPC0A

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1800 *date time applid tranid* **The CICS ONC RPC connection manager has purged an alias task. Task status:** *status* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The alias for the 4-tuple has been purged by the connection manager.

System Action: *Status* indicates the status of the alias task when the purge request was issued. The following actions are taken:

- *Running* indicates that the alias task was running. The connection manager removes the entry from the alias list. The alias abends with abend code ARPJ and message DFHRP0173 is issued.
- *Scheduled* indicates that the alias task was scheduled to run and may still do so. The connection manager removes the entry from the alias list. The alias abends with abend code ARPJ and messages DFHRP0113 and DFHRP0173 are issued.

User Response: None.

Destination: CRPO

Module: DFHRPC10

XMEOUT Parameters: *date, time, applid, tranid, status, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1801 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error while processing the alias list.**

Explanation: The connection manager has detected an internal error while processing a request to display or purge entries in the alias list.

System Action: A system dump is taken. The connection manager panel is redisplayed. No alias tasks are displayed or purged. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC10

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1802 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error while processing the alias list.**

Explanation: The connection manager has detected an internal error while processing a request to display or purge entries in the alias list.

System Action: A system dump is taken. The connection manager panel is redisplayed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC10

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1803 *date time applid tranid* **The CICS ONC RPC connection manager received an error response while attempting to browse the alias list.**

Explanation: The connection manager attempted to start browsing the alias list, but received a response that indicated a severe error had occurred.

System Action: The connection manager panel is redisplayed. No alias tasks are displayed.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC10

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1804 *date time applid tranid* **The CICS ONC RPC connection manager could not process the alias list. It could not obtain the required CICS storage.**

Explanation: A GETMAIN issued by the connection manager when attempting to build the alias list returned an error response.

System Action: A system dump is taken. The connection manager panel is redisplayed. No alias tasks are displayed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: CICS may be temporarily short on storage. Retry the operation. If the condition persists, contact your system administrator to see if there are problems with CICS storage. If CICS is not short on storage, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC10

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1805 *date time applid tranid* **The CICS ONC RPC connection manager has detected an error when freeing storage.**

Explanation: A FREEMAIN issued by the connection manager when attempting to free storage used to build the alias list returned an error response.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC10

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1806 *date time applid tranid* **The CICS ONC RPC connection manager received an error response while attempting to retrieve an entry from the alias list.**

Explanation: The connection manager tried to retrieve an entry from the alias list, but received a response that indicated a severe error had occurred.

System Action: The connection manager panel is redisplayed.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC10

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1807 *date time applid tranid* **The CICS ONC RPC connection manager received an error response while attempting to complete its browse of the alias list.**

Explanation: The connection manager attempted to finish browsing the alias list, but received a response that indicated a severe error had occurred.

System Action: The connection manager panel is redisplayed.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC10

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1810 *date time applid tranid* **The CICS ONC RPC connection manager received an error response while attempting to delete an entry from the alias list.**

Explanation: The connection manager tried to delete an entry from the alias list, but received a response that indicated a severe error had occurred.

System Action: The connection manager panel is redisplayed.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC10

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1861 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error while accessing an internal table. Host IP address:** *hostaddr***.**

Explanation: An internal error has occurred in the connection manager while accessing an internal table.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC08

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1862 *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error while accessing an internal table.**

Explanation: The connection manager detected an error while accessing an internal table.

System Action: A system dump is taken. If the error occurs during CICS ONC RPC enable processing, CICS ONC RPC remains disabled. If the error occurs during the processing of a client request, an **svcerr_systemerr** call is used to send a reply to the client. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC08

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1863 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error while accessing an internal table. Host IP address:** *hostaddr***.**

Explanation: An internal error has occurred in the connection manager while accessing an internal table.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC08

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1864 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error while accessing an internal table. Host IP address:** *hostaddr***.**

Explanation: An internal error has occurred in the connection manager while accessing an internal table.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC08

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1865 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error while accessing an internal table. Host IP address:** *hostaddr***.**

Explanation: An internal error has occurred in the connection manager while accessing an internal table.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC08

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1866 *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error while accessing an internal table. Host IP address:** *hostaddr***.**

Explanation: An internal error has occurred in the connection manager while accessing an internal table.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1867 *date time applid tranid* **The CICS ONC RPC connection manager could not complete the requested operation as an invalid CICS ONC RPC global work area address has been detected.**

Explanation: The connection manager was attempting to access or initialize the list of registered 4-tuples, but detected an invalid global work area address. This may indicate that CICS ONC RPC is disabled.

System Action: A system dump is taken. The requested operation is not completed. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Retry the operation when CICS ONC RPC is enabled. If this occurred during enable processing, check that another connection manager transaction has not disabled CICS ONC RPC.

Destination: CRPO

Module: DFHRPC08

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1868 *date time applid tranid* **The CICS ONC RPC connection manager could not complete the requested operation. It could not obtain the required CICS storage. Host IP address:** *hostaddr***.**

Explanation: A GETMAIN issued by connection manager when attempting to build a list of registered 4-tuples returned an error response.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: CICS may be temporarily short on storage. Retry the operation. If the condition persists, contact your system administrator to see if there are problems with CICS storage. If CICS is not short on storage, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC08

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1869 *date time applid tranid* **The CICS ONC RPC connection manager detected an error when freeing storage. Host IP address:** *hostaddr***.**

Explanation: A FREEMAIN issued by connection manager when attempting to free storage used to build a list of registered 4-tuples returned an error response.

System Action: Processing continues.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC08

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1879 *date time applid tranid* **The CICS ONC RPC connection manager has detected an internal error while accessing an internal table. Host IP address:** *hostaddr***.**

Explanation: An internal error has occurred in the connection manager while accessing an internal table.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC08

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHRP1900 *date time applid tranid* **The CICS ONC RPC connection manager could not find the global work area.**

Explanation: The connection manager could not find the global work area. The task related user exit DFHRPTRU has been wrongly defined.

System Action: A system dump is taken. CICS ONC RPC remains disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that all the CEDA groups for CICS ONC RPC have been installed correctly, then try to enable CICS ONC RPC again.

Investigate whether the operator has disabled DFHRPTRU for any reason.

Destination: CRPO

Module: DFHRPC0B

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1901 *date time applid tranid* **The CICS ONC RPC connection manager could not find the task-related user exit, program DFHRPTRU.**

Explanation: The connection manager cannot find the task-related user exit, DFHRPTRU, for one of the following reasons:

- DFHRPTRU has not been defined to CICS
- DFHRPTRU is not in the CICS load library
- DFHRPTRU has been disabled

System Action: A system dump is taken. CICS ONC RPC remains disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that all the CEDA groups for CICS ONC RPC have been installed correctly, then try the enable request again.

Destination: CRPO

Module: DFHRPC0B

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1902 *date time applid tranid* **The CICS ONC RPC connection manager does not have sufficient authority to issue the EXEC CICS EXTRACT EXIT command. EIBRESP2:** *eibresp2***.**

Explanation: The connection manager does not have the correct authority to issue the privileged EXEC CICS EXTRACT EXIT command. It cannot function without this authority.

System Action: A system dump is taken. The connection manager abends with abend code ARPZ. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use the EIBRESP2 value to identify the problem. Ensure that the connection manager and its associated program DFHRPC00 have the necessary level of security to issue the EXEC CICS EXTRACT EXIT command for the CICS ONC RPC task related user exit DFHRPTRU.

Destination: CRPO

Module: DFHRPC0B

XMEOUT Parameters: *date, time, applid, tranid, eibresp2*

DFHRP1903 *date time applid tranid* **The CICS ONC RPC connection manager has received an unexpected response from CICS.**

Explanation: The connection manager received an unexpected response from CICS to an EXEC CICS command.

This is a logic error.

System Action: A system dump is taken. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC0B

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1906 *date time applid tranid* **The CICS ONC RPC connection manager found an error in the length of the CICS ONC RPC global work area.**

Explanation: The connection manager found that the length of its global work area is not correct.

System Action: A system dump is taken. CICS ONC RPC is disabled. It is not possible to enable CICS ONC RPC until DFHRPTRU has been correctly defined to CICS. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that DFHRPTRU has not been enabled by an operator command.

Destination: CRPO

Module: DFHRPC0B

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1907 *date time applid tranid* **The CICS ONC RPC connection manager found invalid data in the global work area.**

Explanation: The connection manager found invalid data in the global work area. This is probably caused by a storage overwrite.

System Action: A system dump is taken. CICS ONC RPC is disabled. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the reason for the storage overwrite

Destination: CRPO

Module: DFHRPC0B

XMEOUT Parameters: *date, time, applid, tranid*

DFHRP1950 *date time applid tranid* **The CICS ONC RPC connection manager detected a logic error. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager has received an unexpected response from CICS following an EXEC CICS command.

System Action: A system dump is taken. Registration of the 4-tuple currently being processed is not possible. The 4-tuple is not registered. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1951 *date time applid tranid* **The CICS ONC RPC connection manager could not load the requested XDR program** *xdrname***. EIBRESP:** *eibresp* **EIBRESP2:** *eibresp2* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager used EXEC CICS LOAD for the CICS program *xdrname*, which has been requested as the XDR routine for the 4-tuple being processed, but received an error response.

System Action: The 4-tuple is not registered.

User Response: The problem is probably due to an error in defining the requested program *xdrname* to CICS, or to wrongly defining an XDR routine name for the 4-tuple. Use the values provided in *eibresp* and *eibresp2* to identify the reason for the error in the LOAD, and use the CICS CEDA transaction or the connection manager to rectify the problem.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, xdrname, eibresp, eibresp2, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1952 *date time applid tranid* **The CICS ONC RPC connection manager could not load the XDR routine** *xdrname***. EIBRESP:** *eibresp* **EIBRESP2:** *eibresp2* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager used EXEC CICS LOAD for CICS program with name *xdrname*, which has been requested as the XDR routine for the 4-tuple being processed, but received an error response.

System Action: The 4-tuple is not registered.

User Response: Use the values provided in EIBRESP and EIBRESP2 to identify the reason for the error in the LOAD.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, xdrname, eibresp, eibresp2, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1953 *date time applid tranid* **The CICS ONC RPC connection manager detected a logic error when loading XDR routine** *xdrname***. EIBRESP:** *eibresp* **EIBRESP2:** *eibresp2* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager used EXEC CICS LOAD for the CICS program *xdrname*, which has been requested as the XDR routine for the 4-tuple being processed, but it received an unexpected response.

System Action: A system dump is taken. The 4-tuple is not registered. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, xdrname, eibresp, eibresp2, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1954 *date time applid tranid* **The CICS ONC RPC connection manager detected a logic error detected while registering a 4-tuple. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager has received an unexpected response from CICS following an EXEC CICS command.

System Action: A system dump is taken. The connection manager abends with abend code ARPV. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1955 *date time applid tranid* **The CICS ONC RPC connection manager could not register a 4-tuple because of an internal error. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager could not add an XDR routine name to an internal table.

System Action: The 4-tuple is not registered.

User Response: Try to register the 4-tuple again If the condition persists, you need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1956 *date time applid tranid* **CICS ONC RPC is being disabled. Requested operation not performed. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager is unable to complete the current register operation because CICS ONC RPC is in disable processing.

System Action: The 4-tuple is not registered.

User Response: Once CICS ONC RPC has completed disable processing, enable it again using the connection manager, and try the register operation again.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1957 *date time applid tranid* **CICS ONC RPC is not enabled, so the register operation could not be performed. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager is unable to complete the current register operation because CICS ONC RPC is not currently enabled. It may have been disabled by another connection manager transaction.

System Action: The 4-tuple is not registered.

User Response: Use the connection manager to enable CICS ONC RPC, and try the register operation again.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1958 *date time applid tranid* **The CICS ONC RPC connection manager could not register the 4-tuple because it was already registered. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager is unable to complete the current register operation because the requested 4-tuple is already registered.

System Action: The connection manager continues, but the 4-tuple is not registered.

User Response: This may be a temporary condition, so try the register again. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information. If the condition persists, see the *CICS External Interfaces Guide* for further guidance on how to proceed.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1959 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while registering a 3-tuple with TCP/IP for MVS. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager is unable to complete the current register operation because an error was returned by TCP/IP for MVS.

System Action: The connection manager continues, but the 4-tuple is not registered.

User Response: See the associated diagnostics issued by CICS and TCP/IP for MVS for problem determination. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1960 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while registering a 3-tuple with TCP/IP for MVS. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager is unable to complete the current register operation because an error was returned by TCP/IP for MVS. This may be on an **svcudp_create** or **svctcp_create** operation.

System Action: The connection manager continues, but the 4-tuple is not registered.

User Response: See the associated diagnostics issued by CICS and TCP/IP for MVS for problem determination. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1961 *date time applid tranid* **Data entered in field** *fieldname1* **is incompatible with data entered in field** *fieldname2***.**

Explanation: Data was entered on a connection manager panel in *fieldname1* that is incompatible with data entered in *fieldname2*.

System Action: The connection manager panel is redisplayed and the field in error is highlighted.

User Response: Enter compatible data in the fields indicated.

Destination: Terminal End User

Modules: DFHRPC0D, DFHRPC05

DFHRP1962 *date time applid tranid* **Enter the Program Number, Version Number, Procedure Number and Protocol for the 4-tuple to be displayed.**

Explanation: To retrieve information about a 4-tuple in the CICS ONC RPC data set you must supply the program number, version number, procedure number, and protocol.

System Action: None.

User Response: Enter the required data.

Destination: Terminal End User

Modules: DFHRPC0D, DFHRPC03

DFHRP1963 *date time applid tranid* **Enter the following fields before register or save to data set: Program Number, Version Number, Procedure Number, XDR Routines, and Program Name.**

Explanation: The following fields are required before registration or saving of the 4-tuple: the Program Number, Version Number, Procedure Number, Inbound XDR Routine, Outbound XDR Routine (if RPC Call Type of blocking), and Program Name.

System Action: The connection manager panel is redisplayed.

User Response: Enter valid data in the field(s) indicated.

Destination: Terminal End User

Modules: DFHRPC0D, DFHRPC05

DFHRP1964 *date time applid tranid* **Data entered in the Getlengths field is incompatible with data entered in the Server Input Length or Server Output Length fields.**

Explanation: Either you have specified YES for Getlengths and put information in Server Input Length or Server Output Length, or you have specified NO for Getlengths but put no information in Server Input Length and Server Output Length.

System Action: The connection manager panel is redisplayed.

User Response: Decide whether the lengths are to be specified on this panel, or to be supplied by the **Getlengths** function of the converter for this 4-tuple.

Destination: Terminal End User

Modules: DFHRPC0D, DFHRPC05

DFHRP1965 *date time applid tranid* **With Server Data Format of CONTIGUOUS, the Server Input Length and Server Output Length together must not exceed 32767 Bytes.**

Explanation: An invalid server data length has been detected on a CRPC panel. The maximum total data length which can pass between the alias and the CICS program that services the client request is 32767. If server data format of CONTIGUOUS is specified, the Server Input Length and the Server Output Length added together must not exceed this value.

System Action: The connection manager panel is redisplayed.

User Response: Enter valid data in the fields.

Destination: Terminal End User

Modules: DFHRPC0D, DFHRPC05

DFHRP1966 *date time applid tranid* **Procedure Number of 0 is not allowed.**

Explanation: A value of zero has been entered in the Procedure Number field. This is not allowed.

System Action: The connection manager panel is redisplayed, and the field in error is highlighted.

User Response: Enter valid data in the field indicated.

Destination: Terminal End User

Modules: DFHRPC0D, DFHRPC05, DFHRPC06

DFHRP1967 *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error while trying to register a 4-tuple. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager detected an internal error while trying to register a 4-tuple.

System Action: A system dump is taken. The connection manager continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See associated messages to find out whether the 4-tuple was registered. You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1968 *date time applid tranid* **The CICS ONC RPC connection manager has not performed a register operation because it detected an invalid global work area. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager is unable to complete the current register operation because it has detected an invalid global work area address. CICS ONC RPC may have been disabled by another connection manager transaction.

System Action: The connection manager continues, but the 4-tuple is not registered.

User Response: Use the connection manager to enable CICS ONC RPC, and try the register operation again. If message DFHRP0002 was issued to the console, the explanation of that message might contain more information.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1969 *date time applid tranid* **The CICS ONC RPC connection manager detected an abend in converter** *progname* **during Getlengths processing. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager is unable to complete the current register operation because it has detected an abend in the converter when invoking it for the **Getlengths** function.

System Action: The connection manager continues, but the 4-tuple is not registered.

User Response: Use CICS diagnostics to correct the converter.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, progname, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1970 *date time applid tranid* **The CICS ONC RPC connection manager has registered the 4-tuple. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The 4-tuple has been registered.

System Action: None.

User Response: None.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1980 *date time applid tranid* **The CICS ONC RPC connection manager cannot register the 4-tuple because it has already been registered. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The 4-tuple has already been registered.

System Action: The connection manager panel is redisplayed.

User Response: Enter a new 4-tuple for registration.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1981 *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error while registering a 4-tuple. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager has detected an internal error while registering the 4-tuple.

System Action: The 4-tuple is not registered.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1982 *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error detected while registering a 4-tuple. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager has detected an internal error while registering the 4-tuple.

System Action: Processing continues.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1983 *date time applid tranid* **The CICS ONC RPC connection manager detected an error while linking to the converter** *converter_program_name***. EIBRESP:** *eibresp* **EIBRESP2:** *resp2val* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager used EXEC CICS LINK for the converter to perform **Getlengths** processing for the 4-tuple. The response was PGMIDERR.

System Action: The 4-tuple is not registered.

User Response: Use the EIBRESP2 value to identify the problem.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, eibresp, resp2val, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1984 *date time applid tranid* **The CICS ONC RPC connection manager cannot link to converter** *converter_program_name* **because it is remote. EIBRESP:** *eibresp* **EIBRESP2:** *resp2val* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager used EXEC CICS LINK for the converter to perform **Getlengths** processing, but the response was TERMERR or SYSIDERR. The connection manager passes pointers to the converter, so the converter must be in the same CICS region as CICS ONC RPC.

System Action: The 4-tuple is not registered.

User Response: Install and define the converter program in the same CICS region as CICS ONC RPC.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, eibresp, resp2val, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1985 *date time applid tranid* **The CICS ONC RPC connection manager received an unexpected response from CICS while linking to converter** *converter_program_name***. EIBRESP:** *eibresp* **EIBRESP2:** *resp2val* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager used EXEC CICS LINK for the converter to perform **Getlengths** processing, but received an unexpected response.

System Action: The 4-tuple is not registered.

User Response: See the associated diagnostics issued by CICS for problem determination.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, eibresp, resp2val, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1986 *date time applid tranid* **The CICS ONC RPC connection manager is not authorized to link to converter** *converter_program_name***. EIBRESP:** *eibresp* **EIBRESP2:** *resp2val* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The connection manager used EXEC CICS LINK for the converter to perform **Getlengths** processing, but received a NOTAUTH response.

System Action: The 4-tuple is not registered.

User Response: When CICS ONC RPC is next disabled, redefine connection manager with RESSEC=NO.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, eibresp, resp2val, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1988 *date time applid tranid* **The CICS ONC RPC connection manager encountered an error in Getlengths processing in converter** *converter_program_name***. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: **Getlengths** returned URP_EXCEPTION.

System Action: The **Getlengths** parameter area is traced. The 4-tuple is not registered.

User Response: Use the trace information to correct the converter.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1989 *date time applid tranid* **The CICS ONC RPC connection manager encountered an error in Getlengths processing in converter** *converter_program_name***. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: **Getlengths** returned URP_INVALID.

System Action: The **Getlengths** parameter area is traced. The 4-tuple is not registered.

User Response: Use the trace information to correct the converter.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1990 *date time applid tranid* **The CICS ONC RPC connection manager encountered an error during Getlengths processing in converter** *converter_program_name***. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: **Getlengths** returned URP_DISASTER.

System Action: The **Getlengths** parameter area is traced. The 4-tuple is not registered.

User Response: Use the trace information to correct the converter.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1991 *date time applid tranid* **The CICS ONC RPC connection manager has detected an invalid server data length returned by the Getlengths function of converter** *converter_program_name***. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The communication area length calculated from the **glength_server_data_format**, **glength_server_input_data_len**, and **glength_server_output_data_len** parameters exceeds 32 767.

System Action: The **Getlengths** parameter area is traced. The 4-tuple is not registered.

User Response: Use the trace information to correct the converter.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP1992 *date time applid tranid* **The CICS ONC RPC connection manager has detected an invalid server data format returned by the Getlengths function of converter** *converter_program_name***. Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol***. Host IP address:** *hostaddr***.**

Explanation: The **glength_server_data_format** returned must have a value of URP_CONTIGUOUS or URP_OVERLAID.

System Action: The **Getlengths** parameter area is traced. The 4-tuple is not registered.

User Response: The **glength_server_data_format** must be set to URP_CONTIGUOUS or URP_OVERLAID, or left unaltered, in which case the value specified on panel DFHRP5 when the 4-tuple was registered will be used.

Destination: CRPO

Module: DFHRPC0E

XMEOUT Parameters: *date, time, applid, tranid, converter_program_name, X'prognum', X'versnum', X'procnum', protocol, hostaddr*

DFHRP2000 *date time applid tranid* **A browse of the CICS ONC RPC alias list could not be performed because another browse is active.**

Explanation: Only one task can browse the alias list at a time. This is enforced by use of an ENQ in the connection manager. However, the alias list component has been called to start a browse and has found that there is already a browse active. This is due either to a logic error in CICS ONC RPC code, or to a storage overwrite.

System Action: A system dump is taken. The browse request is rejected. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If the problem is due to a storage overwrite, it is almost certain that there are errors in other CICS functions for no apparent reason. If this is not the case, you may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CRPO

Module: DFHRPAL

XMEOUT Parameters: *date, time, applid, tranid*

DFHRSxxxx messages

DFHRS2110 *date time applid* **Abnormal reply to exchange log name request received from system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: An abnormal reply has been received in response to an exchange log name request sent either following a session failure or at first session initiation after system restart. The abnormal reply may indicate that:

- The remote system detected a warm or cold mismatch, or a log name mismatch.
- The remote system failed to interpret the exchange log name data sent to it.

System Action: For APPC protocol, any synclevel 2 attaches are inhibited. This prevents recoverable activity between the two systems.

For IRC protocol, the message indicates that resynchronization was attempted and failed.

User Response: The most likely cause of the message is an initial start (as opposed to emergency restart or its equivalent) of this system when the remote system has resynchronization work outstanding. If it is a cold or warm mismatch or log name mismatch, other diagnostic messages on the local system may indicate the reason for the error. If it is not, examine the log of the remote system which should have generated diagnostic information describing the reason for the abnormal response.

For APPC protocol where a logname mismatch is suspected, override the error situation by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

For IRC, the message may indicate an initial start of one system when the other has resynchronization outstanding; the resynchronization was started before the initial start occurred and becomes invalid. The associated unit of work may need to be committed by using CEMT SET UOW. The message should not recur.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname, protocol*

DFHRS2111 *date time applid* **Cold/Warm restart mismatch with system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: A cold start indication was received from the remote system during an exchange log names sequence. However, this system has units of work that need resynchronizing from the previous run. An exchange log names sequence is started either following a session failure or at first session initiation after system restart; both the local and remote systems may initiate the sequence at the same time.

System Action: Any synclevel 2 attaches are inhibited. This means that recovery activity between the two systems is prevented.

User Response: Override the error by issuing CEMT SET CONN(*sysid*) NOTPENDING commands for the failing connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition CICS does not carry out any APPC resynchronization with the remote system.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname, protocol*

DFHRS2112 *date time applid* **Log name mismatch with system** *sysid***, netname** *netname***, protocol** *protocol***. Expected LUNAME.LOGNAME** *local_logname* **Received LUNAME.LOGNAME** *remote_logname* **.**

Explanation: A failure has occurred in the exchange log names process which is carried out either following a session failure or at first session initiation after system restart. This system's memory of the remote system's log name conflicts with the log name sent by the remote system.

System Action: For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, resynchronization was attempted and failed.

User Response: For APPC, override the error by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition CICS does not carry out any APPC resynchronization activity with the remote system. The message may indicate a logic error in CICS or the remote system, and you may need assistance from IBM to prevent a recurrence. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

For IRC, the message may indicate the initial start of one system when the other has resynchronization outstanding; the resynchronization was started before the initial start occurred and becomes invalid. The associated unit of work may need to be committed by using CEMT SET UOW. The message should not recur.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname, protocol, local_logname, remote_logname*

DFHRS2113 *date time applid* **Log name mismatch with system** *sysid***, netname** *netname***, protocol** *protocol***, local LOGNAME** *local_logname* **, received LOGNAME** *remote_logname* **.**

Explanation: This message is issued when a failure has occurred in the exchange log names process which is carried out prior to resynchronization following an earlier session failure. System *sysid* has sent an exchange log names request which contains the remote system's memory (*remote_logname*) of this system's log name (*local_logname*).

This system has detected a log name mismatch. This indicates that system *sysid* and this system do not have the correct logs for resynchronization.

System Action: For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed.

User Response: For APPC, override the error by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition CICS does not carry out any APPC resynchronization activity with the remote system. The message may indicate a logic error in CICS or the remote system, and you may need assistance from IBM to prevent a recurrence. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

For IRC, the message may indicate the initial start of one system when the other has resynchronization outstanding; the resynchronization was started before the initial start occurred and becomes invalid. The associated unit of work may need to be committed by using CEMT SET UOW. The message should not recur.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname, protocol, local_logname, remote_logname*

DFHRS2114 *date time applid* **Abnormal termination of exchange log names sequence received from system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: This message is issued when an FMH7 has been received in response to an exchange log name reply. An exchange log names sequence is sent either following a session failure or at first session initiation after system restart. The remote system started the sequence, and the FMH7 reply indicates that the remote system failed to interpret the exchange log name reply data sent to it.

System Action: For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

User Response: Investigate the cause of the error using the system dump. Format the control blocks for the trace domain and the terminal control program. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

Determine from the message which session was being used for this exchange log names conversation.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. For IRC, the TIOA contains the equivalent data. Check the data against the format of the exchange log names reply GDS variable. The correct format of this SNA defined field can be found in the *SNA Formats* manual.

Examine the log of the remote system. If a protocol violation was detected, the remote system may have generated diagnostic information itself which may help to diagnose the cause.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname, protocol*

DFHRS2115 *date time applid protocol* **protocol support mismatch with system** *sysid***, netname** *netname***. Expected support byte** *X'ww'***, received support byte** *X'xx'***, expected extended support bytes** *X'yyyy'***, received extended support bytes** *X'zzzz'***.**

Explanation: This system's memory of the protocols previously negotiated with the remote system conflicts with the indicators sent in an exchange log names variable.

System Action: For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocols, resynchronization fails. Communications continue normally.

User Response: For APPC protocols, the indicators expected from a CICS Transaction Server system are: basic support, X'70'; extended support, X'C000'. For CICS/ESA 4.1 the expected indicators are: basic support, X'40'; extended support, X'0000'. If this combination of the four indicator fields appears in the message, first check that you have Initial started the partner system at the CICS Transaction Server level during a migration from CICS/ESA 4.1, or Cold started a CICS/ESA 4.1 system after running CICS Transaction Server. If this possibility can be ruled out, the message may indicate a logic error in CICS or in the remote system and you may need assistance from IBM to prevent a recurrence. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

You can override the error situation by issuing CEMT SET CONN(*sysid*) NORECOVDATA commands for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition CICS does not carry out any APPC resynchronization activity with the remote system.

For IRC protocols, you may need to use the CEMT SET UOW command to resolve the state of any units or work which cannot be resolved by the normal resynchronization process.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, protocol, sysid, netname, X'ww', X'xx', X'yyyy', X'zzzz'*

DFHRS2116 *date time applid* **Abnormal termination of exchange log names sequence received from system** *sysid***, netname** *netname***, protocol** *protocol***. The connection was in a cold state.**

Explanation: An FMH7 has been received in response to an exchange log names reply. An exchange log names sequence is sent either following a session failure or at first session initiation after system startup. This system was either started with the SIT parameter START=INITIAL or CEMT SET CONN(*sysid*) NORECOVDATA has been issued, both of which reset the state of the connection. This means that no log name is stored for the remote system.

For APPC protocols, the FMH7 reply may indicate one of two causes:

- The remote system has resynchronization work outstanding following a previous failure of a conversation during sync point processing and has detected a cold/warm mismatch.

- The remote system failed to interpret the exchange log names reply data sent to it.

For IRC protocol, the problem is caused by the failure of the remote system to interpret the exchange log names reply data.

System Action: For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

User Response: The most likely cause of the message is an initial start (as opposed to emergency restart or its equivalent) of this system when the other has resynchronization work outstanding. This can be confirmed by examining the message log of the remote system.

For APPC protocol, the connection on the remote system may need to be reset by issuing the CEMT SET CONN(sysid) NOTPENDING command against the connection entry for this system.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization.

For IRC protocol, a protocol violation or logic error is the only possible cause.

If a cold/warm mismatch is eliminated as the cause of the error, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname, protocol*

DFHRS2117 *date time applid* **Abnormal reply to exchange log names received from system** *sysid***, netname** *netname***, protocol** *protocol***. The connection on this system was in a cold state.**

Explanation: This message is issued when an abnormal reply has been received in response to an exchange log name request. An exchange log names sequence is sent either following a session failure or at first session initiation after system startup. This system was either started with the SIT parameter START=INITIAL, or CEMT SET CONN(*sysid*) NORECOVDATA has been issued, and no log name is stored for the remote system. The abnormal reply may indicate one of two causes in the case of APPC protocol.

- The remote system has resynchronization work outstanding following a previous failure of a conversation during sync point processing and has detected a cold/warm mismatch.
- The remote system failed to interpret the exchange log name data sent to it.

For IRC protocol, the problem is caused by the failure of the remote system to interpret the exchange log name data.

System Action: For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

User Response: The most likely cause of the message is an intial start (as opposed to emergency restart or its equivalent) of this system when the other has resynchronization work outstanding. This can be confirmed by examining the message log of the remote system.

For APPC protocol, the connection on the remote system may need to be reset by issuing the CEMT SET CONN(sysid) NOTPENDING command against the connection entry for this system.

Note: If this command is issued, CICS unilaterally commits any resources waiting for APPC resynchronization.

For IRC protocol, a protocol violation or logic error is the only possible cause.

If a cold/warm mismatch is eliminated as the cause of the error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname, protocol*

DFHRS2118 *date time applid* **Abnormal termination of exchange log names sequence received from system** *sysid***, netname** *netname***, protocol** *protocol***. There has been previous contact with that system.**

Explanation: This message is issued when an FMH7 has been received in response to an exchange log name reply.

An exchange log names sequence is sent either following a session failure or at first session initiation after system startup. Both systems have records of previous contact and have log names stored which were being verified by the exchange log names protocol, which was initiated by the remote system.

The FMH7 may indicate one of two causes:

- The remote system has detected a mismatch in the log names or protocol support indicated in the exchange log name reply sent to it.
- The remote system failed to interpret the exchange log name reply data sent to it.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

For LU6.2 protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

User Response: For APPC protocol, the connection may need to be reset by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

The cause of the error may be indicated by diagnostic information produced by the remote system. The system dump taken by local system can be used to investigate the possibility of an error in the exchange log names reply GDS.

Format the control blocks for the trace domain and the terminal control program. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

Determine from the message which session was being used for this exchange log names conversation.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. For IRC, the TIOA contains the equivalent data. Check that the data against the format of the exchange log names reply GDS variable. The correct format of this SNA defined field can be found in the *SNA Formats* manual.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname, protocol*

DFHRS2134 *date time applid* **An error has occurred while sending an exchange log names request on session** *sessid* **to remote system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: An error has occurred during the transmission of an exchange log names request to a remote system. CICS was attempting to establish the connection on first contact with the partner, or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This message implies a failure of the session used to carry the transmission.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

In many cases CICS continues to operate normally, and the resynchronization or connection establishment is retried in an attempt to overcome the session failure. However for APPC protocol, a repeated failure may have resulted in exchange log names flows being unsuccessful preventing any synclevel 2 attaches between the local system and the remote system.

For IRC protocol, resynchronization has failed but the connection continues to operate normally.

User Response: Issue CEMT INQUIRE CONN(*sysid*) and look at the XOK field. If exchange log names has not been done, the exchange log names process can be retried by issuing the CEMT SET CONN(*sysid*) RESYNC command.

Investigate the cause of the error using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system, and examine the log of the remote system. If a protocol violation was detected, the remote system may have generated diagnostic information itself.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

Determine from the message which session was being used for this exchange log names conversation.

If the internal trace table is available, use it to track the commands issued against that session and check that the state transitions of the User state machine are correct. If any of the state transitions are not valid, it is possible that there has been a CICS logic error.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2135 *date time applid* **An error has occurred while sending a compare states request on session** *sessid* **to remote system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: An error has occurred during the transmission of a compare states request to a remote system. CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This implies one of the following:

- The remote system has detected a protocol violation in the local system's exchange log names GDS variable.
- Some other error in communications has occurred.

System Action: For APPC protocol connections (but not IRC protocol), the failure may have prevented the completion of the exchange log names protocol and this prevents any synclevel 2 attaches between the local system and the remote system.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: For APPC protocol, investigate the state of the connection. Issue CEMT INQUIRE CONN(*sysid*) and look at the XOK field. If exchange log names has not been done, the exchange log names process can be retried by issuing the CEMT SET CONN(*sysid*) RESYNC command. If there has been previous successful contact between the systems the connection can be reset to its original state and retried. The state can be reset by issuing CEMT SET CONN(*sysid*) NORECOVDATA. It may be necessary to issue this command on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

The cause of the error may be indicated by diagnostic information produced by the remote system. Use the system dump taken by the local system to investigate the possibility of an error in the GDS variables.

Format the control blocks for the trace domain and the terminal control program. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

Determine from the message which session was being used for this exchange log names conversation.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. For IRC, the TIOA contains the equivalent data. Check that the data against the format of the exchange log names and compare states GDS variables. The correct format of this SNA defined field can be found in the *SNA Formats* manual.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2136 *date time applid* **An error has occurred while receiving an exchange log names reply on session** *sessid* **from remote system** *sysid*, **netname** *netname*, **protocol** *protocol*.

Explanation: An error has occurred during an attempt to receive exchange log names reply data from a remote system. CICS was attempting to initialize the connection, or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

The message means that:

- The remote system has detected a protocol violation in the local system's exchange log names GDS variable or compare states GDS variable and sent an FMH7 to indicate the error.
- Some other error in communication has occurred in either the local or the remote system.

System Action: For APPC protocol the failure of exchange log names may mean that any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: For APPC protocol, investigate the state of the connection. Issue CEMT INQUIRE CONN(*sysid*) and look at the XOK field. If exchange log names has not been done, the exchange log names process can be retried by issuing the CEMT SET CONN(*sysid*) RESYNC command. If there has been previous successful contact between the systems the connection may be reset to its original state and retried. The state can be reset by issuing CEMT SET CONN(*sysid*) NORECOVDATA. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition CICS does not carry out any APPC resynchronization activity with the remote system.

The cause of the error may be indicated by diagnostic information produced by the remote system. Use the system dump taken by the local system to investigate the possibility of an error in the GDS variables.

Format the control blocks for the trace domain and the terminal control program. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

Determine from the message which session was being used for this exchange log names conversation.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. For IRC, the TIOA contains the equivalent data. Check the data against the format of the exchange log names and compare states GDS variables. The correct format of this SNA defined field can be found in the *SNA Formats* manual.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2137 *date time applid* **An error has occurred while receiving a compare states reply on session** *sessid* **from remote system** *sysid*, **netname** *netname*, **protocol** *protocol*.

Explanation: An error has occurred during the receipt of a compare states reply from a remote system. CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This implies one of the following:

- The remote system has detected a protocol violation in the local system's compare states GDS variable.
- There has been an internal error in CICS APPC processing.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

CICS continues to operate normally and the resynchronization attempt is retried at the next opportunity.

User Response: Investigate the cause of the error first by examining the log of the remote system which may have produced diagnostic information about the data it received. The problem can be investigated locally using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain and the terminal control program. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

Determine from the message which session was being used for this resynchronization conversation.

If the internal trace table is available, use this to track the commands issued against that session and check that the state transitions of the user state machine are correct. If any of the state transitions are not valid, it is possible that there has been a CICS logic error.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. Similar information is contained in the TIOA for IRC sessions. Locate the data for the session in question, and check that the contents of the buffer are correct. The buffer contains the compare states GDS variable. The correct format of this SNA defined data can be found in the *SNA Formats* manual.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2138 *date time applid* **Invalid exchange log names reply data has been received on session** *sessid* **from remote system** *sysid*, **netname** *netname*, **protocol** *protocol*.

Explanation: The local system has received data which it attempted to parse using the exchange log names reply GDS format. Either the data could not be parsed, or invalid data was detected.

This system was attempting to initialize the connection for synclevel 2 work, or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. Exchange log names was sent and an invalid reply received.

This failure implies an error in the remote system or a CICS logic error.

System Action: If resynchronization was being attempted it has failed and is retried at the next opportunity.

For APPC protocol connections (but not IRC protocol) the failure prevents the completion of the exchange log names protocol and this may prevent any synclevel 2 attaches between the local system and the remote system.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: For APPC protocol, investigate the state of the connection. Issue CEMT INQUIRE CONN(*sysid*) and look at the XOK field. If exchange log names has not been done, the exchange log names process can be retried by issuing the CEMT SET CONN(*sysid*) RESYNC command. If there has been previous successful contact between the systems the connection may be reset to its original state and retried. The state can be reset by issuing CEMT SET CONN(*sysid*) NORECOVDATA. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

An exception trace entry contains the received data, and the reason for the failure is interpreted. Check the format of the exchange log names reply GDS variable. The correct format of this SNA defined field can be found in the *SNA Formats* manual.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2139 *date time applid* **Invalid compare states reply data has been received on session** *sessid* **from remote system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: The local system has received data which it attempted to parse using the compare states reply GDS format. Either the data could not be parsed or invalid data was detected.

The local system was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. Data from the remote system received in reply to the compare states was invalid.

This failure implies an error in the remote system or a CICS logic error.

System Action: A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

The failure prevents the completion of the resynchronization of distributed resources.

User Response: Investigate any units of work for which resynchronization is outstanding using the CEMT INQUIRE UOWLINK SYSID(*sysid*) command. Use the same command on the remote system to determine whether to commit or backout the unit of work. Alternatively, for APPC connections, resynchronization can be overridden by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for resynchronization. Also, CICS does not carry out any resynchronization activity with the remote system.

Investigate the cause of the error using the system dump. Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

An exception trace entry contains the received data, and the reason for the failure is interpreted. Check the format of the compare states reply GDS variable. The correct format of this SNA defined field can be found in the *SNA Formats* manual.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2140 *date time applid* **A protocol violation has occurred while resynchronizing with remote system** *sysid***, netname** *netname***, protocol** *protocol***, via session** *sessid***. The resynchronization was initiated by the local system.**

Explanation: The local system has detected a protocol violation while resynchronizing with the remote system. CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. The resynchronization was initiated by the local system.

This implies one of the following:

- An error was detected by the remote system and the resynchronization sequence was abnormally terminated.
- A logic error exists in the remote system which caused it to send invalid data.
- A CICS logic error.

System Action: CICS continues to operate normally and the resynchronization attempt is retried at the next opportunity.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Diagnostics may have been output by the local CICS system, the access methods, or the operating system. Also, investigate the cause of the error in the remote system. It may have produced diagnostic messages indicating why the resynchronization sequence was terminated.

The resynchronization sequence can be analyzed locally by formatting the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

Determine from the message which session was being used for this resynchronization conversation.

The trace entries for the DFHCRRSY program show the state of the conversation which was being used and the data received. At the point of failure a confirmation was expected from the remote system as the final flow in the sequence but was not received.

Compare the resynchronization flows with those documented in the *SNA LU6.2 Reference: Peer Protocols* manual, (SC30-6808). A possible cause of this error is that the remote system did not observe the correct protocols. Investigation at the remote system may be necessary.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname, protocol, sessid*

DFHRS2141 *date time applid* **A protocol violation has occurred while resynchronizing with remote system** *sysid***, netname** *netname***, protocol** *protocol***, via session** *sessid***. The resynchronization was initiated by the remote system.**

Explanation: The local system has detected a protocol violation while resynchronizing with the remote system. CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. The resynchronization was initiated by the remote system.

This implies one of the following:

- An error was detected by the remote system and the resynchronization sequence was abnormally terminated.
- A logic error exists in the remote system which caused it to send invalid data.
- A CICS logic error.

System Action: CICS continues to operate normally and the resynchronization attempt is retried at the next opportunity.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See any diagnostics output by the local CICS system, the access methods, or the operating system. Also, investigate the cause of the error in the remote system; it may have produced diagnostic messages indicating why the resynchronization sequence was terminated.

The resynchronization sequence can be analyzed locally by formatting the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

Determine from the message which session was being used for this resynchronization conversation.

The trace entries for the DFHCRRSY program show the state of the conversation which was being used and the data received. At the point of failure a request confirmation message was expected from the remote system as the third flow in the sequence but was not received.

Compare the resynchronization flows with those documented in the *SNA LU6.2 Reference: Peer Protocols* manual, (SC30-6808). A possible cause of this error is that the remote system did not observe the correct protocols; investigation at the remote system may be necessary.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname, protocol, sessid*

DFHRS2142 *date time applid* **Compare states request data could not be received on session** *sessid* **from remote system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: The local system has received an exchange log names request from the remote system but failed while attempting to receive subsequent data which was assumed to be a compare states GDS variable. The remote system was probably attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This implies one of the following:

- An error in the remote system
- A session failure during the resynchronization
- A CICS logic error.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

The resynchronization attempt should be retried at the next opportunity by the remote system. However, for APPC protocol connections, the failure may have resulted in exchange log names flows being unsuccessful and this prevents any synclevel 2 attaches between the local system and the remote system.

User Response: Issue CEMT INQUIRE CONN(*sysid*) and look at the XOK field. If exchange log names has not been done, the error situation may be correctable by issuing CEMT SET CONN(*sysid*) RESYNC. If this fails to cure the problem, resynchronization can be canceled for an APPC connection by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for resynchronization. In addition, CICS does not carry out any resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

Locate the exception trace entries for the DFHCRRSY program and examine any data sent by the remote system. Also examine the state of the conversation at the point of failure. It should have been in receive state.

A possible cause is that the remote system did not send valid data or failed to follow the protocol for compare states. Compare the resynchronization flows with those documented in the *SNA LU6.2 Reference: Peer Protocols* manual, (SC30-6808). Investigation at the remote system may be necessary.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2143 *date time applid* **Do_know confirmation was not received on session** *sessid* **from remote system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: The local system sent a Do_know GDS variable to the remote system but did not receive a valid reply. This indicates an earlier failure of a protected conversation during sync point processing and the resolution of the unit of work. This system was using the Do_know GDS variable to cause resynchronization to be started by the remote system.

This implies an error in the remote system or a CICS logic error.

System Action: The resynchronization attempt should be retried at the next opportunity by the remote system.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Issue CEMT SET CONN(*sysid*) RESYNC to cause resynchronization to be retried.

Investigate the cause of the error using the system dump and any previously output diagnostic information provided by CICS, the access methods or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

Locate the exception trace entries for the DFHCRRSY program and examine any data sent by the remote system. Also examine the state of the conversation at the point of failure.

A possible cause is that the remote system did not send valid data, or failed to follow the protocol for Do_Know in which case it may be necessary to obtain further diagnostic material from the remote system.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2144 *date time applid* **System_restart confirmation was not received on session** *sessid* **from remote system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: The local system sent a System_restart GDS variable to the remote system but did not receive a valid reply. This indicates that the local system has restarted and not previously contacted the remote system as part of the initiation of resynchronization protocols.

This indicates an error in the remote system or a CICS logic error.

System Action: The transmission of the message is retried the next time the connection is initialized.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Issue CEMT SET CONN(*sysid*) RESYNC to cause transmission to be retried.

Investigate the cause of the error using the system dump and any diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

Locate the exception trace entries for the DFHCRRSY program and examine any data sent by the remote system. Also examine the state of the conversation at the point of failure.

A possible cause is that the remote system did not send valid data or failed to follow the protocol for the System_restart message. In this case it may be necessary to obtain further diagnostic material from the remote system.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2145 *date time applid* **Invalid exchange log names data has been received on session** *sessid* **from remote system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: The local system has received data which it attempted to parse using the exchange log names GDS format. Either the data could not be parsed or invalid data was detected.

The remote system was attempting to initialize the connection for synclevel 2 work or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. Exchange log names is sent in both of these cases.

This failure indicates either an error in the remote system or a CICS logic error.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

If resynchronization was being attempted, it has failed and is retried at the next opportunity.

For APPC protocol connections (but not IRC protocol), the failure prevents the completion of the exchange log names protocol. This prevents any synclevel 2 attaches between the local system and the remote system.

User Response: For APPC protocol connections, issue CEMT INQUIRE CONN(*sysid*) and look at the XOK field. If exchange log names has not been done but there has been previous contact between the systems, the error can be overridden by resetting the state of the connection. To do this, issue CEMT SET CONN(*sysid*) NORECOVDATA commands for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources waiting for APPC resynchronization. Also CICS does not carry out any APPC resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

An exception trace entry contains the received data, and the reason for the failure is interpreted. Check the format of the exchange log names GDS variable. The correct format of this SNA defined field can be found in the *SNA Formats* manual.

The format of the GDS variable is incorrect and the cause of the error should be located. A likely cause is that the remote system did not send a valid GDS variable in which case it may be necessary to obtain further diagnostic material from the remote system.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2146 *date time applid* **Invalid compare states data has been received on session** *sessid* **from remote system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: The local system has received data which it attempted to parse using the compare states GDS format. Either the data could not be parsed or invalid data was detected.

The remote system was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This failure indicates either an error in the remote system or a CICS logic error.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

The failure prevents the completion of the resynchronization of distributed resources.

User Response: Investigate any units of work for which resynchronization is outstanding using the command CEMT INQUIRE UOWLINK SYSID(*sysid*). Use the same command on the remote system to determine whether to commit or backout the unit of work. Alternatively, resynchronization can be overridden by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for resynchronization. In addition CICS does not carry out any resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

An exception trace entry contains the received data, and the reason for the failure is interpreted. Check the format of the compare states GDS variable. The correct format of this SNA defined field can be found in the *SNA Formats* manual.

The format of the GDS variable is incorrect and the cause of the error should be located. A possible cause is that the remote system did not send a valid GDS variable, in which case it may be necessary to obtain further diagnostic material from the remote system.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2147 *date time applid* **Unrecognized data was received following transmission of an exchange log names reply on session** *sessid* **to remote system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: An exchange log names request was received from another system and a reply was sent. More data was expected from the other system but this was not recognized as part of the exchange log names protocol.

This implies one of the following:

- The remote system has detected a protocol violation in the local system's exchange log names reply GDS variable.
- There has been an internal error in CICS processing.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

For APPC protocol, the failure may have resulted in no exchange log name flows being successful preventing any synclevel 2 attaches between the local system and the remote system.

For IRC protocol, resynchronization may fail but communications links remain active.

User Response: For links using APPC protocol, issue CEMT INQUIRE CONN(*sysid*) and look at the XOK field. If exchange log names has not been done, the error situation can be overridden by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any diagnostic information provided by CICS, the access methods, or the operating system. The remote system may also have created diagnostic messages if it detected an error in the data it received.

The data sent by the local system can be investigated by formatting the system dump to show the control blocks belonging to the trace domain and the terminal control program. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

Determine from the message which session was being used for this exchange log names conversation.

If the internal trace table is available, use it to track the commands issued against that session and check that the state transitions of the user state machine are correct. If any of the state transitions are not valid, it is possible that there has been a CICS logic error.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. The TIOA contains similar information for IRC. Locate the send/receive buffer for the session in question and check that the contents of the buffer are correct. The buffer should contain a valid exchange log names GDS reply variable. The correct format of this SNA defined field can be found in the *SNA Formats* manual.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2148 *date time applid* **Resynchronization with system** *sysid***, netname** *netname***, protocol** *protocol* **was attempted but was terminated because no partner log name was found.**

Explanation: CICS has initiated a resynchronization sequence following the failure of a protected conversation during syncpoint processing. No valid log name was found for the partner system. The resynchronization could not continue.

This message indicates that a CEMT SET CONNECTION NORECOVDATA command was issued before the resynchronization with the partner system could be completed. The UOW and UOWLINK describing the outstanding work have also been deleted.

System Action: None

User Response: None. This message is issued for information only.

Destination: CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname, protocol*

DFHRS2149 *date time applid* **Resynchronization/Exchange log names with system** *netname* **(protocol** *protocol***) could not be executed because no suitable connection entry was found.**

Explanation: CICS has initiated a resynchronization sequence following the failure of a protected conversation during syncpoint processing. Data exists describing the conversation but no suitable connection definition was found for the partner system. The resynchronization could not continue because communications could not be established.

System Action: Processing continues.

User Response: The condition may be due to the discarding of the connection definition or to a cold start which has caused a connection definition to be deleted by CICS; the definition may have been autoinstalled. An autoinstalled definition may be reinstalled by subsequent activity in the system. Alternatively, a suitable definition can be installed manually using CEDA.

Destination: CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, netname, protocol*

DFHRS2150 *date time applid* **Invalid data has been received during the resynchronization sequence on session** *sessid* **from remote system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: The local system has received data which it attempted to parse as one of the following types of SNA GDS data:

Exchange log names
Do_know
System_restart

The data could not be recognized.

The remote system was attempting to initialize the connection for synclevel 2 work, or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This failure implies one of the following:

- An error was detected by the remote system and it sent an error indication in an FMH7.
- An error has occurred in the remote system.
- A CICS logic error has occurred.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

If resynchronization was being attempted, it has failed and is retried at the next opportunity.

For APPC protocol connections (but not IRC protocol), the failure prevents the completion of the exchange log names protocol and this prevents any synclevel 2 attaches between the local system and the remote system.

User Response: For APPC protocol connections, issue CEMT INQUIRE CONN(*sysid*), and examine the XOK field. If exchange log names has not been done but there has been previous contact between the systems, the error can be overridden by resetting the state of the connection. To do this, issue the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note: If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on this, see the *CICS Problem Determination Guide*.)

An trace entry contains the received data. Check the format of this data. The correct format of the SNA defined field can be found in the *SNA Formats* manual.

A possible cause is that the remote system did not send a valid GDS variable. In this case, it may be necessary to obtain further diagnostic material from the remote system.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2151 *date time applid* **Invalid data has been received during the resynchronization sequence on session** *sessid* **from remote system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: The local system was attempting to receive data as part of a resynchronization sequence but the conversation was in the wrong state or an error FMH was received.

The remote system was attempting to initialize the connection for synclevel 2 work or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

The failure implies one of the following:

- An error was detected by the remote system and it sent an error indication in an FMH7.
- An error occurred in the remote system
- A CICS logic error has occurred.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

If resynchronization was being attempted, it has failed and will be retried at the next opportunity.

User Response: The sequence of resynchronization can be retried by issuing CEMT SET CONN(*sysid*) RESYNC.

Investigate the cause of the error using the system dump and any diagnostic information already issued by CICS, the access methods or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

The trace entries show the state of the conversation with the remote system and the arrival of any error FMH indicating an error detected in the remote system. If necessary, obtain further diagnostic material from the remote system.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2152 *date time applid* **A conversation error has occurred during resynchronization sequence on session** *sessid* **initiated to remote system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: The local system has initiated a sequence of resynchronization exchanges with the partner system and has completed one or more of them. The conversation is not in the right state to continue the process.

The failure indicates either an error in the remote system or a CICS logic error.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

If resynchronization was being attempted, it has failed and is retried at the next opportunity.

User Response: The sequence of resynchronization can be retried by issuing CEMT SET CONN(*sysid*) RESYNC.

Investigate the cause of the error using the system dump and any diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

The trace entries show the state of the conversation with the remote system. The arrival of any error FMH indicates an error in the remote system. In this case it may be necessary to obtain further diagnostic material from the remote system.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2153 *date time applid* **An error has occurred while sending a system_restart request on session** *sessid* **to remote system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation: An error has occurred during the transmission of a System_restart request to a remote system. CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This implies one of the following:

- The remote system has detected a protocol violation during the preceding exchange log names sequence.
- Some other error in communications has occurred.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: The cause of the error may be indicated by diagnostic information produced by the remote system. Diagnostics issued by the local system, the access method, or the operating system may indicate a reason for the failure. Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the *CICS Problem Determination Guide*.)

Determine from the message which session was being used for this exchange log names conversation.

If the internal trace table is available, use it to track the commands issued against the session reported in the message. Check that the state transitions of the user state machine are correct and that the conversation was in send state at the time of the error. If any of the state transitions are not valid, there may have been a CICS logic error.

Destination: Console and Transient Data Queue CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sessid, sysid, netname, protocol*

DFHRS2154 *date time applid* **A logic error has occurred during resynchronization with system** *sysid***, netname** *netname***.**

Explanation: A logic error has occurred during resynchronization with the partner system.

The local data associated with the resynchronization was locked at the start of processing but could not be unlocked at the end.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

An ASQL abend is subsequently issued by the transaction processing the resynchronization, and a transaction dump is taken.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname*

DFHRS2155 *date time applid* **Affinity changed by partner resource known as connection** *sysid***, netname** *netname***. Old LUNAME was** *old-luname***, new LUNAME is** *new-luname***.**

Explanation: A change in the generic resource member associated with the partner system has occurred but the local system has resynchronization work to complete.

The local system has previously made contact with the generic resource known as connection *sysid* (netname *netname*), and synclevel(2) work has been exchanged with the assigned member, identified by *old-luname*. Since that time, the affinity with *old-luname* has been changed to *new-luname* by action in the remote system. Resynchronization of the synclevel(2) work cannot take place.

System Action: No system action is taken, but subsequent messages may indicate an exchange log names failure which could prevent the connection being used for synclevel(2) work. Alternatively, messages may indicate that resynchronization work has subsequently been erased by CICS as a result of the XLNACTION setting on the connection definition.

Destination: CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname, old-luname, new-luname*

DFHRS2156 *date time applid* **A logic error occurred during resynchronization with system** *sysid***, netname** *netname***.**

Explanation: The CLS2 transaction was processing exchange lognames or resynchronization for a connected partner identified by a netname *netname*. The connection entry associated with this netname is *sysid*, and was located and locked, but could not be unlocked in subsequent processing. This indicates a CICS internal logic error.

System Action: A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

An ASQK abend is subsequently issued by the transaction processing the resynchronization, and a transaction dump is taken.

User Response: The condition indicates an error in the CICS table manager (which may have produced its own exception trace records), or in the resynchronization program itself. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname*

DFHRS2157 *date time applid* **A logic error has occurred during resynchronization with system** *sysid***, netname** *netname***.**

Explanation: The CLS2 transaction was executing exchange log names and attempted to save a log name received from system *sysid* (netname *netname*) by invoking the CICS recovery manager domain. This operation failed because of a CICS internal error in the recovery manager domain or in the resynchronization program.

System Action: The transaction is terminated with a transaction dump. A system dump is taken unless you have specifically suppressed dumps in the dump table. Abend ASQI is subsequently issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname*

DFHRS2158 *date time applid* **A logic error has occurred during resynchronization with system** *sysid***, netname** *netname***.**

Explanation: The CLS2 transaction was executing exchange log names or resynchronization with system *sysid* (netname *netname*). A CICS internal error prevented the successful completion of the operation.

System Action: The transaction is terminated with a transaction dump. A system dump is taken unless you have specifically suppressed dumps in the dump table. Abend ASQB may subsequently be issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHCRRSY

XMEOUT Parameters: *date, time, applid, sysid, netname*

DFHRTxxxx messages

DFHRT0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the *OS/390 MVS System Codes* manual.

Next, look up the CICS abend code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

For further information about *code*, see the *CICS Problem Determination Guide*.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHRTSU

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHRT0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHRTSU

XMEOUT Parameters: *applid, X'code', modname*

DFHRT4401 *time applid* **No transaction identification specified. Please try again.**

Explanation: The terminal operator has not entered an identifier for this transaction.

System Action: CICS processing continues.

User Response: Enter a valid transaction identifier.

Destination: Terminal End User

Module: DFHRTE

DFHRT4402 *time applid* **You cannot use a Program Function key to start transactions on other systems.**

Explanation: Program function keys cannot be used to initiate a transaction on another system using the routing transaction (CRTE).

System Action: CICS processing continues.

User Response: Enter a valid transaction identifier.

Destination: Terminal End User

Module: DFHRTE

DFHRT4403 *time applid* **The routing session to system** *sysid* **has been terminated. Further transactions will not be routed to the connected system.**

Explanation: The routing session has been terminated. Subsequent transaction identifiers will not be shipped to the connected system.

System Action: CICS processing continues without the connection to system *sysid*.

User Response: If you need to use system *sysid*, investigate why the routing session has terminated.

Destination: Terminal End User

Module: DFHRTE

DFHRT4404 *time applid* **Please change format of request to CRTE SYSID=XXXX,TRPROF=YYYYYYYY.**

Explanation: The request to the routing transaction CRTE contained incorrect syntax.

System Action: CICS processing continues.

User Response: Reenter the request to the routing transaction CRTE using the correct syntax.

Destination: Terminal End User

Module: DFHRTE

DFHRT4405 *time applid* **System** *sysid* **cannot be found. Please check that you have used the correct system name.**

Explanation: System *sysid* is not defined to CICS.

System Action: CICS processing continues.

User Response: Check that you have used the correct system name. Either reenter the request specifying the correct system name, or define system *sysid* to CICS.

Destination: Terminal End User

Module: DFHRTE

DFHRT4406 *time applid* **System** *sysid* **is not in service or is released.**

Explanation: The system *sysid* is not currently in service, or is released.

System Action: CICS processing continues. If a routing session had been established before the connection became unavailable, it remains in force until the user enters CANCEL. If the connection becomes usable before this, transactions are again routed. If this message is in response to the initial CRTE command, no routing session is in force and no routing is attempted for subsequent terminal input.

User Response: Wait until system *sysid* becomes available. Enter CANCEL to terminate an existing routing session.

Destination: Terminal End User

Module: DFHRTE

DFHRT4407 *time applid* **This system does not include support of Intersystem Communication.**

Explanation: The system has not been generated with support for intersystem communication.

System Action: CICS processing continues without support for intersystem communication.

User Response: Generate the system with support for intersystem communication.

Destination: Terminal End User

Module: DFHRTE

DFHRT4408 *time applid* **Terminal** *termid* **is not of the type supported by routing transaction** *tranid***.**

Explanation: The routing transaction does not support the type of terminal being used.

System Action: CICS processing continues without support for terminal *termid*.

User Response: Use a terminal of the type supported by the routing transaction, that is, a 3270 display terminal or a console.

Destination: Terminal End User

Module: DFHRTE

DFHRT4409 *time applid* **The routing session to system** *sysid* **has been started.**

Explanation: The routing session has been started.

System Action: CICS processing continues.

User Response: None.

Destination: Terminal End User

Module: DFHRTE

DFHRT4410 *time applid* **System** *sysid* **is unavailable. The routing session to it is terminated.**

Explanation: The routing transaction has been terminated because the system became unavailable. Subsequent transaction identifiers will not be shipped to the connected system.

System Action: CICS processing continues.

User Response: If appropriate, re-enter the transaction when the routing session to system *sysid* becomes available.

Destination: Terminal End User

Module: DFHRTE

DFHRT4411 *time applid* **The Communication Profile cannot be found.**

Explanation: The profile, specified for a transaction invoked from the terminal to which the message is directed, is not defined to CICS.

System Action: CICS stops initialization of the transaction.

User Response: Define the communication profile to CICS and reinvoke the transaction. For further information on how to define the profile, refer to the *CICS Distributed Transaction Programming Guide*.

Destination: Terminal End User

Module: DFHRTE

DFHRT4412 *time applid* **The transaction code is not defined on the remote system.**

Explanation: A transaction identification, routed to a remote CICS system, is not an installed transaction definition in the remote system. CICS directs this message to the terminal at which the transaction identification was entered.

This message is similar to DFHAC2001 in a local system.

System Action: CICS stops initialization of the transaction.

User Response: Enter a valid transaction ID, or install the transaction on the remote system.

Destination: Terminal End User

Module: DFHZTSP

DFHRT4413 *time applid* **The transaction has been disabled on the remote system.**

Explanation: A transaction, routed to a remote CICS system, is disabled in the installed transaction definition of the remote system. CICS directs this message to the terminal at which the transaction identification was entered.

This message is similar to DFHAC2008 in a local system.

System Action: CICS stops initialization of the transaction.

User Response: Enable the transaction on the remote system.

Destination: Terminal End User

Module: DFHZTSP

DFHRT4414 *time applid* **Transaction** *tranid* **cannot run. CICS shutdown is in progress in the remote system.**

Explanation: A transaction *tranid* was routed to a remote CICS system that was being quiesced. CICS directs this message to the terminal at which the transaction identification was entered.

This message is similar to DFHAC2007 in a local system.

System Action: The remote CICS system continues quiescing.

User Response: Reenter the transaction when the remote CICS system is in normal execution mode.

Destination: Terminal End User

Module: DFHZTSP

DFHRT4415 *time applid* **Transaction CXRT was invoked directly by terminal input. This is not allowed.**

Explanation: The transaction code CXRT, which is reserved for an internal CICS transaction, was entered from a terminal.

System Action: The transaction is run with no effect.

User Response: Do not enter transaction code CXRT at a terminal.

Destination: Terminal End User

Module: DFHCRT

DFHRT4416 *date time applid* **Abend** *abcode* **has occurred in the** *{Dynamic | Distributed}* **Routing Program. Module name:** *modname***.**

Explanation: Either the dynamic routing program or the distributed routing program has abnormally terminated with abend code *abcode*.

System Action:

1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

User Response: See the description of abend code *abcode* for further guidance.

If the code is not a CICS transaction abend code, it is a user abend code. Request an explanation from the programmer responsible for this area.

Destination: CSMT

Modules: DFHAPRT, DFHEIIC, DFHEPC, DFHICXM

XMEOUT Parameters: *date, time, applid, abcode, {1=Dynamic, 2=Distributed}, modname*

DFHRT4417 *date time applid* **Abend** *abcode* **in** *modname* **-** *{Dynamic | Distributed}* **routing program must be AMODE=31.**

Explanation: CICS has failed to link to EITHER the dynamic routing program OR the distributed routing program because it is not AMODE 31.

System Action:

1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

User Response: Recompile, reassemble, and link edit the dynamic routing program to AMODE 31.

Destination: CSMT

Modules: DFHAPRT, DFHEIIC, DFHEPC, DFHICXM

XMEOUT Parameters: *date, time, applid, abcode, modname, {1=Dynamic, 2=Distributed}*

DFHRT4418 *date time applid* **Abend** *abcode* **in** *modname* **-** *{Dynamic | Distributed}* **routing program PPT entry not found.**

Explanation: CICS was unable to find a PPT entry for EITHER the dynamic routing program OR the distributed routing program.

System Action:

1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

User Response: Ensure that EITHER

1. the dynamic routing program specified by the system initialization parameter DTRPGM=*program name*, or specified via the EXEC CICS SET SYSTEM DTRPROGRAM(*program name*) has been correctly defined to CICS
2. the distributed routing program specified by the system initialization parameter DSRTPGM=*program name*, or specified via the EXEC CICS SET SYSTEM DSRTPROGRAM(*program name*) has been correctly defined to CICS

Destination: CSMT

Modules: DFHAPRT, DFHEIIC, DFHEPC, DFHICXM

XMEOUT Parameters: *date, time, applid, abcode, modname, {1=Dynamic, 2=Distributed}*

DFHRT4419 *date time applid* **Abend** *abcode* **in** *modname* **- Fetch for** *{dynamic | distributed}* **routing program failed.**

Explanation: CICS was unable to load EITHER the dynamic routing program or. the distributed routing program.

System Action:

1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

User Response: Ensure that EITHER

1. the dynamic routing program specified by the system initialization parameter DTRPGM=*program name*, or specified via the EXEC CICS SET SYSTEM DTRPROGRAM(*program name*) has been correctly defined. Ensure that it is also in a load library accessible to CICS.
2. the distributed routing program specified by the system initialization parameter DSRTPGM=*program name*, or specified via the EXEC CICS SET SYSTEM DSRTPROGRAM(*program name*) has been correctly defined. Ensure that it is also in a load library accessible to CICS.

Destination: CSMT

Modules: DFHAPRT, DFHEIIC, DFHEPC, DFHICXM

XMEOUT Parameters: *date, time, applid, abcode, modname, {1=dynamic, 2=distributed}*

DFHRT4420 *date time applid* **Abend** *abcode* **in** *modname* **- Link to the** *{dynamic | distributed}* **routing program failed.**

Explanation: An unexpected return code was returned from the link to the dynamic routing program.

System Action:

1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHAPRT, DFHEIIC, DFHEPC, DFHICXM

XMEOUT Parameters: *date, time, applid, abcode, modname, {1=dynamic, 2=distributed}*

DFHRT4421 *date time applid* **Unable to Delete remote Terminal** *termid* **that is connected to system** *sysid***.**

Explanation: A transaction could not be started because the remote terminal definition for *termid*, system *sysid* was flagged for deletion but the DELETE failed. This might indicate a transaction looping on the terminal.

System Action: The user transaction abends with abend code AZTI.

User Response: See the associated DFHZCxxxx messages for further guidance. Once corrected, you can attempt to run the transaction again.

Destination: Console and Transient Data Queue CSMT

Module: DFHZTSP

XMEOUT Parameters: *date, time, applid, termid, sysid*

DFHRT4422 *time applid* **The connection to system** *sysid* **does not support transaction routing. Please check that you have used the correct system name.**

Explanation: The connection to system *sysid* is not an MRO or APPC connection.

System Action: CICS processing continues.

User Response: Check that you have used the correct system name. Either reenter the request specifying the correct system name, or define the connection to system *sysid* as an MRO or APPC connection.

Destination: Terminal End User

Module: DFHRTE

DFHRT4423 *date time applid* **An error has occurred while attempting to invoke the distributed routing program.**

Explanation: An error has been detected while attempting to invoke the distributed routing program for a non-terminal start request. This error would normally result in a transaction abend but in this case no abend is issued because doing so would result in the task being suspended indefinitely.

System Action: None

User Response: See the preceeding DFHRTxxxx messages for further guidance.

Destination: Console and Transient Data Queue CSMT

Module: DFHICXM

XMEOUT Parameters: *date, time, applid*

DFHRT4480 *time applid* **The CSSF transaction is no longer supported. Please use CESF.**

Explanation: A user has attempted to run the CSSF transaction. The CSSF transaction is only invoked internally by CICS for CRTE cancel processing.

System Action: The transaction terminates.

User Response: Use the CESF transaction to sign off.

Destination: Terminal End User

Module: DFHRTC

DFHRUxxxx messages

DFHRU2816 *applid* **Exit program** *progname* **is not available**

Explanation: The user-defined global exit program, *progname*, is

- not defined, or
- disabled, or
- missing from the program library.

System Action: CICS abnormally terminates the recovery control restart task with transaction abend ARCB. CICS then terminates abnormally.

User Response: Make program *progname* available.

Destination: Console

Module: DFHRCEX

XMEOUT Parameters: *applid, progname*

DFHRXxxxx messages

DFHRX0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three

hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHRXDM

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHRX0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHRXDM

XMEOUT Parameters: *applid, X'code', modname*

DFHRX0100I *applid* **RX domain initialization has started.**

Explanation: This is an informational message indicating the start of RX domain initialization.

System Action: Initialization continues.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHRXDM

XMEOUT Parameter: *applid*

DFHRX0101I *applid* **RX domain initialization has ended.**

Explanation: RX domain initialization has completed successfully.

System Action: Initialization continues.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHRXDM

XMEOUT Parameter: *applid*

DFHRX0102 *applid* **Errors were encountered during initialization of the RX domain. Domain initialization has ended.**

Explanation: Errors have been detected by the Resource Recovery Services (RX) domain during CICS initialization. Accompanying messages describe the nature of the errors.

System Action: A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

User Response: If your CICS system will not use any services that depend on Resource Recovery Services, no action is necessary. Otherwise, you will need to shut CICS down, and restart it once the problems identified by the earlier messages have been corrected.

Destination: Console

Module: DFHRXDM

XMEOUT Parameter: *applid*

DFHRX0103 *applid* **An unexpected return code** *X'rc'* **was received from RRMS service** *xxxxxxxx***.**

Explanation: An unexpected return code was received when CICS issued a request to Recoverable Resource Management Services (RRMS). The name of the RRMS service included in the message indicates the component of RRMS as follows:

CRGxxxx Registration Services

CTXxxxx Context Services

ATRxxxx Resource Recovery Services (RRS)

This message may indicate a problem with RRMS.

System Action: CICS continues, but - depending on the service and the return code - CICS services that depend on RRMS may not be available. Further messages will provide more information.

User Response: Record the name of the RRMS service and the return code. RRMS return codes are documented in *GC28-1793 OS/390 MVS Programming: Resource Recovery*.

If you are unable to determine the cause of the problem from this information, you may need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHRXDM, DFHRXUW

XMEOUT Parameters: *applid, X'rc', xxxxxxxx*

DFHRX0104I *applid* **The Resource Recovery Services (RRS) exit manager** *aaaaaaaaaaaaaaaa* **is now available.**

Explanation: This message is issued when CICS discovers that a Resource Recovery Services (RRS) exit manager is available. The insert *aaaaaaaaaaaaaaaa* is the name of the exit manager.

System Action: CICS begins restart processing with RRS.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHRXDM

XMEOUT Parameters: *applid, aaaaaaaaaaaaaaaa*

DFHRX0105I *applid* **The Resource Recovery Services (RRS) exit manager** *aaaaaaaaaaaaaaaa* **is now unavailable.**

Explanation: This message is issued when CICS discovers that a Resource Recovery Services (RRS) exit manager is unavailable. The insert *aaaaaaaaaaaaaaaa* is the name of the exit manager. Transactions which use RRS to coordinate their updates cannot be successfully executed.

System Action: CICS continues. Message DFHRX0104 will be issued when the exit manager becomes available once more.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHRXDM

XMEOUT Parameters: *applid, aaaaaaaaaaaaaaaa*

DFHRX0106I *applid* **Restart processing with Resource Recovery Services (RRS) is beginning.**

Explanation: This message is issued when CICS begins restart processing with Resource Recovery Services (RRS).

System Action: CICS continues.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHRXDM

XMEOUT Parameter: *applid*

DFHRX0107I *applid* **Restart processing with Resource Recovery Services (RRS) has ended.**

Explanation: This message is issued when restart processing with Resource Recovery Services (RRS) ends. If RRS has become unavailable during restart processing (indicated by message DFHRX0105) restart processing may be incomplete.

System Action: CICS continues. If RRS has become unavailable, CICS will resume restart processing when RRS becomes available once more.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHRXDM

XMEOUT Parameter: *applid*

DFHRX0108 *date time applid* **Log name mismatch with Resource Recovery Services. Expected Log name** *logname***. Received Log name** *logname***.**

Explanation: During the exchange of log names with Resource Recovery Services (RRS), which occurred when RRS restarted, this system's memory of RRS's log name did not match the log name retrieved from RRS. RRS may have performed a cold start.

System Action: CICS execution continues. Units of work that are awaiting resynchronization with RRS will not be resolved automatically.

User Response: The associated units of work may need to be resolved by using CEMT SET UOW. The message should not recur.

Destination: Console and Transient Data Queue CSMT

Module: DFHRXDM

XMEOUT Parameters: *date, time, applid, logname, logname*

DFHRX0109 *date time applid* **Invalid pass token received on connection** *sysid* **session** *termid***.**

Explanation: A batch program using the extended External CICS Interface (EXCI) has issued a DPL request which does not include the SYNCONRETURN option. However, the value of the pass token received from the batch region does not match that which was lodged with Recoverable Resource Management Services (RRMS) in the batch region.

System Action: DFHRXUW provides console message DFHRX0002, and possibly a system dump (depending on the options in the dump table). The transactional DPL request will not be processed, and the batch job which issued the request may be suspended until it times out.

User Response: Investigate why the pass token was incorrect. It is possible that an unauthorized user has attempted to guess the value of the pass token in order to influence the outcome of a Unit of Work that has expressed interest in an RRMS Unit of Recovery.

If you are satisfied that there has been no attempt to interfere with the pass token, you may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console and Transient Data Queue CSCS

Module: DFHRXUW

XMEOUT Parameters: *date, time, applid, sysid, termid*

DFHRX0110 *applid* **Restart processing with Resource Recovery Services (RRS) was attempted on the wrong system.**

Explanation: Resource Recovery Services (RRS) has rejected a request to begin restart processing because there is incomplete recoverable work associated with this CICS applid on another system in the sysplex.

System Action: CICS execution continues, but CICS services that depend upon RRS will not be available until the problem is corrected.

User Response: If your CICS system will not use any services that depend on RRS, no action is necessary. Otherwise, close CICS down and restart it on the correct system in the sysplex. Use the RRS ISPF panels to scan the RRS Resource Manager Data log in order to find the correct system on which to restart CICS.

If, for some reason, you cannot restart CICS on another system in the sysplex, you can take the following steps. However, if you do so, resources may be out of synchronization:

1. Use the RRS Unit of Recovery list panels to force completion of the incomplete recoverable work
2. Restart CICS or RRS
3. Force any CICS units of work that are awaiting resolution from RRS.

Destination: Console

Module: DFHRXDM

XMEOUT Parameter: *applid*

DFHSHxxxx messages

DFHSH0001 *applid* **An abend (code** *code***) has occurred at offset** *X'offset'* **in module** *module***.**

Explanation: An unexpected program check or abend occurred with abend code *aaa/bbbb*.

The program status word (PSW) at the time of the program check or abend indicated that CICS was executing at offset X'*offset*' in module *modname*. This may have been caused by corruption of CICS code or control blocks.

System Action: A system dump is taken and the system attempts to continue operation unless otherwise directed by entries in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the cause of the program check or abend using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSHRT1, DFHSHRT2, DFHSHDM, DFHSHPR, DFHSHRQ, DFHSHSY

XMEOUT Parameters: *applid, code, X'offset', module*

DFHSH0002 *applid* **A severe error (code** *X'code***) has occurred in module** *module***.**

Explanation: The SH domain has received an unexpected error response from some other part of CICS. The operation requested by recovery manager is described by code X'*code*'.

For further information about CICS exception trace entries, refer to the *CICS Problem Determination Guide*.

System Action: A system dump is taken and the system attempts to continue operation unless specifically inhibited by dump table entries.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Investigate the cause of the problem as follows:

1. Determine if the problem can be explained by any previous messages issued from some other CICS component.
2. Examine the symptom string.
3. Examine the dump.

If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSHRT1, DFHSHRT2, DFHSHDM, DFHSHPR, DFHSHSY, DFHSHRE

XMEOUT Parameters: *applid, X'code', module*

DFHSH0101 *date time applid* **The call to invoke the Distributed Routing Program,** *program***, has failed. Refer to message DFHSH0105.**

Explanation: An error occurred when attempting to link to the Distributed Routing Program, identified by the DSRTPGM SIT parameter.

System Action: A ASHU dump may be produced depending on type of failure.

User Response: Ensure that the Distributed Routing Program is available to the system. It must be defined to Program Manager and it must be present in the DFHRPL library concatenation. Alternatively, name a new Distributed Routing Program using SET SYSTEM DSRTPROGRAM or from CEMT.

Destination: CSSH

Module: DFHSHRT2

XMEOUT Parameters: *date, time, applid, program*

DFHSH0102 *date time applid* **The Distributed Routing Program,** *program***, has returned a bad response. See following message DFHSH0105.**

Explanation: The Distributed Routing Program, identified by the DSRTPGM SIT parameter, has returned a bad response. The request may not be serviced immediately.

System Action: No dumps are taken.

User Response: None

Destination: CSSH

Module: DFHSHRE

XMEOUT Parameters: *date, time, applid, program*

DFHSH0103 *date time applid* **The call to invoke the Distributed Routing Program,** *program***, has failed. The Distributed Routing Program has abnormally terminated with abend Code** *abcode***.**

Explanation: The Distributed Routing Program has abnormally terminated with abend code *abcode*.

System Action:

1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - an abended condition is returned to the calling program.

User Response: See the description of abend code *abcode* for further guidance.

If the code is not a CICS transaction abend code, it is a user abend code. Request an explanation from the programmer responsible for this area.

Destination: CSSH

Module: DFHSHRT2

XMEOUT Parameters: *date, time, applid, program, abcode*

DFHSH0104 *date time applid* **The call to invoke the Distributed Routing Program,** *program***, has failed due to an invalid AMODE.**

Explanation: An error occurred when attempting to link to the Distributed Routing Program, identified by the DSRTPGM SIT parameter. The program has an invalid AMODE specified.

System Action: No dumps are taken.

User Response: Ensure that the Distributed Routing Program definition is correct.

Destination: CSSH

Module: DFHSHRT2

XMEOUT Parameters: *date, time, applid, program*

DFHSH0105 *date time applid* **Request (Id:** *requestid***, Processtype:** *processtype***, Processname:** *processname***, Activityname:** *activityname***, Transaction:** *tranid***) cannot be serviced. It will be retried every minute and will be purged after 24 hours if not serviced then.**

Explanation: A request cannot be serviced immediately. This is either because the Distributed Routing Program, identified by the DSRTPGM SIT parameter, has returned a response which indicates that it is unable to route a request, or a temporary error occurred during an attempt to service the request locally.

The request is identified by the request id *id* (the key of the request on the Local Request Queue data set (DFHLRQ)), the process type *processtype*, the process name *processname*, the activity name *activityname*, and the transaction id *tranid*.

System Action: No dumps are taken. The request is marked unserviceable, and is then retried every minute until it is either serviced, or 24 hours have elapsed in which case the request is purged and message DFHSH0107 issued.

Message DFHSH0106 is issued once every hour while the request cannot be serviced. If the request is serviced successfully, message DFHSH0108 is issued.

User Response: Investigate why the request cannot be serviced. This may be caused by one of the following:

- The local request queue is unavailable.
- The request refers to a resource (activity or process) which is unavailable.
- The system to which the request is to be routed is down, or the link is down.
- The Distributed Routing Program is failing or is returning an invalid target system.

Destination: Console and Transient Data Queue CSSH

Module: DFHSHRM

XMEOUT Parameters: *date, time, applid, requestid, processtype, processname, activityname, tranid*

DFHSH0106 *date time applid* **Request (Id:** *requestid***, Processtype:** *processtype***, Processname:** *processname***, Activityname:** *activityname***, Transaction:** *tranid***) still cannot be serviced. It will be retried every minute and will be purged after** *hours* **hours if not serviced successfully.**

Explanation: Following message DFHSH0105, this message is issued every hour while a request cannot be successfully serviced.

The request is identified by the request id *requestid* (the key of the

request on the Local Request Queue data set (DFHLRQ)), the process type *processtype*, the process name *processname*, the activity name *activityname*, and the transaction id *tranid*.

System Action: No dumps are taken. The request continues to be retried every minute until it is either serviced successfully, or 24 hours have elapsed since message DFHSH0105 was issued, in which case the request is purged and message DFHSH0107 is issued.

User Response: See message DFHSH0105.

Destination: Console and Transient Data Queue CSSH

Module: DFHSHRM

XMEOUT Parameters: *date, time, applid, requestid, processtype, processname, activityname, tranid, hours*

DFHSH0107 *date time applid* **Request (Id:** *requestid***, Processtype:** *processtype***, Processname:** *processname***, Activityname:** *activityname***, Transaction:** *tranid***) has remained unserviceable for 24 hours and has now been purged.**

Explanation: A request has been unserviceable for 24 hours and has now been purged. This message will have been preceded by message DFHSH0105 and several occurrences of message DFHSH0106.

The request is identified by the request id *requestid* (the key of the request on the Local Request Queue data set (DFHLRQ)), the process type *processtype*, the process name *processname*, the activity name *activityname*, and the transaction id *tranid*.

System Action: No dumps are taken. The request is deleted.

User Response: See message DFHSH0105.

Destination: Console and Transient Data Queue CSSH

Module: DFHSHRQ

XMEOUT Parameters: *date, time, applid, requestid, processtype, processname, activityname, tranid*

DFHSH0108 *date time applid* **Previously unserviceable request (Id:** *requestid***, Processtype:** *processtype***, Processname:** *processname***, Activityname:** *activityname***, Transaction:** *tranid***) has now been successfully serviced.**

Explanation: A request which was previously unserviceable has now been successfully serviced. This message will have been preceded by message DFHSH0105 and possibly one or more occurrences of message DFHSH0106.

The request is identified by the request id *requestid* (the key of the request on the Local Request Queue data set (DFHLRQ)), the process type *processtype*, the process name *processname*, the activity name *activityname*, and the transaction id *tranid*.

System Action: No dumps are taken.

User Response: None.

Destination: Console and Transient Data Queue CSSH

Module: DFHSHRM

XMEOUT Parameters: *date, time, applid, requestid, processtype, processname, activityname, tranid*

DFHSH0109 *date time applid* **An error has occurred when attempting to access the Local Request Queue data set (DFHLRQ).** *{The file could not be found. | The file was closed. | The file was disabled. | There was insufficient space. | An I/O error occurred. | The data set is being copied.}* **The Local Request Queue is now unavailable.**

Explanation: One of the following errors was detected when attempting to access the Local Request Queue data set (DFHLRQ):

- The file could not be found.
- The file was closed.
- The file was disabled.
- There was insufficient space.
- An I/O error occurred.
- The dataset is being copied.

System Action: The Local Request Queue is made unavailable. CICS then attempts to access the data set every minute. If successful, message DFHSH0110 is issued to indicate the data set is now available.

User Response: Investigate the error which caused the Local Request Queue to be made unavailable.

Destination: Console and Transient Data Queue CSSH

Modules: DFHSHRE, DFHSHRQ, DFHSHSY

XMEOUT Parameters: *date, time, applid, {1=The file could not be found., 2=The file was closed., 3=The file was disabled., 4=There was insufficient space., 5=An I/O error occurred., 6=The data set is being copied.}*

DFHSH0110 *date time applid* **The Local Request Queue data set (DFHLRQ) is now available.**

Explanation: The Local Request Queue data set (DFHLRQ), which was previously unavailable, is now available. See message DFHSH0109.

System Action: None.

User Response: None.

Destination: Console and Transient Data Queue CSSH

Module: DFHSHSY

XMEOUT Parameters: *date, time, applid*

DFHSH0111 *date time applid tranid trannum userid* **An error has occured in Scheduler Services during the prepare phase of syncpoint.**

Explanation: Scheduler Services domain encountered an error during the prepare phase of syncpoint.

System Action: Scheduler Services returns a NO vote to the Recovery Manager. The transaction will be abended with an ASP7 abend.

User Response: Check for other Scheduler Services messages that may indicate the cause of the error. For example, message DFHSH0109 indicates problems with the Local Request Queue.

Destination: Console and Transient Data Queue CSSH

Module: DFHSHRM

XMEOUT Parameters: *date, time, applid, tranid, trannum, userid*

DFHSIxxxx messages

DFHSI0914I *applid* **Unable to initiate transaction CSFU. Files will not be opened at initialization.**

Explanation: Module DFHSIJ1 could not start transaction CSFU. Execution of the DFHIC TYPE=INITIATE macro failed. Either CSFU is not an installed transaction definition, or DFHFCU is not an installed program definition.

System Action: CICS does not open any files at initialization time. If a file is defined in the file control table (FCT) to be opened at initialization time, CICS will open it on first reference.

User Response: Make transaction CSFU and program DFHFCU available for execution. Group DFHOPCLS in DFHLIST contains all of the definitions needed for file opening and closing (dynamically as well as at initialization time).

Destination: Console

Module: DFHSIJ1

XMEOUT Parameter: *applid*

DFHSI1250 *applid* **VSAM error processing SHOWCAT for intrapartition data set** *dsetname* **R15=***xxxx***.**

Explanation: During SHOWCAT processing for the intrapartition data set, *dsetname*, VSAM detected an error and issued return code *xxxx*.

System Action: CICS writes a dump and terminates abnormally.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Check the return code in the *OS/VS VSAM Programmer's Guide*, and restart CICS.

Destination: Console

Module: DFHSID1

XMEOUT Parameters: *applid, dsetname, xxxx*

DFHSI1499 *applid* **Unable to acquire special storage.**

Explanation: As part of CICS initialization, an attempt is made to acquire an area of storage from the fetch-protected subpool. The attempt has been unsuccessful.

System Action: CICS terminates abnormally with a dump.

User Response: This error indicates a severe problem with your operating system. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHSIB1

XMEOUT Parameter: *applid*

DFHSI1500 *applid element* **startup is in progress for CICS Transaction Server Version** *version*

Explanation: This is an informatory message indicating that *element* startup is in progress.

Element is part of CICS Transaction Server Version *version*.

Element = CICS Version = 1.3.0

System Action: System initialization continues.

User Response: None. This message cannot be suppressed.

Destination: Console

Module: DFHAPSIP

XMEOUT Parameters: *applid, element, version*

DFHSI1501I *applid* **Loading CICS nucleus.**

Explanation: This is an informatory message indicating that the CICS nucleus is being loaded.

System Action: System initialization continues.

User Response: None.

Destination: Console

Modules: DFHSIB1

XMEOUT Parameter: *applid*

DFHSI1502I *applid* **CICS startup is** *{Cold | Warm | Emergency | Initial}***.**

Explanation: During CICS initialization, the type of restart is determined and the operator notified by this message.

System Action: System initialization continues.

User Response: None.

Destination: Console

Modules: DFHSIC1, DFHSII1

XMEOUT Parameters: *applid, {1=Cold, 2=Warm, 3=Emergency, 4=Initial}*

DFHSI1503I *applid* **Terminal data sets are being opened.**

Explanation: This is an informatory message indicating that the terminal data sets are being opened.

System Action: System initialization continues.

User Response: None.

Destination: Console

Module: DFHSIF1

XMEOUT Parameter: *applid*

DFHSI1506 *applid* **Unable to OPEN the global catalog.**

Explanation: During initialization, CICS issued an OPEN for the global catalog DFHGCD data set, but the OPEN failed.

System Action: CICS terminates abnormally with a dump.

User Response: Examine the preceding VSAM message for the reason for the OPEN failure. Note that if you specify START=AUTO, or if you define your system with journal support, you must supply a global catalog data set in the JCL.

Destination: Console

Module: DFHSIC1

XMEOUT Parameter: *applid*

DFHSI1511I *applid* **Installing group list** *grplist***.**

Explanation: Group list *grplist* is being installed.

System Action: System initialization continues.

User Response: None.

Destination: Console

Module: DFHAMPIL

XMEOUT Parameters: *applid, grplist*

DFHSI1513 *applid* **CICS checking for TCAM MCP.**

Explanation: CICS is checking for the presence of a TCAM MCP region during CICS initialization.

System Action: This message is issued three times with a time interval of ten seconds. If the TCAM MCP is still not available, message DFHSI1520 is issued.

User Response: None.

Destination: Console

Module: DFHSIF1

XMEOUT Parameter: *applid*

DFHSI1517 *applid* **Control is being given to CICS.**

Explanation: This is an informatory message indicating that control is being given to CICS.

applid is the VTAM APPLID of the CICS system issuing the message.

System Action: System initialization continues.

User Response: None.

Destination: Console

Module: DFHSIJ1

XMEOUT Parameter: *applid*

DFHSI1519I *applid* **The interregion communication session was successfully started.**

Explanation: This is an informatory message indicating that the interregion communication (IRC) session has been successfully started.

System Action: System initialization continues.

User Response: None.

Destination: Console

Module: DFHSIJ1

XMEOUT Parameter: *applid*

DFHSI1520 TCAM MCP NOT CURRENTLY AVAILABLE. REPLY 'RETRY' OR 'CANCEL' OR 'CONT'

Explanation: During initialization, CICS discovered that the TCAM message control program (MCP) was required, but was not operational.

System Action: The system waits for a response.

User Response: The operator can respond with 'RETRY' (when the TCAM region becomes active), 'CANCEL' (to terminate CICS), or with 'CONT' (to proceed with CICS initialization without the TCAM MCP).

All DD statements that refer to a TCAM queue must be removed from the startup job stream before a reply of 'CONT' is given, otherwise an ABEND occurs.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHSIF1

DFHSI1521 *applid* **CICS unable to continue for reasons given above.**

Explanation: CICS initialization cannot continue because of one or more serious errors. One or more preceding messages describe these errors.

System Action: CICS terminates with a dump.

User Response: Refer to any preceding messages for further guidance on what the problems may be and how to solve them. Correct the errors and restart CICS.

Destination: Console

Module: DFHSII1

XMEOUT Parameter: *applid*

DFHSI1522D *applid* **Restart errors reported above. Reply 'GO' or 'CANCEL'.**

Explanation: One or more error messages precede this message. CICS can continue initialization but only in degraded mode.

System Action: Depending on your response to this message, CICS terminates or continues initialization in degraded mode.

User Response: Consider the reported errors and their effects, and decide if you want CICS to continue in degraded mode. If you do, reply 'GO'. If you do not, then reply 'CANCEL'. Correct the errors and restart CICS.

Destination: Console

Module: DFHSII1

XMEOUT Parameter: *applid*

DFHSI1530 *applid* **Purge of non-executable ATI request inoperative.**

Explanation: CICS is unable to initiate the CRSQ task to delete automatic transaction initiation (ATI) requests from the system when those requests are not honored for longer than the ATI purge delay interval.

System Action: System initialization continues.

User Response: If ATI purge is required, ensure that the CRSQ task is available next time CICS is initialized.

Destination: Console

Module: DFHSIJ1

XMEOUT Parameter: *applid*

DFHSI1531 *applid* **Terminal control incompatibility.** *macro* **VTAM return code:** *retcode* **error code:** *errcode* **(modname: DFHZRPL).**

Explanation: CICS found an inconsistency during the initialization of terminal control.
macro is the name of the failing VTAM macro.
retcode is the VTAM hexadecimal return code in Register 15.
errcode contains the contents of Register 0, which is the associated error code in hexadecimal.
Refer to the *ACF/VTAM Programmer's Reference* manual for a complete description of the VTAM return code *retcode* and the VTAM error code *errcode*.

The probable cause of this inconsistency is that VTAM=YES was specified (perhaps by default) in the SIT, but the VTAM macros GENCB and SHOWCB are not available.

System Action: After issuing this message, CICS system initialization abnormally terminates with a system dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use the VTAM return code and error code to determine the cause of failure in the VTAM macro *macro*. Correct the error using the *ACF/VTAM Programmer's Reference* manual, and restart CICS.

Destination: Console

Module: DFHZRPL

XMEOUT Parameters: *applid, macro, retcode, errcode*

DFHSI1533 *applid modname* **loaded at X'***address***'.**

Explanation: This is an informatory message indicating that CICS has loaded module *modname* at address *address*.

System Action: System initialization continues.

User Response: None.

Destination: Console

Module: DFHAPSIP

XMEOUT Parameters: *applid, modname, address*

DFHSI1534 *applid* **Unable to link to program DFHAMP - GRPLIST parameter ignored.**

Explanation: The DFHAMP program cannot be found on the load library. The GRPLIST parameter cannot be processed and so is ignored.

System Action: System initialization continues.

User Response: Ensure that the DFHAMP program is on the load library.

Destination: Console

Module: DFHSII1

XMEOUT Parameter: *applid*

DFHSI1535 *applid* **Severe error detected in DFHAMP - CICS is terminating.**

Explanation: A severe error was detected while the GRPLIST parameter was being processed.

System Action: A dump is provided and CICS is terminated.

User Response: This is most probably a logic error in DFHAMP. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHSII1

XMEOUT Parameter: *applid*

DFHSI1536D *applid* **GRPLIST** *grplist* **does not exist. Enter alternative name, 'GO' or 'CANCEL'.**

Explanation: Group list *grplist* cannot be found on the CSD file.

System Action: CICS waits for a reply. If you reply CANCEL, CICS terminates. If you reply GO, CICS ignores the specified GRPLIST and tries to install the next one. If you specify a valid list name, CICS initialization continues and the list is installed.

User Response: Enter 'GO', 'CANCEL' or a valid GRPLIST.

Destination: Console

Module: DFHAMPIL

XMEOUT Parameters: *applid, grplist*

DFHSI1537D *applid* **GRPLIST** *grplist* **does not exist. Enter alternative name or 'CANCEL'.**

Explanation: Group list *grplist* cannot be found on the CSD file.

System Action: CICS waits for a reply. If you reply CANCEL, CICS terminates. If you specify a valid list name, CICS initialization continues and the list is installed.

User Response: Enter 'CANCEL' or a valid GRPLIST.

Destination: Console

Module: DFHAMPIL

XMEOUT Parameters: *applid, grplist*

DFHSI1538D *applid* **Install GRPLIST Errors. Is startup to be continued - Enter 'GO' or 'CANCEL'.**

Explanation: Errors have been detected in DFHAMP while installing GRPLIST during CICS initialization. Accompanying messages describe the nature of the errors.

System Action: CICS waits for a reply. If you reply CANCEL, CICS terminates. If you reply GO, CICS initialization continues.

User Response: See the associated messages for further information about these errors. Reply with GO or CANCEL.

Destination: Console

Module: DFHSII1

XMEOUT Parameter: *applid*

DFHSI1539 *applid* **Error attaching the CESC (Terminal Timeout) transaction.**

Explanation: The CESC transaction failed to start during initialization of an alternate XRF region. Although CICS continues to initialize, terminals left signed on after the takeover are not timed out.

System Action: A dump is produced and CICS continues initialization.

User Response: Use the dump to investigate why the transaction could not be started. It may be that the system was short on storage or that the transaction has been disabled.

Destination: Console

Module: DFHSIJ1

XMEOUT Parameter: *applid*

DFHSI1542 *applid* **Takeover by the CICS alternate system has failed. Emergency restart could not be performed.**

Explanation: This CICS alternate system is attempting to take over from its associated active CICS system but the recovery manager component has indicated that an initial start is required because of a system log failure.

System Action: CICS is abnormally terminated and a dump is provided.

User Response: Look for console messages issued by the active CICS system which indicate the nature of the log failure. If no such messages have been issued, an internal CICS error may have occurred. In this case you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHSII1

XMEOUT Parameter: *applid*

DFHSI1543 *applid* **Time-Of-Day clock inoperative.**

Explanation: System initialization was unable to establish the time-of-day clock values for CICS.

System Action: CICS is abnormally terminated and a dump is provided.

User Response: The time-of-day clock is external to CICS execution and may have been disabled. Enable the time-of-day clock and restart CICS.

Destination: Console

Module: DFHSII1

XMEOUT Parameter: *applid*

DFHSI1547 *applid* **Notification of a default qualified LUNAME to the recovery manager domain has failed.**

Explanation: CICS is running with VTAM=NO, or an attempt to open the VTAM ACB has failed.

If VTAM=NO is specified, CICS uses the UOWNETQL system initialization parameter to form a default qualified LUNAME to pass to the recovery manager. If the VTAM ACB failed to open, CICS uses UOWNETQL to form the default qualified LUNAME. If UOWNETQL has not been specified, CICS sets UOWNETQL to the invalid value '9UNKNOWN' to highlight the problem.

An attempt was then made to transfer the default qualified LUNAME of the system to the recovery manager domain for use in constructing unit of work (UOW) identifiers. The attempt failed, indicating a serious error.

System Action: CICS continues. UOW identifiers constructed by the recovery manager domain do not contain a qualified luname.

User Response: Keep the exception trace data produced by the recovery manager domain. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHSIF1

XMEOUT Parameter: *applid*

DFHSI1548 *applid* **After opening the VTAM ACB, CICS has failed to transfer the fully qualified LUNAME to the recovery manager domain.**

Explanation: The VTAM ACB was opened by CICS to allow communication via VTAM. An attempt was then made to transfer the fully qualified LUNAME of the system. The LUNAME is provided to the recovery manager domain by VTAM for use in constructing unit of work (UOW) identifiers. The attempt failed, indicating a serious error.

System Action: CICS continues. Unit of work identifiers constructed by the recovery manager domain do not contain a fully qualified LUNAME.

User Response: Keep the exception trace data produced by the recovery manager domain. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHZSLS

XMEOUT Parameter: *applid*

DFHSI1549 *applid* **Logic error when building TCT module list.**

Explanation: Either the format of the modules DFHZCA, ZCB, ZCP, ZCW, ZCX, ZCY, ZCZ and ZCXR was not as expected, or the TCT was generated incorrectly.

System Action: CICS is abnormally terminated and a dump is provided.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Possible reasons for this message are:

1. The modules listed were generated without VTAM facilities, but the system initialization table (SIT) specifies VTAM=YES.
2. The TCT does not include ACCESSMETHOD=VTAM, but the system initialization table (SIT) specifies VTAM=YES.
3. The entry points of the listed modules are incorrect.
4. The module list in each of the listed modules is incorrect.

If reason 1 or 2 applies, correct the error. Otherwise, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHSIF1

XMEOUT Parameter: *applid*

DFHSI1550 *applid* **A severe error has occurred while making a** *domain* **domain call with response (***X'response'***) and reason (***X'reason'***).**

Explanation: An unexpected error was returned from the specified domain. The response and reason codes are given.

System Action: A system dump is taken, unless the failing domain has previously taken diagnostics.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system administrator. This failure indicates a serious error in CICS.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHSII1

XMEOUT Parameters: *applid, domain, X'response', X'reason'*

DFHSI1551 *applid* **The CICS region userid** *userid* **is not authorized to use the PLTPIUSR parameter userid** *userid***. Initialization cannot continue, so CICS is terminated.**

Explanation: The userid specified in the job control statements for the CICS region is not authorized to use the userid specified in the PLTPIUSR system initialization parameter.

System Action: CICS initialization terminates.

User Response: Ensure that the correct userid is specified for PLT processing.

Ensure that the userid for the CICS region has the necessary authorization. This may require the assistance of a security administrator.

When the necessary corrections have been made rerun the CICS job.

Destination: Console

Module: DFHSII1

XMEOUT Parameters: *applid, userid, userid*

DFHSI1552 *applid* **Userid** *userid* **specified for the PLTPIUSR parameter has not been defined correctly to the external security manager (ESM). SAF codes are (***X'safresp'***,***X'safreas'***). ESM codes are (***X'esmresp'***,***X'esmreas'***).**

Explanation: The userid specified for the PLTPIUSR initialization parameter has been defined incorrectly.

System Action: CICS terminates abnormally with a dump.

User Response: Ensure that the desired userid is specified for PLT processing and that external security manager (ESM) definitions have been specified correctly.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the *OS/390 MVS Programming: Authorized Assembler Services Guide* and in *External Security Interface (RACROUTE) Macro Reference for MVS and VM* (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Correct the errors and restart CICS.

Destination: Console

Module: DFHSII1

XMEOUT Parameters: *applid, userid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHSI1553 *applid* **The unit of work network qualifier specified via the UOWNETQL parameter contains invalid characters or begins with a number. A dummy qualifier is substituted.**

Explanation: The UOWNETQL system initialization parameter has been specified incorrectly. The UOWNETQL parameter must consist of uppercase letters (A through Z), or numbers in the range 0 through 9. The first character must be a letter.

CICS is running with VTAM=NO, or an attempt to open the VTAM ACB has failed.

When VTAM=NO is specified, CICS uses UOWNETQL to form a default qualified LUNAME to pass to the recovery manager.

If the VTAM ACB fails to open, CICS uses UOWNETQL to form the default qualified LUNAME.

System Action: CICS continues but with the UOWNETQL deliberately set to the invalid value '9UNKNOWN' to highlite the problem.

User Response: Correct the UOWNETQL system initialization parameter.

Destination: Console

Module: DFHSIF1

XMEOUT Parameter: *applid*

DFHSI1556 *applid* **SKRP** *{A | F}x* **disabled due to extension of PGRET value.**

Explanation: The new PGRET value supplied as an initialization option has caused all the single-key retrieval values to be rebuilt. The value shown in the message exceeds 16 bytes. *x* can be a value 1 through 3 for A and 1 through 12 for F.

System Action: The key given in the message (PA1-PA3 and PF1-PF12 respectively) is disabled.

User Response: If it has been specified (by PARM) that initialization overrides can be entered by means of the console, the opportunity will be given to re-enter the PGRET and/or the SKR*xxxxx* initialization option.

Destination: Console

Module: DFHPASY

XMEOUT Parameters: *applid, {1=A, 2=F}, x*

DFHSI1558 *applid* **Program** *progname* **cannot be found.**

Explanation: Program *progname* is essential for CICS to initialize correctly, but was not defined in a group referenced by the group list specified in the startup job stream.

System Action: A dump is provided and CICS is terminated.

User Response: Ensure that the program is defined in a group referenced by the group list specified in the startup job stream.

Destination: Console

Module: DFHSIJ1

XMEOUT Parameters: *applid, progname*

DFHSI1559 *applid* **Profile DFHCICSE cannot be found.**

Explanation: The DFHCICSE profile is essential for CICS to initialize correctly. However it was not defined in the group list specified in the startup job stream.

System Action: A dump is provided and CICS is terminated.

User Response: Ensure that the DFHCICSE profile is defined in the group list specified in the startup job stream. A definition of DFHCICSE is provided in the DFHSTAND group on the CICS system definition (CSD) file.

Destination: Console

Modules: DFHXCPA, DFHSIJ1

XMEOUT Parameter: *applid*

DFHSI1562 *applid* **Unable to initialize application domain statistics.**

Explanation: During CICS initialization, an error was detected while the application domain (AP) statistics control module, DFHSII1, was being initialized. This could indicate a problem with the AP component of CICS.

System Action: An exception trace entry is made in the trace table and CICS terminates abnormally with a system dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This error may have occurred because of an earlier error detected by the kernel (KE) domain of CICS. Look for earlier messages from the KE domain beginning DFHKE*xxxx*, CICS trace table entries with the prefix KE and a dump. These indicate the type of error and the action that should be taken.

If no earlier error is detected by the KE component, DFHSII1 makes an exception entry in the trace table (id=X'0700') and terminates CICS abnormally with code=1562 and with a system dump. In this case you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHSII1

XMEOUT Parameter: *applid*

DFHSI1572 *applid* **Unable to OPEN VTAM ACB - RC=***xxxxxxxx* **ACB Code=***yy***.**

Explanation: An error was encountered during system initialization while attempting to open the VTAM ACB. RC=*xxxxxxxx* is the VTAM error code found in Register 15. *yy* is the hexadecimal contents of the ACB.

System Action: CICS initialization continues.

User Response: Refer to the *ACF/VTAM Programmer's Reference* for a complete description of the values of the ACB error field and the return code.

Use the values and the return code to determine the cause of the problem.

Decide whether to cancel or to continue. (This message appears if you bring up CICS before you bring up VTAM.)

If you want to use VTAM terminals in this CICS run, you must activate VTAM. You can open the VTAM ACB with the CEMT SET VTAM OPEN command.

Destination: Console

Module: DFHSIF1

XMEOUT Parameters: *applid, xxxxxxxx, yy*

DFHSI1573 *date time applid* **Terminal Control is unavailable due to an unsupported access method.**

Explanation: ACB/TCAM, and releases of VTAM prior to version 3, are not supported by this release of CICS.

System Action: CICS terminates with a system dump.

User Response: Update your access method.

Destination: Console

Module: DFHZSLS

XMEOUT Parameters: *date, time, applid*

DFHSI1574 *applid* **TCTUA Subpool not added in DFHZRPL. CICS initialization cannot continue.**

Explanation: An attempt to add a subpool by the storage manager has failed. Module DFHZRPL has failed in an attempt to add a subpool for use by the TCTUA's associated with non-VTAM terminals. Since it is necessary to have the subpool present for use when needed, this is a serious error.

System Action: The initialization of the CICS system which tried to perform the addition of the subpool abends. If it was not able to add the subpool, then CICS is not able to execute properly.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHZRPL

XMEOUT Parameter: *applid*

DFHSI1575 *applid* **Getmain failed for TCTUA subpool in module DFHZRPL. CICS initialization cannot continue.**

Explanation: The module DFHZRPL has failed in an attempt to GETMAIN an area of storage for use by the TCTUA subpool. This subpool has already been added but no storage yet exists for it. This is a serious error.

System Action: As a result of the GETMAIN failure so early in the initialization sequence, it is not possible to continue the CICS initialization. The CICS system which tried and failed to perform the GETMAIN terminates.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHZRPL

XMEOUT Parameter: *applid*

DFHSI1576 *applid* **Unable to find VTAM ACB.**

Explanation: An error was encountered during system initialization while attempting to find the VTAM ACB.

System Action: CICS continues to initialize, but VTAM is not available.

User Response: If you do not require VTAM support, this message can be ignored.

If you have VTAM installed on your system, check that VTAM=NO has not been specified as a system initialization parameter. If VTAM=YES is specified, investigate why VTAM is not currently available on your system.

Destination: Console

Module: DFHSIF1

XMEOUT Parameter: *applid*

DFHSI1578D *applid* **PLTPI specified cannot be found. Reply 'GO' or 'CANCEL'.**

Explanation: The post-initialization program list table (PLTPI) cannot be found because the PLT does not exist in the CICS program library.

System Action: If the response is 'CANCEL', CICS is terminated. If the response is 'GO', processing continues without PLT processing.

User Response: Respond 'GO' or 'CANCEL'.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameter: *applid*

DFHSI1579D *applid* **Module** *modname{ PLT | connection }***program** *progname* **not found. Reply 'GO' or 'CANCEL'.**

Explanation: This message indicates that either a program defined in the post-initialization program list table (PLTPI) cannot be found, or a connection program used when connecting to DBCTL, DB2 or MQ cannot be found. The attempt to invoke a connection program results from coding DBCTLCON=YES, or DB2CONN=YES, or MQCONN=YES in the SIT.

For PLT programs, if the message is issued during the first PLT phase in initialization, the program does not exist in the CICS program library. If the message is produced during the post-initialization PLT phase, the program did not have an installed program entry or was not found in the CICS program library.

For connection programs, the program did not have an installed program entry or was not found in the CICS program library.

modname indicates which of the modules issued the message. *progname* is the name of the program which cannot be found.

System Action: If the response is 'CANCEL', CICS is terminated. If the response is 'GO', the program is bypassed.

User Response: Reply 'CANCEL' or 'GO'.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameters: *applid, modname, {1= PLT , 2= connection }, progname*

DFHSI1580D *applid{ PLT | Connection }***program** *program-name* **has abended, code** *abcode***. Reply 'GO' or 'CANCEL'.**

Explanation: CICS was processing either the initialization program list table (PLT) when the PLT program *program-name* abended with abend code *abcode*, or was processing connection program *program-name* and it abended with abend code *abcode*.

System Action: If the response is 'CANCEL', CICS is terminated. If the response is 'GO', the program is bypassed.

User Response: Reply 'CANCEL' or 'GO'.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameters: *applid, {1=PLT , 2= Connection }, program-name, abcode*

DFHSI1582 *applid* **Local DLI PSBs present in the PDIR. CICS does not support local DLI.**

Explanation: CICS has detected that local PSBs are present in the user specified PDIR. CICS no longer supports local DLI. A PDIR is only required for remote DLI, and must contain only remote PSB definitions. A PDIR is not required for DBCTL.

System Action: A CICS abend dump is produced, and CICS is terminated.

User Response: If remote DLI is required, correct the PDIR by removing the local PSBs. Then reassemble and relinkedit the PDIR, and resubmit the CICS job.

If remote DLI support is not required, change the system initialization table (SIT) to specify PDIR=NO.

Destination: Console

Module: DFHSIH1

XMEOUT Parameter: *applid*

DFHSI1589 *applid* **VTAM is not currently active.**

Explanation: CICS initialization cannot OPEN the VTAM access method control block (ACB) because VTAM is not active.

System Action: If this is an alternate system, CICS waits for 15 seconds and retries the OPEN indefinitely.

If this is not an alternate system, CICS proceeds with the rest of initialization. The Open VTAM Retry transaction COVR is attached, and retries the OPEN every 5 seconds for ten minutes.

User Response: In the case of an alternate, check that VTAM is on its way up. If it is not, you can cancel this alternate.

Destination: Console

Module: DFHSIF1

XMEOUT Parameter: *applid*

DFHSI1590 *applid* **XRF alternate cannot proceed without VTAM.**

Explanation: CICS initialization cannot OPEN the VTAM access method control block (ACB). The ACB error code may be found in the preceding message DFHSI1572.

System Action: CICS is terminated with a dump.

User Response: Refer to DFHSI1572 and use the information to try and resolve the causes of the errors.

Destination: Console

Module: DFHSIF1

XMEOUT Parameter: *applid*

DFHSI1592 *applid* **CICS applid not (yet) active to VTAM.**

Explanation: CICS initialization cannot OPEN the VTAM access method control block (ACB) because VTAM does not recognize the APPLID (VTAM error X'5A'). There may be a user error in the value of APPLID (for example, on a SIT override) or the application subarea containing APPLID may not be active in VTAM. Alternatively, it may be possible that VTAM is still coming up. If so, the problem may correct itself when VTAM completes its initialization.

System Action: If this is an alternate CICS, wait for 15 seconds and retry the OPEN indefinitely. If this is not an alternate, CICS proceeds with the rest of initialization.

User Response: In the case of an alternate, check that VTAM is on its way up. If it is, check that the required application sub-area is active in VTAM. If it is, you may cancel this alternate.
If this is not an alternate, you can use CEMT to retry the OPEN when CICS has initialized.

Destination: Console

Module: DFHSIF1

XMEOUT Parameter: *applid*

DFHSI1594 *applid* **A** *xxxx* **level of module** *progname* **is being loaded.**

Explanation: The system is loading a level of module *progname* that was not assembled against the current level of CICS in the CICS Transaction Server product. The level *xxxx* shows the level of the module being used.

System Action: System initialization continues.

User Response: Ensure that it is valid to use an old level of module *progname*. Usually, it will be necessary to reassemble the module for the current level of CICS being used.

Destination: Console

Module: DFHAPSIP

XMEOUT Parameters: *applid, xxxx, progname*

DFHSI1596 *applid* **Nucleus module** *progname* **cannot be located.**

Explanation: Nucleus module *progname* was not found in the CICS library while loading the nucleus.

System Action: The AP domain initialization routines continue to attempt to load the remaining nucleus modules. After trying to load all the nucleus modules, CICS is terminated.

User Response: Add the missing module *progname* to the appropriate library and restart CICS.

Destination: Console

Modules: DFHAPSIP, DFHSID1

XMEOUT Parameters: *applid, progname*

DFHSI1597 *applid* **VTAM=YES invalid with a non VTAM TCT - VTAM=NO forced.**

Explanation: The TCT loaded has not been assembled with ACCESSMETHOD=VTAM but VTAM=YES was specified on the SIT.

System Action: CICS continues but without VTAM support.

User Response: To use VTAM, assemble the TCT with ACCESSMETHOD=VTAM or use the CICS supplied TCT which has a suffix of DY.

Destination: Console

Module: DFHZINT

XMEOUT Parameter: *applid*

DFHSI1599 *applid* **Region/Partition size insufficient to initialize transient data.**

Explanation: Transient data initialization failed, either because an attempt to create Storage Manager subpool failed or because an attempt to get storage failed.

System Action: A system dump is produced, and CICS is abnormally terminated.

User Response: Increase the region size available to CICS.

Destination: Console

Module: DFHSID1

XMEOUT Parameter: *applid*

DFHSI1784 *applid* **The user shutdown assist transaction** *tranid* **has not been defined as a shutdown enabled local transact ion.**

Explanation: This message is issued during CICS initialization and indicates that the user shutdown assist transaction specified on the system initialization table (SIT) has not been defined as a shutdown enabled local transaction.

System Action: No action is taken. A TRANSIDERR may be returned on PERFORM SHUTDOWN.

User Response: Do one of the following:

- Correct the shutdown transaction definition.
- Change or remove the SIT SDTRAN option.
- Use the CEMT or EXEC CICS PERFORM SHUTDOWN SDTRAN option.

Destination: Console

Module: DFHSIJ1

XMEOUT Parameters: *applid, tranid*

DFHSI2810 *applid* **CANCEL reply received. CICS is terminating.**

Explanation: A CANCEL reply has been received.

System Action: CICS terminates.

User Response: Refer to previous messages to determine what action to take.

Destination: Console

Modules: DFHSII1, DFHSIPLT, DFHAMPIL

XMEOUT Parameter: *applid*

DFHSI2813 *applid* **Program DFHRCEX cannot be found.**

Explanation: CICS cannot find DFHRCEX in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

System Action: CICS initialization terminates with a dump.

User Response: To correct this error, place DFHRCEX in a partitioned data set in the DFHRPL DD statement.

Destination: Console

Module: DFHSIJ1

XMEOUT Parameter: *applid*

DFHSI8420I *applid* **About to link to PLT programs during the second stage of initialization.**

Explanation: CICS is about to link to the user PLT programs defined in the PLTPI system initialization parameter during the second stage of initialization.

System Action: Control is passed to the user PLT programs.

User Response: None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameter: *applid*

DFHSI8424I *applid* **Control returned from PLT programs during the second stage of initialization.**

Explanation: Control is returned to CICS to continue system initialization.

System Action: Control is returned to CICS.

User Response: None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameter: *applid*

DFHSI8430I *applid* **About to link to PLT programs during the third stage of initialization.**

Explanation: CICS is about to link to the user PLT programs defined in the PLTPI SIT parameter during the third stage of initialization.

System Action: Control is passed to the user PLT programs.

User Response: None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameter: *applid*

DFHSI8434I *applid* **Control returned from PLT programs during the third stage of initialization.**

Explanation: Control is returned to CICS to continue system initialization.

System Action: Control is returned to CICS.

User Response: None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameter: *applid*

DFHSI8440I *applid* **Initiating connection to** *resmanager***.**

Explanation: CICS is about to connect to the specified resource manager immediately prior to running PLT programs during the third stage of initialization. The resource manager is DBCTL, DB2 or MQ. Connection is initiated because DBCTLCON=YES, or DB2CONN=YES, or MQCONN=YES was specified in the SIT.

System Action: Control is passed to the resource manager connect program.

User Response: None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameters: *applid, resmanager*

DFHSI8441I *applid* **Connection to** *resmanager qualifier* **successfully completed.**

Explanation: CICS has sucessfully connected to the specified resource manager immediately prior to running PLT programs during the third stage of initialization. The resource manager name is shown along with the resource manager qualifier.

System Action: CICS processing continues.

User Response: None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameters: *applid, resmanager, qualifier*

DFHSI8442 *applid* **Connection to** *resmanager* **has failed.**

Explanation: CICS was unable to connect to resource manager *resmanager* immediately prior to running PLT programs during the third stage of initialization. The resource manager is DBCTL, DB2 or MQ. Connection was initiated because DBCTLCON=YES, or DB2CONN=YES, or MQCONN=YES was specified in the SIT.

System Action: CICS processing continues.

User Response: Refer to previous messages issued by CICS or the resource manager adapter to determine why the connection attempt failed.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameters: *applid, resmanager*

DFHSI8443 *applid* **Connection to** *resmanager* **not completed. Adapter is awaiting initialization of** *resmanager***.**

Explanation: CICS was unable to complete connection to resource manager *resmanager* immediately prior to running PLT programs during the third stage of initialization. The resource manager is DBCTL, DB2 or MQ. Connection was initiated because DBCTLCON=YES, or DB2CONN=YES, or MQCONN=YES was specified in the SIT.

The resource manager adapter is waiting for the resource manager to be initialized.

System Action: CICS processing continues. The connection is completed when the resource manager is initialized.

User Response: Refer to messages issued by the relevant resource manager adapter to determine when connection is completed.

Destination: Console

Module: DFHSIPLT

XMEOUT Parameters: *applid, resmanager, resmanager*

DFHSKxxxx messages

DFHSK1101 *applid* **General purpose subtask terminated abnormally - system completion code =** *X'xxxx'*

Explanation: A subtask attached by DFHSKP has completed abnormally.

System Action: CICS continues in degraded mode.

User Response: Find out why the subtask failed. *xxxx* is the operating system completion code.

Destination: Console

Module: DFHSKP

XMEOUT Parameters: *applid, X'xxxx'*

DFHSK1102 *applid* **Unable to attach general purpose subtask - system return code =** *X'xxxx'*

Explanation: DFHSKP has attempted to attach an operating system subtask. The ATTACH has failed.

System Action: CICS continues in degraded mode.

User Response: Find out why the attach failed. *xxxx* is the operating system completion code.

Destination: Console

Module: DFHSKP

XMEOUT Parameters: *applid, X'xxxx'*

DFHSK1103 *applid* **ESTAE macro failed in general purpose subtask - system return code =** *X'xxxx'*

Explanation: A general purpose subtask issued an MVS ESTAE macro. *xxxx* is the nonzero response from MVS.

System Action: CICS continues in degraded mode.

User Response: Find out why the macro failed (this is a failure in MVS). Response code is output with the message.

Destination: Console

Module: DFHSKP

XMEOUT Parameters: *applid, X'xxxx'*

DFHSK1104I *applid* **General purpose subtask terminated because error threshold has been reached**

Explanation: A general purpose subtask has failed several times while executing its own code. CICS has terminated the task.

System Action: CICS continues in degraded mode.

User Response: Find out why the subtask failed.

Destination: Console

Module: DFHSKP

XMEOUT Parameter: *applid*

DFHSK1106I *applid* **Unable to authorize a general purpose subtask - RC=***nn*

Explanation: The CICS subtask program issued the CICS SVC to CICS authorize the TCB of an MVS subtask. The SVC returned the error response code *nn*. The possible values of *nn* and their meanings are:

nn	**Meaning**
01	SVC service is not authorized.
02	Load of DFHASV failed.
03	Internal error in CICS SVC.
04	Internal error in CICS SVC. RB check failed.
10	DFHAUTH TYPE=CHECK macro failed.
14	Invalid TCB address passed to DFHASV.
18	DFHAUTH TYPE=subtask AFCB storage failed.
1C	GETMAIN for subtask AFCB storage failed.
20	Main task AFCB version is pre-CICS 1.7.
24	Main task AFCB version is too large for the SVC version in use.
Other	The SVC has not been defined and installed as described in the *CICS Transaction Server for OS/390 Installation Guide*.

System Action: CICS continues. The CICS SVC may fail again if reinvoked by a general purpose subtask.

User Response: Use the response code in the message to determine the cause of the failure.

Destination: Console

Module: DFHSKP

XMEOUT Parameters: *applid, nn*

DFHSMxxxx messages

DFHSM0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.
If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSMAD, DFHSMAR, DFHSMCK, DFHSMDM, DFHSMGF, DFHSMMCI, DFHSMMC2, DFHSMMF, DFHSMMG, DFHSMPQ, DFHSMPP, DFHSMSR, DFHSMST, DFHSMSU, DFHSMSY

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHSM0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

See the *CICS Trace Entries* for a description of the exception trace point ID, X'*code*' and the data it contains.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSMAD, DFHSMAR, DFHSMCK, DFHSMGF, DFHSMMC2, DFHSMMF, DFHSMMG, DFHSMPQ, DFHSMPP DFHSMSCP, DFHSMSR, DFHSMST, DFHSMSU, DFHSMSY

XMEOUT Parameters: *applid, X'code', modname*

DFHSM0004 *applid* **A possible loop has been detected at offset** *X'offset'* **in module** *modname***.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSMMCI, DFHSMST

XMEOUT Parameters: *applid, X'offset', modname*

DFHSM0006 *applid* **Insufficient storage to satisfy Getmain (code** *X'code'***) in module** *modname***. MVS code** *mvscode***.**

Explanation: An MVS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'*code*' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code *mvscode* is the MVS GETMAIN return code.

System Action: An exception entry is made in the trace table (code X'*code*'). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

See the *CICS Trace Entries* for a description of the exception trace point ID, X'*code*' and the data it contains.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual.

Try decreasing the limits of the CICS dynamic storage areas (DSAs), or increasing the MVS region size. You can vary the CICS DSAs dynamically using the DSALIM and EDSALIM parameters on the CEMT master terminal command. To increase the MVS region size you must bring CICS down and change the MVS JCL REGION parameter.

Destination: Console

Module: DFHSMDM

XMEOUT Parameters: *applid, X'code', modname, mvscode*

DFHSM0102 *applid* **A storage violation (code** *X'code'***) has been detected by module** *modname***.**

Explanation: A storage violation has been detected by module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies the type of storage violation.

System Action: An exception entry (X'*code*' in the message) is made in the trace table. Use the exception trace point ID, X'*code*', to investigate the cause of the storage violation. A description of the exception trace point ID, and the data it contains, is in the *CICS Trace Entries*. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If you have enabled storage recovery (by specifying the system initialization parameter STGRCVY=YES), CICS attempts to repair the storage violation. Otherwise, the storage is left unchanged.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use the exception trace point ID, X'*code*', to investigate the cause of the storage violation. See the *CICS Trace Entries* for a description of the exception trace point ID and the data it contains.

Destination: Console

Modules: DFHSMAR, DFHSMCK, DFHSMGF, DFHSMMC2, DFHSMMF

XMEOUT Parameters: *applid, X'code', modname*

DFHSM0103 *applid* **A storage violation (code** *X'code'***) has been detected by the storage violation trap. Trap is now inactive.**

Explanation: A storage violation has been detected by the storage violation trap, which may be enabled via the CHKSTSK or the CHKSTRM system initialization parameters or via the CSFE transaction. The code X'*code*' is the exception trace point ID which uniquely identifies the type of storage violation detected.

System Action: CICS disables the storage violation trap. An exception entry (X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If you have enabled storage recovery (by specifying the system initialization parameter STGRCVY=YES), CICS attempts to repair the storage violation. Otherwise, the storage is left unchanged.

Message DFHME0116 is normally produced containing the symptom string for this problem.

Note: Even if CICS is able to repair the storage, the storage violation trap still remains inactive.

User Response: Use the exception trace point ID, X'*code*', to investigate the cause of the storage violation. See the *CICS Trace Entries* for a description of the exception trace point ID and the data it contains.

Destination: Console

Module: DFHSMCK

XMEOUT Parameters: *applid, X'code'*

DFHSM0113I *applid* **Storage protection is not active.**

Explanation: This is an informatory message stating that storage protection has not been requested (STGPROT=NO) and is not in effect for this execution of CICS.

System Action: CICS continues.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0. Storage protection can be enabled by specifying the system initialization parameter STGPROT=YES.

Destination: Console

Module: DFHSMDM

XMEOUT Parameter: *applid*

DFHSM0114 *applid* **Storage protection was requested but the support is not available. Storage protection is not active.**

Explanation: This is an informatory message stating that although storage protection was requested, it is not in effect for this execution of CICS because the necessary hardware and/or operating system support is not available.

System Action: CICS continues.

User Response: None.

Destination: Console

Module: DFHSMDM

XMEOUT Parameter: *applid*

DFHSM0115I *applid* **Storage protection is active.**

Explanation: This is an informatory message stating that storage protection is requested (STGPROT=YES) and is in effect for this execution of CICS.

System Action: CICS continues.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHSMDM

XMEOUT Parameter: *applid*

DFHSM0120I *applid* **Reentrant programs will not be loaded into read-only storage.**

Explanation: This is an informatory message stating that read-only programs will not be loaded into read-only storage for this execution of CICS. This is because RENTPGM=NOPROTECT was specified as a system initialization parameter.

System Action: CICS continues.

User Response: None.

You should not specify RENTPGM=NOPROTECT unless you wish to deliberately overwrite programs (to set breakpoints while testing, for example).

Destination: Console

Module: DFHSMDM

XMEOUT Parameter: *applid*

DFHSM0122I *applid* **Limit of DSA storage below 16MB is** *dsalimit***K.**

Explanation: This message gives the limit *dsalimit* of the dynamic storage area (DSA) below 16MB.

System Action: CICS continues.

User Response: None. You can suppress this message with the message level system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHSMDM

XMEOUT Parameters: *applid, dsalimit*

DFHSM0123I *applid* **Limit of DSA storage above 16MB is** *edsalimit***M.**

Explanation: This message gives the limit *edsalimit* of the dynamic storage area (DSA) above 16MB.

System Action: CICS continues.

User Response: None. You can suppress this message with the message level system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHSMDM

XMEOUT Parameters: *applid, edsalimit*

DFHSM0124 *applid* **Transaction isolation was requested but the support is not available or storage protection is not active. Transaction isolation is not active.**

Explanation: The combination of system initialization parameters STGPROT(NO) and TRANISO(YES) is invalid. During a warm or emergency start of CICS, the catalogued system initialization parameters are incompatible with a SIT override. Although transaction isolation was requested, it is not in effect for this execution of CICS because the necessary hardware and/or operating system support is not available, and/or storage protection is not active.

System Action: CICS continues.

User Response: None.

Destination: Console

Module: DFHSMDM

XMEOUT Parameter: *applid*

DFHSM0125I *applid* **Transaction isolation is active.**

Explanation: Transaction isolation is requested (TRANISO=YES) and is in effect for this execution of CICS.

System Action: CICS continues.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHSMDM

XMEOUT Parameter: *applid*

DFHSM0126I *applid* **Transaction isolation is not active.**

Explanation: Transaction isolation has not been requested (TRANISO=NO) and is not in effect for this execution of CICS.

System Action: CICS continues.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0. Transaction isolation can be enabled by specifying TRANISO=YES as a system initialization parameter.

Destination: Console

Module: DFHSMDM

XMEOUT Parameter: *applid*

DFHSM0127 *applid* **Insufficient storage to allocate requested size for DSA limit storage below 16MB (***dsalimit***K).**

Explanation: CICS has issued an MVS GETMAIN for the requested limit *dsalimit* of DSA storage below 16MB, but the GETMAIN request failed.

System Action: If the requested size is greater than the default, CICS reissues the MVS GETMAIN request using the default size for the DSALIM parameter.

If the requested size is not greater than the default, the storage manager makes an exception entry in the trace table. An error return code is sent to the domain manager DFHDMDM (the caller of the storage manager). The domain manager might then terminate CICS, in which case a message to this effect is issued.

User Response: Ensure that the DSALIM system initialization parameter is specified correctly.

Ensure that the REGION parameter for the CICS job is large enough.

See the *OS/390 MVS JCL Reference* for further information about specifying storage on the REGION parameter.

Destination: Console

Module: DFHSMDM

XMEOUT Parameters: *applid, dsalimit*

DFHSM0128 *applid* **Insufficient storage to allocate requested size for DSA limit storage above 16MB (***dsalimit***M).**

Explanation: CICS has issued an MVS GETMAIN for the requested limit *dsalimit* of DSA storage above 16MB, but the GETMAIN request failed.

System Action: If the requested size is greater than the default, CICS reissues the MVS GETMAIN request using the default size for the EDSALIM parameter.

If the requested size is not greater than the default, the storage manager makes an exception entry in the trace table. An error return code is sent to the domain manager DFHDMDM (the caller of the storage manager). The domain manager might then terminate CICS, in which case a message to this effect is issued.

User Response: Ensure that the EDSALIM parameter is specified correctly.

Ensure that the REGION parameter for the CICS job is large enough.

See the *OS/390 MVS JCL Reference* for more information about specifying storage on the REGION parameter.

Destination: Console

Module: DFHSMDM

XMEOUT Parameters: *applid, dsalimit*

DFHSM0129 *applid* **Insufficient storage to allocate default size for DSA limit storage below 16MB (***dsalimit***K).**

Explanation: Following message DFHSM0127, CICS has reduced the MVS GETMAIN request to the default size for the DSALIM system initialization parameter but the GETMAIN request has still failed.

System Action: The storage manager makes an exception entry in the trace table.

An error return code is sent to the domain manager, DFHDMDM, (the caller of storage manager). The domain manager might then terminate CICS, in which case a message to this effect is issued.

User Response: See DFHSM0127 for further information.

Ensure that the REGION parameter for the CICS job is large enough.

See the *OS/390 MVS JCL Reference* for more information about specifying storage on the REGION parameter.

Destination: Console

Module: DFHSMDM

XMEOUT Parameters: *applid, dsalimit*

DFHSM0130 *applid* **Insufficient storage to allocate default size for DSA limit storage above 16MB (***dsalimit***M).**

Explanation: Following message DFHSM0128, CICS has reduced the MVS GETMAIN request to the default size for the EDSALIM system initialization parameter but the GETMAIN request has still failed.

System Action: The storage manager makes an exception entry in the trace table.

An error return code is sent to the domain manager, DFHDMDM, (the caller of storage manager). The domain manager might then terminate CICS, in which case a message to this effect is issued.

User Response: See DFHSM0128 for further information.

Ensure that the REGION parameter for the CICS job is large enough.

See the *OS/390 MVS JCL Reference* for more information about specifying storage on the REGION parameter.

Destination: Console

Module: DFHSMDM

XMEOUT Parameters: *applid, dsalimit*

DFHSM0131 *applid* **CICS is under stress (short on storage below 16MB).**

Explanation: This message is produced when there is a shortage of storage in any of the dynamic storage areas (DSAs) below 16MB. Either the largest free area in one of the DSAs is less than the size of the internally defined cushion for that DSA, or there is at least one transaction suspended due to insufficient contiguous free storage.

System Action: An exception entry is made in the trace table to record the event.

CICS continues to operate but takes steps to alleviate the situation by, for example, slowing down the rate at which new tasks are started and by releasing storage occupied by programs which are not currently in use.

User Response: No immediate action is required. However, if the problem persists you could increase the value of the DSALIMIT parameter, if possible, or reduce the storage requirements below 16MB of your CICS system. For more information about how to do this, see the *CICS Performance Guide*.

Destination: Console

Module: DFHSMSY

XMEOUT Parameter: *applid*

DFHSM0132 *applid* **CICS is no longer short on storage below 16MB.**

Explanation: The short on storage condition reported by message DFHSM0131 has ceased.

System Action: CICS continues.

User Response: None.

Destination: Console

Module: DFHSMSY

XMEOUT Parameter: *applid*

DFHSM0133 *applid* **CICS is under stress (short on storage above 16MB).**

Explanation: There is a shortage of storage in one of the dynamic storage areas (DSAs) above 16MB. Either the largest free area in one of the DSAs is less than the size of the internally defined cushion for that DSA, or there is at least one transaction suspended due to insufficient contiguous free storage.

System Action: An exception entry is made in the trace table to record the event.

CICS continues to operate but takes steps to alleviate the situation by, for example, slowing down the rate at which new tasks are

started and by releasing storage occupied by programs which are not currently in use.

User Response: No immediate action is required. However, if the problem persists you could, if possible, increase the value of the EDSALIMIT parameter, or reduce the storage requirements of your CICS system above 16MB. For guidance on how to do this, see the *CICS Performance Guide*.

Destination: Console

Module: DFHSMSY

XMEOUT Parameter: *applid*

DFHSM0134 *applid* **CICS is no longer short on storage above 16MB.**

Explanation: The short on storage condition reported by message DFHSM0133 has ceased.

System Action: CICS continues.

User Response: None.

Destination: Console

Module: DFHSMSY

XMEOUT Parameter: *applid*

DFHSM0135 *applid* **Insufficient storage to allocate the requested size of** *dsasize***K for the** *dsaname***.**

Explanation: CICS has attempted to allocate the requested size of *dsasize* for the dynamic storage area *dsaname* but there is insufficient storage to satisfy the request.

Note: The size of a dynamic storage area (DSA) below 16MB specified via the SIT override is rounded up to a multiple of 256KB (or 1MB for the UDSA if transaction isolation is in effect). The size of a DSA above 16MB specified via the SIT override is rounded up to a multiple of 1MB.

System Action: An error return code is sent to the domain manager, DFHDMDM (the caller of storage manager). The domain manager might then terminate CICS, in which case a message to this effect is issued.

User Response: Either reduce the value specified in the DSASZE parameter, or increase the value specified in the DSALIM parameter.

Destination: Console

Module: DFHSMDM

XMEOUT Parameters: *applid, dsasize, dsaname*

DFHSM0136I *applid* **The size of the** *dsaname* **was specified as** *dsasize***K.**

Explanation: This is an informatory message giving the size *dsasize* of the dynamic storage area (DSA) *dsaname*.

System Action: CICS continues.

User Response: None. You can suppress this message with the message level system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHSMDM

XMEOUT Parameters: *applid, dsaname, dsasize*

DFHSM0300 DFHSMUTL ERROR REPORT

Explanation: This is the report from the local catalog storage manager domain subpool record manipulation program, DFHSMUTL. A number of lines may be written to the report:
DFHSM0300 DFHSMUTL REPORT
Report header.
ADD SUBPOOL=xxxxxxxx PROCESSED SUCCESSFULLY
ADD SUBPOOL=xxxxxxxx has been processed successfully.
DEL SUBPOOL=xxxxxxxx PROCESSED SUCCESSFULLY
DEL SUBPOOL=xxxxxxxx has been processed successfully.
FOUND DFHLCD RECORD SMSUBPOL=xxxxxxxx
Subpool record found by the LST command.
ERROR OPENING DFHLCD
An error has occurred opening the local catalog data set. The program is terminated.
UNRECOGNISED VERB xxx IN INPUT
Only ADD, DEL and LST are allowed. The statement is ignored.
UNRECOGNISED OPERAND xxxxxxxx IN INPUT
Only ADD SUBPOOL=xxxxxxxx or DEL SUBPOOL=xxxxxxxx are allowed. The statement is ignored.
ERROR PROCESSING 'ADD SUBPOOL=xxxxxxxx'. R15 = X'yy'. RPL FEEDBACK CODE = X'zz'. SEE DFSMS/MVS MACRO INSTRUCTIONS FOR DATA SETS
A VSAM error has occurred whilst processing an ADD SUBPOOL=xxxxxxxx command. For the meaning of the VSAM codes, refer to *DFSMS/MVS Macro Instructions for Data Sets*, SC26-4913. The program is terminated.
ERROR PROCESSING 'DEL SUBPOOL=xxxxxxxx'. R15 = X'yy'. RPL FEEDBACK CODE = X'zz'. SEE DFSMS/MVS MACRO INSTRUCTIONS FOR DATA SETS
A VSAM error has occurred whilst processing a DEL SUBPOOL=xxxxxxxx command. For the meaning of the VSAM codes, refer to *DFSMS/MVS Macro Instructions for Data Sets*, SC26-4913. The program is terminated.
END OF DFHSMUTL REPORT
Report trailer.

System Action: See Explanation.

User Response: If an error is reported, correct the cause and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHSMUTL

DFHSNxxxx messages

DFHSN0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring

to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the description of the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSNUS, DFHSNAS, DFHSNPU, DFHSNSU, DFHSNTU, DFHSNXR,

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHSN0002 *applid* **A severe error (code** *X'code'***) has occurred in program** *progname***.**

Explanation: CICS has detected a severe error while running module *progname*. This error is associated with exception trace point ID *code*. For further information about CICS exception trace entries, refer to the *CICS Problem Determination Guide*.

System Action: The task issuing the signon abends.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSNUS, DFHSNAS, DFHSNPU, DFHSNSU, DFHSNTU, DFHSNXR

XMEOUT Parameters: *applid, X'code', progname*

DFHSN0004 *applid* **A possible loop has been detected at offset** *X'offset'* **in module** *modname***.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSNUS, DFHSNAS, DFHSNPU, DFHSNSU, DFHSNTU, DFHSNXR

XMEOUT Parameters: *applid, X'offset', modname*

DFHSN1100 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **in group** *groupid* **is complete.**

Explanation: Terminal *portname* has been signed on. It now has the security attributes for userid *userid* in group *groupid*.

System Action: Processing continues.

User Response: The user at terminal *portname* can now use those CICS transactions permitted for this userid in group *groupid*.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid, groupid*

DFHSN1101 *date time applid* **Signon at** *{netname | console | terminal }portname* **has failed. User** *userid* **not recognized.**

Explanation: A signon has been issued from terminal *portname* which specified a userid *userid* that is not known to the ESM.

System Action: The signon request is rejected.

User Response: Unless this implies a breach of security that needs investigating, contact your security administrator so that the userid can be made known to the ESM.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1102 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed. Password not recognized.**

Explanation: A signon has been issued from terminal *portname* which specified an incorrect password.

This was probably caused by a misspelling of the password or because the password is not valid for this userid.

System Action: The signon request is rejected.

User Response: None, unless this implies a breach of security that needs investigating.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1103 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed. OID card damaged or not authorized.**

Explanation: A signon has been issued from terminal *portname* which used an unauthorized or damaged operator identification (OID) card.

System Action: The signon request is rejected.

User Response: None, unless this implies a breach of security that needs investigating.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1104 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed. New password not allowed.**

Explanation: A signon has been issued from terminal *portname* which attempted to change the password to a value that the external security manager (ESM) does not allow.

System Action: The signon request is rejected.

User Response: None, unless this implies a breach of security that needs investigating.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1105 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **requires a password.**

Explanation: A signon has been issued from terminal *portname* which did not specify a password. The signon has been rejected because user *userid* requires a password.

System Action: The signon request is rejected.

User Response: None, unless this implies a breach of security that needs investigating.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1106 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **requires a new password.**

Explanation: A signon has been issued from terminal *portname* for which the external security manager (ESM) indicates the password has expired.

This does not imply a security breach. It is a normal response indicating that the ESM password has expired.

System Action: The signon request is rejected.

User Response: None.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1107 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **requires an OID card.**

Explanation: A signon has been issued from terminal *portname* which did not use an operator identification (OID) card when the external security manager (ESM) indicates that one should have been used.

System Action: The signon request is rejected.

User Response: None, unless this implies a breach of security which needs investigating.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1108 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed. SAF codes are (***X'safresp'***,***X'safreas'***). ESM codes are (***X'esmresp'***,***X'esmreas'***).**

Explanation: A signon has been issued from terminal *portname* and has been rejected by the external security manager (ESM).

System Action: The signon request is rejected.

User Response: The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE

REQUEST=EXTRACT macros. These return codes are described in the *OS/390 MVS Programming: Authorized Assembler Services Guide* and in *External Security Interface (RACROUTE) Macro Reference for MVS and VM* (SC28-1366). See these manuals for an explanation of the codes.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHSN1112 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed because the terminal has preset security.**

Explanation: A signon has been issued from terminal *portname*. This terminal has been defined to CICS with fixed security attributes. It does NOT support signon.

System Action: The signon request is rejected.

User Response: None, unless this implies a breach of security that needs investigating.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1113 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed because the terminal was already signed on.**

Explanation: A signon has been issued from terminal *portname* while a previous signon was still in effect for this terminal.

System Action: The signon request is rejected.

User Response: None, unless this implies a breach of security which needs investigating.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1114 *date time applid* **Signon by user** *userid* **has failed because there is no terminal associated with the requesting task.**

Explanation: A signon has been issued by user *userid* from a task that had been started without a terminal.

System Action: The signon request is rejected.

User Response: Investigate why a signon has been issued from a task that is not associated with a terminal.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, userid*

DFHSN1115 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed. Signon is not allowed at a surrogate terminal except by use of the CRTE transaction.**

Explanation: CICS does not support the signing-on of surrogate terminals, except when done during a CRTE routing session.

System Action: Processing continues.

User Response: Investigate how and why users are attempting to use signon via transaction routing.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1116 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed because the national language to be used is not supported in this run of CICS.**

Explanation: The national language specified has been recognized as a valid IBM national language. However, either this language cannot be specified as a valid national language for CICS initialization, or CICS has not been initialized with this language in the current run of CICS.

See the *CICS Application Programming Reference* for a list of national languages that CICS can be initialized to use.

System Action: Signon fails.

User Response: Retry signon with a national language that CICS has been initialized to use.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1117 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed because an invalid national language was selected.**

Explanation: Signon failed because the language specified was not recognized as an IBM national language.

System Action: Signon fails.

User Response: Retry signon with a correct language value.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1118 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed because the user is not authorized to use the terminal.**

Explanation: A signon has been issued from terminal *portname* which has failed. The user is not authorized to use the terminal.

System Action: The signon request is rejected.

User Response: Contact your security administrator, who should check if the user should be authorized to use terminal *portname*.

In particular, check if the user should be able to access the system on this particular day and time and whether the terminal may be used on this day and time.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1119 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed because the user is not authorized to use application** *applname***.**

Explanation: A signon has been issued from terminal *portname* which has failed. The user is not authorized to use the application *applname*.

- If you are using the VTAM generic resource function, *applname* is the generic resource name specified in the GRNAME system initialization parameter.
- If you are using XRF, *applname* is the generic applid specified as the first operand of the APPLID system initialization parameter.
- Otherwise, *applname* is the application identifier specified as the single operand of the APPLID system initialization parameter.

System Action: The signon request is rejected.

User Response: Contact your security administrator, who should check whether the user should have authorization to use application *applid*.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid, applname*

DFHSN1120 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed because the** *{userid | group access}* **has been revoked.**

Explanation: Either the userid, or the user's access to the ESM group containing it, has been revoked by the ESM. This is usually the result of repeated attempts to signon with an invalid password.

System Action: The signon request is rejected.

User Response: For revoked userids, contact your security administrator who can reauthorize the revoked userid by issuing the ALTUSER RESUME function. For revoked group access, contact your security administrator who can restore the user's access to the group by issuing the CONNECT RESUME function.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid, {1=userid, 2=group access}*

DFHSN1129 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed because the user is already signed on elsewhere.**

Explanation: A signon has been issued from terminal *portname* while the user is already signed on under the restrictions imposed by the current setting of the SNSCOPE system initialization parameter.

System Action: The signon request is rejected.

User Response: Investigate why users are attempting to signon twice within the current signon scope.

See the *CICS System Definition Guide* for more information about the SNSCOPE parameter.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1130 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **failed because the userid was not found in the specified group.**

Explanation: A signon has been issued from terminal *portname* which has failed. Either the userid is not in the specified group, or the group specified for this user to be associated with after signon is not known to the ESM.

System Action: The signon request is rejected.

User Response: Check that the groupid specified is correct. If it is, contact your security administrator to ensure that this group is defined properly, and that the user is connected to this group.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1131 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed because security is not active in this CICS region.**

Explanation: A signon has been issued from terminal *portname* which has failed. This is because this CICS region is running without security active.

System Action: The signon request is rejected.

User Response: None.

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1132 *date time applid* **Signon at terminal** *termid* **by user** *userid* **has failed because the terminal is a session.**

Explanation: A signon has been issued from terminal *termid* which is a session. The security attributes of a session can only be changed on receipt of a valid FMH-5 attach header.

System Action: The signon request is rejected.

User Response: Investigate how and why users are attempting to use signon for a session.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, termid, userid*

DFHSN1133 *date time applid* **Signon at** *{netname | console | terminal }portname* **by user** *userid* **has failed because of an error during SNSCOPE checking.**

Explanation: A signon has been issued from terminal *portname*. The SNSCOPE initialization parameter disallows signon to more than one terminal at a time. An internal failure during SNSCOPE checking means that CICS is unable to confirm if the user is already signed on elsewhere. The failure has occurred because the limit of concurrent MVS ENQ requests has been reached.

System Action: The signon request is rejected. Message DFHUS0120 will have been written to the console. See the explanation of this message for further information.

User Response: Please report this problem to your CICS systems programmer.

See the *CICS System Definition Guide* for more information about the SNSCOPE parameter.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHSN1150 *date time applid* **Signon at TCAM pool by user** *userid* **in group** *groupid* **is complete.**

Explanation: A TCAM pool of terminals has been signed on by user *userid*. All terminals in this TCAM pool now have the security attributes for user *userid* in group *groupid*.

System Action: Processing continues.

User Response: The user at any of these TCAM terminals can now use those CICS transactions permitted for this userid in group *groupid*.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, userid, groupid*

DFHSN1200 *date time applid* **Signoff at** *{netname | console | terminal }portname* **by user** *userid* **is complete.** *tt* **transactions entered with** *nn* **errors.**

Explanation: Terminal *portname* has been signed off. It now has the default security attributes.

nn indicates the number of errors which have occurred.

System Action: Processing continues.

User Response: None.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname, userid, tt, nn*

DFHSN1211 *date time applid* **Signoff at terminal** *termid* **has failed because the terminal is a session.**

Explanation: A signoff has been issued from terminal *termid* which is a session. The security attributes of a session can only be changed on receipt of a valid FMH-5 attach header.

System Action: The signoff request is rejected.

User Response: Investigate how and why users are attempting to use signoff for a session.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, termid*

DFHSN1212 *date time applid* **Signoff at** *{netname | console | terminal }portname* **has failed because the terminal has preset security.**

Explanation: A signoff has been issued from terminal *portname* which has been defined to CICS with fixed security attributes and so does not support signoff.

System Action: The signoff request is rejected.

User Response: None, unless this implies a breach of security which needs investigating.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname*

DFHSN1213 *date time applid* **Signoff at** *{netname | console | terminal }portname* **has failed because the terminal was not signed on.**

Explanation: A signoff has been issued from terminal *portname* while no previous signon was in effect.

System Action: The signoff request is rejected.

User Response: None, unless this implies a breach of security which needs investigating.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname*

DFHSN1214 *date time applid* **An attempted signoff has failed because there was no terminal associated with the requesting task.**

Explanation: A signoff has been issued from a task that had been started without a terminal.

System Action: The signoff request is rejected.

User Response: Investigate why a signoff has been issued from a task that is not associated with a terminal.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid*

DFHSN1215 *date time applid* **Signoff at** *{netname | console | terminal }portname* **has failed. Signoff is not allowed at a surrogate terminal except by use of the CRTE transaction.**

Explanation: CICS does not support the signing off of surrogate terminals, except when done during a CRTE routing session.

System Action: Processing continues.

User Response: Investigate how and why users are attempting to use signoff via transaction routing.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, {1=netname , 2=console , 3=terminal }, portname*

DFHSN1250 *date time applid* **Signoff at TCAM pool is complete.**

Explanation: A TCAM pool of terminals has been signed off. All terminals in this TCAM pool now have default security attributes.

System Action: Processing continues.

User Response: None.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid*

DFHSN1300 *date time applid* **An attempt to reschedule BMS pages for operator** *opid* **at** *{netname | console | terminal }portname* **has failed following a timeout. Pages on temporary storage queue** *X'hexqueueid'* **may require cleanup.**

Explanation: Operator *opid* has been timed out on terminal *netname* while viewing BMS pages. CICS has attempted to reschedule the pages so that they are available when the operator signs on again, but the reschedule has failed.

The pages are available on temporary storage queue *hexqueueid*. This queue continues to exist until it is explicitly disposed of.

System Action: Processing continues.

User Response: If you still need to view this data, repeat the processing which created the BMS pages.

Destination: CSCS

Module: DFHSNTU

XMEOUT Parameters: *date, time, applid, opid, {1=netname , 2=console , 3=terminal }, portname, X'hexqueueid'*

DFHSN1400 *date time applid* **Session signon for session** *session* **by user** *userid* **is complete.**

Explanation: The two CICS systems are connected and the MRO/ISC session is given the security authority of user *userid*.

System Action: The MRO/ISC sessions are signed on.

User Response: None.

Destination: CSCS

Module: DFHSNSU

XMEOUT Parameters: *date, time, applid, session, userid*

DFHSN1401 *date time applid* **Session signon for session** *session* **by user** *userid* **has failed. SAF codes are (***X'safresp'***,***X'safreas'***). ESM codes are (***X'esmresp'***,***X'esmreas'***).**

Explanation: An MRO/ISC signon is attempted by user *userid* but the signon has failed for the reason given.

System Action: The session is not signed on.

User Response: The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the *OS/390 MVS Programming: Authorized Assembler Services Guide*, and in *External Security Interface (RACROUTE) Macro Reference for MVS and VM* (SC28-1366). Consult the manuals to find the cause of the codes.

Destination: CSCS

DFHSOxxxx messages

DFHSO0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.
If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHSOCK

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHSO0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSODM, DFHSOL, DFHSOCK, DFHSORD, DFHSOIS.

XMEOUT Parameters: *applid, X'code', modname*

DFHSO0004 *applid* **A possible loop has been detected at offset** *X'offset'* **in module** *modname***.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which happened to be executing at the time when the error was detected.

System Action: An exception entry is made in the trace table.

A system dump is taken unless you have specifically suppressed the dump (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function, and there may not be an error. Usually, CICS purges a CICS function which exceeds the runaway task time interval that you have specified in the ICVR system initialization parameter. This means that execution of module *modname* is terminated and CICS continues.

If you have specified system initialization parameter ICVR=0 and you consider that module *modname* is looping, you must terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the value of the ICVR system initialization parameter. You have to close down CICS at a suitable time to do this permanently. You can change the ICVR time interval temporarily online using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHSOCK, DFHSOSE

XMEOUT Parameters: *applid, X'offset', modname*

DFHSO0100I *applid* **Sockets domain initialization has started.**

Explanation: This is an informational message indicating that sockets domain initialization has started.

System Action: System initialization continues.

User Response: None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHSODM

XMEOUT Parameter: *applid*

DFHSO0101I *applid* **Sockets domain initialization has ended.**

Explanation: This is an informational message indicating that sockets domain initialization has completed successfully.

System Action: System initialization continues.

User Response: None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHSODM

XMEOUT Parameter: *applid*

DFHSO0103 *applid* **ENCRYPTION=STRONG is not available on this system.**

Explanation: The ENCRYPTION=STRONG system initialization parameter was specified, but the necessary feature to implement it was not installed on your system.

System Action: This message is followed by message DFHSO0104, and system initialization continues.

User Response: If you wish to use strong encryption with the secure sockets layer, you must order and install the North American Secure Encryption feature. This CICS feature is only available in the United States of America and Canada.

If the feature is unavailable, you must specify ENCRYPTION=NORMAL, which is the default.

Destination: Console Routecodes 2, 9, 10 and 11

Module: DFHSODM

XMEOUT Parameter: *applid*

DFHSO0104 *applid* **Secure sockets program** *pgmname* **could not be loaded. Secure Sockets Layer is not available.**

Explanation: The program module *pgmname*, which is required to implement the secure sockets layer, could not be loaded.

System Action: System initialization continues, but support for the secure sockets layer is not enabled.

User Response: If this message is preceded by message DFHSO0103, try restarting CICS with ENCRYPTION=NORMAL.

Destination: Console Routecodes 2, 9, 10 and 11

Module: DFHSODM

XMEOUT Parameters: *applid, pgmname*

DFHSO0106 *date time applid* **An OpenEdition Assembler Callable Service error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

User Response: This indicates a possible error in CICS code or the called Assembler Callable Service routine. The exception trace entry will tell you which service routine was called and the return values that were returned. Refer to the OS/390 OpenEdition Messages and Codes book to determine the cause of the error. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

Module: DFHSOCK

XMEOUT Parameters: *date, time, applid, X'code', modname*

DFHSO0107 *date time applid* **TCPIPSERVICE** *tcpipservice* **has been opened on port** *portnumber* **at IP address** *ipaddress***.**

Explanation: The TCPIPSERVICE *tcpipservice* has been opened on port *portnumber* at the IP address specified.

System Action: CICS continues.

User Response: None.

Destination: CSOO

Module: DFHSOCK

XMEOUT Parameters: *date, time, applid, tcpipservice, portnumber, ipaddress*

DFHSO0108 *date time applid* **TCPIPSERVICE** *tcpipservice* **on port** *portnumber* **at IP address** *ipaddress* **has been closed.**

Explanation: The TCPIPSERVICE *tcpipservice* on port *portnumber* on the specified IP address has been closed.

System Action: CICS continues.

User Response: None.

Destination: CSOO

Module: DFHSOCK

XMEOUT Parameters: *date, time, applid, tcpipservice, portnumber, ipaddress*

DFHSO0109 *date time applid* **The TCPIPSERVICE** *tcpipservice* **could not be opened because the port** *portnumber* **is already in use on the IP address** *ipaddress* **.**

Explanation: This message is issued when the open of a TCPIPSERVICE cannot be completed. The port number specified is already in use in combination with the IP address. By default, TCP/IP only allows one server to be listening on a port at any one time.

Specifically, this message is issued when the TCP/IP bind call fails with a return code of EADDRINUSE.

System Action: The TCPIPSERVICE does not open, but remains closed. An exception trace entry is written detailing the return values from the TCP/IP bind call. An application using the EXEC API to set the TCPIPSERVICE open receives an RESP(INVREQ) RESP2(9).

User Response: Check that there are no other TCPIPSERVICES open using the same port number and IP address as the failing one. If there is another TCPIPSERVICE open using the port, it must be closed before the new one can be opened.

If no TCPIPSERVICES are using the requested port, there may be another OS/390 application acting as a TCP/IP server already listening on the port. For example, the Lotus Go for OS/390 web server may be installed and running on port 80 on the same TCP/IP stack as CICS. Attempting to open a TCPIPSERVICE on port 80 will fail. Use the TSO command NETSTAT to display TCP/IP servers on the system. Choose an unused port for the TCPIPSERVICE.

If your OS/390 system has more than one TCP/IP stack you may specify another stack's IP address on the TCPIPSERVICE definition. This will allow you to install multiple TCPIPSERVICES each using the same port number. You may also configure support in TCP/IP for virtual IP addresses on a single system. This will also allow more than one TCPIPSERVICE to share the same port.

Finally, TCP/IP for OS/390 can be configured with port sharing. This allows multiple servers (TCPIPSERVICES) to use the same port with TCP/IP using load balancing to direct incoming connections to the set of servers on the port. With this enabled, multiple TCPIPSERVICES can each be opened on the same IP address with the same port.

Destination: CSOO

Module: DFHSOCK

XMEOUT Parameters: *date, time, applid, tcpipservice, portnumber, ipaddress*

DFHSO0110 *date time applid* **The TCPIPSERVICE** *tcpipservice* **cannot be opened on the IP address** *ipaddress* **because the address is unknown to TCP/IP.**

Explanation: Opening the TCPIPSERVICE has failed because the IP address specified on the definition is not known to TCP/IP.

This message is issued when the TCP/IP bind call fails with the return value of EADDRNOTAVAIL.

System Action: The IP address must be a valid address known to TCP/IP. It is possible to configure multiple TCP/IP stacks for a single OS/390 system, or to have virtual IP addresses on a single stack. If the system only has one IP address then the IP address field of the TCPIPSERVICE definition can be left blank, or filled with the string INADDR_ANY. This causes the bind to use the default IP address for the system. To use an alternative, a valid address must be specified.

User Response: Check that the address specified on the TCPIPSERVICE definition is known to TCPIP on the system. If it is not, then consult the OS/390 TCP/IP OpenEdition: Configuration Guide for information on defining IP address.

Destination: CSOO

Module: DFHSOCK

XMEOUT Parameters: *date, time, applid, tcpipservice, ipaddress*

DFHSO0111 *date time applid* **Opening the TCPIPSERVICE** *tcpipservice* **has failed because the region userid is not authorized to bind to port** *portnumber***.**

Explanation: Opening the TCPIPSERVICE has failed because the userid of the region is not authorized to use the port number specified.

Binding to port numbers below 1024 requires configuration directives in the TCP/IP configuration files, or the userid to have root authority. It is also possible to explicitly associate userids with port numbers in the TCP/IP configuration files, thus port numbers greater than 1024 may be unavailable to an unauthorized userid.

This message is issued when the TCP/IP bind call fails with a return value of EPERM.

System Action: The TCPIPSERVICE is not opened. If an application has used the EXEC API to open the TCPIPSERVICE, it receives RESP(INVREQ) RESP2(3) values.

User Response: The CICS region's userid must be authorized to open the specified port. Consult the S/390 TCP/IP OpenEdition: Configuration Guide for details on how to do this.

Destination: CSOO

Module: DFHSOCK

XMEOUT Parameters: *date, time, applid, tcpipservice, portnumber*

DFHSO0112 *date time applid* **TCPIPSERVICE** *tcpipservice* **cannot be opened because TCPIP status is not OPEN.**

Explanation: Opening the TCPIPSERVICE has failed because TCPIP is currently not open. Either TCPIP=NO has been specified in the SIT or TCPIP has been dynamically closed using CEMT or an SPI command.

System Action: The TCPIPSERVICE is not opened. If an application has used the EXEC API to open the TCPIPSERVICE, it receives RESP(INVREQ) RESP2(4) values.

User Response: Open TCPIP and re-open the TCPIPSERVICE.

Destination: CSOO

Module: DFHSORD

XMEOUT Parameters: *date, time, applid, tcpipservice*

DFHSO0113 *applid* **The IP address** *ip_address* **cannot be resolved to a host name by the gethostbyaddr function.**

Explanation: CICS has issued the TCP/IP function gethostbyaddr to resolve the IP address *ip_address* to a host name, but the call failed.

System Action: An exception trace entry is made. CICS will continue to attempt to access the name server for subsequent requests.

User Response: The gethostbyaddr function will usually perform a name server reverse lookup to resolve the IP address into a host name. This can fail if CICS is unable to contact a name server, or the name server does not know the correct host name to IP address mapping.

Check that the name server defined to TCP/IP in the /etc/resolv.conf file is valid and responding correctly. You can issue the TSO NSLOOKUP command to query the name server. If a SYSTCPD DD name has been defined in the CICS job, check that the file it references correctly defines the name server. If the name server is defined correctly to CICS then contact the administrator to determine why the IP address lookup has failed.

Destination: Console

Module: DFHSOIS

Module:

XMEOUT Parameters: *applid, ip_address*

DFHSO0114 *date time applid* **The socket listener cannot attach the transaction** *transaction***, the TCPIPSERVICE** *tcpipservice* **will be closed.**

Explanation: The TCP/IP listener task has received a connection from a client but the attach for the transaction associated with the TCPIPSERVICE definition has failed. The associated transaction may not have been installed or the TCPIPSERVICE definition could have specified the wrong transaction.

System Action: The TCPIPSERVICE that is defined on the port that the connection arrived on is closed. The socket accepted for the client is closed.

User Response: Determine why the attach for the transaction has failed. Correct the error and re-open the TCPIPSERVICE.

Destination: CSOO

Module: DFHSOCK

XMEOUT Parameters: *date, time, applid, transaction, tcpipservice*

DFHSO0115 *date time applid* **CICS has registered the group name** *groupname* **with Work Load Manager. The TCP/IP host name** *genericname* **will become available for DNS connection optimization.**

Explanation: The group name has been registered with Work Load Manager for Domain Name Service (DNS) connection optimization. This occurs when a TCPIPSERVICE is opened where its name begins with the character 'D'. The new generic TCP/IP host name becomes available for clients to use to access the CICS system, and any others that have registered with the named group name.

System Action: CICS has issued the Work Load Manager macro IWMSRSRG to register the specified group name for DNS connection optimization. This only occurs when the name of the TCPIPSERVICE begins with a 'D'. Work Load manager registration only occurs once for a given group name. If multiple TCPIPSERVICES define the same group name, then registration will only occur once.

The group name registered is taken from a combination of part of the name of the TCPIPSERVICE and the transaction defined for the TCPIPSERVICE. Any characters of the name following a dot '.' are concatenated onto the transaction identifier to form the group name. For example, a TCPIPSERVICE has the name D1.CICS and is defined with the transaction IIOP (The IIOP transaction being an alias of the CICS supplied CIOR transaction). The group name generated is 'CICSIIOP'. If the TCPIPSERVICE name does not contain a dot, then only the transaction identifier is used. For example, a TCPIPSERVICE with a name of 'DYNWEB' and a transaction of WWW will generate a registration for the group 'WWW'.

The group name registered effectively becomes a new name in the sysplex TCP/IP domain. When multiple CICS systems in a sysplex each register with the same group name, the DNS server uses Work Load Manager to resolve the group name into one of the IP addresses of the associated systems. The IP address returned is that of the system that is most eligible according to Work Load Manager's load balancing rules. For example, two OS/390 systems in a sysplex are mvs1.plex.hursley.ibm.com and mvs2.plex.hursley.ibm.com; and on each system, CICS registers with the group name cicsiiop. The new name cicsiiop.plex.hursley.ibm.com is dynamically added to the DNS name servers tables. Client TCP/IP applications can use this name instead of the name of one of the specific OS/390 images. When a client resolves the name to an IP address using the DNS, it will get the IP address of the most eligible system. Since the DNS dynamically knows when systems register and deregister, additional CICS systems can be registered as required to expand the list of available IP addresses returned for a group name. If a system fails, its IP address will be removed from the DNS server's list of associated addresses for any groups with which it was registered.

User Response: No user action is necessary.

Destination: CSOO

Module: DFHSOCK

XMEOUT Parameters: *date, time, applid, groupname, genericname*

DFHSO0116 *date time applid* **CICS has deregistered the group name** *groupname* **with Work Load Manager.**

Explanation: The group name has been deregistered from Work Load Manager. This CICS system will no longer participate in connection optimization in the group specified. This occurs when a TCPIPSERVICE is closed where its name begins with a 'D'.

System Action: The Work Load Manager IWMSRDRS call is made to deregister the group name. This will remove the IP address of the system from the DNS servers table associated with the group name.

If more than one open TCPIPSERVICE share the same group name, then the WLM deregistration only occurs when the last one is closed.

User Response: Check the availability of the name server.

Destination: CSOO

Module: DFHSOCK

XMEOUT Parameters: *date, time, applid, groupname*

DFHSO0117 *applid* **Unable to determine the TCP/IP host name. OpenEdition return code** *X'retcode'***, reason code** *X'rc'***. TCP/IP services are unavailable.**

Explanation: OpenEdition has returned a non-zero return code/reason code to a gethostname call during Listener initialization.

System Action: Listener initialization terminates. The CICS region does not open its TCP/IP interface.

User Response: Determine the reason for the gethostname failure. The return code and reason code included in the message text are described in the OS/390 UNIX System Services Messages and Codes manual.

Destination: Console

Module: DFHSOCK

XMEOUT Parameters: *applid, X'retcode', X'rc'*

DFHSO0119 *applid* **Unable to register service** *servicename* **for WLM DDNS on host** *hostname***.**

Explanation: During activation of a TCPIPSERVICE, the Sockets Domain was unable to locate a TCP/IP name server. Without a name server, CICS cannot obtain the information necessary for registration with WLM DDNS.

System Action: TCPIPSERVICE activation continues, but this service is not registered with WLM DDNS.

User Response: Determine why no name server was found. Message DFHSO0113 may have preceded this message. Once the name server has been activated, re-install the TCPIPSERVICE.

Destination: Console

Module: DFHSOCK

XMEOUT Parameters: *applid, servicename, hostname*

DFHSRxxxx messages

DFHSR0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in program** *progname***.**

Explanation: An abnormal end (abend) or program check has occurred in program *progname*. Storage protection is active, and CICS was executing in USER key at the time of the abend or program check.

The code *aaa* is a three digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The four digit code *bbbb*, which follows *aaa*, is a user abend code, produced either by CICS or by another product on the user's system. Message DFHME0116 is normally produced containing the symptom string for this problem.

System Action: An exception trace entry is made giving details of the error. System dump SR0001 is taken unless you have specifically suppressed dumps for that dumpcode in the dump table.

CICS continues and abends the transaction, unless you have specified in the dump table that CICS should terminate. The transaction abend code is ASRA, ASRB, ASRD or ASRE.

User Response: As the execution key was USER key, *modname* is probably a customer application program. Review this program and correct the error.

Note that if the error was an 0C4 program check caused by an attempt to overwrite a CICS DSA, the exception trace entry indicates which DSA the program attempted to overwrite. If this is the case, also refer to the explanation for message DFHSR0622.

For advice on problem determination, refer to the *CICS Problem Determination Guide*.

Report the details of the symptom string given in message DFHME0116.

If you want to suppress system dumps that precede ASRA, ASRB, ASRD or ASRE abends when the execution key is USER, you must specify this on an entry in the dump table for system dumpcode SR0001. Use either CEMT or an EXEC CICS command. Further guidance on this can be found in the *CICS System Definition Guide*.

Destination: Console

Module: DFHSRP

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', progname*

DFHSR0601 *applid* **Program interrupt occurred with system task** *taskid* **in control**

Explanation: A program check has been detected in a system task. *taskid* is the system task identifier (for example, TCP, III) as set in field TCAKCTTA.

System Action: CICS abnormally terminates with system dump SR0601 and an exception trace entry which gives the kernel error data for the program check.

User Response: Use the dump to determine the cause of the program check. The most likely causes are either an error in a CICS module, or an error in a user-written PLT program.

For advice on problem determination, refer to the *CICS Problem Determination Guide*.

Destination: Console

Module: DFHSRP

XMEOUT Parameters: *applid, taskid*

DFHSR0602 *applid* **Program interrupt routine has been entered while processing program interrupt for same task**

Explanation: A program check occurred. CICS started to abend the task with an abend code of ASRA when another program check occurred. As this is a potentially recursive situation, DFHSRP terminates CICS.

System Action: CICS abnormally terminates with system dump SR0602 and exception trace entries giving the kernel error data for each program check.

User Response: Try to discover where and why the first program check occurred. The most likely cause is an error in the application program. The second program check may be due to a CICS error while terminating the task.

For advice on problem determination, refer to the *CICS Problem Determination Guide*.

Destination: Console

Module: DFHSRP

XMEOUT Parameter: *applid*

DFHSR0603 *applid* **Program interrupt has occurred**

Explanation: A program check occurred, and CICS did not attempt to recover, because SRT=NO was specified in the system initialization table or by the operator at start-up time.

System Action: CICS abnormally terminates with system dump SR0603 and an exception trace entry giving the kernel error data for the program check.

User Response: Initially, check that the specification of SRT=NO is correct. If it is incorrect, change it as described in the *CICS System Definition Guide*.

For advice on problem determination, refer to the *CICS Problem Determination Guide*.

Destination: Console

Module: DFHSRP

XMEOUT Parameter: *applid*

DFHSR0605 *applid* **Error from KE Domain - DFHSRP initialization**

Explanation: Module DFHSRP has detected a severe error during the initialization phase of CICS. It is unlikely that any recovery functions can run until the error is found and corrected.

System Action: CICS abnormally terminates with system dump SR0605.

User Response: Use the dump to determine, if possible, the cause of the problem and what must be done to correct it.

For advice on problem determination, refer to the *CICS Problem Determination Guide*

Destination: Console

Module: DFHSRP

XMEOUT Parameter: *applid*

DFHSR0606 *applid* **Abend (code** *aaa/bbbb***) has been detected.**

Explanation: DFHSRP has detected an abnormal termination which CICS is not able to handle fully (for example, the abend code cannot be found in the SRT). In this instance it is the CICS system and not merely a transaction, that has abnormally terminated.

The code *aaa* is a three digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The four digit code *bbbb*, which follows *aaa*, is a user abend code produced either by CICS or by another product on the user's system.

System Action: CICS abnormally terminates. A system dump (dumpcode SR0606) can be taken with this message depending on the abend code. An exception trace entry is produced giving the kernel error data for the abend.

User Response: Use the dump to determine the abnormal termination, and to investigate its cause.

Destination: Console

Module: DFHSRP

XMEOUT Parameters: *applid, aaa/bbbb*

DFHSR0612 *applid* **Abend recovery has been entered by same task**

Explanation: An operating system abnormal termination occurred. CICS started to abend the task with abend code ASRB when another operating system abnormal termination occurred. As this is a potentially recursive situation, DFHSRP terminates CICS.

System Action: CICS abnormally terminates with system dump SR0612 and exception trace entries giving the kernel error data for each operating system abend.

User Response: The most likely cause of the second operating system abend is an error in a global user exit program running at the XSRAB exit. This is the global user exit that can be invoked when an abend code is found in the SRT. If such a program was running, determine the cause of the second abend and take steps to prevent a recurrence.

Note that this message will also be issued if a global user exit program running at the XSRAB exit gets into a loop (runaway), or issues an unknown XPI call (kernerror). The second exception trace entry should help to diagnose this.

For advice on problem determination, see the *CICS Problem Determination Guide*.

Destination: Console

Module: DFHSRP

XMEOUT Parameter: *applid*

DFHSR0613 *applid* **Abend has occurred with system task** *taskid* **in control**

Explanation: An operating system abnormal termination has been detected in a system task. *taskid* is the system task identifier (for example, TCP, III) as set in field TCAKCTTA.

System Action: CICS abnormally terminates with system dump SR0613 and an exception trace entry giving the kernel error data for the operating system abend.

User Response: Use the dump to determine the cause of the abend, and take action to correct it.

For advice on problem determination, see the *CICS Problem Determination Guide*.

Destination: Console

Module: DFHSRP

XMEOUT Parameters: *applid, taskid*

DFHSR0615 *applid* **Program interrupt has occurred in recovery task**

Explanation: An operating system abnormal termination occurred. CICS started to abend the task with an abend code of ASRB when a program check occurred. DFHSRP terminates CICS.

System Action: CICS abnormally terminates with system dump SR0615 and exception trace entries giving the kernel error data for the operating system abend and the program check.

User Response: The most likely cause of the program check is an error in a global user exit program running at the XSRAB exit. This is the global user exit that can be invoked when an abend code is found in the SRT. If such a program was running, determine the cause of the program check and correct it.

For advice on problem determination, refer to the *CICS Problem Determination Guide*.

Destination: Console

Module: DFHSRP

XMEOUT Parameter: *applid*

DFHSR0618 *applid* **An illegal macro call or reference to the CSA or TCA has caused the abend which follows**

Explanation: A user program was executing which either contains an assembler macro which is no longer supported, or refers illegally to the CICS TCA or CSA. This error appears as an 0C4 program check.

System Action: Either The transaction abends with abend code ASRD. This message is followed by message DFHAP0001 or DFHSR0001 which gives the name of the program in error and the offset into that program at which the error occurred.

Or This is a critical error and CICS is terminated. This message is followed by a DFHSR06xx message giving the reason for the termination.

User Response: Review the program and correct the error.

If the error is in the module DFHUEHC, ensure that UEPCSA and UEPTCA are not being used because these reference fetch-protected storage.

For advice on problem determination, refer to the *CICS Problem Determination Guide*.

Destination: Console

Module: DFHSRP

XMEOUT Parameter: *applid*

DFHSR0619 *date time applid* **An illegal reference to the RCT has caused the abend which follows.**

Explanation: A user program was executing and referred illegally to the RCT. This error appears as an 0C4 program check.

System Action:

The transaction abends with abend code ASRE. This message is followed by message DFHAP0001 or DFHSR0001 which gives the name of the program in error and the offset into that program at which the error occurred.

User Response: Review the program and correct the error by using the CICS supplied SPI commands to retrieve data from the RCT.

For advice on problem determination, refer to the *CICS Problem Determination Guide*.

Destination: Console and Transient Data Queue CDB2

Module: DFHSRP

XMEOUT Parameters: *date, time, applid*

DFHSR0622 *applid* **An attempt to** *{overwrite | access}* **the** *dsaname* **has caused the abend which follows**

Explanation: An 0C4 program interrupt (protection exception) has occurred. CICS has diagnosed the cause of the 0C4 as an attempt to either *access* or *overwrite* storage in DSA *dsaname*. The DSA is one of CDSA, RDSA, UDSA, ECDSA, ERDSA or EUDSA for *overwrite*, or either UDSA or EUDSA for *access*.

If *dsaname* is CDSA or ECDSA:

CICS is running with storage protection active. Both the CDSA and the ECDSA therefore contain CICS key storage. They are write protected from user programs executing in User key. The most likely causes of the 0C4 are:

- A program executing in CICS key passed the address of CICS key storage in the CDSA or ECDSA to a user program executing in User key and this user program attempted to write to this storage.
- A user program executing in User key contains an error and accidentally attempted to write to CICS key storage in the CDSA or ECDSA.
- A user program executing in User key deliberately attempted to write to CICS key storage in the CDSA or ECDSA.

If *dsaname* is ERDSA or RDSA:

CICS may be running with or without storage protection active. The ERDSA or RDSA contains only reentrant CICS and user programs. If RENTPGM=PROTECT was specified as a system initialization parameter, the ERDSA or RDSA is write protected from programs executing in both CICS key and User key. If RENTPGM=NOPROTECT, the ERDSA or RDSA is only protected from user programs executing in User key. The most likely causes of the 0C4 are:

- A user program residing in the ERDSA or RDSA has attempted to modify its own storage, (that is, the program is not reentrant).
- A user program contains an error and accidentally attempted to overwrite program storage in the ERDSA or RDSA.

If *dsaname* is EUDSA or UDSA:

CICS is running with both storage protection and transaction isolation active. The EUDSA and UDSA contain only USER key non-shared storage. The most likely causes of the 0C4 are:

- If the action is *overwrite*, a program has attempted to modify the non-shared storage belonging to another transaction.
- If the action is *access*, a program has attempted to either read storage or execute an instruction within another transaction's non-shared storage.

System Action: Either, the transaction abends with abend code ASRA. This message is followed by message DFHAP0001 or DFHSR0001 which gives the name of the program in error and the offset into that program at which the error occurred. Additionally, an exception trace entry is taken which gives program, offset, execution key and the DSA in question.

Or, this is a critical error and CICS is terminated. This message is followed by a DFHSR06xx message giving the reason for the termination.

User Response: Depending on the cause and *dsaname*, do one of the following:

- Correct any error in the program.
- Redefine transactions with ISOLATE(NO) where they have to share storage.
- Change the program resource definition so that it executes in CICS key (and the basespace).
- Ensure that the program is not loaded into the ERDSA by not link-editing it with the RENT option.

Destination: Console

Module: DFHSRP

XMEOUT Parameters: *applid, {1=overwrite, 2=access}, dsaname*

DFHSTxxxx messages

DFHST0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code.

Alternatively, unexpected data has been input, or storage has been overwritten.

Note: There is NO *applid* for DFHSTUP modules.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table.

For modules DFHSTST and DFHSTTI, a dump is taken and the collection interval is set to 24 hours. Message DFHST0101 is also issued.

For module DFHSTDM, the action depends on the initialization error action value which is used by the domain (DM) manager. The usual action is to terminate CICS with a dump.

For module DFHSTUE, processing continues.

For modules DFHSTWR, DFHSTRD, and DFHSTU*x* (modules within DFHSTUP), the job step is terminated with a dump.

For ALL modules, a system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the *OS/390 MVS System Codes* manual. Then look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, a runaway or a recovery percolation, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSTST, DFHSTDM, DFHSTTI, DFHSTUE, DFHSTUx (Modules within DFHSTUP), DFHSTWR, DFHSTRD

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHST0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS will continue unless you have specified in the dump table that CICS should terminate.
If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Inform the system programmer. This indicates a possible error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

For further information about CICS exception trace entries, refer to the *CICS Problem Determination Guide*.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSTST, DFHSTDM, DFHSTTI, DFHSTUE

XMEOUT Parameters: *applid, X'code', modname*

DFHST0003 *applid* **Insufficient storage to satisfy GETMAIN (code** *X'code'***) in module** *modname***.**

Explanation: A CICS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.
The code X'*code*' is the exception trace point id which uniquely identifies the place where the error was detected.
This error has occurred above the 16MB line.

System Action: An exception entry is made in the trace table

(code X'*code*' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try increasing the size limits of the DSAs or EDSAs. If CICS is not already terminated, you need to bring CICS down to do this. See the *CICS System Definition Guide* or the *CICS Performance Guide* for further information on CICS storage.

Destination: Console

Module: DFHSTDM

XMEOUT Parameters: *applid, X'code', modname*

DFHST0004 *applid* **A possible loop has been detected at offset** *X'offset'* **in module** *modname***.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

Note that no *applid* is included for DFHSTUP modules.

System Action: An exception entry is made in the trace table.

For modules DFHSTST and DFHSTTI, a system dump is taken and the collection interval is set to 24 hours. Message DFHST0101 will also be issued.

For module DFHSTDM, the action depends on the initialization error action value which is used by the domain (DM) manager. The usual action will be to terminate CICS with a dump.

For module DFHSTUE, processing continues.

For modules DFHSTWR, DFHSTRD, and DFHSTU*x* (modules within DFHSTUP), the job step is terminated with a dump.

For ALL modules, a system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSTST, DFHSTDM, DFHSTTI, DFHSTUE, DFHSTUx (Modules within DFHSTUP), DFHSTWR, DFHSTRD

XMEOUT Parameters: *applid, X'offset', modname*

DFHST0005 *applid* **A hardware error has occurred (module** *modname***, code** *X'code'***). The Time-of-Day clock is invalid.**

Explanation: Execution of the STCK machine instruction resulted in a non-zero condition code.

System Action: A system dump is taken and interval collections are cancelled. Message DFHST0102 is also issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. This is in all probability a hardware error and you should in the first instance investigate the MVS Store Clock and find out whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSTST, DFHSTDM

XMEOUT Parameters: *applid, modname, X'code'*

DFHST0101I *applid* **The Statistics Domain has set the collection interval to 24 hours.**

Explanation: A problem has been detected by, or has been passed back to, the statistics (ST) domain. As a result, the collection interval has been set to the maximum value. The end-of-day collection time is unchanged.

A message explaining the problem has already been issued by the module in error.

System Action: Other processing continues.

User Response: Refer to the associated message for guidance on resolving the original problem.

Use CEMT SET STATISTICS to reset the interval when the problem has been resolved.

Destination: Console

Modules: DFHSTST, DFHSTDM, DFHSTTI

XMEOUT Parameter: *applid*

DFHST0102I *applid* **The Statistics Domain has cancelled interval collections.**

Explanation: A problem has been detected by, or has been passed back to, the statistics (ST) domain. A message explaining the problem may have already been issued by the module in error.

To reduce the occurrence of this problem, the interval collections have been cancelled. The end-of-day collection time is unchanged.

System Action: Other processing continues.

User Response: Refer to any associated message for guidance on resolving the original problem.

If no associated message has been issued, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSTST, DFHSTDM, DFHSTTI

XMEOUT Parameter: *applid*

DFHST0103 *applid* **An SMF error has occurred with return code** *X'rc'***.**

Explanation: SMF has returned to the statistics (ST) domain with an error return code X'*rc*' from the SMFEWTM macro.

System Action: Other CICS processing continues.

User Response: Refer to the *OS/390 MVS System Management Facility (SMF)* manual for a detailed explanation of the meaning of the return code.

Destination: Console

Module: DFHSTST

XMEOUT Parameters: *applid, X'rc'*

DFHST0201 S An attempt to open the statistics data set has failed.

Explanation: DFHSTUP has tried to open the unloaded SMF data set but has failed.

System Action: A dump is taken and the job step is terminated.

User Response: Ensure that the JCL for the job is correct. A sample set of JCL to execute the DFHSTUP utility is contained in the *CICS Operations and Utilities Guide*.

If incorrect JCL is not the cause of the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: SYSPRINT

Module: DFHSTRD

DFHST0202 S A read error on the statistics data set has occurred

Explanation: A read error was encountered on the unloaded SMF data set.

System Action: A dump is taken and the job step is terminated.

User Response: Inform the system programmer. First check that the JCL for the job is correct. A sample set of JCL to execute the DFHSTUP utility is contained in the *CICS Operations and Utilities Guide*. Resubmit the job.

Destination: SYSPRINT

Module: DFHSTRD

DFHST0203 W The statistics data set is empty.

Explanation: An end-of-file condition was detected during the first attempt to read the unloaded SMF data set, or the unloaded SMF dataset contained no CICS statistics from any CICS system.

System Action: The job step is terminated.

User Response: The most likely cause is an error in the JCL which unloads the SMF dataset. First check that the JCL is correct. A sample set of JCL to unload the SMF dataset is contained in the *CICS Operations and Utilities Guide*. Also check that you have unloaded the correct SMF dataset. Resubmit the job.

Destination: SYSPRINT

Module: DFHSTIN

DFHST0204 S Invalid record id *recid* **encountered on the statistics data set.**

Explanation: An invalid record identifier *recid* has been encountered in the unloaded SMF data set.

System Action: A dump is taken and the job step is terminated.

User Response: Check that the unloaded SMF data set contains statistics records. CICS statistics records are of SMF record type 110, sub-type 2. For further information, see the *CICS Data Areas*.

If the SMF data set does contain statistics records, the most likely cause of the problem is a corrupted SMF dataset. Unload the SMF dataset again and rerun the DFHSTUP utility. If the problem persists, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: SYSPRINT

Modules: DFHSTU*x* (modules within DFHSTUP)

DFHST0206 S An invalid parameter (*parameter***) has been specified for the DFHSTUP utility.**

Explanation: One or more of the parameters specified in the SYSIN data set were incorrect.

System Action: The job step is terminated.

User Response: Correct the erroneous parameter as identified in the message and resubmit the job.

Destination: SYSPRINT

Module: DFHSTUP1

DFHST0207 W An incomplete data record has been encountered on the statistics data set.

Explanation: A record input from the unloaded SMF data set specifies that the data it contains is incomplete.

System Action: Processing continues.

User Response: For an incomplete data record to have been encountered, there must have been an error in the running of CICS. This should result in an exception trace and perhaps a dump being issued.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: SYSPRINT

Modules: DFHSTUx (modules within DFHSTUP)

DFHST0208 S An attempt to open the SYSIN data set has failed.

Explanation: DFHSTUP has tried to open the SYSIN data set but has failed.

System Action: A dump is taken and the job step is terminated.

User Response: Ensure that the JCL for the job is correct. A sample set of JCL to execute the DFHSTUP utility is contained in the *CICS Operations and Utilities Guide*.

If incorrect JCL is not the cause of the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: SYSPRINT

Module: DFHSTRD

DFHST0209 S A read error on the SYSIN data set has occurred.

Explanation: A read error was encountered on the SYSIN data set.

System Action: A dump is taken and the job step is terminated.

User Response: Inform the system programmer.

To resolve the problem, collect the dumps and any relevant messages and determine why the read failed. Resubmit the job.

Destination: SYSPRINT

Module: DFHSTRD

DFHST0210 I No statistics are available for applid ***applid*****.**

Explanation: No statistics data records exist for applid *applid* in the unloaded SMF data set. This is because

- Applid *applid* is unknown, or
- You have unloaded the wrong SMF data set, or
- You have specified a COLLECTION TYPE= parameter for which applid *applid* has no statistics, or
- No CICS statistics records were written for applid *applid*.

System Action: The job step continues.

User Response: Check that you have specified the correct applid. If necessary, respecify the correct applid.
Check that you have unloaded the correct SMF data set. If necessary, unload the correct SMF data set.
If you have specified the correct applid and unloaded the correct SMF data set, then there are no statistics data records for applid *applid*.

Destination: SYSPRINT

Module: DFHSTUP1

DFHST0211 S Processing terminated. Getmain failed with a short on storage condition.

Explanation: The DFHSTUP utility detected an error from a GETMAIN macro while obtaining working storage. This was because DFHSTUP had exhausted the available storage.

System Action: A dump is taken and the job step terminates.

User Response: Check that you have specified the correct REGION size on the EXEC JCL command used to execute the DFHSTUP utility. A sample set of JCL to execute the DFHSTUP utility is contained in the *CICS Operations and Utilities Guide*.

If you have specified the correct REGION size, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: SYSPRINT

Module: All DFHSTUP modules

DFHST0212 S Processing terminated. DFSORT message dataset (DD=SYSOUT) is missing.

Explanation: The dataset used by the DFSORT utility to output its messages is missing.

System Action: A dump is taken and the job step is terminated.

User Response: Check the JCL used to execute the DFHSTUP utility to ensure that the SYSOUT DD was correctly specified. A sample set of JCL to execute the DFHSTUP utility is contained in the *CICS Operations and Utilities Guide*.

If you have specified the correct SYSOUT DD statement, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: SYSPRINT

Module: DFHSTUP1

DFHST0213 S Processing terminated. Error detected by DFSORT. Check DFSORT messages.

Explanation: An error was detected by the DFSORT utility and the DFHSTUP utility terminated.

System Action: A dump is taken and the job step is terminated.

User Response: The user must inspect the DFSORT message dataset and search for messages indicating the reason for the failure of the DFSORT utility. A detailed explanation of the messages produced by DFSORT can be found in the *DFSORT Application Programming Guide* (SC33-4035).

After analyzing the DFSORT error message, take the appropriate corrective actions and resubmit the job.

Destination: SYSPRINT

Module: DFHSTUP1

DFHST0214 S Processing terminated. Failure to obtain system time and date.

Explanation: The DFHSTUP utility was unable to obtain the system time and date from the CICS kernel.

System Action: A dump is taken and the job step is terminated.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: SYSPRINT

Module: DFHSTUP1

DFHST0216 W An incompatible statistics record version number ***version*****, was detected by module** ***module*****.**

Explanation: The statistics utility program has detected that a statistics record has a version number which is incompatible with the version number expected by the DFHSTUP utility.

System Action: The statistics record containing the invalid version number is ignored. Statistics records immediately following which are of the same type and which also contain an invalid version number are also ignored. Processing continues.

User Response: Obtain a dump of the SMF data set. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: SYSPRINT

Module: All DFHSTUP modules.

DFHST0217 S An attempt to open the DFHSTWRK data set has failed.

Explanation: The statistics utility program has detected an error while attempting to open the DFHSTWRK data set during non-summary statistics processing.

System Action: The statistics utility program ends abnormally.

User Response: Ensure that the DFHSTWRK data set has been specified on the job, and that the attributes of the data set are correct.

Destination: SYSPRINT

Module: DFHSTU17

DFHST0218 S A write error has occurred on the DFHSTWRK data set.

Explanation: The statistics utility program has detected an error while attempting to write to the DFHSTWRK data set during non-summary statistics processing.

System Action: The statistics utility program ends abnormally.

User Response: Ensure that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

Destination: SYSPRINT

Module: DFHSTU17

DFHST0219 S A read error has occurred on the DFHSTWRK data set.

Explanation: The statistics utility program has detected an error while attempting to read from the DFHSTWRK data set during non-summary statistics processing.

System Action: The statistics utility program ends abnormally.

User Response: Check that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

Destination: SYSPRINT

Module: DFHSTU17

DFHST0220 S An attempt to open the DFHSTWRK data set has failed.

Explanation: The statistics utility program has detected an error while attempting to open the DFHSTWRK data set while processing summary statistics.

System Action: The statistics utility program ends abnormally.

User Response: Check that the DFHSTWRK data set has been specified on the job, and that the attributes of the data set are correct.

Destination: SYSPRINT

Module: DFHST17X

DFHST0221 S A write error has occurred on the DFHSTWRK data set.

Explanation: The statistics utility program has detected an error while attempting to write to the DFHSTWRK data set during summary statistics processing.

System Action: The statistics utility program ends abnormally.

User Response: Check that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

Destination: SYSPRINT

Module: DFHST17X

DFHST0222 S A read error has occurred on the DFHSTWRK data set.

Explanation: The statistics utility program has detected an error while attempting to read from the DFHSTWRK data set during summary statistics processing.

System Action: The statistics utility program ends abnormally.

User Response: Check that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

Destination: SYSPRINT

Module: DFHST17X

DFHST0223 I There are no data table statistics to report.

Explanation: The file subsection of the DFHSTUP report entitled 'Data Table Requests Information' only contains formatted information if the data currently being processed contains statistics records for files accessed as data tables. This message is written to the DFHSTUP report, when the utility program detects that there are no data table statistics in this section of the statistics report.

System Action: Processing continues normally.

User Response: Take no action unless you expect data table statistics in the DFHSTUP report. In this case, ensure that the data tables feature is in use during the time period covered by the statistics being processed.

Destination: SYSPRINT

Modules: DFHSTU17, DFHST17X

DFHST0224 I There are no intrapartition queues to report.

Explanation: The transient data subsection of the DFHSTUP report entitled 'Transient Data - Intrapartition' contains no data.

System Action: Processing continues normally.

User Response: Take no action unless you expect TD intrapartition statistics in the DFHSTUP report.

Destination: SYSPRINT

Modules: DFHSTUTQ, DFHSTTQX

DFHST0225 I There are no extrapartition queues to report.

Explanation: The transient data subsection of the DFHSTUP report entitled 'Transient Data - Extrapartition' contains no data.

System Action: Processing continues normally.

User Response: Take no action unless you expect TD extrapartition statistics in the DFHSTUP report.

Destination: SYSPRINT

Modules: DFHSTUTQ, DFHSTTQX

DFHST0226 I There are no indirect queues to report.

Explanation: The transient data subsection of the DFHSTUP report entitled 'Transient Data - Indirect' contains no data.

System Action: Processing continues normally.

User Response: Take no action unless you expect TD indirect statistics in the DFHSTUP report.

Destination: SYSPRINT

Modules: DFHSTUTQ, DFHSTTQX

DFHST0227 I There are no remote queues to report.

Explanation: The transient data subsection of the DFHSTUP report entitled 'Transient Data - Remote' contains no data.

System Action: Processing continues normally.

User Response: Take no action unless you expect TD remote statistics in the DFHSTUP report.

Destination: SYSPRINT

Modules: DFHSTUTQ, DFHSTTQX

DFHSZxxxx (FEPI) messages

DFHSZ4001 I *date time applid* **FEPI initialization has started.**

Explanation: The Front End Programming Interface (FEPI) is being initialized.

This means the CSZI transaction – FEPI – has started its processing. CSZI is started as part of CICS system initialization, if the system initialization parameter FEPI is set to YES.

If you specified FEPI=YES and this message does not appear during CICS initialization, CSZI failed to start; the most common reason for this is that group DFHFEPI is not included in the list specified by the GRPLIST system initialization parameter.

If message DFHSZ4001 is not followed by message DFHSZ4002, FEPI failed to start. In this case, a DFHSZnnnn message is issued to indicate the error.

System Action: FEPI initialization proceeds.

User Response: None.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: *date, time, applid*

DFHSZ4002 I *date time applid* **FEPI initialization has ended.**

Explanation: The Front End Programming Interface (FEPI) has finished initialization.

System Action: EXEC CICS FEPI commands are made available.

User Response: None.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: *date, time, applid*

DFHSZ4003 I *date time applid* **FEPI termination complete.**

Explanation: The Front End Programming Interface (FEPI) has ended.

A DFHSZnnnn message may precede message DFHSZ4003 to indicate what caused FEPI to terminate.

System Action: EXEC CICS FEPI commands are made unavailable.

User Response: Resolve the problem indicated by the messages, then restart CICS.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: *date, time, applid*

DFHSZ4004 E *date time applid* **FEPI cannot be started: FEPI=YES not specified in the SIT.**

Explanation: The Front End Programming Interface (FEPI) cannot be started because the FEPI system initialization parameter was set to NO indicating that FEPI is not required.

This message usually means that you attempted to start the FEPI transaction (CSZI) manually, but did not set up the correct environment for it to run.

System Action: The FEPI transaction is not run.

User Response: If you require FEPI in the CICS system, restart CICS specifying the system initialization parameter FEPI=YES. You do not need to start the FEPI transaction manually.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: *date, time, applid*

DFHSZ4005 E *date time applid* **FEPI cannot be started: FEPI is already active, in state** *X'ssssssss'***.**

Explanation: The Front End Programming Interface (FEPI) cannot be started because FEPI is already active in the system.

This message usually means that you attempted to start a new instance of FEPI manually by running the FEPI transaction (CSZI), but the previous instance of FEPI failed in some way that caused an 'active' indication to be left in error.

The possible FEPI states (X'ssssssss') are:

State	Meaning
X'00000002'	FEPI is being initialized
X'00000003'	FEPI is active
X'00000004'	FEPI is terminating as CICS is undergoing a normal shutdown

X'00000005'	FEPI is terminating as CICS is undergoing an immediate shutdown
X'00000006'	FEPI is terminating as CICS is undergoing an abnormal shutdown

System Action: The request to start a new instance of FEPI is rejected.

User Response: If the state suggests that a previous instance of FEPI failed, you must restart CICS to resolve the problem. You do not need to start the FEPI transaction manually.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: *date, time, applid, X'ssssssss'*

DFHSZ4006 E *date time applid* **FEPI initialization failed: enqueue failure, code** *X'rr'***.**

Explanation: The Front End Programming Interface (FEPI) cannot be initialized because an attempt to enqueue on the FEPI enqueue name SZENQRMI failed, indicating that FEPI is already active in the system. FEPI initialization issues this enqueue to prevent a second instance of FEPI being present in the system.

This message usually means that you attempted to start the FEPI transaction (CSZI) manually, but there is a previous instance of CSZI still running.

The possible values of X'*rr*', the reason for failure, are:

Code	Meaning
X'31'	Duplicate enqueue on SZENQRMI attempted.
X'32'	Failure during enqueue processing.

System Action: The request to start a second instance of FEPI is rejected.

User Response: None.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: *date, time, applid, X'rr'*

DFHSZ4007 E *date time applid* **FEPI initialization failed: storage ADD_SUBPOOL failure for subpool** *pppppppp***, reason** *X'rr'* **response** *X'ee'***.**

Explanation: The Front End Programming Interface (FEPI) cannot be initialized because creating the named storage subpool for FEPI use failed.

The values of X'*rr*', the reason for failure, are:

Reason	Meaning
X'01'	Insufficient storage available for the subpool
X'03'	Subpool requested with an invalid fixed length
X'04'	Subpool requested with an invalid boundary alignment
X'05'	Subpool requested with an invalid initial number of elements
X'06'	Subpool requested with an invalid name
X'08'	Subpool requested already exists
X'11'	Access to the Storage Manager was denied

The values of X'*ee*', the response to the failed request, are:

Response	Meaning
X'01'	Request completed successfully
X'02'	Exception response generated
X'03'	Disaster response generated
X'04'	Invalid response generated
X'05'	A kernel error was detected
X'06'	The request was purged

System Action: FEPI initialization ends, and EXEC CICS FEPI commands are unavailable. An exception trace entry is generated.

User Response: The only action you can take is when there is insufficient storage, in which case you can increase the storage available to CICS on restart.

All other errors are system failures, and you should consult the system programmer. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: *date, time, applid, pppppppp, X'rr', X'ee'*

DFHSZ4008 E *date time applid* **FEPI initialization failed: Non-runaway task setting failure, reason** *X'rr'* **response** *X'ee'***.**

Explanation: The Front End Programming Interface (FEPI) cannot be initialized. Because FEPI is a long-running transaction (CSZI), it must not be subject to a runaway task time out. The request to prevent this failed.

The value of X'*rr*', the reason for failure, is always X'00'.

The values of X'*ee*', the response to the failed request, are:

Response	Meaning
X'01'	Request completed successfully
X'02'	Exception response generated
X'03'	Disaster response generated
X'04'	Invalid response generated

System Action: FEPI initialization ends, and EXEC CICS FEPI commands are made unavailable. An exception trace entry is generated.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: *date, time, applid, X'rr', X'ee'*

DFHSZ4009 E *date time applid* **FEPI initialization failed: change-priority failure, response** *X'ee'***.**

Explanation: The Front End Programming Interface (FEPI) cannot be initialized because changing the dispatching priority of the FEPI transaction (CSZI) failed.

Because FEPI runs as a transaction, a high priority is required. The request to set this dispatching priority failed.

The values of X'*ee*', the response to the failed request, are:

Response	Meaning
X'01'	Request completed successfully
X'03'	Disaster response generated
X'04'	Invalid response generated

X'05' A Kernel error was detected

System Action: FEPI initialization ends, and EXEC CICS FEPI commands are made unavailable. An exception trace entry is generated.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: *date, time, applid, X'ee'*

DFHSZ4010 E *date time applid* **FEPI initialization failed: SZ TCB swap failure, response** *X'ee'***.**

Explanation: The Front End Programming Interface (FEPI) usually runs under the CICS SZ TCB. Transferring the FEPI transaction (CSZI) from running under the QR TCB to the SZ TCB failed.

The values of X'*ee*', the response to the failed request, are:

Response	Meaning
X'01'	Request completed successfully
X'02'	Exception response generated
X'03'	Disaster response generated
X'04'	Invalid response generated
X'05'	A kernel error was detected

System Action: FEPI initialization ends, and EXEC CICS FEPI commands are made unavailable. An exception trace entry is generated.

User Response: The SZ TCB is created as part of the early CICS initialization and you should examine the console log to see if any messages were generated indicating a TCB creation failure.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: *date, time, applid, X'ee'*

DFHSZ4011 E *date time applid* **FEPI storage GETMAIN failed in subpool NB, reason** *X'rr'* **response** *X'ee'***.**

Explanation: The Front End Programming Interface (FEPI) issued a GETMAIN storage request in the SZSPFCNB storage subpool for NIB usage which failed.

The values of X'*rr*', the reason for failure, are:

Reason	Meaning
X'01'	Insufficient storage for the request
X'02'	Invalid subpool token given
X'04'	Invalid length of element requested
X'05'	Length of element not specified
X'08'	Access was denied to the storage subpool
X'11'	Invalid initial image supplied
X'12'	An abnormal end occurred in the storage manager
X'13'	A loop was detected in the storage manager

The values of X'*ee*', the response to the failed request, are:

Response	Meaning
X'01'	Request completed successfully.
X'02'	Exception response generated.
X'03'	Disaster response generated.
X'04'	Invalid response generated.
X'05'	A Kernel error was detected.
X'06'	The request was purged.

All these responses indicate that a system error has occurred.

System Action: An exception trace entry is generated.

FEPI tries to recover from this error by retrying the request. However, no action is taken to prevent multiple occurrences.

User Response: If this message occurs frequently, you should take a dump of the CICS system before restarting it. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZZNG)

XMEOUT Parameters: *date, time, applid, X'rr', X'ee'*

DFHSZ4012 E *date time applid* **FEPI storage GETMAIN failed in subpool DA, reason** *X'rr'* **response** *X'ee'***.**

Explanation: The Front End Programming Interface (FEPI) issued a GETMAIN storage request in the SZSPVCDA storage subpool for general usage which failed.

The values of X'*rr*', the reason for failure, are:

Reason	Meaning
X'01'	Insufficient storage for the request.
X'02'	Invalid subpool token given.
X'04'	Invalid length of element requested.
X'05'	Length of element not specified.
X'08'	Access was denied to the storage subpool.
X'11'	Invalid initial image supplied.
X'12'	An abnormal end occurred in the storage manager.
X'13'	A loop was detected in the storage manager.

The values of X'*ee*', the response to the failed request, are:

Response	Meaning
X'01'	Request completed successfully.
X'02'	Exception response generated.
X'03'	Disaster response generated.
X'04'	Invalid response generated.
X'05'	A kernel error was detected.
X'06'	The request was purged.

All of these responses indicate that a system error occurred.

System Action: An exception trace entry is generated.

FEPI tries to recover from this error by retrying the request. However, no action is taken to prevent multiple occurrences.

User Response: If this message occurs frequently, you should take a dump of the CICS system before restarting it.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZZAG)

XMEOUT Parameters: *date, time, applid, X'rr', X'ee'*

DFHSZ4013 E *date time applid* **FEPI storage GETMAIN failed in subpool RP, reason** *X'rr'* **response** *X'ee'***.**

Explanation: The Front End Programming Interface (FEPI) issued a GETMAIN storage request in the SZSPPCRP storage subpool for RPL usage. The request failed.

The values of X'*rr*', the reason for failure, are:

Reason	Meaning
X'01'	Insufficient storage for the request.
X'02'	Invalid subpool token given.
X'04'	Invalid length of element requested.
X'05'	Length of element not specified.
X'08'	Access was denied to the storage subpool.
X'11'	Invalid initial image supplied.
X'12'	An abnormal end occurred in the storage manager.
X'13'	A loop was detected in the storage manager.

The values of X'*ee*', the response to the failed request, are:

Response	Meaning
X'01'	Request completed successfully.
X'02'	Exception response generated.
X'03'	Disaster response generated.
X'04'	Invalid response generated.
X'05'	A kernel error was detected.
X'06'	The request was purged.

All of these responses indicate that a system error occurred.

System Action: An exception trace entry is generated.

FEPI tries to recover from this error by retrying the request. However, no action is taken to prevent multiple occurrences.

User Response: If this message occurs frequently, you should take a dump of the CICS system before restarting it.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZZRG)

XMEOUT Parameters: *date, time, applid, X'rr', X'ee'*

DFHSZ4014 E *date time applid* **FEPI storage FREEMAIN failed in subpool DA|NB|RP, reason** *X'rr'* **response** *X'ee'***.**

Explanation: The Front End Programming Interface (FEPI) issued a FREEMAIN storage request in an SZSPxxxx storage subpool. The request failed.

The values of X'*rr*', the reason for failure, are:

Reason	Meaning
X'02'	Invalid subpool token given.
X'03'	The address of the element to be freed is invalid.
X'06'	Invalid length of element specified.
X'07'	Length of element not specified.
X'08'	Access was denied to the storage subpool.
X'10'	The specified storage subpool was empty.
X'12'	An abnormal end occurred in the storage manager.
X'13'	A loop was detected in the storage manager.

The values of X'*ee*', the response to the failed request, are:

Response	Meaning
X'01'	Request completed successfully.
X'02'	Exception response generated.
X'03'	Disaster response generated.
X'04'	Invalid response generated.
X'05'	A kernel error was detected.
X'06'	The request was purged.

All of these responses indicate that a system error occurred.

System Action: The request is rejected, and a retry is not attempted (perhaps leaving storage that is never subsequently accessible). An exception trace entry is generated.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZZFR)

XMEOUT Parameters: *date, time, applid, X'rr', X'ee'*

DFHSZ4015 I *date time applid* **FEPI** *{normal | immediate | forced}* **termination has started.**

Explanation: The Front End Programming Interface (FEPI) has acknowledged a shutdown request and is starting to terminate.

Message DFHSZ4003 is issued when FEPI completes termination.

FEPI terminates only in response to a CICS shutdown request (such as CEMT PERFORM SHUTDOWN). Some types of CICS shutdown can result in more than one DFHSZ4015 message being issued.

System Action: Certain EXEC CICS FEPI commands are made unavailable during FEPI termination.

Normal termination allows all transactions using FEPI resources to end before FEPI itself ends. However, no new usage of FEPI resources is permitted.

Immediate termination stops usage of FEPI facilities immediately but does a controlled shutdown of communication functions.

Forced termination stops usage of FEPI facilities immediately, and does the quickest possible shutdown of communication functions (which may lead to many VTAM messages being issued).

User Response: None.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZRDP)

XMEOUT Parameters: *date, time, applid, {1=normal, 2=immediate, 3=forced}*

DFHSZ4099 E *date time applid* **FEPI ended abnormally.**

Explanation: The Front End Programming Interface (FEPI) has ended abnormally.

System Action: A system dump is taken. All EXEC CICS FEPI commands are made unavailable.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console and Transient Data Queue CSZL

Module: DFHSZRMP(DFHSZSIP)

XMEOUT Parameters: *date, time, applid*

DFHSZ4101 I *date time applid* **FEPI node** *nnnnnnnn* **installed, for transaction** *xxxx***.**

Explanation: The Front End Programming Interface (FEPI) has successfully installed the named node.

System Action: Processing continues.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZRII)

XMEOUT Parameters: *date, time, applid, nnnnnnnn, xxxx*

DFHSZ4102 W *date time applid* **FEPI node** *nnnnnnnn* **installation failed, code** *rrr***, for transaction** *xxxx***.**

Explanation: The Front End Programming Interface (FEPI) cannot install the named node. The code indicates the reason, and is the RESP2 value returned by the EXEC CICS FEPI INSTALL NODE command.

System Action: Processing continues.

User Response: Investigate the failure, and correct it.

Destination: CSZL

Module: DFHSZRMP(DFHSZRII)

XMEOUT Parameters: *date, time, applid, nnnnnnnn, rrr, xxxx*

DFHSZ4103 I *date time applid* **FEPI node** *nnnnnnnn* **discarded, for transaction** *xxxx***.**

Explanation: The Front End Programming Interface (FEPI) has successfully discarded the named node.

System Action: Processing continues.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZRDN)

XMEOUT Parameters: *date, time, applid, nnnnnnnn, xxxx*

DFHSZ4104 I *date time applid* **FEPI node** *nnnnnnnn* **discard scheduled, for transaction** *xxxx***.**

Explanation: The Front End Programming Interface (FEPI) has scheduled the discard operation for the named node.

System Action: Processing continues. The node is discarded when it becomes inactive.

User Response: None.

Explanation: The Front End Programming Interface (FEPI) cannot add the named target to the named pool. The code indicates the reason, and is the RESP2 value returned by the EXEC CICS FEPI ADD POOL command.

System Action: Processing continues.

User Response: Investigate the failure, and correct it.

Destination: CSZL

Module: DFHSZRMP(DFHSZRII)

XMEOUT Parameters: *date, time, applid, tttttttt, pppppppp, rrr, xxxx*

DFHSZ4126 I *date time applid* **FEPI target** *tttttttt* **deleted from pool** *pppppppp***, for transaction** *xxxx***.**

Explanation: The Front End Programming Interface (FEPI) has successfully deleted the named target from the named pool.

System Action: Processing continues.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZRID)

XMEOUT Parameters: *date, time, applid, tttttttt, pppppppp, xxxx*

DFHSZ4127 W *date time applid* **FEPI target** *tttttttt* **not deleted from pool** *pppppppp***, code** *rrr***, for transaction** *xxxx***.**

Explanation: The Front End Programming Interface (FEPI) cannot delete the named target from the named pool. The code indicates the reason, and is the RESP2 value returned by the EXEC CICS FEPI DELETE POOL command.

System Action: Processing continues.

User Response: Investigate the failure, and correct it.

Destination: CSZL

Module: DFHSZRMP(DFHSZRID)

XMEOUT Parameters: *date, time, applid, tttttttt, pppppppp, rrr, xxxx*

DFHSZ4128 W *date time applid* **FEPI delete from pool** *pppppppp* **failed, code** *rrr***, for transaction** *xxxx***.**

Explanation: The Front End Programming Interface (FEPI) cannot do a delete operation on the named pool. The code indicates the reason, and is the RESP2 value returned by the EXEC CICS FEPI DELETE POOL command.

System Action: Processing continues.

User Response: Investigate the failure, and correct it.

Destination: CSZL

Module: DFHSZRMP(DFHSZRID)

XMEOUT Parameters: *date, time, applid, pppppppp, rrr, xxxx*

DFHSZ4151 I *date time applid* **Unsolicited data received for FEPI pool** *pppppppp* **target** *tttttttt* **node** *nnnnnnnn***. Transaction** *xxxx* **started.**

Explanation: The Front End Programming Interface (FEPI) received some unsolicited data for the named pool-target-node connection, and started the named transaction to process this data.

System Action: Processing continues.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZBUN)

XMEOUT Parameters: *date, time, applid, pppppppp, tttttttt, nnnnnnnn, xxxx*

DFHSZ4152 I *date time applid* **Begin-session processing required for FEPI pool** *pppppppp* **target** *tttttttt* **node** *nnnnnnnn***. Transaction** *xxxx* **started.**

Explanation: The Front End Programming Interface (FEPI) invoked begin-session processing for the named pool-target-node connection, by starting the named transaction.

System Action: Processing continues.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZBSI)

XMEOUT Parameters: *date, time, applid, pppppppp, tttttttt, nnnnnnnn, xxxx*

DFHSZ4153 I *date time applid* **STSN processing required for FEPI pool** *pppppppp* **target** *tttttttt* **node** *nnnnnnnn***. Transaction** *xxxx* **started.**

Explanation: The Front End Programming Interface (FEPI) invoked STSN processing for the named pool-target-node connection, by starting the named transaction.

System Action: Processing continues.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZBST)

XMEOUT Parameters: *date, time, applid, pppppppp, tttttttt, nnnnnnnn, xxxx*

DFHSZ4154 W *date time applid* **FEPI session setup in pool** *pppppppp* **to target** *tttttttt* **and node** *nnnnnnnn* **failed with a reason code of** *X'rrrrrrrr'***. Setup will be retried later.**

Explanation: The Front End Programming Interface (FEPI) has detected an error during session setup for the named pool-target-node connection. Refer to *VTAM Messages and Codes* or to *SNA Formats* for a description of the reason code (error code or sense code) that describes this error.

System Action: Processing continues; the session setup is tried again after a short interval, using a different node if one is available.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZBLO)

XMEOUT Parameters: *date, time, applid, pppppppp, tttttttt, nnnnnnnn, X'rrrrrrrr'*

DFHSZ4155 W *date time applid* **FEPI session in pool** *pppppppp* **to target** *tttttttt* **and node** *nnnnnnnn* **ended with a reason code of** *X'rrrrrrrr'***.**

Explanation: The Front End Programming Interface (FEPI) has detected this VTAM event for the named pool-target-node connection. Refer to *VTAM Messages and Codes* or to *SNA Formats* for a description of the reason code (error code or sense code) that describes this event.

System Action: Processing continues.

User Response: None. This message can have a reason code of zero. If a message with a reason code of zero is not wanted, we recommend the use of the XMEOUT global user exit to suppress it.

Destination: CSZL

Module: DFHSZRMP(DFHSZBLO)

XMEOUT Parameters: *date, time, applid, pppppppp, tttttttt, nnnnnnnn, X'rrrrrrrr'*

DFHSZ4156 I *date time applid* **End-session processing required for FEPI pool** *pppppppp* **target** *tttttttt* **node** *nnnnnnnn***. Transaction** *xxxx* **started.**

Explanation: The Front End Programming Interface (FEPI) invoked end-session processing for the named pool-target-node connection, by starting the named transaction.

System Action: Processing continues.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZBFT)

XMEOUT Parameters: *date, time, applid, pppppppp, tttttttt, nnnnnnnn, xxxx*

DFHSZ4157 W *date time applid* **FEPI session setup in pool** *pppppppp* **to target** *tttttttt* **and node** *nnnnnnnn* **failed with a reason code of** *X'rrrrrrrr'***. Setup will not be retried.**

Explanation: The Front End Programming Interface (FEPI) has detected an error during session setup for the named pool-target-node connection. Refer to *VTAM Messages and Codes* or to *SNA Formats* for a description of the reason code (error code or sense code) that describes this error. Setting up a session for this connection has failed several times.

System Action: Processing continues; the session setup for this connection is not tried again.

User Response: None; operator intervention may be needed to make the connection available.

Destination: CSZL

Module: DFHSZRMP(DFHSZBLO)

XMEOUT Parameters: *date, time, applid, pppppppp, ttttttt, nnnnnnnn, X'rrrrrrrr'*

DFHSZ4158 W *date time applid* **The VTAM OPEN request for FEPI node** *nnnnnnnn* **failed with a reason code of** *X'rrrrrrrr'***. This operation will be retried.**

Explanation: The Front End Programming Interface (FEPI) has detected an error during VTAM OPEN processing for the named node.

The possible values of X'*rrrrrrrr*', the reason for failure, are:

Code	Meaning
X'00000000'	VTAM TPEND occurred with error code 0.
X'00000004'	VTAM TPEND occurred with error code 4.
X'00000008'	VTAM TPEND occurred with error code 8.
X'0000000C'	VTAM SETLOGON failed.
other values	VTAM OPEN failed with error code given.

Refer to *VTAM Programming* for a description of these error codes.

System Action: Processing continues; the VTAM OPEN for the node is repeated after a short interval.

User Response: None.

Destination: CSZL

Module: DFHSZRMP(DFHSZRIO)

XMEOUT Parameters: *date, time, applid, nnnnnnnn, X'rrrrrrrr'*

DFHSZ4159 W *date time applid* **The VTAM OPEN request for FEPI node** *nnnnnnnn* **failed with a reason code of** *X'rrrrrrrr'***. This operation will not be retried.**

Explanation: The Front End Programming Interface (FEPI) has detected an error during VTAM OPEN processing for the named node. The reason code is the error code returned by the VTAM OPEN operation. Refer to *VTAM Programming* for a description of these error codes.

System Action: Processing continues; the VTAM OPEN for the node is not repeated.

User Response: None; operator intervention may be needed to make the node available.

Destination: CSZL

Module: DFHSZRMP(DFHSZRIO)

XMEOUT Parameters: *date, time, applid, nnnnnnnn, X'rrrrrrrr'*

DFHSZ4201 I *date time applid* **FEPI node** *nnnnnnnn* **now has status** *{INSERVICE | OUTSERVICE | GOINGOUT}***,** *{ACQUIRED | RELEASED | ACQUIRING | RELEASING}***.**

Explanation: The status of a Front End Programming Interface (FEPI) node has been changed by an EXEC CICS FEPI SET NODE or a CEMT SET FENODE command, and is now as described.

System Action: Processing continues.

User Response: None

Destination: CSZL

Module: DFHSZRMP(DFHSZRIW)

XMEOUT Parameters: *date, time, applid, nnnnnnnn, {1=INSERVICE, 2=OUTSERVICE, 3=GOINGOUT}, {4=ACQUIRED, 5=RELEASED, 6=ACQUIRING, 7=RELEASING}*

DFHSZ4202 I *date time applid* **FEPI pool** *pppppppp* **now has status** *{INSERVICE | OUTSERVICE | GOINGOUT}***.**

Explanation: The status of a Front End Programming Interface (FEPI) pool has been changed by an EXEC CICS FEPI SET POOL or a CEMT SET FEPOOL command, and is now as described.

System Action: Processing continues.

User Response: None

Destination: CSZL

Module: DFHSZRMP(DFHSZRIW)

XMEOUT Parameters: *date, time, applid, pppppppp, {1=INSERVICE, 2=OUTSERVICE, 3=GOINGOUT}*

DFHSZ4203 I *date time applid* **FEPI target** *ttttttt* **now has status** *{INSERVICE | OUTSERVICE | GOINGOUT}***.**

Explanation: The status of a Front End Programming Interface (FEPI) target has been changed by an EXEC CICS FEPI SET TARGET or a CEMT SET FETARGET command, and is now as described.

System Action: Processing continues.

User Response: None

Destination: CSZL

Module: DFHSZRMP(DFHSZRIW)

XMEOUT Parameters: *date, time, applid, ttttttt, {1=INSERVICE, 2=OUTSERVICE, 3=GOINGOUT}*

DFHTCxxxx messages

DFHTC1001 *applid* **Terminal control initialization failed (***modname***).**

Explanation: The CICS terminal control restart task could not complete because a necessary step failed. The task has done some essential recovery operations and has abnormally terminated itself with code ATC1.

System Action: CICS writes a transaction dump for the terminal control restart task. CICS sends two messages to the console, one to identify the error detected by the terminal control restart task, and one, DFHTC1001, to say that the task has failed. A third message follows, either to say that CICS has terminated abnormally with a dump or to ask you to reply GO or CANCEL. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: First, if CICS has requested a response, you must reply. If you reply 'GO', CICS continues processing, but without terminal control. If you reply 'CANCEL', CICS terminates abnormally with a dump. Use the messages and dumps to find out the cause of the failure. You need further assistance from IBM to

resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSII1, DFHTCRP

XMEOUT Parameters: *applid, modname*

DFHTC1002 *applid* **Unable to link to program DFHTCRP.**

Explanation: The CICS terminal control recovery program, DFHTCRP, is unavailable. CICS cannot find DFHTCRP in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

System Action: CICS terminates abnormally with a dump.

User Response: To correct this error, place DFHTCRP in a partitioned data set in the DFHRPL DD statement.

Destination: Console

Module: DFHSII1

XMEOUT Parameter: *applid*

DFHTC1004 *applid* **Program DFHTORP cannot be found. Typeterms cannot be initialized**

Explanation: The CICS terminal object resolution program, DFHTORP, is not available. CICS cannot find DFHTORP in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

System Action: CICS terminates abnormally with a dump.

User Response: To correct this error, place DFHTORP in a partitioned data set in the DFHRPL DD statement.

Destination: Console

Module: DFHTCRP

XMEOUT Parameter: *applid*

DFHTC1011 *applid* **Unable to load** *xxxxxx* **During a CICS cold or initial start, CICS could not PC LOAD the CICS module, DFH***xxxxxx***, probably because it is missing from the library.**

System Action: CICS initialization continues, but, even if it completes, VTAM resource initialization will be incorrect in some respect, depending on the function of module DFH*xxxxxx*.

User Response: If CICS completes initialization, processing of VTAM resources will be invalid. You should cancel CICS, make module DFH*xxxxxx* available and then restart CICS.

Destination: Console

Module: DFHTCRP

XMEOUT Parameters: *applid, xxxxxx*

DFHTC1012 *applid* **Failure in installing VTAM resources**

Explanation: During a cold or initial start, CICS could not install all the VTAM resources defined by TCT macros. CICS has issued other message(s) identifying which resources could not be installed.

System Action: CICS initialization continues.

User Response: If any of the uninstalled resources is essential, use RDO to make it available, or cancel CICS. The most likely reasons for this message are:

- The output of the DFHTCT assembly was corrupted, **or**
- A previous CICS message such as DFHTC1011, **or**
- CICS code contains a logic error.

If you suspect an error in CICS, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHTCRP

XMEOUT Parameter: *applid*

DFHTC1013 *applid* **Restore failed for** *xxxxxx*

Explanation: During a warm or emergency restart, CICS could not restore the resource *xxxxxx*.

System Action: CICS continues initialization.

User Response: If resource *xxxxxx* is essential to your system, cancel CICS. This problem is probably caused by a CICS logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHTCRP

XMEOUT Parameters: *applid, xxxxxx*

DFHTC1014 *date time applid* **Communication resource definition for (***resname***) was not restored from the catalog because the resource definition for (***highname***) was not installed.**

Explanation: During an emergency restart, CICS could not restore the resource *resname* from the catalog, because the definition for another resource *highname* that it depends on is not present. Usually *resname* is a session or modegroup and *highname* is a connection.

System Action: CICS continues restart, and deletes this resource from the CICS catalog. If the definition refered to was being installed when the previous CICS failed, both definitions are restored from the system log later in the restart.

User Response: If resource *resname* is essential to your system and is not restored later in initialization you can reinstall the resource having first installed the resource that it depends on. This message can be caused by:

- An install which was not complete when CICS failed, in which case it is forward recovered from the system log later, and no action is needed.
- A failure during warm shutdown in the previous run. In this case messages are produced for connections that were autoinstalled and were not uncataloged by the warm shutdown. In this case some auto-installed connections which would have been removed from the catalog if the warm shutdown had completed are recovered, but those which cause these messages are not.
- A corrupted CICS catalog. If large numbers of unrelated resources are missing, and the preceeding CICS run was not warm keypointing at the time of failure, the catalog may have been corrupted. CICS continues, but you may want to initial start in order to get your definitions to a known state.
- A CICS logic error. In this case you need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHTCRP

XMEOUT Parameters: *date, time, applid, resname, highname*

DFHTC1015 *applid* **TCT load module contains obsolete entries**

Explanation: During CICS initialization, the TCT load module DFHTCT*xx* (*xx* being the suffix) was found to contain entries not generated by the assembly macros for this release of CICS. This table cannot be used.

System Action: The bring-up is abandoned.

User Response: Either the incorrect TCT suffix was specified or implied, or the TCT has been assembled against the wrong level of CICS macros. Retry the bring-up, specifying a different suffix, or using a TCT assembled against the correct macros, as appropriate.

Destination: Console

Module: DFHAPSIP

XMEOUT Parameter: *applid*

DFHTC1022 *applid* **Error for XRF tracking record - Type:** *type* **- Key:** *key*

Explanation: An error during XRF tracking prevented a change to a resource from being tracked. The resource is of type *type* and is associated with key *key*.

type is the tracking record type. This is one of the following:

TCT CONTENTS

ZCP SESSIONS

key is the location of an object in the TCTTE hierarchy.

System Action: The associated resource is in an incorrect state, missing, or not deleted at the end of takeover.

User Response: Decide whether the named resource is critical and see if you can resolve the problem.

Destination: Console

Module: DFHTCRP

XMEOUT Parameters: *applid, type, key*

DFHTC1023 *applid* **Logic error in tracking** *condition*

Explanation: During XRF tracking, a condition was detected which is not possible within the intended design. The insert indicates which of the checked conditions has been detected:

1. No broadcast message accepted outside tracking. The GETMSG routine in DFHTCRP should only accept broadcast messages and those whose id matches that in field GETMSPEC. This field should only be set during tracking.
2. Broadcast message with null key. A null-key record indicates that the catch-up stream that it arrives in is complete. This can only happen to the broadcast tracking stream if the active has just done a normal (warm) shut-down.

System Action: The message in question is ignored

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHTCRP

XMEOUT Parameters: *applid, condition*

DFHTC1024I *applid* **XRF takeover while catching up.**

Explanation: The alternate CICS that issued this message has only just started. Apparently the active CICS failed before the alternate could obtain all the information about TCT resources in the active. Please refer to messages DFHTC1034-DFHTC1036 for details of the types of information which may be missing or may be incomplete.

System Action: Takeover continues.

User Response: Watch for further messages.

Destination: Console

Module: DFHTCRP

XMEOUT Parameter: *applid*

DFHTC1034I *applid* **TCT contents incomplete. Will read catalog.**

Explanation: DFHTC1024 provides background information for this message. Apparently, the active CICS failed before the alternate CICS could obtain the definitions for all the trackable resources in the active's TCT. Definitions may be missing at this point. However, the CICS catalog in the active may contain a more complete set of definitions in the restart data set. These will now be read as for a warm or emergency restart.

System Action: Takeover continues.

User Response: Look out for any errors while reading the CICS catalog.

Destination: Console

Module: DFHTCRP

XMEOUT Parameter: *applid*

DFHTC1035E *applid* **Session states may be incorrect**

Explanation: DFHTC1024 provides background information for this message. Apparently, the active CICS failed before the alternate CICS could obtain the session-state for all the trackable resources in the active's TCT. States may be incorrect at this point.

System Action: Takeover continues.

User Response: Be prepared for some logical units (LUs) that were ACQUIRED in the old active not to be after the takeover.

Destination: Console

Module: DFHTCRP

XMEOUT Parameter: *applid*

DFHTC1036I *applid* **Unimplemented tracking-type incomplete:** *xxxx*

Explanation: DFHTC1024 provides background information for this message. Apparently, the active CICS failed before the alternate CICS had been sent all the information regarding a type of resource which has not been implemented. This does not have any serious consequences as the information would have been thrown away. However, it does indicate a level of incompatibility between the old active system and this system.

System Action: Takeover continues.

User Response: Decide whether the implied level incompatibility exists and is expected. DFHTCRP

XMEOUT Parameters: *applid, xxxx*

DFHTC1040I *applid nnnn* **Terminal control tracking records received.**

Explanation: An alternate is standing by and has received *nnnn* terminal control tracking messages from the active.

System Action: Tracking continues.

User Response: None.

Destination: Console

Module: DFHTCRP

XMEOUT Parameters: *applid, nnnn*

DFHTC1041I *applid* **Terminal control tracking started.**

Explanation: An alternate is initializing, and is now about to start accepting messages from the active. Message DFHTC1044 should appear shortly.

System Action: Initialization continues.

User Response: None.

Destination: Console

Module: DFHTCRP

XMEOUT Parameter: *applid*

DFHTC1042I *applid* **Waiting for terminal control tracking to drain.**

Explanation: An alternate is taking over and is processing the remaining few tracking records from the active. This message is issued every 15 seconds while the takeover is held up for processing to complete. This is potentially an error, especially if it is repeated an unusual number of times. The likely causes include a delay in STANDBY BIND or UNBIND processing in VTAM, or a CICS logic error. The system issues this message twice and then flushes the outstanding tracking activity as described in message DFHTC1046.

User Response: Look for message DFHTC1046.

Destination: Console

Module: DFHZXQO

XMEOUT Parameter: *applid*

DFHTC1043I *applid* **Terminal control tracking ended -** *nnn* **records received.**

Explanation: An XRF alternate system is taking over. The last of the terminal control tracking records from the failing active system has been received and is being processed.

System Action: Takeover continues.

User Response: None.

Destination: Console

Module: DFHTCRP

XMEOUT Parameters: *applid, nnn*

DFHTC1044I *applid* **Terminal control catch-up started.**

Explanation: An XRF alternate system is preparing to standby and has received the first message from the active containing information about terminal control resources installed and/or bound before this alternate was started.

System Action: Initialization continues.

User Response: None.

Destination: Console

Module: DFHTCRP

XMEOUT Parameter: *applid*

DFHTC1045I *applid* **Terminal control catch-up complete.**

Explanation: An XRF alternate system is standing by, and has now received all the terminal control information it needs about terminal control resources installed and/or bound in the active before this alternate was started.

System Action: Normal tracking continues.

User Response: None.

Destination: Console

Module: DFHTCRP

XMEOUT Parameter: *applid*

DFHTC1046I *applid* **Flushing terminal control tracking.**

Explanation: An alternate is taking over and is processing the remaining few tracking records from the active. Message DFHTC1042 has been issued twice. DFHZXQO is now doing a controlled flush of the outstanding activity.

System Action: CICS posts one outstanding action every 2 seconds in an attempt to free the hold-up. A system dump is taken for the first action only.

User Response: This processing only occurs when an error or unforeseen circumstance arises. If the problem can be reproduced, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHZXQO

XMEOUT Parameter: *applid*

DFHTC1047I *applid* **Higher node missing. Record dropped for** *key*

Explanation: An XRF alternate has received a tracking message from the active CICS, but either the associated system entry for this terminal is not present, or the ordering of terminal catalog records on the restart data set is incorrect (in that the terminal in error comes before the associated system entry).

key is the location of an object in the TCTTE hierarchy. This situation occurs if the active CICS was unable to send all of its tracking messages. This sometimes results in the system entry not being sent.

System Action: The tracking message is discarded and so the associated action (an INSTALL or LOGON) is not performed.

User Response: Ensure the CAVM message data set is large enough and restart the alternate. Check that the active CICS job is referring to the correct restart data set.

Destination: Console

Module: DFHTCRP

XMEOUT Parameters: *applid, key*

DFHTC1060 *applid* **Insufficient storage - code(***X'code'***) in module DFHTCRP.**

Explanation: A request for storage could not be satisfied in module DFHTCRP. The specific error is identified by the X'*code*' in the message. This implies that the dynamic storage area (DSA) size is too small. The X'*code*' identifies an exception trace record.

System Action: Terminal control initialization is terminated with a system dump and message DFHTC1001 is issued.

User Response: Since sufficient storage should be obtainable from within the minimum size DSA, this may imply a logic error within CICS. Try to increase the CDSASZE parameter in the system initialization table (SIT). You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHTCRP

XMEOUT Parameters: *applid, X'code'*

DFHTC1575 *applid* **No TCT entry for** *termid*

Explanation: This message is issued when system initialization reads a warm start record for which there is no matching terminal control table (TCT) entry. *termid* is the TCT name that is missing.

System Action: The record is ignored.

User Response: If TCT *termid* is required, system initialization should be canceled. Ensure that a matching TCT entry for terminal *termid* exists and retry.

Destination: Console

Module: DFHTCRP

XMEOUT Parameters: *applid, termid*

DFHTC2500 *date time applid {Line | CU | Terminal }***out of service** *{Term | W/Term }termid*

Explanation: This message indicates the OUT-OF-SERVICE conditions on completion of error processing in DFHTACP. It is possible that some of these conditions were true before the error was detected.

System Action: Other processing continues.

User Response: None.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, {1=Line , 2=CU , 3=Terminal }, {1=Term , 2=W/Term }, termid*

DFHTC2501 Msg too long, please resubmit

Explanation: The terminal operator has keyed in more data than was expected for this READ.

System Action: The transaction in progress is terminated.

User Response: Reset the terminal and restart the transaction after the message TRANSACTION HAS BEEN ABENDED has been received.

Destination: Terminal End User

Module: DFHTACP

DFHTC2502 *date time applid* **TCT search error** *{on line w/term | at term }termid{, trans | , dest }tranid|destid{, rel line=}rr***,***time*

Explanation: An invalid terminal address was received on the line identified by terminal *termid*. This error can normally occur only on control unit devices such as a 2980 or a 3270. This is because CICS uses general polling and not all terminals on the control unit may be defined to CICS. All other conditions are undefined. The optional part of the message "**dest***destid*" applies only to TCAM. The destination *destid* is given when it does not match any of the network names (netnames) specified on the TCTTE generation.

System Action: The control unit is placed out of service or, if it is not a general polled device, the line is placed out of service.

User Response: Ensure that all terminals on the failing control unit are defined in the terminal control table (TCT).

Where applicable, ensure that the TCAM MCP terminal generation names match the CICS DFHTCT TYPE=TERMINAL NETNAME parameter.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, {1=on line w/term , 2=at term }, termid, {1=, trans , 2=, dest }, tranid|destid, {1=, rel line=}, rr, time*

DFHTC2506 *date time applid* **Output event rejected return code** *zz {on line w/term | at term }termid{, trans }tranid{, rel line=}rrtime*

Explanation: An output operation was attempted but was halted by the I/O routines and resulted in the SAM return code *zz*. If an abnormal condition is detected after a READ or WRITE macro, the operation is not started, and control is returned to the user program at the instruction following the READ or WRITE macro.

System Action: The line is placed out of service.

User Response: Ensure that the system is dumped at shutdown time in order to document the failure. For an explanation of the SAM return codes, *zz*, refer to the *OS/VS SAM* manual, (GC27-6980).

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, zz, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time*

DFHTC2507 *date time applid* **Input event rejected return code** *zz {on line w/term | at term }termid{, trans }tranid{, rel line=}rr***,***time*

Explanation: An input operation was attempted but was halted by the I/O routines, and resulted in the SAM return code *zz*. If an abnormal condition is detected after a READ or WRITE macro instruction, the operation is not started, and control is returned to your program at the instruction following the READ or WRITE macro instruction.

System Action: The line is placed out of service.

User Response: Ensure the system is dumped at shutdown time in order to document the failure.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, zz, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time*

DFHTC2511 *date time applid* **Invalid write request** *{on line w/term | at term }termid{, trans }tranid{, rel line=}rr,time*

Explanation: This message is issued when one of the following has occurred.

1. A transaction has issued a write to its terminal facility that currently has a terminal status of input.
2. A transaction has issued a write to a 3735 during batch transmission prior to receipt of the end-of-file (EOF) condition.

System Action: The write request is not executed, and the transaction terminates abnormally. CICS processing continues.

User Response: The user response depends on the condition that has occurred. For condition

1. ensure that transactions do not issue write requests to terminals in input status.
2. ensure that the 3735 batch transaction does not issue its first write request before it has received the EOF condition.

Destination: CSTL

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time*

DFHTC2513 *date time applid* **Output length zero** *{on line w/term | at term }termid{, trans }tranid{, rel line=}rr,time*

Explanation: The data length in TIOATDL was not positive for a write operation.

System Action: The transaction is abnormally terminated.

User Response: Correct the zero or negative data length specification in the application program.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time*

DFHTC2514 *date time applid* **No output area provided** *{on line w/term | at term }termid{, trans }tranid{, rel line=}rr,time*

Explanation: A write was requested on terminal *termid* by transaction *tranid*. However, the TCTTEDA field was not initialized.

System Action: The write request is not executed, and the transaction terminates abnormally. CICS processing continues.

User Response: Ensure that transaction *tranid* obtains the required storage and initializes the TCTTEDA field.

Destination: CSTL

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time*

DFHTC2515 *date time applid* **Output area exceeded** *{on line w/term | at term }termid{, trans }tranid{, rel line=}rr,time*

Explanation: One of the following has occurred:

- The terminal I/O area (TIOA) is not large enough to contain both the data and carrier control characters.
- The TIOA data length is greater than the TCAM block size specified in the DFHTCT TYPE=SDSCI macro.
- The application requires a TIOA larger than 32767 bytes.

System Action: The write request is not executed, the terminal write storage is freed (if possible), and the transaction terminates abnormally. CICS processing continues.

User Response: Ensure that application programs do not set the value of TIOATDL greater than the TIOA GETMAIN size, and that the TIOA data length is not greater than the TCAM blocksize. Also ensure that the application program does not require a TIOA larger than 32767 bytes.

Destination: CSTL

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time*

DFHTC2516 *date time applid* **Unit check SNS=***ss {on line w/term | at term }termid{, trans }tranid{, rel line=}rr,time*

Explanation: A unit check error has occurred on the line defined by terminal *termid*. The sense (SNS=*ss*) is provided.
D/T 3275 dialed gives an automatic two-minute time out if there is no activity on the line.

System Action: The line is placed out of service on SAM lines.

Intervention on a switched line causes the task to be abnormally terminated and the line to be logically disconnected. Intervention on a non-switched line with a dummy (unidentified) terminal causes the line to be placed out of service. With a real terminal, intervention causes the terminal to be placed out of service and the transaction to be abnormally terminated.

A data check with a dummy terminal causes the line to be placed out of service. With a real terminal, it causes the terminal to be placed out of service and the transaction to be abnormally terminated.

Lost data on a READ,TEXT command causes a MESSAGE TOO LONG response to be sent to the terminal. The transaction is abnormally terminated.

Time-out on a READ,TEXT command causes a MESSAGE TOO LONG response to be sent to the terminal. Time-out with a dummy terminal causes the line to be placed out of service. With a real terminal, it causes the terminal to be placed out of service and the transaction to be abnormally terminated.

User Response: Examine the system console log message generated by SAM for this error and have the unit error corrected.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, ss, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time*

DFHTC2517 *date time applid* **Unit check SNS=***ss***, S.N.O.** *{on line w/term | at term }termid{, trans }tranid{, rel line=}rr***,***time*

Explanation: A unit check error has occurred on the line defined by terminal *termid*. SAM indicates this error as undefined - S.N.O (should not occur). The sense (SNS=*ss*) is provided.

System Action: The line is placed out of service on SAM lines.

Intervention on a switched line causes the task to be abnormally terminated and the line to be logically disconnected. Intervention on a nonswitched line with a dummy (unidentified) terminal causes the terminal to be placed out of service and the transaction (task) to be abnormally terminated. With a real terminal, intervention causes the terminal to be placed out of service and the transaction to be abnormally terminated.

A data check with a dummy terminal causes the line to be placed out of service. With a real terminal, it causes the terminal to be placed out of service and the transaction to be abnormally terminated.

A time-out on a READ,TEXT command causes a MESSAGE TOO LONG response to be sent to the terminal. Time-out with a dummy terminal causes the line to be placed out of service. With a real terminal, it causes the terminal to be placed out of service and the transaction to be abnormally terminated.

User Response: Examine the system console log message generated by SAM for this error and have the unit error corrected.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, ss, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time*

DFHTC2518 *date time applid* **Unit exception on** *{on line w/term | at term }termid{, trans }tranid{, rel line=}rr***,***time*

Explanation: A unit exception error occurred on the line defined by terminal *termid*.

System Action: With a:

- Switched line, the transaction is abnormally terminated and the line is logically disconnected.
- Dummy terminal, the line is placed out of service.
- Real terminal, the terminal is placed out of service and the transaction is abnormally terminated.

User Response: Examine the system console log message generated by SAM for this error and have the unit error corrected.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time*

DFHTC2519 *date time applid* **Unit exception S.N.O.** *{on line w/term | at term }termid{, trans }tranid{, rel line=}rr***,***time*

Explanation: A unit exception error has occurred on the line defined by terminal *termid*. SAM indicates this error as undefined - S.N.O (should not occur).

System Action: With a:

- Switched line, the transaction is abnormally terminated and the line is logically disconnected.
- Dummy terminal, the line is placed out of service.
- Real terminal, the terminal is placed out of service and the transaction is abnormally terminated.

User Response: Examine the system console log message generated by SAM for this error. Have the unit error corrected.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time*

DFHTC2521 *date time applid* **Undetermined unit error** *{on line w/term | at term }termid{, trans }tranid{, rel line=}rr***,***time*

Explanation: An I/O error (that was *not* a unit check, a unit exception, or a negative response) occurred on the line defined by terminal *termid*.

System Action: The line associated with terminal *termid* is placed out of service.

User Response: Examine the system console log message generated by SAM for this error. Have the unit error corrected.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time*

DFHTC2522 *date time applid* **Intercept Required for terminal** *termid* **transaction** *tranid***,***time*

Explanation: The task associated with terminal *termid* and transaction *tranid* was to have been abnormally terminated, but TPURGE(NO) was specified in the CSD definition for this task.

System Action: The terminal is placed out of service.

User Response: Use the master terminal facility to intercept or terminate the task.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, termid, tranid, time*

DFHTC2529 *date time applid* **Unsolicited input** *{on line w/term | at term }termid{, trans }tranid{, rel line=}rr***,***time*

Explanation: Input has occurred on a control unit (general poll) for which terminal *termid* is out of service or has a task that has not issued a DFHTC TYPE=READ macro.

System Action: No action is performed by CICS. Control is given to a user-written terminal error program, DFHTEP.

User Response: Code DFHTEP as dictated by environmental needs.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, {1=on line w/term , 2=at term }, termid, {1=, trans }, tranid, {1=, rel line=}, rr, time*

DFHTC2534 *date time applid* **Invalid destination at term** *termid***, trans** *tranid***,***time*

Explanation: An invalid destination was passed to TCAM from terminal *termid*.

System Action: The write is halted and the task is abnormally terminated with a dump.

User Response: Ensure that the destination is defined in the TCAM message control program (MCP).

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, termid, tranid, time*

DFHTC2536 *date time applid* **Link to DFHTEP from DFHTACP failed because** *{module DFHTEP is not AMODE 31 | module DFHTEP could not be loaded | there is no PPT entry for program DFHTEP}***.**

Explanation: While processing an error for a non-VTAM terminal, CICS attempted to link to user replaceable module DFHTEP. The link failed. One or more of the default actions described in message DFHTC2538 have been taken.

System Action: The default action(s) set by DFHTACP are taken.

User Response: Refer to message DFHTC2538 for an explanation of the default action(s) that have been taken.

Possible solutions are:

- Ensure that DFHTEP is linked with AMODE 31.
- Ensure that DFHTEP is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
- Ensure that the PPT entry for module DFHTEP exists and is valid.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, {1=module DFHTEP is not AMODE 31, 2=module DFHTEP could not be loaded, 3=there is no PPT entry for program DFHTEP}*

DFHTC2537 *date time applid* **Abend** *abcode* **has occurred in module DFHTEP.**

Explanation: While processing an error for a non-VTAM terminal, user replaceable module DFHTEP was linked to and the program has abended with abend code *abcode*. One or more of the default actions described in message DFHTC2538 have been taken.

System Action: Control is passed back to the calling module DFHTACP. DFHTACP reinstates the default action(s) set before DFHTEP was called. The action(s) are then taken.

User Response: Refer to message DFHTC2538 for an explanation of the default action(s) that have been taken. Refer to abend code *abcode* for details of the original error. Follow the user response given in abend code *abcode* to solve the problem.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, abcode*

DFHTC2538 *date time applid* **Default actions** *actions***have been taken for message number** *relatedmessage***.**

Explanation: A problem has arisen during the processing of an error for a non-VTAM terminal and message *msgno* has been issued. The explanations for all possible default actions are as follows:

Action	Meaning
LINEOS	Place line out of service
NONPRGT	Non purgeable task
TERMOS	Place terminal out of service
ABENDT	Abend task on terminal
ABORTWR	Abort write and free terminal storage
RELTIOA	Release TCAM incoming message
SIGNOFF	Call the signoff program for terminal in error

System Action: The system action is stated in message *related message*.

User Response: Follow the guidance given in the user response section of message *related message*.

Destination: CSMT

Module: DFHTACP

XMEOUT Parameters: *date, time, applid, actions, relatedmessage*

DFHTC8510 *date time applid* **SNA protocol violation detected in query response at termid** *termid*

Explanation: CICS has detected a violation of SNA protocols in a query response from device *termid*.

System Action: DFHQRY runs without effect.

User Response: Find out why an invalid query response is being sent to CICS.

Destination: CSMT

Module: DFHQRY

XMEOUT Parameters: *date, time, applid, termid*

DFHTDxxxx messages

DFHTD0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a three 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; TS1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the *OS/390 MVS System Codes* manual. Then look up the CICS alphanumeric code. This tells you, for example, whether the error is a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDA, DFHTDB, DFHTDRM, DFHTDOC

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHTD0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the *CICS Problem Determination Guide*.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: The severity of this error depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDA, DFHTDB, DFHTDRM, DFHTDOC

XMEOUT Parameters: *applid, X'code', modname*

DFHTD0100I *applid* **Transient Data initialization has started.**

Explanation: This is an informational message indicating that transient data initialization has started.

System Action: System initialization continues.

User Response: None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameter: *applid*

DFHTD0101I *applid* **Transient Data initialization has ended.**

Explanation: This is an informational message indicating that transient data initialization has completed successfully.

System Action: System initialization continues.

User Response: None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDRP, DFHTDRM

XMEOUT Parameter: *applid*

DFHTD0102 *applid* **Transient Data initialization has failed.**

Explanation: Transient data initialization has failed.

The SETXIT routine in DFHTDRP has been entered following abnormal termination of the transient data initialization task.

Alternatively an attempt to open the intrapartition data set failed.

System Action: Provided there are no subsequent serious errors which prevent further initialization of CICS, CICS issues one of two messages depending on what other errors, if any, have occurred during initialization.

If DFHSI1521 is issued, CICS initialization is terminated. If DFHSI1522 is issued, decide if CICS initialization is to be continued in degraded mode or to be terminated.

If, as part of a restart of CICS rather than during an initial start or a cold start, the intrapartition data set fails to open successfully when it was successfully opened on the previous CICS run, message DFHSI1521 is issued and CICS is terminated.

User Response: Check previous console messages, one of which should explain why transient data initialization has failed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameter: *applid*

DFHTD0103I *applid* **Transient Data initialization has been suspended pending takeover.**

Explanation: This is an informational message indicating that transient data initialization has been suspended pending takeover. Some transient data initialization can be performed while CICS is operating in standby mode. However the remaining initialization can not be performed until takeover is complete because transient data sets, with the exception of the DFHCXRF data set, are assumed to be passively shared.

System Action: System initialization continues.

User Response: None. The message can be suppressed with the SIT parameter MSGLVL=0.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameter: *applid*

DFHTD0104I *applid* **Transient Data initialization has been resumed following takeover.**

Explanation: This is an informational message indicating that transient data initialization has been resumed following takeover.

System Action: System initialization continues.

User Response: None. This message can be suppressed with the system initilization parameter MSGLVL=0.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameter: *applid*

DFHTD0105I *applid* **Transient Data intrapartition queues will be initialized empty as EMPTY was specified on the TDINTRA SIT parameter.**

Explanation: This is an informational message indicating that transient data is being initialized with TDINTRA=EMPTY specified on the SIT. This has the effect of initializing all intrapartition TD queues in an empty state. The TDINTRA SIT parameter is ignored during a cold or initial start.

System Action: System initialization continues.

User Response: None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameter: *applid*

DFHTD0170 *applid* **The intrapartition data set has been corrupted.**

Explanation: During a warm or emergency restart, CICS has found that the contents of the intrapartition data set are not consistent with that in the DCTEs. The intrapartition data set could have been corrupted.

System Action: CICS terminates after producing a dump and writing an exception trace.

A system dump with dumpcode TD0170 is taken unless you have specifically suppressed dumps in the dump table.

User Response: Reinitialize the intrapartition data set.

Perform a cold start or an initial start of CICS.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRM

XMEOUT Parameter: *applid*

DFHTD0180 *applid* **Unexpected response (code** *X'response'***) and reason (code** *X'reason'***) from a** *dfhxxyym* **call.**

Explanation: A transient data module cannot continue processing following the failure of a *dfhxxyym* call to domain *xx*.

The response (code X'*response*') and reason (code X'*reason*') are those returned from the domain call (that is, *xxyy_response* and *xxyy_reason*).

System Action: This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0180 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDA, DFHTDB, DFHTDOC, DFHTDRM

XMEOUT Parameters: *applid, X'response', X'reason', dfhxxyym*

DFHTD0182 *applid* **Unexpected response (code** *X'response'***) and reason (code** *X'reason'***) from a** *dfhxxyym* **call.**

Explanation: Module DFHTDRP cannot continue processing following the failure of a *dfhxxyym* call to domain *xx*.

The response (code X'*response*') and reason (code X'*reason*') are those returned from the domain call (that is, *xxyy_response* and *xxyy_reason*).

System Action: This is a critical error.

CICS writes a dump and terminates abnormally.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: *applid, X'response', X'reason', dfhxxyym*

DFHTD0183 *applid* **Unexpected response (code** *X'response'***) and reason (code** *X'reason'***) from a** *dfhxxyym* **call during processing of intrapartition queue** *queue***.**

Explanation: The trigger level has been reached for intrapartition transient data queue *queue*.

Module DFHTDB or DFHTDRM could not initiate the associated transaction following the response of a *dfhxxyym* call to domain *xx*.

The response (code X'*response*') and reason (code X'*reason*') are those returned from the domain call (that is, *xxyy_response* and *xxyy_reason*).

Initiation of the associated transaction has failed.

System Action: This is probably a CICS logic error.

Each subsequent write to the transient data queue causes another attempt to initiate the transaction, which will fail. However, this message is only issued the first time the error is detected.

CICS writes a dump and continues processing. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: *applid, X'response', X'reason', dfhxxyym, queue*

DFHTD0240 *applid* **Queue** *queue* **(DD name** *ddname***) is full.**

Explanation: No more data can be written to extrapartition queue *queue*.

A system abend, MVS code X'37', has occurred during processing on the data set with ddname *ddname*.

System Action: If the system abend occurs during processing of an EXEC CICS WRITEQ TD command, the NOSPACE condition is returned.

If the system abend occurs during processing of an EXEC CICS SET TDQUEUE CLOSED command, the data set is not closed and the IOERR condition is returned.

Note that a second attempt to close the data set succeeds.

User Response: Consider allocating more space to the data set before you bring CICS up again.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDA, DFHTDOC

XMEOUT Parameters: *applid, queue, ddname*

DFHTD0242 *applid* **Abend** *abcode* **has been detected during processing for queue** *queue* **(DD name** *ddname***).**

Explanation: A system abend, MVS code *abcode*, has occurred during processing on the extrapartition queue *queue* (that is, the data set with ddname *ddname*).

System Action: A system dump with dumpcode TD0242 is taken unless you have specifically suppressed dumps in the dump table.

Since this may not be a critical error, CICS is not terminated, and the IOERROR condition is returned.

User Response: Examine the CICS job log. QSAM issues a message explaining the reason for the system abend. See *OS/390 MVS System Messages* for a description of this message.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDA, DFHTDOC

XMEOUT Parameters: *applid, abcode, queue, ddname*

DFHTD0244 *applid* **An I/O error has occurred during an output operation to an extrapartition dataset for queue** *queue***. (DD name =** *ddname***).**

Explanation: An I/O error has occurred during the processing of an output operation to the extrapartition data set *ddname* on queue *queue*.

System Action: An IOERR condition is returned. Subsequent put requests are returned IOERR.

User Response: Close data set *ddname* via CEMT. If the I/O errors persist after a subsequent open, you probably need to reallocate this data set on a different volume.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDA, DFHTDOC

XMEOUT Parameters: *applid, queue, ddname*

DFHTD0245 *applid* **NOSPACE condition on a PUT to the intrapartition data set (DD name** *ddname***). The RBA of the next CI would have exceeded 2 gigabytes.**

Explanation: An attempt to write to intrapartition transient data set with ddname *ddname* has failed due to a NOSPACE condition. CICS did attempt to extend the data set but the relative byte address (RBA) of the next control interval (CI), if it were added, would have exceeded 2 gigabytes (x'7FFFFFFF').

System Action: The system continues normally.

User Response: Delete unwanted transient data queues from the intrapartition data set.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDB

XMEOUT Parameters: *applid, ddname*

DFHTD0246 *applid* **An I/O error has occurred during an input operation to an extrapartition dataset for queue** *queue***. (DD name =** *ddname***).**

Explanation: An I/O error has occurred during the processing of an input operation to the extrapartition data set *ddname* on queue *queue*.

System Action: An IOERR condition is returned. Subsequent put requests are returned IOERR.

User Response: Close data set *ddname* via CEMT. If the I/O errors persist after a subsequent open, you probably need to reallocate this data set on a different volume.

Check the definition of the extrapartition transient data queue. The specification of an invalid blocksize or recordsize may have caused the I/O error.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDA, DFHTDOC

XMEOUT Parameters: *applid, queue, ddname*

DFHTD0250 *applid* **Dynamic allocation of queue** *queue* **failed. Return code** *X'rrrr'*,*X'cccc'* **in module** *module*.

Explanation: While dynamically allocating queue *queue*, CICS transient data issued an MVS DYNALLOC macro. The DYNALLOC failed with return code *cccc*. *rrrr* is the additional return code in register 15.

System Action: CICS continues with queue *queue* closed.

User Response: For the meaning of the DYNALLOC return codes, see the *OS/390 MVS Programming: Authorized Assembler Services Guide*.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDOC

XMEOUT Parameters: *applid, queue, X'rrrr', X'cccc', module*

DFHTD0251 *applid* **Dynamic deallocation of queue** *queue* **failed. Return code -** *X'rrrr'*,*X'cccc'* **in module** *module*.

Explanation: While closing queue *queue*, CICS transient data issued the MVS macro, DYNALLOC, to dynamically deallocate the queue. Deallocation failed with the MVS return code, *cccc*. *rrrr* is the return code in register 15.

System Action: CICS continues with the queue closed, but still allocated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If you change the DSNAME in the DCTE, and then reopen the queue in the same CICS run, CICS may open the original data set. For an explanation of the MVS return code, see the *OS/390 MVS Programming: Authorized Assembler Services Guide*.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDOC

XMEOUT Parameters: *applid, queue, X'rrrr', X'cccc', module*

DFHTD0252 *applid* **Open of queue** *queue* **failed. DSNAME not available from JCL or DCTE. Module** *module*.

Explanation: An attempt by CICS to open queue *queue* failed because neither the JCL nor the DCTE specified the data set name.

CICS transient data has not opened queue *queue*, for the following reasons:

- At initialization time, the startup JCL did not include a DD statement.
- No user-submitted routine allocated the queue dynamically.
- The DCTE does not contain a DSNAME parameter to enable CICS to allocate the file dynamically.

System Action: CICS continues processing with queue *queue* closed.

User Response: Before resubmitting the transaction, supply the data set name in the JCL or the DCTE. You can set the name in the DCTE while CICS is running by using CEDA to correct and reinstall the DCT entry.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDOC

XMEOUT Parameters: *applid, queue, module*

DFHTD0340 *applid* **Transaction** *tranid* **initiated when the trigger level is reached for Transient Data queue** *queue* **is defined as REMOTE. The transaction initiation has failed.**

Explanation: The trigger level has been reached for the transient data queue *queue*. The transaction associated with the queue is remote, which is invalid for trigger transactions. The initiation of the transaction has, therefore, failed.

System Action: Until the error is corrected, each subsequent write to the transient data queue causes another attempt to initiate the transaction, which fails. However, in order to avoid filling the log with messages, this message is only issued the first time the error is detected.

User Response: Perform one of the following, as appropriate:

- If the transid in the DCT is incorrect:
  - Amend the DCT, replacing the transid for the queue with a transid that is local, and reassemble, or
  - Use EXEC CICS SET TDQUEUE(*queue*) ATITRANID(*tranid*) to replace the transid for the queue with a local transid. See the *CICS System Programming Reference* for more information.
- If the transaction definition is incorrect, amend the transaction definition using CEDA to make the transaction local.
- Use CEDA to alter the DCTE definition and reinstall.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDXM

XMEOUT Parameters: *applid, tranid, queue*

DFHTD0341 *applid* **Transaction** *tranid* **associated with the trigger level for Transient Data queue** *queue* **has not been initiated.**

Explanation: The trigger level has been reached for transient data queue *queue*. Initiation of the associated transaction has failed due to an error in system set up.

System Action: Until the error is corrected, each subsequent write to the transient data queue causes another unsuccessful attempt to initiate the transaction. However, in order to avoid filling the log with messages, this message is only issued the first time the error is detected.

User Response: Check the definition for the queue in the DCT. The queue must have a transaction associated with it that exists, is defined as local, and is installed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: *applid, tranid, queue*

DFHTD0342 *applid* **Transaction** *tranid* **associated with the trigger level for Transient Data queue** *queue* **has not been scheduled.**

Explanation: The trigger level has been reached for the transient data queue *queue*. The schedule of the associated transaction has failed due to an error in system set up.

System Action: Until the error is corrected, each subsequent write to the transient data queue causes another attempt to schedule the transaction, which fails. However, in order to avoid filling the log with messages, this message is only issued the first time the error is detected.

User Response: Check the following and amend if necessary:

- The queue must have a transaction associated with it that exists, is defined as local, and is installed. The transaction was local since the Remote attributes were not set in the transaction definition, yet the dynamic parm indicated that it could be remote.
- For DESTFAC (destination facility) of SYSTEM or TERMINAL, the named facility must exist, and any required system links must be installed and in service.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: *applid, tranid, queue*

DFHTD0343 *date time applid* **Automatic transaction restart for transaction** *tranid* **processing TD queue** *queue-name* **has failed.**

Explanation: A transaction that was attached when a TD trigger level was reached is ending abnormally and automatic transaction restart was requested for this transaction via the user replaceable module DFHREST. A severe error occurred when CICS attempted to restart the transaction.

System Action: Message DFHAP0002 is issued with a dump for the severe error that caused the restart to fail. Abnormal termination of the transaction for which restart was requested continues. The transaction is not automatically restarted.

The system attempts to reattach the trigger level transaction when the next TD request is received for this TD queue and the trigger level has been reached or exceeded.

User Response: Investigate the reason for the earlier severe error. See message DFHAP0002 for further guidance.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDXM

XMEOUT Parameters: *date, time, applid, tranid, queue-name*

DFHTD0360 *applid* **Logical I/O error occurred during a GET request to the intrapartition data set (DD name** *ddname***); VSAM return codes are R15=***X'retcode'***, FDBK=***X'fdbkcode'***.**

Explanation: An attempt to read a control interval from the intrapartition data set with ddname *ddname* has failed due to a logical I/O error. *retcode* is the return code in register 15 and *fdbkcode* is the value of the feedback field in the request parameter list (RPL).

System Action: This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.
A system dump with dumpcode TD0360 is taken unless you have specifically suppressed dumps in the dump table.

User Response: Message DFHME0116 is normally produced containing the symptom string for this problem. For the meaning of the codes in the message, refer to the *DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets*.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: *applid, ddname, X'retcode', X'fdbkcode'*

DFHTD0361 *applid* **Logical I/O error occurred during a PUT request to the intrapartition data set (DD name** *ddname***); VSAM return codes are R15=***X'retcode'***, FDBK=***X'fdbkcode'***.**

Explanation: An attempt to write or rewrite a control interval to the intrapartition data set with ddname *ddname* has failed due to a logical I/O error. *retcode* is the return code in register 15 and *fdbkcode* is the value of the feedback field in the request parameter list (RPL).

System Action: This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0361 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: For the meaning of the codes in the message, refer to the *DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets*.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: *applid, ddname, X'retcode', X'fdbkcode'*

DFHTD0362 *applid* **Physical I/O error occurred during a GET request to the intrapartition data set (DD name** *ddname***); VSAM return codes are R15=***X'retcode'***, FDBK=***X'fdbkcode'***.**

Explanation: An attempt to read a control interval from the intrapartition data set with ddname *ddname* has failed due to a physical I/O error. *retcode* is the return code in register 15 and *fdbkcode* is the value of the feedback field in the request parameter list (RPL).

System Action: A system dump with dumpcode TD0362 is taken unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

User Response: For the meaning of the codes in the message, refer to the *DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets*.

A copy of the physical error message produced by VSAM appears in (one of) the transient data VSAM error message area(s) in the system dump.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: *applid, ddname, X'retcode', X'fdbkcode'*

DFHTD0363 *applid* **Physical I/O error occurred during a PUT request to the intrapartition data set (DD name** *ddname***); VSAM return codes are R15=***X'retcode'***, FDBK=***X'fdbkcode'***.**

Explanation: An attempt to write or rewrite a control interval to the intrapartition data set with ddname *ddname* has failed due to a physical I/O error. *retcode* is the return code in register 15 and *fdbkcode* is the value of the feedback field in the request parameter list (RPL).

System Action: A system dump with dumpcode TD0363 is taken unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

User Response: For the meaning of the codes in the message, refer to the *DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets*.

A copy of the physical error message produced by VSAM will appear in (one of) the transient data VSAM error message area(s) in the system dump.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: *applid, ddname, X'retcode', X'fdbkcode'*

DFHTD0380 *applid* **Illegal attempt to read control interval 0 for the intrapartition data set (DD name** *ddname***).**

Explanation: Control interval 0 in the intrapartition data set is reserved for transient data control information. The remaining control intervals are allocated to hold data for queues as determined by transient data processing on behalf of application program requests.

An invalid attempt has been made to read control interval 0 for the intrapartition data set with ddname *ddname*.

System Action: This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0380 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Each intrapartition DCTE contains pointers which, if the queue is not empty, are relative byte addresses (RBAs) associated with the intrapartition data set with *ddname*.

Furthermore each allocated control interval, apart from the first, contains one or more user records as well as a queue control record. This latter record, the first in the control interval, contains the forward chain pointer or RBA for the next control interval containing data for the queue.

In each case, transient data assumes that RBAs address record boundaries within the intrapartition data set.

The assumption can be violated in several ways. The type of violation may be determined from:

- a control interval print of the intrapartition data set, or
- using Access Method Services, or
- using the system dump.

Violations include:

- THE WRONG INTRAPARTITION DATA SET WAS USED
  If the wrong data set has been used, that is, the data set used for this CICS start up was not used for the previous CICS start up, then it is highly probable that most of the RBAs in the DCTEs will not address record boundaries in the intrapartition data set.
  A cold start or an initial start of CICS must be carried out.
- THE INTRAPARTITION DATA SET WAS ALTERED
  If the records have been moved, possibly through data set compression, then it is highly probable that control interval 0 will contain more than one record and that most of the RBAs in the DCTEs will not address record boundaries in the intrapartition data set.
  A cold start or an initial start of CICS must be carried out.
- A DCTE WAS CORRUPTED
  If a DCTE has been corrupted, it is highly probable that just one or two RBAs will not address record boundaries in the intrapartition data set.
  A specialized trap may be required to identify the offending program.

  CICS may be restarted. An emergency restart for transient data will result in the RBAs being reconstructed from the system log and the intrapartition data set.

  If an activity keypoint was taken between the occurrence of the error and its detection, it may prove necessary for a cold start or an initial start of CICS to be carried out.
- AN I/O BUFFER WAS CORRUPTED

If an I/O buffer has been corrupted, it is highly probable one of the RBAs in the DCTE will not address record boundaries in the I/O buffer.
A specialized trap may be required to identify the offending program.

CICS may be restarted. An emergency restart for transient data results in the RBAs being reconstructed from the system log and the intrapartition data set.

Note: If the contents of the I/O buffer were written to the intrapartition data set between the occurrence of the error and its detection, it may prove necessary to perform a cold start or an initial start of CICS.

- A CICS LOGIC ERROR OCCURRED You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: *applid, ddname*

DFHTD0381 *applid* **Invalid attempt to (re)write control interval 0 for the intrapartition data set (DD name** *ddname***).**

Explanation: Control interval 0 in the intrapartition data set is reserved for transient data control information; the remaining control intervals are allocated to hold data for queues as determined by transient data processing on behalf of application program requests.

An invalid attempt has been made to (re)write control interval 0 for the intrapartition data set with ddname *ddname*.

System Action: This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0381 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Refer to message DFHTD0380.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: *applid, ddname*

DFHTD0382 *applid* **The output pointer for queue** *qqqq* **does not match the contents of the intrapartition data set (DD name** *ddname***).**

Explanation: The output pointer for queue *qqqq* does not address a record boundary within the intrapartition data set with ddname *ddname*.

System Action: This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.
A system dump with dumpcode TD0382 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Refer to message DFHTD0380.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: *applid, qqqq, ddname*

DFHTD0383 *applid* **The input pointer for queue** *qqqq* **does not match the contents of the intrapartition data set (DD name** *ddname***).**

Explanation: The input pointer for queue *qqqq* does not address a record boundary within the intrapartition data set with ddname *ddname*.

System Action: This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0383 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Refer to message DFHTD0380.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: *applid, qqqq, ddname*

DFHTD0384 *applid* **A forward chain pointer for queue** *qqqq* **does not match the contents of the intrapartition data set (DD name** *ddname***).**

Explanation: A forward chain pointer for queue *qqqq* is invalid with respect to the intrapartition data set with ddname *ddname*.

System Action: This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.
A system dump with dumpcode TD0384 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Refer to message DFHTD0380.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: *applid, qqqq, ddname*

DFHTD0385 *applid* **Invalid attempt to allocate/deallocate CI 0 for the intrapartition data set (DD name** *ddname***).**

Explanation: Control interval (CI) 0 in the intrapartition data set, *ddname*, is reserved for transient data control information. The remaining control intervals are allocated to hold data for queues as determined by transient data processing on behalf of application program requests.

System Action: System dump TD0385 is taken unless you have specifically suppressed dumps in the dump table.

This is a critical error. CICS is terminated even if you have specified in the dump table that CICS should not terminate.

User Response: Refer to the **User Response** of message DFHTD0380.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHTDB, DFHTDRM

XMEOUT Parameters: *applid, ddname*

DFHTD0401 *date time applid terminal userid tranid* **TDQUEUE entry for** *queuename* **has been deleted.**

Explanation: This is an audit log message indicating that transient data queue entry *tdqueuename* has been deleted from the DCT using the DISCARD command. Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSQL

Module: DFHTDTM

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, queuename*

DFHTD0402 *date time applid terminal userid tranid* **TDQUEUE entry for** *tdqueuename* **has been added.**

Explanation: This is an audit log message indicating that transient data queue entry *tdqueuename* has been added to the DCT using the INSTALL command Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSQL

Module: DFHTDTM

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, tdqueuename*

DFHTD0403 *date time applid terminal userid tranid* **TDQUEUE entry for** *tdqueuename* **has been replaced.**

Explanation: This is an audit log message indicating that transient data queue entry *tdqueuename* has been replaced in the DCT using the INSTALL command. Where:

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSQL

Module: DFHTDTM

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, tdqueuename*

DFHTD1210 *applid* **DCT index in error,** *xxxx* **failed**

Explanation: While carrying out operation *xxxx* (INSTALL) CICS found an error in the destination control table (DCT) index. This message is either issued on cold or initial starts when transient data is installing entries detailed in the macro load module, or on warm or emergency restarts when transient data is installing entries from the global catalog. The most likely reasons for this error are:

1. Storage violation.

   An application program has overwritten the index,

   or

2. CICS logic error

   The CICS table mapping program, DFHTMP, created the index incorrectly. **or**

3. Corrupt global catalog entries

   The global catalog has been corrupted.

System Action: CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Respond GO or CANCEL to message DFHSI1522.

The *CICS Data Areas* gives the format of the DCT index entries, under TMDEL and TMSKT. Find these entries in the dump and find the invalid data, which may help you to decide if the problem is caused by a storage violation or a CICS error.

Look at the contents of the global catalog, to determine if the catalog entry has been corrupted for the DCTE that is failing to install.

Assuming that the error is a storage violation, and that you have activated the trace facility, find in the trace the unsuccessful attempt to access the DCT by DFHTDP. Then find the last preceding successful access. You have now narrowed the search to programs that were running between these two accesses. Examine these programs for an error that could cause a storage violation.

If you have not activated trace, but you can recreate the error, activate trace, recreate the error, and proceed as in the previous paragraph.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: *applid, xxxx*

DFHTD1212 *applid* **Unrecognizable entry found in the DCT**

Explanation: During initialization, CICS found an unrecognizable entry in the destination control table (DCT). This means that the loaded DCT is in error – either a DFHDCT macro was coded incorrectly, or the output of the macro assembly was corrupted.

System Action: CICS ignores the unrecognizable DCT entry **and all subsequent DCT entries**, and continues initialization.

User Response: Depending on how many DCT entries CICS has ignored, you may have almost all or very few transient data destinations available in the initialized run. You must decide whether or not to terminate CICS. To solve the problem permanently, remove or replace the invalid DCT entry.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameter: *applid*

DFHTD1217 *applid* **Unable to install entry** *xxxx* **into the DCT.**

Explanation: During a cold or initial start, CICS was unable to add a particular entry to the destination control table (DCT) for destination *xxxx*. The definition was provided in a DCT load module which was produced using the DFHDCT assembler macro.

System Action: CICS ignores the definition and continues initialization.

User Response: The cause of this install failure may be indicated in earlier messages issued from the transient data (TD) component. It may be the result of a failure to open the DFHINTRA data set, or a security error associated with any userid included in the definition. In the latter case, it is possible to create an RDO definition for the entry, with the correct userid, once CICS has initialized, and then to install it using the CEDA transaction.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: *applid, xxxx*

DFHTD1221 *applid* **DCT not restored,** *xxxx* **failed**

Explanation: During a warm start, while carrying out operation *xxxx* (STARTBROWSE, GETNEXT or ENDBROWSE), the transient data recovery program (DFHTDRP) found an error in the destination control table (DCT) catalog.

The most likely reasons for this error are I/O errors in the catalog data set, or a logic error in the CICS module, DFHCCCC.

System Action: CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Respond GO or CANCEL to message DFHSI1522.

Determine and correct the I/O errors on the catalog data set. If you cannot restore the catalog data set, or suspect that there might be a CICS logic error in DFHCCCC, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: *applid, xxxx*

DFHTD1260 *applid* **No DD statement for intrapartition data set** *ddname*

Explanation: CICS is unable to open the intrapartition data set *ddname* because no DD statement has been provided.

System Action: During a cold or initial start, TD initialization continues until any DCT macro entries have been processed. Any intrapartition entries found are not installed and message DFHTD1217 is issued for each install failure encountered. At the end of TD initialization, message DFHTD0102 is issued. If no other initialization errors occur, message DFHSI1522 is issued.

For all other starts, TD checks the catalog to see if DFHINTRA had opened successfully on the previous CICS run. If it did, initialization is terminated. If it did not, TD initialization continues normally.

User Response: During a cold or initial start, respond GO or CANCEL to message DFHSI1522.

Modify the CICS JCL to add a DD statement defining the intrapartition data set (DFHINTRA).

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: *applid, ddname*

DFHTD1261 *applid* **Intrapartition data set** *ddname* **not defined as VSAM ESDS**

Explanation: CICS is unable to open the intrapartition data set *ddname* because it is not defined as VSAM ESDS.

System Action: During a cold or initial start, TD initialization continues until any DCT macro entries have been processed. Any intrapartition entries found are not installed and message DFHTD1217 is issued for each install failure encountered. At the end of TD initialization, message DFHTD0102 is issued. If no other initialization errors occur, message DFHSI1522 is issued.

For all other starts, TD checks the catalog to see if DFHINTRA had opened successfully on the previous CICS run. If it did, initialization is terminated. If it did not, TD initialization continues normally.

User Response: On a cold or initial start, respond GO or CANCEL to message DFHSI1522.

Recreate the intrapartition data set as a VSAM ESDS and restart CICS.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: *applid, ddname*

DFHTD1262 *applid* **Intrapartition data set** *ddname* **not formatted**

Explanation: The intrapartition data set *ddname* is not formatted (it is empty). Initial formatting is done (if necessary) when CICS is cold or initial started.

System Action: CICS continue to initialize until the destination control table has been completed. Any intrapartition definitions being read from the global catalogue will fail to install because of the original failure. When DFHTDRP completes its processing, CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

User Response: Respond GO or CANCEL to message DFHSI1522.

Perform a cold or initial start when CICS is next brought up.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: *applid, ddname*

DFHTD1263 *applid* **Invalid control record for Intrapartition data set** *ddname*

Explanation: The intrapartition data set *ddname* was not initialized for intrapartition transient data. The most likely reason for this is data corruption by:

- VSAM export and import
- DFHSM migration and recall.

System Action: CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

User Response: Respond GO or CANCEL to message DFHSI1522.

Reinitialize the intrapartition data set.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: *applid, ddname*

DFHTD1271 *applid* **VSAM error processing SHOWCB for intrapartition data set** *ddname***, R15=***retcode*

Explanation: VSAM has detected an error during SHOWCB processing for the intrapartition data set *ddname* with VSAM return code *retcode*.

System Action: CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Respond GO or CANCEL to message DFHSI1522.

Check the return code in the *DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets*.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: *applid, ddname, retcode*

DFHTD1272 *applid* **VSAM error processing OPEN for Intrapartition data set** *ddname***, R15=***retcode***, RC=***errorcode*

Explanation: VSAM has detected an error during OPEN processing for the intrapartition data set *ddname*. *retcode* is the VSAM return code and *errorcode* is the VSAM error code.

System Action: CICS writes a dump, then attempts to continue with initialization. If a cold or initial start is taking place, any entries found in a DCT load module are installed, except for any intrapartition entries. If any of these are found, message DFHTD1217 is issued for each install failure. When TDRP completes its processing message DFHTD0102 is issued followed by message DFHSI1522.

For all other types of start, if DFHINTRA had failed during the previous run of CICS, processing continues as normal. If DFHINTRA was open on the previous run, CICS terminates.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: On a cold or initial start, respond GO or CANCEL to message DFHSI1522.

Check the return code and error code in the *DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets*.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: *applid, ddname, retcode, errorcode*

DFHTD1273 *applid* **VSAM error processing CLOSE for intrapartition data set** *ddname***, R15=***retcode*

Explanation: VSAM has detected an error during CLOSE processing for the intrapartition data set *ddname*. *retcode* is the VSAM return code.

System Action: CICS writes a dump, then attempts to continue with initialization. If a cold or initial start is taking place, any entries found in a DCT load module are installed, except for any intrapartition entries. If any of these are found, message DFHTD1217 is issued for each install failure. When TDRP completes its processing message DFHTD0102 is issued followed by message DFHSI1522.

For all other types of start, if DFHINTRA had failed during the previous run of CICS, processing continues as normal. If DFHINTRA was open on the previous run, CICS terminates.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: For a cold or initial start, respond GO or CANCEL to message DFHSI1522.

Check the return code in the *DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets*.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: *applid, ddname, retcode*

DFHTD1274 *applid* **VSAM error processing PUT for intrapartition data set** *ddname***, R15=***retcode***, RC=***errorcode*

Explanation: VSAM has detected an error during PUT processing for the intrapartition data set *ddname*. *retcode* is the VSAM return code and *errorcode* is the VSAM error code.

System Action: CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Respond GO or CANCEL to message DFHSI1522.

Check the return code and error code in the *DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets*.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: *applid, ddname, retcode, errorcode*

DFHTD1275 *applid* **VSAM error processing GET for intrapartition data set** *ddname***, R15=***retcode***, RC=***errorcode*

Explanation: VSAM has detected an error during GET processing for the intrapartition data set *ddname*. *retcode* is the VSAM return code and *errorcode* is the VSAM error code.

System Action: CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Respond GO or CANCEL to message DFHSI1522.

Check the return code and error code in the *DFSMS/MVS Version 1 Release 5 Macro Instructions for Data Sets*.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDRP

XMEOUT Parameters: *applid, ddname, retcode, errorcode*

DFHTD1278 *applid* **An error occurred during initialization of intrapartition queue** *queuename* **for userid** *userid***. The queue has not been added to the Destination Control Table.**

Explanation: Transient data initialization detected an error with userid *userid* during installation of the intrapartition queue for automatic transaction initiation.

The specified userid is not valid for use by this CICS job for non-terminal transactions initiated by the transient data trigger.

There may be a previous message which gives the cause of this error.

System Action: Transient data initialization continues.

The intrapartition queue definition is not added to the destination control table.

User Response: Notify the system programmer.

If the userid is invalid, correct the userid specified in the resource definition for the intrapartition queue.

If the userid is valid, ensure that it can be used by non-terminal transactions that are initiated by trigger for the intrapartition queue. See the *CICS RACF Security Guide* for guidance.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDTM

XMEOUT Parameters: *applid, queuename, userid*

DFHTD1279 *applid* **Unexpected response (code** *X'response'***) and reason (code** *X'reason'***) from a** *dfhxxyym* **call.**

Explanation: Module DFHTDTM detected the failure of a *dfhxxyym* call to domain *xx* while attempting to install an intrapartition entry containing a USERID.

The response (code X'*response*') and reason (code X'*reason*') are those returned from the domain call (that is, *xxyy_response* and *xxyy_reason*).

This can be due to a CICS logic error.

System Action: If the error occurred during transient data initialization, this process will continue if possible. If processing cannot continue then a dump will be taken and an abend ATDY is issued.

User Response: Refer to earlier messages and the dump produced by domain *xx*.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDTM

XMEOUT Parameters: *applid, X'response', X'reason', dfhxxyym*

DFHTD1280 *applid* **An attempt to establish security has failed for userid** *userid***. SAF codes are (***X'safresp'***,***X'safreas***). ESM codes are (***X'esmresp'***,***X'esmreas***).**

Explanation: An attempt was made to establish security for userid *userid*. The attempt was rejected by the external security manager (ESM).

System Action: Security has not been established for the userid.

User Response: The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the *OS/390 MVS Programming: Authorized Assembler Services Guide* and in *External Security Interface (RACROUTE) Macro Reference for MVS and VM* (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHTDTM

XMEOUT Parameters: *applid, userid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHTFxxxx messages

DFHTF0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error occurred in a crucial XM domain module.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHTFIQ, DFHZSUP, DFHTFRF, DFHTFAL, DFHTFXM

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHTF0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error is critical.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHTFIQ, DFHZSUP, DFHTFRF, DFHTFAL

XMEOUT Parameters: *applid, X'code', modname*

DFHTF0100 *date time applid nnnn* **AIDs canceled for terminal** *termid***.** *nnnn* **AIDs remain.**

Explanation: AIDs queuing for terminal *termid* have been canceled. This could be due to the terminal being deleted, or as a result of an SPI or CEMT SET TERMINAL(*termid*) CANCEL command. Any AIDs remaining after this operation are also enumerated in this message. For programming information about CICS SET TERMINAL, see the *CICS System Programming Reference*. For information about the equivalent CEMT command, see the *CICS Supplied Transactions*.

System Action: Requests represented as AIDs queuing for the terminal have been purged from the system.

User Response: None.

Destination: CSMT

Module: DFHALP

XMEOUT Parameters: *date, time, applid, nnnn, termid, nnnn*

DFHTF0101 *date time applid nnnn* **AIDs** *{canceled | force-canceled}* **for connection** *conname***.** *nnnn* **AIDs remain.**

Explanation: AIDs queuing for connection *conname* have been canceled or force-canceled. This could be due to connection reinstall, or as a result of a SPI or CEMT SET CONNECTION(*conname*) CANCEL or FORCECANCEL command. Any AIDs remaining after this operation are also enumerated in this message. See the *CICS System Programming Reference* for more information.

System Action: Requests represented as AIDs queuing for the connection will have been purged from the system.

User Response: None.

Destination: CSMT

Module: DFHALP

XMEOUT Parameters: *date, time, applid, nnnn, {1=canceled, 2=force-canceled}, conname, nnnn*

DFHTIxxxx messages

DFHTI0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *module*. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

Message DFHME0116 is normally produced containing the symptom string for this problem.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example the domain manager, DFHDMDM). A message is issued to this effect.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual. Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHTISR, DFHTIDM

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHTI0004 *applid* **A possible loop has been detected at offset** *X'offset'* **in module** *modname***.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time when the error was detected.

Message DFHME0116 is normally produced containing the symptom string for this problem.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example the domain manager, DFHDMDM). A message is issued to this effect.

User Response: If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname* and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHTISR, DFHTIDM

XMEOUT Parameters: *applid, X'offset', modname*

DFHTI0005 *applid* **A hardware error has occurred (module** *modname***, code** *X'code'***). The Time-of-Day clock is invalid.**

Explanation: An error has occurred during the running of module *modname*. The MVS Store Clock facility is the timing mechanism for the operating system.

The code X'*code*' is the exception trace point id which uniquely identifies the place where the error was detected.

Message DFHME0116 is normally produced containing the symptom string for this problem.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues if possible, unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example the domain manager, DFHDMDM). A message is issued to this effect.

User Response: If CICS is still running, it is necessary to decide whether to terminate CICS. First, investigate the MVS Store Clock and find out whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHTISR, DFHTIDM

XMEOUT Parameters: *applid, modname, X'code'*

DFHTMxxxx messages

DFHTM1703 *applid product* **is being terminated by userid** *userid* **in transaction** *tranid{at netname | at terminal }terminal***.**

Explanation: This message is issued after a PERFORM SHUT IMMEDIATE request.

System Action: The termination process continues.

User Response: None.

Destination: Console and Terminal End User

Module: DFHSTP

XMEOUT Parameters: *applid, product, userid, tranid, {1= at netname , 2= at terminal }, terminal*

DFHTM1707I *applid* **Program DFHWKP cannot be found. No warm keypoint taken.**

Explanation: CICS cannot take a warm keypoint because the CICS module, DFHWKP, cannot be found in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

System Action: CICS passes control to the user phase 1 PLT program.

User Response: None.

Destination: Console

Module: DFHSTP

XMEOUT Parameter: *applid*

DFHTM1709I *applid* **About to link to PLT programs.**

Explanation: DFHSTP is about to link to the user PLT program PLTSD parameter in the system initialization table.

System Action: Control is passed to the user PLT programs.

User Response: None.

Destination: Console

Module: DFHSTP

XMEOUT Parameter: *applid*

DFHTM1710I *applid* **Control returned from PLT programs.**

Explanation: Control is returned to DFHSTP to continue system termination.

System Action: Control is returned to DFHSTP.

User Response: None.

Destination: Console

Module: DFHSTP

XMEOUT Parameter: *applid*

DFHTM1711I *applid* **About to link to phase 2 PLT programs.**

Explanation: DFHSTP is about to link to the phase 2 PLT programs as defined by the PLTSD parameter in the system initialization table.

System Action: CICS passes control to the phase 2 user PLT programs.

User Response: None.

Destination: Console

Module: DFHSTP

XMEOUT Parameter: *applid*

DFHTM1712I *applid* **Control returned from phase 2 PLT programs.**

Explanation: CICS returns control to DFHSTP so that system shutdown may continue.

System Action: CICS returns control to DFHSTP.

User Response: None.

Destination: Console

Module: DFHSTP

XMEOUT Parameter: *applid*

DFHTM1715 *applid product* **is being quiesced by userid** *userid* **in transaction** *tranid{at netname | at terminal }terminal***.**

Explanation: This message is issued after a PERFORM SHUT request.

System Action: Quiesce of CICS continues.

User Response: None.

Destination: Console and Terminal End User

Module: DFHSTP

XMEOUT Parameters: *applid, product, userid, tranid, {1= at netname , 2= at terminal }, terminal*

DFHTM1752 *applid* **PLT - program** *progname* **not available.**

Explanation: The program list table (PLT) specified for shutdown contains program *progname*, but CICS is unable to link to the program because one of the following has occurred:

- An executable copy of the program could not be brought into storage.
- The installed definition for the program is disabled.
- There is no installed definition for the program.

System Action: CICS termination continues without executing program *progname*.

User Response: In the next execution, check that each program specified in the PLT is contained as a data set concatenated to the DFHRPL DD statement in the startup job stream, and ensure that the program is defined and enabled.

Destination: Console

Module: DFHSTP

XMEOUT Parameters: *applid, progname*

DFHTM1780 *applid* **Abend has occurred while processing program** *progname* **during termination, code=***abcode***.**

Explanation: Program *progname* specified in the program list table (PLT) for shutdown has abnormally terminated. *abcode* is the abend code.

System Action: Control is passed to the next program specified in the PLT and a CICS dump is supplied for review.

User Response: Refer to abend code *abcode* for further information about the error. Try and correct program *progname*.

Destination: Console

Module: DFHSTP

XMEOUT Parameters: *applid, progname, abcode*

DFHTM1781 *applid* **CICS shutdown cannot complete because some non-system user tasks have not terminated.**

Explanation: This message is issued during shutdown of the CICS session and indicates that one or more CICS tasks are still active, thereby delaying the successful termination of CICS.

System Action: CICS shutdown waits until the active task or tasks are successfully terminated.

If the default shutdown transaction (CESD) is active, it attempts, after a delay, to purge and backout all active tasks. This usually leads to a successful termination of CICS within a few minutes without operator intervention.

User Response: If the default shutdown transaction (CESD) is not active, determine which CICS tasks are still running, using the CEMT INQUIRE TASK command, and take whatever steps are necessary to terminate them.

Destination: Console

Module: DFHSTP

XMEOUT Parameter: *applid*

DFHTM1782I *applid* **All non-system tasks have been successfully terminated.**

Explanation: This message is issued during shutdown of the CICS session after successful termination by the user of any active tasks which had previously prevented termination.

System Action: CICS shutdown continues normally.

User Response: None

Destination: Console

Module: DFHSTP

XMEOUT Parameter: *applid*

DFHTM1783 *applid* **CICS shutdown cannot complete because a system task which prevents normal shutdown has not terminated.**

Explanation: This message is issued during shutdown of the CICS session and indicates that CICS system transaction CLS1 is still active, thereby preventing the successful termination of CICS.

System Action: CICS shutdown waits until the active task is successfully terminated.

User Response: Determine, what is delaying the CLS1 transaction (for example the other CICS job or system being hung), and take whatever steps are necessary to resolve the situation.

Destination: Console

Module: DFHSTP

XMEOUT Parameter: *applid*

DFHTM1784 *applid* **The user shutdown assist transaction** *tranid* **cannot be started.**

Explanation: This message is issued during CICS shutdown and indicates that the user shutdown assist transaction specified on the system initialization table (SIT), or on the CEMT or EXEC CICS PERFORM SHUTDOWN SDTRAN option could not be started.

System Action: CICS shutdown continues without starting a shutdown assist transaction.

User Response: Do one of the following:

- Determine why the shutdown transaction could not start.
- Change or remove the SIT SDTRAN option.
- Change or remove the CEMT or EXEC CICS PERFORM SHUTDOWN SDTRAN option.

Destination: Console and Terminal End User

Module: DFHSTP

XMEOUT Parameters: *applid, tranid*

DFHTM1785 *date time applid* **The user shutdown assist transaction** *tranid* **cannot be started.**

Explanation: This message is issued during CICS shutdown and indicates that the user shutdown assist transaction specified on the system initialization table (SIT), or on the CEMT or EXEC CICS PERFORM SHUTDOWN SDTRAN option could not be started.

System Action: A TRANIDERR is returned and CICS shutdown is not performed.

User Response: Do one of the following:

- Correct the shutdown transaction definition.
- Change or remove the SIT SDTRAN option.
- Change or remove the CEMT or EXEC CICS PERFORM SHUTDOWN SDTRAN option.

Destination: CSMT

Module: DFHEIPSH

XMEOUT Parameters: *date, time, applid, tranid*

DFHTM1797 *applid* **System termination program has abended.**

Explanation: While terminating CICS, the CICS system termination program DFHSTP has abnormally terminated.

System Action: CICS terminates abnormally with a system dump.

User Response: Try to find out why DFHSTP terminated. If you cannot resolve the problem, keep the dump and contact your IBM Support Center.

Destination: Console

Module: DFHSTP

XMEOUT Parameter: *applid*

DFHTM1798 *applid* **Requested dump in progress.**

Explanation: This message is issued when CICS is terminated before the requested dump has started.

System Action: CICS produces a system dump and shutdown continues.

User Response: None.

XMEOUT Parameter: *applid*

DFHTOxxxx messages

DFHTO6000 E *date time applid* **The definition for TERMINAL** *termdef* **refers to an undefined TYPETERM** *termtype***.**

Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a TERMINAL definition (*termdef*) that referenced an nonexistent TYPETERM definition (*termtype*).

System Action: The TERMINAL is not installed.

User Response: Correct the TERMINAL definition or define the named TYPETERM.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, termdef, termtype*

DFHTO6001 E *date time applid* **The definition for pooled TERMINAL** *termdef* **refers to an undefined TYPETERM** *termtype***.**

Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a TERMINAL definition (*termdef*) that referenced a nonexistent TYPETERM definition (*termtype*).

System Action: The TERMINAL is not installed.

User Response: Correct the TERMINAL definition or define the named TYPETERM.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, termdef, termtype*

DFHTO6002 E *date time applid* **The definition for SESSIONs** *sesdef* **refers to an undefined CONNECTION** *condef***.**

Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a SESSIONS definition (*sesdef*) that referenced a nonexistent CONNECTION definition (*condef*).

System Action: The SESSIONS definition is not installed.

User Response: Correct the SESSIONS definition or define the named CONNECTION.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, sesdef, condef*

DFHTO6003 E *date time applid* **TERMINAL** *termdef* **specifies CONSOLE or CONSNAME but refers to TYPETERM** *termtype* **which does not specify DEVICE=CONSOLE.**

Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a TERMINAL definition (*termdef*), specified with CONSOLE=*nn* or CONSNAME=*name*, which referred to a TYPETERM definition (*termtype*) specified without DEVICE=CONSOLE.

System Action: The TERMINAL definition is not installed. (The TYPETERM definition is installed and may be referred to by other compatible TERMINAL definitions).

User Response: Correct the TERMINAL or TYPETERM definition.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, termdef, termtype*

DFHTO6004 E *date time applid* **TERMINAL** *termdef* **does not specify CONSOLE but refers to TYPETERM** *termtype* **which specifies DEVICE=CONSOLE.**

Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a TERMINAL definition (*termdef*), specified with CONSOLE=NO, which referred to a TYPETERM definition (*termtype*) specified with DEVICE=CONSOLE.

System Action: The TERMINAL definition is not installed. (The TYPETERM definition is installed and may be referred to by other compatible TERMINAL definitions).

User Response: Correct the TERMINAL or TYPETERM definition.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, termdef, termtype*

DFHTO6005 E *date time applid* **PRINTER or ALTPRINTER for TERMINAL** *termdef* **is invalid for the DEVICE specified in TYPETERM** *termtype***.**

Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a TERMINAL definition (*termdef*) specified with PRINTER or ALTPRINTER or both, which referred to a TYPETERM definition (*termtype*) that did not specify one of these DEVICEs: 3270, 3275, 3270P, LUTYPE2, or LUTYPE3.

System Action: The TERMINAL definition is not installed. (The TYPETERM definition is installed and may be referenced by other compatible TERMINAL definitions).

User Response: Correct the TERMINAL or TYPETERM definition.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, termdef, termtype*

DFHTO6006 E *date time applid* **PRINTERCOPY or ALTPRINTCOPY for TERMINAL** *termdef* **is invalid for the DEVICE specified in TYPETERM** *termtype***.**

Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected incompatible TERMINAL and TYPETERM definitions. The TERMINAL definition *termdef* specified PRINTERCOPY or ALTPRINTCOPY or both, but referred to a TYPETERM definition *termtype* which specified an LUTYPE2 or LUTYPE3 device.

System Action: The TERMINAL definition is not installed. (The TYPETERM definition is installed and may be referenced by other compatible TERMINAL definitions).

User Response: Correct the TERMINAL or TYPETERM definition.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, termdef, termtype*

DFHTO6007 E *date time applid* **AUTINSTMODEL YES|ONLY for TERMINAL** *termdef* **is invalid for the DEVICE specified in TYPETERM** *termtype***.**

Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a TERMINAL definition (*termdef*) specified with AUTINSTMODEL=[YES|ONLY], which referred to a TYPETERM definition (*termtype*) that specified DEVICE=3614|TLX|TWX, or was a PIPELINE terminal.

System Action: The TERMINAL definition is not installed. (The TYPETERM definition is installed and may be referenced by other compatible TERMINAL definitions).

User Response: Correct the TERMINAL or TYPETERM definition.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, termdef, termtype*

DFHTO6009 E *date time applid* **The definition for SESSIONs** *sesdef* **refers to CONNECTION** *condef* **which specifies a different PROTOCOL.**

Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a SESSIONS definition (*sesdef*) that referred to a CONNECTION definition (*condef*) that specified a different PROTOCOL.

System Action: The SESSIONS definition is not installed.

User Response: Correct the SESSIONS or CONNECTION definition.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, sesdef, condef*

DFHTO6010 E *date time applid* **The definition for SESSIONs** *sesdef* **must specify PROTOCOL LU61 as it refers to an MRO CONNECTION** *condef***.**

Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a SESSIONS definition (*sesdef*), specified without LU61, which referred to a CONNECTION definition (*condef*) that specified ACCESSMETHOD={IRC|XM} (MRO).

System Action: The SESSIONS definition is not installed.

User Response: Correct the SESSIONS or CONNECTION definition.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, sesdef, condef*

DFHTO6011 E *date time applid* **SESSIONs** *sesdef* **must specify both SENDCOUNT and RECEIVECOUNT as it refers to an MRO CONNECTION** *condef***.**

Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a SESSIONS definition (*sesdef*), specified with either SENDCOUNT=0 or RECEIVECOUNT=0, which referred to a CONNECTION definition (*condef*) that specified ACCESSMETHOD={IRC|XM} (MRO).

System Action: The SESSIONS definition is not installed.

User Response: Correct the SESSIONS or CONNECTION definition.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, sesdef, condef*

DFHTO6012 *date time applid* **The catalog dataset is not available. RDO function is restricted.**

Explanation: During initialization for a cold or initial start, CICS could not find the global catalog data set.

System Action: CICS continues, but with the following restrictions to RDO function:

- A TYPETERM definition must be in the same group as the TERMINAL definitions that refer to it.
- AUTOINSTALL is not available, because the MODEL definitions cannot be stored.

User Response: If you wish to avoid the above restrictions to RDO function in future CICS runs, create a global catalog data set and make it available to CICS in the DFHGCD DD statement of the CICS startup job stream.

Destination: CSMT

Module: DFHTORP

XMEOUT Parameters: *date, time, applid*

DFHTO6013 E *date time applid* **No SESSIONs definition refers to CONNECTION** *condef***.**

Explanation: During installation of a GRPLIST at initialization time, during CEDA INSTALL of a GROUP, a CHECK, or an EXEC CICS CREATE command, a CONNECTION definition was detected that had no valid SESSIONS definitions. This is valid only for INDIRECT or REMOTE connections.

System Action: The CONNECTION is not installed.

If the reason for the failure is one or more invalid SESSIONS definitions, CICS issues another message which identifies the incorrect definition(s). If the reason was a missing SESSIONS definition, this is the only message.

User Response: Correct the CONNECTION definition, create a SESSIONS definition, or correct existing SESSIONS definition(s), as appropriate.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, condef*

DFHTO6014 E *date time applid* **POOL is required for TERMINAL** *termdef* **as it refers to TYPETERM** *typedef* **which specifies SESSIONTYPE=PIPELINE.**

Explanation: An attempt has been made to install a terminal whose TYPETERM specified SESSIONTYPE=PIPELINE, but whose terminal definition did not specify POOL.

System Action: CICS initialization continues, but TERMINAL *termdef* is not installed.

User Response: Correct the TERMINAL definition, or the TYPETERM definition.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, termdef, typedef*

DFHTO6015 E *date time applid* **TRANSACTION for TERMINAL** *termdef* **is invalid for the DEVICE specified in TYPETERM** *typedef***.**

Explanation: An attempt has been made to install a TERMINAL definition which specified TRANSACTION, but referred to a TYPETERM specifying device APPC.

System Action: CICS initialization continues, but TERMINAL *termdef* is not installed.

User Response: Correct the TERMINAL definition, or the TYPETERM definition.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, termdef, typedef*

DFHTO6016 E *date time applid* **The MRO CONNECTION** *condef* **is referenced by more than one SESSIONs definition, including** *sesdef***.**

Explanation: When installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS has detected a CONNECTION definition *condef* that specified ACCESSMETHOD=(IRC|XM), which implies that it is an MRO connection. This CONNECTION was then referenced by more than one SESSIONS definition, one of which was *sesdef*. An MRO connection must only have one SESSIONS definition referencing it. Other SESSION definition names that reference this CONNECTION are listed in further occurrences of this message.

System Action: The CONNECTION definition is not installed.

User Response: Correct the CONNECTION definition or the SESSIONS definitions.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, condef, sesdef*

DFHTO6017 E *date time applid* **REMOTESYSTEM for TERMINAL '***termid***' is invalid for the DEVICE specified in TYPETERM '***typeterm***'.**

Explanation: When installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a CONSOLE that was defined as remote. This is an invalid option.

System Action: The CONSOLE is not installed.

User Response: Correct the CONSOLE that is defined as remote.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, termid, typeterm*

DFHTO6018 E *date time applid* **TERMINAL '***termid***' refers to TYPETERM '***typeterm***' which has an invalid ALTSCREEN.**

Explanation: A TYPETERM definition includes an invalid ALTSCREEN. ALTSCREEN has two components; width and height. One of these components is zero while the other is nonzero. This is an invalid combination. CICS has detected this problem in a TERMINAL definition while installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command.8

System Action: The TERMINAL definition is not installed.

User Response: Correct the TYPETERM that is referenced or reference a different TYPETERM in the TERMINAL definition. See the *CICS Resource Definition Guide* for details of valid ALTSCREEN values.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, termid, typeterm*

DFHTO6019 E *date time applid* **User** *userid* **is not authorized to install TERMINAL** *tttt* **with preset security.**

Explanation: User *userid* was attempting to install TERMINAL *tttt* but the userid does not have sufficient authority. This is because the TERMINAL has preset security (the definition for TERMINAL *tttt* specifies a USERID value). Installing a resource with preset security requires special authorization.

System Action: Resource security violation messages are logged to the CSCS transient data queue and to the system console. The resource is not installed. CICS continues.

User Response: In order to install this resource, do one of the following:

- Use the CESN transaction to sign on with a userid that is permitted to install TERMINALs with preset security.
- Ask your security administrator to authorize user *userid* to install terminals with preset security.
- Remove the USERID specification from the resource definition and install the resource without preset security.

Destination: CSMT

Module: DFHTOATM

XMEOUT Parameters: *date, time, applid, userid, tttt*

DFHTO6020 E *date time applid* **SESSIONS** *sesdef* **refers to single-session CONNECTION** *condef* **but has an invalid MAXIMUM option specified.**

Explanation: The value specified for the MAXIMUM option in the SESSIONS definition *sesdef* is incompatible with the CONNECTION definition *condef* because *condef* is defined as single-session. This was detected when *sesdef* referred to *condef* during installation of a GRPLIST at initialization, during CEDA INSTALL of a GROUP, or following a CHECK command, or during an EXEC CICS CREATE.

When a SESSION definition refers to a single-session CONNECTION definition, the value of the MAXIMUM option should be *(1,0)*.

System Action: The SESSIONS definition is not installed.

User Response: There are two ways to solve this problem:

- Correct the SESSIONS definition by specifying MAXIMUM(1,0) using either CEDA or the CSD batch update utility DFHCSDUP.
- Redefine the CONNECTION definition so that it is no longer single-session by specifying SINGLESESS=NO.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, sesdef, condef*

DFHTO6022 E *date time applid* **TERMINAL** *termdef* **specifies DCEATTACHSEC ACCEPTED or REQUIRED but TYPETERM** *termtype* **does not specify RECOVOPTION=NONE.**

Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS has detected that TERMINAL definition *termdef*, specified with DCEATTACHSEC=ACCEPTED or DCEATTACHSEC=REQUIRED, refers to the TYPETERM definition *termtype* which is specified without RECOVOPTION=NONE.

System Action: The invalid TERMINAL is not installed.

User Response: Correct the TERMINAL or TYPETERM definition.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, termdef, termtype*

DFHTO6023 E *date time applid* **Connection definition @BCH detected. Batch shared database connections are not supported.**

Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected a CONNECTION definition named @BCH. In previous releases this connection definition was reserved for use with batch shared database support, and allowed zero send sessions to be defined for an IRC connection. CICS Transaction Server for OS/390 Release 3 does not support batch shared database and does not allow the associated sessions definition to specify zero send sessions.

System Action: Installation of @BCH sessions fails.

User Response: Remove the SESSIONS and CONNECTION definitions for batch shared database.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid*

DFHTO6025 E *date time applid* **The definition for LU6.1 SESSIONs** *sesdef* **specifies a send or receive count with no prefix.**

Explanation: While installing a GRPLIST during initialization, or while executing a CEDA CHECK, a CEDA INSTALL, or an EXEC CICS CREATE command, CICS detected an LU6.1 SESSIONS definition (*sesdef*) that specified a send count with no send prefix or a receive count with no receive prefix. Prefixes must be specified for LU6.1.

System Action: The SESSIONS definition is not installed.

User Response: Correct the definition referred to in the message.

Destination: CSMT

Module: DFHTOR

XMEOUT Parameters: *date, time, applid, sesdef*

DFHTPxxxx messages

DFHTP4101 Cannot reset from temporary paging to autopaging.

Explanation: A terminal requested that it be reset from temporary paging status to autopaging status. However, the terminal is defined as a paging terminal, or the message is marked to state that the operator must purge it.

System Action: Other processing continues.

User Response: If the terminal is defined as a purging terminal, use the master terminal program to change the status of the terminal.

If the message is so marked, the operator must purge the message. The system then automatically resets the status to autopaging.

Destination: Terminal End User

Module: DFHTPR

DFHTP4102 *nnnn* **messages are queued for immediate delivery.**

Explanation: The operator requested the *nnnn* messages to be delivered via the page retrieve command queue.

System Action: The count of messages queued for this operator or terminal is displayed.

User Response: None.

Destination: Terminal End User

Module: DFHTPR

DFHTP4103 Attempting to PURGE, COPY or CHAIN, but no pages are currently connected to this terminal.

Explanation: There are currently no tasks attached to this terminal.

System Action: Other processing continues.

User Response: None.

Destination: Terminal End User

Module: DFHTPR

DFHTP4104 A paging request was received but there are no pages for display.

Explanation: The CICS paging command (CSPG) or a request for paging was entered from a terminal in transaction status, but there are no pages to be displayed at the terminal.

System Action: Other processing continues.

User Response: None.

Destination: Terminal End User

Module: DFHTPR

DFHTP4105 The specified message is not recognized.

Explanation: The terminal operator tried to retrieve or purge a specific message using a message identifier (rather than the current or next available message). However, the specified message does not exist, or is not destined for this terminal.

System Action: Other processing continues.

User Response: None.

Destination: Terminal End User

Module: DFHTPR

DFHTP4106 You are not allowed to RETRIEVE or PURGE this message.

Explanation: The terminal operator tried to retrieve or purge a specific message using a message identifier (rather than the current or next available message). However, the specified message is not destined for this operator identifier.

System Action: Other processing continues.

User Response: None.

Destination: Terminal End User

Module: DFHTPR

DFHTP4107 Chain value *chain* is less than 1 or greater than the level of chaining allowed.

Explanation: The chain value, *chain*, as indicated by the page retrieval command, is either less than one or is greater than the level of chaining at that terminal.

System Action: Other processing continues.

User Response: None.

Destination: Terminal End User

Module: DFHTPR

DFHTP4108 Requested page *pageno* does not exist (it is less than 1 or more than the number of pages in the message).

Explanation: The page *pageno*, as indicated by the page retrieval command, is either less than one or is greater than the number of pages in the message. This can be caused, for example, by requesting the previous page after the first page, or the next page after the last page.

System Action: Other processing continues.

User Response: The paging session can be continued with a valid page value. The last valid page displayed is still the current page. For example, to recall the last valid page displayed, execute the page retrieval command used to get a current page.

Destination: Terminal End User

Module: DFHTPR

DFHTP4109 The requested command *command* was not recognized. Check that you have the correct value.

Explanation: Transaction CSPG was entered at the terminal, but what follows cannot be identified as a paging command. *command* represents the first four nonblank characters after CSPG.

System Action: Other processing continues.

User Response: None.

Destination: Terminal End User

Module: DFHTPR

DFHTP4110 *function* is not valid. Page RETRIEVE function must be A, C, L, N, P, Q, or a number.

Explanation: The page retrieve function represented by *function* is not one of the following: A, C, L, N, P, Q, or a number that may be preceded by a + (plus) or a – (minus) sign, where:

Function	Meaning
A	All logical messages destined for and being displayed on that terminal.
C	The current (level) logical message.
L	The last page.
N	The next page.
P	The previous page.
Q	(Query) display the identifier of all logical messages destined for this terminal. If the message is security protected, its identifier is displayed only if the operator identifier and class for the signed-on operator match those in the message. The identifier consists of 1-to-6-digit hexadecimal number, and optionally, a message title.

System Action: Other processing continues.

User Response: Use a valid page retrieve function.

Destination: Terminal End User

Module: DFHTPR

DFHTP4111 *function* is not valid. Page PURGE function must be A, B, C, H, or R.

Explanation: The page purge function represented by *function* is not A, B, C, H, or R. The functions have the following meanings.

Function	Meaning
A	All logical messages destined for and being displayed on that terminal.
B	The logical message being displayed on that terminal and all logical messages chained to it.
C	The current (level) logical message.
H	All logical messages chained to the base logical message being displayed on that terminal.
R	All logical messages queued for immediate delivery (routed) to the terminal.

System Action: Other processing continues.

User Response: Use a valid page purge function.

Destination: Terminal End User

Module: DFHTPR

DFHTP4112 The terminal identifier *termid* is unknown or is not supported.

Explanation: The terminal identifier represented by *termid* does not exist or is not supported under basic mapping support (BMS).

System Action: Other processing continues.

User Response: Use a valid terminal identifier.

Destination: Terminal End User

Module: DFHTPR

DFHTP4113 *date time applid msgno termtype pageno* I/O error on MCR or Page (MODULE NAME: *modname*).

Explanation: While attempting to retrieve a message control record (MCR) or page of a message, a temporary storage I/O error occurred. *msgno* represents the message number in hexadecimal; *termtype* is the terminal type; *pageno* is zero if the error occurred for the MCR, or is the page number. The message or page noted may be lost for this and/or other terminals.

System Action: If pages are being displayed at an autopaging terminal, the next page if any is displayed. Otherwise no action takes place.

User Response: None.

Destination: CSMT

Module: DFHTPQ

XMEOUT Parameters: *date, time, applid, msgno, termtype, pageno, modname*

DFHTP4114 You must purge messages from the terminal before issuing a new transaction.

Explanation: While messages were being displayed at the terminal, the operator entered data that was not a paging command, either in error or to initiate a new transaction. However, at least one of the messages on the terminal is marked that the operator must specifically purge it before initiating a new transaction.

System Action: Other processing continues.

User Response: Purge all messages being displayed at this terminal (T/A), or chain the desired transaction using the chaining command.

Destination: Terminal End User

Module: DFHTPR

DFHTP4115 You must purge the message from your terminal to continue.

Explanation: A transaction is displaying pages at the terminal. Before the operator can continue with the transaction, the message must be purged.

System Action: Other processing continues.

User Response: Purge the current message (T/C).

Destination: Terminal End User

Module: DFHTPR

DFHTP4116 Your message request cannot be done while another message is being displayed.

Explanation: While viewing a message, the operator entered a request for a specific message (for example, P/1,*xxx*) or requested the message identifiers of messages waiting to be displayed (P/Q). CICS cannot service this request while another message is being displayed. *xxx* is the message identifier of one of the messages waiting to be displayed.

System Action: Other processing continues.

User Response: If desired, reenter the request when there are no messages being displayed at the terminal.

Destination: Terminal End User

Module: DFHTPR

DFHTP4117 Purge display % after viewing.

Explanation: The operator at a 3270 has requested a display of message identifiers waiting to be displayed. The reply is constructed as one or more pages stored in temporary storage and can be viewed like any page message. *%* is the page number indicator.

System Action: Other processing continues.

User Response: Purge the message when viewing is complete.

Destination: Terminal End User

Module: DFHTPR

DFHTP4118 An ID error occurred while retrieving a Message Control Record (MCR) or Message Page. Message *bmsid*, terminal type *termtype*, page *pageno*.

Explanation: CICS was trying to retrieve page *pageno* of a message from temporary storage when an identifier error was received.

Alternatively, if page *pageno* is equal to zero, CICS could have been trying to retrieve a message control record (MCR) when the identifier error was received. The probable cause of the error is that temporary storage was cold started after the message was scheduled or after the message was saved. Otherwise the message had already been purged.

The insert *bmsid* is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page or message. The insert *termtype* identifies the terminal type.

System Action: The message or page may be lost. Other processing continues.

User Response: None.

Destination: Terminal End User

Module: DFHTPR

DFHTP4119 An invalid request on Message Control Record (MCR) or Page Retrieval has occurred. Message *bmsid*, terminal type *termtype*, page *pageno*.

Explanation: CICS was trying to store or retrieve page *pageno* of a message when a temporary storage invalid request occurred. Alternatively, CICS could have been trying to store or retrieve a message control record (MCR) if the page *pageno* equaled zero when the temporary storage invalid error was received.

The message or page may be lost. The probable cause is that temporary storage was not loaded. *bmsid* is the BMS logical message identifier, which is a unique hexadecimal identifier used in

the generation of a TS key for saving this page or message. *termtype* is the terminal type.

System Action: Other processing continues.

User Response: Ensure that the temporary storage program is loaded.

Destination: Terminal End User

Module: DFHTPR

DFHTP4120 Unable to interpret input. Please try again.

Explanation: The operator entered data that could not be interpreted.

System Action: Input is discarded.

User Response: Verify that input is valid under existing conditions.

Destination: Terminal End User

Module: DFHTPR

DFHTP4121 An I/O error occurred while retrieving a message control record or message page. Message *bmsid***, terminal type** *termtype***, page** *pageno***.**

Explanation: CICS was trying to retrieve page *pageno* of a message when a temporary storage I/O error occurred. Alternatively, CICS could have been trying to store or retrieve a message control record (MCR) if the page *pageno* equaled zero when the temporary storage I/O error occurred.

The message or page may be lost. *bmsid* is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page or message. *termtype* is the terminal type.

System Action: If pages are being displayed at an autopaging terminal, the next page, if any, is displayed. Otherwise no action takes place.

User Response: None.

Destination: Terminal End User

Module: DFHTPR

DFHTP4122 Requested purge completed successfully.

Explanation: CICS has completed a page purge function requested from the terminal.

System Action: Processing continues.

User Response: None.

Destination: Terminal End User

Module: DFHTPR

DFHTP4123 Terminal is now Autopaging.

Explanation: The terminal operator has requested that CICS reset a terminal that is temporarily in paging status, to autopaging status.

System Action: The rest of the pages in the message are displayed. If there are none left and the message can be purged automatically, it is purged.

User Response: None.

Destination: Terminal End User

Module: DFHTPR

DFHTP4124 Page copied from terminal *termid* **(Message number** *msgno***).**

Explanation: This message appears in the display of messages waiting to be displayed (P/Q) and identifies a copied page. *msgno* is the message number of the copied page and *termid* is the terminal for which it is queued.

System Action: Processing continues.

User Response: None.

Destination: Terminal End User

Module: DFHTPR

DFHTP4126 *msgno* **has been copied.**

Explanation: This message is issued in response to a request to copy to another terminal. *msgno* is the message number of the message being displayed.

System Action: Processing continues.

User Response: None.

Destination: Terminal End User

Module: DFHTPR

DFHTP4127 *nnnn* **must be a number. Please try again.**

Explanation: The characters *nnnn* are not valid. The system expected a decimal value for a page or chain number, or a hexadecimal value for a message number.

System Action: Other processing continues.

User Response: Reenter the paging command. Use a valid number.

Destination: Terminal End User

Module: DFHTPR

DFHTP4128 *command* **is undefined for page retrieval.**

Explanation: After a page retrieval (PR) session had been started, the operator pressed a PA or PF key for which no PR command had been defined in the SIT.

System Action: The command is ignored. The display status bit is not altered.

User Response: Ensure that the PR command in question is defined in the SIT.

Destination: Terminal End User

Module: DFHTPR

DFHTP4130 You have used an unrecognized logical device. The valid names are *xxx,yyy***.**

Explanation: A paging command containing an invalid logical device mnemonic was entered. *xxx,yyy,...* indicates the valid logical device mnemonics for the requested logical message.

System Action: Input is discarded and other processing continues.

User Response: Reenter the paging command with a logical device mnemonic chosen from those listed in the message.

Destination: Terminal End User

Module: DFHTPR

DFHTP4131 Requested page cannot be copied to that terminal.

Explanation: The operator has tried to copy a page that refers to an outboard format:

- To a terminal that does not support outboard formats, or
- To a terminal that does support outboard formats, but which has a different page width or a smaller page depth than the source terminal.

System Action: The paging request is ignored.

User Response: Carry out whichever one of the following is appropriate:

- Copy the offending page to a terminal that supports outboard formatting
- Make the referenced format nonoutboard
- Copy the offending page to a terminal that does support outboard formatting and which has a page size the same as that of the source terminal.

Destination: Terminal End User

Module: DFHTPR

DFHTP4132 No pages have been built for this partition.

Explanation: This an information message issued during a page retrieval session. It appears in a screen partition for which no pages have been built.

System Action: Processing continues.

User Response: None, unless a display was expected in the affected partition. In this case, check for an operator or application error.

Destination: Terminal End User

Module: DFHTPR

DFHTP4133 *date time applid bmsid termtype pageno* **ID error on MCR or page.**

Explanation: CICS was trying to retrieve page *pageno* of a message when an identifier error was received. Alternatively, CICS could have been trying retrieve a message control record (MCR) if the page *pageno* equaled zero when the identifier error was received. The message or page may be lost.

The probable cause is that temporary storage was cold-started after the message was scheduled or saved, or the message has already been purged.

bmsid is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page/message. *termtype* is the terminal type.

System Action: Other processing continues.

User Response: None.

Destination: CSMT

Module: DFHTPQ

XMEOUT Parameters: *date, time, applid, bmsid, termtype, pageno*

DFHTP4134 *date time applid bmsid termtype pageno* **Invalid request on MCR or page.**

Explanation: CICS was trying to store or retrieve page *pageno* of a message when a temporary storage invalid request error occurred. Alternatively, CICS could have been trying to store or retrieve a message control record (MCR) if the page *pageno* equaled zero when the temporary storage invalid request error occurred. The message or page may be lost.

The probable cause is that temporary storage was not loaded.

bmsid is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page/message. *termtype* is the terminal type.

System Action: Other processing continues.

User Response: Ensure that the temporary storage program is loaded.

Destination: CSMT

Module: DFHTPQ

XMEOUT Parameters: *date, time, applid, bmsid, termtype, pageno*

DFHTP4150 *date time applid* **ID error on MCR.**

Explanation: During processing of a delayed delivery message a temporary storage identification error occurred. The message is lost for all destination terminals. Temporary storage was probably cold started after the message was originally scheduled.

System Action: Other processing continues.

User Response: None.

Destination: CSMT

Module: DFHTPS

XMEOUT Parameters: *date, time, applid*

DFHTP4151 *date time applid* **I/O error on MCR.**

Explanation: During processing of a delayed delivery message a temporary storage I/O error occurred. The message is lost for all destination terminals.

System Action: Other processing continues.

User Response: None.

Destination: CSMT

Module: DFHTPS

XMEOUT Parameters: *date, time, applid*

DFHTP4152 *date time applid* **Invalid request on MCR.**

Explanation: During processing of a delayed delivery message, a temporary storage invalid request error occurred. The message is lost for all destination terminals. The system was probably initialized without temporary storage.

System Action: Other processing continues.

User Response: Ensure that the system is initialized with temporary storage.

Destination: CSMT

Module: DFHTPS

XMEOUT Parameters: *date, time, applid*

DFHTP4160 *date time applid* **Message** *msgno* **purged as undeliverable from** *nnnn* **terminal(s).**

Explanation: The message numbered *msgno* has been waiting for display at a terminal, but *nnnn* of these terminals are unable to display the message because they are out of service. This message is sent to the master terminal operator.

System Action: To avoid affecting system performance, messages waiting longer than a time specified by the installation are purged.

User Response: None.

Destination: CSMT

Module: DFHTPQ

XMEOUT Parameters: *date, time, applid, msgno, nnnn*

DFHTP4161 Message *msgno* **was not delivered. It was purged from terminal(s)** *termid***. Message title was** *title***.**

Explanation: The message numbered *msgno* has been purged because it was not delivered within the system-defined time limit.

title is the title of message *msgno* and appears in this message only if one exists. *termid* is the terminal from which the message was purged.

System Action: The message is purged from the system. No further attempt is made to deliver the message.

User Response: None.

Destination: Terminal End User

Module: DFHTPQ

DFHTP4162 *date time applid nnnn* **BMS system messages purged as undeliverable from error notification terminal.**

Explanation: Basic mapping support (BMS) system messages (for example, DFHTP4161) have been waiting to be displayed at the error notification terminal, but the terminal is unable to display them because its status is not consistent with their status, or because traffic is too heavy.

nnnn is the number of BMS system messages purged and *termid* is the error notification terminal's identifier.

System Action: To avoid affecting system performance, messages waiting longer than a time specified by the installation, are purged.

User Response: Either alter the status of the terminal to allow messages to be displayed or increase purge delay time at CICS system initialization.

Destination: CSMT

Module: DFHTPQ

XMEOUT Parameters: *date, time, applid, nnnn*

DFHTP4164 *date time applid termid* **cannot accept message DFHTP4161. It is undefined or does not support paging.**

Explanation: *termid* is the identifier of a terminal specified to receive notification if a message could not be delivered. However, *termid* is not now in the TCT or is not defined as a terminal supported by BMS. This message is followed by DFHTP4161, which contains the error notification.

System Action: Other processing continues.

User Response: Notify terminal *termid* of the contents of message DFHTP4161, which is issued following this message.

Destination: CSMT

Module: DFHTPQ

XMEOUT Parameters: *date, time, applid, termid*

DFHTP4165 Undeliverable messages are being purged. The terminal is available for use.

Explanation: This message is sent to destination CSMT. It is also sent to the originating terminal if transaction CSPQ is entered from the terminal. Program DFHTPQ has been time-initiated to purge any messages that are considered undeliverable.

System Action: A non-terminal task is initiated to purge undeliverable messages.

User Response: None. The message is displayed at the terminal to indicate that the terminal is available for use.

Destination: Terminal End User

Module: DFHTPQ

DFHTP4166 *date time applid* **BMS has received an error return code** *retcode* **from CICS macro** *{TS PURGE | BMS TEXTBLD | BMS PAGEOUT | TS PUT}***.**

Explanation: BMS received an error return code after issuing a CICS system macro request. *retcode* is the return code and *macro* is the macro request.

System Action: Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHTPQ

XMEOUT Parameters: *date, time, applid, retcode, {1=TS PURGE, 2=BMS TEXTBLD, 3=BMS PAGEOUT, 4=TS PUT}*

DFHTP4170 *date time applid* **Request from system** *sysid* **to route message number** *msgno* **to terminal** *termid* **was not executed.**

Explanation: BMS received a request from system *sysid* to route message *msgno* to terminal *termid*. The request could not be executed.

System Action: Processing continues.

User Response: Ensure that the TCTs for the two systems are consistent.

Destination: CSMT

Module: DFHTPS

XMEOUT Parameters: *date, time, applid, sysid, msgno, termid*

DFHTP4171 *date time applid* **Request from system** *sysid* **to route message number** *msgno* **to terminal** *termid* **was not executed. Terminal not valid.**

Explanation: BMS received a request from system *sysid* to route message *msgno* to terminal *termid*. The request could not be executed because terminal *termid* is not defined on this system.

System Action: Processing continues.

User Response: Ensure that the TCTs for the two systems are consistent.

Destination: CSMT

Module: DFHTPS

XMEOUT Parameters: *date, time, applid, sysid, msgno, termid*

DFHTP4172 *date time applid* **Request from system** *sysid* **to route message number** *msgno* **to terminal** *termid* **was not executed. Terminal not supported by BMS.**

Explanation: BMS received a request from system *sysid* to route message *msgno* to terminal *termid*. The request could not be executed because terminal *termid* is of a type not supported by BMS.

System Action: Processing continues.

User Response: Ensure that the TCTs for the two systems are consistent.

Destination: CSMT

Module: DFHTPS

XMEOUT Parameters: *date, time, applid, sysid, msgno, termid*

DFHTP4173 *date time applid* **Request from system** *sysid* **to route message number** *msgno* **to terminal** *termid* **was not executed. Invalid LDC specified.**

Explanation: BMS has received a request from system *sysid* to route message *msgno* to terminal *termid*. The request could not be executed because the LDC specification was invalid.

System Action: Processing continues.

User Response: Ensure that the TCTs for the two systems are consistent.

Destination: CSMT

Module: DFHTPS

XMEOUT Parameters: *date, time, applid, sysid, msgno, termid*

DFHTP4174 *date time applid* **Message routing has failed for terminal** *termid***. The termid was invalid or could not be located.**

Explanation: BMS has received a request from system *sysid* to route message *msgno* to terminal *termid*. The request could not be executed because *termid* is invalid or could not be located.

System Action: Processing continues.

User Response: Ensure that the TCTs for the two systems are consistent.

Destination: CSMT

Module: DFHTPS

XMEOUT Parameters: *date, time, applid, termid*

DFHTP4180 *date time applid* **Terminal** *termid* **specified as error terminal for message** *msgno* **from system** *sysid* **invalid and ignored.**

Explanation: BMS has received a request from system *sysid* to route message *msgno*, specifying terminal *termid* to be notified in the event of the message not being delivered. Terminal *termid* is not defined in the terminal control table.

System Action: Processing continues.

User Response: Ensure that the TCTs for the two systems are consistent.

Destination: CSMT

Module: DFHTPS

XMEOUT Parameters: *date, time, applid, termid, msgno, sysid*

DFHTP4190 Please enter your data again in the partition containing the cursor.

Explanation: The terminal operator entered data from a partition other than the expected input partition. The expected input partition is activated (that is, the cursor is moved into it), and the terminal operator should reenter data in this partition.

System Action: Processing continues.

User Response: Ensure that the terminal operator enters data in the correct partition.

Destination: Terminal End User

Module: DFHPHP

DFHTRxxxx messages

DFHTR0001 *applid* **An abend (code** *abcode***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code.

Alternatively, unexpected data has been input, or storage has been overwritten.

The code *abcode* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHTRSR, DFHTRPT, DFHTRDM , DFHTRFT

XMEOUT Parameters: *applid, abcode, X'offset', modname*

DFHTR0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the *CICS Problem Determination Guide*.

System Action: An exception entry (code X'*code*') is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: There may be an error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHTRSR

XMEOUT Parameters: *applid, X'code', modname*

DFHTR0004 *applid* **A possible loop has been detected at offset** *X'offset'* **in module** *modname***.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname* and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHTRSR, DFHTRPT, DFHTRDM, DFHTRFT

XMEOUT Parameters: *applid, X'offset', modname*

DFHTR0101 STORAGE FOR INTERNAL TRACE TABLE NOT AVAILABLE -TRACE INOPERATIVE.

Explanation: During CICS initialization, there was insufficient storage for even the minimum allowable internal trace table size (16KB).

System Action: CICS terminates with a system dump.

User Response: The failure to get even 16KB from MVS at this early stage of initialization almost certainly means that other areas of CICS and other system functions will not be able to acquire the storage they require to operate, so the system is unlikely to initialize completely. A possible solution is to increase the value for the REGION keyword on the EXEC statement for the CICS job.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRDM

DFHTR0102 REQUESTED TRACE TABLE SIZE NOT AVAILABLE.

Explanation: CICS issues a variable-type GETMAIN to MVS for the internal trace table storage. This message indicates that the upper limit specified (on the TRTABSZ keyword) was not available, but that at least the lower limit of 16K was obtained.

Message DFHTR0103 which follows this message gives the actual size acquired.

System Action: CICS continues with an internal trace table of the size given by message DFHTR0103.

User Response: There are three possible courses of action:

- Allow CICS to run with the decreased table size if this is thought to be adequate.
- Terminate the system and reinitialize after increasing the region size available to CICS.
- Once the system is initialized, use CETR to increase the table size to the required value.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRDM

DFHTR0103 TRACE TABLE SIZE IS *nn*K.

Explanation: The internal trace table acquired during CICS initialization has a table size *nn*KB.

This is either the same as that specified on the TRTABSZ keyword of the SIT or message DFHTR0101 or DFHTR0102 has preceded this on the console.

System Action: CICS continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRDM

DFHTR0104 *applid* No buffer storage available for auxiliary trace data set. Auxiliary trace is inoperative.

Explanation: An attempt to start auxiliary trace failed because there was insufficient storage available from MVS for the 4KB output buffer.

System Action: A CICS system dump with dump code TR0104 is taken. CICS then continues with auxiliary trace inactive.

User Response: Determine why so little MVS storage is available and retry if possible.

Destination: Console

Module: DFHTRDM

XMEOUT Parameter: *applid*

DFHTR0105 AUXILIARY TRACE DATA SET *dataset* COULD NOT BE OPENED - AUXILIARY TRACE INOPERATIVE.

Explanation: An attempt to start auxiliary trace or to switch auxiliary trace extents has failed because the request to BSAM to open data set *dataset* failed.

System Action: There are two cases:

- If the error occurs after an explicit request to start auxiliary trace (as opposed to switching extents), a CICS system dump with dump code TR0105 is taken. CICS then continues with auxiliary trace inactive.
- If the error occurs when auxiliary trace is already active, that is, an explicit switch request when auxiliary trace starts or an end-of-extent with autoswitching active, an SDUMP with dump code KERNDUMP is taken. This type of dump is not subject to suppression or modification by use of the dump table.

User Response: Check that the DD statement for data set *dataset* is present.

If it is, format the system dump and examine the TR domain information. The DCB for the auxiliary trace data set should be present. Use this to determine the reason for the open failure.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHTRSR, DFHTRSU

DFHTR0106 *applid* DFHTRAO could not be loaded. Auxiliary trace is inoperative.

Explanation: An attempt to start auxiliary trace failed because the CICS module, DFHTRAO, which is used to write to the auxiliary trace data set, could not be loaded.

System Action: The loader domain (LD) will have issued messages and dumps as necessary. CICS continues with auxiliary trace inactive.

User Response: Refer to the associated loader domain messages for further information and guidance.

Destination: Console

Module: DFHTRSR

XMEOUT Parameter: *applid*

DFHTR0107 ABEND *X'abcode'* ON AUXILIARY TRACE DATA SET *dataset* - AUXILIARY TRACE STOPPED.

Explanation: The DCB abend exit for named auxiliary trace data set *dataset* was driven after a request to BSAM.

The 3-digit abend code is indicated as X'*abcode*'

System Action: CICS continues with auxiliary trace inactive.

User Response: Refer to the *OS/390 MVS System Codes* manual for an explanation of the abend code, X'*abcode*'.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRAO

DFHTR0108 I/O ERROR ON AUXILIARY TRACE DATA SET *dataset* - AUXILIARY TRACE STOPPED.

Explanation: The SYNAD exit for the auxiliary trace data set *dataset* was driven after a request to BSAM.

System Action: CICS will continue with auxiliary trace inactive.

User Response: Use this message and any BSAM messages to determine the source of the error.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRAO

DFHTR0109 AUXILIARY TRACE DATA SET *dataset* FULL -AUXILIARY TRACE HAS BEEN STOPPED.

Explanation: The auxiliary trace data set *dataset* is full. Auxiliary trace has been stopped because autoswitch is not active.

System Action: CICS continues with auxiliary trace inactive.

User Response: The auxiliary trace data set *dataset* can now be processed by the print routine DFHTU520.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRSU

DFHTR0110 AUXILIARY TRACE DATA SET *dataset1* **FULL - SWITCHING TO** *dataset2***.**

Explanation: The auxiliary trace data set *dataset1* is full. Auxiliary trace is continuing on data set *dataset2* because autoswitching was requested.

System Action: CICS continues with auxiliary trace active on the data set *dataset2*.

User Response: Process the full data set if required.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRSU

DFHTR0111 *applid* **Unable to acquire storage for GTF buffer - GTF trace inoperative.**

Explanation: An attempt to start CICS tracing to the MVS Generalized Trace Facility (GTF) failed because there was insufficient storage available from MVS for the 256-byte buffer required.

This message can be issued by DFHTRDM during CICS initialization if GTFTR=ON is specified on the SIT or start-up overrides, or by DFHTRSU if the request to start GTF was made after CICS was up and running.

System Action: CICS continues with GTF tracing inactive.

User Response: The failure to acquire even 256 bytes of storage indicates that the CICS region is probably in a stall condition. This can only be relieved by removing some of the users of MVS storage or by restarting CICS, possibly with a larger region size.

Destination: Console

Modules: DFHTRDM, DFHTRSU

XMEOUT Parameter: *applid*

DFHTR0112 *applid* **Bad data passed for tracing to module** *modname***.**

Explanation: Some data passed to the trace (TR) domain for addition to the internal trace table, auxiliary trace data set or GTF trace caused a program check when an attempt was made to access it.

This could either be as a result of a request made by CICS system code or a request made by a user program through the API or XPI.

If transaction isolation is active, this message can be issued if a transaction passes another transaction's storage to CICS. A program check occurs when CICS attempts to trace this storage because the storage is fetch protected.

System Action: A system dump with dump code TR0112 is taken.

If the message was issued by DFHTRPT the dump contains an exception trace entry (point ID TR0102) that includes the erroneous parameter list passed to DFHTRPT.

If the message was issued by DFHTRFT the dump contains an exception trace entry (point ID TR0402) that includes the erroneous parameter list passed to DFHTRFT.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Examine the interpreted exception trace entry to determine the domain that issued the call and the ID of the entry. Then look at the specified addresses and lengths in the data*n* fields to see if they contain reasonable values. The fault is in the module that set up these fields for the trace call.

If transaction isolation is active, examine the calling domain's parameter list, data2, for storage that belongs to another transaction. Correct the offending application program. It should not be passing another transaction's storage. Alternatively, alter the definition of the application so that it can validly access another transaction's storage. See the *CICS Resource Definition Guide* for more information on how to alter the definition.

Destination: Console

Modules: DFHTRPT, DFHTRFT

XMEOUT Parameters: *applid, modname*

DFHTR0113 *applid* **Auxiliary trace is being started on data set** *dataset***.**

Explanation: A request to start auxiliary trace has been successfully processed. The trace records are being written to data set *dataset*.

System Action: CICS continues with auxiliary trace active.

User Response: None.

Destination: Console

Module: DFHTRSR

XMEOUT Parameters: *applid, dataset*

DFHTR0114 AN ABEND HAS OCCURRED DURING INITIALIZATION OF TRACE IN MODULE *modname***.**

Explanation: Module *modname*'s recovery routine received control during pre-initialization of the trace (TR) domain. This indicates that a program check has occurred in module *modname*.

There are three possible causes of this condition.

1. The module has been overwritten in main storage.
2. The module is at an incompatible level with the rest of the CICS modules.
3. There is an error in the module.

System Action: A system dump with dump code KERNDUMP is taken.

User Response: Inform the system programmer.

There may be an error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

Use the dump to determine the cause of the condition.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHTRDM , DFHTRSR

DFHTR0115 AN ABEND HAS OCCURRED IN THE AUXILIARY TRACE MODULE DFHTRAO.

Explanation: Module DFHTRAO's recovery routine has received control.

This indicates a program check or MVS abend has occurred in DFHTRAO.

There are three possible causes of this condition:

- DFHTRAO has been overwritten in main storage
- DFHTRAO is at an incompatible level with the rest of the CICS modules
- There is an error in DFHTRAO.

System Action: A system dump with dump code KERNDUMP is taken.

User Response: There may be an error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module DFHTRAO is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module DFHTRAO, you should bring CICS down in a controlled shutdown.

Use the dump to determine the cause of the condition.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRAO

DFHTR0116 AN ABEND HAS OCCURRED IN THE TRACE SUBROUTINES MODULE DFHTRSU.

Explanation: The recovery routine belonging to the trace domain module DFHTRSU has received control.

This indicates a program check or MVS abend has occurred in that module.

There are three possible causes of this condition:

- DFHTRSU has been overwritten in main storage.
- DFHTRSU is at an incompatible level with the rest of the CICS modules.
- There is an error in DFHTRSU.

System Action: A system dump with dump code KERNDUMP is taken.

User Response: There may be an error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module DFHTRSU is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module DFHTRSU, bring CICS down in a controlled shutdown.

Use the dump to determine the cause of the condition.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRSU

DFHTR0117 *applid* **Auxiliary trace on data set** *dataset* **has been stopped.**

Explanation: An operator or application program request, to stop CICS tracing to the auxiliary trace data set *dataset*, has been successfully processed.

System Action: CICS continues with auxiliary trace inactive.

User Response: The auxiliary trace data set *dataset* can now be processed by the print routine DFHTU520.

Destination: Console

Module: DFHTRSR

XMEOUT Parameters: *applid, dataset*

DFHTR0118 *applid* **Auxiliary trace is being switched from** *dataset1* **to** *dataset2***.**

Explanation: An operator or application program request to switch extents on the auxiliary trace data set while auxiliary trace is active is being processed.

System Action: CICS stops tracing on the first named data set *dataset1*, and resumes tracing on the second named data set *dataset2*.

User Response: The first named auxiliary trace data set *dataset1* can now be processed by the print routine DFHTU520.

Destination: Console

Module: DFHTRSR

XMEOUT Parameters: *applid, dataset1, dataset2*

DFHTR1000 *applid* **CICS abend requested by global trap exit DFHTRAP in module** *modname***.**

Explanation: The field engineering global trap exit program (DFHTRAP) requested termination of CICS.

System Action: CICS disables the trap exit so that it will not be reentered, and terminates CICS.

User Response: Determine why DFHTRAP has requested system termination and act accordingly. **You should use the global trap exit only in consultation with an IBM support representative.**

Destination: Console

Modules: DFHTRPT, DFHTRFT

XMEOUT Parameters: *applid, modname*

DFHTR1001 *applid* **Program check occurred within global trap exit - DFHTRAP now marked unusable by module** *modname***.**

Explanation: After making a trace entry, the CICS trace domain (TR) called the field engineering global trap exit program (DFHTRAP). A program check occurred during execution of DFHTRAP.

System Action: CICS marks the currently active version of DFHTRAP unusable, and will ignore it on future calls to TR domain. CICS then takes a dump with system dump code TR1001, and continues execution.

User Response: Use the dump to find the cause of the program check. To replace the currently active but unusable DFHTRAP by

a new version in the CICS program library, issue the following commands in the sequence shown:

CSFE DEBUG,TRAP=OFF (to deactivate the current trap)
CEMT SET PROGRAM(DFHTRAP) NEWCOPY (to update the trap disk address known to CICS)
CSFE DEBUG,TRAP=ON (to activate the new version of the trap)

You should use the global trap exit only in consultation with an IBM support representative.

Destination: Console

Modules: DFHTRPT, DFHTRFT

XMEOUT Parameters: *applid, modname*

DFHTR1002 *applid* **Program DFHTRAP is not available - global trap not activated**

Explanation: CICS could not activate the field engineering global trap exit program, DFHTRAP, during processing of the TRAP=ON SIT keyword or override in CICS initialization. This is almost certainly because DFHTRAP is not present in the program library.

System Action: CICS takes a system dump with dump code TR1002 and continues with the global trap not activated.

User Response: Ensure that DFHTRAP is defined to RDO and made available in the program library.

You should use the global trap exit only in consultation with an IBM support representative.

Destination: Console

Module: DFHTRDM

XMEOUT Parameter: *applid*

DFHTR1003 *applid* **CICS system dump requested by global trap exit DFHTRAP in module** *modname***.**

Explanation: The user-coded global trap exit program (DFHTRAP) has requested a system dump in its return action settings.

System Action: CICS takes a system dump with dump code TR1003 and continues with the global trap still active.

User Response: Analyse the requested dump.

You should use the global trap exit only in consultation with an IBM support representative.

Destination: Console

Modules: DFHTRPT, DFHTRFT

XMEOUT Parameters: *applid, modname*

DFHTR2000 INCOMPLETE ENTRY IGNORED.

Explanation: CICS trace entries longer than 256 bytes have to be split into multiple Generalized Trace Facility (GTF) entries because of GTF's length restriction. The CICS entry becomes a header entry followed by one or more continuation entries. This message in the GTF printout indicates that a CICS entry on GTF longer than 256 bytes has not been printed because a new header entry from the same MVS TCB was encountered before all of the continuation entries from a previous split entry were received.

System Action: The incomplete entry is ignored.

User Response: This situation can arise in one of two ways:

- The MVS TCB making the first split trace entry abnormally terminated while writing the continuation entries.

  This results in messages and a system dump during the CICS run.

  Refer to the associated messages for further information and guidance. Use the dump to determine and solve the problem.
- GTF has failed to record one or more of the continuation entries because of an internal error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHTRPRG

DFHTR2001 INSUFFICIENT STORAGE FOR RECONSTRUCTION BUFFER.

Explanation: A CICS entry longer than 256 bytes has been split into a header record and one or more continuation records on the generalized trace facility (GTF). It cannot be formatted because MVS could not allocate sufficient working storage for a buffer to allow reconstruction of the segmented entry.

System Action: The entry is printed in hexadecimal and the print job continues.

User Response: Rerun the GTF print job with a larger region size.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHTRPRG

DFHTR2002 INVALID ENTRY PASSED FOR FORMATTING.

Explanation: A GTF entry with the CICS format identifier (X'EF') has been passed to the CICS GTF print routine but the data it contains is not part of a valid CICS trace entry.

System Action: The invalid entry is printed in hexadecimal and the print job continues.

User Response: Examine the entry for clues to its origin.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHTRPRG

DFHTR2003 UNEXPECTED CONTINUATION ENTRY ENCOUNTERED.

Explanation: CICS trace entries longer than 256 bytes have to be split into multiple GTF entries because of GTF's length restriction. The CICS entry becomes a header entry followed by one or more continuation entries. This message in the GTF printout indicates that a GTF entry has been passed to the CICS GTF print routine that is not the start of a CICS segmented entry and the entry type is not one for which a continuation is currently expected.

System Action: The invalid entry is printed in hexadecimal and the print job continues.

User Response: This situation could arise if the header record for a segmented entry is overwritten because of GTF's normal cyclic

re-use of space in its data set. In this case the invalid entries would be very close to the start of the printout.

If this is not so, examine the entry for clues to its origin.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHTRPRG

DFHTR2004 THE MAXIMUM NUMBER OF BUFFERS (*nn*) HAVE BEEN ALLOCATED. NONE ARE FREE FOR REUSE.

Explanation: A CICS trace entry longer than 256 bytes has been split into a header record and one or more continuation records on the generalized trace facility (GTF). However, it cannot be formatted because the maximum number of buffers allowed for reconstruction of segmented entries for a specific type has been reached. This maximum is currently set to *nn*. The number of buffers for a specific type relates directly to the number of regions or systems writing trace entries to the GTF trace data set. During writing, the segmented entries for some of the different regions or systems could become interleaved in the data set. To ensure that the entries are formatted completely and correctly, it is necessary to have a buffer available for each region or system whose trace entries have become interleaved in this way. For further information on trace types and segmented entries see the section on trace formatting in the *CICS Diagnosis Reference*.

System Action: The entry is printed in hexadecimal and the print job continues.

User Response: None, but if the situation occurs regularly, contact your IBM Support Center to discuss whether the maximum value set is too low.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHTRPRG

DFHTR2005 THE LOAD FAILED FOR LOAD MODULE *modname*. PLACE MODULE IN THE LINK LIST AND TRY AGAIN.

Explanation: The generalized trace facility (GTF) trace formatter tried to load the correct release of trace formatter for the trace entry being processed.

System Action: The job continues printing trace entries in hexadecimal only.

User Response: Place the named trace formatter load module into the link list and rerun the job. If the named trace formatter is not available, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHTRPRG

DFHTR3001 ERROR IN OPENING DFHAXPRT FILE.

Explanation: The auxiliary trace print program DFHTU520 could not open the data set defined to receive the print output.

System Action: The print job terminates with a return code of 8.

User Response: Ensure that the DD statement for DFHAXPRT is present and correct in the DFHTU520 job.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRPRA

DFHTR3002 ERROR IN OPENING DFHAUXT FILE.

Explanation: The auxiliary trace print program DFHTU520 could not open the auxiliary trace data set to be processed.

System Action: The print job terminates with a return code of 8.

User Response: Ensure that the DD statement for DFHAUXT is present and correct in the DFHTU520 job.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRPRA

DFHTR3003 ERROR IN OPENING DFHAXPRM FILE.

Explanation: The auxiliary trace print program DFHTU520 could not open the parameter input data set DFHAXPRM.

System Action: The print job terminates with a return code of 8.

User Response: Ensure that the DD statement for DFHAXPRM is present and correct in the DFHTU520 job, or specify your input parameters on the PARM keyword of the EXEC statement.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHTRPRA

DFHTR3010 ERROR IN TRACE DATA - ENTRIES MAY HAVE BEEN LOST.

Explanation: The trace block being formatted contains invalid length and/or pointer fields. This can happen if the trace table is accidentally overwritten.

System Action: The trace formatting code scans the block to try and find valid entries. Any that are found are printed. The rest of the data is ignored.

User Response: Try and determine what caused the overwriting of the internal trace table.

The trace entries immediately before and after this message in the print out should be viewed with suspicion. They may contain incorrect data, or there may be one or more entries missing altogether at this point.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHTRFPB

DFHTSxxxx messages

DFHTS0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHTSAM, DFHTSBR, DFHTSDM, DFHTSPT, DFHTSQR, DFHTSRM, DFHTSSH, DFHTSSR, DFHTSST, DFHTSWQ.

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHTS0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHTSAM, DFHTSBR, DFHTSDM, DFHTSPT, DFHTSQR, DFHTSRM, DFHTSSH, DFHTSSR, DFHTSST, DFHTSWQ.

XMEOUT Parameters: *applid, X'code', modname*

DFHTS0100I *applid* **Temporary Storage initialization has started.**

Explanation: This is an informational message indicating the start of temporary storage domain initialization.

System Action: Initialization continues.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHTSDM

XMEOUT Parameter: *applid*

DFHTS0101I *applid* **Temporary Storage initialization has ended.**

Explanation: Temporary storage domain initialization has completed successfully

System Action: Initialization continues.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHTSDM

XMEOUT Parameter: *applid*

DFHTS0102I *applid* **About to format the temporary storage data set (***numcis* **control intervals).**

Explanation: Temporary storage has been cold-started with a new data set. This message is issued when formatting of the data set commences, and indicates the number *numcis* of control intervals which will be formatted.

System Action: CICS continues. Message DFHTS0101 is issued when temporary storage initialization has been completed. Note that formatting can take a significant time if the data set is large.

User Response: None. You can suppress this message with the message level system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHTSDM.

XMEOUT Parameters: *applid, numcis*

DFHTS0103 *applid* **Invalid attempt to switch between a TST and RDO for Temporary Storage. The attempt is ignored.**

Explanation: Temporary storage has detected an implicit attempt to switch between using a TST and RDO for TS queues, but CICS has not been COLD started.

Switching from using a TST to RDO for TS (or vice versa) is permitted only on a COLD or INITIAL start of CICS.

System Action: CICS continues. The attempt to switch is ignored. CICS will use a TST (if specified) or RDO models for TS queues, as for the previous CICS run.

User Response: You may wish to restart CICS specifying an INITIAL or COLD start in order to complete the switch.

Destination: Console

Module: DFHTSAD

XMEOUT Parameter: *applid*

DFHTS1301 *applid {READ | WRITE}* **Error detected by temporary storage. RPL feedback area is** *X'yyyyy'***.**

Explanation: An I/O error has been detected by temporary storage. Either:

- A hardware error occurred while a task was accessing the temporary storage data set, or
- VSAM detected a logic error in the request. The most likely cause of this is that the data set was defined incorrectly.

System Action: An I/O ERROR return code is returned to the application program.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that the definition of the temporary storage data set is correct. For logic errors see the DFSMS/MVS Macro Instructions for Data Sets manual for assistance in interpreting RPL feedback codes.

See the *CICS Problem Determination Guide* for more guidance in dealing with temporary storage problems.

Destination: Console

Module: DFHTSAM

XMEOUT Parameters: *applid, {1=READ, 2=WRITE}, X'yyyyy'*

DFHTS1310 *applid* **Temporary storage data set does not match bit map**

Explanation: The temporary storage domain has detected an inconsistency between its control blocks. The inconsistency was detected either during compression of an I/O buffer or by the TS control block checking which is enabled via TS trace level 3.

Possible causes of the inconsistency are:

- An incorrect temporary storage data set (DFHTEMP) was used.
- The control interval size (CISIZE) of the temporary storage data set was changed between CICS runs.
- A storage overlay has occurred.
- An internal error has occurred within the TS domain.

System Action: CICS is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: To determine the cause of the error, check that:

- The correct data set was used.
- The CISIZE of DFHTEMP was not altered between CICS runs (if CISIZE **was** altered, temporary storage should have been cold started).

Whatever the cause of the error, temporary storage must now be cold started.

See the *CICS Problem Determination Guide* for more guidance in dealing with temporary storage problems. If an overlay has occurred, you will need further assistance from IBM.

See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHTSAM

XMEOUT Parameter: *applid*

DFHTS1311 *applid* **Temporary storage data set is full and cannot be extended**

Explanation: The temporary storage data set is full. CICS has failed in an attempt to extend it.

System Action: Processing continues.

User Response: Consider whether you need to increase the space allocation for the temporary storage data set.

Destination: Console

Module: DFHTSAM

XMEOUT Parameter: *applid*

DFHTS1315 *applid* **The temporary storage data set has exceeded the maximum number of control intervals supported.**

Explanation: During a temporary storage write request, an attempt has been made to add a new control interval to the temporary storage data set. The temporary storage data set already contains the maximum number of supported control intervals and cannot be extended.

System Action: Processing continues.

User Response: Consider whether you need to increase the control interval size for the temporary storage data set. See the *CICS System Definition Guide* for guidance on defining the temporary storage data set.

Destination: Console

Module: DFHTSAM

XMEOUT Parameter: *applid*

DFHTS1340 *applid* **No DD statement provided for temporary storage data set.**

Explanation: CICS is unable to open the auxiliary temporary storage data set because no DD statement has been provided.

System Action: A dump is provided and CICS is terminated.

User Response: Correct the error and restart CICS.

Destination: Console

Module: DFHTSDM

XMEOUT Parameter: *applid*

DFHTS1341 *applid* **VSAM error processing SHOWCAT for temporary storage data set.**

Explanation: VSAM has detected an error during SHOWCAT processing for the auxiliary temporary storage data set.

System Action: A dump is provided and CICS is terminated.

User Response: Correct the error and restart CICS.

Destination: Console

Module: DFHTSDM

XMEOUT Parameter: *applid*

DFHTS1342 *applid* **Invalid VSAM definition for temporary storage data set.**

Explanation: CICS is unable to open the auxiliary temporary storage data set because it is not defined as VSAM ESDS.

System Action: A dump is provided and CICS is terminated.

User Response: Correct the error and restart CICS.

Destination: Console

Module: DFHTSDM

XMEOUT Parameter: *applid*

DFHTS1362 *applid* **Temporary storage data set not formatted**

Explanation: The auxiliary temporary storage data set is not formatted. It is empty. If initial formatting is necessary, it is performed when temporary storage is cold started.

System Action: The temporary storage initialization task is abnormally terminated.

User Response: Correct the error and restart CICS.

Destination: Console

Module: DFHTSDM

XMEOUT Parameter: *applid*

DFHTS1363 *applid* **Invalid control record for temporary storage data set**

Explanation: The auxiliary temporary storage data set was not initialized for temporary storage.

System Action: The temporary storage initialization task is abnormally terminated.

User Response: Correct the error and restart CICS.

Destination: Console

Module: DFHTSDM

XMEOUT Parameter: *applid*

DFHTS1371 *applid* **VSAM error processing SHOWCB for temporary storage data set, RC=***X'retcode'*

Explanation: VSAM has detected an error during SHOWCB processing for the auxiliary temporary storage data set.

System Action: The temporary storage initialization task is abnormally terminated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response:

Check the return code in the appropriate VSAM publication.

Destination: Console

Module: DFHTSDM

XMEOUT Parameters: *applid, X'retcode'*

DFHTS1372 *applid* **VSAM error processing OPEN for temporary storage data set, R15=***X'retcode'***, RC=***X'errorcode'*

Explanation: VSAM has detected an error during OPEN processing for the auxiliary temporary storage data set. The inserts identify the return code and the error code.

System Action: The temporary storage initialization task is abnormally terminated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response:

Check the return code and error code in the appropriate VSAM publication.

Destination: Console

Module: DFHTSDM

XMEOUT Parameters: *applid, X'retcode', X'errorcode'*

DFHTS1373 *applid* **VSAM error processing CLOSE for temporary storage data set, R15=***X'retcode'***, RC=***X'errorcode'*

Explanation: VSAM has detected an error during CLOSE processing for the auxiliary temporary storage data set. The inserts identify the return code and the error code.

System Action: The temporary storage initialization task is abnormally terminated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response:

Check the return code and error code in the appropriate VSAM publication.

Destination: Console

Module: DFHTSDM

XMEOUT Parameters: *applid, X'retcode', X'errorcode'*

DFHTS1374 *applid* **VSAM error processing PUT for temporary storage data set, R15=***X'retcode'***, RC=***X'errorcode'*

Explanation: VSAM has detected an error during PUT processing for the auxiliary temporary storage data set. The inserts identify the return code and the error code.

System Action: The temporary storage initialization task is abnormally terminated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response:

Check the return code and error code in the appropriate VSAM publication.

Destination: Console

Module: DFHTSDM

XMEOUT Parameters: *applid, X'retcode', X'errorcode'*

DFHTS1375 *applid* **VSAM error processing GET for temporary storage data set, R15=***X'retcode'***, RC=***X'errorcode'*

Explanation: VSAM has detected an error during GET processing for the auxiliary temporary storage data set. The inserts identify the return code and the error code.

System Action: The temporary storage initialization task is abnormally terminated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response:

Check the return code and error code in the appropriate VSAM publication.

Destination: Console

Module: DFHTSDM

XMEOUT Parameters: *applid, X'retcode', X'errorcode'*

DFHTS1376 *applid* **VSAM error processing MODCB for temporary storage data set, R15=***X'retcode'*

Explanation: VSAM has detected an error during MODCB processing for the auxiliary temporary storage data set. The insert identifies the return code.

System Action: The temporary storage initialization task is abnormally terminated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response:

Check the return code and error code in the appropriate VSAM publication.

Destination: Console

Module: DFHTSDM

XMEOUT Parameters: *applid, X'retcode'*

DFHTS1390 *date time applid* **TSQUEUE** *name* **(***X'hexval'***) not recovered. Time last referenced:** *hh:mm:ss mm/dd/yy***. TSAGE:** *tsage*

Explanation: During an emergency start, the recoverable temporary storage queue (TSQUEUE) *name* was not recovered. This is because the time elapsed since it was last referenced exceeded the aging limit of temporary storage data as specified in the value of TSAGE *tsage* in the DFHTST macro.

System Action: The queue is not recovered and processing continues.

User Response: Ensure that the value of TSAGE specified in the DFHTST macro is adequate.

Destination: CSMT

Module: DFHTSRM

XMEOUT Parameters: *date, time, applid, name, X'hexval', hh:mm:ss, mm/dd/yy, tsage*

DFHTS1576 *applid* **Temporary storage format error**

Explanation: A nonzero return code was received from the VSAM macro GENCB when CICS was attempting to build a VSAM request parameter list (RPL).

System Action: CICS terminates abnormally with a system dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHTSDM

XMEOUT Parameter: *applid*

DFHTS1599 *applid* **Region/Partition size insufficient to initialize CICS.**

Explanation: The temporary storage domain has been unable to GETMAIN sufficient storage for its own control blocks during initialization.

System Action: CICS terminates with a system dump.

User Response: Increase the region/partition size and retry. You can get information about the size and number of occurrences of relevant control blocks by using the *CICS Data Areas* in conjunction with the system dump.

Destination: Console

Module: DFHTSDM

XMEOUT Parameter: *applid*

DFHUPxxxx messages

DFHUP0201 *applid* **ANOTHER PRODUCT HAS ALREADY REGISTERED FOR THIS DOMAIN. IFAUSAGE RC 4 HAS BEEN ISSUED. MODULE** *module*

Explanation: A return code of 4 has been issued in response to an IFAUSAGE macro call. Another product has already registered for this domain.

System Action: The current request is accepted but there is duplicate recording of data for both products.

User Response: Examine the type 89 records to determine which product is causing the duplicate registration to the domain.

See the *MVS/ESA Support for Measured Usage License Charges* manual for an explanation of the return code.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHCSDUP, DFHDRPA, DFHDUP, DFHEXP1$, DFHJUP, DFHKETCB, DFHMNDUP, DFHMSCAN, DFHSTUP, DFHTUP, DFHWOS

DFHUP0202 *applid* **THE UNAUTHORIZED REQUEST LIMIT HAS BEEN EXCEEDED. IFAUSAGE RC 8 HAS BEEN ISSUED. MODULE** *module*

Explanation: A return code of 8 has been issued in response to an IFAUSAGE macro call. This unauthorized request would cause the number of such requests to exceed the unauthorized request limit.

System Action: Processing continues.

User Response: See the *MVS/ESA Support for Measured Usage License Charges* manual for an explanation of the return code.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHCSDUP, DFHDRPA, DFHDUP, DFHEXP1$, DFHJUP, DFHKETCB, DFHMNDUP, DFHMSCAN, DFHSTUP, DFHTUP, DFHWOS

DFHUP0203 *applid* **USAGE DATA COLLECTION FUNCTION IS NOT AVAILABLE ON THIS SYSTEM. IFAUSAGE RC 16 HAS BEEN ISSUED. MODULE** *module*

Explanation: A return code of 16 has been issued in response to an IFAUSAGE macro call. The usage data collection function is not available on this system.

System Action: Processing continues.

User Response: If SMF usage processing is not available on this system (for example, if apar 0W02855 is not installed), you can ignore this message.

See the *MVS/ESA Support for Measured Usage License Charges* manual for an explanation of the return code.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHTUP, DFHWOS, DFHKETCB, DFHSIP

DFHUP0204 *applid* **AN INVALID REQUEST HAS BEEN MADE. IFAUSAGE RETURN CODE** *X'code'***. MODULE** *module*

Explanation: The return code X'*code*' has been issued in response to an IFAUSAGE macro call. An invalid request or an internal parameter error has occurred.

System Action: Processing continues.

User Response: If SMF usage processing is not available on this system (for example, if apar 0W02855 is not installed) you can ignore this message.

See the *MVS/ESA Support for Measured Usage License Charges* manual for an explanation of the return code.

You may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHCSDUP, DFHDRPA, DFHDUP, DFHEXP1$, DFHJUP, DFHKETCB, DFHMNDUP, DFHMSCAN, DFHSTUP, DFHTUP, DFHWOS

DFHUSxxxx messages

DFHUS0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHUS0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where it was detected.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM

XMEOUT Parameters: *applid, X'code', modname*

DFHUS0004 *applid* **A possible loop has been detected at offset** *X'offset'* **in module** *modname***.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. However you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM

XMEOUT Parameters: *applid, X'offset', modname*

DFHUS0006 *applid* **Insufficient storage to satisfy Getmain (code** *X'code'***) in module** *modname***. MVS code** *mvscode***.**

Explanation: An MVS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'*code*' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code *mvscode* is the MVS GETMAIN return code.

System Action: An exception entry is made in the trace table (code X'*code*'). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the User Response for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual.

Try decreasing the size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. See the *CICS System Definition Guide* or the *CICS Performance Guide* for more information on CICS storage.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHUSDM, DFHUSAD

XMEOUT Parameters: *applid, X'code', modname, mvscode*

DFHUS0050 *applid* **The default userid** *userid1* **cannot be used by this CICS job with region userid** *userid2***.**

Explanation: The default userid specified in the system initialization parameter DFLTUSER cannot be used by this CICS job.

The region userid for this CICS job is not authorized to use the userid specified in the DFLTUSER system initialization parameter.

System Action: CICS initialization terminates.

User Response: Ensure the default userid and the userid for the CICS region are correct.

If the two userids are correct, obtain the necessary authorization for the default userid to be used by the CICS region userid. This may require the assistance of a security administrator.

Previous messages may have been produced by the job giving additional information.

Destination: Console

Module: DFHUSDM

XMEOUT Parameters: *applid, userid1, userid2*

DFHUS0120 *applid* **An error occurred when performing SNSCOPE checking for a signon request.**

Explanation: The MVS ENQ issued as part of SNSCOPE checking has failed. The return code indicates that the CICS job has reached the limit of concurrent resource requests.

System Action: A system dump is suppressed, unless you have specifically enabled dumps for this dumpcode in the dump table. The request to signon is rejected.

User Response: See the OS/390 MVS Programming Authorized Assembler Services Guide for guidance on increasing the MVS ENQ limit. The MVS ENQ is issued by CICS in an unauthorised state.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHUSAD, DFHUSFL

XMEOUT Parameter: *applid*

DFHUS0150 *applid* **An attempt to establish security has failed for userid** *userid* **in group** *groupid***,** *{no terminal, | netname | console }portname* **applid** *applid***. Unable to initialize the transaction** *tranid***. SAF codes are (***X'safresp'***,***X'safreas'***). ESM codes are (***X'esmresp'***,***X'esmreas'***).**

Explanation: An attempt was made to establish security for userid *userid* in group *groupid* with access to resources allowed for the terminal or console *portname* and the application *applid*. The attempt was rejected by the external security manager (ESM).

The transaction *tranid* cannot be initialized.

System Action: Security has not been established for the userid. The attempt to initialize the transaction has failed.

User Response: The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the *OS/390 MVS Programming: Authorized Assembler Services Guide* and in *External Security Interface (RACROUTE) Macro Reference for MVS and VM* (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHUSXM

XMEOUT Parameters: *applid, userid, groupid, {99=no terminal, , 1=netname , 2=console }, portname, applid, tranid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHUS0200 *date time applid* **User** *userid* **in group** *groupid{ at netname | at console }portname* **has been timed out.**

Explanation: User *userid* in group *groupid* (at terminal *portname* if appropriate) has been removed from this CICS system because the userid has been unused for a period longer than that specified in the USRDELAY system initialization parameter.

System Action: Processing continues.

User Response: See the *CICS System Definition Guide* for more information about USRDELAY.

Destination: CSCS

Module: DFHUSDM

XMEOUT Parameters: *date, time, applid, userid, groupid, {1= at netname , 2= at console }, portname*

DFHWBxxxx CICS Web Interface messages

| Messages in the range 7001-7009 are issued by the
| CICS-supplied ICAPI (Internet Connection Application
| Programming Interface) DLL program, which executes under
| control of the ICSS/390 (Internet Connection Secure Server
| for OS/390) Web server program.

| The messages appear in the log file of the ICSS/390 job.

DFHWB0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.
If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHWBWB

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHWB0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID, which gives an indication of the cause of the error:

- 4643—DFHWBST was called with an invalid format
- 4644—DFHWBST was called with an invalid function
- 4647—The Web State manager was unable to update the Web state token directory when creating a new state block
- 4654—The Web State manager was unable to browse the Web state token directory during garbage collection
- 4652—The Web State manager was unable to perform a LOCK of the Web state data
- 4653—The Web State manager was unable to perform an UNLOCK of the Web state data
- 4683—DFHWBTC was called with an invalid format
- 4684—DFHWBTC was called with an invalid function
- 4685—An error was returned by the LE/370 pre-initialized environment (CEEPIPI)
- 4686—Call to CICS Web 3270 emulator failed

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response:

You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHWBST, DFHWBTC

XMEOUT Parameters: *applid, X'code', modname*

DFHWB0004 *applid* **A possible loop has been detected at offset** *X'offset'* **in module** *modname***.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction that was executing at the time the error was detected.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Because some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module *modname* will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHWBST, DFHWBTC

XMEOUT Parameters: *applid, X'offset', modname*

DFHWB0006 *applid* **Insufficient storage to satisfy Getmain (code** *X'code*`)` **in module** *modname***. MVS code** *mvscode***.**

Explanation: An MVS GETMAIN was issued by module *modname* but there was insufficient storage available to satisfy the request.

The code X'*code*' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code *mvscode* is the MVS GETMAIN return code.

During initialization, CICS may not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System Action: CICS will terminate with a system dump. An exception entry is made in the trace table (code *code* in the message).

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Inform the system programmer.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the overall size limit of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. If CICS is not already terminated, you will need to bring CICS down to do this. See the *CICS System Definition Guide* or the *CICS Performance Guide* for further information on CICS storage.

Destination: Console

Module: DFHWBST

XMEOUT Parameters: *applid, X'code', modname, mvscode*

DFHWB0100 *date time applid tranid* **The CICS Web Interface program cannot link to program DFHWBBLI. EIBRESP:** *eibresp***. EIBRESP2:** *resp2val***. Host IP address:** *hostaddr***. Client IP address:** *clientaddr***.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: The alias program used EXEC CICS LINK but was unable to link to program DFHWBBLI.

System Action: The link is abandoned. An HTTP response code of 500 (internal server error) is returned to the Web Browser. The alias abends with abend code AWBL.

User Response: Use the CEDA transaction to ensure that program DFHWBBLI has been correctly defined and installed.

Destination: CWBO

Module: DFHWBA

XMEOUT Parameters: *date, time, applid, tranid, eibresp, resp2val, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0101 *date time applid tranid* **The CICS Web Interface alias program DFHWBA detected a failure in program DFHWBBLI. Host IP address:** *hostaddr***. Client IP address:** *clientaddr***.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBBLI has returned an error response to the alias.

System Action: The request is abandoned. The error response returned by program DFHWBBLI is returned to the Web Browser in an HTTP response:

403 The userid associated with the request is not authorized to invoke the requested converter program, or the requested server program.

404 A link to the converter program or to the server program failed because CICS could not locate the requested program.

500 A link to the converter program or to the server program failed with an unexpected error.

503 A link to the converter program or to the server program failed for one of the following reasons:

- The server program is defined as remote, but the link to this program failed with a SYSID error, so the remote connection is either not defined correctly, or not active.
- The link to the converter or the server program failed with the ROLLEDBACK response.

The alias abends with abend code AWBM.

User Response: Check program DFHWBBLI and the programs which it calls.

Destination: CWBO

Module: DFHWBA

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice*

Explanation: The alias program has received an unexpected response on a call made to CICS during alias initialization.

System Action: The alias abends with abend code AWBI.

User Response: You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CWBO

Module: DFHWBA

XMEOUT Parameters: *date, time, applid, tranid, eibresp, resp2val, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0103 *date time applid tranid* **The CICS Web Interface alias program has received an error response (code** *X'code'***) on a call made to CICS during alias initialization.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: The alias program was unable to locate the START data for this request, or the START data was invalid. The error response code X'*code*' is the exception trace point id that uniquely identifies which error has occurred. A code of '4565'X means that the START data was missing, and '4566'X means that the START data was invalid.

System Action: The alias abends with abend code AWBF and a trace entry is made in the trace table.

User Response: The alias program DFHWBA is only to be used for alias transactions started by the CICS Web Interface. User-written applications should not be starting alias transactions, as data passed to the alias will not be in the expected format.

Destination: CWBO

Module: DFHWBA

XMEOUT Parameters: *date, time, applid, tranid, X'code', {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0106 *date time applid tranid* **The CICS Web Interface program DFHWBA has detected an error.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: The alias had detected an error.

System Action: A system dump is taken. The alias abends with abend code AWBH. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CWBO

Module: DFHWBA

XMEOUT Parameters: *date, time, applid, tranid, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0108 *date time applid tranid* **The CICS Web Interface alias program has detected an abend. Host IP address:** *hostaddr***. Client IP address:** *clientaddr***.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: The alias has detected an abend.

System Action: The alias abends with abend code AWBK.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CWBO

Module: DFHWBA

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0109I *applid* **Web domain initialization has started.**

Explanation: This is an informational message indicating the start of Web domain initialization.

System Action: CICS initialization continues.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHWBDM

XMEOUT Parameter: *applid*

DFHWB0110I *applid* **Web domain initialization has ended.**

Explanation: Web domain initialization has completed successfully.

System Action: CICS initialization continues.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHWBDM

XMEOUT Parameter: *applid*

DFHWB0111 *applid* **WB Domain initialization failed. Reason Code:** *X'rc'***.**

Explanation: The CICS Web domain initialization failed with reason code *rc*.

System Action: CICS initialization continues. Subsequent calls to the components of the CICS Web environment may fail.

User Response: Use the reason code *rc* to determine why initialization failed. The possible reasons are:

1	Storage for the Web anchor block could not be obtained.
5	Storage for the State Manager anchor block could not be obtained.
6	The creation of the State Token Directory failed.
7	The subpool required for state management could not be added.
8	The subpool required for HTTP buffers could not be added.
9	The addition of the Web State Manager lock failed.
A	The subpool required for 3270 buffers could not be added.
B	The initialization of the webrequest class failed.

Destination: Console

Module: DFHWBDM

XMEOUT Parameters: *applid, X'rc'*

DFHWB0117 *date time applid tranid* **The CICS Web Interface program DFHWBBLI has received a corrupt parameter list from the converter program** *program_name* **during** *{Decode | Encode}* **processing.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBBLI received an error response from the converter program *program_name* during either Decode or Encode processing, and the parameter list being passed was corrupt.

System Action: An error message is sent to the client and an exception trace entry is made in the trace table.

User Response: Ensure that the converter program being used is correct.

Destination: CWBO

Module: DFHWBBLI

XMEOUT Parameters: *date, time, applid, tranid, program_name, {4=Decode, 5=Encode}, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0118 *date time applid tranid* **The CICS Web Interface program DFHWBBLI has detected an error.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBBLI has detected an error.

System Action: A system dump is taken. The transaction abends with abend code AWBR. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CWBO

Module: DFHWBBLI

XMEOUT Parameters: *date, time, applid, tranid, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0119 *date time applid tranid* **The CICS Web Interface program DFHWBBLI has been started incorrectly.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBBLI has detected an error while validating initialization information. This probably means that the program has been started incorrectly.

System Action: The transaction abends with abend code AWBQ.

User Response: Check that the program was not started by a transient data trigger level or by a CECI user.

Destination: CWBO

Module: DFHWBBLI

XMEOUT Parameters: *date, time, applid, tranid, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0120 *date time applid tranid* **The CICS Web Interface program DFHWBBLI cannot link to program** *program_name***. EIBRESP:** *eibresp* **EIBRESP2:** *resp2val***.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBBLI used an EXEC CICS LINK but was unable to link to the given program and an EIB response was returned.

System Action: The link is abandoned.

User Response: Ensure that the program definition is correct.

Destination: CWBO

Module: DFHWBBLI

XMEOUT Parameters: *date, time, applid, tranid, program_name, eibresp, resp2val, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0121 *date time applid tranid* **The CICS Web Interface program DFHWBBLI encountered an error during Decode processing in the converter** *program***. Response code:** *respcode***, reason code:** *reasoncode***.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: The Decode function of the converter has returned an error.

System Action: An error message is sent to the client.

User Response: The response code insert gives the RESPONSE code returned by the converter program. The reason code insert gives the REASON code returned by the converter program.

The values defined by CICS for these fields are defined in copybook DFHWBUCD. The CICS defined values for the RESPONSE code are:

0 OK

4 Exception

8 Invalid data supplied

16 Disaster

The CICS defined values for the REASON code are:

1 Security failure

2 Corrupt client data

Users can architect their own response and reason code values to be returned by the analyzer, but they should use values other than those defined in the CICS supplied copybook DFHWBUCD.

Examine the response and reason codes returned to determine the cause of the error.

Destination: CWBO

DFHWB0123 *date time applid tranid* **The CICS Web Interface program DFHWBA1 has detected an error.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBA1 has detected an error.

System Action: A system dump is taken. The transaction abends with abend code AWBR. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CWBO

Module: DFHWBA1

XMEOUT Parameters: *date, time, applid, tranid, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0124 *date time applid tranid* **The CICS Web Interface program DFHWBA1 has been started incorrectly.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBA1 has detected an error while validating initialization information. This probably means that the program has been started incorrectly.

System Action: The transaction abends with abend code AWBQ.

User Response: Check that the program was not started by a transient data trigger level or by a CECI user.

Destination: CWBO

Module: DFHWBA1

XMEOUT Parameters: *date, time, applid, tranid, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0125 *date time applid tranid* **The CICS Web Interface program DFHWBBLI has detected an abend issued by the program** *program.{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBBLI has detected an abend by the program that was servicing the request.

System Action: The alias returns control to the caller.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CWBO

Module: DFHWBBLI

XMEOUT Parameters: *date, time, applid, tranid, program, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0126 *date time applid tranid* **The CICS Web Interface program DFHWBBLI has detected an abend issued by Encode in converter program** *program.{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBBLI has detected an abend by the program that was servicing the request during Encode processing.

System Action: The alias returns control to the caller.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CWBO

Module: DFHWBBLI

XMEOUT Parameters: *date, time, applid, tranid, program, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0127 *date time applid tranid* **The CICS Web Interface program DFHWBBLI has detected an abend issued by Decode in converter** *program.{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBBLI has detected an abend by the converter that was servicing the request during Decode processing.

System Action: The alias returns control to the caller.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CWBO

Module: DFHWBBLI

XMEOUT Parameters: *date, time, applid, tranid, program, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0128 *date time applid tranid* **An error has been detected by program** *program.{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBBLI has detected an error.

System Action: The alias returns control to the caller.

User Response: Examine the diagnostics to determine the reason for the error.

Destination: CWBO

Module: DFHWBBLI

XMEOUT Parameters: *date, time, applid, tranid, program, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0130 *date time applid tranid* **No state token passed to program DFHWBLT.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBLT was not passed the expected state token.

System Action: The transaction abends with code AWC2, and an exception trace entry 410C is written.

User Response: You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CWBO

Module: DFHWBLT

XMEOUT Parameters: *date, time, applid, tranid, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0131 *date time applid tranid* **An error code** *X'code'* **occurred in DFHWBLT while accessing the Web state data for this transaction.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: The Web Bridge Exit program, DFHWBLT, has detected an error when attempting to access the Web state data held for this transaction.

System Action: An exception trace entry is made in the trace table using code X'*code*. The transaction abends with abend code AWC1 if the Bridge Exit was trying to establish a partnership with the CICS Web Interface alias transaction.

User Response:

Use the error code *code* to determine the reason for the failure:

4106 Unable to establish a partnership with the associated CICS Web Interface alias transaction.

4107 A call to terminate the partnership between this instance of DFHWBLT and its associated CICS Web Interface alias transaction failed.

4108 A call to wait for the CICS Web Interface alias transaction associated with this instance of DFHWBLT failed.

4109 A call to reactivate the CICS Web Interface alias transaction associated with this instance of DFHWBLT failed.

4116 A call to suspend this instance of DFHWBLT failed.

4112 A call to update the state data for this transaction failed.

4113 A call to retrieve the state data for this transaction failed.

4114 The alias task associated with this instance of DFHWBLT was not in the required state.

411B A call to destroy the state data for this instance of DFHWBLT failed.

The most likely cause of the error is that the timeout interval for the Web state data has been exceeded, and the relevant state data has been deleted. Check that the timeout interval for the state data is set to a suitable value. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CWBO

Module: DFHWBLT

XMEOUT Parameters: *date, time, applid, tranid, X'code', {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0132 *date time applid tranid* **Program DFHWBLT terminated due to storage problems.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: A getmain for storage issued by DFHWBLT failed. Without the storage, processing cannot continue.

System Action: The transaction abends with code AWC5, and an exception trace entry 410D is written.

User Response: If this error occurs repeatedly, you may need to examine the storage setup of your CICS system. Refer to the *CICS Customization Guide* for further information on controlling CICS storage.

Destination: CWBO

Module: DFHWBLT

XMEOUT Parameters: *date, time, applid, tranid, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0133 *date time applid tranid* **Error** *X'code'* **occurred during CICS Web 3270 transaction processing.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBTTA detected an error when attempting to attach the Web bridge transaction or the Web 3270 Bridge exit program DFHWBLT encountered an internal error.

System Action: The transaction returns an internal server error (HTTP response 500) to the HTTP client.

User Response: The error code *code* identifies the CICS trace entry that corresponds to the failure. You may determine the transaction identifier of the Web bridge transaction from this entry and its significant characteristics.

Collect the CICS trace output. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CWBO

Modules: DFHWBTTA, DFHWBLT

XMEOUT Parameters: *date, time, applid, tranid, X'code', {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0134 *date time applid tranid* **Error** *X'code'* **occurred resolving the AID from HTTP forms data in the CICS Web terminal translation application.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBTTA is unable to resolve an attention identifier from the HTTP forms data returned from a web browser. DFHWBTTA translates the HTTP forms data into the correct 3270 format required by the CICS terminal-oriented transaction that is the target of this request. The attention identifier or AID is a mandatory part of this format. DFHWBTTA cannot locate a `name=value` pair in the HTTP forms data that adheres to the naming convention defined by the CICS Web Interface to represent an AID, and so cannot return an AID value to the terminal-oriented transaction.

System Action: DFHWBTTA returns an internal server error (HTTP response 500) to the HTTP client, and terminates the exchange with the terminal-oriented transaction.

User Response: The error code *code* identifies the CICS trace entry that corresponds to the failure. The HTTP forms data is produced as trace data. Collect the CICS trace output. Examine the HTTP forms data to determine what was returned from the web browser. Identify what HTML input type caused the web browser to submit the HTML form. Corruption of the HTTP forms data may be the cause of the problem. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CWBO

Module: DFHWBTTA

XMEOUT Parameters: *date, time, applid, tranid, X'code', {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0135 *date time applid tranid* **Error** *X'code'* **occurred resolving the next transaction identifier from HTTP forms data in the CICS Web terminal translation application.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBTTA is unable to resolve the next transaction identifier from the HTTP forms data returned from a web browser. DFHWBTTA translates the HTTP forms data and extracts the identifier of the next transaction to be executed. DFHWBTTA cannot locate a `name=value` pair in the HTTP forms data that adheres to the naming convention defined by CICS to represent the next transaction identifier and so it cannot determine which terminal-oriented transaction to start.

System Action: DFHWBTTA returns an internal server error (HTTP response 500) to the HTTP client.

User Response: The error code *code* identifies the CICS trace entry that corresponds to the failure. The HTTP forms data is produced as trace data. Collect the CICS trace output. Examine the

HTTP forms data to determine what was returned from the web browser. Corruption of the HTTP forms data may be the cause of the problem. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CWBO

Module: DFHWBTTA

XMEOUT Parameters: *date, time, applid, tranid, X'code', {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0136 *date time applid tranid* **An error code** *X'code'* **has occurred as a result of the Web State Garbage Collection process.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: Program DFHWBLT detected an error when attempting to access the Web state data held for this transaction. The transaction wait time has exceeded the garbage collection limit and the state block has been deleted by the garbage collection process.

System Action: If the error occurs in DFHWBLT, a TERMERR condition is returned to the application and processing continues. If the error occurs in DFHWBTTA, an error response is sent to the browser and processing continues.

User Response:

Use the error code *code* to determine which module received the error:

4108 The error occurred in DFHWBLT.

420B The error occurred in DFHWBTTA.

The cause of the error is that the garbage collection interval for the Web state data has been exceeded, and the relevant state data has been deleted. Check that the garbage collection interval for the state data is set to a suitable value. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CWBO

Modules: DFHWBLT, DFHWBTTA

XMEOUT Parameters: *date, time, applid, tranid, X'code', {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0137 *date time applid tranid* **An error code** *X'code'* **occurred in DFHWBTTA while accessing the Web state data for this transaction.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: The Web Terminal Translation Application program, DFHWBTTA, has detected an error when attempting to access the Web state data held for this transaction.

System Action: An exception trace entry is made in the trace table using code X'*code*.

User Response:

Use the error code *code* to determine the reason for the failure:

4203 Unable to establish a partnership with the associated CICS Web Interface alias transaction.

4204 Unable to initialize a partnership with the associated CICS Web Interface alias transaction.

4205 The alias task associated with this instance of DFHWBTTA was not in the required state.

4206 A call to create the state data for this instance of DFHWBTTA failed.

4207 A call to destroy the state data for this instance of DFHWBTTA failed.

4208 A call to retrieve the state data for this instance of DFHWBTTA failed.

4209 A call to break the established partnership between the associated transaction and DFHWBTTA has failed.

420A A call to reactivate the CICS Web Interface alias transaction associated with this instance of DFHWBTTA failed.

420B A call to wait for the CICS Web Interface alias transaction associated with this instance of DFHWBTTA failed.

420C A call to terminate the partnership between this instance of DFHWBTTA and its associated CICS Web Interface alias transaction failed.

4213 A call to update the state data for this transaction failed.

The most likely cause of the error is that the timeout interval for the Web state data has been exceeded, and the relevant state data has been deleted. Check that the timeout interval for the state data is set to a suitable value. You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBTTA

XMEOUT Parameters: *date, time, applid, tranid, X'code', {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0150 *date time applid tranid* **The CICS HTML template manager could not locate template** *template_name* **in the HTML template data set.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: The CICS HTML template manager DFHWBTL could not find template name *template_name* in the HTML data set.

System Action: Because 3270 / HTML conversion cannot be performed without the template, CICS returns a TERMERR condition to the application. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Make sure that the template exists in the template library. See the *CICS External Interfaces Guide* for guidance on how to create HTML templates. Report the details of the symptom string given in message DFHME0116.

Destination: CWBO

Module: DFHWBTC

XMEOUT Parameters: *date, time, applid, tranid, template_name, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0151 *date time applid tranid* **The CICS Web Interface 3270 emulation code was unable to process the data it was passed.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: The CICS Web Interface routine that converts 3270 data streams to HTML, and vice versa, has detected an error. This is probably because it has been passed an invalid 3270 data stream on an EXEC CICS SEND command, or because the browser has returned some data that it is incapable of handling in response to an EXEC CICS RECEIVE command.

System Action: The transaction is abended with code AEIP (INVREQ). There will be subsequent messages from the web state management code as it tidies up for the abending task. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use CEDX or trace to look at the data that was in error and then correct the sending application. Report the details of the symptom string given in message DFHME0116.

Destination: CWBO

Module: DFHWBTC

XMEOUT Parameters: *date, time, applid, tranid, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0500I *date time applid tranid* **CICS Web Interface enable processing is complete. Host IP address:** *hostaddr***.**

Explanation: The enable process has completed successfully.

System Action: Processing continues.

User Response: None.

Destination: Console and Transient Data Queue CWBO

Module: DFHWBM

XMEOUT Parameters: *date, time, applid, tranid, hostaddr*

DFHWB0551 *date time applid tranid* **The CICS Web Interface server controller detected an abend ACN1 processing a request from client** *clientaddr***. Host IP address:** *hostaddr***.**

Explanation: The HTTP caller detected an error after invoking program DFHCCNV to perform data conversion on incoming data.

System Action: If there is no DFHCNV table defined, the CICS Web Interface cannot perform data conversion on incoming data. An exception disable of the CICS Web Interface is initiated. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that there is a valid DFHCNV table link-edited into one of the libraries in the DFHRPL library concatenation.

Destination: CWBO

Module: DFHWBM

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr*

DFHWB0723 *date time applid tranid* **The CICS Web analyzer program returned an error response. Program name:** *progname***. RESPONSE:** *response***. REASON:** *reason***. Host IP address:** *hostaddr***. Client IP address:** *clientaddr***.{ | TCPIPSERVICE: }tcpipservice**

Explanation: As part of its normal processing of a request, CICS Web attach processing invokes the user replaceable analyzer to tailor the required actions. This program returns RESPONSE and REASON values. If a CICS supplied sample analyzer is being used, possible RESPONSE code values are:

0 OK

4 Exception

8 Invalid

12. Disaster

possible REASON code values are:

1 URL of incoming HTTP request is too short

2 No "/" character in the URI of the HTTP request

3. There is more data to be received for this request

4 Converter program name is less than 1 or greater than 8 bytes long

5 Alias transaction ID is less than 1 or greater than 4 bytes long

6 Server program name is less than 1 or greater than 8 bytes long

7 User token passed as query string data on this request is not valid

8 URL passed on this request is not valid

Users can also architect their own response and reason code values to be returned by the analyzer, but they should use values other than those defined in the CICS supplied copybook DFHWBUCD.

If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN" in the message.

System Action: An error response is sent to the client and processing of the request is terminated.

User Response: Examine the RESPONSE and REASON code values in the message to determine the cause of the error.

Destination: CWBO

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, progname, response, reason, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0724 *date time applid tranid* **CICS Web attach processing detected an error linking to the codepage conversion module DFHCCNV. Host IP address:** *hostaddr***. Client IP address:** *clientaddr***.{ | TCPIPSERVICE: }tcpipservice**

Explanation: An error linking to program DFHCCNV has forced CICS Web attach processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN.

System Action: A system dump is taken. An error response is sent to the client and the request is terminated. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CWBO

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0725 *date time applid tranid* **CICS Web attach processing detected an error linking to the analyzer user replaceable module** *progname***. Host IP address:** *hostaddr***. Client IP address:** *clientaddr***.{ | TCPIPSERVICE: }***tcpipservice*

Explanation: An error linking to the Analyzer user replaceable module forced CICS Web attach processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN.

System Action: An error response is sent to the client and the request is terminated. The tcpipservice remains open but unusable.

User Response: Ensure that the program specified has been correctly installed and defined to CICS. If the user replaceable module (URM) has been set dynamically using CEMT or the SPI command, then ensure that the module is defined to CICS and enabled, or available in the library if autoinstall is active.

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, progname, hostaddr, clientaddr, {1= , 2=TCPIPSERVICE: }, tcpipservice*

DFHWB0726 *date time applid tranid* **CICS Web attach processing cannot link to the analyzer user replaceable program. No analyzer specified. Host IP address:** *hostaddr***. Client IP address:** *clientaddr***.{ | TCPIPSERVICE: }***tcpipservice*

Explanation: CICS Web attach processing cannot invoke the analyzer user replaceable module because none was specified for the TCPIPSERVICE associated with the request being processed. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN.

System Action: An error response is sent to the client and the request is terminated. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use CEMT SET TCPIPSERVICE to specify an analyzer name on the URM parameter. CEDA can be used to alter the stored definitions. The URM name for CICS Web TCPIPSERVICEs (those TCPIPSERVICEs which have CWXN specified as the transaction ID) MUST specify a valid analyzer program name for the URM keyword.

Destination: CWBO

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0727 *date time applid tranid* **CICS Web Interface attach processing could not attach the requested alias transaction** *tranid***. Userid:** *userid***. Host IP address:** *hostaddr***. Client IP address:** *clientaddr***.{ | TCPIPSERVICE: }***tcpipservice*

Explanation: Web attach processing could not attach a new task with the requested alias transaction ID *tranid*. An error response is sent to the client and processing of the request is terminated with abend code AWB2. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN.

User Response: Ensure that the alias transaction ID supplied by the Analyzer user-replaceable program has been defined to CICS.

Destination: CWBO

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, tranid, userid, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0728 *date time applid tranid* **CICS Web attach processing detected a storage error within the Web receive module DFHWBSR. Host IP address:** *hostaddr***. Client IP address:** *clientaddr***.{ | TCPIPSERVICE: }***tcpipservice*

Explanation: A storage error in program DFHWBSR has forced CICS Web attach processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN."

System Action: An error response is sent to the client and the request is terminated.

User Response: The most probable cause of this error is there being insufficient storage to process the client request. This failure may indicate that you need to increase the size limits of the EDSAs. EDSA storage limits are specified by the EDSALIM system initialization parameter. See the *CICS System Definition Guide* for more guidance on EDSALIM.

Destination: CWBO

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0730 *date time applid tranid* **CICS Web attach processing encountered an internal error while processing a client request. Client IP address:** *clientaddr* **Host IP address:** *hostaddr***.{ | TCPIPSERVICE: }***tcpipservice*

Explanation: An internal error has forced CICS Web processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN."

System Action: A system dump is taken. An error response is sent to the client and the request is terminated. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CWBO

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0731 *date time applid tranid* **CICS Web attach processing detected an HTTP header longer than 32767 bytes. Host IP address:** *hostaddr***. Client IP address:** *clientaddr***.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: An HTTP request was being received by DFHWBSR when it detected that the header data of the request exceeded the currently supported maximum of 32767 bytes. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System Action: Trace entry 0418 is issued containing the web request block. The length of the HTTP header data can be inferred from the user_data_offset field.

User Response: Examine the input HTTP request and reduce the length of the header information to be within the allowed limit. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CWBO

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, hostaddr, clientaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB0732 *date time applid tranid* **CICS Web attach processing encountered a sockets I/O error while receiving a client request. Client IP address:** *clientaddr***. Host IP address:** *hostaddr***.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: A sockets I/O error has forced CICS Web processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN."

System Action: The Web error program DFHWBEP is driven, but no error response can be sent to the client. The request is terminated.

User Response: Check for any associated sockets domain error messages, which may give more details on the error which has occurred. The error may have been caused by a user terminating their Web Browser before CICS has been able to process the request. If the problem persists, there may be a problem with the TCP/IP network. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CWBO

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, clientaddr, hostaddr, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB1007 *applid* **Initializing CICS Web environment.**

Explanation: Module DFHWBIP has been invoked to initialize the CICS Web 3270 environment.

System Action: Processing continues.

User Response: None.

Destination: Console

Module: DFHWBIP

XMEOUT Parameter: *applid*

DFHWB1008 *applid* **CICS Web environment initialization is complete.**

Explanation: The CICS Web 3270 environment has been initialized, and it is now ready to process Web-related work.

System Action: Processing continues.

User Response: None.

Destination: Console

Module: DFHWBIP

XMEOUT Parameter: *applid*

DFHWB1009 *applid* **CICS Web environment initialization failed. Reason Code:** *X'rc'***.**

Explanation: The CICS Web 3270 environment initialization failed with reason code *rc*.

System Action: CICS initialization continues. Subsequent calls to the components of the CICS Web environment may fail.

User Response: Use the reason code *rc* to determine why initialization failed. The possible reasons are:

1	Storage for the Web anchor block could not be obtained.
3	Load for module DFHWBST failed.
4	Load for module DFHWBTC failed.
5	Storage for the State Manager anchor block could not be obtained.
6	The creation of the State Token Directory failed.
7	The subpool required for state management could not be added.
8	The subpool required for HTTP buffers could not be added.
9	The addition of the WBST lock failed.
A	Load for module DFHWBIP failed.

Reason codes 1 to 9 originate in DFHWBIP. Reason code A originates from DFHSIJ1.

Destination: Console

Modules: DFHWBIP, DFHSIJ1

XMEOUT Parameters: *applid, X'rc'*

DFHWB1020 *date time applid* **CICS Web State Manager could not find state data for state token** *stoken* **for a** *{destroy | retrieve | store}* **request.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: The CICS Web State Manager could not find the state data for the state token *stoken* or the supplied state token *stoken* does not exist.

System Action: The requested state data cannot be destroyed, updated or retrieved by the Web State Manager. An exception trace entry is made in the trace table.

User Response: Ensure that the supplied state token *stoken* is correct. On a busy CICS region, the most likely cause of this error is that the state data has been discarded by the Web garbage collection process before the Web state manager could access it. Check that the system initialization *WEBDELAY* parameters are appropriate values. See the *CICS System Definition Guide* for

guidance on setting the values of the Web garbage collection interval and the Web terminal timeout interval.

Destination: CWBO

Module: DFHWBST

XMEOUT Parameters: *date, time, applid, stoken, {1=destroy, 2=retrieve, 3=store}, {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB1021 *date time applid* **CICS Web State Manager could not find state data for state token** *stoken* **in order to perform the** *{initialize partnership | make partnership | break partnership | trigger partner | wait for partner | query partner | terminate partnership}* **request for task number** *taskid***, CICS unit of work id** *X'cuowid'***.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: The CICS Web State Manager could not find the state data for the state token *stoken* because the supplied state token *stoken* does not exist. The running task is task number *taskid* and the associated CICS unit of work id is *cuowid*.

System Action: The Web State Manager cannot therefore perform the requested partnership function for the running task. An exception trace entry is made in the trace table.

User Response: Ensure that the supplied state token *stoken* is correct. On a busy CICS region, the most likely cause of this error is that the state data has been discarded by the Web garbage collection process before the Web State Manager could access it for the running task. Check that the system initialization *WEBDELAY* parameters are appropriate values. See the *CICS System Definition Guide* for guidance on setting the values of the Web garbage collection interval and the Web terminal timeout interval.

Destination: CWBO

Module: DFHWBST

XMEOUT Parameters: *date, time, applid, stoken, {1=initialize partnership, 2=make partnership, 3=break partnership, 4=trigger partner, 5=wait for partner, 6=query partner, 7=terminate partnership}, taskid, X'cuowid', {1= , 2= TCPIPSERVICE: }, tcpipservice*

DFHWB1100 E *date time applid* **The CICS Web Interface received data from the user application that is longer than expected.**

Explanation: The environment variables program has received data from a user application. However, the data received was longer than expected.

System Action: Exception trace point 4623 is written. The environment variables program abnormally terminates with abend code AWB7.

User Response: Examine the data sent to CICS from the application program.

Destination: Console Routecodes 2 and 12 and Transient Data Queue CWBO

Module: DFHWBENV

XMEOUT Parameters: *date, time, applid*

DFHWB1200 *date time applid tranid* **The CICS Web Interface analyzer program set parameter WBRA_USER_DATA_LENGTH to more than the maximum. Program name:** *progname***. RESPONSE:** *response***. REASON:** *reason***. Host IP address:** *hostaddr***. Client IP address:** *clientaddr***. Data offset:** *X'dataoffset'***. Data length:** *X'datalength'***. Buffer length:** *X'bufferlength'***.***{ | TCPIPSERVICE: }tcpipservice*

Explanation: As part of its normal processing of a request, Web attach processing invokes the user replaceable analyzer to tailor the required actions. This program is passed the length of the user data part of the HTTP request in parameter WBRA_USER_DATA_LENGTH, which it can modify. However, the modified value is greater than the maximum allowable value which represents the available space in the data buffer.

System Action: An error response is sent to the client and processing of the request is terminated.

User Response: Modify the analyzer program so that it does not set the parameter WBRA_USER_DATA_LENGTH to be greater than the maximum. The sum of the data offset and the data length should not exceed the buffer length.

Destination: CWBO

Module: DFHWBXN

XMEOUT Parameters: *date, time, applid, tranid, progname, response, reason, hostaddr, clientaddr, X'dataoffset', X'datalength', X'bufferlength', {1= , 2=TCPIPSERVICE: }, tcpipservice*

DFHWB1525 *date time applid tranid* **The CICS Web Interface connection manager received an unexpected response from CICS.**

Explanation: The connection manager received an unexpected response to a CICS command. This is a logic error.

System Action: A system dump is taken. Processing continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You may need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116.

Destination: CWBO and Terminal End User

Module: DFHWBC01

XMEOUT Parameters: *date, time, applid, tranid*

DFHWB1551 *date time applid* **The CWBC Transaction is no longer used to manage CICS Web resources.**

Explanation: An attempt has been made to run the CICS-supplied transaction CWBC. This transaction is no longer used to manage CICS Web resources.

System Action: None. Processing continues.

User Response: Refer to the CICS Internet and External Interfaces Guide, and the Resource Definition Guide for details of how to manage CICS Web resources. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CWBO and Terminal End User

Module: DFHWBC01

XMEOUT Parameters: *date, time, applid*

DFHWB7001 HTTPD_extract for *envvar* failed. Processing of this request terminated rc=*retcode*.

Explanation: The CICS GWAPI program received an error response *retcode* when it executed the `HTTPD_extract` function to retrieve the specified environment variable *envvar*.

System Action: The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User Response: Investigate whether the &ICSS. has been correctly configured to use the CICS GWAPI DLL. Refer to the *CICS External Interfaces Guide* for further information.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHWBAPI

DFHWB7002 HTTPD_read for HTTP user data failed. Processing of this request terminated rc=*retcode*.

Explanation: The CICS GWAPI program received an error response *retcode* when it executed the `HTTPD_read` function to retrieve the user data sent with an HTTP request.

System Action: The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User Response: Investigate whether the &ICSS. has been correctly configured to use the CICS GWAPI DLL. Refer to the *CICS External Interfaces Guide* for further information.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHWBAPI

DFHWB7003 Invalid URL passed to DFHWBAPI: *url*. Processing of this request terminated rc=*retcode*.

Explanation: The CICS GWAPI program has attempted to analyze the path name section of the Uniform Resource Locator *url* that it received from the Web browser, but has determined that its syntax is not in the standard format expected to decide which CICS region, transaction, and program should process the request.

The reason for the failure is given by one of the following values for the return code *retcode*.

1 The path name contains fewer than eight characters.
2 The path name does not begin with a leading slash ('/') character.
3 The CICS applid is invalid.
4 The converter name is invalid.
5 The transaction name is invalid.
6 The server program name is invalid.

System Action: The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User Response: Investigate whether the &ICSS. has been correctly configured to use the CICS GWAPI DLL. Refer to the *CICS External Interfaces Guide* for further information.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHWBAPI

DFHWB7006 Link to program *program_name* at applid *applid* failed for URL *url*. Processing of this request terminated RESP=*resp* RESP2=*resp2*.

Explanation: The CICS GWAPI program has attempted to use the CICS External Call Interface (EXCI) to link to the Business Logic Interface program *program_name* in the CICS region with applid *applid*, but the link was unsuccessful. The EIBRESP and EIBRESP2 values from the EXEC CICS LINK command are *resp* and *resp2*.

System Action: The CICS GWAPI program terminates and returns an HTTP error response to the Web browser. If *resp* and *resp2* indicate that there is a temporary problem establishing an Inter-Region Communication connection, the HTTP error response is 503 (system not available), otherwise it is 500 (server error).

User Response: Investigate whether the target CICS region has been correctly configured to receive EXCI requests from this &ICSS. address space.

The following must be set up:

- The target CICS region must be active.
- There must be a generic EXCI pipe, or a specific EXCI pipe for *applid*, installed in the target CICS region.
- Inter-Region Communication must be active in the target CICS region.

Refer to the *CICS External Interfaces Guide* for further information.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHWBAPI

DFHWB7007 Error detected by program *program_name*. Processing of this request terminated rc=*retcode*.

Explanation: The CICS GWAPI program has attempted to use the CICS External Call Interface (EXCI) to link to the Business Logic Interface program *program_name* in a CICS region, but an error response was returned by the program. The return code *retcode* is the Business Logic Interface response that was returned in `wbbl_response`.

System Action: The CICS GWAPI program terminates and returns *retcode* as the HTTP server response to the Web browser.

User Response: Investigate the reason for the error response. The values that can be returned in `wbbl_response` are documented in the *CICS External Interfaces Guide*, and are generally caused by a programming error in either the converter program or the server application program.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHWBAPI

DFHWB7008 HTTPD_set for *variable* failed for URL *url*. Processing of this request terminated rc=*retcode*.

Explanation: The CICS GWAPI program received an error response *retcode* when it executed the `HTTPD_set` function to set a value for the specified variable *variable* while processing URL *url*.

System Action: The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User Response: Investigate whether the &ICSS. has been correctly configured to use the CICS GWAPI DLL. Refer to the *CICS External Interfaces Guide* for further information.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHWBAPI

DFHWB7009 HTTP_write failed for URL *url***. Processing of this request terminated rc=***retcode***.**

Explanation: The CICS GWAPI program received an error response *retcode* when it executed the `HTTPD_write` function to write the user data to be sent with an HTTP response for URL *url*.

System Action: The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User Response: Investigate whether the &ICSS. has been correctly configured to use the CICS GWAPI DLL. Refer to the *CICS External Interfaces Guide* for further information.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHWBAPI

DFHXAxxxx messages

DFHXA6521I *applid* **CICS shutdown initiated by CEBT event**

Explanation: This is an informational message issued from the CICS TCB.

System Action: CICS terminates normally.

User Response: None.

Destination: Console

Module: DFHXRCP

XMEOUT Parameter: *applid*

DFHXA6526I *applid* **MESSAGE RECEIVED FOR UNSUPPORTED QUEUE** *X'queue'***.**

Explanation: This message is issued from the CAVM TCB. A tracking message has been received for a queue with hexadecimal name X'*queue*'. However this queue is not recognized by CICS.

System Action: CICS processing continues, but tracking messages for queue X'*queue*' are ignored.

User Response: Check that the active CICS system and the alternate CICS system are at the same functional level with respect to XRF.

If both CICS systems are at the same level, check why the active CICS system has written data to the alternate system.

Ensure that the queue name has not been corrupted.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHXRB

DFHXA6528I *applid* **Unable to link to program** *progname*

Explanation: This message is issued from the CICS TCB. CICS is unable to link to program *progname*.

System Action: CICS terminates abnormally with a system dump and abend code 0210.

User Response: Examine the dump to determine why CICS was unable to link to program *progname*.

Ensure that the named program is not missing from the data sets concatenated in the DFHRPL DD statement. If *progname* is missing, obtain a copy of the program and include it in the library. In addition, ensure that enough storage is available for the dynamic storage areas.

Destination: Console

Module: DFHXRE

XMEOUT Parameters: *applid, progname*

DFHXA6530 *applid* **START=STANDBY specified. CICS start-up is terminated because XRF=NO is specified**

Explanation: START=STANDBY and XRF=NO cannot be specified together.

System Action: CICS terminates abnormally with a dump.

User Response: Correct the conflicting values of the operands START and XRF.

Destination: Console

Module: DFHSIC1

XMEOUT Parameter: *applid*

DFHXA6540I XRF HAS FAILED. ERROR NUMBER *nn* **ON XRF MESSAGE DATA SET IN CONTROL INTERVAL WITH RBA HEX'***xx***'.**

Explanation: The XRF message manager has encountered a problem with the contents of the given control interval in the message data set. The message includes an error number *nn* which can take one of the following values:

01 The CI does not contain an XRF message manager control record.

02 The XRF message control record contains a cycle number less than that of the current read cycle.

03 The XRF message manager did not find a message record boundary where it expected one.

04 There is an XRF message sequence number error.

05 The CIDF is invalid (for example, the free area length is negative).

06 The length in the RDF is less than the length of a message record header, or is inconsistent with the data length in the message record header.

07 The end of the record lies outside the data area defined by the data length field of the CIDF.

System Action: Surveillance by the alternate system ceases.

User Response: Check that the active and alternate systems are using the same pair of data sets for XRF surveillance. If they are, this is almost certainly a CICS error affecting either the alternate system, the active system, or both.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWMRD

DFHXA6541I XRF HAS FAILED. THE XRF MESSAGE READER IN THE ALTERNATE SYSTEM HAS FALLEN TOO FAR BEHIND.

Explanation: The alternate system has been unable to keep up with the messages generated by the active CICS system. Its read position in the wrap-round message data set has been 'lapped' by the active system.

System Action: Surveillance by the alternate system ceases.

User Response: Try to determine and correct the reason for the delay to the alternate system. It may be that the message data set is too small to allow adequate buffering, or the message data set has been reserved by the active CEC – not necessarily by the active CICS.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWMRD

DFHXA6560I *applid* **TERMINATION COMMAND FAILED:** *command***.**

Explanation: The command issued by the alternate CICS during takeover to terminate the active CICS failed. MVS rejected the system operator command *command* issued under program control as being invalid.

System Action: Message DFHXA6581 or DFHXA6582 is also displayed. The alternate CICS continues with its processing to detect termination of the active CICS job.

User Response: Ensure that the active CICS job terminates. See messages DFHXA6581 and DFHXA6582. For problem determination, hard copy of the console log may be required.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6561D *applid* **WHEN** *jesno jobname* **ENDS REPLY 'JOB' OR WHEN CEC** *sid* **HAS FAILED REPLY 'CEC'.**

Explanation: During a takeover attempt, the issuing CICS system was unable to determine whether job *jobname*, running on a different CEC, has terminated. This is for one of the following reasons:

- CICS was unable to issue a system operator command under program control to cancel the named job. In this case, message DFHXA6560, DFHXA6569 or DFHXA6570 has been produced.
- CICS has either successfully issued a cancel command, or job *jobname* is a failing DBCTL subsystem, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

If *jobname* is the active CICS. Takeover cannot continue until *jobname* has ended. If *jobname* is a DBCTL subsystem, an alternate DBCTL cannot be started until *jobname* has ended.

System Action: The system waits for a reply. In the meanwhile, the issuing CICS system continues processing to detect termination of the job.

If termination is detected while the reply is still outstanding, this message is deleted and message DFHXA6564 is displayed. In this case, a reply is no longer required.

If the reply is 'JOB', then processing continues as if CICS had detected the termination itself.

This also happens if the reply is 'CEC', but in addition an internal record is created indicating that the CEC is inoperative at this time. Other alternate CICS which have issued this message for jobs executing on the CEC specified, and which are still waiting for a reply, will detect the internal record of the failed CEC. Having done so they delete their outstanding replies and issue message DFHXA6563.

User Response: The operator should either:-

- Ensure that job *jobname* with JES number *jesno* terminates, and then reply 'JOB', or
- Ensure that the CEC with MVS system identifier *sid* is inoperative at this time, for example by selecting SYSTEM RESET on that CEC, and then reply 'CEC'.

No action is necessary if at any time CICS deletes this message, as described above.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6563I *applid jesno jobname* **ENDED DUE TO FAILURE OF CEC** *sid***.**

Explanation: During takeover, the alternate CICS has detected that the CEC with MVS system identifier *sid* has failed and therefore that the active CICS job with job name *jobname* and JES job number *jesno* is regarded to have ended.

System Action: The alternate CICS continues with its takeover processing.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6564I *applid* **TERMINATION OF** *jesno jobname* **DETECTED.**

Explanation: During takeover, the alternate CICS has detected that the active CICS job with specified job name and JES job number has ended.

System Action: The alternate CICS continues with its takeover processing.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6566I *applid modname* **NOT LINK-EDITED REENTERABLE.**

Explanation: Module *modname*, the CLT or RST currently in use, was found not to have been link-edited with the reenterable module attribute.

The initialization option CLT=*xx* or RST=*xx* specifies the suffix of the CLT or RST currently in use by this alternate CICS.

System Action: Further messages are issued which describe the action taken by CICS.

User Response: The appropriate response is indicated by subsequent messages.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6567I *applid* **APPLID** *applid2* **NOT FOUND IN** *modname***.**

Explanation: Module *modname*, the CLT or RST currently in use by this alternate CICS, was found not to contain the APPLID *applid2*.

System Action: Further messages are issued which describe the action taken by CICS.

User Response: The appropriate response is indicated by subsequent messages.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6568I *applid* **JOBNAME** *jobname* **NOT FOUND IN** *modname***.**

Explanation: Module *modname* is either a CLT or an RST.

If the module is a CLT, it was found not to contain the job name *jobname* associated with the APPLID of this alternate CICS.

If the module is an RST, it was found not to contain the job name *jobname* associated with the DBCTL subsystem identified in the message.

jobname is the job name which the alternate CICS would have used to cancel the active CICS job or DBCTL job during a takeover

System Action: Further messages are issued which describe the action taken by CICS.

User Response: The appropriate response is indicated by subsequent messages.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6569I *applid* **MVS SYSTEM IDENTIFIER** *sid* **NOT FOUND IN DFHCLT***xx***.**

Explanation: The CLT currently in use was found not to contain the specified MVS system identifier *sid*, which identifies the CEC on which the active CICS was executing.

The initialization option CLT=*xx* specifies the suffix of the CLT currently in use by this alternate CICS.

System Action: Further messages are issued by the alternate CICS to describe the action taken.

User Response: The appropriate response is indicated by subsequent messages.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6570I *applid* **JES SUBSYSTEM NAME** *jesname* **NOT FOUND IN DFHCLT***xx* **FOR MVS SYSTEM** *sid***.**

Explanation: The CLT currently in use does not contain the JES subsystem name *jesname* associated with the MVS system *sid* of the CEC on which the active CICS was executing.

The initialization option CLT=*xx* specifies the suffix of the CLT currently in use by this alternate CICS.

System Action: Further messages are issued by the alternate CICS to describe the action taken.

User Response: The appropriate response is indicated by subsequent messages.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6571I *applid* **CICS IS NOT DEFINED AS AN MVS SUBSYSTEM.**

Explanation: The alternate CICS attempted to access an internal record of CEC failures to determine whether the CEC on which the active CICS job was executing had failed. To access this information CICS has to be defined as an MVS subsystem. Because it is not, the attempt failed.

System Action: Processing continues.

User Response: None. For further information about defining CICS as an MVS subsystem, see the *CICS Transaction Server for OS/390 Installation Guide*.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6572I *applid* **UNABLE TO LOAD** *modname***.**

Explanation: The module *modname*, defined by the CLT or RST for use by the alternate CICS that issued this message, cannot be loaded.

System Action: Further messages are issued by the alternate CICS to describe the action taken.

User Response: The appropriate response is indicated by subsequent messages.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6573I *applid* **LOAD MODULE** *modname* **IS NOT VALID.**

Explanation: Module *modname*, the CLT or RST defined for use by this CICS system, is not valid.

System Action: Further messages are issued by the alternate CICS to describe the action taken.

User Response: The appropriate response is indicated by subsequent messages.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6574I *applid* **ERROR FOUND WITH DFHCLT***xx***.**

Explanation: The alternate CICS that issued this message is unable to load a CLT, or has performed a check on the CLT contents and has found an error. If the specified CLT is used during a future takeover, the takeover might not be successful. A new or corrected CLT can be made available and loaded at takeover.

System Action: Processing continues.

User Response: Verify that the alternate CICS job is authorized to perform a takeover of the active CICS. Take appropriate action if not.

Locate the previous message issued by this alternate CICS, which provides details of the CLT error.

Perform the appropriate source edit, assembly and link-edit tasks necessary to make a correct CLT available for this alternate CICS.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6575I *applid* **SUBSYSTEM NAME** *subsysid* **NOT FOUND IN** *rstname* **FOR THIS APPLID.**

Explanation: This is an informational message indicating that RST *rstname*, which was selected via the SIT, does not include an entry for DBCTL subsystem *subsysid* in any RSE containing the specific APPLID *applid* of this CICS.

System Action: No action results directly when this message is issued. Other messages may be issued following this verification failure.

User Response: Check the RST suffix specified in the SIT, the RST, and the DBCTL subsystem to which CICS is connected.

Check any other messages that may also have been issued.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6576I *applid* **CLT PROCESSING NOT POSSIBLE OWING TO ERROR IN DFHCLT***xx***.**

Explanation: During takeover, the alternate CICS that issued this message performed a check on the CLT contents and found an error.

A previous message specifies the error.

System Action: Commands in the CLT are not issued by this alternate CICS. Other takeover processing continues.

User Response: Verify that the alternate CICS job is authorized to perform a takeover of the active CICS and take appropriate action if it is not.

If the takeover is to be successful, the system operator should monitor and coordinate execution of the active CICS and alternate CICS jobs in the XRF complex.

Perform the source edit, assembly and link-edit tasks necessary to correct the CLT.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6577I *applid* **NOT AUTHORIZED TO CANCEL** *jesno jobname* **ON CEC** *sid***.**

Explanation: The issuing alternate CICS is attempting a takeover of the specified active CICS job. It has been unable to find the data that is needed to fully authorize takeover in the CLT or RST. This may be because the alternate cannot load the table, or because job *jobname* cannot be found:

- In the CLT, for an active CICS, or
- In the RST, for a DBCTL subsystem, or
- Because the CLT or RST is invalid.

Further messages specify the error with the CLT or RST, or define why the CLT or RST is invalid.

System Action: The issuing CICS system cannot issue a CANCEL, but attempts to alert the active CICS system to the takeover request via the XRF control data set. In most cases this causes the active system to initiate termination. The alternate continues processing to detect termination of the job.

When termination is detected, message DFHXA6563 or DFHXA6564 is displayed.

User Response: Verify that the alternate CICS job is authorized to perform a takeover of the active CICS. Take appropriate action if the alternate CICS job is not authorized.

Your CLT and/or RST may require some maintenance action.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6578I *applid* **NOT AUTHORIZED TO CANCEL** *jesno jobname***.**

Explanation: The issuing alternate CICS is attempting a cancel of the specified active CICS job. It has been unable to find the data that is needed to fully authorize the cancellation in the CLT or RST. This may be because the alternate cannot load the table, or because job *jobname* cannot be found:

- In the CLT, for an active CICS, or
- In the RST, for a DBCTL subsystem. or

- Because the CLT or RST is invalid.

Further messages specify the error with the CLT or RST, or define why the CLT or RST is invalid.

System Action: The issuing CICS system cannot issue a CANCEL, but attempts to alert the active CICS system to the takeover request via the XRF control data set. In most cases this causes the active system to initiate termination. The alternate continues processing to detect termination of the job.

When termination is detected, message DFHXA6564 is displayed.

User Response: Verify that the alternate CICS job is authorized to perform a takeover of the active CICS. Take appropriate action if the alternate CICS job is not authorized.

Your CLT and/or RST may require maintenance action.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6580I PROGRAM LOGIC ERROR DETECTED.

Explanation: An internal error has been detected that prevents the CICS XRF CAVM supervisor state processing from continuing.

Depending on the CAVM supervisor state service being processed at the time, CICS may or may not abnormally terminate.

The CAVM TCB for processing the service has abnormally terminated.

Job output should include a dump of MVS LSQA associated with the SYSABEND DD statement.

Diagnostics: Register 2 is the base register for DFHWTI global storage. This storage begins with the eye catcher WTISTOR. The format of this storage is defined in DSECT WSTORAGE in source member DFHWTI.

DFHWTI request arguments copied to global storage begin at field WGLODATA.

Source member DFHWTADS defines the format of global storage arguments.

Field WGLOLOCA contains the address of the first register save area for a routine in DFHWTI.

In the SVRB for the CICS SVC call that invoked DFHWTI, the first *fullword* in the FEPARM field contains the address of DFHWTI global storage.

Register 4 is the base register for local storage for each routine in DFHWTI. Its format is defined in a DSECT whose name is of the form WLOC*xxx* where *xxx* is the short name of the routine (see below for a list of routine names).

These DSECTs are in source member DFHWTI. The first *halfword* is the internal return code for the routine. The values used for internal return codes are the same as the DFHWTI request reason codes as defined in source member DFHWTADS field name WTARRC.

In addition, internal return codes of the format X'40nn' are used. X'40F0' is 'Internal Logic Error' variable name, RCLOGERR.

Other internal return codes of this format are defined in the local storage DSECTs.

The DFHWTI request type for the CAVM supervisor state service is copied into local storage associated with the DFHWTI initialization and termination routine, field name WWTIREQ, DSECT WLOCWTI in source member DFHWTI.

Register 6 is the base register for each routine in DFHWTI. When set, it points at a location immediately following an eye catcher of the routine's long name (see list of routine names).

Register 13 is the base register for a register save area local to a routine in DFHWTI. These save areas are standard MVS format except the first *fullword* contains the routine's short name (see list of names). They are chained in the standard way with backward and forward pointers set on entry to a routine and zeroed on return.

Register save areas physically precede the storage local to a routine.

If a routine has to access the CLT, its address is in local storage for the routine. The field name for the CLT address is of the form W*xxx*CLTA, where *xxx* is the short name of the routine.

System Action: In general, the CAVM request issued by this CICS job will fail. For the effect this has on processing by this CICS job, refer to messages issued after this one.

CAVM XRF supervisor state processing issues an MVS abend with system abend code 0214 and an MVS SYSABEND dump is produced.

User Response: Keep the job output and console log for problem determination.

Using the SYSABEND dump of the MVS LSQA, and if available, the MVS symptom dump output, find the DFHWTI routine that detected the error from the value of register 6 or register save area chain fields.

Find the internal return code currently set in local storage for the routine.

Using the reason code value, remaining content of local storage and global storage, try to determine the cause of the action by the routine.

An assembly listing of the CLT assembled with the PRINT NOGEN option may be required.

Routine names
Long names are used for:

- The routine entry point name, and
- The routine entry eye catcher.

Short names are used for:

- The routine register save area eye catcher,
- Characters 2 to 4 of routine local storage field names,
- Characters 5 to 7 of routine local storage DSECT names, and
- Characters 1 to 3 of routine labels.

Routines are as follows:

Long Name	Short Name
(1)	WTI
TIPENTRY	TIP
OATERM	OAT
OAWAIT	OAW
VERCLT	VCL
CLPENTRY	CLE
CLPROC	CLP
OPCLT	OCL
CHECKT	CHT
OPCDATA	OPC
INQJES	IJE
TSSENTRY	TSS

MUVENTRY	MUV
VAXENTRY	VAX
SCMENTRY	SCM
DXRENTRY	DXR
IJESSUB(2)	*

1. Module entry point with standard DFHVM fields.
2. Subtask with start of module as entry point and using SIJSTOR for local storage.

For further guidance in error diagnosis, see the *CICS Problem Determination Guide*.

Note: This message cannot be changed with the message editing utility.

Module: DFHWTI

DFHXA6581I *applid* **UNABLE TO DETERMINE STATUS OF JOB** *jesno jobname***.**

Explanation: The issuing CICS system was unable to determine whether job *jobname*, running on the same CEC, has terminated. This is for one of the following reasons:

1. CICS was unable to issue a system operator command under program control to cancel the named job. In this case, message DFHXA6560 has been produced.
2. CICS has successfully issued a cancel command, but the job still appears to be running after the time period specified by the initialization parameter JESDI.
3. Job *jobname* is a failing DBCTL subsystem, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

If *jobname* is the active CICS, takeover cannot continue until *jobname* has ended.

If *jobname* is a DBCTL subsystem, an alternate DBCTL cannot be started until *jobname* has ended.

System Action: Takeover is suspended until the issuing CICS system detects the termination of the named job.

When termination is detected the message DFHXA6564 is displayed.

User Response: Ensure that the active CICS job terminates.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6582I *applid* **UNABLE TO DETERMINE STATUS OF JOB** *jesno jobname* **ON MVS SYSTEM** *mvsname***(***sid***).**

Explanation: The issuing CICS system was unable to determine whether job *jobname*, running on MVS image *mvsname*, has terminated. This is for one of the following reasons:

- CICS was unable to issue a system operator command under program control to cancel the named job. In this case, message DFHXA6560, DFHXA6569, or DFHXA6570 has been produced.
- CICS has successfully issued a cancel command, but the job still appears to be running after the time period specified by the initialization parameter JESDI.
- Job *jobname* is a failing DBCTL subsystem, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

If *jobname* is the active CICS, takeover cannot continue until *jobname* has ended.

If *jobname* is a DBCTL subsystem, an alternate DBCTL cannot be started until *jobname* has ended.

System Action: Takeover is suspended until the issuing CICS system detects the termination of the named job.

When termination is detected the message DFHXA6583 is displayed.

User Response: Ensure that the active CICS job terminates.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWTI

DFHXA6583I *applid* **TERMINATION OF JOB** *jesno jobname* **ON MVS SYSTEM** *mvsname***(***sid***) HAS BEEN DETECTED.**

Explanation: During takeover, the alternate CICS has detected that the active CICS job *jobname* with JES job number *jesno* running on MVS image *mvsname* has ended.

System Action: The CICS alternate continues takeover processing.

User Response: None.

Note: This message cannot be changed with the message editing utility.

DFHXCxxxx messages

DFHXC6600I *applid* **CAVM DATA SET INITIALIZATION FAILED.**

Explanation: The CICS job which displayed this message attempted to sign on to the CAVM but the signon request failed because the CAVM data sets could not be initialized properly. This is due to one of the following:

- The data set formatting subtask had not completed its processing in 2 minutes. This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs cause a CAVM data set's DASD volume or a VSAM catalogue to remain inaccessible for a protracted period.
- SIGNON found that one of the CAVM data sets had already been formatted by a different CICS job but that the other was either empty or could not be opened because of conflict with another user of the data set. SIGNON waited for the other CICS job to finish the data set formatting, but 5 minutes later, this still had not been done. This might occur if a CICS job failed during data set formatting. A specific error reported in a previous message prevented successful completion of data set initialization.

System Action: See following message issued by this CICS job.

User Response: Correct the JCL or redefine the CAVM data sets if necessary and resubmit the CICS job. See the *CICS System Definition Guide* for information on CAVM data sets.

Note: This message cannot be changed with the message editing utility.

DFHXC6606I *applid* **CI SIZE OF CAVM DATA SET** *dsname* **MUST BE AT LEAST 4K.**

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to open the CAVM data sets, but the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN3

DFHXC6607I *applid* **SIGNON IS WAITING TO RESERVE OR ACCESS CAVM DATA SET** *dsname*

Explanation: The CICS job which displayed this message issued a sign on to the CAVM. CAVM is attempting to reserve or access the CAVM data set indicated in the message text, but for some considerable time, either the required resource has remained unavailable or an outstanding I/O request has not completed. The reason for issuing this particular message cannot be failure of a conditional reserve request unless new empty CAVM data sets are being used for the first time. The reserve attempt should not fail anyway unless another CICS job using the same CAVM data set and executing a sign on, sign-off or takeover request has been held up, possibly by I/O delays, after issuing a successful reserve. I/O delay might be caused by reserves issued by jobs (not necessarily CICS) running in other CECs that have made the CAVM data set's DASD volume temporarily inaccessible.

System Action: After a short delay, the CICS job that displayed this message either reissues the conditional reserve macro or checks for completion of the outstanding I/O. If the required resource is now available or the I/O request has completed, normal processing continues. Otherwise, this message is reissued.

User Response: None, unless the condition persists. If so, another CEC might have failed after reserving the DASD volume containing a CAVM data set. In this case, follow your installation's operations procedure for removing an outstanding reserve for a shared DASD. (For example, issue system reset on the failed CEC.)

Note: This message cannot be changed with the message editing utility.

Module: DFHWSSN3

DFHXC6608I *applid* **I/O ERROR ACCESSING CAVM DATA SET** *dsname* **DURING SIGNON.**

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to access the CAVM data sets, but the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN3

DFHXC6609I *applid* **CAVM DATA SET** *dsname* **IS OF THE WRONG TYPE OR ITS FORMAT IS INCOMPATIBLE WITH THIS CODE LEVEL.**

Explanation: The CICS job that displayed this message issued a SIGNON to the CAVM. However, the CAVM found that the information in the data set's control record either did not agree with its intended use or had been placed there by an incompatible level of CAVM code. This will occur if:

- The data set with ddname DFHXRCTL is not empty and has already been used for something other than a CAVM control data set or by an incompatible level of CAVM code.
- The data set with ddname DFHXRMSG is not empty and has already been used for something other than a CAVM message data set or by an incompatible level of CAVM code.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN3

DFHXC6610I *applid* **CAVM DATA SET** *dsname* **DOES NOT BELONG TO THE GENERIC APPLID SPECIFIED AT SIGNON.**

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. However, the CAVM found that the generic APPLID specified in the sign on request did not match that saved in the CAVM data set's control record when the data set was first formatted.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN3

DFHXC6611I *applid* **CAVM DATA SETS DO NOT FORM A VALID PAIR.**

Explanation: The CICS job that displayed this message issued a SIGNON to the CAVM. However, the CAVM found that the time stamps that were placed in the control records of the two data sets when they were first formatted do not match. This will occur unless the two CAVM data sets were used for the first time as a pair by a single CICS job.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN3

DFHXC6612I *applid* **MULTIPLE VOLUMES ARE NOT SUPPORTED FOR CAVM DATA SET** *dsname*

Explanation: The CICS job that displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to OPEN the CAVM data sets but the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN3

DFHXC6613I *applid* **MULTIPLE UNITS ARE NOT SUPPORTED FOR CAVM DATA SET** *dsname*

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to open the CAVM data sets but the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN3

DFHXC6614I *applid* **CONCATENATION IS NOT SUPPORTED FOR CAVM DATA SET** *dsname*

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to open the CAVM data sets, but the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN3

DFHXC6615I *applid* **ALLOCATION CHANGE DURING SIGNON IS NOT SUPPORTED FOR CAVM DATA SET** *dsname*

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to OPEN the CAVM data sets, but the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN3

DFHXC6616I *applid* **CAVM CONTROL AND MESSAGE DATA SETS MUST BE DISTINCT.**

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to format the CAVM data sets, but the ddnames DFHXRMSG and DFHXRCTL refer to the same data set.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN3

DFHXC6617I *applid* **OBTAIN ERROR WHILE FORMATTING CAVM DATA SET** *dsname*

Explanation: The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to gain exclusive access to a CAVM data set to format it. The CAVM issued a reserve macro specifying the DASD device allocated for the data set and then issued an OBTAIN macro for the volume's Format-4 DSCB to cause a hardware reserve command to be executed if necessary. Possible causes of the OBTAIN failure are:

- Specified volume not mounted
- I/O error
- VTOC is invalid.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN3

DFHXC6618I *applid* **SPACE ALLOCATED TO CAVM DATA SET** *dsname* **IS INADEQUATE.**

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM. The CAVM is attempting to format the CAVM data sets, but the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN3

DFHXC6620I *applid* **SIGNON IS WAITING TO RESERVE OR ACCESS A CAVM DATA SET.**

Explanation: The CICS job that displayed this message issued a sign on to the CAVM. CAVM is attempting to reserve the CAVM control data set or access either the control or the message data set, but for some considerable time either the required resource has remained unavailable or an outstanding I/O request has not completed. The reserve attempt should not fail unless another CICS job using the same CAVM data set and executing a sign on, sign-off or takeover request has been held up, possibly by I/O delays, after issuing a successful reserve. I/O delay might be caused by reserves issued by jobs (not necessarily CICS) running in other CECs that have made the CAVM data set's DASD volume temporarily inaccessible.

System Action: See message DFHXC6607.

User Response: See message DFHXC6607.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN2

DFHXC6621I *applid* **CAVM SIGNON CANNOT PROCEED BECAUSE JES IS EITHER NOT RUNNING OR NOT RESPONDING TO JOB STATUS ENQUIRIES.**

Explanation: The CICS job that displayed this message issued a sign on to the CAVM. To process the request, CAVM needs to know the status of a job identified by an entry in the control data set, but cannot obtain this information for the reason given in the message text.

System Action: After a one minute delay, the CICS job that displayed this message reissues the failing job status enquiry. If the request is completed successfully this time, normal processing continues. Otherwise, this message is reissued.

User Response: If JES is not running, restart it if possible. Otherwise, if the condition persists, try to correct the problem that is preventing job status enquiries from being answered. In some cases, just stopping JES and restarting it again may achieve the desired effect. In a JES2 environment, a possible cause of this trouble is that another CEC has failed after reserving the DASD volume containing the check-point data set. See message DFHXC6607. In a JES3 environment, job status enquiries cannot be answered if the global processor has failed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN2

DFHXC6622I *applid* **ERROR IN INQUIRE HEALTH EXIT DURING SIGNON.**

Explanation: The CICS job that displayed this message issued a SIGNON to the CAVM, but the return code passed back to CAVM by the INQUIRE HEALTH exit (DFHXRC) when it was called during sign on processing was nonzero. This message always indicates an internal error in CAVM or CICS.

System Action: CAVM SIGNON continues but XRF function is probably degraded.

User Response: Inform your installation's system programmer.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN2

DFHXC6623I *applid* **CAVM SIGNON IMPOSSIBLE AT PRESENT BECAUSE ANOTHER JOB HAS SIGNED ON WITH THE SAME SPECIFIC APPLID.**

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: None unless the wrong specific applid has been requested for the new job or the conflicting job was started by mistake. If so, resubmit the failing CICS job with appropriate corrections or after canceling the conflicting job.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN2

DFHXC6624I *applid* **CAVM SIGNON IMPOSSIBLE BECAUSE SMF IS NOT ACTIVE FOR THE REQUESTING JOB.**

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: Re-IPL the MVS system, ensuring that the system parameters chosen include SMF.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN2

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: See message DFHXC6600

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN2

DFHXC6626D *applid* **POSSIBLE CAVM SIGNON CONFLICT. IS JOB** *jobname*,*jesno* **RUNNING ON SYSTEM** *sid*? **REPLY 'YES' OR 'NO'.**

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM but the CAVM needs the operator's help in order to decide whether it is safe to accept the request. The CAVM has found that the control data set refers to a job satisfying all the following conditions:

- JES believes that this job is still executing.
- If JES is right, the current sign on request must be rejected because the presence of this job would conflict with it.
- This job is not running in the same CEC as the CICS job which is attempting to sign on.
- This job's surveillance signals appear to be absent.

Such a situation might have arisen as a result of a failure of the CEC in which the conflicting job was running and if so, the CAVM should not reject the sign on request unless it finds another reason for doing so. If the job which displayed this message is a CICS active, the conflicting job is another active or an alternate which has started a takeover. If the job which displayed this message is a CICS alternate, the conflicting job is another alternate. The jobname, JES job identifier and CEC SMF identifier of the conflicting job are specified in the message text.

System Action: The CICS job waits for a reply.

User Response: If the job which displayed this message is a CICS active job, reply NO only if:

1. You are certain that the job referred to in the message text is not executing. It might be necessary to perform a System Reset of the CEC where it was running to guarantee this.

   AND

2. The job which issued this message ought to continue with its CAVM sign on request and become the CICS active job.

Otherwise reply YES.

If the job which displayed this message is a CICS alternate job, reply NO only if:

1. You are certain that the job referred to in the message text is not executing. It might be necessary to perform a System Reset of the CEC where it was running to guarantee this.

   AND

2. The job which issued this message ought to continue with its CAVM sign on request and become the CICS alternate job.

Otherwise reply YES.

Note: This message cannot be changed with the message editing utility.

Module: DFHWSSN2

DFHXC6627I *applid* **CAVM SIGNON IMPOSSIBLE BECAUSE THIS JOB IS CURRENTLY SIGNED ON OR WAS ONCE AN ACTIVE SYSTEM.**

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: This message indicates an internal error has occurred.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN2

DFHXC6628I *applid* **CAVM SIGNON IMPOSSIBLE AT PRESENT BECAUSE CONFLICTING JOB(S) HAVE NOT YET SIGNED OFF OR TERMINATED.**

Explanation: The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: None unless the wrong START option has been requested for the new job or the conflicting job(s) were started by mistake. If so, resubmit the failing CICS job with appropriate corrections or after canceling the conflicting job(s).

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN2

DFHXC6629I *applid* **CAVM SIGNON IMPOSSIBLE BECAUSE REQUESTING JOB AND SIGNED-ON JOB(S) DO NOT SHARE A COMMON JES JOB QUEUE.**

Explanation: The CICS job which issued this message issued a sign on to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System Action: See following message issued by this CICS job.

User Response: If any of the signed on jobs are running under the control of the wrong JES, cancel them. Resubmit the failing job and any that had to be canceled, ensuring that all are running under the control of either a single JES or multiple JESs that share a common job queue.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSN2

DFHXC6630I *applid* **TAKEOVER REJECTED BECAUSE LAST ACTIVE SIGNED OFF NORMALLY.**

Explanation: The CICS job that issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text.

System Action: See following message issued by this CICS job.

User Response: None

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSTKV

DFHXC6631I *applid* **TAKEOVER REJECTED BECAUSE LAST ACTIVE INSTANCE NUMBER DOES NOT MATCH THAT SPECIFIED.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text. This error would occur if a new CICS active job signed on to the CAVM after this CICS alternate job had already made the decision to attempt to take over from the previous CICS active job.

System Action: See following message issued by this CICS job.

User Response: None

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSTKV

DFHXC6632I *applid* **NON PRE-EMPTIVE TAKEOVER REJECTED BECAUSE LATEST ACTIVE VERSION NUMBER DOES NOT MATCH THAT SPECIFIED.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text.

System Action: See following message issued by this CICS job.

User Response: None

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSTKV

DFHXC6633I *applid* **NON PRE-EMPTIVE TAKEOVER REJECTED BECAUSE A TAKEOVER IS ALREADY IN PROGRESS.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text.

System Action: See following message issued by this CICS job.

User Response: None

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSTKV

DFHXC6634I *applid* **TAKEOVER REJECTED BECAUSE NECESSARY TOD CLOCK DIFFERENCE INFORMATION IS NOT AVAILABLE.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text. This error cannot occur unless both the following conditions are satisfied:

- The CICS active and alternate jobs are running in different CECs.
- A TAKEOVER has been attempted before the alternate job has had the chance to observe the active job's surveillance signals for the short time (less than 1 minute) needed to deduce the maximum possible difference between the respective TOD clocks.

The takeover cannot be performed unless the difference between the CECs' TOD clocks is known because normal CICS processing must not be resumed until the current TOD clock reading is later than the TOD clock reading when the old CICS active job terminated as observed in the CEC where it had been running.

System Action: See following message issued by this CICS job.

User Response: None

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSTKV

DFHXC6635I *applid* **TAKEOVER PROCESSING TERMINATED BECAUSE ANOTHER BACKUP HAS STARTED A PRE-EMPTIVE TAKEOVER.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM and the request was accepted, but the error condition described in the message text was encountered before the completion of TAKEOVER.

System Action: See following message issued by this CICS job.

User Response: None

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSTKV

DFHXC6636I *applid* **TAKEOVER PROCESSING TERMINATED BECAUSE STATUS OF ACTIVE JOB CANNOT BE DETERMINED.**

Explanation: The CICS job which issued this message issued a takeover request to the CAVM and the request was accepted, but takeover processing could not be completed because of an error encountered in using the CAVM services provided by the CICS SVC.

System Action: See following message issued by this CICS job.

User Response: For problem determination, consult the *CICS Problem Determination Guide*. The console log and job output may be required.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSTKV

DFHXC6637I *applid* **TAKEOVER IS WAITING TO RESERVE OR ACCESS THE CAVM CONTROL DATA SET.**

Explanation: The CICS job that issued this message issued a TAKEOVER request to the CAVM. CAVM is attempting to reserve or access the CAVM control data set in order to process the request, but for some considerable time, either the required resource has remained unavailable or an outstanding I/O request has not completed. The reserve attempt should not fail unless another CICS job using the same CAVM data set and executing a SIGNON, SIGNOFF or TAKEOVER request has been held up, possibly by I/O delays, after issuing a successful reserve.

System Action: See message DFHXC6607.

User Response: See message DFHXC6607.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSTKV

DFHXC6638I *applid* **NOTIFY RC=** *retcode* **-** *text*

Explanation: The CICS job that displayed this message has found that the return code passed back to CAVM by the NOTIFY exit (DFHXRB) was non-zero. The message includes the actual return code value *retcode* (or greater than 99) and some text identifying the type of event which was being processed when the error occurred. This message always indicates either an internal error in CAVM or CICS or that code or data has become corrupted.

System Action: Processing continues but XRF function is probably degraded.

User Response: Inform your installation's system programmer.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSTKV

DFHXC6640I *applid* **ALL STATUS WRITERS ARE IN I/O WAIT.**

Explanation: The CICS job which displayed this message has found that the writes of its latest status issued to the control data set and the message data set are both taking a long time to complete. This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs have made the DASD volumes of both CAVM data sets temporarily inaccessible.

System Action: The CICS job re-issues this warning message at intervals until one of its status writes completes. Meanwhile, it continues to perform any processing which is not dependent on status write completion. If the job which displayed this message is a CICS active and the condition persists for long enough, it is possible that an unwanted takeover will be initiated when the alternate (assuming that it is able to read the CAVM data sets because it is running in a different CEC) notices that the active system's surveillance signals have ceased.

User Response: If this message is issued by an CICS active job which does not seem to be experiencing other problems, it might be advisable to issue a suitable command to the corresponding alternate job to prevent it from initiating an unnecessary takeover. See also message DFHXC6607.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSW

DFHXC6641I *applid* **STATUS WRITE I/O ERROR ON** *dsname*

Explanation: The CICS job which displayed this message has encountered an I/O error in writing its latest status to either the control data set or the message data set.

System Action: If the CICS job is able to write its status successfully to either the control data set or the message data set, processing continues. Further writes to the failing data set might be attempted later on because it is possible that the error condition was transient. If both data sets become unusable simultaneously, the CAVM TCB ABENDs.

User Response: Inform your installation's system programmer.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSW

DFHXC6642I *applid* **ALL STATUS READERS ARE IN I/O WAIT.**

Explanation: The CICS job which displayed this message has found that the reads it has issued to the control data set and the message data set to obtain the latest available status of its partner system are both taking a long time to complete. This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs have made the DASD volumes of both CAVM data sets temporarily inaccessible.

System Action: The CICS job reissues this warning message at intervals until one of the status reads completes. Meanwhile, it continues to perform any processing which is not dependent on status read completion. If the job which displayed this message is a CICS alternate, It is possible that a takeover will not be initiated if the active fails, since the alternate cannot detect that the active's surveillance signals have ceased.

User Response: See message DFHXC6607.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSR

DFHXC6643I *applid* **STATUS READ I/O ERROR ON** *dsname*

Explanation: The CICS job which displayed this message has encountered an I/O error in reading the latest available status of its partner system from either the control data set or the message data set. *dsname* is the name of the data set.

System Action: Processing continues but XRF function will be degraded because the affected system might not be able to detect changes in its partner's status. Further reads from the failing data set might be attempted later on because it is possible that the error condition was transient. If this error is encountered in an alternate system while it is processing a takeover request, the takeover will fail.

User Response: Inform your installation's system programmer.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSR

DFHXC6644I *applid* **NOTIFY RC=** *retcode* **-** *text*

Explanation: The CICS job which displayed this message has found that the return code passed back to CAVM by the NOTIFY exit (DFHXRB) was non-zero. The message includes the actual return code value *retcode* (or a value greater than 99) and some text identifying the type of event that was being processed when the error occurred. This message always indicates either an internal error in CAVM or CICS or that code or data has become corrupted.

System Action: Processing continues but XRF function is probably degraded.

User Response: Inform your installation's system programmer.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSR

DFHXC6645I *applid* **ERROR IN INQUIRE HEALTH EXIT.**

Explanation: The CICS job which displayed this message has found that the return code passed back to CAVM by the INQUIRE HEALTH exit (DFHXRC) was nonzero. This message indicates either an internal error in CAVM or in CICS, or that code or data has become corrupted.

System Action: Processing continues but XRF function is probably degraded.

User Response: Inform your installation's system programmer.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSTI

DFHXC6646I *applid* **ERROR CALLING CICS SVC -** *xxxxxxxxxxx*

Explanation: The CICS job which displayed this message has encountered an error calling the CICS supervisor code (SVC) to determine the status of another MVS image in the same XCF sysplex as the calling CICS MVS image.

System Action: Processing continues but XRF function is probably degraded.

User Response: Ensure that the correct level of CICS SVC has been specified. Also ensure that MVS has issued an acceptable return code as this error can be caused by a change in MVS response codes. If the error is caused by neither of these, it could be the result of an internal error in CAVM. If this is the case, you need further guidance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSR

DFHXC6649I *applid* **SIGNOFF IS UNABLE TO RESERVE THE CAVM CONTROL DATA SET.**

Explanation: The CICS job which issued this message issued a SIGNOFF request to the CAVM or SIGNOFF processing was invoked implicitly by abnormal termination of the CAVM TCB. CAVM attempted to reserve the CAVM control data set in order to process the request, but for some considerable time, the required resource remained unavailable. The reserve attempt should not fail unless another CICS job using the same CAVM data set and executing a SIGNON, SIGNOFF or TAKEOVER request has been held up, possibly by I/O delays, after issuing a successful reserve.

System Action: The CAVM TCB terminates without updating the CAVM data sets to indicate that this CICS job has signed off. See also any following message issued by this CICS job.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSSOF

DFHXC6650I *applid* **CAVM HAS FAILED, CODE =** *code*

Explanation:

System Action: An ABEND U0218 is issued with a reason code equal to the code in message DFHXC6650. This results in abnormal termination of the CICS XRF job. See also any following messages issued by this CICS XRF job.

User Response: Inform your installation's system programmer.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHWSRTR, DFHWSSN1, DFHWSSN2, DFHWSSN3, DFHWSSOF, DFHWSSR, DFHWSSW, DFHWSTKV

DFHXC6651I *applid* **CAVM HAS DETECTED AN INVALID REQUEST.**

Explanation: CAVM has found that the parameter block passed to it is invalid, or that the request is being made at an inappropriate time.

System Action: An ABEND U0218 is issued with reason code 1. This results in the abnormal termination of the CICS job. See also any following messages issued by this CICS job.

User Response: Restart the failing CICS job and inform your installation's system programmer.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWSRTR

DFHXGxxxx (XRF general) messages

DFHXG6215 *applid progname operation* **failure, response code** *cccc cccc* **keyrange:** *rrrr{. | key: }key*

Explanation: Table builder services (DFHTBSS) failed in an operation on the global catalog (DFHCCCC).

The failing operation is shown in the message, and is a DELETE, WRITE_NEXT, START_WRITE or END_WRITE. request.

- *cccc cccc* are the response and reason codes from the catalog domain.
- *rrrr* is the internal RQ token passed to the catalog domain.
- *key* appears in the message only for a WRITE or DELETE operation, and usually includes the name of the resource for which CICS failed to record information on the global catalog.

This is normally an internal CICS error, however, it can occur during shut down if one task initiates a normal shut down, and another initiates an immediate shut down shortly afterwards. This is because the immediate shut down closes resources that are being used by the normal shut down task.

This can also occur if the global catalog is not big enough and a large group is being installed.

System Action: CICS terminates.

User Response: Check the size of the global catalog. Redefine a larger one if necessary.

Alternatively this message could be caused by an immediate shutdown of CICS because tasks not yet quiesced may abend trying to access a service removed by the shutdown process.

DFHXG6411I *applid* **Sign off abnormal from the CAVM detected.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the alternate CICS has signed off from the CAVM.

System Action: The system continues with normal processing. However, you should be aware that takeover does not occur if the active CICS fails.

User Response: Determine the reason for the abnormal sign-off.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6415I *applid* **CICS is being taken over. Execution will be terminated.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has accepted a takeover request from alternate CICS.

System Action: CICS is terminated abnormally with abend code 206.

User Response: None.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6416I *applid* **APPARENT FAILURE OF ALTERNATE CICS DETECTED.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the alternate CICS appears to have failed.

System Action: The system continues with normal processing. However, you should be aware that takeover may not occur should the active CICS fail.

User Response: Determine the reason for the apparent failure of the alternate CICS.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHXRSP

DFHXG6417I *applid* **Recovery of alternate CICS detected.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that alternate CICS has recovered from the apparent failure reported by message DFHXG6416.

System Action: The system continues with normal processing.

User Response: None.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6422I *applid* **Sign off normal from the CAVM assumed.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has assumed that the alternate CICS has signed off from the CAVM.

This is likely to occur when the active CICS is running on CEC 1 and:

1. the CICS alternate is started on CEC 2, or
2. the CEC 2 initial program load is repeated, or
3. CICS alternate is restarted on CEC 2.

System Action: CICS processing is continued.

User Response: None.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6423I *applid* **CAVM failure detected. CICS cannot continue as active.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has failed.

Messages are produced by the CAVM to note the reasons for failure.

System Action: CICS terminates abnormally with abend code 212.

User Response: Correct the error.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6427I *applid* **Terminal control restart task has failed. CICS execution will be terminated.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that the terminal control restart task has failed. It is no longer possible for CICS to continue either as active or as alternate.

Messages are produced by the terminal control restart task to note the reasons for failure.

System Action: CICS terminates abnormally with abend code 209.

User Response: Correct the error.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6429I *applid* **Transaction CXCU cannot be attached.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS is unable to attach transaction CXCU. Therefore, CICS is unable to initiate the transmission of tracking messages. Takeover is adversely affected if CXCU cannot be attached. This can occur if:

1. CXCU is not defined to CICS, or
2. CICS is short on storage

System Action: CICS attempts to attach CXCU at regular intervals.

User Response: Either install CXCU using RDO, or alleviate the storage shortage.

Destination: Console

XMEOUT Parameter: *applid*

DFHXG6440I I/O ERROR ON XRF MESSAGE DATA SET. RPL ADDRESS = HEX'*xx*'.

Explanation: VSAM reported a physical I/O error on the XRF message data set. The address X'*xx*' is that of the VSAM RPL which reported the error.

System Action: Surveillance by the XRF system ceases.

User Response: It is necessary to restart both the active and alternate CICS systems with a fresh pair of surveillance data sets. For diagnostic purposes, the message gives the address of the RPL being used at the time the error was reported. The RPL has an associated VSAM message area.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWMMT

DFHXG6441I LOGICAL ERROR ON XRF MESSAGE DATA SET. VSAM FEEDBACK DATA = HEX' *xx*'.

Explanation: VSAM reported a logical error on the XRF message data set.

System Action: Surveillance by the XRF system ceases.

User Response: This is an error in the CICS system. For diagnostic purposes the message contains the VSAM feedback data for the error.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWMMT

DFHXG6442I INTERNAL ERROR IN XRF MESSAGE MANAGER.

Explanation: Request chains maintained by the CICS message manager are in an inconsistent state.

System Action: Surveillance by the XRF system ceases.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWMQS

DFHXG6443I INTERNAL ERROR IN XRF SURVEILLANCE COMPONENT.

Explanation: An invalid internal call has been made to a routine in XRF surveillance component.

System Action: Surveillance by the XRF system ceases.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWCCS

DFHXG6444I VSAM REQUEST REJECTED FOR XRF MESSAGE DATA SET.

Explanation: A VSAM PUT or GET request directed to the XRF message data set has been rejected.

System Action: Surveillance by the XRF system ceases.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWMMT

DFHXG6445I XRF MESSAGE DATA SET FORMATTING STARTED.

Explanation: The XRF message data set is new and must be formatted before it can be used to pass messages from the active to the alternate.

System Action: Normal service continues.

User Response: Depending on the size of the message data set, there will be some delay before the active can send messages to the alternate. It may be advisable to defer starting an alternate system until the corresponding message DFHXG6446 has been received.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWMMT

DFHXG6446I XRF MESSAGE DATA SET FORMATTING COMPLETED.

Explanation: The XRF message data set has now been formatted. It can be used to pass messages from the active to the alternate.

System Action: Normal service continues.

User Response: None. See message DFHXG6445.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWMMT

DFHXG6447I NON CRUCIAL XRF MESSAGE(S) DISCARDED.

Explanation: The XRF message data set is full. Some messages are being discarded in preference to invalidating the alternate system by overwriting messages that it has not yet read.

System Action: Normal service continues.

User Response: This situation is likely to arise in circumstances similar to those described for message DFHXA6541. The alternate has not yet become invalid but is likely to become so and corrective action is warranted. Refer to message DFHXA6541 for further guidance.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWMWR

DFHXG6450I SVC GETMAIN FAILED IN XRF SURVEILLANCE.

Explanation: An SVC GETMAIN issued by the CICS surveillance component has failed. The GETMAIN may have been issued under either the CICS TCB or the XRF TCB.

System Action: An MVS abend 0190 is issued.

User Response: Since the GETMAIN requests storage above the 16MB line, it is extremely unlikely that the request cannot be satisfied.

A system error may have occurred. If this is the case, you will require further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWCCS

DFHXG6451I SVC GETMAIN FAILED IN XRF SURVEILLANCE.

Explanation: An SVC GETMAIN issued by the CICS surveillance component has failed. The GETMAIN may have been issued under either the CICS TCB or the XRF TCB.

System Action: An MVS abend 0191 is issued.

User Response: Since the GETMAIN requests storage above the 16MB line it is extremely unlikely that the request cannot be satisfied.

A system error may have occurred. If this is the case, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWLGET

DFHXG6452I INTERNAL ERROR IN XRF SURVEILLANCE.

Explanation: A consistency check made by the XRF LIFO storage manager has failed. The failure may have occurred while running under either the CICS TCB or the XRF TCB.

System Action: An MVS abend 0192 is issued.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWLFRE

DFHXG6453I INTERNAL ERROR IN XRF SURVEILLANCE.

Explanation: A consistency check made by the XRF process manager has failed. A process has made an invalid internal lock request.

System Action: An MVS abend 0193 is issued.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWDWAT

DFHXG6454I PROGRAM CHECK IN XRF SURVEILLANCE. PSW = HEX'*xx***' '***xx***'. ADDRESS OF EPIE COPY = HEX'***xx***'.**

Explanation: A program check occurred from which the XRF process was unable to recover.

System Action: An MVS abend 0194 is issued and a dump is produced.

User Response: This is an error in the CICS system. The message gives the PSW at which the check occurred. Further information is preserved in the dump.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWDSRP

DFHXG6475 *applid iiii* **Backup simlogon(s) abandoned**

Explanation: An XRF alternate is taking over, and is processing the last few session tracking requests.

CICS has issued a SIMLOGON for a standby session, but VTAM has not yet returned the logon request to CICS's VTAM logon exit.

Message DFHXG6480 has been issued twice, and CICS has now assumed that the logons will not appear.

Normal processing continues, though the state of the sessions currently pending backup SIMLOGON is unpredictable at the end of CICS initialization.

The reconnection process attempts to BIND these sessions normally.

System Action: Normal takeover processing continues.

User Response: The CSTL log and CICS trace should be collected.

Destination: Console

Module: DFHZXST

XMEOUT Parameters: *applid, iiii*

DFHXG6476I *applid* **XRF catch-up abandoned - all XRF alternates signed off**

Explanation: A run of the XRF catch-up transaction has been abandoned because there are no XRF alternates. A failing alternate may have issued some messages.

System Action: Normal processing continues.

User Response: None.

Destination: Console

Module: DFHZXCU

XMEOUT Parameter: *applid*

DFHXG6477I *applid* **Generic and Specific Ids have same value**

Explanation: A CICS system has issued the command to re-assign the VTAM USERVAR representing the XRF complex so that from now on logon requests to the XRF complex are directed to this CICS. However, this system is an XRF primary, and the value of the specific ID is the same as the generic ID for the XRF complex.

System Action: Normal processing continues.

User Response: None. However special care must be taken when using the application ID. You must make it clear whether reference is being made to the CICS system or to the XRF complex.

Destination: Console

Module: DFHZXSTS

XMEOUT Parameter: *applid*

DFHXG6479 *applid* **Modify USERVAR issued unsuccessfully. Return code** *nn*

Explanation: A CICS system has unsuccessfully issued a command to re-assign the VTAM USERVAR representing the XRF complex.

System Action: Normal processing continues.

User Response: The system operator can issue the command on CICS's behalf. The format is as follows:

F procname,USERVAR,ID=generic-id,VALUE=specific-id

Where:

- 'procname' is the procedure name for VTAM,
- 'generic-ID' is the VTAM application ID for the whole complex, and
- 'specific-ID' is the VTAM application ID for the new CICS

If it is not possible to change the USERVAR, end-user logons which name the generic-ID value continue to be directed to the old specific-applid, with unpredictable results.

(However, logons quoting the specific-ID of the new system are routed to that system.)

Destination: Console

Module: DFHZXSTS

XMEOUT Parameters: *applid, nn*

DFHXG6480I *applid* **Waiting for backup simlogon processing to drain**

Explanation: An XRF alternate is taking over, and is processing the last few session tracking requests.

CICS has issued SIMLOGON for a standby session, but VTAM has not yet returned the logon request to the CICS VTAM logon exit.

This message is issued every 5 seconds for 20 seconds while the takeover is being held up.

This indicates either a VTAM error or a CICS logic error.

System Action: This message is issued twice and then message DFHXG6475 is issued.

User Response: If this message is repeated look for other evidence of failure in CICS or VTAM.

Destination: Console

Module: DFHZXQO

XMEOUT Parameter: *applid*

DFHXG6481I *applid* **Autoconnect delayed for** *hh* **hours,** *mm* **minutes,** *ss* **seconds.**

Explanation: CICS has delayed running the reconnection transaction CXRE for an interval of *hh* hours, *mm* minutes, *ss* seconds, to either:

- acquire AUTOCONNECT terminals after a CICS startup, or
- reacquire terminal sessions after an XRF takeover.

The delay value, *hh* hours, *mm* minutes, *ss* seconds, is taken from the AUTCONN system initialization parameter.
In the case of XRF takeover, a value calculated from the number of standby BINDs held at the time of takeover. This extra interval allows the switching of XRF-capable terminals before non-XRF sessions are reconnected by CXRE.

System Action: Normal processing continues.

User Response: None.

Destination: Console

Module: DFHSIJ1

XMEOUT Parameters: *applid, hh, mm, ss*

DFHXG6482 *applid* **Unable to issue SETLOGON HOLD (***reqcode***,***reg15***,***reg0***)**

Explanation: This message is issued if VTAM SETLOGON START fails during initialization or if in preparation for changing the routing of VTAM logons, this system (which is currently doing an XRF takeover) has attempted to request VTAM to stop passing any more logon requests to it. The attempt failed, and the details of the failure are given in the message, as follows.

The first insert is one of the following.

- 'S'—The SETLOGON START request failed.
- 'H'—The SETLOGON HOLD request failed.

The second and third inserts are the values of registers 15 and 0, respectively, at the time of the failure.

See the *VTAM Programming* manual for your release of VTAM for the interpretation of these values.

Valid logons reaching CICS before message DFHSI1517 is issued may be rejected.

System Action: Normal processing continues.

User Response: Note the message.

Destination: Console

Module: DFHZXSTS

XMEOUT Parameters: *applid, reqcode, reg15, reg0*

DFHXG6483I *applid* **This will be the last pass.**

Explanation: The reconnection transaction CXRE is about to scan the VTAM terminals and sessions that were to be (re)connected for the last time. All those found are listed in message DFHXG6486.

System Action: Processing continues

User Response: If any of the VTAM terminals or sessions listed in message DFHXG6486 are crucial, then check whether they are successfully connected as a result of this pass.

Destination: Console

Module: DFHZXRE

XMEOUT Parameter: *applid*

DFHXG6484I *applid* **Autoconnect processing now complete.**

Explanation: The reconnection transaction CXRE has just scanned all the VTAM terminals and sessions, and all those that were to be (re)connected are now connected.

System Action: Processing continues

User Response: None.

Destination: Console

Module: DFHZXRE

XMEOUT Parameter: *applid*

DFHXG6485 *applid* **Unable to schedule Autoconnection / Reconnection process.**

Explanation: CICS initialization attempted to schedule the reconnection process, but was unable to do this as CICS rejected the DFHPC TYPE=LINK call.

See following message DFHXG6487 or DFHXG6488 for the reason.

System Action: The reconnection process is not run.

User Response: CEMT must be used to restore individual terminals to the desired state.

Destination: Console

Module: DFHZOPA

XMEOUT Parameter: *applid*

DFHXG6486I *applid termid* **may not be acquired after takeover**

Explanation: The reconnection transaction, CXRE, is making its last run, but has discovered that terminal or session *termid* is still not bound in the same status that it was in during the previous failed run of CICS.

System Action: Normal processing continues.

User Response: Note the terminal identification *termid* in the message, and try to discover why previous reconnection attempts failed. The terminal may not have been physically switched, for example, CEMT may be used to acquire individual terminals after such problems have been cleared.

Destination: Console

Module: DFHZXRE0

XMEOUT Parameters: *applid, termid*

DFHXG6487 *applid* **Unexpected IC/PC error code** *X'code'***. Module** *modname*

Explanation: The reconnection transaction CXRE could not be scheduled or rescheduled., as the DFHIC TYPE=INITIATE or DFHPC TYPE=LINK was rejected with code X'*code*'. This is caused by a CICS logic error.

This message follows either:

- DFHXG6485 if CICS was unable to schedule CXRE, or
- DFHXG6489 if CICS was unable to reschedule CXRE.

System Action: The action taken by CICS depends upon whether the error occurred during scheduling or rescheduling of CXRE.

Refer to the system action for either DFHXG6485 or DFHXG6489 for further details about the action taken by CICS.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHSIJ1, DFHZOPA

XMEOUT Parameters: *applid, X'code', modname*

DFHXG6488 *applid* **Required transaction CXRE is not defined to CICS. Module** *modname*

Explanation: The reconnection transaction, CXRE, could not be rescheduled. This was because either the transaction code required no longer has an installed transaction definition, or the program required does not have an installed program definition.

This message follows DFHXG6489 or DFHXG6485

System Action: The current run of the reconnection transaction is the last one. Message DFHXG6486 is issued for all terminals and sessions found.

User Response: If non-XRF terminals are to be reconnected, correct the problem.

Destination: Console

Modules: DFHSIJ1, DFHZOPA

XMEOUT Parameters: *applid, modname*

DFHXG6489 *applid* **Unable to schedule Autoconnection / Reconnection transaction CXRE. Module** *modname***.**

Explanation: The reconnection transaction, CXRE, attempted to reschedule itself, but was unable to as CICS interval control rejected the DFHIC TYPE=INITIATE call.

This message is followed either by DFHXG6487 or DFHXG6488, which provides further information about the cause of the error.

System Action: The current run of the reconnection transaction is the last one. Message DFHXG6486 is issued for all terminals and sessions found.

User Response: See the following message. CEMT may be used to acquire individual terminals.

Destination: Console

Module: DFHSIJ1

XMEOUT Parameters: *applid, modname*

DFHXG6490I *applid* **Reconnecting VTAM session - pass number** *xxxx*

Explanation: Control has recently been given to CICS after an XRF takeover. The reconnection transaction, CXRE, which attempts to start acquire processing for logical units that were in session in the failed active, has just started for the pass number *xxxx*.

System Action: Normal processing continues.

User Response: Note any error messages arising as CICS attempts to reconnect terminals and sessions.

Destination: Console

Module: DFHZXRE0

XMEOUT Parameters: *applid, xxxx*

DFHXG6491 *applid* **Logic error during session tracking. REASON** *rcode terminal/session event*

Explanation: XRF session tracking encountered an unexpected circumstance probably due to a design error. The reason code (*rcode*) is one of the following.

1 POST called but no pending action for terminal or session.

Inserts:

- name of terminal or session.

2 DFHZXST called with bad request value.

3 XRF-capable session lacks a correlation id.

Inserts:

- name of terminal or session,
- code for event being tracked.

The following are valid for DFHSUSX only.

- X'01'—Send sign on data
- X'02'—Send sign on data (catchup)
- X'03'—Receive sign on data

The following are valid for DFHZXST only.

- X'F1'—BIND
- X'F2'—Free LOGON data
- X'F3'—UNBIND

4 Could not get key to build tracking message.

Inserts:

- name of terminal or session
- code for event being tracked (see 3 above)

5 Could not get send tracking message.

Inserts:

- name of terminal or session
- code for event being tracked (see 3 above)

6 Could not find session named in tracking message.

Inserts:

- name of terminal or session
- code for event being tracked (see 3 above)

7 Illegal entry named in tracking message.

Inserts:

- name of terminal or session
- code for event being tracked (see 3 above)

8 Bad request code in tracking message.

Inserts:

- name of terminal or session
- bad request code (see 3 above for valid DFHZXST codes)

9 Correlator in tracking message is longer than 8.

Insert:

- name of terminal or session

10 Unable to schedule standby BIND.

Insert:

- name of terminal or session.

System Action: Normal processing continues.

User Response: Note the message. Resources and states may be incorrect should the backup take over. If many of these messages are issued, then it is likely that there is a more general problem.

Destination: Console

Modules: DFHSUSX, DFHZXST

XMEOUT Parameters: *applid, rcode, terminal/session, event*

DFHXG6492I *applid* **XRF catch-up logic error** *reason length*

Explanation: The XRF catch-up program encountered an unexpected circumstance probably due to a CICS design error. The reason, indicated by the first insert, is one of the following:

1 Catalog record internal length value not correct.
2 Catalog record format error. There is no room for a key.
3 Catalog record format error. The key is longer than 16.
4 Catalog record too long for buffer (variable CUBUFFER). The second insert gives the required length.
5 Unexpected ABEND or response from EXEC CICS command.
6 Catalog record format error. There is no resource manager prefix.

System Action: In cases 1, 2, 3, and 6 above, normal processing continues.

In case 4, DFHZXCU abends with abend code AZXB. In case 5, DFHZXCU abends with abend code AZXA.

User Response: Note the message. Resources and states may be incorrect should the alternate take over. If many of these messages are issued, it is likely that there is a more general problem.

Destination: Console

Module: DFHZXCU

XMEOUT Parameters: *applid, reason, length*

DFHXG6493 *date time applid* **XRF tracking record could not be sent** *xxxx xxxx xxxx xxxx xxxx* **(Module:** *modname***)**

Explanation: The XRF catch-up program obtained a bad return code from the XRF message manager and was unable to send a record that the alternate would require to obtain a correct copy of the active. The inserts (internal diagnostic information) are:

1. WMSRETC

   DFHWMS return code. (For values and meanings of the return codes, refer to the XRF CICS manager request interface block (WMSPS) listing in the *CICS Data Areas*.)
2. WMSREASN

   DFHWMS reason code. (For values and meanings of the reason codes, please refer to the XRF CICS manager request interface block (WMSPS) listing in the *CICS Data Areas*.)
3. XTR-KEY-VALUE is the key of the tracking record.
4. XTR-ID is the record ID, where
   - zero = tracking, and
   - non-zero = catch-up.
5. XTR-TYPE is the record type (see DFHZXTR), where
   - X = tracking control,
   - C = TCT contents,
   - S = ZCP session tracking, and
   - U = sign on data

The message is issued from module *modname*.

System Action: Normal processing continues.

User Response: Note the message. Resources and states may be incorrect should the alternate take over. If many of these messages are issued, then it is likely that there is a more general problem.

Destination: Console and Transient Data Queue CSMT

Modules: DFHZXCU, DFHZXST, DFHTCRP, DFHTBSSP, DFHSUSX

XMEOUT Parameters: *date, time, applid, xxxx, xxxx, xxxx, xxxx, xxxx, modname*

DFHXG6494I *date time applid* **XRF session state catch-up ended**

Explanation: The XRF catch-up program has just finished an attempt to send messages to allow a newly signed-on alternate CICS to bring itself up to date with respect to the bound or unbound session states.

System Action: Normal processing continues.

User Response: None.

Destination: CSMT

Module: DFHZXCU

XMEOUT Parameters: *date, time, applid*

DFHXG6495I *date time applid* **XRF session state catch-up started**

Explanation: The XRF catch-up program is about to start an attempt to send messages to allow a newly signed-on alternate CICS to bring itself up to date with respect to the bound or unbound session states.

System Action: Normal processing continues.

User Response: None.

Destination: CSMT

Module: DFHZXCU

XMEOUT Parameters: *date, time, applid*

DFHXG6496I *date time applid* **XRF TCT contents catch-up ended**

Explanation: The XRF catch-up program has just finished an attempt to send messages to allow a newly signed-on alternate CICS to bring itself up to date with respect to the contents of the TCT.

System Action: Normal processing continues.

User Response: None.

Destination: CSMT

Module: DFHZXCU

XMEOUT Parameters: *date, time, applid*

DFHXG6497I *date time applid* **XRF TCT contents catch-up started**

Explanation: The XRF catch-up program is about to start an attempt to send messages to allow a newly signed-on alternate CICS to bring itself up to date with respect to the contents of the TCT.

System Action: Normal processing continues.

User Response: None.

Destination: CSMT

Module: DFHZXCU

XMEOUT Parameters: *date, time, applid*

DFHXG6499I *date time applid* **XRF catch-up started**

Explanation: The XRF catch-up program is about to start an attempt to send messages to allow a newly signed-on alternate CICS to bring itself up to date.

User Response: None.

System Action: Normal processing continues.

Destination: CSMT

Module: DFHZXCU

XMEOUT Parameters: *date, time, applid*

DFHXG6500I *applid* **Signing on to the CAVM as alternate with generic APPLID** *genericid*

Explanation: This is an informational message issued from the CICS TCB. It indicates that the system is about to sign on to the CICS availability manager (CAVM) as alternate. The message insert provides the generic applid.

System Action: CICS initialization is delayed until the sign on request has been processed. In general the delay is insignificant. In those cases where the delay is significant messages are produced by the CAVM to note the reasons.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameters: *applid, genericid*

DFHXG6501I *applid* **Sign on to the CAVM as alternate accepted**

Explanation: This is an informational message issued from the CICS TCB. It indicates that the sign on request has been accepted by the CAVM. (Refer to message DFHXG6500.)

System Action: CICS initialization is resumed.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: *applid*

DFHXG6502I *applid* **Sign on to the CAVM as alternate rejected**

Explanation: This is an informational message issued from the CICS TCB. It indicates that the sign on request has been rejected by the CAVM. (Refer to message DFHXG6500.) Messages are produced by the CAVM to note the reasons for rejecting the request.

System Action: CICS initialization is terminated.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: *applid*

DFHXG6503I *applid* **Sign on of** *specificid* **to the CAVM as active detected.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the named active CICS has signed on to the CAVM.

System Action: CICS initialization continues.

User Response: None.

Destination: Console

Module: DFHXRSP

XMEOUT Parameters: *applid, specificid*

DFHXG6507I *applid* **Sign off normal from the CAVM detected.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that active CICS has signed off from the CAVM.

System Action: CICS processing is terminated.

User Response: None.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6511I *applid* **Sign off abnormal from the CAVM detected.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that active CICS has signed off from the CAVM.

System Action: The action taken depends on the current value of the takeover option. This is specified in the system initialization table. The CEBT SET TAKEOVER command is used to change the value. A takeover request is passed to the CAVM if the current value of the takeover option is either AUTOMATIC or MANUAL.

User Response: The user response, if any, is installation dependent.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6512I *applid* **Takeover request passed to the CAVM**

Explanation: This is an informational message issued from the CICS TCB. It indicates that the system is about to request the CAVM to initiate takeover.

System Action: CICS initialization continues.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: *applid*

DFHXG6513I *applid* **Takeover request accepted by the CAVM**

Explanation: This is an informational message issued from the CICS TCB. It indicates that the takeover request (refer to message DFHXG6512) has been accepted by the CAVM.

System Action: CICS initialization continues.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: *applid*

DFHXG6514I *applid* **Takeover request rejected by the CAVM**

Explanation: This is an informational message issued from the CICS TCB. It indicates that the takeover request (refer to message DFHXG6512) has been rejected by the CAVM. Messages are produced by the CAVM to note the reasons for rejecting the request.

System Action: CICS initialization continues.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: *applid*

DFHXG6516I *applid* **Apparent failure of active CICS detected.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that active CICS appears to have failed.

System Action: The action taken depends on the current value of the takeover option. This is specified in the system initialization table. The CEBT SET TAKEOVER command is used to change the value. A takeover request will be passed to the CAVM if the current value of the takeover option is AUTOMATIC. Message DFHXG6518 will be sent to the console if the current value is MANUAL.

User Response: Determine the reason for the apparent failure of active CICS.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6517I *applid* **Recovery of active CICS detected.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that active CICS has recovered from the apparent failure reported by message DFHXG6516.

System Action: CICS initialization continues.

User Response: None.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6518A *applid* **APPARENT FAILURE OF ACTIVE CICS DETECTED. REPLY 'TAKEOVER' OR 'IGNORE'**

Explanation: This is an action message issued from the CICS TCB. It is issued when the current value of the active CICS appears to have failed.

System Action: If the reply is 'TAKEOVER', CICS requests the CAVM to initiate takeover.

If the reply is 'IGNORE', CICS assumes one of the following:

- The active CICS system recovers from the apparent failure.
- The active CICS system is restarted.
- The CEBT PERFORM TAKEOVER command is used to initiate takeover.

Subsequent events may mean that the user need not reply to message DFHXG6518A. Examples of this are :

- If CICS is notified that the active CICS system has recovered from the apparent failure reported by message DFHXG6516, messages DFHXG6517 and DFHXG6519 are sent to the console.
- If CICS is notified that the active CICS system has signed off abnormally from the CAVM, messages DFHXG6511 and DFHXG6519 are sent to the console.
- If takeover is initiated (from the alternate CICS system) at the same time as the active CICS recovers from the apparent failure reported by message DFHXG6516, messages DFHXG6513 and DFHXG6539 are sent to the console.

User Response: Determine the reason for the apparent failure of the active CICS. If possible, resolve the failure and make the appropriate reply.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHXRSP

DFHXG6519I *applid* **The reply to message DFHXG6518 is assumed to be IGNORE.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS no longer requires the user to respond to message DFHXG6518.

System Action: CICS initialization continues.

User Response: None.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6520I *applid* **CICS shutdown initiated by CAVM event.**

Explanation: This is an informational message issued from the CICS TCB. CICS initiated shutdown occurs in the following situations:

1. CICS is notified that active CICS has signed off normally from the CAVM. Message DFHXG6507 is sent to the console.
2. CICS is notified that active CICS has been restarted "in place". Message DFHXG6511 is sent to the console.
3. CICS assumes that the active CICS has signed off normally from the CAVM. Message DFHXG6522 is sent to the console.

System Action: CICS terminates normally, but note that takeover does not occur if (active) CICS fails.

User Response: Consider restarting (alternate) CICS.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6522I *applid* **Sign off normal from the CAVM assumed.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has assumed that the active CICS has signed off from the CAVM. This is likely to occur when the alternate CICS is running on CEC 1 and:

1. Active CICS is started on CEC 2.
2. CEC 2 is reinitialized.
3. Active CICS is restarted on CEC 2.

System Action: CICS processing is terminated.

User Response: None.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6523I *applid* **CAVM failure detected. CICS cannot continue as Alternate.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has failed. Messages are produced by the CAVM to note the reasons for failure.

System Action: CICS terminates abnormally. The abend code is 207.

User Response: Correct the error.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6524I *applid* **CAVM error detected. CICS cannot continue as Alternate.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has detected an error that prevents CICS from continuing as an alternate.

This would be the case, for example, where the alternate CICS has been unable to keep up with the messages generated by the active CICS.

Messages are produced by the CAVM to note the reasons for failure.

System Action: CICS terminates abnormally. The abend code is 213.

User Response: Correct the error.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6539I *applid* **The reply to message DFHXG6518 is assumed to be TAKEOVER.**

Explanation: This is an informational message issued from the CICS TCB. It indicates that CICS no longer requires the user to respond to message DFHXG6518.

System Action: CICS initialization continues.

User Response: None.

Destination: Console

Module: DFHXRSP

XMEOUT Parameter: *applid*

DFHXG6680I *applid* **TIME-OF-DAY CLOCK DIFFERENCE IS AT LEAST** *sss* **SECONDS.**

Explanation: This is an informational message issued from the CICS TCB. Active CICS and alternate CICS systems are executing on different CECs, and the time-of-day clock on the alternate CEC is earlier than that on the active CEC. If takeover occurs then some CICS processing will have to be delayed until the time-of-day clock on the alternate CEC is later than that on the active CEC. The CAVM has estimated the lower bound to the clock difference and this is at least 15 seconds; the message contains the estimated difference. Note that the lower bound may change as more surveillance signals are processed by the CAVM. This may be the case within the first 3 to 5 surveillance signals of the active CICS starting. An elapsed time of some 10 seconds. This message is repeated as necessary.

System Action: CICS processing continues.

User Response: Ensure that the time-of day clocks are synchronized as closely as possible. Note that takeover times may be increased if the difference in values is significant.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHXRSP

DFHXG6681I *applid* **TIME-OF-DAY CLOCK DIFFERENCE IS AT MOST** *sss* **SECONDS.**

Explanation: This is an informational message issued from the CICS TCB. Active CICS and alternate CICS systems are executing on different CECS, and the time-of-day clock on the alternate CEC is earlier than that on the active CEC. If takeover occurs then some CICS processing will have to be delayed until the time-of-day clock on the alternate CEC is later than that on the active CEC. The CAVM has estimated the upper bound to the clock difference and this is at least 15 seconds; the message contains the estimated difference. Note that the upper bound may change as more surveillance signals are processed by the CAVM; message DFHXG6681 will be repeated as necessary.

System Action: CICS processing continues.

User Response: Ensure that the time-of day clocks are synchronized as closely as possible. Note that takeover times may be increased if the difference in values is significant.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHXRSP

DFHXG6682I *applid* **XRF clock synchronization started**

Explanation: This is an informational message issued from the CICS TCB. The time-of-day clock on the alternate CEC is earlier than that on the active CEC; time dependent processing must be suspended. Such processing is delayed until the time-of-day clock value on the alternate is later than that on the active CEC when the active job terminated.

System Action: Some CICS initialization continues.

User Response: Ensure that the time-of-day clocks are synchronized as closely as is possible. Note that takeover times may be increased if the difference in values is significant.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: *applid*

DFHXG6683I *applid* **XRF clock synchronization ended**

Explanation: This is an informational message issued from the CICS TCB. The time-of-day clock on the alternate CEC is now later than that on the active CEC; time dependent processing can be resumed.

System Action: CICS initialization continues.

User Response: None.

Destination: Console

Module: DFHXRA

XMEOUT Parameter: *applid*

DFHXMxxxx messages

DFHXM0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error occurred in a crucial XM domain module.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual. for further guidance.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHXMAT, DFHXMBD, DFHXMCL, DFHXMDD, DFHXMDM, DFHXMER, DFHXMFD, DFHXMIQ, DFHXMLD, DFHXMQD, DFHXMQC, DFHXMRP, DFHXMSR, DFHXMTA, DFHXMXD, DFHXMXE

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHXM0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error is critical.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHXMAT, DFHXMBD, DFHXMCL, DFHXMDD, DFHXMDM, DFHXMER, DFHXMFD, DFHXMIQ, DFHXMLD, DFHXMQD, DFHXMQC, DFHXMRP, DFHXMSR, DFHXMTA, DFHXMXD, DFHXMXE

XMEOUT Parameters: *applid, X'code', modname*

DFHXM0004 *applid* **A possible loop has been detected at offset** *X'offset'* **in module** *modname***.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which happened to be executing at the time when the error was detected.

System Action: An exception entry is made in the trace table. A system dump is taken unless you have specifically suppressed the dump (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that execution of module *modname* is terminated and CICS continues.

If you have specifies ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

DFHXM0101 *date time applid terminal userid tranid* **TRANSACTION definition entry for** *transname* **has been added.**

Explanation: This is an audit log message indicating that transaction definition entry *transname* has been added to the system using the INSTALL command.

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSKL

Module: DFHXMXD

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, transname*

DFHXM0103 *date time applid terminal userid tranid* **TRANSACTION definition entry for** *transname* **has been deleted.**

Explanation: This is an audit log message indicating that transaction definition entry *transname* has been deleted from the system using the DISCARD command.

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSKL

Module: DFHXMDD

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, transname*

DFHXM0105 *date time applid terminal userid tranid* **TRANSACTION definition entry for** *transname* **has been replaced.**

Explanation: This is an audit log message indicating that transaction definition entry *transname* has been replaced in the system using the INSTALL command.

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSKL

Module: DFHXMXD

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, transname*

DFHXM0110 *date time applid* **Transaction definition** *transid1* **has been installed with the same REMOTENAME and REMOTESYSTEM as existing definition** *transid2***.**

Explanation: Transaction definition *transid1* has been installed with the same REMOTENAME and REMOTESYSTEM as transaction definition *transid2*.

If this CICS system routes a transaction to the CICS system named as the REMOTESYSTEM of both the definitions and that transaction issues an EXEC CICS START request for the transaction-id named as the REMOTENAME of *transid1* and *transid2*, CICS can either attach *transid1* or *transid2* on the local system to satisfy the START request.

System Action: The install of transaction definition *transid1* continues normally.

If an EXEC CICS START request is issued on a remote system as described in the message explanation, CICS attaches *transid1* and not *transid2* on the local system.

CICS does not always resolve this ambiguity in the same way after a warm or emergency restart, however.

User Response: This situation usually causes no problems because the correct transaction is attached in the remote system. However, the correct transaction in the local system may not have been attached and this can manifest itself in the following ways:

- Inconsistent statistics being accumulated in the local system.
- The incorrect TRPROF being used when routing the START request back over to the remote system.
- CEMT INQUIRE TASK showing the wrong set of transactions running in the local system.

Although these are not necessarily problems, you may want to check the definitions of the remote transactions in this system in case they have been defined incorrectly.

If remote START requests are issued as described, and it does matter which transaction CICS attaches in the local system, you should modify and reinstall the transaction definition that should not be attached. This removes any ambiguity.

Destination: CSMT

Module: DFHXMXD

XMEOUT Parameters: *date, time, applid, transid1, transid2*

DFHXM0111 *date time applid* **Catalog failure while processing** *{INSTALL | SET | DISCARD}* **request for transaction definition** *transid***.**

Explanation: An error has occurred while altering the catalog during the processing of an install, set, or discard request for transaction definition *transid*.

System Action: The request continues as normal.

Depending upon the error that has occurred with the catalog, there may be severe problems if a warm or emergency restart of CICS is attempted. The catalog domain will have issued a message outlining the problem in this case.

Alternatively the problem may only be local to the catalog record containing the image of transaction definition *transid* and the following problems may occur only on a warm or emergency restart.

INSTALL	If it is a reinstall, the old version of the transaction definition is recovered. If it is an install, the transaction definition is not recovered.
SET	The change requested by the SET is not recovered. Instead the transaction definition is recovered to the state prior to the SET request being issued.
DISCARD	The transaction definition is recovered on the restart even though it is currently discarded.

User Response: No immediate action is required. Consider performing a cold or initial start the next time CICS is restarted to remedy the problem. If a cold or initial start is not appropriate and the problem is only localized to transaction definition *transid*, remedy the effects outlined for each case previously.

For example,

INSTALL	Reinstall the tranclass definition after the restart.
SET	Reissue the SET command after CICS has been restarted.
DISCARD	Reissue the DISCARD command after CICS has been restarted.

If the catalog problem persists after the restart, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console and Transient Data Queue CSMT

Modules: DFHXMDD, DFHXMXD

XMEOUT Parameters: *date, time, applid, {1=INSTALL, 2=SET, 3=DISCARD}, transid*

DFHXM0112 *date time applid* **The install of transaction definition** *transid1* **has removed ALIAS** *alias* **of** *transid2***.**

Explanation: Transaction definition *transid1* has been installed with an ALIAS of *alias*. However, ALIAS *alias* currently invokes transaction definition *transid2*.

System Action: The install of *transid1* continues as normal.

The ALIAS *alias* now invokes transaction definition *transid1* and not *transid2* as previously.

User Response: If removal of transaction definition *transid2*'s ALIAS was expected, no action is required. However, transaction definition *transid2* should be modified on the CSD so that it no longer specifies the ALIAS.

If the ALIAS has been removed in error, reinstall transaction definition *transid2* to reinstate its ALIAS. Transaction definition *transid1* should be modified on the CSD so that it no longer specifies the ALIAS.

Destination: CSMT

Module: DFHXMXD

XMEOUT Parameters: *date, time, applid, transid1, alias, transid2*

DFHXM0113 *date time applid* **The install of transaction definition** *transid1* **has removed TASKREQ** *taskreq* **of** *transid2***.**

Explanation: Transaction definition *transid1* has been installed with a TASKREQ of *taskreq*. However, TASKREQ *taskreq* currently invokes transaction definition *transid2*.

System Action: The install of *transid1* continues as normal.

The TASKREQ *taskreq* now invokes transaction definition *transid1* and not *transid2* as previously.

User Response: If removal of transaction definition *transid2*'s TASKREQ was expected, no action is required. However, transaction definition *transid2* should be modified on the CSD so that it no longer specifies the TASKREQ.

If the TASKREQ has been removed in error, reinstall transaction definition *transid2* to reinstate its TASKREQ. Transaction definition *transid1* should be modified on the CSD so that it no longer specifies the TASKREQ.

Destination: CSMT

Module: DFHXMXD

XMEOUT Parameters: *date, time, applid, transid1, taskreq, transid2*

DFHXM0114 *date time applid* **The install of transaction definition** *transid1* **has removed XTRANID** *X'xtranid'* **of** *transid2***.**

Explanation: Transaction definition *transid1* has been installed with a XTRANID of *xtranid*. However, XTRANID *xtranid* currently invokes transaction definition *transid2*.

System Action: The install of *transid1* continues as normal.

The XTRANID *xtranid* now invokes transaction definition *transid1* and not *transid2* as previously.

User Response: If removal of transaction definition *transid2*'s XTRANID was expected, no action is required. However, transaction definition *transid2* should be modified on the CSD so that it no longer specifies the XTRANID.

If the XTRANID has been removed in error, reinstall transaction definition *transid2* to reinstate its XTRANID. Transaction definition *transid1* should be modified on the CSD so that it no longer specifies the XTRANID.

Destination: CSMT

Module: DFHXMXD

XMEOUT Parameters: *date, time, applid, transid1, X'xtranid', transid2*

DFHXM0115 *date time applid* **The install of transaction definition** *transid1* **has removed TPNAME** *tpname* **of** *transid2***.**

Explanation: Transaction definition *transid1* has been installed with a TPNAME of *tpname*. However, TPNAME *tpname* currently invokes transaction definition *transid2*.

System Action: The install of *transid1* continues as normal.

The TPNAME *tpname* now invokes transaction definition *transid1* and not *transid2* as previously.

User Response: If removal of transaction definition *transid2*'s TPNAME was expected, no action is required. However, transaction definition *transid2* should be modified on the CSD so that it no longer specifies the TPNAME.

If the TPNAME has been removed in error, reinstall transaction definition *transid2* to reinstate its TPNAME. Transaction definition *transid1* should be modified on the CSD so that it no longer specifies the TPNAME.

Destination: CSMT

Module: DFHXMXD

XMEOUT Parameters: *date, time, applid, transid1, tpname, transid2*

DFHXM0116 *date time applid* **PROGRAM parameter missing from transaction definition** *transid***. PROGRAM is required because REMOTESYSTEM is the same as the local system.**

Explanation: Transaction definition *transid* has been installed without a PROGRAM parameter. Since it has been defined with a REMOTESYSTEM equal to the local system, a program is required if the transaction is executed on this system.

System Action: The install of *transid* continues as normal. Any attempt to run the transaction *transid* will fail because there is no program to link to.

User Response: This message is issued for information only. There is no problem if transaction *transid* is not executed on this system. If it is to be executed, the definition of *transid* needs to be modified and then reinstalled.

If the transaction is not executed, you may wish to investigate why the transaction definition has been installed. It could be that the transaction is defined in an RDO group that is shared between a number of different CICS systems. For example *transid* may be TTT1 in the following pair of definitions used to implement transaction routing to this local system CICB.

```
Transaction  Remotesystem   Remotename   Program
TTT1         CICB           TTT2         -
TTT2         -              -            PROGA
```

In this example, a single definition would suffice if the transaction was made to have the same name on this system.

```
Transaction  Remotesystem   Remotename   Program
TTT1         CICB           TTT1         PROGA
```

Module: DFHXMXD

XMEOUT Parameters: *date, time, applid, transid*

DFHXM0201 *date time applid terminal userid tranid* **TRANCLASS definition entry for** *tranclassname* **has been added.**

Explanation: This is an audit log message indicating that tranclass definition entry *tranclassname* has been added to the system using the INSTALL command.

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSKL

Module: DFHXMCL

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, tranclassname*

DFHXM0203 *date time applid terminal userid tranid* **TRANCLASS definition entry for** *tranclassname* **has been deleted.**

Explanation: This is an audit log message indicating that tranclass definition entry *tranclasssname* has been deleted from the system using the DISCARD command.

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSKL

Module: DFHXMCL

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, tranclassname*

DFHXM0205 *date time applid terminal userid tranid* **TRANCLASS definition entry for** *tranclassname* **has been replaced.**

Explanation: This is an audit log message indicating that tranclass definition entry *transname* has been replaced in the system using the INSTALL command.

- *terminal* is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
- *userid* is the user identifier of the user associated with the transaction issuing the message.
- *tranid* is the transaction issuing the message.

System Action: The system continues normally.

User Response: None.

Destination: CSKL

Module: DFHXMCL

XMEOUT Parameters: *date, time, applid, terminal, userid, tranid, tranclassname*

DFHXM0211 *date time applid* **Catalog failure while processing** *{INSTALL | SET | DISCARD}* **request for tranclass definition** *tranclassname***.**

Explanation: An error has occurred while altering the catalog during the processing of an install, set, or discard request for tranclass definition *tranclassname*.

System Action: The request continues normally.

Depending upon the error that has occurred with the catalog, there may be severe problems if a warm or emergency restart of CICS is attempted. The catalog domain will have issued a message outlining the problem in this case.

Alternatively the problem may only be local to the catalog record containing the image of tranclass definition *tranclassname* and the following problems may occur only on a warm or emergency restart.

INSTALL	If it is a reinstall, the old version of the tranclass definition is recovered. If it is an install, the tranclass definition was not recovered.
SET	The change requested by the SET is not recovered. Instead the tranclass definition is recovered to the state it was in before the SET request was issued.
DISCARD	The tranclass definition is recovered on the restart even though it is currently discarded.

User Response: No immediate action is required. To fully resolve the problem, consider performing a cold or initial start the next time CICS is restarted. If a cold or initial start is not appropriate and the problem is only localized, to tranclass definition *tranclassname*, you can resolve each of the symptoms separately.

For example:

INSTALL	Reinstall the tranclass definition after CICS has been restarted.
SET	Reissue the SET command after CICS has been restarted.
DISCARD	Reissue the DISCARD command after CICS has been restarted.

If the catalog problem persists after the restart, you may need further assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console and Transient Data Queue CSMT

Module: DFHXMCL

XMEOUT Parameters: *date, time, applid, {1=INSTALL, 2=SET, 3=DISCARD}, tranclassname*

DFHXM0212 *applid* **Transaction** *transid* **has been attached with unknown tranclass** *tranclassname***.**

Explanation: Transaction *transid* has just been attached. It is defined as belonging to tranclass *tranclassname* but *tranclassname* does not exist.

This message is only issued the first time transaction *transid* is attached with the unknown tranclass.

System Action: The attach of transaction *transid* proceeds as normal but without being subject to any tranclass scheduling constraints.

User Response: If transaction *transid* should belong to tranclass *tranclassname*, install that tranclass. If not, modify the transaction definition for *transid* as appropriate, and reinstall.

The CEDA CHECK command can be used to ensure that each of the tranclasses referenced by transaction definitions are defined within the same startup GRPLIST.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHXMQC

XMEOUT Parameters: *applid, transid, tranclassname*

DFHXM0213 *applid* **Insufficient storage for system attach of transaction** *transid***.**

Explanation: There is insufficient storage for a new task to be created for the attach of transaction *transid*.

Since the majority of the storage required for the new task is obtained from DSA storage, CICS is probably short on storage in one of the DSAs.

System Action: The attach request is queued. It is retried later when more storage should have become available. If the retried attach fails, it is queued and retried repeatedly until it succeeds.

User Response: If CICS is short on storage, message DFHSM0133 is also issued. Refer to that message for advice on how to resolve the condition.

If message DFHSM0133 has not been issued, the problem has been caused by insufficient MVS storage. In this case consider lowering the EDSALIM of the system to increase the amount of available MVS storage.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHXMAT

XMEOUT Parameters: *applid, transid*

DFHXM0301 *date time applid* **An attempt to link to the user-replaceable transaction restart program (DFHREST) has failed for task number** *tasknum***. Transaction restart is not performed for transaction** *tranid***.**

Explanation: A restartable transaction abended and the transaction manager attempted to link to the user-replaceable transaction restart program (DFHREST) but the link has failed. Likely reasons are:

- DFHREST is not defined (and not autoinstalled)
- DFHREST is not present in any library specified in the DFHRPL concatenation.
- DFHREST has been linked with AMODE(24).

System Action: The transaction is not restarted.

User Response: If the problem is not rectified, a message is issued each time the link to DFHREST fails. To avoid this, ensure that DFHREST is properly defined and present in a library specified in the DFHRPL concatenation.

See the *CICS Customization Guide* for more information about user-replaceable programs.

Destination: Console and Transient Data Queue CSMT

Module: DFHXMTA.

XMEOUT Parameters: *date, time, applid, tasknum, tranid*

DFHXM0302 *applid* **An abend** *abcode* **occurred in the user-replaceable transaction restart program (DFHREST) under task number** *tasknum***. Transaction restart is not performed for transaction** *tranid***.**

Explanation: A restartable transaction abended and the transaction manager linked to the user-replaceable transaction restart program (DFHREST). DFHREST abended.

System Action: The transaction is not restarted.

User Response: If the problem is not rectified, a message is issued each time DFHREST abends. To avoid this, fix the problem in DFHREST and ensure that it is properly defined and present in a library specified in the DFHRPL concatenation.

See the *CICS Customization Guide* for more information about user-replaceable programs.

Destination: Console

Module: DFHXMTA.

XMEOUT Parameters: *applid, abcode, tasknum, tranid*

DFHXM0303 *applid* **A severe error (code** *X'code'***) has occurred while initializing task number** *tasknum* **with transaction identifier** *tranid***. Terminal** *termid* **has not been released. The task is suspended indefinitely.**

Explanation: An internal error has prevented the initialization of task number *tasknum* with identifier *tranid*.

The task cannot run and cannot be abended. The principal facility of the task is a terminal. No message may be sent to the terminal and it is unusable by CICS. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented

from running because they also need access to the same resources. You may wish to add a dump table entry to always terminate CICS on this message.

System Action: The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

The terminal principal facility of the task is unusable by CICS until CICS is canceled.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User Response: You must cancel CICS if you need to release the terminal associated with the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code X'*code*'. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid, termid*

DFHXM0304 *applid* **A severe error (code** *X'code'***) has occurred while initializing task number** *tasknum* **with transaction identifier** *tranid***. Transient data queue** *tdqueue* **has not been released. The task is suspended indefinitely.**

Explanation: An internal error has prevented the initialization of task number *tasknum* with identifier *tranid*.

The task cannot run and cannot be abended. The principal facility of the task is a transient data queue. The TD queue will not trigger another task until CICS is terminated. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry always to terminate CICS on this message.

System Action: The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User Response: You must cancel CICS if you need to release the TD queue associated with the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code X'*code*'. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid, tdqueue*

DFHXM0305 *applid* **A severe error (code** *X'code'***) has occurred while initializing task number** *tasknum* **with transaction identifier** *tranid***. The interval control element has not been released. The task is suspended indefinitely.**

Explanation: An internal error has prevented the initialization of task number *tasknum* with identifier *tranid*.

The task cannot run and cannot be abended. The principal facility of the task is an interval control element. Any start data associated with the ICE will not be retrieved. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry always to terminate CICS on this message.

System Action: The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User Response: You must cancel CICS if you need to destroy the ICE. Any start data will remain in temporary storage until it is deleted unless it is nonrecoverable in which case it will disappear on the next cold, initial or emergency restart of CICS. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code X'*code*'. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid*

DFHXM0306 *applid* **A severe error (code** *X'code'***) has occurred while initializing task number** *tasknum* **with transaction identifier** *tranid***. The task is suspended indefinitely.**

Explanation: An internal error has prevented the initialization of task number *tasknum* with identifier *tranid*.

The task cannot run and cannot be abended. The task has no principal facility bound to it. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry to always terminate CICS on this message.

System Action: The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User Response: You must cancel CICS if you need to destroy the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force purge the task.

Note the error code X'*code*'. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid*

DFHXM0307 *applid* **A severe error (code** *X'code*'**) has occurred while terminating task number** *tasknum* **with transaction identifier** *tranid***. The terminal** *termid* **has not been released. The task is suspended indefinitely.**

Explanation: An internal error has prevented the termination of task number *tasknum* with identifier *tranid*. It is not possible to abend the task or send a message to its terminal principal facility. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry to always terminate CICS on this message.

System Action: The task is suspended indefinitely. First failure diagnostics should be produced by the component which detected the error. The transaction manager also takes a dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

The terminal principal facility of the task is unusable until CICS is canceled.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User Response: You must cancel CICS if you need to free up the terminal associated with the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force purge the task.

Note the error code X'*code*'. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid, termid*

DFHXM0308 *applid* **A severe error (code** *X'code*'**) has occurred while terminating task number** *tasknum* **with transaction identifier** *tranid***. The transient data queue** *tdqueue* **has not been released. The task is suspended indefinitely.**

Explanation: An internal error has prevented the termination of task number *tasknum* with identifier *tranid*. It is not possible to abend the task. The principal facility of the task is a transient data queue. The TD queue will not trigger another task until CICS is terminated. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Destination: Console

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid*

DFHXM0310 *applid* **A severe error (code** *X'code'***) has occurred while terminating task number** *tasknum* **with transaction identifier** *tranid***. If the task had a principal facility, it has been released. The task is suspended indefinitely.**

Explanation: An internal error has prevented the termination of task number *tasknum* with identifier *tranid*. It is not possible to abend the task. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry always to terminate CICS on this message.

System Action: If the task had a principal facility, it has been released. If this was a terminal, the terminal should be usable by CICS.

The task is suspended indefinitely. First failure diagnostics should be produced by the component which detects the error. The transaction manager also takes a dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User Response: You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code X'*code*'.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid*

DFHXM0311 *applid* **A severe error (code** *X'code'***) has occurred while initializing task number** *tasknum* **with transaction identifier** *tranid***. Scheduler resources associated with the task have not been released. The task is suspended indefinitely.**

Explanation: An internal error has prevented the initialization of task number *tasknum* with identifier *tranid*.

The task cannot run and cannot be abended. The principal facility of the task is the scheduler. The scheduler will not initiate another task until CICS is terminated. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues), so you should cancel CICS at your earliest convenience. Otherwise, you risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry to always terminate CICS on production of this message.

System Action: The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User Response: You must cancel CICS if you need to release the resources associated with the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code X'*code*'. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Module: DFHXMTA.

XMEOUT Parameters: *applid, X'code', tasknum, tranid*

DFHXM0501 *applid* **CICS cannot satisfy request for MXT. Value** *mxtvalue* **has been used instead.**

Explanation: The value entered for MXT cannot be handled by the system. *mxtvalue* is the largest value for which CICS has been able to acquire task storage.

The majority of the task storage required is now acquired from CICS DSAs.

System Action: The system continues to run with a MXT value of *mxtvalue*.

User Response: Check that the original value entered for MXT was correctly typed. If the value is mistyped, use CEMT to amend the MXT value (you are unlikely to be able to force the value higher). Remember that MXT now only includes user tasks and so it should not need to be set to a value as high as in previous releases.

If the value *mxtvalue* is acceptable, no action is necessary.

If the value *mxtvalue* is too small, check to see which programs, apart from CICS, are running in this region. To relieve the storage constraint, either increase the DSALIM or EDSALIM of the system to give CICS more storage for its own use. For further details

about storage allocation at initialization, see the *CICS Transaction Server for OS/390 Installation Guide*.

Destination: Console

Module: DFHXMSR

XMEOUT Parameters: *applid, mxtvalue*

DFHXM0502 *applid* **A catalog failure has occurred while saving the MXT setting.**

Explanation: An error has occurred while saving the requested MXT setting on the catalog.

System Action: The requested MXT change request continues as normal.

Depending upon the error that has occurred with the catalog, there may be severe problems if a warm or emergency restart of CICS is attempted. The catalog domain will have issued a message outlining the problem in this case.

Alternatively the problem may only be local to the catalog record containing the MXT value and only it may not be recovered on a warm or emergency restart.

User Response: No immediate action is required. Consider performing a cold or initial start, with the required MXT value specified in the SIT the next time CICS is restarted. If a cold start is not appropriate, add MXT as a SIT override specifying the required MXT value.

Destination: Console

Module: DFHXMSR

XMEOUT Parameter: *applid*

DFHXM0503 *applid* **CICS cannot support minimum MXT value of** *minmxt***. CICS is terminated.**

Explanation: A severe lack of storage has resulted in CICS not being able to acquire enough task storage to satisfy even the minimum MXT value of *minmxt*.

CICS cannot perform any useful work without *minmxt* number of user tasks.

System Action: CICS is terminated.

User Response: Investigate why there is insufficient storage for CICS to support such a low number of user tasks.

To relieve the storage constraint, either increase the DSALIM or EDSALIM of the system to give CICS more storage for its own use. For further details about storage allocation at initialization, see the *CICS Transaction Server for OS/390 Installation Guide*.

Destination: Console

Module: DFHXMSR

XMEOUT Parameters: *applid, minmxt*

DFHXOxxxx messages

DFHXO6700 OPTION STARTING *xxx* **HAS ILLEGAL SYNTAX.**

Explanation: The option *xxx* has illegal syntax.

System Action: The overseer program is abnormally terminated after completion of parameter analysis.

User Response: Correct the error and resubmit the overseer program.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWOSA

DFHXO6702 JOB STEP IS NOT APF-AUTHORIZED.

Explanation: Part of CICS initialization must be done in an APF-authorized state. The kernel has detected that DFHSIP is not APF-authorized.

System Action: The overseer program is abnormally terminated.

User Response: Ensure that the job step is APF-authorized. All libraries concatenated in the STEPLIB concatenation should be APF-authorized, and DFHSIP should be link-edited with an authorization code of 1.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWOSA

DFHXO6703 UNABLE TO SET UP AUTHORIZED FACILITY.

Explanation: Insufficient storage is available to initialize the authorized facility required by the overseer.

System Action: The overseer program is abnormally terminated.

User Response: Ensure that the REGION parameter is sufficiently large.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWOSA

DFHXO6704 UNABLE TO OPEN DFHLIB.

Explanation: A DD statement for (ddname) DFHLIB was missing from the batch job stream.

System Action: The overseer program is abnormally terminated.

User Response: Correct the JCL.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWOS

DFHXO6705 *xxx* **OPTION IS MISSING.**

Explanation: The option *xxx* may not be omitted.

System Action: The overseer program is abnormally terminated after completion of parameter analysis.

User Response: Correct the error and resubmit the overseer program.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWOSA

DFHXO6706 CYTIM OPTION MUST BE IN RANGE 20 TO 32767.

Explanation: The CYTIM option must fall within the range 20 through 32767.

System Action: The overseer program is abnormally terminated after completion of parameter analysis.

User Response: Correct the error and resubmit the overseer program.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWOSA

DFHXO6707 VALUE OF *xxx* OPTION IS LONGER THAN 5 DIGITS.

Explanation: The value of the given numeric option must occupy no more than five digits.

System Action: The overseer program is abnormally terminated after completion of parameter analysis.

User Response: Correct the error and resubmit the overseer program.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWOSA

DFHXO6708 VALUE OF *xxx* OPTION IS NON-NUMERIC.

Explanation: The value of the option *xxx* must be numeric.

System Action: The overseer program is abnormally terminated after completion of parameter analysis.

User Response: Correct the error and resubmit the overseer program.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWOSA

DFHXO6709 VALUE OF *xxx* OPTION IS LONGER THAN 8 CHARACTERS.

Explanation: The value of option *xxx*must occupy no more than eight characters.

System Action: The overseer program is abnormally terminated after completion of parameter analysis.

User Response: Correct the error and resubmit the overseer program.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWOSA

DFHXO6712 *xxx* IS AN INVALID OPTION KEYWORD.

Explanation: The specified keyword *xxx* is an invalid option.

System Action: Option *xxx* is ignored.

User Response: Correct the error.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWOSA

DFHXO6720 THE CICS XRF OVERSEER HAS RECEIVED AN INVALID RESPONSE TO A SUBSYSTEM INTERFACE REQUEST.

Explanation: Overseer services has received an inconsistent response to an MVS subsystem interface request for job status. The response indicates insufficient storage although more than the indicated necessary amount is provided.

System Action: A dump is taken and the overseer job abnormally terminates with MVS user abend code 224.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWOSB

DFHXO6721 THE CICS XRF OVERSEER HAS BEEN UNABLE TO GET STORAGE FOR A SUBSYSTEM INTERFACE REQUEST.

Explanation: The XRF overseer application program has issued a DFHWOSM FUNC=JJC, JJS or QJJS macro. The MVS subsystem interface request issued by the overseer services program while processing this request has failed. The response indicates that the reply area is too small. The MVS GETMAIN request to obtain a larger area is not satisfied.

System Action: The subsystem options block (SSOB), indicating ‘status array too small’ (SSOBRETN=SSCSMALL), is returned to the caller in the 256 byte SSOB return area specified in the DFHWOSM macro.

User Response: Since the areas involved are small, the condition should not normally occur. If it persists, or disrupts the effectiveness of your overseer application, you may need to cancel the overseer job with a dump to investigate the reason for the shortage of storage.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHWOSB

DFHXQxxxx messages

DFHXQ0101I Shared TS queue server initialization is in progress.

Explanation: The queue server program has started execution.

System Action: Initialization continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQMN

DFHXQ0102I Shared TS queue server for pool *poolname* **is now active.**

Explanation: The queue server for the named pool has completed initialization and is now ready to accept connections.

System Action: The server waits for connection requests or operator commands.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQMN

DFHXQ0103 The pool name parameter is missing.

Explanation: The shared TS queue server program needs to know the name of the queue pool in order to complete initialization but no pool name was specified in the SYSIN or PARM field parameters.

System Action: The queue server is terminated.

User Response: Ensure that the parameter POOLNAME=name is specified either in the SYSIN parameters or in the PARM field of the JCL for the queue server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQMN

DFHXQ0104 Shared TS queue server initialization failed because program DFHXQMN is not APF authorized.

Explanation: The queue server main program DFHXQMN cannot complete initialization because it is not running with APF authorization.

System Action: The queue server is terminated.

User Response: Ensure that the queue server program DFHXQMN is loaded from an APF authorized library and has been linkedited with the option AC(1).

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQMN

DFHXQ0111I Shared TS queue server for pool *poolname* **is terminating.**

Explanation: The queue server has started termination processing, so no further requests will be processed.

System Action: Termination continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQMN

DFHXQ0112I Shared TS queue server has terminated, return code *retcode***, reason code** *rsncode***.**

Explanation: The queue server has completed termination processing. If the termination was caused by an error, the return code will be non-zero and the reason code will normally be the number of a previous DFHXQnnnn message giving the reason for termination.

System Action: The queue server program returns control (via the AXM termination routines) to MVS for job step termination.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQMN

DFHXQ0113 Shared TS queue server completion code is *cmpcode***, reason code** *rsncode***.**

Explanation: The queue server has terminated after intercepting an abnormal termination (ABEND) request. If the completion code is a system completion code, it is shown as three hexadecimal digits, otherwise it is shown as four decimal digits for a user completion code.

System Action: The queue server program returns control (via the AXM termination routines) to MVS for job step termination.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQMN

DFHXQ0201I Processing *type parameters*

Explanation: The queue server parameter processing routine is interpreting the specified parameter string. The first word gives the type of parameter (SYSIN/PARM/SET/DISPLAY/PRINT) and the rest is the specified parameters optionally followed by descriptive comment text after one or more spaces. If the parameters start with an asterisk or a space, the whole line is taken as descriptive comments.

System Action: Any specified parameters will be processed.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHXQPR

DFHXQ0202 Unknown parameter keyword: *keyword*

Explanation: This parameter keyword did not match any of the defined parameter keywords for the queue server.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Correct the parameter keyword (or remove the incorrect parameter) and reenter the command or restart the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQPR

DFHXQ0203 Value *value* **for parameter POOLNAME is incorrect. It must be a 1 to 8 character name.**

Explanation: The value specified for the queue server POOLNAME= parameter was either empty or exceeded the maximum length of 8 characters.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Correct the parameter keyword (or remove the incorrect parameter) and reenter the command or restart the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQPR

DFHXQ0204 Value *value* **for parameter** *keyword* **is incorrect. It must be a decimal number.**

Explanation: The value of this queue server parameter should have been specified as a decimal number but was not in a valid format. (Numeric parameters can optionally be followed by the letter K, M or G to denote the appropriate powers of 1024).

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQPR

DFHXQ0205 Value *value* **for parameter** *keyword* **is greater than the maximum allowed value** *maximum***.**

Explanation: The value of this queue server parameter exceeded the maximum allowed value *maximum*.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQPR

DFHXQ0206 Value *value* **for parameter** *keyword* **is less than the minimum allowed value** *minimum***.**

Explanation: The value of this queue server parameter was less than the minimum allowed value *minimum*.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQPR

DFHXQ0207 Value *value* **for parameter** *keyword* **is incorrect. It should be a time hh&:.mm&:.ss or hh&:.mm or a number of seconds.**

Explanation: The value of this queue server parameter did not conform to the correct syntax for a time interval.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQPR

DFHXQ0208 Parameter keyword *keyword* **is not supported for** *command***.**

Explanation: A queue server parameter keyword was specified in a context where it is not valid, usually indicating an attempt to SET dynamically a parameter which can only be specified at initialization time.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQPR

DFHXQ0209 Parameter text contains invalid character: *text*

Explanation: The queue server parameter processing routine found some unexpected text when attempting to process parameters.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Correct the parameters (or remove the incorrect parameter) and reenter the command or restart the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQPR

DFHXQ0210 Parameter keyword *keyword* **should not have a value for** *command***.**

Explanation: A queue server parameter keyword was specified in the form keyword=value in a context where it was not expected, for example on a DISPLAY command.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Reenter the command without specifying a value for the parameter to be displayed.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQPR

DFHXQ0211I Parameter value: *keyword***=***value*

Explanation: This message is issued to show the current value of a queue server parameter setting in response to a DISPLAY or PRINT command.

System Action: Processing continues normally.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQPR

DFHXQ0212 Value *value* **for parameter** *keyword* **is incorrect. It must be one of** *validlist***.**

Explanation: The value of this queue server parameter was not recognized. It should have been specified as one of the indicated list of values.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQPR

DFHXQ0213 Value for parameter *keyword* **is missing. The correct form is keyword=value.**

Explanation: A parameter keyword was specified without an associated parameter value on a queue server SET command or in a SYSIN or PARM parameter string. Note that the only character which should appear between the parameter keyword and its intended value is the equals sign, without any extra spaces.

System Action: Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User Response: Reenter the parameter specification in the correct form keyword=value.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQPR

DFHXQ0301I Console operator *consname* **issued command:** *command*

Explanation: A queue server operator command has been issued via the MVS MODIFY or STOP command. This message identifies the console name (or TSO userid) from which the command was issued and the text of the command.

System Action: Processing continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHXQOP

DFHXQ0302I *command* **command ignored because no valid parameters were given.**

Explanation: A queue server command was issued which had no valid parameters on it but was otherwise syntactically valid. The command has had no effect.

System Action: Processing continues normally.

User Response: Ensure that the command was entered correctly.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQOP

DFHXQ0303I *command* **command has been processed.**

Explanation: A queue server command has been processed successfully.

System Action: Processing continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQOP

DFHXQ0304I STOP command is waiting for connections to be closed. Number of active connections = *connections***.**

Explanation: A queue server STOP command has been issued (either via an MVS STOP command or via an MVS MODIFY command with the text STOP) but there are still active connections to the server, so the STOP command has not yet taken effect.

System Action: The server rejects any further attempts to establish new connections, but continues processing requests for existing connections. Each time a connection is terminated, this message is repeated for as long as there are more active connections.

User Response: Further information about the connections which are still active can be obtained using the command DISPLAY CONNECTIONS.

If the server needs to be shut down without waiting for connections to be closed, issue the queue server CANCEL command. Note that this immediately terminates any active connections, causing any further requests for that server to be given a SYSIDERR indication. (The MVS CANCEL command can also be used, but should preferably be avoided because it prevents the server from producing its normal closedown statistics and reports).

Note that if a CICS region is abnormally terminated while server connect or disconnect processing is in progress, or is terminated without going through end of task processing (for example using the FORCE command) there is a slight chance that the server will not be notified that the connection has been terminated. In this case the server is not able to be closed down with the server STOP command, but only with the server CANCEL command.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQOP

DFHXQ0305I STOP command has been processed.

Explanation: Processing of a queue server STOP command has now been successfully completed. This means that there are no longer any active connections and the server is ready to close down.

System Action: The queue server starts termination processing.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQOP

DFHXQ0306 Shared TS queue server does not support this command: *command*

Explanation: An operator command was addressed to the queue server using the MVS MODIFY command, but the first word of the MODIFY text is not a recognized queue server command (SET, DISPLAY, PRINT, STOP or CANCEL).

System Action: The command is ignored.

User Response: Correct and reenter the command.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQOP

DFHXQ0307I CANCEL command has been processed. Number of active connections = *connections***.**

Explanation: A queue server CANCEL command has been issued, either from an operator console or internally by the queue server in response to a severe error. This message includes the number of active connections which may be affected by this command.

System Action: The queue server terminates immediately, without waiting to close connections.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQOP

DFHXQ0351I Connection: Job *jobname* **Appl** *applid* **Idle** *idletime*

Explanation: This describes a single connection in response to the command DISPLAY CONNECTIONS or PRINT CONNECTIONS. The information shows the job name, the specific APPLID and the time in hours, minutes and seconds since the most recent queue request or inquire call was issued using the connection.

System Action: This message is issued for each active connection then message DFHXQ0352I is issued to show the total number of active connections.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCN

DFHXQ0352I Queue pool *poolname* **total active connections:** *connections***.**

Explanation: This describes the total number of active connections to the queue pool server, in response to the server command DISPLAY CONNECTIONS or PRINT CONNECTIONS.

System Action: Processing continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCN

DFHXQ0401I Connected to CF structure *strname***.**

Explanation: The queue server has successfully established a connection to the coupling facility list structure for the queue pool, using the IXLCONN macro.

System Action: Processing continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0402I CF structure *strname* **was allocated by this connection.**

Explanation: The list structure did not previously exist and was allocated as part of the connection process.

System Action: List structure initialization will be performed if necessary.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0403 Connection to CF structure *strname* **failed, IXLCONN return code** *retcode***, reason code** *rsncode***.**

Explanation: The IXLCONN macro to connect the queue server to its coupling facility list structure failed.

System Action: The queue server is terminated.

User Response: See the IXLCONN macro in *MVS/ESA Programming: Sysplex Services Reference* (GC28-1496) for the explanation of the return and reason code. If the reason code is of the form xxxx0C08, indicating structure allocation failure, this message is followed by message DFHXQ0409 giving the facility reason code for each CF in which allocation was attempted.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0404 CF structure *strname* **cannot be used because it has been allocated with attribute** *attribute***.**

Explanation: The queue server has successfully connected to its list structure but has found that the structure has been allocated using an IXLCONN structure attribute keyword which is not supported by the queue server.

System Action: The queue server is terminated.

User Response: This probably indicates that the structure has been allocated or modified by some program other than the queue server. In this case, the incorrect structure should be deleted (for example using the SETXCF FORCE command) so that it will be reallocated correctly when the queue server is restarted.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0405 CF structure *strname* **element size** *elemsize* **is incorrect. It should be a power of 2 in the range 256 to 4096.**

Explanation: The queue server list structure element size (specified via the ELEMSIZE initialization parameter) is not a power of two, or is outside the range supported by the list structure hardware.

System Action: The queue server is terminated (without attempting to connect to the list structure).

User Response: Correct the ELEMSIZE parameter and restart the queue server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0406 Initialization failed for CF structure *strname* **with response** *response***.**

Explanation: Queue server processing to initialize the list structure failed with an abnormal internal response code.

System Action: The server is terminated.

User Response: If the response code is 8 (I/O error), it indicates that an IXLLIST macro gave an abnormal return code, in which case a previous DFHXQ0441 message will have been issued giving the IXLLIST return code and reason code. If this response code is any other value, this indicates that the list structure is in a state which should not occur, probably indicating that it was allocated or modified by a program other than the queue server. In this case the structure may need to be deleted (using SETXCF FORCE) so that it will be reallocated when the server is restarted.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0407 CF structure *strname* is not available for shared use.

Explanation: The queue pool is currently locked for exclusive use by some other job such as a queue pool unload or reload job. (This serialization uses an MVS ENQ with scope SYSTEMS for major name SYSZDFH minor name DFHXQLS_poolname).

System Action: The server is terminated.

User Response: Check whether a queue pool maintenance job is currently running. If it is, wait until it has finished before trying to start the server again.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0408 CF structure *strname* is not available for exclusive use.

Explanation: The current job (an unload or reload) requires exclusive use of the queue pool, but some other job is running which already has shared or exclusive use of the pool. (This serialization uses an MVS ENQ with scope SYSTEMS for major name SYSZDFH minor name DFHXQLS_poolname).

System Action: The server is terminated.

User Response: Check whether a queue pool server or maintenance job is currently running. If it is, wait until it has finished before trying to run the current job again.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0409 CF structure *strname* could not be allocated in facility *cfname*, reason code *rsncode*.

Explanation: If a previous message DFHXQ0403 indicated an IXLCONN failure because the structure could not be allocated, this message is issued for each CF in which allocation was attempted to show the facility reason code indicating why structure allocation failed. If the reason code is known to the server, the name of the reason code is given (without the ConaRsn prefix), otherwise its decimal value is shown.

If the response indicates InvalidStructureSize, this means that the initial list structure size (specified on the server POOLSIZE parameter or in the CFRM policy INITSIZE parameter) is not large enough to contain the required structure control information. The size of the control information is affected by the number of list headers (determined by the server MAXQUEUES parameter) and by the maximum structure size specified in the CFRM policy.

System Action: The queue server is terminated.

User Response: See the descriptions of the reason codes in the MVS macro IXLYCONA which maps the connect answer area.

If the response was InvalidStructureSize, increase the initial structure size specification in the server POOLSIZE parameter or the CFRM policy INITSIZE parameter to ensure that there is enough space for data in addition to the structure control information. Also, check that the server MAXQUEUES parameter and the maximum structure size specified in the CFRM policy are not unnecessarily large. See the *System Definition Guide* for more information on how to estimate temporary storage queue pool sizes.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0410 CF structure *strname* cannot be used, coupling facility maintenance level is too low.

Explanation: Initialization test routines executed against the allocated list structure gave incorrect results, indicating that the coupling facility control code does not include all maintenance necessary to support shared temporary storage.

System Action: The queue server is terminated.

User Response: Ensure that the required level of coupling facility maintenance is applied.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0411I CF structure *strname* now has *percentage*% of entries in use.

Explanation: This message is issued by the queue server when the percentage of list entries in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after an ALTER request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio.

System Action: The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not making full use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

User Response: Note that the structure may soon become full, preventing queues from being created. If the structure was allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be altered dynamically using the MVS SETXCF command with the START,ALTER options.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0412I CF structure *strname* now has *percentage*% of elements in use.

Explanation: This message is issued by the queue server when the percentage of list data elements in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after an ALTER request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio.

System Action: The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not

making full use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

User Response: Note that the structure may soon become full, preventing queues from being created. If the structure was allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be altered dynamically using the MVS SETXCF command with the START,ALTER options.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0413I Starting ALTER to adjust CF structure *strname* **entry/element ratio to** *entries*/*elements***.**

Explanation: The queue server has determined that the ratio of free entries to free elements is significantly different from the ratio of entries to elements actually in use. It is issuing an IXLALTER macro to request the coupling facility to adjust the ratio to make better use of the coupling facility storage.

System Action: The server continues by issuing the IXLALTER macro. A further message will be issued when the ALTER request is accepted or rejected by MVS.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0414I ALTER started for CF structure *strname***.**

Explanation: The queue server has successfully started an ALTER request to change the entry to element ratio for the list structure.

System Action: The queue server event exit will be notified by MVS when the ALTER request completes and a further message will then be issued.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0415I ALTER rejected for CF structure *strname***, ALTER already active.**

Explanation: The queue server attempted to start an ALTER to change the entry to element ratio for the list structure, but this was rejected by the system because another ALTER was already active.

System Action: The queue server event exit will be notified by MVS when the ALTER request completes and a further message will then be issued.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0416 ALTER request failed for CF structure *strname***, IXLALTER return code** *retcode***, reason code** *rsncode***.**

Explanation: The queue server attempted to start an ALTER to change the entry to element ratio for the list structure, but this was rejected by the system with an unexpected return code.

System Action: The current ALTER attempt is abandoned. Another attempt may be made when the minimum alter interval has expired.

User Response: See the IXLALTER macro in *MVS/ESA Programming: Sysplex Services Reference* (GC28-1496) for the explanation of the return and reason code.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0417I ALTER completed normally for CF structure *strname***.**

Explanation: The queue server has been notified by the system that an ALTER request has completed normally.

System Action: New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHXQ0411 and DFHXQ0412 to indicate the new usage percentages.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0418I ALTER ended abnormally for CF structure *strname* **with status** *status***.**

Explanation: The queue server has been notified by the system that an ALTER request has ended abnormally. The two bytes of status information in this message are taken from EEPLALTERENDSTATEFLAGS in the event exit parameter list (defined in the IXLYEEPL macro).

System Action: No action is taken as a result of this notification, but the problem which caused the ALTER to fail will probably result in other related problems.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0419I ALTER ended normally for CF structure *strname* **but target was not attained.**

Explanation: The queue server has been notified by the system that an ALTER request has ended normally but that the target ratio or target size was not attained.

System Action: New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHXQ0411 and DFHXQ0412 to indicate the new usage percentages.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0424 Connectivity has been lost to CF structure *strname*. The shared TS queue server cannot continue.

Explanation: The queue server has been notified by the system that connectivity has been lost to its list structure.

System Action: The server issues an internal CANCEL command to terminate itself immediately.

User Response: Restart the server when connectivity to the server from the current system has been reestablished. If connectivity is still available from other systems, CICS transactions which require access to the affected queue pool should be diverted to those systems if possible.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0425 CF structure *strname* has failed. The shared TS queue server cannot continue.

Explanation: The queue server has been notified by the system that its list structure has been lost due to coupling facility failure. All data in the queue pool has been lost.

System Action: Each queue server for the affected pool issues an internal CANCEL command to terminate itself immediately.

User Response: If another coupling facility is available and is included in the CFRM preference list for the failed structure, delete the failed structure and restart the servers to cause a fresh copy of the list structure to be allocated on the alternate coupling facility. If no other coupling facility is available, wait until the original coupling facility has been made available again before restarting the servers.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0431I Access statistics for CF structure *strname*:

Explanation: This message gives a summary of coupling facility access statistics. It is issued in response to a DISPLAY or PRINT command which includes the CFSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

```
Index:    Wrt Adjs    Writes     Reads   Deletes   Rereads Read Adjs
                n         n         n         n         n         n
Data:      Creates    Writes     Reads   Deletes   Rereads  Rewrites
                n         n         n         n         n         n
Responses:  Asynch    Normal   Len err   Not fnd  Vers chk  List chk
                n         n         n         n         n         n
          List full  Str full   I/O err
                n         n         n
```

System Action: Processing continues.

User Response: The statistics are described in detail in the DFHXQS1D data area. For queues which do not exceed 32K bytes, the data is included in the queue index, otherwise it is stored as a separate list. The individual fields have the following meanings:

- Index access counts:
  - Wrt Adjs — Number of index writes to update adjunct area only. (This area contains the read cursor for small queues and the queue status including last used data).
  - Writes — Number of queue writes (new or update) including data.
  - Reads — Number of queue index reads.
  - Delete — Number of queue deletes.
  - Rereads — Number of reads which had to be repeated because the data was larger than the default data transfer size.
  - Read Adjs — Number of index reads for the status area only. This is used for inquire processing, and also to read the queue details if necessary during delete processing.
- Data access counts:
  - Creates — Number of times a separate data list was created.
  - Writes — Number of writes to add items to separate data lists.
  - Reads — Number of reads from separate data lists.
  - Delete — Number of times a separate data list was deleted.
  - Rereads — Number of reads which had to be repeated because the data was larger than the default data transfer size.
  - Rewrites — Number of writes to replace items in separate data lists.
- Response counts:
  - Asynch — Number of requests for which completion was asynchronous.
  - Normal — Number of normal responses.
  - Len err — The input buffer was too small to contain the data. The server often tries a buffer size of only 4K in order to use a synchronous read if possible. If this response occurs, the server sets up the maximum sized buffer and reissues the read.
  - Not fnd — The specified entry (queue or item) was not found.
  - Vers chk — A version check failed for an entry being updated or created, indicating that another task had updated it first.
  - List chk — A list authority comparison failed, usually meaning that the queue is in the process of being deleted.
  - List full — A queue reached the maximum number of items, causing the relevant list to be marked as full.
  - Str full — The list structure became full.
  - I/O err — Some other error code was returned by IXLLIST.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0432I Queue pool statistics for CF structure *strname*:

Explanation: This message gives a summary of the usage statistics for the queue pool list structure. It is issued in response to a DISPLAY or PRINT command which includes the POOLSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

```
Structure:    Size  Max size Elem size   Queues:   Current   Highest
               nK        nK         n                   n         n
Lists:       Total    In use  Max used   Control      Data
                 n         n         n         n         n
              100%        n%        n%        n%        n%
Entries:     Total    In use  Max used      Free  Min free
                 n         n         n         n         n
              100%        n%        n%        n%        n%
Elements:    Total    In use  Max used      Free  Min free
                 n         n         n         n         n
              100%        n%        n%        n%        n%
```

System Action: Processing continues.

User Response: The statistics are described in detail in the DFHXQS1D data area. Pool usage statistics are calculated from information returned by coupling facility requests, and are not always very accurate, especially if the relevant information has not been accessed recently by the current server. The individual fields have the following meanings:

- Structure:
  - Size — Current allocated size of the list structure.
  - Max size — Maximum size to which this structure could be altered.
  - Elem size — Data element size used for the structure.
- Queues:
  - Current — Number of queues currently in existence.
  - Highest — Highest number of queues at any time (since last reset).
- Lists:
  - Total — Maximum number of list headers in the structure.
  - In Use — Number currently in use.
  - Max Used — Maximum number in use (since last reset).
  - Control — Number of lists in use for control information.
  - Data — Number of lists in use for queue data.
- Entries:
  - Total — Total entries in the currently allocated structure. (Obtained at connection time, may be updated by ALTER).
  - In Use — Number of entries currently in use.
  - Max Used — Maximum number in use (since last reset).
  - Free — Number of entries currently free (total minus used).
  - Min Free — Minimum number of free entries (since last reset).
- Elements:
  - Total — Total data elements in the currently allocated structure. (Obtained at connection time, may be updated by ALTER).
  - In Use — Number of elements currently in use.
  - Max Used — Maximum number in use (since last reset).
  - Free — Number of elements currently free (total minus used).
  - Min Free — Minimum number of free elements (since last reset).

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0441 CF structure *strname* request failed, IXLLIST return code *retcode*, reason code *rsncode*.

Explanation: A coupling facility access request issued via the IXLLIST macro gave an abnormal return code.

System Action: The failing request is given an I/O error indication, giving an IOERROR condition if it originated from a CICS API request.

User Response: See the IXLLIST macro in *MVS/ESA Programming: Sysplex Services Reference* (GC28-1496) for the explanation of the return and reason code.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0442 CF structure *strname* request failed, structure is full.

Explanation: A coupling facility access request issued via the IXLLIST macro failed because there are insufficient free entries or elements to store the new data in the structure.

System Action: The failing request is given a NOSPACE indication if it originated from a CICS API request. For reload processing, if an automatic ALTER is in progress, the request may be suspended until the outcome of the ALTER is known, then retried. This message will not be issued again for further failures until the used numbers of elements and entries fall well below the warning threshold.

User Response: Any queues which are no longer in use should be deleted so that the space can be reused. If the structure is not at its maximum size, it may be possible to start an ALTER request to increase the size using the MVS SETXCF command.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0443 CF structure *strname* request failed, all lists are in use.

Explanation: A coupling facility access request issued via the IXLLIST macro failed because all list headers defined in the structure are now in use. The number of list headers is determined by the MAXQUEUES server initialization parameter when the structure was allocated.

System Action: The failing request is given a NOSPACE indication if it originated from a CICS API request. This message will not be issued again for further failures while the shortage of list entries remains.

User Response: Any queues of total size greater than 32K bytes which are no longer in use should be deleted to free up data lists. As the number of lists is fixed when the structure is allocated, the only way to increase the number of lists is to unload the structure,

use SETXCF FORCE to delete it then reload it with a larger MAXQUEUES parameter.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0444I CF request has been suspended to await ALTER completion.

Explanation: A coupling facility access request issued from the server address space (during reload processing) ran out of space in the list structure, but an automatic ALTER attempt to free up more space is either already active or is being started at this point. The request is therefore being suspended to await the outcome of the ALTER attempt.

System Action: The request is suspended until either the ALTER request completes (normally or abnormally), then the request is retried.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0445I CF request is being retried after ALTER completion.

Explanation: A request which was suspended to await the completion of an ALTER request is now being retried because the ALTER has either completed or failed.

System Action: The suspended request will be restarted.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0451 Purge for CF structure *strname* **failed, IXLPURGE return code** *retcode***, reason code** *rsncode***.**

Explanation: A queue access request was terminated abnormally and the queue server issued an IXLPURGE macro to ensure any active IXLLIST request was purged before releasing the I/O buffer, but the IXLPURGE macro gave a non-zero return code.

System Action: The error is ignored because this only occurs when a request is already being terminated abnormally.

User Response: See the IXLPURGE macro in *MVS/ESA Programming: Sysplex Services Reference* (GC28-1496) for the explanation of the return and reason code.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0461I Disconnected from CF structure *strname***.**

Explanation: The server has successfully disconnected from the CF structure (using the IXLDISC macro).

System Action: Processing continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0462 Disconnect from CF structure *strname* **failed, IXLDISC return code** *retcode***, reason code** *rsncode***.**

Explanation: The IXLDISC macro to disconnect the queue server from its coupling facility list structure failed.

System Action: The error is ignored, as disconnection only occurs when the server is already terminating.

User Response: See the IXLDISC macro in *MVS/ESA Programming: Sysplex Services Reference* (GC28-1496) for the explanation of the return and reason code.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQCF

DFHXQ0501 Insufficient storage, only *actual* **of** *requested* **data buffers allocated.**

Explanation: The queue server was unable to allocate the specified number of data buffers (of 32K bytes) during initialization because the relevant storage pool (AXMPGANY) was exhausted.

System Action: The server is terminated.

User Response: Decrease the BUFFERS initialization parameter to a value less than the number which were successfully allocated (to leave plenty of storage for request processing) and restart the server. Alternatively, increase the region size for the queue server to allow more buffers to be allocated.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQBF

DFHXQ0511I Queue index buffer pool statistics:

Explanation: This message gives a summary of the usage statistics for the queue index buffer pool, which is used to read and write queue index entries and their associated data, and to save recently accessed index entries in storage to reduce coupling facility I/O. It is issued in response to a DISPLAY or PRINT command which includes the BUFSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

```
Buffers:     Total  Max used    Active    On LRU     Empty
                 n         n         n         n         n
Requests:     Gets      Puts     Keeps     Frees    Purges
                 n         n         n         n         n
Results:   Got hit  Got free   Got new   Got LRU   No buff
(Get)            n         n         n         n         n
Errors:  Not freed  No purge Not owned    Waits: Pool lock  Buf lock
                 n         n         n                   n         n
```

System Action: Processing continues.

User Response: The statistics are described in detail in the DFHXQS2D data area. The individual fields have the following meanings:

- Buffers:

  Total — Number of buffers in the pool.

  Max used — Highest number ever used (not affected by reset).

  Active — Buffers currently in use.

  On LRU — Buffers with valid contents on LRU chain to allow reuse.

  Empty — Buffers previously used but now empty.

- Requests:

  Gets — Requests to get a buffer.

  Puts — Requests to put back a buffer with valid contents.

  Keeps — Requests to put back a buffer with modified contents. (This function is not currently used by the queue server).

  Frees — Requests to put back a buffer as empty.

  Purges — Requests to discard contents of a previously valid buffer.

- Results (Get):

  Got hit — Request found a valid match on the LRU chain.

  Got free — Request obtained an empty buffer.

  Got new — Request obtained a buffer not previously used.

  Got LRU — Request discarded and reused the oldest valid buffer.

  No buff — Request failed to obtain a buffer.

- Errors:

  Not freed — Request tried to free a buffer which it did not own. (This can occur during error recovery).

  No purge — A purge request did not find any matching buffer.

  Not owned — A purge request hit a buffer owned by another task.

- Waits:

  Pool lock — Number of waits for the buffer pool header lock.

  Buf lock — Number of waits because another request owned the buffer.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQBF

DFHXQ0601I Starting statistics collection for interval since *lasttime*.

Explanation: The queue server is about to collect interval, end of day or closedown statistics. This message identifies the start of the time interval to which the statistics apply, which is either the time that the server was started up or the time of the last reset, which occurs whenever interval or end of day statistics are produced.

System Action: The queue server proceeds with statistics collection.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHXQST

DFHXQ0602I Statistics collection completed, reset performed.

Explanation: Queue server statistics have been collected and counters have been reset. This occurs for interval or end of day statistics.

System Action: Processing continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHXQST

DFHXQ0603I Statistics collection completed.

Explanation: Queue server statistics have been collected but counters have not been reset. This normally occurs at server closedown.

System Action: Processing continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHXQST

DFHXQ0604 Timer SET failed, return code *retcode*, reason code *rsncode*.

Explanation: An attempt by the queue server statistics subtask to set up a timer wait interval failed.

System Action: The interval statistics function is terminated with message DFHXQ0606.

User Response: Check the return code and reason code. A return code of 4 indicates an attempt to set up more than one concurrent timer interval, which indicates a logic error in the server. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM SET.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQST

DFHXQ0605 Timer CANCEL failed, return code *retcode*, reason code *rsncode*.

Explanation: An attempt by the queue server statistics subtask to cancel a timer wait interval failed.

System Action: The interval statistics function is terminated with message DFHXQ0606.

User Response: Check the return code and reason code. A return code of 4 indicates an attempt to cancel a nonexistent timer interval, which indicates a logic error in the server. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM CANCEL.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQST

DFHXQ0606 Statistics collection function is no longer available.

Explanation: The queue server statistics collection subtask was unable to continue processing and has terminated. The reason will have been indicated by an earlier message.

System Action: The interval statistics subtask terminates and no further interval statistics or end of day statistics will be produced for this run of the server.

User Response: See the earlier message indicating the reason for the termination of the subtask.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQST

DFHXQ0610I Statistics written to SMF, return code was *retcode***.**

Explanation: Queue server statistics have been sent to SMF. The return code from the SMFEWTM macro is indicated in this message. A non-zero return code usually indicates that SMF recording was suppressed because of current SMF options or an installation exit.

System Action: Processing continues.

User Response: If the return code is non-zero but SMF statistics were expected to be successfully written, see the SMFEWTM macro in *MVS/ESA System Management Facilities (SMF)* (GC28-1457) for more information about return codes.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Module: DFHXQST

DFHXQ0701I Shared TS queue pool *poolname* **is to be unloaded.**

Explanation: The server program has been started with the UNLOAD option requesting that the queue pool is unloaded to a sequential data set.

System Action: The server starts to process the unload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQUL

DFHXQ0702I Shared TS queue pool *poolname* **has been successfully unloaded.**

Explanation: The queue pool has been unloaded successfully.

System Action: The server closes down normally.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQUL

DFHXQ0703I Number of unloaded queues: *queues***. Blocks written:** *blocks***.**

Explanation: This message provides additional information about the results of the unload process, giving the number of queues which were unloaded and the number of 4K data blocks written to the unloaded queue pool data set.

System Action: Server termination continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQUL

DFHXQ0704 DFHXQUL data set for unload could not be opened.

Explanation: The data set to contain the unloaded queue pool could not be opened.

System Action: Unload processing is terminated and the server is closed down with message DFHXQ0706.

User Response: Check that the DFHXQUL DD statement is present in the JCL for the unload job.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQUL

DFHXQ0705 Unload access to CF structure *strname* **failed with response** *response***.**

Explanation: The unload process failed because of a problem with coupling facility access.

System Action: Unload processing is terminated and the server is closed down with message DFHXQ0706.

User Response: If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous error message will have been issued. Any other response code indicates an internal logic error.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQUL

DFHXQ0706 Unload for shared TS queue pool *poolname* **was unsuccessful.**

Explanation: The queue pool unload process failed. The reason will have been described in a previous message.

System Action: The server is terminated.

User Response: See the previous message giving the reason for the unload failure. Note that any unload data set produced in this case will be incomplete and will not be valid for reload purposes.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQUL

DFHXQ0801I Shared TS queue pool *poolname* is to be reloaded.

Explanation: The server program has been started with the RELOAD option requesting that the queue pool is to be reloaded from a sequential data set produced using the UNLOAD option.

System Action: The server starts to process the reload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQRL

DFHXQ0802I Shared TS queue pool *poolname* has been successfully reloaded.

Explanation: The queue pool has been reloaded successfully.

System Action: The server closes down normally.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQRL

DFHXQ0803I Queues reloaded: *queues*. Queues bypassed: *duplicates*. Blocks read: *blocks*.

Explanation: This message provides additional information about the results of the reload process. Queues on the unloaded data set are bypassed during reload processing if they already exist in the pool (for example as a result of a previous reload which could not be completed due to lack of space).

System Action: Server termination processing continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQRL

DFHXQ0804 DFHXQRL data set for reload could not be opened.

Explanation: The data set containing the queue pool to be reloaded could not be opened.

System Action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User Response: Check that the DFHXQRL DD statement is present in the JCL for the reload job.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQRL

DFHXQ0805 Reload access to CF structure *strname* failed with response *response*.

Explanation: The reload process failed because of a problem with coupling facility access.

System Action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User Response: If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous message DFHXQ0441 will have been issued. Any other response code indicates an internal logic error.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQRL

DFHXQ0806 Unexpected end of file encountered on reload data set.

Explanation: End of file was encountered on the unloaded data set before the logical end of the unloaded data was encountered.

System Action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User Response: This indicates that the unloaded data set is incomplete, perhaps because the unload process was abnormally terminated.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQRL

DFHXQ0807 Reload data set contains incorrect data near block *block*, offset *offset*.

Explanation: The reload process failed because the unloaded queue pool data set is not in the correct format.

System Action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User Response: Check that the correct data set is being used and that the unload process completed normally.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQRL

DFHXQ0808 Reload for shared TS queue pool *poolname* was unsuccessful.

Explanation: The queue pool reload process could not be completed. The reason will have been described in a previous message.

System Action: The program is terminated.

User Response: See the previous message giving the reason for the reload failure.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQRL

DFHXQ0809 Reload for CF structure *strname* **failed, structure is full.**

Explanation: Reload processing failed because there are insufficient free entries or elements to store the new data in the structure.

System Action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User Response: If the structure is not at its maximum size, use the MVS SETXCF FORCE to delete the structure, then change the reload parameters to specify a larger POOLSIZE parameter and rerun the reload job. The approximate amount of information which could not be reloaded can be estimated by comparing the numbers of blocks read and queues reloaded, as described by following message DFHXQ0803, with the corresponding numbers from message DFHXQ0703 in the unload job.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: DFHXQRL

DFHXQ0810 Reload for CF structure *strname* **failed, all lists are in use.**

Explanation: Reload processing failed because all list headers defined in the structure are now in use.

System Action: Reload processing is terminated and the server is closed down with message DFHXQ0808.

User Response: Use the MVS SETXCF FORCE to delete the structure, then change the reload MAXQUEUES parameter to a large value and rerun the reload job.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Module: various

DFHXSxxxx messages

DFHXS0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHXSAD, DFHXSCL, DFHXSDM, DFHXSFL, DFHXSIS, DFHXSLU, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHXS0002 *applid* **A severe error (code** *X'code***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated

by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHXSAD, DFHXSCL, DFHXSDM, DFHXSFL, DFHXSIS, DFHXSLU, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: *applid, X'code', modname*

DFHXS0004 *applid* **A possible loop has been detected at offset** *X'offset'* **in module** *modname***.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHXSAD, DFHXSCL, DFHXSDM, DFHXSFL, DFHXSIS, DFHXSLU, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: *applid, X'offset', modname*

DFHXS0006 *applid* **Insufficient storage to satisfy Getmain (code** *X'code'***) in module** *modname***. MVS code** *mvscode***.**

Explanation: An MVS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'*code*' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code *mvscode* is the MVS GETMAIN return code.

System Action: An exception entry is made in the trace table (code X'*code*'). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. See the *CICS System Definition Guide* or the *CICS Performance Guide* for further information on CICS storage.

Destination: Console

Modules: DFHXSAD, DFHXSCL, DFHXSDM, DFHXSFL, DFHXSIS, DFHXSLU, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT Parameters: *applid, X'code', modname, mvscode*

DFHXS0200I *date time applid* **External security initialization has been successfully tracked.**

Explanation: An external security initialization performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD) has been tracked to the XRF alternate system, and has completed successfully.

System Action: None.

User Response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Module: DFHXSWM

XMEOUT Parameters: *date, time, applid*

DFHXS0201I *date time applid* **External security initialization has been tracked, and has failed with return code** *X'xx'* **and reason code** *X'yy'***.**

Explanation: An external security initialization was performed on an active CICS system by use of a CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD.

The external security initialization has been tracked to the XRF alternate system, but has failed with return code *xx* and reason code *yy*.

xx and *yy* are the values placed in registers 15 and 0 by the external security manager.

System Action: CICS provides a system dump of the XRF alternate system, and continues tracking security initializations.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: The security characteristics of the alternate system no longer match those of the active system. Either shut down the alternate system, perform a security rebuild at takeover, or accept the difference.

Use the return codes in the message, to determine why the security initialization failed.

If the codes are invalid, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHXSWM

XMEOUT Parameters: *date, time, applid, X'xx', X'yy'*

DFHXS0202 *date time applid* **An attempt to track external security initialization has failed, tracking data could not be sent.**

Explanation: An external security initialization was performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD).

It has not been tracked to an alternate system because the tracking data could not be sent.

System Action: CICS provides a system dump of the active, and continues tracking security initializations.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: The security characteristics of the alternate will no longer match those of the active. Either shut down the alternate, perform a security rebuild at takeover, or accept the difference.

Destination: CSCS

Module: DFHXSWM

XMEOUT Parameters: *date, time, applid*

DFHXS0203 *date time applid* **An attempt to track external security initialization has failed, tracking data could not be received.**

Explanation: An external security initialization was performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD).

The external security initialization has not been tracked to an alternate system because the tracking data could not be received.

Message DFHME0116 is normally produced containing the symptom string for this problem.

System Action: CICS provides a system dump of the alternate system, and ceases to track the security initializations.

User Response: The security characteristics of the alternate system no longer match those of the active system. Either shut down the alternate system, perform a security rebuild at takeover, or accept the difference.

Destination: CSCS

Module: DFHXSWM

XMEOUT Parameters: *date, time, applid*

DFHXS0204 *date time applid* **An attempt to track external security initialization has failed, tracking data was corrupted.**

Explanation: An external security initialization was performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD).

It has been tracked to an alternate system but the tracking data was corrupted in transit.

System Action: CICS provides a system dump of the alternate systems, and ceases to track the security initializations.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: The security characteristics of the alternate system no longer match those of the active system. Either shut down the alternate system, perform a security rebuild at takeover, or accept the difference.

Destination: CSCS

Module: DFHXSWM

XMEOUT Parameters: *date, time, applid*

DFHXS1100I *applid* **Security initialization has started.**

Explanation: This is an informational message indicating that security domain initialization has started.

System Action: System initialization continues.

User Response: None.

This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHXSDM

XMEOUT Parameter: *applid*

DFHXS1101I *applid* **Security initialization has ended.**

Explanation: This is an informational message indicating that security domain initialization has completed successfully.

System Action: System initialization continues.

User Response: None.

This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHXSDM

XMEOUT Parameter: *applid*

DFHXS1102I *applid* **Security is inactive.**

Explanation: This is an informational message indicating that security is not active.

System Action: System initialization continues.

User Response: None.

This message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Module: DFHXSDM

XMEOUT Parameter: *applid*

DFHXS1103I *applid* **Default security for userid** *dfltuser* **has been established.**

Explanation: CICS has established a security environment for the default userid *dfltuser*.

System Action: The authorities that are assigned to this userid by the external security manager will be used in CICS resource checks whenever no other userid has been established.

User Response: None.

Destination: Console Routecodes 2, 9 and 11

Module: DFHXSDM

XMEOUT Parameters: *applid, dfltuser*

DFHXS1104 *applid* **Default security could not be established for userid** *dfltuser***. The security domain cannot continue, so CICS is terminated. SAF codes are (***X'safresp'***,***X'safreas'***). ESM codes are (***X'esmresp'***,***X'esmreas'***).**

Explanation: CICS could not establish a security environment for the default userid *dfltuser*. The security domain cannot continue without a default user. The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY macro.

System Action: CICS terminates.

User Response: Use the external security manager codes to determine why the RACROUTE REQUEST=VERIFY operation failed. Then, either correct the errors for the failing default user and restart CICS, or restart CICS with a different default userid.

Destination: Console Routecodes 2, 9, 10 and 11

Module: DFHXSDM

XMEOUT Parameters: *applid, dfltuser, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHXS1105 *applid* **Resource profiles for class** *classname* **have been built.**

Explanation: The security resource profiles for the class *classname* have been successfully loaded into storage by the external security manager.

System Action: The profiles are used in subsequent resource checks to determine users' authorizations to access resources in the named class.

User Response: None.

Destination: Console Routecodes 2, 9, 10 and 11

Module: DFHXSRC

XMEOUT Parameters: *applid, classname*

DFHXS1106 *applid* **Resource profiles could not be built for class** *classname***. CICS is terminated. SAF codes are (***X'safresp'***,***X'safreas'***). ESM codes are (***X'esmresp'***,***X'esmreas'***).**

Explanation: The security resource profiles for the class *classname* could not be loaded into storage by the external security manager. The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=LIST macro.

The build of the profiles was requested by one of the following:

- The initialization of the security domain
- The CEMT command PERFORM SECURITY REBUILD
- A user-supplied transaction invoking the EXEC CICS PERFORM SECURITY REBUILD command.

System Action: CICS is unable to provide reliable resource security, so it terminates.

User Response: Use the external security manager codes to determine why the RACROUTE REQUEST=LIST operation failed. Rectify the problem in the external security manager, then restart CICS.

Destination: Console Routecodes 2, 9, 10 and 11

Module: DFHXSRC

XMEOUT Parameters: *applid, classname, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHXS1107 *applid* **Partner-LU profiles for class APPCLU have been built.**

Explanation: The partner-LU profiles for the class APPCLU have been successfully loaded into storage by the external security manager.

System Action: The profiles are used in subsequent bind authorization checks for LU6.2 sessions whose CONNECTION definition specifies BINDSECURITY(YES).

User Response: None.

Destination: Console Routecodes 2, 9, 10 and 11

Module: DFHXSRC

XMEOUT Parameter: *applid*

DFHXS1108 *applid* **Partner-LU profiles could not be built for class APPCLU. SAF codes are (***X'safresp'***,***X'safreas***'). ESM codes are (***X'esmresp'***,***X'esmreas***').**

Explanation: The partner-LU profiles for the class APPCLU could not be loaded into storage by the external security manager. CICS therefore has no APPCLU security profiles. The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=LIST macro.

The build of the profiles was requested by one of the following:

- The initialization of VTAM support in terminal control
- The CEMT command SET VTAM OPEN
- The CEMT command PERFORM SECURITY REBUILD
- A user-supplied transaction invoking the EXEC CICS SET VTAM OPEN command.
- A user-supplied transaction invoking the EXEC CICS PERFORM SECURITY REBUILD command.

System Action: If the failure occurs during CICS initialization or PERFORM SECURITY REBUILD, CICS terminates. If the failure occurs during SET VTAM OPEN, the VTAM ACB is closed and CICS continues.

User Response: Use the external security manager codes to determine why the RACROUTE REQUEST=LIST operation failed. Rectify the problem in the external security manager, then restart CICS.

Destination: Console Routecodes 2, 9, 10 and 11

Modules: DFHXSIS, DFHXSRC

XMEOUT Parameters: *applid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHXS1109 *applid* **APPC PROFILE** *profile* **COULD NOT BE AUDITED. SAF CODES ARE (***X'safresp'***,***X'safreas***'). ESM CODES ARE (***X'esmresp'***,***X'esmreas***').**

Explanation: An audit request for a partner-LU verification check has failed for profile *profile*.

During the start-up of an APPC session, each partner can validate the other. During this validation process, the system:

- Retrieves the relevant APPCLU profile from the external security manager
- Checks that the session key is still usable
- Requests the external security manager to write audit records concerning this profile and the validation to the system management facility (SMF).

The following events are audited:

- Whether the session partner was correctly validated
- Whether the session partner failed validation
- Whether the session key will expire in less than six days
- Whether the retrieved profile is “locked”
- Whether the session key is null, or all zero
- Whether the session key has expired.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=AUDIT macro.

System Action: The CICS system is not affected by this event, and CICS continues.

User Response: Use the external security manager codes to determine why the RACROUTE REQUEST=AUDIT operation failed. Correct the problem in the external security manager, then perform a security rebuild, if appropriate.

Note: This message cannot be changed with the message editing utility.

Destination: Console Routecode 9

Module: DFHXSSB

DFHXS1110 *applid* **Security is requested, but the external security manager is inactive.**

Explanation: Security was requested for this region, but the external security manager (ESM) was found to be inactive. The SEC system initialization parameter was specified as YES or left as its default value. CICS cannot initialize its security manager unless the ESM is active.

System Action: CICS terminates.

User Response: If you have an ESM installed on your system, ensure that it is active before attempting to start CICS. Otherwise, restart CICS without security by specifying SEC=NO as a system initialization parameter. Note that the SEC parameter cannot be entered as a console override.

Destination: Console Routecodes 1, 9, 10 and 11

Module: DFHXSIS

XMEOUT Parameter: *applid*

DFHXS1111 *date time applid tranid* **Security violation by user** *userid{ at netname | at console }portname* **for resource** *resource* **in class** *classname***. SAF codes are (***X'safresp'***,***X'safreas***'). ESM codes are (***X'esmresp'***,***X'esmreas***').**

Explanation: CICS has detected a security violation by user *userid* while performing an authority check for resource *resource* in resource class *classname*.

If the userid causing the violation is signed on at a VTAM terminal, the phrase “at netname *portname*” reports the netname at which the violation occurred. If the userid causing the violation is signed on at a console, the phrase “at console *portname*” reports the console name at which the violation occurred. If the userid causing the violation is not signed on or this is a non terminal task, the entry port does not appear in this message as it is not available.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=FASTAUTH or RACROUTE REQUEST=AUTH macros. These return codes are described in the *OS/390 MVS Programming: Authorized Assembler Services Guide* and in *External Security Interface (RACROUTE) Macro Reference for MVS and VM* (SC28-1366).

CICS can also issue this message when you use the EXEC CICS QUERY SECURITY command with the LOGMESSAGE(LOG) option.

System Action: CICS abnormally terminates the task requesting the invalid access except under one of the following conditions:

- The command is issued within the scope of an EXEC CICS HANDLE NOTAUTH command.

- The command is issued as a result of an EXEC CICS QUERY SECURITY command.

User Response: Note the security violation.

Destination: CSCS

Module: DFHXSRC

XMEOUT Parameters: *date, time, applid, tranid, userid, {1= at netname , 2= at console }, portname, resource, classname, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHXS1112 *applid* **The CICS region userid and groupid could not be determined. SAF codes are (***X'safresp'***,***X'safreas'***). ESM codes are (***X'esmresp'***,***X'esmreas'***).**

Explanation: CICS could not determine the userid and groupid for this CICS region.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=EXTRACT macro.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

User Response: Use the external security manager codes to determine why the RACROUTE REQUEST=EXTRACT operation failed. Then, either correct the errors for the failing region userid and groupid, and restart CICS, or restart CICS with a different userid and groupid.

Destination: Console Routecodes 2, 9, 10 and 11

Module: DFHXSIS

XMEOUT Parameters: *applid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHXS1113 *applid* **The region userid cannot access system transaction** *tranid***. CICS will terminate. SAF codes are (***X'safresp'***,***X'safreas'***). ESM codes are (***X'esmresp'***,***X'esmreas'***).**

Explanation: The region userid for this CICS system is not authorized to attach the system transaction *tranid*. It is a CICS requirement that the region userid must be able to access this transaction.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=FASTAUTH or AUTH macro.

System Action: CICS terminates.

User Response: Authorize the CICS region userid to access all the required CICS system transactions, or specify a different region userid that does have the required authority. (The required transactions are documented as the 'Category 1' transactions in the *CICS RACF Security Guide*. To authorize the region userid to use these transactions, you should execute the sample clist DFH$CAT1, as described in the *CICS Transaction Server for OS/390 Installation Guide*.) Then restart CICS.

Destination: Console Routecodes 2, 9, 10 and 11

Module: DFHXSRC

XMEOUT Parameters: *applid, tranid, X'safresp', X'safreas', X'esmresp', X'esmreas'*

DFHXS1201 *date time applid* **The password supplied in the verification request for userid** *userid* **was invalid. This occurred in transaction** *tranid* **when userid** *userid* **was signed on at netname** *netname***.**

Explanation: An invalid password was supplied for user verification.

System Action: The external security manager also issues a message on the MVS/ESA security console.

CICS continues. No dump is taken.

User Response: Supply the correct password, or contact your security administrator for assistance. If you continue to supply incorrect passwords, the userid may be revoked by the external security manager. A revoked userid can only be reinstated by a security administrator.

Destination: CSCS

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, userid, netname*

DFHXS1202 *date time applid* **The password supplied in the verification request for userid** *userid* **has expired. This occurred in transaction** *tranid* **when userid** *userid* **was signed on at netname** *netname***.**

Explanation: An expired password was supplied for user verification.

System Action: CICS continues. No dump is taken.

User Response: Change the password using the CICS signon process, the EXEC CICS CHANGE PASSWORD API, or any other method available to you. Alternatively, contact your security administrator for assistance.

Destination: CSCS

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, userid, netname*

DFHXS1203 *date time applid* **The userid supplied in the verification request for userid** *userid* **is revoked. This occurred in transaction** *tranid* **when userid** *userid* **was signed on at netname** *netname***.**

Explanation: A revoked userid was supplied for user verification.

System Action: CICS continues. No dump is taken.

User Response: Contact your security administrator for assistance.

Destination: CSCS

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, userid, netname*

DFHXS1205 *date time applid* **The userid** *userid* **supplied in a verification request is not defined in the ESM. This occurred in transaction** *tranid* **at netname** *netname***.**

Explanation: An undefined userid was supplied for user verification.

System Action: CICS continues. No dump is taken.

User Response: Contact your security administrator for assistance.

Destination: CSCS

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, netname*

DFHXS1211 *date time applid* **The password supplied in a change password request for userid** *userid* **was invalid. This occurred in transaction** *tranid* **when userid** *userid* **was signed on at netname** *netname***.**

Explanation: An invalid password was supplied for change password processing.

System Action: The external security manager also issues a message on the MVS security console.

CICS continues. No dump is taken.

User Response: Supply the correct password or contact your security administrator for assistance. If you continue to supply incorrect passwords, the userid may be revoked by the external security manager. A revoked userid can only be reinstated by a security administrator.

Destination: CSCS

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, userid, netname*

DFHXS1213 *date time applid* **The userid supplied in a change password request for userid** *userid* **is revoked. This occurred in transaction** *tranid* **when userid** *userid* **was signed on at netname** *netname***.**

Explanation: A revoked userid was supplied on a password change request

System Action: CICS continues. No dump is taken.

User Response: You should have the userid reinstated before it can be used. Contact your security administrator for assistance.

Destination: CSCS

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, userid, netname*

DFHXS1214 *date time applid* **The new password supplied in a change password request for userid** *userid* **was not accepted. This occurred in transaction** *tranid* **when userid** *userid* **was signed on at netname** *netname***.**

Explanation: An invalid new password was supplied on a password change request.

System Action: CICS continues. No dump is taken.

User Response: Select a suitable new password and try again. If necessary, contact your security administrator for assistance.

Destination: CSCS

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, userid, netname*

DFHXS1215 *date time applid* **The userid** *userid* **supplied in a change password request is not defined in the ESM. This occurred in transaction** *tranid* **at netname** *netname***.**

Explanation: An undefined userid was supplied on a password change request

System Action: CICS continues. No dump is taken.

User Response: Contact your security administrator for assistance.

Destination: CSCS

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, netname*

DFHXS1216 *date time applid* **The userid** *userid* **supplied in a change password request has a revoked connection to the default group in the ESM. This occurred in transaction** *tranid* **at netname** *netname***.**

Explanation: The userid supplied on a password change request is revoked in the ESM connection to the default group.

System Action: CICS continues. No dump is taken.

User Response: Contact your security administrator for assistance.

Destination: CSCS

Module: DFHXSPW

XMEOUT Parameters: *date, time, applid, userid, tranid, netname*

DFHZCxxxx messages

Messages that are generated because the VTAM SYNAD and LERAD exits have been entered are followed by VTAM RETURN CODE *xxyy* where *xx* is the VTAM recovery action return code and *yy* is the VTAM specific error return code, each obtained from fields of the RPL.

Messages that are generated because system or user sense data has been received, are followed by SENSE RECEIVED *xxyy zzzz* where *xx* is the VTAM system sense information byte, *yy* is the VTAM system sense modifier byte, and *zzzz* represents 2 bytes of user sense information.

Values for *xx*, *yy*, and *zzzz* are hexadecimal. The VTAM system sense information byte, *xx*, can have the following values:

xx	**meaning**
X'00'	User sense data only (see *zzzz*)
X'08'	Request reject
X'10'	Request error
X'20'	State error
X'40'	Request header (RH) usage error
X'80'	Path error

For the meaning of *yy*, see the *SNA Formats* manual.

The *sense* insert is not included in DFHZCxxxx messages when no meaningful feedback is available.

The *instance* field on some DFHZCxxxx messages is for IBM internal use only.

DFHZC0001 *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation: An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the *OS/390 MVS System Codes* manual.

Next, look up the CICS abend code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

For further information about *code*, see the *CICS Problem Determination Guide*.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHZGBM, DFHZGCA, DFHZGCC, DFHZGCN, DFHZGDA, DFHZGPC, DFHZGRP, DFHZGSL, DFHZGUB

XMEOUT Parameters: *applid, aaa/bbbb, X'offset', modname*

DFHZC0002 *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation: An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System Action: An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHZGCA, DFHZGCC, DFHZGCN, DFHZGDA, DFHZGPC, DFHZGRP, DFHZGSL, DFHZGUB

XMEOUT Parameters: *applid, X'code', modname*

DFHZC0003 *applid* **Insufficient storage (code** *X'code'***) in module** *modname***.**

Explanation: A CICS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'*code*' is the exception trace point ID which uniquely identifies the place where the error was detected.

System Action: An exception entry is made in the trace table (code X'*code*' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller A message will be issued to this effect. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Inform the system programmer.

Try increasing the size of the DSA or EDSA. See the *CICS System Definition Guide* or the *CICS Performance Guide* for more information on CICS storage.

Destination: Console

Modules: DFHTCRP, DFHZGRP

XMEOUT Parameters: *applid, X'code', modname*

DFHZC0004 *applid* **A possible loop has been detected at offset** *X'offset'* **in module** *modname***.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System Action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module:

XMEOUT Parameters: *applid, X'offset', modname*

DFHZC0101I *date time applid* **A predatory takeover has forced VTAM to allow another application to open the ACB which CICS was using.**

Explanation: A predatory takeover is occurring. This means that a job is initializing which has the same applid as the CICS system. This initiates a takeover of the network. As a normal part of this process, VTAM drives the TPEND exit.

System Action: All requests on VTAM sessions are abnormally terminated and the sessions closed. The VTAM ACB is then opened by the application which is using the same APPLID as the CICS region. The new system recovers any persisting sessions.

User Response: If this takeover of the network was unintentional, you can prevent it happening in future by using RACF to protect the APPLID. Refer to the VTAM application security section in the *VTAM Network Implementation Guide*, SC31-6434 for details of how to do this.

Destination: Console and Transient Data Queue CSNE

Module: DFHZNCA

XMEOUT Parameters: *date, time, applid*

DFHZC0110 *date time applid* **The LU6.2 NIB and the TCTTE/BIND data for session** *sessid* **did not match during a persistent sessions restart. Reason code** *X'n'***.**

Explanation: A node initialization block (NIB) has been passed to CICS by VTAM during a persistent sessions restart. An attempt was made by CICS to match the NIB to a session TCTTE. The reason code explains the cause of the mismatch.

Reason	Explanation
1	Single/parallel session indication did not match.
2	LU type did not match.
3	LU type and single/parallel session did not match.

System Action: The attempt to match a persisting session with a TCTTE has failed. The session is unbound. CICS ignores this session and continues with the next session if there is one.

User Response: The production of this message means that there is no suitable global catalog record to match the NIB which VTAM has passed in. This implies that the wrong global catalog is being used for this initialization of CICS, or that the catalog records are corrupted. Ensure that the global catalog being used is correct.

Destination: CSNE

Module: DFHZGPC

XMEOUT Parameters: *date, time, applid, sessid, X'n'*

DFHZC0111 *date time applid* **No session TCTTE is available to match sysid** *sysid* **for modename** *modename* **because VTAM has returned more NIBs than the CNOS session limit values require.**

Explanation: During persistent sessions restart VTAM has returned more node initialization blocks (NIBs) than the current CNOS session limit values require. This is probably because a CNOS from a high session limit to a lower session limit was in progress when CICS failed.

System Action: The process NIB function is terminated. The session is unbound. CICS ignores this session and continues with the next session if there is one.

This situation has no effect on the restored CICS. The last catalogued CNOS values are restored.

User Response: None.

Destination: CSNE

Module: DFHZGPC

XMEOUT Parameters: *date, time, applid, sysid, modename*

DFHZC0112 *date time applid* **No TCTME was found for sysid** *sysid* **modename** *modename* **during a persistent sessions restart.**

Explanation: An error has occurred during persistent sessions restart. VTAM passed a NIB to CICS containing the named modename, but CICS was unable to locate the corresponding TCTME.

System Action: The attempt to match the NIB to a TCTTE is terminated. The session is unbound.

A system dump is produced.

The CNOS values not related to this modegroup are restored, but the named modegroup cannot be recovered.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Module: DFHZGPC

XMEOUT Parameters: *date, time, applid, sysid, modename*

DFHZC0120I *applid* **VTAM sessions persisted for a cold or initial start. Sessions terminated. Inquire issued** *icount***, sessions persisting** *spcount***, sessions terminated** *stcount***.**

Explanation: CICS is initializing with a cold or initial start, but some VTAM sessions have persisted from a previous CICS with a nonzero PSDI value.

CICS has attempted to terminate all persisting sessions. The message inserts are as follows:

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS has terminated with a CLSDST or TERMSESS macro. This should be equal to *spcount*. If it is not, persistent session recovery probably failed. Earlier messages explain why.

  If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

System Action: CICS continues.

User Response: None.

Destination: Console

Module: DFHZGRP

XMEOUT Parameters: *applid, icount, spcount, stcount*

DFHZC0121I *applid* **VTAM sessions persisted for a WARM start. Sessions terminated. Inquires issued** *icount***, sessions persisting** *spcount***, sessions terminated** *stcount***.**

Explanation: CICS is initializing with a WARM start, but some VTAM sessions unexpectedly persisted from a previous CICS with a nonzero PSDI value.

CICS has attempted to terminate all persisting sessions. The message inserts are as follows:

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS has terminated with a CLSDST or TERMSESS macro. This should be equal to *spcount*. If it is not, persistent session recovery probably failed. Earlier messages explain why.

  If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

System Action: CICS continues.

User Response: Examine the JOBLOG from the previous run to determine why sessions persisted despite a WARM shut down.

Destination: Console

Module: DFHZGRP

XMEOUT Parameters: *applid, icount, spcount, stcount*

DFHZC0122I *applid* **VTAM sessions persisted for an EMERGENCY, XRF=YES start. Sessions terminated. Inquires issued** *icount***, sessions persisting** *spcount***, sessions terminated** *stcount***.**

Explanation: CICS is initializing with an EMERGENCY start, but XRF = YES has been specified and some VTAM sessions persisted unexpectedly from a previous CICS with a nonzero PSDI value.

CICS has attempted to close all persisting sessions. The message inserts are as follows:

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS has terminated with a CLSDST or TERMSESS macro. This should be equal to *spcount*. If it is not, persistent session recovery probably failed. Earlier messages explain why.

  If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

System Action: CICS continues.

User Response: You should not mix XRF and persistent sessions. If you wish to use XRF, do a cold or initial start.

Destination: Console

Module: DFHZGRP

XMEOUT Parameters: *applid, icount, spcount, stcount*

DFHZC0123I *applid* **VTAM sessions persisted when OPEN VTAM ACB issued. Sessions terminated. Inquires issued** *icount***, sessions persisting** *spcount***, sessions terminated** *stcount***.**

Explanation: The VTAM ACB has been opened while CICS is running, however some VTAM sessions persisted either from a previous CICS with a nonzero PSDI value, or when the VTAM ACB was closed.

Persisting sessions have been terminated. The message inserts are as follows:

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS terminated with a CLSDST or TERMSESS macro. This should be equal to *spcount*. If it is not, persistent session recovery probably failed. Earlier messages explain the reason.

  If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

System Action: CICS continues.

User Response: None.

Destination: Console

Module: DFHZGRP

XMEOUT Parameters: *applid, icount, spcount, stcount*

DFHZC0124I *applid* **VTAM sessions persisted for an EMERGENCY start. Inquires issued** *icount*, **sessions persisting** *spcount*, **sessions terminated** *stcount*, **sessions OPNDSTed** *socount*, **sessions in error** *secount*.

Explanation: CICS was initializing with an EMERGENCY start and some VTAM sessions persisted from a previous CICS with a nonzero PSDI value.

Each of the persisting sessions has been restored or terminated. The message inserts are as follows:

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS terminated with a CLSDST or TERMSESS macro. If an OPNDST failure occurred for an entire NIBLIST (see message DFHZC0129), the sessions in the NIBLIST have been terminated and this count includes these sessions.
- *socount* is the number of VTAM sessions that CICS restored successfully with an OPNDST OPTCD=RESTORE macro.
- *secount* is the number of sessions that CICS failed to restore.

System Action: CICS continues.

User Response: None.

Destination: Console

Module: DFHZGRP

XMEOUT Parameters: *applid, icount, spcount, stcount, socount, secount*

DFHZC0125 *date time applid netname* **persistent session will be terminated.** *sense* **((***instance***) Module name: {DFHZGRP})**

Explanation: CICS was initializing with an EMERGENCY start and some VTAM sessions persisted from a previous CICS with a nonzero PSDI value.

However, the session with a NETNAME of *netname* is terminated for one of the following reasons as indicated by the *instance* in the message. An AP exception trace entry is made for each *instance* as follows.

Instance	Point ID and Explanation
1	X'FB21' There is not enough storage to recover an APPC session.
2	X'FB22' There is not enough storage to recover a terminal session.
3	X'FB25' The NIB and the TCTTE with the same NETNAME were not of the same LU TYPE.

System Action: An AP exception trace with a point ID as above is issued. The session is terminated and CICS continues.

User Response: The exception trace point identifies where the message was issued and determines the action to take.

Destination: CSNE

Module: DFHZGRP

XMEOUT Parameters: *date, time, applid, netname, sense, instance, {1=DFHZGRP, 2=DFHZGRP, 3=DFHZGRP}*

DFHZC0126I *applid* **No VTAM sessions persisted for an EMERGENCY restart.**

Explanation: CICS was initializing with an EMERGENCY start but no VTAM sessions persisted from a previous CICS run. Possible reasons are:

- No persistence was specified in the previous run.
- CICS crashed with the ACB open but no sessions were in use.
- The PSDI value expired.
- An error occurred before DFHZGRP could determine if any sessions persist.

System Action: CICS continues.

User Response: None.

Destination: Console

Module: DFHZGRP

XMEOUT Parameter: *applid*

DFHZC0127 *applid* **Cannot reestablish persisting sessions - VTAM ACB is closed. Code:** *X'code'*. **Module name:** *module*

Explanation: The VTAM ACB has been opened and CICS is processing VTAM persisting sessions, however the ACB was closed, or is being closed by operator action before all the sessions could be restored or terminated.

System Action: CICS continues to close the VTAM ACB and then runs without VTAM support.

User Response: Determine why the operator closed the ACB and either continue without VTAM, dynamically open the ACB, or shut CICS down normally and restart it.

X'code' is the AP exception trace entry that determines which VTAM macro diagnosed the ACB as being closed and where it was issued.

Destination: Console

Modules: DFHZGRP DFHZGUB

XMEOUT Parameters: *applid, X'code', module*

DFHZC0128 *applid* **Cannot reestablish persisting sessions - VTAM not responding. Module name:** *module*

Explanation: CICS is processing VTAM persisting sessions. However it has issued a VTAM macro and has waited for 8 minutes for the response.

System Action: If this occurs during start up, CICS terminates. If this occurs during dynamic open, the VTAM ACB is closed and CICS continues without VTAM.

A dump is taken for this message in both cases.

User Response: You can restart CICS again immediately, or wait for the persistent sessions to time out and then restart CICS.

If this problem recurs you need to find out why VTAM is not responding to the INQUIRE or OPNDST macro (if the message is issued by DFHZGRP), or the CLSDST or TERMSESS macro (if the message is issued by DFHZGUB).

You can determine which macro is not responding by examining the TCP section of the dump and looking at the RPLs in the PS POOL labeled PS_RPL. The first RPL is for use by INQUIRE or OPNDST, the next 10 by CLSDST or TERMSESS.

Destination: Console

Modules: DFHZGRP, DFHZGUB

XMEOUT Parameters: *applid, module*

DFHZC0129 *applid* **VTAM OPNDST RESTORE failed. All sessions in the NIBLIST will be terminated instead. RTNCD,FDB2:** *X'rc',X'fd'***. Code:** *X'code'*

Explanation: CICS is processing VTAM persistent sessions during an EMERGENCY restart but VTAM returned a RTNCD,FDB2 of *rc*,*fd* in response to the OPNDST OPTCD=RESTORE macro.

System Action: An AP exception trace entry, *X'code'*, is made.

A system dump is taken on the first occurrence of this problem unless dumps have been specifically suppressed in the dump table.

CICS attempts to terminate all the sessions in the NIBLIST instead of restoring them.

User Response: Use the dump taken on the first occurrence of this problem or the exception trace entry and the *VTAM programming manual* to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

Destination: Console

Module: DFHZGRP

XMEOUT Parameters: *applid, X'rc', X'fd', X'code'*

DFHZC0130 *applid* **VTAM INQUIRE PERSESS failed. Cannot restore any persisting sessions. RTNCD,FDB2:** *X'rc',X'fd'***. Code:** *X'code'*

Explanation: CICS is processing VTAM persistent sessions but VTAM returned a RTNCD,FDB2 of *rc,fd* in response to the INQUIRE OPTCD=PERSESS macro.

System Action: An AP exception trace entry, *X'code'*, is made.

A system dump is taken unless dumps have been specifically suppressed in the dump table.

If this occurs during initialization, CICS terminates.

If this occurs during a dynamic open of the ACB, CICS closes the ACB and continues to run without VTAM.

The sessions persist until the PSDI value times out or until VTAM operator commands are issued to terminate the sessions.

User Response: Use the dump or the exception trace entry and the *VTAM programming manual* to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

If the problem occurs during initialization, try to correct the error and then retry the start up, or wait until the PSDI value time expires and restart CICS.

If the problem occurs when the ACB was opened dynamically, you can repeat the command to open the VTAM ACB, or wait until the PSDI time expires and then repeat it.

Destination: Console

Module: DFHZGRP

XMEOUT Parameters: *applid, X'rc', X'fd', X'code'*

DFHZC0131 *date time applid netname termid* **VTAM OPNDST RESTORE failed.**

Explanation: CICS is processing VTAM persistent sessions and has issued an OPNDST OPTCD=RESTORE against a NIBLIST. However, the NIB identified by *netname* and a session or termid of *termid* failed to open successfully. This is probably because the session was terminated by the VTAM operator after INQUIRE OPTCD=PERSESS was issued.

System Action: CICS continues.

User Response: Reopen the session in the normal way.

Destination: CSNE

Module: DFHZGRP

XMEOUT Parameters: *date, time, applid, netname, termid*

DFHZC0132 *applid* **VTAM INQUIRE PERSESS failed. Cannot restore some persisting sessions. Network only partially restored. RTNCD,FDB2:** *X'rc',X'fd'***. Code:** *X'code'*

Explanation: CICS is processing VTAM persistent sessions but VTAM returned a RTNCD,FDB2 of *rc*,*fd* in response to a subsequent INQUIRE OPTCD=PERSESS macro.

System Action: An AP exception trace entry, *X'code'*, is made.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

CICS continues with a partial network. Some of the sessions are usable, others are not until the PSDI value times out or the VTAM operator terminates the sessions that failed.

User Response: Use the dump or the exception trace entry and the *VTAM programming manual* to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

If enough of the network is available, wait until the PSDI value expires or use VTAM operator commands to terminate the sessions.

If the network is unusable, either close and reopen the VTAM ACB, or restart CICS.

Destination: Console

Module: DFHZGRP

XMEOUT Parameters: *applid, X'rc', X'fd', X'code'*

DFHZC0133A *applid* **Persistent session recovery failed.**

Explanation: CICS was initializing when an attempt to process VTAM persistent session failed. The reasons are given in earlier messages.

System Action: CICS terminates.

User Response: Examine earlier messages and exception trace entries to determine the reason for failure.

Destination: Console

Module: DFHSII1

XMEOUT Parameter: *applid*

DFHZC0134I *applid* **VTAM sessions persisted when OPEN ACB issued. Inquires issued** *icount***, sessions persisting** *spcount***, sessions terminated** *stcount***, sessions OPNDSTed** *socount***, sessions in error** *secount***.**

Explanation: The VTAM ACB has been opened while CICS is running, and some VTAM sessions persisted after VTAM abended.

Each of the persisting sessions has been restored or terminated. The message inserts are as follows:

- *icount* is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- *spcount* is the number of VTAM sessions that persisted.
- *stcount* is the number of sessions that CICS terminated with a CLSDST or TERMSESS macro. If an OPNDST failure occurred for an entire NIBLIST (see message DFHZC0129), the sessions in the NIBLIST have been terminated and this count includes these sessions.
- *socount* is the number of VTAM sessions that CICS restored successfully with an OPNDST OPTCD=RESTORE macro.
- *secount* is the number of sessions that CICS failed to restore.

System Action: CICS continues.

User Response: None.

Destination: Console

Module: DFHZGRP

XMEOUT Parameters: *applid, icount, spcount, stcount, socount, secount*

DFHZC0136 *applid* **PSDI value indicated persistence but the run time VTAM does not support persistent sessions.**

Explanation: The PSDI value is nonzero. This specifies that VTAM sessions are to persist across CICS failures. However, this release of VTAM does not support persistent sessions.

System Action: CICS sets the PSDI value to 0 and continues without persistent session support.

User Response: ACF/VTAM Release 3 Version 4 Modification 1 or higher must be used in order to take advantage of CICS persistent session support.

To prevent this message being issued when using an earlier release of VTAM, set the PSDINT system initialization parameter to zero, and when using the EXEC CICS SET VTAM command, either omit, or specify a value of zero for the PSDINTERVAL operand.

Destination: Console

Module: DFHZSLS

XMEOUT Parameter: *applid*

DFHZC0137 *applid* **PSDI value indicated persistence but the TCT assemble time VTAM does not support persistent sessions.**

Explanation: The PSDI value is nonzero. This specifies that VTAM sessions are to persist across CICS failures. However, DFHTCT*xx* was assembled against a release of VTAM that cannot support persistent sessions.

System Action: CICS sets the PSDI value to 0 and continues without persistent session support.

User Response: Reassemble the TCT against ACF/VTAM Release 3 Version 4 Modification 1 or higher in order to take advantage of CICS persistent session support.

To prevent this message being issued when using an earlier release of VTAM, set the PSDINT system initialization parameter to zero, and when using the EXEC CICS SET VTAM command, either omit, or specify a value of zero for the PSDINTERVAL operand.

Destination: Console

Module: DFHZSLS

XMEOUT Parameter: *applid*

DFHZC0140 *applid* **SETLOGON PERSIST failed. RTNCD,FDB2:** *X'rc'*,*X'fd'***. Code:** *X'code'*

Explanation: CICS was opening the VTAM ACB, setting the PSDI value from an operator command or doing a WARM shut down. It attempted to issue the VTAM command SETLOGON OPTCD=PERSIST or OPTCD=NPERSIST. However, VTAM returned a RTNCD,FDB2 of *rc*,*fd*.

System Action: An AP exception trace entry, *code*, is made.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

If the ACB was being opened, no VTAM sessions persist and the PSDI value is set to 0.

If just the PSDI value was being changed, either by the operator or during termination, the value is unchanged, both to CICS and to VTAM.

If this occurs during a VTAM shut down and some sessions are not closed, sessions may exist on VTAM start-up and are terminated then.

User Response: Use the dump taken or the exception trace entry *code* and the *VTAM programming manual* to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

Destination: Console

Module: DFHZGSL

XMEOUT Parameters: *applid, X'rc', X'fd', X'code'*

DFHZC0144 *date time applid sysid termid* **Synclevel 2 conversation started by** *netname* **before completion of exchange lognames.** *sense* **((**_instance_**) Module name: {DFHZGDA})**

Explanation: CICS has received an attach FMH5 for a synclevel 2 conversation from a partner with netname *netname* before exchange lognames processing is complete.

System Action: A Deallocate(Abend) with sense code 08640001 is issued for the conversation.

User Response: No further APPC synclevel 2 conversations can be started by the partner until exchange lognames has completed. Use CEMT to inquire on the status of the connection in order to determine whether exchange lognames has completed (see the *CICS Supplied Transactions* for more information).

Destination: CSNE

Module: DFHZGDA

XMEOUT Parameters: *date, time, applid, sysid, termid, netname, sense, instance, {1=DFHZGDA}*

DFHZC0145 *date time applid netname termid* **Synclevel 2 APPC conversation started before Exchange Lognames completed. Error occurred executing Deallocate(Abend).** *sense* **((***instance***) Module name: {DFHZGDA})**

Explanation: The APPC session *termid* with *netname* persisted during a CICS persistent sessions restart. The partner initiated a new synclevel 2 conversation before Exchange Lognames processing had completed. CICS attempted to issue a Deallocate(Abend) for the conversation. The Deallocate(Abend) could not be completed for the reason indicated by the *instance* in the message as follows.

Instance	Explanation
01	DFHZGDA called with chain Finite State Machine in unexpected state.
02	DFHZGDA called with bracket Finite State Machine in unexpected state

For the meaning of the sense data, see the explanation on page 678.

System Action: The state of the session after the persistent sessions restart cannot be determined, and the session is deactivated in order to reset the states The sessions are reactivated.

User Response: If the session is not successfully reactivated, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

Destination: CSNE

Module: DFHZGDA

XMEOUT Parameters: *date, time, applid, netname, termid, sense, instance, {1=DFHZGDA, 2=DFHZGDA}*

DFHZC0146 *date time applid* **VTAM session for** *termid* **successfully recovered following a persistent sessions restart** *sense* **((***instance***) Module name: {DFHZXRC})**

Explanation: CICS has restored the VTAM persistent session for terminal *termid* following a persistent sessions restart.

The equivalent message for APPC sessions is DFHZC0156.

System Action: If recovery notification is specified for this terminal, the recovery message is sent to the terminal, or the transaction requested to run at recovery notification time is started.

User Response: If required, code an NEP to override the recovery notification option originally specified in the TYPETERM definition for this session. See the *CICS Resource Definition Guide* and the *CICS Customization Guide* for more information.

Destination: CSNE

Module: DFHZXRC

XMEOUT Parameters: *date, time, applid, termid, sense, instance, {1=DFHZXRC}*

DFHZC0147 *date time applid sysid termid* **Error occurred recovering persisting session.** *sense* **((***instance***) Module name: {DFHZGDA})**

Explanation: An error has prevented the recovery of an APPC conversation which persisted across an emergency restart.

The session with a termid of *termid* is terminated. The reason and the corresponding AP exception trace entry are indicated by the *instance* in the message;

Instance	Point ID and explanation
1	X'FB79' SEND not executed due to invalid bracket state.
2	X'FB7B' Insufficient storage for session recovery.
3	X'FB76' Recovery status byte TCTE_PRSS contains an unexpected value.
4	X'FB7A' RECEIVE not executed due to invalid bracket state.
5	X'FB78' Unexpected sense received during persistent sessions recovery.

System Action:

An AP exception trace with a point ID as above is issued. The session is terminated and CICS continues.

User Response: If recovery failed due to insufficient storage, try increasing the DSA or EDSA size limits (see the *CICS Customization Guide*). If any of the other instances occur, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Module: DFHZGDA

XMEOUT Parameters: *date, time, applid, sysid, termid, sense, instance, {1=DFHZGDA, 2=DFHZGDA, 3=DFHZGDA, 4=DFHZGDA, 5=DFHZGDA}*

DFHZC0148 *date time applid sysid termid* **VTAM send or receive failed during persistent sessions recovery.** *sense* **((***instance***) Module name: {DFHZGDA})**

Explanation: As part of session recovery following a persistent session restart CICS issued a VTAM SEND or RECEIVE. The VTAM request failed leaving the session in an unknown state.

For the meaning of the sense data, see the explanation on page 678.

System Action: The session is terminated.

User Response: To determine the cause of the problem, see the associated DFHZC*nnnn* message in the CSNE log. This message gives further diagnostic information on the failing VTAM request.

Destination: CSNE

Module: DFHZGDA

XMEOUT Parameters: *date, time, applid, sysid, termid, sense, instance, {1=DFHZGDA, 2=DFHZGDA}*

DFHZC0149 *date time applid termid* **Connection failure occurred during a persistent sessions restart** *sense* **((***instance***) Module name: {DFHZNSP})**

Explanation: During a persistent sessions restart, CICS has been notified of the failure of a session initiation request issued during the previous instance of CICS.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: None

Destination: CSNE

Module: DFHZNSP

XMEOUT Parameters: *date, time, applid, termid, sense, instance, {1=DFHZNSP}*

DFHZC0150 *date time applid termid* **Error processing the session state data returned after a persistent sessions restart.** *sense* **((***instance***) Module name: {DFHZXRC})**

Explanation: The VTAM session for terminal *termid* persisted during a CICS persistent sessions restart, but an error occurred while processing the session state data returned by VTAM. The reason is indicated by the *instance* in the message as follows.

Instance Explanation

01 DFHZXRC called with an invalid request.

02 TCTTEDA contains null characters instead of the expected address.

03 Reserved

04 The vector key of the data passed by VTAM is not correct.

05 The length of the vector_29 data is too short.

06 Unidentified cleanup action detected.

07 Unidentified recovery option detected.

08 Invalid cleanup action for RECOVOPTION(NONE).

09 Invalid cleanup action for RECOVOPTION(MESSAGE).

10 Invalid cleanup action for RECOVOPTION(TRANSACTION).

11 Reserved.

12 DFHZXRC has been driven to process an LU6 session.

13 Neither XRF nor persistent sessions recovery is in progress DFHZXRC has been called in error.

For the meaning of the sense data, see the explanation on page 678.

System Action: The state of the session after the persistent sessions restart cannot be determined, and the session is terminated in order to reset the states. Non-APPC sessions are restarted.

User Response: If the session is not successfully restarted, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

Destination: CSNE

Module: DFHZXRC

XMEOUT Parameters: *date, time, applid, termid, sense, instance, {1=DFHZXRC, 2=DFHZXRC, 3=DFHZXRC, 4=DFHZXRC, 5=DFHZXRC, 6=DFHZXRC, 7=DFHZXRC, 8=DFHZXRC, 9=DFHZXRC, 10=DFHZXRC, 11=DFHZXRC, 12=DFHZXRC, 13=DFHZXRC}*

DFHZC0155 *date time applid sysid termid* **Error occurred during processing of session state data returned after restart of persisting session.** *sense* **((***instance***) Module name: {DFHZXPS})**

Explanation:

System Action: An AP exception trace with a point ID is issued. The state of the session after the restart cannot be determined, and the session is terminated in order to reset the states. The session is restarted. A system dump is produced for all instances except 04.

User Response: If the session is not successfully restarted, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

Destination: CSNE

Module: DFHZXPS

XMEOUT Parameters: *date, time, applid, sysid, termid, sense, instance, {1=DFHZXPS, 2=DFHZXPS, 3=DFHZXPS, 4=DFHZXPS, 5=DFHZXPS, 6=DFHZXPS, 7=DFHZXPS, 8=DFHZXPS, 9=DFHZXPS, 10=DFHZXPS, 11=DFHZXPS, 12=DFHZXPS, 13=DFHZXPS, 14=DFHZXPS, 15=DFHZXPS, 16=DFHZXPS, 17=DFHZXPS, 18=DFHZXPS, 19=DFHZXPS, 20=DFHZXPS, 21=DFHZXPS, 22=DFHZXPS, 23=DFHZXPS, 24=DFHZXPS, 25=DFHZXPS, 26=DFHZXPS, 27=DFHZXPS, 28=DFHZXPS, 29=DFHZXPS, 30=DFHZXPS, 31=DFHZXPS, 32=DFHZXPS, 33=DFHZXPS, 34=DFHZXPS, 35=DFHZXPS, 36=DFHZXPS, 37=DFHZXPS, 38=DFHZXPS, 39=DFHZXPS, 40=DFHZXPS, 41=DFHZXPS, 42=DFHZXPS, 43=DFHZXPS, 44=DFHZXPS, 45=DFHZXPS, 46=DFHZXPS, 47=DFHZXPS, 48=DFHZXPS, 49=DFHZXPS, 50=DFHZXPS, 51=DFHZXPS, 52=DFHZXPS, 53=DFHZXPS, 54=DFHZXPS, 55=DFHZXPS, 56=DFHZXPS, 57=DFHZXPS, 58=DFHZXPS, 59=DFHZXPS, 60=DFHZXPS, 61=DFHZXPS, 62=DFHZXPS, 63=DFHZXPS, 64=DFHZXPS, 65=DFHZXPS}*

DFHZC0156 *date time applid sysid* **VTAM APPC session** *termid* **successfully recovered following a persistent sessions restart.** *sense* **((***instance***) Module name: {DFHZXPS})**

Explanation: CICS has restored the VTAM APPC persisting session for *sysid termid* following a persistent sessions restart.

The equivalent message for non-APPC sessions is DFHZC0146. Note that the RECOVNOTIFY option that applies to message DFHZC0146 is not applicable to APPC sessions.

System Action: Processing continues.

User Response: None.

Destination: CSNE

Module: DFHZXPS

XMEOUT Parameters: *date, time, applid, sysid, termid, sense, instance, {1=DFHZXPS, 2=DFHZXPS}*

DFHZC0157 *date time applid sysid* **VTAM APPC session** *termid* **could not be recovered following a persistent sessions restart. The session will be unbound.***sense* **((***instance***) Module name: {DFHZXPS})**

Explanation: CICS was unable to restore the APPC persisting session for *sysid termid* following a persistent sessions restart. There are three possible reasons for this:

1. The BIND processing was incomplete when CICS failed.
2. Resynchronization was in progress for the session when CICS failed.
3. The recovery data returned by VTAM for the session was capable of more than one interpretation.

The TCTTE and TIOA are output for information only.

System Action: The session is unbound and rebound.

User Response: None.

Destination: CSNE

Module: DFHZXPS

XMEOUT Parameters: *date, time, applid, sysid, termid, sense, instance, {1=DFHZXPS}*

DFHZC0160 *date time applid tranid* **CNOS changes for modename** *modename* **to node** *netname* **connection** *sysid* **are incomplete.**

Explanation: CICS has made two attempts to implement the change number of sessions (CNOS) command for the modename *modename* on the APPC connection *sysid*. The command was not successful because of other activity on the modegroup. This only happens on modegroups which are very busy. The state of one or more of the sessions has changed during the processing of the CNOS request.

The CNOS command results from a connection acquire, a connection release, or a request for a specific modename on this system or the connected system. If the connected system is not CICS, commands specific to that system may have been used.

System Action: The modegroup is left in the state reached after the second attempt to implement the changes.

User Response: Use the CEMT INQUIRE MODENAME command to determine the current state of the modegroup. The command may show the modegroup as you expect for successful CNOS completion. This is because the command only shows data for available and active sessions. CICS may have had problems with CNOS values for loser sessions, which would not be apparent by using CEMT. If the values are not as required, re-issue the original command.

Destination: CSNE

Module: DFHZGCA

XMEOUT Parameters: *date, time, applid, tranid, modename, netname, sysid*

DFHZC0161 *date time applid tranid* **CNOS command for modename** *modename* **to node** *netname* **connection** *sysid* **has failed with code** *X'code'***.**

Explanation: CICS has encountered an error while attempting to execute a change number of sessions (CNOS) command for the modename *modename* on the APPC connection *sysid*. The failure code X'*code*' is one of the following:

X'FBA2' The request to create a lock manager lock for *modename* failed.

X'FBA3' CICS could not allocate a session for the CNOS negotiation conversation.

X'FBA6' The request to obtain a lock manager lock for *modename* failed.

X'FBAA' *modename* was not found or has been defined with one of the reserved names SNASVCMG or CPSVCMG.

X'FBAB' *sysid* is known, but not as a connection.

X'FBAC' The specified connection *sysid* has no modegroups. This is probably caused by a storage overwrite.

X'FBAD' The first modegroup on the specified connection *sysid* has no sessions. This is probably caused by a storage overwrite.

X'FBAF' The receive command for the CNOS reply failed.

X'FBB1' The send command for the CNOS command or CNOS reply failed.

X'FBB2' The session for the single-session connection could not be found. This is probably caused by a storage overwrite.

X'FBB3' *sysid* is not a known connection name.

X'FBB4' The connection is defined to CICS as not supporting CNOS. This is probably caused by a storage overwrite.

System Action: CICS makes an exception trace with ID AP *xxxx*; where *xxxx* is the code in the message. CICS takes a system dump for all failure codes except X'FBA2', X'FBA3', X'FBA6', X'FBAF', and X'FBB1'. CICS continues without completing the request. The task does not abend. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This depends on the error code as follows:

X'FBA2' Follow the guidance given for the lock manager console message that precedes this.

X'FBA3' If all the sessions are busy, make one available and retry.

X'FBA6' Follow the guidance given for the lock manager message that precedes this.

X'FBAA' Reissue the request with the correct modename.

X'FBAB' Reissue the request with the correct connection name.

X'FBAC' See the *CICS Problem Determination Guide* for further guidance on storage problems.

X'FBAD' Same as for X'FBAC'.

X'FBAF' The connected system, or the link to it, has failed. Determine the reason for this from any other messages produced.

X'FBB1' Same as for X'FBAF'.

X'FBB2' Same as for X'FBAC'.

X'FBB3' Reissue the request with the correct connection name.

X'FBB4' Same as for X'FBAC'.

Destination: CSNE

Module: DFHZGCN

XMEOUT Parameters: *date, time, applid, tranid, modename, netname, sysid, X'code'*

DFHZC0162 *date time applid tranid* **CNOS transaction for connection** *sysid* **has failed with code** *X'code'* **subcode** *X'subcode'***.**

Explanation: The change number of sessions (CNOS) transaction program DFHZLS1 could not complete successfully. The error code X'*code*' is one of the following:

X'FB92' The transaction was not started as an IC request with data or by an attach flow from a connected system. The insert *subcode* is the start code from XMIQ_START_CODE.

X'FB93' The transaction was started with data, but no data was found.

X'FB94' The transaction was started with data, but the data was not in the form of the correct parameter list.

X'FB95' The transaction was started with the correct format parameter list, but the function code was invalid.

X'FB96' The transaction was started by an attach from a connected system but there was no CNOS data.

X'FB97' The transaction was started by an attach from a connected system but the associated data was not a CNOS command.

System Action: CICS produces an exception trace, and except for in the case of an invalid start, a system dump is taken. The task terminates. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This depends on the error code as follows:

X'FB92' The transaction was probably started by entering the transaction ID at a terminal. This is not allowed.

X'FB93' Analyze the dump to determine why IC could not find the data.

X'FB94' Analyze the dump to determine what the data was.

X'FB95' Analyze the dump to determine what the data was.

X'FB96' Analyze the dump to determine why no data was available.

X'FB97' Analyze the dump to determine why the correct data was not sent with the attach.

Destination: CSNE

Module: DFHZLS1

XMEOUT Parameters: *date, time, applid, tranid, sysid, X'code', X'subcode'*

DFHZC0170I *applid* **CICS registered successfully to VTAM generic resource name** *grname***.**

Explanation: CICS has registered as a VTAM generic resource in the group *grname*.

System Action: CICS continues. It is now possible to log on using the generic resource name.

User Response: None.

Destination: Console

Module: DFHZGSL

XMEOUT Parameters: *applid, grname*

DFHZC0171 *applid* **CICS registration as a VTAM generic resource in the group** *grname* **failed. VTAM return code:** *X'rc'***. FDB2:** *X'fd'***.**

Explanation: CICS failed to register as a VTAM generic resource in the group *grname*.

VTAM returned a RTNCD,FDB2 of *rc,fd* in response to the SETLOGON OPTCD=GNAMEADD macro.

System Action: An AP exception trace entry is output with trace point FB8E.

CICS continues without generic resource support.

User Response: Use the *VTAM programming manual* to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct the problem.

When the problem has been corrected a further attempt may be made to register CICS as a generic resource by closing and reopening the VTAM ACB.

Destination: Console

Module: DFHZGSL

XMEOUT Parameters: *applid, grname, X'rc', X'fd'*

DFHZC0172I *applid* **CICS deregistered successfully from VTAM generic resource name** *grname***.**

Explanation: CICS has deregistered from VTAM generic resource group *grname*.

System Action: None. CICS will not reregister to the generic resource until the VTAM ACB has been closed and opened again.

User Response: None.

Destination: Console

Module: DFHZGSL

XMEOUT Parameters: *applid, grname*

DFHZC0173 *applid* **CICS deregistration from VTAM generic resource name** *grname* **failed. VTAM return code:** *X'rc'***. FDB2:** *X'fd'***.**

Explanation: CICS failed to deregister from VTAM generic resource group *grname*.

VTAM returned a RTNCD,FDB2 of *rc,fd* in response to the SETLOGON OPTCD=GNAMEDEL macro.

This may be due to a hardware failure in another part of the sysplex or to corruption of the TCT prefix causing CICS to attempt to deregister with the wrong name.

System Action: An AP exception trace entry is output with a trace point of X'FB8E'.

User Response: Use the *VTAM Programming Manual* to determine the meaning of the register 15 and register 0 values output by VTAM. If the problem is not caused by use of the wrong version of VTAM, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHZGLS

XMEOUT Parameters: *applid, grname, X'rc', X'fd'*

DFHZC0174 *applid* **Control block initialization has failed. Generic resource registration or deregistration will not be attempted. Return codes** *r15*,*r0***.**

Explanation: A call to a VTAM macro to initialize the node initialization block (NIB) before registering or deregistering as a VTAM generic resource has failed.

A possible explanation is that the wrong level of VTAM is being used.

System Action: The values of register 15 and register 0 returned by VTAM are output.

An exception trace is output with trace point X'FBED'.

If registration was about to be attempted, CICS continues without generic resource support.

If deregistration was about to be attempted, ACB shutdown continues. VTAM removes CICS as a member for the generic resource name when the ACB is closed.

User Response: Use the *VTAM Programming Manual* to determine the meaning of the register 15 and register 0 values output by VTAM. If the problem is not caused by use of the wrong version of VTAM, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: DFHZGLS

XMEOUT Parameters: *applid, r15, r0*

DFHZC0175 *applid* **A value was specified for GRNAME but the assemble time or run time VTAM does not support generic resource registration.**

Explanation: A value was specified for the GRNAME system initialization parameter. This indicates that CICS is to register as a VTAM generic resource. However, either DFHTCT*xx* was assembled against a release of VTAM that cannot support generic resource registration, or CICS is running on a VTAM earlier than release 4 version 2.

System Action: CICS sets the generic resource name to blanks and continues without attempting generic resource registration.

User Response: If you are running with ACF/VTAM Release 4 Version 2 or higher, reassemble the TCT against this level of VTAM in order to take advantage of CICS support for generic resource registration.

To prevent this message being issued when using an earlier release of VTAM, do not specify a value for the GRNAME system initialization parameter.

Destination: Console

Module: DFHZSLS

XMEOUT Parameter: *applid*

DFHZC0176 *date time applid* **VTAM was unable to execute a CHANGE OPTCD=ENDAFFIN macro to end an affinity between this application, which is a member of generic resource** *grname***, and a remote LU with netid** *netid* **netname** *netname***. VTAM return code:** *X'rc'***, FDB2:** *X'fd'***, R15:** *X'r15'***.**

Explanation: An attempt was made to end an affinity between this CICS, which is a member of generic resource *grname*, and a remote LU with netid *netid* and netname *netname* by means of a SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command. The attempt has failed because a problem with VTAM prevented the VTAM CHANGE OPTCD=ENDAFFINITY macro from being issued.

VTAM has issued the return code-feedback (RTNCD,FDB2) X'*rc*',X'*fd*' in response to the CHANGE OPTCD=ENDAFFINITY macro.

R15 *r15* is the register 15 value returned by VTAM.

System Action: Processing continues. VTAM has made no attempt to end the affinity.

User Response: See the *VTAM programming manual* for the meaning of the RTNCD,FDB2 and for guidance on correcting the problem.

When the problem has been corrected retry the command.

Destination: CSNE

Module: DFHZGCH

XMEOUT Parameters: *date, time, applid, grname, netid, netname, X'rc', X'fd', X'r15'*

DFHZC0177 *date time applid* **Connection** *sysid* **has created an affinity between this application, which is a member of generic resource** *grname***, and a remote LU with netid** *netid* **netname** *netname***.**

Explanation: A generic resource member has established an APPC synclevel 2, APPC limited resource, or LU6.1 connection with another LU. For connections of these types VTAM creates affinities which are owned by CICS and have to be ended by the CICS operator using the SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command. The message is output whenever the connection is acquired but the affinity is not recreated for each acquire unless it has been ended in the meantime.

System Action: Processing continues.

User Response: None, but note that the affinity has to be ended before the partner LU can establish a connection with another generic resource member.

The affinity may be ended automatically by the connection quiesce transaction when the connection is released. However, it is not done if the system crashes or is shut down 'immediate' whilst the connection is still acquired.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, sysid, grname, netid, netname*

DFHZC0178 *date time applid* **An attempt to end an affinity between this application, which is a member of generic resource** *grname***, and a remote LU with netid** *netid* **netname** *netname* **was rejected by VTAM. VTAM return code:** *X'rc'***. FDB2:** *X'fd'***.**

Explanation: An attempt was made to end an affinity between this CICS, which is a member of generic resource *grname*, and a remote LU with netid *netid* and netname *netname* using a SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command. The request has been rejected by VTAM.

VTAM has issued the return code-feedback (RTNCD,FDB2) X'*rc*',X'*fd*' in response to the CHANGE OPTCD=ENDAFFINITY macro.

System Action: Processing continues.

User Response: See the *VTAM programming manual* for the meaning of the RTNCD,FDB2 code and for guidance on correcting the problem.

When the problem has been corrected, retry the command if appropriate.

Destination: CSNE

Module: DFHZGCH

XMEOUT Parameters: *date, time, applid, grname, netid, netname, X'rc', X'fd'*

DFHZC0179 I *date time applid* **Connection** *sysid* **netname** *netname* **is a link to generic resource** *grname* **member** *membername***.**

Explanation: A connection *sysid* from netname *netname* to generic resource *grname* has been established.

The message is issued once for each connection acquire.

System Action: Processing continues.

User Response: None.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, sysid, netname, grname, membername*

DFHZC0180 *date time applid* **An affinity between this application, which is a member of generic resource** *grname***, and a remote LU with netid** *netid* **netname** *netname* **has ended successfully.**

Explanation: VTAM has responded positively to an attempt to end an affinity with remote LU netid *netid*, netname *netname*. The affinity was ended implicitly by the connection quiesce transaction when the connection was released or explicitly by a SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command.

System Action: Processing continues. The remote LU can now establish a connection with a different generic resource member.

User Response: None.

Destination: CSNE

Module: DFHZGCH

XMEOUT Parameters: *date, time, applid, grname, netid, netname*

DFHZC0181 *date time applid* **No affinity exists between this application, which is a member of generic resource** *grname***, and a remote LU with netid** *netid* **netname** *netname***. VTAM return code: X'14', FDB2: X'88'.**

Explanation: An unsuccessful attempt was made to end an affinity between this CICS, which is a member of generic resource *grname*, and a remote LU with netid *netid* and netname *netname* using a SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command. VTAM has issued return code-feedback (RTNCD,FDB2) of X'14',X'88' in response to the CHANGE OPTCD=ENDAFFINITY macro indicating that no such affinity exists.

System Action: Processing continues.

User Response: Ensure that the values input to the SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command are correct.

Destination: CSNE

Module: DFHZGCH

XMEOUT Parameters: *date, time, applid, grname, netid, netname*

DFHZC0182 *date time applid* **VTAM was unable to execute an INQUIRE OPTCD=NQN macro to determine the network qualified netname of logical unit** *luname***. VTAM return code:** *X'rc'***, FDB2:** *X'fd'***, R15:** *X'r15'***.**

Explanation: CICS has attempted to determine the network qualified netname of logical unit *luname*. The attempt has failed because a problem with VTAM prevented the VTAM INQUIRE OPTCD=NQN macro from being issued.

VTAM has issued the return code-feedback (RTNCD,FDB2) X'*rc*',X'*fd*' in response to the INQUIRE OPTCD=NQN macro.

R15 *r15* is the register 15 value returned by VTAM.

System Action: The CICS component which requires the network qualified netname of the logical unit determines whether any further action is called for.

User Response: See the *VTAM Programming* manual for the meaning of the RTNCD,FDB2 and for guidance on correcting the problem.

Destination: CSNE

Module: DFHZGIN

XMEOUT Parameters: *date, time, applid, luname, X'rc', X'fd', X'r15'*

DFHZC0183 *date time applid* **An attempt to determine the network qualified name of logical unit** *luname* **was rejected by VTAM. VTAM return code:** *X'rc'***. FDB2:** *X'fd'***.**

Explanation: CICS has attempted to determine the network qualified name of logical unit *luname*. The request has been rejected by VTAM.

VTAM has issued the return code-feedback (RTNCD,FDB2) X'*rc*',X'*fd*' in response to the INQUIRE OPTCD=NQN macro.

System Action: The CICS component which requires the network qualified name of the logical unit decides whether further action is called for.

User Response: See the *VTAM Programming* manual for the meaning of the RTNCD,FDB2 code and for guidance on correcting the problem.

Destination: CSNE

Module: DFHZGIN

XMEOUT Parameters: *date, time, applid, luname, X'rc', X'fd'*

DFHZC0184 *date time applid* **VTAM was unable to execute an INQUIRE OPTCD=SESSNAME macro to determine the member of generic resource set** *grname* **to which logical unit** *netid.luname* **is logged on. VTAM return code:** *X'rc'***, FDB2:** *X'fd'***, R15:** *X'r15'***.**

Explanation: CICS has attempted to determine the member of a generic resource set *grname* to which logical unit *netid.luname* is logged on. The attempt has failed because a problem with VTAM prevented the VTAM INQUIRE OPTCD=SESSNAME macro from being issued.

VTAM has issued the return code-feedback (RTNCD,FDB2) X'*rc*',X'*fd*' in response to the INQUIRE OPTCD=NQN macro.

R15 *r15* is the register 15 value returned by VTAM.

System Action: The CICS component which needs to know where the logical unit is logged on determines whether any further action is called for.

User Response: See the *VTAM Programming* manual for the meaning of the RTNCD,FDB2 and for guidance on correcting the problem.

Destination: CSNE

Module: DFHZGIN

XMEOUT Parameters: *date, time, applid, grname, netid, luname, X'rc', X'fd', X'r15'*

DFHZC0185 *date time applid* **An attempt to determine the member of generic resource set** *grname* **to which logical unit** *netid.luname* **is logged on was rejected by VTAM. VTAM return code:** *X'rc'***. FDB2:** *X'fd'***.**

Explanation: CICS has attempted to determine the member of generic resource set to which *grname* logical unit *netid.luname* is logged on. The request has been rejected by VTAM.

VTAM has issued the return code-feedback (RTNCD,FDB2) X'*rc*',X'*fd*' in response to the INQUIRE OPTCD=SESSNAME macro.

System Action: The CICS component which requires the member name decides whether further action is called for.

User Response: See the *VTAM Programming* manual for the meaning of the RTNCD,FDB2 code and for guidance on correcting the problem.

Destination: CSNE

Module: DFHZGIN

XMEOUT Parameters: *date, time, applid, grname, netid, luname, X'rc', X'fd'*

DFHZC0186 *date time applid* **Connection** *sysid* **which is a member of generic resource** *grname* **has a duplicate remote LU netname** *netname***.** *sense* **((***instance***) Module name: {DFHZOPN})**

Explanation: Node *nodeid* attempted to log on to CICS but the logon is invalid.

The *nodeid* in the message always starts with the netname of the node attempting to connect to CICS. For some instances of the message resulting from an APPC log on, the modename of the session is concatenated to the netname with a dot separator. Since a string consisting of eight blanks is the default modename, this can lead to idiosyncratic formatting of the message.

If the message is issued by DFHZATA, CICS has failed in its attempt to autoinstall the terminal or connection.

The instance *instance* is one of the following:

1 During the acquire process for a secondary session CICS attempted to add the membername of the partner to a table but this name already exists for a different generic resource connection.

2 During the acquire process for a secondary session CICS attempted to add the membername of the partner to a table but this name has just been used as the netname of a terminal by an install occuring at the same time as the install of this connection.

System Action: The acquire of the connection continues.

User Response: Use the instance number to determine why the netname already exists:

1 Use the CEMT INQUIRE CONNECTION API to see which generic resource has the same membername.

Since this problem should not occur under normal circumstances, you may need further assistence from IBM.

2 Investigate why the LU name of the partner is the same as the LU name of a terminal and remove one of the definitions.

Destination: CSNE

XMEOUT Parameters: *applid, X'retcode'*

DFHZC0201 *applid* **An attempt by the COVR transaction to OPEN VTAM has failed with return code** *X'retcode'***; the COVR transaction will terminate.**

Explanation: The COVR transaction has repeatedly attempted an EXEC CICS SET VTAM OPEN, but the operations have failed. The OPEN ACB has issued the return code *retcode*.

System Action: CICS continues. The COVR transaction terminates and the SET VTAM OPEN is not retried.

User Response: Investigate the reason for VTAM being unavailable. See the *VTAM Programming* manual for an explanation of the ACB return code.

Destination: Console

Module: DFHZCOVR

XMEOUT Parameters: *applid, X'retcode'*

DFHZC2109 E *date time applid* **Unexpected response from Recovery Manager following resynchronization of LU6.1 session** *termid* **with remote system** *sysid***.**

Explanation: Recovery manager was invoked during resynchronization of an LU6.1 session, but gave an unexpected response. This is due to an internal logic error.

System Action: A system dump is taken unless dumps have been specifically suppressed in the dump table.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, sysid*

DFHZC2114 E *date time applid termid tranid* **A SEND response failed during receive-any processing.** *sense* **((***instance***) Module name: {DFHZRAC})**

Explanation: A SEND response issued on a receive-any RPL failed, or was not accepted by VTAM.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: A subsequent message in the log indicates the reasons for the failure. Refer to this message for further information and guidance.

Destination: CSNE

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC}*

DFHZC2115 *applid termid* **Potential CICS hang detected following a SEND to node** *netname***, CID** *X'cid'***. Investigation is required. ((***instance***) Module name: {DFHZRAC})**

Explanation: CICS has issued a VTAM SEND macro to send a response but no notification has been received that the response has completed. Until this SEND operation completes, one of the limited number of receive-any RPLs remains unusable (the number of receive-any RPLs is defined by the RAPOOL system initialization parameter).

This is a serious condition. If all the receive-any RPLs become unusable in this way, CICS is unable to accept any new requests from VTAM. Similarly, a reduction in the number of available receive-any RPLs can adversely affect terminal performance and transaction throughput.

Additionally, while the RPL is hanging, a normal CICS shutdown might be unable to complete.

The CID is the 32-bit VTAM communication identifier which was assigned when the session was established.

System Action: CICS continues to monitor for the SEND operation to complete. Until this happens, CICS reissues this message at approximately three minute intervals.

User Response: This problem is usually caused by a failure in the network which stops the SEND completing. Check the session and the associated logical unit to ensure that there is no error condition which stops VTAM completing the SEND request.

Destination: Console

Module: DFHZRAC

XMEOUT Parameters: *applid, termid, netname, X'cid', instance, {1=DFHZRAC}*

DFHZC2116 E *date time applid* **Resynchronization of LU6.1 session** *termid* **with remote system** *sysid* **failed.**

Explanation: Resynchronization of an LU6.1 session with a remote system has failed to complete for one of the following reasons:

1. There is an apparent inconsistency between the sequence numbers in the two systems
2. There was a protocol error during the exchange of the sequence numbers

3. Neither system requested resynchronization, but there was a shunted unit of work associated with the session.

System Action:

1. A system dump is taken unless dumps have been specifically suppressed in the dump table.
2. The TCTTE for the session on which the error occurred is printed. The local system's sequence numbers, and the numbers or responses received from the remote system can be found in the TCTTE.
3. The failure of resynchronization is reported to recovery manager. Recovery manager issues diagnostics relating to any unit of work affected by the failure.

User Response:

1. Determine whether changes to data in the local and remote system are synchronized. Diagnostics issued by recovery manager will help you to do this. If necessary, take action to resynchronize the data.
2. Determine why the resynchronization failure happened. You will normally need assistance from IBM to do this. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHZRSY, DFHZSCX, DFHZSEX

XMEOUT Parameters: *date, time, applid, termid, sysid*

DFHZC2117 E *date time applid termid tranid* **Data received on pipeline session exceeds RAIA size. ((***instance***) Module name: {DFHZRAC})**

Explanation: CICS has received data on a pipeline session which is larger than the initial I/O area allocated for the receive any RPL. The size of the receive any input area (RAIA) is specified on the RAMAX system initialization parameter.

System Action: CICS ends the session which sent the data and marks it out of service. CICS will also attempt to abnormally terminate any running transactions which were initiated from this session.

User Response: Increase the value of the RAMAX system initialization parameter so that it is at least equal to the largest RUSIZE (from the CINIT) specified for a pipeline session.

Destination: CSNE

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, instance, {1=DFHZRAC}*

DFHZC2118 *applid* **Receive Any stall for netname** *netname***.**

Explanation: All the CICS Receive Any RPLs have been posted but the TCTTE for each one is waiting for a response from a VTAM terminal or session. All the Receive Any RPLs have been stalled for 10 dispatches of the TCP task (CSTP). This message is produced for each session that is in this situation. A VTAM session has not responded to a command such as BID or SHUTD sent by CICS. This is typically caused by a protocol error.

System Action: CICS is NOT running with system initialization parameter RAPOOL=(n,n,FORCE) so CICS VTAM activity is held up until one of the commands completes.

User Response:

Issue the VTAM command V NET,INACT,ID=netname,I for one or more of the sessions indicated by *netname*, to try and free a Receive Any RPL. Note - if the sessions are LU6.2 then the above command will inactivate the partner APPLID to VTAM.

Investigate why the CICS terminal control commands that have caused the stall have not completed. If this is due to a protocol error from the partner or device, attempt to get the protocol error corrected.

Consider increasing the number of Receive Any RPLs specified in the RAPOOL System Initialization parameter. For instance, if you were using the old default of 2, increase this to the new default of 50.

If you still get this message after changing the RAPOOL value consider running CICS with system initialization parameter RAPOOL=(n,n,FORCE), which attempts to issue CLSDST for all the offending sessions or terminals and to re-issue the Receive Any RPLs.

Destination: Console

Module: DFHZRAC

XMEOUT Parameters: *applid, netname*

DFHZC2300 *applid* **Recovery action requested for connection** *sysid***.**

Explanation: The XZIQUE global user exit program has been invoked by CICS because of a potential problem with the connection. The global user exit has used return code UERCAKLL indicating that throughput on the connection is abnormally low and some exceptional action is required. The poor performance of the connection can be caused by:

- Poor response on the receiving end
- Increased load on the sending end.

The condition may be intermittent. Message DFHZC2301 may follow indicating that the connection has recovered.

System Action: CICS cancels all transactions which have outstanding queued requests to use the connection.

User Response: Investigate the cause of the poor performance of the connection. Check the availability and condition of the connected system.

Destination: Console

Module: DFHZISP

XMEOUT Parameters: *applid, sysid*

DFHZC2301I *applid* **Connection** *sysid* **operating normally following recovery action.**

Explanation: Message DFHZC2300 has been issued for this connection. The connection has now recovered and is operating normally.

System Action: Processing continues.

User Response: None

Destination: Console

Module: DFHZISP

XMEOUT Parameters: *applid, sysid*

DFHZC2302 *applid* **SETLOGON start command rejected**

Explanation: CICS issues the SETLOGON START command after a successful OPEN VTAM ACB. The SETLOGON START command is rejected in the following cases:

- The CICS OPEN VTAM ACB was successful, but VTAM subsequently terminated abnormally, or
- The CICS OPEN VTAM ACB was successful, but insufficient system storage was available to satisfy the SETLOGON START command, or
- The CICS OPEN VTAM ACB was successful, but VTAM was subsequently terminated by a VTAM HALT QUICK command.

System Action: If the error occurs during CICS initialization, CICS abnormally terminates with a U2302 abend and a system dump.

If the error occurs as a result of a CEMT or EXEC CICS SET VTAM OPEN, CICS terminates the task abnormally with abend code ATC2 and a transaction dump, and the VTAM ACB is closed.

User Response: The VTAM return code can be found in RTNCD-FDBK2 in the first RPL in the RA pool addressed from TCTVRVRA in the system dump or the transaction dump.

Use the *VTAM Programming* manual, (SC23-0115-3), to determine the cause of the error and the actions necessary to correct it.

After correcting the error, either reinitialize CICS (for abend U2302) or follow the suggestions documented for abend ATC2.

Destination: Console

Module: DFHZSLS

XMEOUT Parameter: *applid*

DFHZC2303 *applid* **No storage available when initiating RECEIVE-ANY's. Code:** *X'code'*

Explanation: While trying to acquire receive-any I/O areas, the SETLOGON START VTAM command found that storage was not available.

System Action: CICS terminates with a dump. An exception entry *code* is made in the trace table.

A system dump is taken unless dumps have been specifically suppressed in the dump table.

Message DFHZC0133 is issued.

User Response: Reduce the size of the RAMAX value in the system initialization table (SIT).

For further information, see the *CICS Performance Guide*.

Destination: Console

Module: DFHZGRP

XMEOUT Parameters: *applid, X'code'*

DFHZC2304 *applid* **RECEIVE-ANY command rejected. Code:** *X'code'*

Explanation: This message is issued when the ACB has been opened either during initialization or dynamic open. DFHZGRP was initiating the VTAM RECEIVE-ANY's but VTAM was short on storage or the VTAM HALT QUICK command was issued.

System Action: An exception entry *code* is made in the trace table.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

If the error occurs during CICS initialization, CICS issues message DFHZC0133 and terminates.

If the error occurs as a result of a CEMT or EXEC CICS SET VTAM OPEN, CICS closes the VTAM ACB.

User Response: The VTAM return code can be found in RTNCD-FDBK2 in the RPL, which is either in the exception trace entry *code*, or in the RA pool addressed from TCTVRVRA in the system dump.

Use the *VTAM Programming* manual, (SC31-6436), to determine the cause of the error and the actions necessary to correct it.

After correcting the error, either reinitialize CICS or reopen the VTAM ACB.

Destination: Console

Module: DFHZGRP

XMEOUT Parameters: *applid, X'code'*

DFHZC2305I *applid* **Termination of VTAM sessions beginning**

Explanation: Either CICS or VTAM is being terminated, or a dynamic close of the VTAM ACB has been requested.

System Action: All CICS-VTAM sessions are closed and the ACB is closed. If termination is not orderly, active transactions are abnormally terminated.

User Response: When VTAM is active, communication may be resumed by using the master terminal operator command CEMT SET VTAM OPEN.

Destination: Console

Module: DFHZSHU

XMEOUT Parameter: *applid*

DFHZC2307 *applid* **CICS VTAM ABNORMALLY QUIESCING (***modname***).**

Explanation: An RPL request has completed without a TCTTE token, for other than a VTAM storage shortage.

System Action: CICS performs a FORCECLOSE of the ACB.

CICS may produce this message twice as both module DFHZRAC and module DFHZSYX may detect the condition.

User Response: When VTAM has been restarted, issue a CEMT SET VTAM OPEN.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHZRAC, DFHZSYX

DFHZC2308 *applid* **TCP Task WAIT failed. Unexpected response from DSSR WAIT_OLDW call (RESPONSE** *X'xx'***, REASON** *X'yy'***).**

Explanation: The TCP task wait has failed.
The TCP dispatcher module, DFHZDSP, has received an unexpected response, with response code X'*xx*' and reason code X'*yy*' from the DSSR WAIT_OLDW call.

System Action: CICS abends with abend U1800 and a system dump is produced.

User Response: Determine the cause of the TCP task wait failure. Investigate the dump in conjunction with any other

accompanying error messages or exception trace entries which may have been issued by dispatcher domain.

Destination: Console

Module: DFHZDSP

XMEOUT Parameters: *applid, X'xx', X'yy'*

DFHZC2309 *applid* **Recovery action requested for connection** *sysid* **using mode group** *modename***.**

Explanation: The XZIQUE global user exit program has been invoked by CICS because of a potential problem with the connection. The global user exit has used return code UERCAKLM indicating that throughput on the connection is abnormally low and some exceptional action is required. The poor performance of the connection can be caused by:

- Poor response on the receiving end
- Increased load on the sending end.

The condition may be intermittent. Message DFHZC2310 may follow indicating that the mode group has recovered.

System Action: CICS cancels all transactions which have outstanding queued requests to use this mode group.

User Response: Investigate the cause of the poor performance of the mode group. Check the availability and condition of the connected system.

Destination: Console

Module: DFHZISP

XMEOUT Parameters: *applid, sysid, modename*

DFHZC2310I *applid* **Connection** *sysid* **using mode group** *modename* **operating normally following recovery action.**

Explanation: Message DFHZC2309 has been issued for this mode group. The mode group has now recovered and is operating normally.

System Action: Processing continues.

User Response: None

Destination: Console

Module: DFHZISP

XMEOUT Parameters: *applid, sysid, modename*

DFHZC2312 * WELCOME TO CICS *****

Explanation: This is the CICS default good morning message for VTAM LUs. It is displayed unless an alternative GMTEXT has been specified as a system initialization parameter, or the typeterm definition logon message (LOGONMSG) has been set to NO.

System Action: Processing continues.

User Response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Terminal End User

Module: DFHSIT

DFHZC2316 *applid* **VTAM ACB is closed**

Explanation: CICS and VTAM have been disconnected. This may be because:

- CICS is terminating, or
- VTAM is terminating, or
- The CICS master terminal operator has issued

```
SET VTAM {CLOSED|IMMCLOSE|FORCECLOSE}
```

System Action: The VTAM ACB is closed.

User Response: If VTAM has not terminated, connection with VTAM can be reestablished by using master terminal operator commands.

Destination: Console

Module: DFHZSHU

XMEOUT Parameter: *applid*

DFHZC2318 *applid* **The autoinstall user program** *progname* **is not enabled. Module** *modname***.**

Explanation: While opening the VTAM ACB, CICS found that no installed program definition exists for the autoinstall user-program *progname* specified in the SIT.

System Action: Other processing continues.

User Response: If you want to use autoinstall, produce an installed program definition for the autoinstall user-program *progname* specified in the SIT.

Destination: Console

Modules: DFHSIJ1, DFHZOPA

XMEOUT Parameters: *applid, progname, modname*

DFHZC2319 *applid* **Unable to close VTAM ACB RC=***xx* **error code=***yy*

Explanation: The VTAM ACB CLOSE request failed.

System Action: CICS continues as if the ACB is closed. (It is not really closed.)

User Response: Refer to the *VTAM Programming* manual for an explanation of the return and error codes.

The return code *xx* is the VTAM return code in Register 15. The error code *yy* is the ACB error flag 'ACBERFLG'.

Destination: Console

Module: DFHZSHU

XMEOUT Parameters: *applid, xx, yy*

DFHZC2320 CORRUPTED TCTTE ADDRESS FOUND DURING SHUTDOWN.

Explanation: A DFHTC CTYPE=LOCATE macro has returned an error indication while shutting down VTAM. This implies that the TCTTE chain has been corrupted, possibly by an overlay of the table manager control blocks.

System Action: CICS is abnormally terminated with a system dump.

User Response: Investigate the dump to determine the cause of the problem.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module: DFHZSHU

DFHZC2350A *date time applid* **CICS Terminal Control shutdown threshold (***mm* **minutes) exceeded. Sessions still active:** *sesslist* **((***instance***) Module name: {DFHZSHU})**

Explanation: CICS' attempt to shut down the network has not been completed within the time period allowed. This time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter.

In the message, *mm* is the value of TCSWAIT, and *sesslist* is the VTAM network names of the first 10 (if there are that many) hung VTAM terminals.

System Action:

CICS issues this message to both the CSNE transient data queue and the operating system console. This message is issued to the operating system console with an MVS write to operator (WTO) message descriptor code of 2. This means that the message is held by the operating system (that is, it does not roll off the screen) until the operator deletes it. For each hung VTAM session, message DFHZC2351 is also issued. DFHZC2351 gives further details of the session and is issued only to the CSNE transient data queue. CICS may attempt a FORCECLOSE on the session (see message DFHZC2351 for further details) but otherwise CICS terminal control shutdown continues as normal.

This message, DFHZC2350, is not processed by DFHZNAC (node abnormal condition program), so the condition cannot be intercepted by the installation's DFHZNEP (node error program). Note however that DFHZC2351 is processed by DFHZNAC and may be intercepted by the installation's DFHZNEP.

User Response: Note the message, then delete it from the operating system console using the MVS CONTROL E (or K E) system command. See message DFHZC2351 for further guidance.

Destination: Console and Transient Data Queue CSNE

Module: DFHZSHU

XMEOUT Parameters: *date, time, applid, mm, sesslist, instance, {1=DFHZSHU}*

DFHZC2351 *date time applid termid netname* **Session still active after TC shutdown threshold expired. Reason:** *{01 Request in progress | 02 Task still active | 03 Waiting for SHUTC | 04 Waiting for BIS | 05 Waiting for UNBIND | 06 Waiting for RTR | 07 BID in progress | 08 Other TC work pending | 99 Undetermined} sense* **((***instance***) Module name: {DFHZSHU})**

Explanation: CICS' attempt to shut down the network has not been completed within the time period allowed. The time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter. This message is issued for each VTAM terminal that is still active (not shut down) after the time period has expired.

In the message *termid* and *netname* are respectively, the CICS terminal identifier, and the VTAM network name of the hung terminal. One of the following is also included in the message to indicate the reason for the hang:

01 Request in progress

02 Task still active

03 Waiting for SHUTC

04 Waiting for BIS

05 Waiting for UNBIND

06 Waiting for RTR

07 BID in progress

08 Other TC work pending

99 Undetermined

System Action: CICS may attempt a FORCECLOSE on the session but otherwise CICS terminal control shutdown continues normally. Whether CICS attempts a FORCECLOSE depends upon:

- The coding of the TCSACTN system initialization parameter, and
- How the installation's DFHZNEP (node error program) handles this condition.

If either of the following conditions is true:

- TCSACTN=UNBIND, and this action is not changed by DFHZNEP,
- TCSACTN=NONE, and this action is changed to FORCECLOSE (UNBIND) by DFHZNEP

CICS terminal control issues a VTAM CLSDST and sends an SNA UNBIND command. If neither of the conditions is true, no special action is taken.

Note: CLSDST is not guaranteed to work in all circumstances.

The first 10 terminals (if there are that many) reported by this message are also included in message DFHZC2350.

User Response: Check the state of the terminal. Check whether the associated DFHZC3437 message includes CLSDST. If DFHZC3437 does not include CLSDST, or it does but the CLSDST still fails to complete, take appropriate action outside of CICS to shut down the terminal.

If after a reasonable interval, terminal control shutdown still fails to complete (message DFHZC2316 is not displayed), take one of the following actions:

- FORCECLOSE the CICS/VTAM ACB.
- Perform a CICS CEMT PERFORM SHUTDOWN IMMEDIATE.
- Cancel the CICS job from the operating system console.

Warning: Do not perform one of these actions unless there are no other suitable actions to take.

The reason why the terminal does not shutdown is more likely to be a problem with the terminal device or the network, than with CICS.

If messages DFHZC2350, DFHZC2351, and DFHZC2352 are issued too early or too late in the shutdown process, take appropriate steps to change the TCSWAIT system initialization parameter on future runs of CICS. Once CICS has initialized, TCSWAIT cannot be changed.

Destination: CSNE

Module: DFHZSHU

XMEOUT Parameters: *date, time, applid, termid, netname, {1=01 Request in progress, 2=02 Task still active, 3=03 Waiting for SHUTC, 4=04 Waiting for BIS, 5=05 Waiting for UNBIND, 6=06 Waiting for RTR, 7=07 BID in progress, 8=08 Other TC work pending, 99=99 Undetermined}, sense, instance, {1=DFHZSHU}*

DFHZC2352 *date time applid sysid netname* **Intersystem parallel connection still active after TC shutdown threshold expired. ((***instance***) Module** *{DFHZSHU})* **).**

Explanation: CICS' attempt to shut down the network has not been completed within the time period allowed. The time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter. This message is issued for the first VTAM intersystem parallel session in each connection (LU Type 6.1 and LU Type 6.2, but not LU Type 6.2 single-session APPC terminals) that is still active (not shut down) after the time period has expired.

In the message *sysid* and *netname* are respectively, the CICS system identifier and the VTAM

System Action:

CICS terminal control shutdown continues as normal. Unlike terminals (see message DFHZC2351), terminal control does not attempt a FORCECLOSE on hung parallel connections. This message is not processed by DFHZNAC (node abnormal condition program), so the condition cannot be intercepted by the installation''s DFHZNEP (node error program). Parallel connections reported by this message are not included in message DFHZC2350.

User Response: Check the state of the connection. Take appropriate action outside of this CICS system to shut down the connection.

If messages DFHZC2350, DFHZC2351, and DFHZC2352 are issued too early or too late in the shutdown process, take appropriate steps to change the TCSWAIT system initialization parameter on future runs of CICS. Once CICS has initialized TCSWAIT cannot be changed.

Destination: Console and Transient Data Queue CSNE

Module: DFHZSHU

XMEOUT Parameters: *date, time, applid, sysid, netname, instance, {1=DFHZSHU}*

DFHZC2400 E *date time applid termid tranid* **Error not supported.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: CICS received an unexpected error code from VTAM.

System Action: CICS terminates the session. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use the symptom string, and if necessary the transaction dump, to determine the source of the error.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX, 3=DFHZSYX, 4=DFHZSYX, 5=DFHZSYX, 6=DFHZSYX, 7=DFHZSYX, 8=DFHZSYX, 9=DFHZSYX, 10=DFHZSYX}*

DFHZC2401 E *date time applid termid tranid* **RPL Active.** *sense* **((***instance***) Module name: {DFHZRVL | DFHZRVS | DFHZSDA | DFHZSDL | DFHZSDR | DFHZSDS | DFHZSES | DFHZSKR})**

Explanation: CICS attempted to request VTAM services using a request parameter list (RPL) that is currently active.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS terminates the session. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use the symptom string, and if necessary, the transaction dump to determine the source of the error.

Destination: CSNE

Modules: DFHZRVS, DFHZSDA, DFHZSDR, DFHZSDS, DFHZSES, DFHZSDL, DFHZRVL, DFHZSKR

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZSDA, 3=DFHZSDL, 4=DFHZSDS, 5=DFHZSES, 6=DFHZSKR, 7=DFHZRVL, 8=DFHZSDR, 9=DFHZRVL, 10=DFHZRVL, 11=DFHZRVL, 12=DFHZSDL}*

DFHZC2402 I *date time applid termid tranid netname* **VTAM has returned error on synchronous receive.** *sense* **((***instance***) Module name: {DFHZRAS})**

Explanation: VTAM has indicated that a synchronous receive issued by DFHZRAS during receive-any slow-down processing did not complete successfully. This indicates a serious mismatch between CICS's view of the state of the session and that of VTAM.

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is ignored. CICS prints the associated session TCTTE on the CSNE transient data destination. The RPL returned by VTAM is included in exception trace entry AP FCA2.

User Response: Determine from the RPL in the exception trace why VTAM raised the error.

Destination: CSNE

Module: DFHZRAS

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZRAS}*

DFHZC2403 E *date time applid termid tranid* **Bind failure.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: An attempt to establish a session has failed. This could be because a physical path to the device could not be found, because the device does not exist or has been defined incorrectly, or because the device has rejected the bind.

For the meaning of the sense data, see the explanation on page 678.

If this is an LU62 or LU61 session and the partner LU has sent sense bytes of X'0835oooo' and oooo is the offset of the NETNAME in the BIND, this indicates that the partner LU was unable to find a suitable session.

If the sense bytes are X'08010000', this may mean that the partner LU has failed to autoinstall a connection.

If the VTAM RETURN CODE FEEDBACK is X'1018' then Generic Resource is in use but the coupling facility is unavailable.

Instance 1 with sense code '0805' - If this system (TOR2) is a member of a generic resource (GR) and the partner (AOR) is not and an affinity already exists between another member (TOR1) of the same generic resource (GR) and the AOR then this indicates that it is not valid to acquire this connection. This message is normally accompanied by DFHZC2411 instance 36 for the equivalent sessions in the AOR. The DFHZC2411 message is saying that the AOR cannot find a connection defined with the real name of TOR2. The AOR connection is defined with the Generic Resource name of the TOR.

System Action: Because communication cannot be established with a node, a VTAM CLSDST macro is issued to release any control blocks previously built, and the node could be placed out of service.

User Response: Use the VTAM sense code given in the message to determine the cause of failure. If appropriate, ensure that the node name was included in the network control program/virtual storage (NCP/VS) generation deck and investigate for a possible bad communication line.

If the sense bytes were X'0835oooo' (where oooo is the offset of the NETNAME in the BIND), the partner LU has been unable to find a suitable session. If the partner LU is CICS, look in the partner LU's log for DFHZC2411 and previous messages for the same session. This should give some indication as to why no session could be found.

If LU62 autoinstall is in use and the sense bytes were X'08010000' look in the partner LU's log for message DFHZC2411 and message DFHZC69xx which should indicate the reason for failure to autoinstall a connection.

If the VTAM RETURN CODE FEEDBACK is X'1018' the logon can be retried once the coupling facility becomes available.

Instance 1 sense '0805'x - Determine if TOR2 was started intentionally with a different APPLID and the same Generic Resource name and if not, correct the problem. If it was and you need a connection between these two systems then you need to end the affinity between AOR and TOR1. The affinity can be ended by:

1. Bring up TOR1, acquire the connection and release it or
2. bring up TOR1 and use ENDAFFIN via CEMT or EXEC CICS or
3. use a batch program described in 'Writing a batch program to end affinities' in the CICS Intercommunication Guide.

However, if the AOR is within the same sysplex as the TOR you should be using MRO connections rather than APPC - you then get no problems with affinities.

If the AOR is outside the sysplex and the connection is acquired from the TOR then you need to use a HUB as described in 'Using a HUB' in the CICS Intercommunication Guide to prevent two TORs from attempting to connect to one AOR using the generic resource name.

Alternatively you can change the AOR connection to address TOR2 by its real name as opposed to its generic resource name and always acquire the connection from the AOR. This implies that you must not use AUTOCONNECT in the TOR connection.

You should release the connection as soon as possible.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX}*

DFHZC2404 E *date time applid termid tranid* **VTAM Detected Logic Error.** *sense* **((***instance***) Module name: {DFHZLEX})**

Explanation: VTAM detected an error in a request. The request was either incomplete or not executable.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS breaks communication with the node (CLSDST), abnormally terminates any attached task, places the node out of service and produces a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that all application programs running concurrently have proper addressability, thereby avoiding alteration of CICS control blocks such as the TCTTE or the RPL. If this message occurs during normal system execution, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

This message may also occur if VTAM is terminating. Under these conditions it is not a serious problem, and usually no response is necessary.

Destination: CSNE

Module: DFHZLEX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZLEX, 2=DFHZLEX, 3=DFHZLEX, 4=DFHZLEX, 5=DFHZLEX, 6=DFHZLEX}*

DFHZC2405 E *date time applid termid tranid* **Node** *netname* **not activated.** *sense* **((***instance***) Module name: {DFHZSIM | DFHZSIX | DFHZSYX})**

Explanation: The node was not activated, or was deactivated by the network operator, or a generic resource affinity already exists with another system in the same generic resource.

Instance 6 - If the partner is a member of a generic resource (TOR2) and this system (AOR) is not and an affinity already exists between the AOR and another member of the same generic resource (TOR1) because TOR1 crashed, then VTAM has indicated that you cannot acquire this connection.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding SEND and RECEIVE requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A VTAM CLSDST macro is issued to halt communication with the node, and internal LOGONs are prevented.

If this message is issued during takeover, the acquire is retried at intervals of 1, 2, 4 and 8 minutes after the first attempt. This allows time for sessions which require manual intervention before the acquire can succeed.

User Response: Use the VTAM VARY command to activate the node before using it in the network. Alternatively, for ISC with IMS, enable IMS for LOGONs.

It is possible that the node in question has previously been used as a generic APPLID (or in VTAM terms – a USERVAR). Use the VTAM operator command DISPLAY USERVAR to see if this is the case. If it is, you can use MODIFY USERVAR,OPTION=DELETE,ID=node to delete the USERVAR.

Instance 6 - Determine if TOR2 was started intentionally with a different APPLID and the same GR name and if not, correct the problem. If it was and you need a connection between these two

systems then you need to end the affinity between the AOR and TOR1. The affinity can be ended by:

1. Bring up TOR1, acquire the connection and release it cleanly or
2. Bring up TOR1 and use ENDAFFIN via CEMT or EXEC CICS or
3. Use a batch program described in 'Writing a batch program to end affinities' in the CICS Intercommunication Guide.

However, if the AOR is within the same sysplex as the TOR you should be using MRO connections rather than APPC - you then get no problems with affinities.

If the AOR is outside the sysplex and the connection is acquired from the TOR then you need to use a HUB as described in 'Using a HUB' in the CICS Intercommunication Guide to prevent two TORs from attempting to connect to one AOR using the generic resource name.

Alternatively you can change the AOR connection to address TOR2 by its real name as opposed to its generic resource name and always acquire the connection from the AOR. This implies that you must not use AUTOCONNECT in the TOR2 connection.

Modules: DFHZSYX, DFHZSIX, DFHZSIM

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZSIM, 2=DFHZSIM, 3=DFHZSIM, 4=DFHZSIM, 5=DFHZSIM, 6=DFHZSYX, 7=DFHZSYX, 8=DFHZSYX, 9=DFHZSIX, 10=DFHZSYX, 11=DFHZSYX}*

DFHZC2406 E *date time applid termid tranid* **Terminate self command received.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: The logical unit (LU) has requested termination of the session.

For the meaning of the sense data, see the explanation on page 678.

System Action: The VTAM CLSDST macro is issued to stop communications with the node. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: None.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX}*

DFHZC2407 E *date time applid termid tranid* **Permanent channel failure.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: Network Control Program/Virtual Storage (NCP/VS) was either shut down by the network operator or was abnormally terminated. Alternatively, there could have been a channel failure.

For the meaning of the sense data, see the explanation on page 678.

System Action: Since communication with the logical unit was broken, the VTAM CLSDST macro instruction is issued to release control blocks previously built by VTAM. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Use the supplied dump to check for a possible NCP/VS or channel problem.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX}*

DFHZC2408 E *date time applid termid tranid* **Apparent VTAM Error.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: VTAM encountered an error during its own processing.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use the sense data to determine the nature of the error.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX, 3=DFHZSYX, 4=DFHZSYX}*

DFHZC2409 I *date time applid termid tranid* **VTAM Recovered Node. LOSTERM Error Code** *X'xx'***.** *sense* **((***instance***) Module name: {DFHZLTX})**

Explanation: VTAM successfully reestablished communication with a node. The reason for entering the LOSTERM exit is given by *xx*, which has one of the following values:

Value	Meaning
0	Dial-disconnect on dial-in.
4	Dial-disconnect on dial-out.
0C	Deactivate immediate.
14	Unconditional terminate self.
1C	Segmenting error.
20	Conditional terminate self.
24	BUFLIM value exceeded.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS reestablishes communication and places the node in service.

User Response: None.

Destination: CSNE

Module: DFHZLTX

XMEOUT Parameters: *date, time, applid, termid, tranid, X'xx', sense, instance, {1=DFHZLTX, 2=DFHZLTX}*

DFHZC2410 E *date time applid termid tranid* **Node Unrecoverable. VTAM LOSTERM Error Code** *X'xx'***.** *sense* **((***instance***) Module name: {DFHZLTX})**

Explanation: Communication with a node was interrupted and cannot be reestablished by VTAM. The reason for entering the LOSTERM exit is given by the error code X'*xx*'.

For the meaning of the sense data, see the explanation on page 678.

System Action: The VTAM CLSDST macro is issued to release any control blocks previously built for the node. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: See the appropriate *VTAM Programming* manual for an explanation of the error code.

Destination: CSNE

Module: DFHZLTX

XMEOUT Parameters: *date, time, applid, termid, tranid, X'xx', sense, instance, {1=DFHZLTX, 2=DFHZLTX, 3=DFHZLTX, 4=DFHZLTX}*

DFHZC2411 E *date time applid termid tranid nodeid* **attempted invalid logon.** *sense* **((***instance***) Module name: {DFHTFP | DFHZATA | DFHZBLX | DFHZLGX | DFHZSCX | RESERVE})**

Explanation: Node *nodeid* attempted to log on to CICS but the logon is invalid.

The *nodeid* in the message will always start with the 'netname' of the node attempting to connect to CICS. For some instances of the message resulting from an LU6.2 log on, the modename of the session will be concatenated to the 'netname' with a dot separator. Since a string consisting of eight blanks is the default modename, this can lead to idiosyncratic formatting of the message.

If the message is issued by DFHZATA, CICS has failed in its attempt to autoinstall the terminal or connection.

The instance *instance* is one of the following:

1 For LU6.1 no suitable TCTTE can be found, or no session TCTTE exists This could occur for one of the following reasons:

1. The bind did not contain a modename.
2. There is an RDO definition for a member name connection in a generic resource communicating with another generic resource over an LU6.1 link.

2 No PLUNAME has been found in the LU6.2 bind processed by CICS.

3 An attempt to autoinstall a member name connection in a generic resource system has failed because the bind was not for a SNA service manager.

4 Autoinstall is not allowed because the system is terminating.

5 Autoinstall is not allowed because the VTAM ACB is closing.

6 ISC support is not present because ISC=NO specified in the SIT.

7 Used by DFHZATA for several reasons, for example BIND bad and user exit bad.

8 The TCTTE address restored and the address found by NIBSEARCH do not agree.

9 The system is terminating.

10 VTAM is terminating.

11 RESERVED.

12 RESERVED.

13 No address is present in the RPL.

14 LU6.1 cannot autoinstall.

If both CICS systems are registered as different generic resources, the LU61 connections must be defined with each other's generic resource netnames; they cannot communicate by member name. In this case CICS looked for the generic resource netname and was unable to find it.

15 ISC support is not present.

16 A CINIT arrived for an APPC parallel session. This is not supported All input for an APPC parallel session should be via a BIND. Also, no connection exists with this NETNAME.

17 Session is not bound.

18 Not used.

19 LU is not enabled. Typically it is an XRF alternate CICS.

20 A second CINIT with the same netname has arrived.

21 Logon rejected due to CATA abend.

22 A CINIT initiated by SIMLOGON occurred for an APPC paralled session. A matching connection exists, but it is being deleted. This should not occur because either the delete should have been cancelled (if it had been scheduled but not started) or the SIMLOGON should have been queued until the delete was attempted and fails because there is SIMLOGON activity.

23 A BIND was received for an LU6.1 connection. This CICS is registered as a generic resource but the partner addressed CICS by its MEMBER name instead of its generic resource name.

Change the partner's connection definition for this system to use a NETNAME of this system's generic resource name.

24 An unsolicited APPC parallel session CINIT was received by the logon exit. CICS does not support this.

25 A CINIT was received for an LU6.1 connection. This CICS is registered as a generic resource but the partner addressed CICS by its MEMBER name instead of its generic resource name.

Change the partner's connection definition for this system to use a NETNAME of this system's generic resource name.

26 A BIND was received for an LU6.1 connection. This CICS is registered as the same generic resource as the partner. However, the partner addressed CICS by the generic resource name instead of the member name which it should use for intra-plex communication.

Change the partner's connection definition for this system to use a NETNAME of this system's member name.

27 A CINIT was received for an LU6.1 connection. This CICS is registered as the same generic resource as the partner. However, the partner addressed CICS by the generic resource name rather than the member name which it should use for intra-plex communication.

Change the partner's connection definition for this system to use a NETNAME of this system's member name.

28 An LU62 bind was received for the netname specified. CICS has found a connection with the relevant netname but the connection was not defined as APPC.

29 A system entry for the connection indicated by the bind has been found but none of its sessions are usable.

30 No modename field UDSS02 was found in the bind.

31 Examination of the session tctte has indicated it to be out of service, a non-SNA service manager session and to have the associated connection released.

32 An attempt to autoinstall a GR name or XRF connection has failed because the bind was not for a SNA service manager.

33 This bind is a SNA service manager request for an existing partner.

34 There is a problem with the user data supplied in the bind. Specifically one of the following.

- There is no user data.
- The user data supplied is too short.
- The user data is not architected.

35 A delete is pending for the connection found. This delete is for a non-transient terminal definition and has been requested explicitly.

36 For a non-generic resource request, examination of the bind has indicated that it is not for a SNA service manager.

This instance also indicates that you should not acquire this connection if the partner is a member of a generic resource, and this system is not, and an affinity already exists between this system and another member of the same generic resource. See message DFHZC2403, which is issued for the partner's equivalent sessions, for how you correct the situation.

37 The current session count has exceeded the maximum session count indicated in the mode group entry.

38 An attempt to acquire a generic resource connection failed because there is a member name connection defined for the generic resource member to which VTAM has chosen to route it.

39 This CICS has deregistered from a generic resource but a remote partner is attempting to bind an APPC session using a generic resource name. This indicates that VTAM affinities have not been ended on both sides.

40 This CICS has deregistered from a generic resource but a remote partner is attempting to bind an LU6.1 session using a generic resource name. This indicates that VTAM affinities have not been ended on both sides.

For the meaning of the sense data, see the explanation on page 678.

If ???????? is displayed in the second half of the *nodeid* field, the BIND may contain a SESSION QUALIFIER or MODENAME with an invalid length.

System Action: The logon is rejected. If the reject is from DFHZSCX via the dummy TCTTE, an attempt is made to print the failing BIND and sense code with which it was rejected as part of the message.

User Response: Use the instance number to determine why the attempted logon has been rejected and take the appropriate action.

Destination: CSNE

Modules: DFHZLGX, DFHZSCX, DFHZATA, DFHZBLX

XMEOUT Parameters: *date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZSCX, 2=DFHZBLX, 3=DFHZBLX, 4=DFHZBLX, 5=DFHZBLX, 6=DFHZBLX, 7=DFHZATA, 8=DFHZLGX, 9=DFHZLGX, 10=DFHZLGX, 11=DFHZSCX, 12=RESERVE, 13=DFHZLGX, 14=DFHZLGX, 15=DFHZLGX, 16=DFHZLGX, 17=DFHZLGX, 18=DFHZLGX, 19=DFHZLGX, 20=DFHZLGX, 21=DFHTFP, 22=DFHZLGX, 23=DFHZSCX, 24=DFHZLGX, 25=DFHZLGX, 26=DFHZSCX, 27=DFHZLGX, 28=DFHZBLX, 29=DFHZBLX, 30=DFHZBLX, 31=DFHZBLX, 32=DFHZBLX, 33=DFHZBLX, 34=DFHZBLX, 35=DFHZBLX, 36=DFHZBLX, 37=DFHZBLX, 38=DFHZLGX, 39=DFHZBLX, 40=DFHZSCX}*

DFHZC2412 E *date time applid termid tranid* **Receive any request failed.** *sense* **((***instance***) Module name: {DFHZRAC})**

Explanation: A receive-any request to VTAM failed. VTAM was terminated.

For the meaning of the sense data, see the explanation on page 678.

System Action: The VTAM RPL control block is logged to the CSMT log for visual inspection.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Determine the reason why the receive-any failed. First, check to see if the VTAM RPL has been altered. If it has been altered, check to see if the alterations could have caused any problems. Correct any obvious errors. It may be useful to refer to the *VTAM Programming* manual, (SC23-0115), during problem determination.

Destination: CSNE

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC}*

DFHZC2413 E *date time applid termid tranid nodeid* **CLSDST failed.** *sense* **((***instance***) Module name: {DFHTFP | DFHZATA | DFHZLGX})**

Explanation: A CLSDST request for the node identified by *nodeid* failed. VTAM may not have sufficient space to respond to the request.

For the meaning of the sense data, see the explanation on page 678.

System Action: No further communication with the node is initiated.

User Response: Inspect the CSNE, CSMT and CSTL logs for indication of a VTAM storage problem or error message. Also check for any messages indicating an I/O problem.

Destination: CSNE

Modules: DFHTFP, DFHZATA, DFHZLGX

XMEOUT Parameters: *date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZATA, 2=DFHZLGX, 3=DFHTFP}*

DFHZC2414 E *date time applid termid tranid* **Temporary VTAM Storage Problem.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: Temporary VTAM storage problem. VTAM is currently short of storage.

For the meaning of the sense data, see the explanation on page 678.

System Action: The failing VTAM request is retried until VTAM is able to accept it.

User Response: Increase the VTAM working buffer storage if this condition recurs and causes undue problems.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX}*

DFHZC2415 E *date time applid termid tranid* **Node** *netname* **out of service.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: A node error condition has occurred on node *nodeid*.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS places the node out of service.

User Response: Use the sense data to determine the nature of the error.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZNAC}*

DFHZC2416 E *date time applid termid tranid* **VTAM is halting.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: A VTAM HALT command was entered by the network operator while a SIMLOGON or OPNDST request was in progress. The instance number indicates what type of halt was requested:

1 Orderly shutdown
2 Quick shutdown.

For the meaning of the sense data, see the explanation on page 678.

System Action: The VTAM network is quiesced to prevent further requests and the node is placed out of service.

User Response: None.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX}*

DFHZC2417 E *date time applid termid tranid* **VTAM Inactive to TCB.** *sense* **((***instance***) Module name: {DFHZCLS | DFHZCLX | DFHZOPN | DFHZOPX | DFHZRAC | DFHZRLP | DFHZRST | DFHZRVL | DFHZRVS | DFHZRVX | DFHZSDA | DFHZSDL | DFHZSDR | DFHZSDS | DFHZSES | DFHZSIM | DFHZSIX | DFHZSKR | DFHZSLX | DFHZSYX | DFHZTAX})**

Explanation: Either CICS has not opened its VTAM ACB or VTAM has halted.

For the meaning of the sense data, see the explanation on page 678.

System Action: The VTAM network is quiesced to prevent further requests and a dump is produced.

User Response: If VTAM was not halted by the network operator, use the supplied dump to determine the problem.

Destination: CSNE

Modules: DFHZSYX, DFHZCLS, DFHZCLX, DFHZOPN, DFHZOPX, DFHZRAC, DFHZRLP, DFHZRST, DFHZRVL, DFHZRVS, DFHZRVX, DFHZSDL, DFHZSDR, DFHZSDS, DFHZSES, DFHZSIM, DFHZSIX, DFHZSKR, DFHZSLX, DFHZTAX, DFHZSDA

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZOPX, 2=DFHZCLS, 3=DFHZOPN, 4=DFHZRLP, 5=DFHZRST, 6=DFHZRVS, 7=DFHZRVX, 8=DFHZSDA, 9=DFHZSDL, 10=DFHZSDS, 11=DFHZSES, 12=DFHZSIM, 13=DFHZSKR, 14=DFHZSLX, 15=DFHZRAC, 16=DFHZCLX, 17=DFHZRVL, 18=DFHZSDR, 19=DFHZSIX, 20=DFHZTAX, 21=DFHZOPX, 22=DFHZSYX}*

DFHZC2418 E *date time applid termid tranid* **Unknown command in RPL.** *sense* **((***instance***) Module name: {DFHZSEX})**

Explanation: An unknown command was detected in the VTAM request parameter list (RPL) by the CICS SESSIONC exit routine. The RPL address could be invalid or the RPL could have been altered.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

A CLSDST is issued to halt communication with the node, and the node is placed out of service.

User Response: First, check if the VTAM RPL has an invalid address. If the address is valid, check to see if the RPL has been altered. If it has been altered, check to see if the alterations could have caused any problems. Correct any obvious errors. It may be useful to refer to the *VTAM Programming* manual, (SC23-0115), while carrying out problem determination.

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSEX, 2=DFHZSEX}*

DFHZC2419 E *date time applid termid tranid* **Unknown command in RPL.** *sense* **((***instance***) Module name: {DFHZRAC | DFHZSLX | DFHZSSX})**

Explanation: An unknown command was detected in the request parameter list (RPL) by the send-data-flow synchronous exit routine. The RPL address could be invalid or the RPL could have been altered.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

A VTAM CLSDST macro is issued to halt communication with the node, and the node is placed out of service.

User Response: In the first instance, check if the VTAM RPL has an invalid address. If the address is valid, check to see if the RPL has been altered. If it has been altered, check to see if the alterations could have caused any problems. Correct any obvious errors. It may be useful to refer to the *VTAM Programming* manual, (SC23-0115-3), while carrying out problem determination.

Destination: CSNE

Modules: DFHZSSX, DFHZSLX, DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSSX, 2=DFHZSLX, 3=DFHZRAC, 4=DFHZRAC, 5=DFHZRAC, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC}*

DFHZC2420 E *date time applid termid tranid* **Unknown command in RPL.** *sense* **((***instance***) Module name: {DFHZSAX})**

Explanation: An unknown command was detected in the request parameter list (RPL) by the send-data-flow asynchronous exit routine. The RPL address could be invalid or the RPL could have been altered.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

A VTAM CLSDST macro is issued to halt communication with the node, and the node is placed out of service.

User Response: In the first instance, check if the VTAM RPL has an invalid address. If the address is valid, check to see if the RPL has been altered. If it has been altered, check to see if the alterations could have caused any problems. Correct any obvious errors. It may be useful to refer to the *VTAM Programming* manual, (SC23-0115), while carrying out problem determination.

Destination: CSNE

Module: DFHZSAX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSAX}*

DFHZC2421 E *date time applid termid tranid* **Unsupported command received.** *sense* **((***instance***) Module name: {DFHZRAC | DFHZRLP | DFHZRVX})**

Explanation: An unknown command or request was detected, or the RPL contains logical unit (LU) status.

For the meaning of the sense data, see the explanation on page 678.

System Action: If an invalid command or request was detected, all outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A VTAM CLSDST macro is issued to halt communication with the node.

For ISC sessions, this error may be caused by specifying incompatible session types at each node. (For example, SESSIONTYPE=SEND in one node and SESSIONTYPE=FASTRECV in the other node.)

If the RPL contains logical unit (LU) status, one of the following messages is issued: DFHZC2461, DFHZC2462, DFHZC2464, DFHZC2465, or DFHZC2466.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: An invalid command or request indicates inconsistencies or errors in the definitions of the named terminals/sessions in CICS, VTAM or the connected system for LU6 sessions. Ensure that these definitions are consistent and correct for the device or session characteristics.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX, DFHZRLP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP, 3=DFHZRVX, 4=DFHZRVX, 5=DFHZRAC, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC}*

DFHZC2422 E *date time applid termid tranid* **ZCP Logic Error.** *sense* **((***instance***) Module name: {DFHZARL | DFHZDET | DFHZERH | DFHZEV1 | DFHZEV2 | DFHZNAC | DFHZOPN | DFHZRAC | DFHZRVS | DFHZSDS | DFHZSIM | DFHZSKR | DFHZSLX | DFHZSSX})**

Explanation: During terminal processing, CICS detected an invalid internal state in DFHZCP.

Instance 1 of the message could be caused by a loss of data following a persistent sessions restart in a partner system. In this case, no logic error has occurred because any updates are backed out. This normally follows an AZCD for the same session and the message DFHZC0144 for the partner session.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged, and the task is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to the CSMT destination for debugging purposes.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that the application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the dump to locate the source of the error.

It may be useful to examine the debugging data printed on the CSMT log for clues about what possibly went wrong.

Destination: CSNE

Modules: DFHZARL, DFHZDET, DFHZERH, DFHZEV1, DFHZEV2, DFHZOPN, DFHZRAC, DFHZRVS, DFHZSDS, DFHZSIM, DFHZSKR, DFHZSLX, DFHZNAC, DFHZSSX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZDET, 2=DFHZSIM, 3=DFHZSIM, 4=DFHZERH, 5=DFHZERH, 6=DFHZERH, 7=DFHZERH, 8=DFHZERH, 9=DFHZERH, 10=DFHZERH, 11=DFHZERH, 12=DFHZERH, 13=DFHZERH, 14=DFHZNAC, 15=DFHZERH, 16=DFHZERH, 17=DFHZERH, 18=DFHZERH, 19=DFHZSDS, 20=DFHZEV1, 21=DFHZEV1, 22=DFHZOPN, 23=DFHZOPN, 24=DFHZRVS, 25=DFHZRVS, 26=DFHZSKR, 27=DFHZSSX, 28=DFHZSLX, 29=DFHZSLX, 30=DFHZRAC, 31=DFHZRAC, 32=DFHZRAC, 33=DFHZRAC, 34=DFHZRAC, 35=DFHZRAC, 36=DFHZRAC, 37=DFHZRAC, 38=DFHZRAC, 39=DFHZARL, 40=DFHZARL, 41=DFHZEV2, 42=DFHZEV2, 43=DFHZRAC, 44=DFHZRAC, 45=DFHZOPN}*

DFHZC2423 E *date time applid termid tranid* **Attempted to send unsupported command.** *sense* **((***instance***) Module name: {DFHZSDS})**

Explanation: A request to send data synchronously was incomplete. Possible reasons are as follows:

1. The TCTTE was altered.
2. A logic error was encountered.
3. The TCTTE was inadvertently placed on the send-synchronous queue.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro instruction.

User Response: For reasons 1 to 3 listed above, ensure that application programs running concurrently do not alter the TCTTE.

If you suspect a logic error (2), check that the VTAM RPL has not been corrupted. If you still cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Module: DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS}*

DFHZC2424 E *date time applid termid tranid* **SESSIONC command request invalid.** *sense* **((***instance***) Module name: {DFHZSES | RESERVE})**

Explanation: A SESSIONC request is incomplete or invalid. Possible reasons are as follows:

1. The TCTTE was altered.
2. The command request bits are incomplete. DFHZSES checks TCTEISDT for a Start Data Traffic (SDT) command, TCTEISTS for a Set and Test Sequence Number (STSN) command, and TCTEICLR for a CLEAR command. If it does not find any of these, DFHZSES causes the message to be issued.
3. The wrong request was queued to SESSIONC.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

Communication with the node is terminated by issuing the VTAM CLSDST macro instruction.

User Response: Ensure that application programs running concurrently do not alter the TCTTE.

If the TCTTE is not altered, check for conditions 2 or 3.

Destination: CSNE

Module: DFHZSES

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSES, 2=DFHZSES, 3=RESERVE}*

DFHZC2425 E *date time applid termid tranid* **ASYNC command request invalid.** *sense* **((***instance***) Module name: {DFHZSDA})**

Explanation: A request to send data asynchronously was incomplete or invalid. This condition can be caused by the TCTTE being altered.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

Communication with the node is terminated by issuing the VTAM CLSDST macro instruction.

User Response: Check the TCTTE. Ensure that application programs running concurrently do not alter the TCTTE.

Destination: CSNE

Module: DFHZSDA

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDA, 2=DFHZSDA}*

DFHZC2426 E *date time applid termid tranid* **Node Status Error. Node is out of service or receive only.** *sense* **((***instance***) Module name: {DFHZATT})**

Explanation: Input was received from a node identified either as output-only or as permanently out of service.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Change the terminal entry in the TCT to indicate that the node is not an output-only device. If the node is out of service, the master terminal operator should place the node back into service.

Destination: CSNE

Module: DFHZATT

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZATT, 2=DFHZATT, 3=DFHZATT}*

DFHZC2427 I *date time applid termid tranid* **NCP Restarted.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: Network Control Program/Virtual Storage (NCP/VS) has been restarted after failing during an OPNDST.

For the meaning of the sense data, see the explanation on page 678.

System Action: The OPNDST request is reissued.

User Response: None.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX}*

DFHZC2428 E *date time applid termid tranid* **Send DFSYN request incomplete.** *sense* **((***instance***) Module name: {DFHZSDS})**

Explanation: A send-synchronous request was issued without indicating that either a command or data was to be sent.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Check the VTAM RPL for obvious errors. Ensure that application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the symptom string, and if necessary, the dump to determine the source of the error.

Destination: CSNE

Module: DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS}*

DFHZC2429 E *date time applid termid tranid* **RESETSR request invalid RTYPE.** *sense* **((***instance***) Module name: {DFHZRST})**

Explanation: An invalid RESETSR request was made in the VTAM macro issued by CICS. The invalid request can be because an RTYPE was not specified or was incorrectly specified, or the TCTTE was altered.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Check the VTAM RPL for obvious errors. Ensure that application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the symptom string, and if necessary the dump, to determine the source of the error.

Destination: CSNE

Module: DFHZRST

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRST, 2=DFHZRST, 3=DFHZRST}*

DFHZC2430 E *date time applid termid tranid* **Send response command request invalid.** *sense* **((***instance***) Module name: {DFHZSDR})**

Explanation: A send-response request was invalid. Either the request did not specify the response level (DR1 or DR2), or the TCTTE was altered.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump and the node is placed out of service.

User Response: Check the VTAM RPL for obvious errors. Ensure that application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the dump to determine the source of the error.

Destination: CSNE

Module: DFHZSDR

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDR}*

DFHZC2431 E *date time applid termid tranid* **Request to a released node.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: CICS requested VTAM to perform a close destination for a node currently “owned” by CICS.

For the meaning of the sense data, see the explanation on page 678.

System Action: If the CICS ACB is open, all outstanding requests are purged, the task is abnormally terminated with a transaction dump if a task is attached, and the node is placed out of service. If however, the ACB is already closed, the only action taken is to place the node out of service.

User Response: If the CICS ACB is open, use the dump to determine the source of the error. Check that the TCTTE is valid.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX}*

DFHZC2432 E *date time applid termid tranid* **Exception response received.** *sense* **((***instance***) Module name: {DFHZRAC | DFHZRVX | DFHZSSX})**

Explanation: CICS has received an exception response.

For the meaning of the sense data, see the explanation on page 678.

System Action: Another CICS message is issued in conjunction with this message.

User Response: Perform the action specified for the associated CICS message.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX, DFHZSSX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRVX, 4=DFHZRVX, 5=DFHZRVX, 6=DFHZRVX, 7=DFHZRVX, 8=DFHZSSX, 9=DFHZSSX, 10=DFHZSSX, 11=DFHZSSX, 12=DFHZRAC, 13=DFHZRAC, 14=DFHZRAC, 15=DFHZRAC, 16=DFHZRAC, 17=DFHZRAC, 18=DFHZRAC, 19=DFHZRAC, 20=DFHZRAC, 21=DFHZRAC, 22=DFHZRAC, 23=DFHZRAC}*

DFHZC2433 E *date time applid termid tranid nodeid* **Logon has failed because autoinstall is disabled.** *sense* **((***instance***) Module name: {DFHZBLX | DFHZLGX})**

Explanation: Node *nodeid* attempted to log on to CICS. The logon has failed because autoinstall is disabled. Possible reasons are:

- Autoinstall system initialization parameters have been incorrectly defined.

- An error has been detected in CICS terminal attach processing.
- The system is short on storage. Autoinstall is reenabled once the SOS condition ends.

System Action: The logon is rejected.

User Response: Ensure that the value for the AIQMAX system initialization parameter is greater than zero. If an autoinstall user program has been specified for system initialization parameter AIEXIT, check that the program name has been defined to CICS. See the *CICS System Definition Guide* for further information about autoinstall parameters.

If the system is short on storage, see the associated messages for further guidance.

Destination: CSNE

Modules: DFHZLGX, DFHZSCX, DFHZBLX

XMEOUT Parameters: *date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZLGX, 2=DFHZLGX, 3=DFHZBLX, 4=DFHZBLX}*

DFHZC2434 E *date time applid termid tranid* **Invalid copy request - Copy not supported.** *sense* **((***instance***) Module name: {DFHZARQ})**

Explanation: A DFHTC TYPE=COPY request has been issued to a 3270 compatibility mode logical unit. The request is invalid because the 3270 COPY command is not supported by a 3270 compatibility mode logical unit.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task abends.

User Response: Change the application program to avoid issuing a COPY request.

Destination: CSNE

Module: DFHZARQ

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARQ}*

DFHZC2435 E *date time applid termid tranid* **RPL missing.** *sense* **((***instance***) Module name: {DFHZRVS})**

Explanation: CICS issued a receive-specific request VTAM without specifying a request parameter list (RPL). This condition could result from one of the following reasons:

- An RPL was not allocated
- An RPL was allocated, but later freed
- TCTERPLA was altered.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A CLSDST macro is issued to terminate communication with the node.

User Response: Use the dump to determine whether the TCTTE was altered by an application program. If it was, correct the error. If the TCTTE has not been altered, check for potential RPL problems.

Destination: CSNE

Module: DFHZRVS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS}*

DFHZC2436 E *date time applid termid tranid* **TIOA missing.** *sense* **((***instance***) Module name: {DFHZRVS | DFHZRVX})**

Explanation: The TIOA was missing while a receive-specific request was being processed. This condition could result from the TIOA being freed or TCTTEDA being altered.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Use the dump to determine if the TCTTE was altered by an application program.

Destination: CSNE

Modules: DFHZRVS, DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZRVX, 3=DFHZRVS}*

DFHZC2437 E *date time applid termid tranid* **Invalid WRITE request to an input only device.** *sense* **((***instance***) Module name: {DFHZSDS})**

Explanation: An output request was issued to a VTAM terminal that is defined as an input-only device. Either the TCTTETS was altered or a task that was attached issued a send request.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The terminal status remains unchanged.

User Response: Either ensure that the node is defined correctly in the TCTTE, or prevent the task from issuing an output request to the node.

Destination: CSNE

Module: DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS}*

DFHZC2438 E *date time applid termid tranid* **Invalid READ request to an output only device.** *sense* **((***instance***) Module name: {DFHZRVS | DFHZSDS})**

Explanation: An input request was issued to a VTAM terminal that is identified as an output-only device. Either the TCTTETS was altered or a task was attached that issued a read request.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The terminal status remains unchanged.

User Response: Either change the definition of the terminal in the TCTTE, or prevent the task from issuing input requests to the node.

Destination: CSNE

Modules: DFHZRVS, DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZSDS}*

DFHZC2439 E *date time applid termid tranid* **Invalid RESUME request.** *sense* **((***instance***) Module name: {DFHZACT})**

Explanation: An invalid resume request was received. The CICS activate-scan function detected a resume request in a TCTTE, but the TCTTE was not part of any transaction.

For the meaning of the sense data, see the explanation on page 678.

System Action: The TCTTE is printed and logged to the CSNE destination for debugging purposes.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use the symptom string to determine the cause of the problem. Check the TCTTE data printed and logged to the CSNE destination for obvious alterations and errors.

Destination: CSNE

Module: DFHZACT

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZACT}*

DFHZC2440 I *date time applid termid tranid* **CICS quiesced by node.** *sense* **((***instance***) Module name: {DFHZASX})**

Explanation: A VTAM logical unit has requested CICS to quiesce all I/O activity with that node.

For the meaning of the sense data, see the explanation on page 678.

System Action: All data transmission to the node is halted until CICS receives a release-quiesce indicator.

User Response: None.

Destination: CSNE

Module: DFHZASX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZASX}*

DFHZC2441 I *date time applid termid tranid* **CICS released by node.** *sense* **((***instance***) Module name: {DFHZASX})**

Explanation: CICS received a release-quiesce indicator from a VTAM logical unit that had previously quiesced CICS.

For the meaning of the sense data, see the explanation on page 678.

System Action: Data transmission to the node is resumed by CICS.

User Response: None.

Destination: CSNE

Module: DFHZASX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZASX}*

DFHZC2442 E *date time applid termid tranid* **Exception response received to a definite response send.** *sense* **((***instance***) Module name: {DFHZRVX})**

Explanation: An exception response was received when a definite response protocol was requested.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS issues a second message in conjunction with this message that explains the reason for the exception response.

User Response: Perform the action specified for the second CICS message received.

Destination: CSNE

Module: DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX}*

DFHZC2443 E *date time applid termid tranid* **Request outstanding when node released.** *sense* **((***instance***) Module name: {DFHZRVL | DFHZRVS | DFHZSDL | DFHZSDS | DFHZSHU})**

Explanation: CICS received a request from an application program, when its node was either not in session or queued to be CLSDSTed.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding requests are ignored. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: None.

Destination: CSNE

Modules: DFHZSDS, DFHZRVL, DFHZRVS, DFHZSDL, DFHZSHU

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZSDL, 3=DFHZSDS, 4=DFHZSDS, 5=DFHZSDS, 6=DFHZSHU, 7=DFHZSHU, 8=DFHZRVL, 9=DFHZSHU}*

DFHZC2444 E *date time applid termid tranid* **CICS bracket state error.** *sense* **((***instance***) Module name: {DFHZRVS | DFHZSDS})**

Explanation: A CICS application program violated bracket protocol. It is possible that the application program issued an I/O request following a write (last) request.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Correct the application program.

Destination: CSNE

Modules: DFHZRVS, DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZSDS}*

DFHZC2445 E *date time applid termid tranid* **Output area exceeded.** *sense* **((***instance***) Module name: {DFHZSDS})**

Explanation: The TIOA was not large enough to hold all the output data. The application program either set up the TIOA incorrectly or it overran the TIOA.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Correct the application program to acquire a larger TIOA.

Destination: CSNE

Module: DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS, 2=DFHZSDS}*

DFHZC2446 E *date time applid termid tranid* **Invalid response to a bid.** *sense* **((***instance***) Module name: {DFHZRAC | DFHZRVX | DFHZSSX})**

Explanation: An invalid response was received for a bid request. A normal response was received in response to a bid indicator while the transaction was in bracket state. The controller application program is in error.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro instruction, and the node is placed out of service.

User Response: Correct the controller application program to return an exception response to a bid indicator when in the bracket state, followed by a ready-to-receive indicator when ready to honor the bid.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX, DFHZSSX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZSSX, 3=DFHZRAC}*

DFHZC2447 E *date time applid termid tranid* **A severe error has occurred as a result of a previous failure.** *sense* **((***instance***) Module name: {DFHZACT | DFHZFRE | DFHZGET | DFHZOPN | DFHZRAC | DFHZRLP | DFHZRVS | DFHZSDA})**

Explanation: A domain call failed and the response could not be handled by module *modname* because of a previous failure. The domain concerned should have issued a message to the console which gives further information about the failure.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests for terminal *termid* are purged. If a task is attached, it is abnormally terminated with a transaction dump. Terminal *termid* is placed out of service and the TCTTE is logged to the CSNE destination.

User Response: Refer to the message issued by the domain that is in error. It indicates the source of the original error.

Destination: CSNE

Modules: DFHZRAC, DFHZRVS, DFHZSDA, DFHZOPN, DFHZFRE, DFHZRLP, DFHZACT, DFHZGET

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZOPN, 2=DFHZRVS, 3=DFHZSDA, 4=DFHZRAC, 5=DFHZRAC, 6=DFHZOPN, 7=DFHZOPN, 8=DFHZFRE, 9=DFHZRLP, 10=DFHZACT, 11=DFHZGET, 12=DFHZGET, 13=DFHZOPN}*

DFHZC2448 E *date time applid termid tranid* **Invalid response requested.** *sense* **((***instance***) Module name: {DFHZRAC | DFHZRVX})**

Explanation: An invalid response was requested. An application program transmitted data to CICS without requesting a response from CICS.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User Response: Correct the application program.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRAC, 3=DFHZRAC}*

DFHZC2449 E *date time applid termid tranid* **Bracket Error.** *sense* **((***instance***) Module name: {DFHZRAC | DFHZRVX})**

Explanation: The application program either sent a begin-bracket indicator while the transaction was in bracket state, or sent an end-bracket indicator.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro, and the node is placed out of service.

User Response: Correct the application program.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRAC, 4=DFHZRAC}*

DFHZC2450 E *date time applid termid tranid* **Bid issued but ATI cancelled.** *sense* **((***instance***) Module name: {DFHZRAC | DFHZRVX | DFHZSSX})**

Explanation: An automatic task initiation (ATI) request was issued without an ATI pending for that terminal.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS will satisfy the BB pending condition by sending a standalone BB-EB.

User Response: If ATI is time-initiated, increase the timer value.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX, DFHZSSX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRVX, 4=DFHZSSX, 5=DFHZSSX, 6=DFHZSSX, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC}*

DFHZC2451 E *date time applid termid tranid* **Outstanding request when clear was issued.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: A request was outstanding when clear was issued. A receive-specific request was pending when a clear indicator was issued. A clear indicator is sent when any of the following occurs:

- The logical unit is lost (LOSTERM).
- CICS issues a VTAM CLSDST macro.
- CICS issues the clear during message resynchronization.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: None.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX}*

DFHZC2452 E *date time applid termid tranid* **Invalid command received.** *sense* **((***instance***) Module name: {DFHZSCX})**

Explanation: CICS received an invalid command (VTAM indicator). The CICS session-control input exit-routine (SCIP) encountered an indicator other than request-recovery. This routine should be scheduled only when a request-recovery indicator is received from the controller application program.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. The session is terminated and the node is placed out of service.

User Response: Check the VTAM RPL for obvious errors. Use the dump to help determine the source of the problem.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHZC2453 E *date time applid termid tranid* **Request recovery received.** *sense* **((***instance***) Module name: {DFHZSCX})**

Explanation: A request for recovery was received. The secondary logical unit requested message resynchronization by sending a request-recovery indicator, but a message sequence number is inconsistent with the sequence number maintained by the 3601 application program.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Message resynchronization is then initiated by CICS.

User Response: None.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHZC2454 E *date time applid termid tranid* **Exception in chain.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: An exception response was returned on a POST=RESP chain-data send. CICS normally does not send chained data using POST=RESP.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use the symptom string, and if necessary the transaction dump, to determine the source of the error.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX}*

DFHZC2455 E *date time applid termid tranid* **In CA mode - Task attached.** *sense* **((***instance***) Module name: {DFHZATT})**

Explanation: An attempt to attach a task to a logical unit (LU) was made, despite the task being in continue-any (CA) mode. However, terminal *termid* already had a task attached to it.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task that is already attached to terminal *termid* is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem. Communication with the node is terminated by issuing the VTAM CLSDST macro. CICS then reestablishes communication with the node by issuing the SIMLOGON macro.

User Response: Use the symptom string, and if necessary the dump, to determine the source of the error. Try to determine why there was an attempt to attach a task to terminal *termid* while it already had a task attached to it.

Destination: CSNE

Module: DFHZATT

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZATT}*

DFHZC2456 E *date time applid termid tranid* **Exception response received to a command.** *sense* **((***instance***) Module name: {DFHZRAC | DFHZSYX})**

Explanation: CICS received an exception response to a command (VTAM indicator) that it sent to a logical unit.

For the meaning of the sense data, see the explanation on page 678.

System Action: In conjunction with this message, CICS issues a second message that explains the reason for the exception response.

User Response: Perform the action specified in the second CICS message received.

Destination: CSNE

Modules: DFHZSYX, DFHZSSX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX, 3=DFHZSYX, 4=DFHZRAC}*

DFHZC2457 E *date time applid termid tranid* **Multiple Errors Encountered.** *sense* **((***instance***) Module name: {DFHZEMW | DFHZRAC | DFHZSYX})**

Explanation: A node encountered consecutive errors. That is, the node abnormal condition program, NACP, encountered a second error while processing the first error.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro. The first error is accompanied by an error message.

User Response: Use the dump to determine the source of the errors. Refer to the error message produced by the first problem and to any VTAM messages that may have been issued.

Destination: CSNE

Modules: DFHZRAC, DFHZSYX, DFHZEMW

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZEMW, 2=DFHZSYX, 3=DFHZSYX, 4=DFHZRAC, 5=DFHZRAC}*

DFHZC2458 E *date time applid termid tranid* **Exception response received to an exception response send.** *sense* **((***instance***) Module name: {DFHZRAC | DFHZRVX})**

Explanation: CICS received an exception response to a send for which an exception response was requested.

For the meaning of the sense data, see the explanation on page 678.

System Action: In conjunction with this message, CICS issues a second message that explains the reason for the exception response.

User Response: Perform the action specified in the second CICS message received.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRVX, 4=DFHZRVX, 5=DFHZRAC, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC, 10=DFHZRAC, 11=DFHZRAC, 12=DFHZRAC}*

DFHZC2459 E *date time applid termid tranid* **No TIOA available for send.** *sense* **((***instance***) Module name: {DFHZSDS})**

Explanation: TCTTEDA was not loaded before issuing a DFHTC TYPE=WRITE, or it was inadvertently cleared.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. The send is purged.

User Response: Ensure that TCTTEDA is loaded with the TIOA address before issuing the write.

Destination: CSNE

Module: DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS, 2=DFHZSDS}*

DFHZC2460 E *date time applid termid tranid* **Sense receive not supported.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: Sense codes not supported by CICS were received from the logical unit.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User Response: The user's node error program (DFHZNEP) can process the sense codes.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2461 E *date time applid termid tranid* **Intervention required.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: Operator action is requested for a physical component of terminal *termid* before a request can be completed.

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is retried, unless the device is one that sends a logical unit status message after intervention is required. In the latter case, the relevant system action is taken.

User Response: Correct the problem with the device.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2462 E *date time applid termid tranid* **Bracket Error.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The secondary logical unit and CICS both sent a begin-bracket indicator concurrently.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro.

User Response: Correct the controller application program so that it cannot send a begin-bracket indicator.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2463 E *date time applid termid tranid* **Node** *nodeid* **resource pending deletion, connection request rejected.** *sense* **((***instance***) Module name: {DFHZBLX | DFHZLGX})**

Explanation: Node *nodeid* tried to connect to CICS. CICS rejected the request because it was deleting the terminal definition for *termid*.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS continues with the resource alteration, or for instance 3 of the message, the autoinstall delete transaction, CATD, is restarted.

User Response: When the resource alteration is complete, retry the connection or logon request.

Destination: CSNE

Modules: DFHZSCX, DFHZBLX, DFHZLGX

XMEOUT Parameters: *date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZBLX, 2=DFHZBLX, 3=DFHZLGX}*

DFHZC2464 E *date time applid termid tranid* **Terminate chain.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The secondary logical unit asked CICS to terminate transmission of further data in the current chain.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A cancel indicator is issued to the logical unit permitting discard of the data in the current chain.

User Response: Use the supplied dump to determine why the logical unit requested the chain to be discarded.

For the meaning of the sense data, refer to the explanatory paragraph in message DFHZC2461.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2465 E *date time applid termid tranid* **Insufficient resources.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The subsystem controller application program has insufficient resources to handle the request. For instance, in the case of 3601, the 3601 diskette might be full, or the data segment in the 3601 might not be large enough to handle the data set.

For the meaning of the sense data, see the explanation on page 678.

System Action: The subsystem is temporarily suspended.

User Response: Determine why the controller application program encountered this condition. For the meaning of the sense data, refer to the explanatory paragraph in message DFHZC2461.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2466 E *date time applid termid tranid* **Function not executable.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The controller application program cannot transmit a message to terminal *termid*. Either a data check occurred, or the node is not available.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Terminal status remains unchanged.

User Response: Use the supplied dump to determine why the application program could not execute the request.

For the meaning of the sense data, refer to the explanatory paragraph in message DFHZC2461.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2467 E *date time applid termid tranid* **Invalid communications ID (CID) detected.** *sense* **((***instance***) Module name: {DFHZLEX})**

Explanation: CICS issued a VTAM request containing a communications identifier (CID) which VTAM did not recognize. This may be due to the TCTECID field having been altered. Alternatively, it may mean that the session is in the process of being closed down by VTAM and that CICS has tried to use it before the process was complete.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. If the failing request is not a CLSDST, the node is placed out of service. If the losterm exit was driven with return code X'0C', X'10', or X'14', CICS issues a CLSDST to VTAM and reset action flag 23, “keep node out of service”.

User Response: Ensure that application programs running concurrently do not alter the TCTECID field in the TCTTE. Also

check that the session is still active; that is, that the system being communicated with is still functioning.

Destination: CSNE

Module: DFHZLEX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZLEX}*

DFHZC2468 E *date time applid termid tranid* **Name** *netname* **unknown or vary activate required.** *sense* **((***instance***) Module name: {DFHZLEX})**

Explanation: Either the node has not been activated by VARY ACTIVATE or CICS issued a VTAM request containing an invalid symbolic node name where:

- The name may have been altered in the node initialization block (NIB)
- The name was specified during VTAM definition and does not agree with the name in the TCT.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service.

User Response: Either issue VARY ACTIVATE for the node, or ensure that application programs running concurrently do not alter the NIB name. Names specified during VTAM definition must agree with those in the TCT.

Destination: CSNE

Module: DFHZLEX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZLEX}*

DFHZC2469 E *date time applid termid tranid* **Exception response received.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: An exception response (negative response) was sent by the secondary logical unit.

For the meaning of the sense data, see the explanation on page 678.

System Action: For a non-3270 device, an exception response is returned to the node, along with the sense codes supplied by VTAM in the request parameter list (RPL) for the inbound message. For a 3270 device, the exception request contains 3270 sense/status.

User Response: Analyze the sense codes in DFHZNEP.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX, 2=DFHZSYX}*

DFHZC2470 E *date time applid termid tranid* **Task active at Shutdown.** *sense* **((***instance***) Module name: {DFHZASX})**

Explanation: One of the following has occurred:

- A request shutdown indicator was received from the controller application program on behalf of the node while a task was still attached.
- During VTAM shutdown, a shutdown complete indicator was received from the controller application program on behalf of the node while a task was still attached
- During VTAM shutdown, a task was still attached to a VTAM 3270 (which cannot send request shutdown or shutdown complete).

For the meaning of the sense data, see the explanation on page 678.

System Action: In the first two cases, CICS honors the command. In all cases, all outstanding send and receive requests are purged, and if a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro.

User Response: None.

Destination: CSNE

Module: DFHZASX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZASX}*

DFHZC2471 E *date time applid termid tranid* **FMH length error.** *sense* **((***instance***) Module name: {DFHZATT | DFHZRAC})**

Explanation: The function management header (FMH) length was greater than that of the data received from the logical unit.

For the meaning of the sense data, see the explanation on page 678.

System Action: All data received is purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Correct the application program in the logical unit.

Note: The first 16 bytes of the I/O area in error are put to the CSNE log data set to aid in error determination.

Destination: CSNE

Modules: DFHZRAC, DFHZATT

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZATT, 2=DFHZATT, 3=DFHZATT, 4=DFHZATT, 5=DFHZATT, 6=DFHZRAC}*

DFHZC2472 E *date time applid termid tranid* **Unable to retrieve overlength data.** *sense* **((***instance***) Module name: {DFHZRAC})**

Explanation: The receive request for the remainder of data in excess of the input area for the receive-any module was not accepted by VTAM.

For the meaning of the sense data, see the explanation on page 678.

System Action: All associated data is purged.

User Response: A subsequent message follows in the log, indicating reasons for the request failing. Refer to this message for further information and guidance.

Destination: CSNE

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC}*

DFHZC2473 E *date time applid termid tranid* **Outbound chaining not supported.** *sense* **((***instance***) Module name: {DFHZSDS})**

Explanation: The application program has attempted to send more data than the generated maximum allowable length.

For the meaning of the sense data, see the explanation on page 678.

System Action: All send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Correct the application program so that it is sensitive to the maximum allowable length of data that can be sent to the terminal (such as checking the device type), providing the terminal does not support outbound chaining of data (such as a pipeline session).

Note: The generated maximum allowable length is specified in the TCTTE.

Destination: CSNE

Module: DFHZSDS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDS, 2=DFHZSDS}*

DFHZC2475 E *date time applid termid tranid* **Function cancelled by LU device.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The logical unit (LU) has terminated all processing connected with one of its components.

For the meaning of the sense data, see the explanation on page 678.

System Action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Correct the problem with the LU component and bring it back online. Possible causes of the problem include the following:

- Power for the device is switched off
- A line that is down
- A hardware problem
- In the case of an LU6 link, the connected transaction, for example, CSMI, has terminated abnormally.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2476 E *date time applid termid tranid* **Resource unavailable.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: A component of the logical unit (LU) is no longer available.

For the meaning of the sense data, see the explanation on page 678.

System Action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Correct the problem with the LU component and bring it back online. Possible causes of the problem include the following.

- Power for the device is switched off.
- A line that is down.
- A hardware problem.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2477 E *date time applid termid tranid* **Chaining not supported.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The logical unit (LU) does not support chaining of data from the host.

For the meaning of the sense data, see the explanation on page 678.

System Action: All send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Ensure that the maximum amount of data being transmitted to the LU does not exceed the length specified in the buffer parameter of the DFHTCT macro instruction.

Note: The buffer parameter value can be increased only to the maximum acceptable limit of the LU.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2478 E *date time applid termid tranid* **Invalid FMH.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The function management header (FMH) transmitted to the logical unit (LU) had no counterpart on the translate table.

For the meaning of the sense data, see the explanation on page 678.

System Action: All send and receive requests are purged. If the batch data interchange program is not being used, the transaction is abnormally terminated with a transaction dump. The first part of the TIOA, containing the FMH, is written to the CSNE log.

User Response: Correct the application program so that the LU has a counterpart on the translate table.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2479 E *date time applid termid tranid* **Function not supported.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The response unit (RU) received by the logical unit (LU) contains a request that this device does not support.

For the meaning of the sense data, see the explanation on page 678.

System Action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Ensure that the terminal control table (TCT) generation specifications for the device are valid as well as able to accommodate the application requests. (For example, a read-only device being defined as transceive, yet having a bid sent to it.)

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2480 E *date time applid termid tranid* **Retry requested.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The logical unit (LU) has indicated, via sense codes contained in an exception response or an LU status message, that it requires the data to be retransmitted.

For the meaning of the sense data, see the explanation on page 678.

System Action: Retransmission of data will be attempted only in the case of protected tasks (message integrity). If the exception response containing the retry sense codes is received for an unprotected task while in chain processing, a cancel command will be sent to the LU and the task will be resumed. If CICS is not in chain processing, the transaction will be resumed.

User Response: If message retransmission is necessary for the LU, ensure that the retry sense codes are imbedded in the exception response. Also ensure that the host transaction is defined as a protected task (message integrity).

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2481 E *date time applid termid tranid* **RU Error.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The response unit (RU) received by the logical unit (LU) was either not translatable or had an invalid length.

For the meaning of the sense data, see the explanation on page 678.

System Action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Retrying the request a number of times by use of the node error program (NEP) mechanism may be necessary. This is because this type of error may stem from a bad communication line. If this fails, check for possible invalid or inappropriate terminal specifications at terminal control table (TCT) generation time.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2482 E *date time applid termid tranid* **Pipeline session bracket error.** *sense* **((***instance***) Module name: {DFHZATT})**

Explanation: Terminal *termid* was defined in the terminal control table (TCT) as running in pipeline session mode. However, the BRACKET operand in that definition was either omitted or was specified as BRACKET=YES. Bracket protocol is not enforced on a pipeline session terminal.

For the meaning of the sense data, see the explanation on page 678.

System Action: All send and receive requests are purged and the session is terminated. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Correct the TCT entry by inserting the BRACKET=NO operand.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZATT}*

DFHZC2483 E *date time applid termid tranid* **Receiver in transmit mode.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: Normal data flow has been interrupted.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: Retry the WRITE.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2484 E *date time applid termid tranid* **Component not available.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: An application request could not be satisfied because the required component was not available.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. All outstanding send and receive requests are purged.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Check the terminal environment, or use the symptom string, and if necessary the dump, to determine the cause of the error.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2485 E *date time applid termid tranid* **Cancel received in 'CS'-mode.** *sense* **((***instance***) Module name: {DFHZRVX})**

Explanation: A CANCEL indicator was received while a task was active.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. All outstanding send and receive requests purged.

User Response: None.

Destination: CSNE

Module: DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX}*

DFHZC2486 E *date time applid termid tranid* **Cancel received in 'CA'-mode.** *sense* **((***instance***) Module name: {DFHZRAC})**

Explanation: A CANCEL indicator was received while no task was active.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: None.

Destination: CSNE

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC}*

DFHZC2487 E *date time applid termid tranid nodeid* **Session connection failed. Node unavailability return code** *returncode***.** *sense* **((***instance***) Module name: {DFHZBLX | DFHZLGX | DFHZSCX})**

Explanation: A connection request was rejected. CICS is temporarily unable to carry out the connection request. The TCTTE for node *nodeid* indicated that the session could not be established. *returncode* gives the reason, as follows:

1. The CLSDST macro has been scheduled for this node
2. The node is in an abnormal condition
3. The node has an error condition raised against it
4. The node is already in use
5. CICS is terminating
6. VTAM is terminating.

For the meaning of the sense data, see the explanation on page 678.

System Action: The connection request is rejected.

User Response: Retry the connection request when the node becomes available. See the *CICS Customization Guide* for more information on the CLSDST macro and for an explanation of abnormal node conditions.

Destination: CSNE

Modules: DFHZLGX, DFHZSCX, DFHZBLX

XMEOUT Parameters: *date, time, applid, termid, tranid, nodeid, returncode, sense, instance, {1=DFHZSCX, 2=DFHZSCX, 3=DFHZSCX, 4=DFHZSCX, 5=DFHZSCX, 6=DFHZSCX, 7=DFHZBLX, 8=DFHZBLX, 9=DFHZLGX, 10=DFHZLGX, 11=DFHZLGX, 12=DFHZLGX, 13=DFHZLGX, 14=DFHZLGX, 15=DFHZLGX, 16=DFHZLGX}*

DFHZC2488 E *date time applid termid tranid nodeid* **logon request rejected as terminal recovery is in progress.** *sense* **((***instance***) Module name: {DFHZBLX | DFHZLGX | DFHZSCX})**

Explanation: A connection request was rejected because the CICS terminal recovery program was still executing.

For the meaning of the sense data, see the explanation on page 678.

System Action: The connection request is rejected.

User Response: Retry the connection request. Message DFHRU2800 is produced when the recovery program has completed processing.

Destination: CSNE

Modules: DFHZLGX, DFHZSCX, DFHZBLX

XMEOUT Parameters: *date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZLGX, 2=DFHZSCX, 3=DFHZBLX}*

DFHZC2489 E *date time applid termid tranid* **3270 - Invalid copy request.** *sense* **((***instance***) Module name: {DFHZARQ})**

Explanation: The terminal control table terminal entry (TCTTE) of the device from which the information is to be copied (“from” device) did not specify the COPY feature. Alternatively, the “from” device:

- Is not defined in the TCT, or
- Is not a 3270, or
- Is not connected to CICS via VTAM.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Ensure that the application program is aware of the device configuration. Furthermore, ensure that the “from” device is defined in the TCT as a 3270 device AND is connected to CICS.

Destination: CSNE

Module: DFHZARQ

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARQ, 2=DFHZARQ, 3=DFHZARQ}*

DFHZC2490 E *date time applid termid tranid* **Request for TOLTEP.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: On a request for TOLTEP, a receive request completes in error.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a transaction is currently attached, it is abnormally terminated. The terminal is disconnected from CICS by a VTAM CLSDST macro, and is queued for logon to CICS when TOLTEP has finished.

User Response: None.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX}*

DFHZC2492 E *date time applid termid tranid* **Intervention required on 3270 printer.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: This message is sent to the CSNE message log when an INTERVENTION REQUIRED condition is detected on a 3270 printer. This condition could occur for any of the reasons listed below.

- A transaction has requested the use of a printer that does not exist.
- The printer adapter feature is not present.
- There is no paper in the printer.
- The printer cover is open.
- The printer is offline.

For the meaning of the sense data, see the explanation on page 678.

System Action: No action is performed except printing of the RPL and the TCTTE.

User Response: Check that the terminal control table (TCT) is properly defined and that the transaction requests proper printer operations. If this is correct, check that the printer itself is in proper working order.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2493 E *date time applid termid tranid* **Intervention required on 3270 device.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: This message occurs when an INTERVENTION REQUIRED condition arises on the 3270 Information Display System.

For the meaning of the sense data, see the explanation on page 678.

System Action: No action is performed.

User Response: Correct the intervention condition.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2494 E *date time applid termid tranid* **Error status** *sense* **received from 3270. ((***instance***) Module name: {DFHZNAC})**

Explanation: An error status message *sense* was received from a 3270 Information Display System. An INTERVENTION REQUIRED condition causes an "intervention required" message to be output instead of this message.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. If bad data, sent by Basic Mapping Support (BMS), causes an operation check, the bad data is purged.

User Response: Analyze the error status codes to determine the proper course of action required to correct the unit error or program error.

For non-SNA 3270 devices, the sense code is 0000 xxxx, where xxxx is sense data returned by the control unit to which the 3270 device is attached. Datastream errors are rejected with an Operation Check, and commands with a Command Reject. Details of error status codes are given in the *IBM 3270 Information Display System 3274 Control Unit Description and Programmer's Guide*.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2495 E *date time applid termid tranid* **Printer Outserv/int reqd/ineligible. Req queued.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: DFHZNAC has performed an interval control PUT to a 3270 printer on behalf of a DFHZC2497 "unavailable printer" condition. The printer is:

- Out of service,
- Has an intervention situation, or
- Does not have a RECEIVE or TRANSCEIVE status.

For the meaning of the sense data, see the explanation on page 678.

System Action: Other processing continues.

User Response: Determine why the printer is unavailable. If the terminal is out of service, put it back into service. If the terminal has an intervention situation, determine what this situation is and correct it. If the terminal does not have a RECEIVE or TRANSCEIVE status, place it into RECEIVE or TRANSCEIVE status.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC2496 E *date time applid termid tranid* **IC put to printer failed***{ | IOERROR | TRNIDER | TRMIDER | INVREQ}***.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: DFHZNAC has attempted to perform a DFHIC TYPE=PUT macro as the result of a DFHZC2497 "unavailable printer" condition and has failed. This message is written to the CSNE log.

For the meaning of the sense data, see the explanation on page 678.

System Action: DFHZNEP is recalled by DFHZNAC to allow for further processing.

User Response: Ensure that:

- The interval control program (ICP) is capable of handling the request that DFHZNAC is issuing for the IOERROR and INVREQ errors
- CSPP is an installed transaction definition for the TRNIDER error
- DFHZNEP is passing DFHZNAC as a valid terminal address for the TRMIDER error.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, {1= , 2= IOERROR, 3= TRNIDER, 4=TRMIDER, 5= INVREQ}, sense, instance, {1=DFHZNAC}*

DFHZC2497 E *date time applid termid tranid* **Unavailable printer.** *sense* **((***instance***) Module name: {DFHZARQ})**

Explanation: A print function was requested on a 3270 display device. Neither the PRINTTO or the ALTPRT printer was available to receive the information.

For the meaning of the sense data, see the explanation on page 678.

System Action: If no NEP action is specified, the print request is halted.

User Response: A possible solution is to route the data available at TCTTEDA in the provided terminal entry to a transient data queue that causes automatic task initiation later to a printer. This would be done in DFHZNEP. For more information, see the *CICS Customization Guide*.

Destination: CSNE

Module: DFHZARQ

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARQ}*

DFHZC2498 E *date time applid termid tranid* **IC put to printer failed.** *sense* **((***instance***) Module name: {DFHZARQ})**

Explanation: A 3270 print request has failed because transaction CSPP could not be initiated. Either transaction CSPP is not an installed transaction definition, or the message to be printed cannot be written to temporary storage.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: Check that transaction CSPP is an installed transaction definition and that you have sufficient temporary storage to accommodate the data to be printed.

Destination: CSNE

Module: DFHZARQ

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARQ}*

DFHZC2499 *date time applid* **The following message was destined for a read only terminal. The text is '***msgtext***'**

Explanation: The user has entered an invalid entry, the entry is rejected, and the request is backed out.

System Action: Terminal Control backs out the request and issues this message with the error information contained in *msgtext*.

User Response: Read the error information that is contained in *msgtext* and reenter the request.

XMEOUT Parameters: *date, time, applid, msgtext*

DFHZC3202 E *date time applid* **Transaction CCIN - VTAM netname** *netname***. The value** *codepage* **in the codepage parameter is not supported.**

Explanation: A CCIN transaction has been run from a CICS client. The codepage which the CICS client has requested is not supported.

netname is the VTAM netname of the CICS client.

System Action: CICS cannot perform the translations required to support the CICS client with the requested character set and codepage. CICS continues but uses a default codepage instead of the supplied one. For details of the default codepage, see the *CICS Family: Communicating from CICS on System/390* manual.

The request to install the CICS client continues, but uses the default codepage. A response code of EXCEPTION and a reason code of INVALIDCODEPAGE is sent to the client.

User Response: See the *CICS Family: Communicating from CICS on System/390* manual for a list of the client codepage values which are supported. It may be necessary to reconfigure the client locale.

Destination: CSCC

Module: DFHZCN2

XMEOUT Parameters: *date, time, applid, netname, codepage*

DFHZC3203 E *date time applid* **Transaction CCIN - VTAM netname** *netname***. The capabilities parameter is not valid.**

Explanation: A CCIN transaction has been run from a CICS client. The capabilities which have been received are not valid. The CICS client has specified that it supports features which no CICS client is supposed to support. The CICS client is violating the CICS client communications architecture.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP301A is written.

The request to install the CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Module: DFHZCN2

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3204 E *date time applid* **Transaction CCIN - VTAM netname** *netname***. The codepage parameter has not been specified.**

Explanation: A CCIN transaction has been run from a CICS client. One of the parameters which must be supplied is the codepage which the CICS client intends to use. This parameter is missing.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP301B is written.

The request to install the CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Module: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3205 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. CICS cannot support the** *{n.a. | n.a. | n.a. | combination of client and virtual terminal codepage. | client codepage. | virtual terminal codepage.}*

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation.

CICS was checking the codepage specified by the CICS client and the codepage specified by the virtual terminal. However one of the following occurred:

1 – 3 *n.a.* - not applicable and should not occur.

4 *unsupported combination of CICS client and virtual terminal codepage.* indicates that the two codepages above are known about but CICS does not support data conversion between the CICS client codepage and the virtual terminal codepage.

5 *unsupported CICS client codepage* indicates that CICS is unable to support the codepage supplied by the CICS client in the CCIN or CTIN transaction.

6 *unsupported virtual terminal codepage* indicates that the CGCSGID parameter defining the virtual terminal codepage is not supported for CICS data conversion. If the virtual terminal was autoinstalled, CGCSGID was specified in the autoinstall model requested by the CICS client. If the virtual terminal was defined, CGCSGID was defined in the TYPETERM named by the virtual terminal definition.

CICS cannot perform the translations required to support the CICS client with the requested codepage.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3035 is written.

4 *unsupported combination of CICS client and virtual terminal codepage.*

A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client. The virtual terminal is NOT installed.

5 *unsupported CICS client codepage*.

The request to install the virtual terminal continues and the invalid codepage is replaced by a default as specified in the *CICS Family: Communicating from CICS on System/390* manual.

A response code of EXCEPTION and a reason code of INVALIDCODEPAGE is sent to the client.

6 *unsupported virtual terminal codepage*.

A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client. The virtual terminal is NOT installed.

User Response: See the *CICS Family: Communicating from CICS on System/390* manual and check the list of the client codepage values then reconfigure the workstation locale or correct the virtual terminal TYPETERM definition.

The exception trace point AP3035 contains the CICS client codepage and the virtual terminal CGCSGID values.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname, {1=n.a., 2=n.a., 3=n.a., 4=combination of client and virtual terminal codepage., 5=client codepage., 6=virtual terminal codepage.}*

DFHZC3206 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. The client's terminal install limit has been exceeded.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However the CICS client whose VTAM netname is *netname* already has 512 virtual terminals.

termid is the name that would have been given to the new virtual terminal. If the CICS client did not supply the name it is blank.

System Action: The request to install the virtual terminal is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User Response: Check why the CICS client has sent so many CTIN installs without corresponding CTIN uninstall functions.

To correct the problem the CICS client must send a CTIN uninstall for each virtual terminal that needs to be deleted.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3207 E *date time applid* **Transaction CTIN - VTAM netname** *netname***. The request has failed because CCIN has not been run.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However there was no previous CCIN install request for the CICS client with the VTAM netname of *netname*. CCIN must always run before CTIN.

This may have been caused by a CICS restart.

netname is the VTAM netname of the CICS client.

System Action: The CTIN transaction abnormally terminates with abend code AZAI.

User Response: The CICS client must carry out CCIN uninstall/install before the next CTIN install.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3208 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. Model** *modelid* **cannot be found.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However CICS was unable to find the model *modelid* which was specified in the CICS_EpiAddTerminal DEVTYPE parameter or terminal emulator ModelId parameter.

netname is the VTAM netname of the CICS client.

System Action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of UNKNOWNMODEL is sent to the client.

User Response: Either correct the DevType in the CICS_EpiAddTerminal function or terminal emulator parameter or install a model of this name using RDO to define the autoinstall model with the RDO TERMINAL and TYPETERM definitions.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname, modelid*

DFHZC3209 E *date time applid* **Transaction CTIN - VTAM netname** *netname***. CICS cannot supply a terminal name because all available names are in use.**

Explanation: A CTIN install request has been received from a CICS client as as a result of a CICS_EpiAddTerminal function or terminal emulator operation. The parameter list did not supply a NetName indicating that CICS should supply the name. However there are only 46,656 possible names available and they are all currently in use.

netname is the VTAM netname of the CICS client.

System Action:

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User Response: As CICS clients issue CTIN uninstalls for autoinstalled virtual terminals these termids will be freed.

It is possible that some of the CICS clients were switched off leaving autoinstalled virtual terminals around. When these are switched back on again they should issue CCIN install which will free the virtual terminals if they are not in use.

DISCARD can be used to delete a virtual terminal - but this should be done with discretion.

If the SIT VTPREFIX coincides with the first character of the termid allocated to a normal autoinstall terminal by the autoinstall URM (default DFHZATDX), there may be some names reserved because the autoinstall terminal existed when CTIN install tried to use the same name. Avoid doing this if possible because the only way to free these names is to restart CICS.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3210 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. CICS cannot attach the CITS transaction.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. As part of the installation process the CITS transaction is called to create a virtual terminal *termid*. However CICS was unable to attach the CITS transaction.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3025 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User Response: Check that the CITS transaction and the DFHZATS program are defined correctly as specified in the DFHSPI IBM supplied group and are installed.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3211 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. The NetName parameter starts with an invalid character.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. The NetName parameter *termid* starts with a character that conflicts with CICS standards.

netname is the VTAM netname of the CICS client.

System Action: The request to install the virtual terminal is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User Response: Change the NetName to start with a different character. It can start with any character that is valid for a normal terminal name except for <,> or -. If the NetName was specified correctly, check the input to the CTIN transaction.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3212 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. The transaction has timed out waiting for CITS to run.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. As part of the installation process the CITS transaction is called to create virtual terminal *termid*. However the CTIN transaction has waited for two minutes for the CITS transaction to run.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3027 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User Response: Investigate why the CITS transaction was unable to start or was hanging.

You may need to increase MAXTASK or the CITS TRANCLASS allocation.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3213 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. CICS cannot attach the CDTS transaction.**

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. As part of the delete process the CDTS transaction is called to delete virtual terminal *termid*. However CICS was unable to attach the CDTS transaction.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3028 is written. The attempt to delete the virtual terminal is rejected.

User Response: Check to see if the CDTS transaction and the DFHZATS program are defined correctly as specified in IBM supplied group DFHSPI and that they are installed.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3214 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. The CTIN transaction has timed out waiting for CDTS to run.**

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. As part of the installation process the CDTS transaction is called to delete virtual terminal *termid*. However the CTIN transaction has waited for the CDTS transaction for two minutes and so ends with this message.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3029 is written. The CDTS attempt to delete the virtual terminal continues and will occur when the CDTS transaction starts or is 'unsuspended'.

User Response: Check to see why the CDTS transaction was unable to start or was hanging.

You may need to increase MAXTASK or the CDTS TRANCLASS allocation.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3215 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. The terminal is in use by another transaction.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However the virtual terminal *termid* is in use, that is the surrogate TCTTE indicates that a transaction is still running against this terminal.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP302E is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User Response: Investigate why a transaction is still running for the virtual terminal.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3216 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. CICS cannot find the terminal.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN specified that a pre defined virtual terminal *termid* should be used, but CICS cannot find it and no ModelId was provided (DevType) so an autoinstall was not attempted.

netname is the VTAM netname of the CICS client.

System Action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of UNKNOWNTERMINAL is sent to the client.

User Response: Ensure that there is an installed predefined terminal for *termid* that has a remote system parameter (REMOTESYSTem) specifying the name of this CICS clients connection and that the VTAM NETNAMEs match. Then install the definition with the correct parameters.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3217 E *date time applid* **Transaction CTIN - VTAM netname** *netname***. The specified function is not valid.**

Explanation: A CTIN request has been received from a CICS client with a VTAM netname of *netname*. However the function specified was not INSTALL or UNINSTALL.

System Action: Exception trace point AP3034 is written. The CTIN transaction abnormally terminates with abend code AZAI.

User Response: Determine where the request originated. Ensure that the input has not been corrupted. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3218 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. A resource with the same name as the terminal is already installed.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN specified that a virtual terminal *termid* should be autoinstalled. However another resource was installed with the same name after the CTIN transaction had ensured that the name was free.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3026 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User Response: Investigate where the duplicate resource came from. It is possible that the terminal/APPC autoinstall URM created the name dynamically. If NetName was specified in the CTIN parameters, ensure that the CICS client names do not conflict with existing CICS terminal or connection names. If NetName was not specified, examine the SIT VTPREFIX override to check that the URM does not create names starting with the VTPREFIX character.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3219 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. The terminal is already in use.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN supplied a NetName *termid* but CICS found a resource with the same name which is either an existing virtual terminal for this client, an existing virtual terminal for another client or another CICS terminal or connection resource.

netname is the VTAM netname of the CICS client.

System Action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User Response: Investigate where the duplicate resource came from. It is possible that the terminal/APPC autoinstall URM created the name dynamically and that the CICS client used a name that clashes with the URM.

It is also possible that a client created the virtual terminal and then tried to reuse it without an intervening uninstall, via CCIN or CTIN.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3220 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. The terminal has already been installed.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN specified that the virtual terminal *termid* should be autoinstalled. However, the virtual terminal was already installed.

netname is the VTAM netname of the CICS client.

System Action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User Response: The CICS client should issue CTIN uninstall before any attempt to issue another CTIN install for the same NetName.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3221 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. The name specified is already in use by another CICS resource.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CTIN specified that the virtual terminal *termid* should be autoinstalled. However, the name specified is already in use by another CICS resource.

netname is the VTAM netname of the CICS client.

System Action: The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of ALREADYINSTALLED is sent to the client.

User Response: Investigate where the duplicate resource came from. It is possible that the terminal/APPC autoinstall URM created the name dynamically.

If NetName was specified on the CTIN install ensure that NetName does not conflict with other CICS resources.

If NetName was not specified, examine the SIT VTPREFIX override to check that the URM does not create names starting with the VTPREFIX character.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3222 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. The CITS task has terminated abnormally.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CICS attempted to autoinstall the virtual terminal *termid*. However, the CITS task which was attached to install the virtual terminal, abended.

If this ABEND was an AZVE, this is because a resource already exists with that name. However, this only occurs if the duplicate resource was added after this CTIN transaction started and checked for any duplicate.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3030 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User Response: Investigate where the duplicate resource came from. It is possible that the terminal/APPC autoinstall URM created the name dynamically.

If NetName was specified on the CTIN install, ensure that the names do not conflict.

If NetName was not specified, examine the SIT VTPREFIX override to check that the URM does not create names starting with the VTPREFIX character.

For any other abend, see the description of the abend code for further guidance.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3223 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. The surrogate TCTTE is in use and cannot be deleted.**

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. However, the surrogate TCTTE attached to the virtual terminal is still in use and cannot be deleted.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP302F is written. The attempt to delete the virtual terminal is rejected.

User Response: Either wait for the transaction to finish or PURGE the transaction. Once the transaction has ended the virtual terminal will be deleted when the client issues CCIN install or uninstall.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3224 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. The terminal specified for deletion cannot be found.**

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. However the virtual terminal *termid* does not exist as a remote terminal for this CICS client.

netname is the VTAM netname of the CICS client.

System Action: The attempt to delete the virtual terminal is rejected.

User Response: Determine why a CICS client requested that a non existent virtual terminal be deleted.

If the CTIN uninstall was issued correctly and the virtual terminal should exist, examine the CICS log for message DFHZC5966 and for DFHZC32*xx* messages referring to this terminal.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3225 E *date time applid* **Transaction CTIN - VTAM netname** *netname***. The terminal cannot be deleted because the NetName parameter is missing.**

Explanation: A CTIN uninstall request has been received from a CICS client as a result of a CICS_EpiDelTerminal function or terminal emulator operation. However the NetName parameter, defining which virtual terminal is to be deleted, is missing.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3037 is written – data 2 contains the data received. The attempt to delete the virtual terminal is rejected.

User Response: Examine the input to CTIN. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3226 E *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname***. CICS cannot access the builder parameter set.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CICS is attempting to extract the details from the virtual terminal that has just been created and return them back to the CICS client. However the attempt to extract the details in the form of a builder parameter set (BPS) failed.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP3031 is written.

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3227 E *date time applid* **Transaction CTIN - VTAM netname** *netname***. The client data is longer than expected.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However the data received was longer than expected. *netname* is the VTAM netname of the CICS client.

System Action: Exception trace point AP302D is written – data 2 contains the length that was received. The CTIN transaction abnormally terminates with abend code AZAI.

User Response: Examine the data sent to CICS from the CICS client. You may need to contact IBM for assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3228 E *date time applid* **Transaction CTIN - VTAM netname** *netname***. The client header data contains an invalid group.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However the header contains an invalid group. *netname* is the VTAM netname of the CICS client.

System Action: Exception trace point AP3024 is written – data 2 contains the data received. The CTIN transaction abnormally terminates with abend code AZAI.

User Response: Examine the data sent to CICS from the CICS client. You may need to contact IBM for assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3229 E *date time applid* **Transaction CTIN - VTAM netname** *netname***. CICS has received invalid data from the client.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CICS attempted to parse this data but found a discrepancy between the number of parameters, the length of the parameters and the length of the data received. *netname* is the VTAM netname of the CICS client.

System Action: Exception trace point AP3033 is written – data 2 contains the data received. The CTIN transaction abnormally terminates with abend code AZAI.

User Response: Examine the data sent to CICS from the CICS client. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3230 E *date time applid* **Transaction CTIN - VTAM netname** *netname***. CICS has received a client request on an unsupported sync level.**

Explanation: A CTIN request has been received on a conversation which is not at synchronization level 0 or 1. *netname* is the VTAM netname of the CICS client.

System Action: Exception trace point AP302B is written. The CTIN transaction abnormally terminates with abend code AZAI.

User Response: Ensure that the CICS client converses at sync level 0 or 1.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3231 E *date time applid* **Transaction CTIN - VTAM netname** *netname***. The client header data contains an invalid version number.**

Explanation: A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However there is an invalid version number in the header. *netname* is the VTAM netname of the CICS client.

System Action: Exception trace point AP3036 is written – data 2 contains the data received. The CTIN transaction abnormally terminates with abend code AZAI.

User Response: Since the version used in the CICS client must match with the version used by the server, one or the other is at the wrong level and should be changed. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Module: DFHZCT1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3240 E *date time applid* **Transaction CCIN - VTAM netname** *netname***. CICS has received a client request on an unsupported sync level.**

Explanation: A CCIN request has been received on a conversation which is not at synchronization level 0 or 1. *netname* is the VTAM netname of the CICS client.

System Action: Exception trace point AP3003 is written. The CCIN transaction abnormally terminates with abend code AZAF.

User Response: Ensure that the CICS client converses at sync level 0 or 1.

Destination: CSCC

Module: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3241 E *date time applid* **Transaction CCIN - VTAM netname** *netname***. The client data is longer than expected.**

Explanation: A CCIN install request has been received from a CICS client. However the data received was longer than expected. *netname* is the VTAM netname of the CICS client.

System Action: Exception trace point AP3004 is written – data 2 contains the length that was received. The CCIN transaction abnormally terminates with abend code AZAF.

User Response: Examine the data sent to CICS from the CICS client. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Module: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3242 E *date time applid* **Transaction CCIN - VTAM netname** *netname***. The client header data contains an invalid group.**

Explanation: A CCIN request has been received from a CICS client. However there is an invalid group in the header. *netname* is the VTAM netname of the CICS client.

System Action: Exception trace point AP3002 is written – data 2 contains the data received. The CCIN transaction abnormally terminates with abend code AZAF.

User Response: Examine the data sent to CICS from the CICS client.

Destination: CSCC

Module: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3243 E *date time applid* **Transaction CCIN - VTAM netname** *netname***. The client header data contains an invalid version number.**

Explanation: A CCIN install request has been received from a CICS client. However the header contains an invalid version value. *netname* is the VTAM netname of the CICS client.

Either the CICS client is setting up the CCIN header incorrectly or a new version of the CICS client software is being used which is not supported on CICS Transaction Server for OS/390 Release 3.

System Action: Exception trace point AP300B is written – data 2 contains the data received. The CCIN transaction abnormally terminates with abend code AZAF.

User Response: Since the version used in the CICS client must match with the version used by the server, one or the other is at the wrong level and should be changed. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Module: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3244 E *date time applid* **Transaction CCIN - VTAM netname** *netname***. The client header data contains an invalid function.**

Explanation: A CCIN request has been received from a CICS client. However there is an invalid function in the header. *netname* is the VTAM netname of the CICS client.

System Action: Exception trace point AP3002 is written - data 2 contains the data received. The CCIN transaction abnormally terminates with abend code AZAF.

User Response: Investigate why the CICS client has sent an unknown function call to CCIN. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Module: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3245 E *date time applid* **Transaction CCIN - VTAM netname** *netname***. The capabilities parameter has not been specified.**

Explanation: A CCIN transaction has been run from a CICS client. One of the parameters which must be supplied is the CAPABILITIES parameter which specifies the capabilities the CICS client can support. This parameter is missing.

netname is the VTAM netname of the CICS client.

System Action: The request to install a CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Module: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3246 *date time applid* **Transaction CCIN - virtual terminal** *termid* **VTAM netname** *netname***. CICS cannot attach the CDTS transaction.**

Explanation: A CCIN request has been received from a CICS client. As part of the processing, the CDTS transaction was called to delete virtual terminal *termid*. However CICS was unable to attach the CDTS transaction.

netname is the VTAM netname of the CICS client.

System Action: The attempt to delete the virtual terminal fails. If this is a CCIN install request, the install continues.

User Response: Ensure that the CDTS transaction and the DFHZATS program are defined correctly as specified in IBM supplied group DFHSPI and that they are installed.

Destination: CSCC

Module: DFHZCN2

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3247 *date time applid* **Transaction CCIN - virtual terminal** *termid* **VTAM netname** *netname***. The CCIN transaction has timed out waiting for CDTS to run.**

Explanation: A CCIN request has been received from a CICS client. As part of the processing, the CDTS transaction is called to delete virtual terminal *termid.* However the CCIN transaction has waited for the CDTS transaction for two minutes and has timed out.

netname is the VTAM netname of the CICS client.

System Action: The CDTS attempt to delete the virtual terminal continues and occurs when the CDTS transaction starts or is 'unsuspended'.

If this is a CCIN install request, the install continues.

User Response: Check to see why the CDTS transaction was unable to start or was hanging.

You may need to increase MAXTASK or the CITS TRANCLASS allocation.

Destination: CSCC

Module: DFHZCN2

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3248 E *date time applid* **Transaction CCIN - virtual terminal** *termid* **VTAM netname** *netname***. The surrogate TCTTE is in use and cannot be deleted.**

Explanation: A CCIN request has been received from a CICS client. There should not be any virtual terminals installed, however, one or more were located. The surrogate TCTTE attached to the virtual terminal is still in use and cannot be deleted. If this was caused by an immediate shut down of the client the transaction abend might not have completed before CICS attempted to delete the client.

netname is the VTAM netname of the CICS client.

System Action: Exception trace point AP301C is written. The attempt to delete the virtual terminal is rejected.

If this is a CCIN install request, the install continues.

User Response: Determine why the virtual terminal was installed when CCIN was run.

Either wait for the transaction to finish or PURGE the transaction. Once the transaction completes the virtual terminall will be deleted at the next CCIN install/uninstall.

Destination: CSCC

Module: DFHZCN2

XMEOUT Parameters: *date, time, applid, termid, netname*

DFHZC3249 E *date time applid* **Transaction CCIN - VTAM netname** *netname***. CICS has received invalid data from the client.**

Explanation: A CCIN install request has been received from a CICS client. CICS attempted to parse this data but found a discrepancy between the number of parameters, the length of the parameters, and the length of the data received. *netname* is the VTAM netname of the CICS client.

System Action: Exception trace point AP300E is written – data 2 contains the data received. The CCIN transaction abnormally terminates with abend code AZAF.

User Response: Examine the data sent to CICS from the CICS client. You may need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSCC

Module: DFHZCN1

XMEOUT Parameters: *date, time, applid, netname*

DFHZC3400 E *date time applid termid tranid* **Chain exceeds max chain size.** *sense* **((***instance***) Module name: {DFHZRAC | DFHZRVS | DFHZRVX})**

Explanation: If chain assembly (BUILDCHAIN) has been specified in the TCTTE, the chain being assembled does not fit into the IOAREALEN for a maximum chain (IOAREALEN Value 2). The remaining space in the IOAREALEN for a maximum chain is smaller than the maximum RECEIVESIZE.

If chain assembly (BUILDCHAIN) has been specified in the TCTTE, but maximum chain value equals zero, either the maximum chain value has been set incorrectly at build time or the value has been overwritten.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Ensure that the maximum chain size, generated in CEDA TYPETERM with IOAREALEN (value 2) keyword, is large enough for the maximum chain expected.

Destination: CSNE

Modules: DFHZRVS, DFHZRVX, DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS, 2=DFHZRVS, 3=DFHZRVS, 4=DFHZRVS, 5=DFHZRVS, 6=DFHZRVX, 7=DFHZRAC, 8=DFHZRAC}*

DFHZC3401 I *date time applid termid tranid* **Resource now available.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: A resource of the logical unit (LU) is now available. It had previously been temporarily unavailable or had required intervention.

For the meaning of the sense data, see the explanation on page 678.

System Action: Any outstanding read or write operation is retried.

User Response: None.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3402 E *date time applid termid tranid* **Invalid READ with outbound chain control.** *sense* **((***instance***) Module name: {DFHZRVS})**

Explanation: A DFHTC TYPE=READ request is being processed, although the previously issued DFHTC TYPE=WRITE request did not complete a chain.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Correct the application program.

Destination: CSNE

Module: DFHZRVS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS}*

DFHZC3405 E *date time applid termid tranid* **Catastrophic bracket error.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The logical unit detected a failure of CICS to enforce bracket rules.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The session is terminated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use the symptom string, a VTAM trace, and if necessary the dump, to determine the source of the problem.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3406 E *date time applid termid tranid* **Parameter error.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The request/response unit (RU) received by the logical unit (LU) contains a control function with invalid parameters.

For the meaning of the sense data, see the explanation on page 678.

System Action: All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A portion of the TIOA is put to the CSNE log.

User Response: Correct the application program.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3407 E *date time applid termid tranid* **READ command does not carry change direction indicator.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: A request for input (for example, a READBUF command) sent to a logical unit (LU) type 2 (3270 compatibility mode logical unit) must carry the SNA change direction indicator. The LU has received such a request, but the indicator is not set.

Since the setting of the change direction indicator is controlled by terminal control, this message indicates that an internal logic error may have occurred. The error is not necessarily in terminal control, but may be in the logical unit or some other element of the network.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task and the VTAM session for the logical unit are abnormally terminated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Identify the request that caused the error, and locate the element of the network responsible.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3408 E *date time applid termid tranid* **Presentation space integrity lost.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The contents of data for screen presentation by a logical unit has been altered. This is usually due to operator action. For example, the TEST/NORMAL key may have been used or the 3270 SYS REQ key may have been pressed.

It may also have been caused by factors other than operator action, for example, 3270 regeneration buffer failure.

For the meaning of the sense data, see the explanation on page 678.

System Action: Any outstanding requests are canceled. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Determine reason for failure at the remote terminal.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3409 E *date time applid termid tranid* **Unexpected negative response received.** *sense* **((***instance***) Module name: {DFHZRAC})**

Explanation: CICS received a negative response to a command for which a negative response would not normally be expected.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to CSNE.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Ensure that the application programs running concurrently do not alter the TCTTE. Check that the SNA flows on the session are valid and that the logical unit is not violating SNA protocols.

Destination: CSNE

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC}*

DFHZC3410 E *date time applid termid tranid* **Invalid input when LU status expected.** *sense* **((***instance***) Module name: {DFHZRVX})**

Explanation: Input (other than a logical unit status message) was received after a request was rejected with a system sense code indicating a possibly rectifiable error condition at the terminal node: for example, Intervention Required. The subsequent LU status message indicates that the error situation has now been corrected, or that the request is permanently not executable.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Conform to SNA protocol by ensuring that the next transmission is an LUSTATUS message with a system sense for either Resource Available (0001) or Function Not Executable (081C).

Destination: CSNE

Module: DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRVX, 3=DFHZRVX}*

DFHZC3411 E *date time applid termid tranid* **Resource temporarily unavailable.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: A terminal resource required to complete a request is temporarily unavailable.

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is retried unless the device is one that sends an LUSTATUS message after receiving a “resource temporarily unavailable” notification.

If “resource temporarily unavailable” notification is received, an associated VTAM message is usually issued.

User Response: Refer to the associated VTAM message, if applicable, and follow the guidance provided.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3412 E *date time applid termid tranid* **Intervention required on secondary resource.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: Operator action is requested for the secondary resource of a logical unit (LU). However, no such resource is immediately available. In the case of a 3270-compatible LU, this message means that the printer most likely to be available for a PRINT request has an Intervention Required status.

For the meaning of the sense data, see the explanation on page 678.

System Action: The system waits for a logical unit status message and, when this is received, takes appropriate system action.

User Response: Correct the problem that relates to the device.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3413 E *date time applid termid tranid* **Logical Unit busy.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The logical unit has rejected a request because its resources are busy (for example, it is communicating with the system services control point (SSCP)), and thus is unable to process the request.

For the meaning of the sense data, see the explanation on page 678.

System Action: The system waits for a logical unit status message and then takes appropriate action.

User Response: None.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3414 E *date time applid termid tranid* **Request not executable. Secondary resource unavailable.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The secondary resource of a logical unit is permanently unavailable to complete a request. For a 3270-compatible LU, this means that a printer was not available for a PRINT request.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Determine the reason why the resource is not available at the remote terminal.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3415 E *date time applid termid tranid* **No data available.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: A receive request has been rejected by the logical unit because it has no data to send for one of the following reasons:

- The device is not capable of input (for instance, it is a printer)
- The logical unit is not capable of sending data at the time. For example, a requested 3790 data set is not available at the time.

For the meaning of the sense data, see the explanation on page 678.

System Action: The receive request is halted. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Verify that the request was issued to the correct device and that the device is capable of data transmission.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3416 E *date time applid termid tranid* **Session failure. A connection request for an invalid node** *nodeid* **could not be terminated.** *sense* **((***instance***) Module name: {DFHZSCX})**

Explanation: The requested logon was to be rejected, but the attempt to send a negative response was rejected by VTAM.

For the meaning of the sense data, see the explanation on page 678.

System Action: No further attempts are made to communicate with the invalid node.

User Response: Inspect the CSNE, CSMT and CSTL logs for an indication of a VTAM storage problem or error message. Determine whether the node was invalid. If it was valid, update the CICS TCT for that node.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, nodeid, sense, instance, {1=DFHZSCX}*

DFHZC3417 E *date time applid termid tranid* **Session processing error. A request for synchronization has been ignored.** *sense* **((***instance***) Module name: {DFHZSDR})**

Explanation: A request for a sync point to be taken was ignored. COMMIT or ABORT has not been issued.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump.

User Response: To determine the cause of the problem, inspect the CSNE, CSMT and CSTL logs for further diagnostic information. Also inspect transaction *tranid*.

Destination: CSNE

Module: DFHZSDR

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDR}*

DFHZC3418 E *date time applid termid tranid* **System generation error. The** *netname* **logon request was rejected.** *sense* **((***instance***) Module name: {DFHZBLX | DFHZLGX | DFHZSCX})**

Explanation: A logon request was rejected because the TCTTE for the ISC session had been generated with an incompatible SESSIONTYPE.

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is rejected.

User Response: Change the TCTTE generation to specify a secondary logical unit at one end of the connection, and a primary logical unit at the other end.

A primary logical unit should have SESSIONTYPE=SEND or SESSIONTYPE=FASTSEND, and a secondary logical unit should have SESSIONTYPE=RECEIVE or SESSIONTYPE=FASTRECV.

Destination: CSNE

Modules: DFHZSCX, DFHZLGX, DFHZBLX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZSCX, 2=DFHZBLX, 3=DFHZLGX}*

DFHZC3419 E *date time applid termid tranid* **Session failure. The bind parameter for node** *netname* **is unacceptable.** *sense* **((***instance***) Module name: {DFHZBLX | DFHZSCX | RESERVE})**

Explanation: A connection request was rejected because the characteristics specified for the connecting system were unacceptable.

Possible reasons for the rejection are:

- For a MEMBER name connection, the network identifier (NETID) passed to CICS is different from that already stored in the system entry (instance 39).
- For a MEMBER name connection, the GRNAME specified in the sessions bind - UDSS04 - is different from that already stored in the system entry (instance 40).

- For a GR name connection, the network identifier (NETID) passed to CICS is different from that already stored in the connections system entry (instance 41).

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is rejected. The bind parameter is printed on the CSNE log.

User Response: Determine whether the connecting system has specified its characteristics correctly. If it has not, correct the requesting system.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=RESERVE, 2=DFHZBLX, 3=DFHZSCX, 4=DFHZSCX, 5=DFHZBLX, 6=DFHZBLX, 7=DFHZSCX, 8=DFHZBLX, 9=DFHZBLX, 10=DFHZBLX, 11=DFHZBLX, 12=DFHZBLX, 13=DFHZBLX, 14=DFHZBLX, 15=DFHZBLX, 16=DFHZBLX, 17=DFHZBLX, 18=DFHZBLX, 19=DFHZSCX, 20=DFHZBLX, 21=DFHZBLX, 22=DFHZBLX, 23=DFHZBLX, 24=DFHZBLX, 25=DFHZBLX, 26=DFHZBLX, 27=DFHZBLX, 28=DFHZBLX, 29=DFHZSCX, 30=DFHZBLX, 31=DFHZBLX, 32=DFHZBLX, 33=DFHZBLX, 34=DFHZBLX, 35=DFHZBLX, 36=DFHZBLX, 37=DFHZBLX, 38=DFHZBLX, 39=DFHZBLX, 40=DFHZBLX, 41=DFHZBLX}*

DFHZC3420 E *date time applid termid tranid* **Session connection error. Node** *netname* **is out of service.** *sense* **((***instance***) Module name: {DFHZBLX | DFHZOPN})**

Explanation: A logon request was rejected because the TCTTE is out of service.

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is rejected.

User Response: Place the terminal in service by using the master terminal program and reissuing the connection request.

Destination: CSNE

Modules: DFHZSCX, DFHZOPN, DFHZBLX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPN, 2=DFHZBLX, 3=DFHZBLX}*

DFHZC3421 E *date time applid termid tranid* **Session shutdown request received. Node** *netname* **is receiving orderly shutdown.** *sense* **((***instance***) Module name: {DFHZASX})**

Explanation: A shutdown request was received for the system. An orderly termination procedure has begun.

For the meaning of the sense data, see the explanation on page 678.

System Action: Orderly termination of the session is started. Access to the remote system is stopped after the current transaction has finished.

User Response: None.

Destination: CSNE

Module: DFHZASX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZASX}*

DFHZC3422 E *date time applid termid tranid* **Connection failure. Request rejected before a session could be started.** *sense* **((***instance***) Module name: {DFHZNSP})**

Explanation: An error occurred while trying to connect the two systems. The request was terminated before a session had been established.

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is terminated.

User Response: Determine the cause of the problem by inspecting the VTAM logs. If the problem is due to a shortage of storage or another temporary error, reissue the request when the system is less heavily loaded.

Destination: CSNE

Module: DFHZNSP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNSP, 2=DFHZNSP}*

DFHZC3423I *date time applid termid tranid* **FM function not supported. A function requested in an FMD RU is not supported by the receiver.** *sense* **((***instance***) Module Name: {DFHZNAC})**

Explanation: CICS has received a negative response (VTAM sense code 0826). The receiver does not support the function requested by the sender.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding SENDs and RECEIVEs are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Investigate the reason for issuing a request for a function that the receiver does not support.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3424 E *date time applid termid tranid* **Session failure. Session terminated immediately.** *sense* **((***instance***) Module name: {DFHZNSP})**

Explanation: Communication with a node was interrupted during a session because a session outage was detected, or because a VTAM VARY INACT command was issued.

Error messages produced for the same session after this message may be caused by the session failure and may not be the reason for it. If this is the case, they can be ignored.

For the meaning of the sense data, see the explanation on page 678.

System Action: The session is canceled. The session may be recovered later by VTAM. See also messages DFHZC2409 and DFHZC2410.

User Response: Check if the failure was caused by an operator-issued VTAM VARY INACT. If this is not the case, use the sense data and any associated messages to investigate the reason for the failure.

Destination: CSNE

Module: DFHZNSP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNSP, 2=DFHZNSP, 3=DFHZNSP}*

DFHZC3426 E *date time applid termid tranid* **Resource unknown.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: During intersystem connection, no matching TCTTE could be found.

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is terminated.

User Response: Ensure that the name of the requested TCTTE is correctly specified in the requesting system.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3427 E *date time applid termid tranid* **Invalid parameter in bind area.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: During intersystem connection, either one or more parameters contained in the bind area of the request were invalid, or were not supported.

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is terminated.

User Response: Determine which parameters in the bind area are incorrect, and correct them.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3429 E *date time applid termid tranid* **Resynch error - CICS did not resynchronize, other logical unit was expecting resynch.** *sense* **((***instance***) Module name: {DFHZRSY | DFHZSYX})**

Explanation: CICS did not go through a resynchronization process that was expected to occur by the other LU.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: Check whether this resynchronization mismatch is acceptable.

Destination: CSNE

Modules: DFHZRSY, DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRSY, 2=DFHZRSY, 3=DFHZRSY, 4=DFHZRSY, 5=DFHZSYX}*

DFHZC3433 E *date time applid termid tranid* **FMH7 was received on ISC session. Sense code is :** *xxxxxxxx{Error log data is : | No error log data received. | No error log data available. }xxxxxxxx sense* **((***instance***) Module name: {DFHZERH | DFHZRAC | DFHZRVX})**

Explanation: The transaction is communicating with a logical unit (LU) type LU6.1 or LU6.2.

The logical unit sent an FMH7 which may carry error log data. If error log data is included, then the text is inserted in this message.

For the meaning of the sense data, see the explanation on page 678.

System Action: The action taken depends upon the sense code.

User Response: If the receiving transaction is designed to handle this situation, no action is necessary. However, if this is not the case, use the sense code and any error log data to determine why the connected logical unit sent the FMH7.

If the connected LU is another CICS system, the error log data is a CICS message.

If the connected LU is not a CICS system, see that product's documentation for details of error log data. Some products permit the user to define the contents of error log data.

Destination: CSNE

Modules: DFHZRVX, DFHZRAC, DFHZERH

XMEOUT Parameters: *date, time, applid, termid, tranid, xxxxxxxx, {1= Error log data is : , 2=No error log data received. , 3=No error log data available. }, xxxxxxxx, sense, instance, {1=DFHZRVX, 2=DFHZRAC, 3=DFHZRAC, 4=DFHZERH}*

DFHZC3434 E *date time applid termid tranid* **Unbind received while session still active.** *sense* **((***instance***) Module name: {DFHZSCX})**

Explanation: One side of the intersystem link (secondary) received an unbind command without normal termination protocol being observed. This means an abnormal termination of the session was performed, possibly caused by the other side of the intersystem link abnormally terminating.

For the meaning of the sense data, see the explanation on page 678.

System Action: The session is terminated.

User Response: Determine the cause of the termination by using CICS Trace and the diagnostic information available on the CSNE log. Try to reestablish the session.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX, 2=DFHZSCX, 3=DFHZSCX, 4=DFHZSCX, 5=DFHZSCX, 6=DFHZSCX, 7=DFHZSCX, 8=DFHZSCX, 9=DFHZSCX, 10=DFHZSCX}*

DFHZC3435 E *date time applid termid tranid* **Path error detected. Device cannot be contacted.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: VTAM can no longer transmit to a device because there is no access path to that device. This usually occurs because the device or 3270 has been powered off.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service. The session is terminated.

User Response: Determine the cause of the termination. Try to reestablish the session.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3436 E *date time applid termid tranid* **End user not authorized.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: A sense code has been received specifying that an unauthorized request was made to the remote node. The request was rejected.

For the meaning of the sense data, see the explanation on page 678.

System Action: The session is terminated.

User Response: Determine why the end user is not authorized to perform the request.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3437 I *date time applid termid tranid* **Node** *netname* **action taken:** *action* **((***instance***) Module name: {DFHZNAC})**

Explanation: After an error has been processed by DFHZNAC, certain actions may be taken to correct the error. This message indicates the actions that were set. The actions taken can differ from the actions set, depending on the type and state of the node at the time of the error.

System Action:

Action	**Effect**
ABRECV	Cancel receive.
ABSEND	Cancel send.
ABTASK	Abend task
CLSDST	Close session.
GMM	Send good morning message.
OUTSRV	Place session out of service.
CREATE	Allow ATI to acquire the session if required.
NOCREATE	Do not allow ATI to acquire the session.
NEG RESP	Send an exception response.
SIMLOGON	Generate SIMLOGON request for the session.
CNTASK	Cancel the task.
SYSDUMP	Take a system dump.
PURGEBMS	Purge any BMS pages.

User Response: The user action depends on what action has been taken by the system. This is indicated by *action* in the message text.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, action, instance, {1=DFHZNAC}*

DFHZC3438 E *date time applid termid tranid* **Device powered off.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: A request has been rejected by the logical unit because the associated device has been powered off. This message may be caused by operator action. For example, the TEST/NORMAL key may have been used.

For the meaning of the sense data, see the explanation on page 678.

System Action: The system waits for a logical unit status message and, when the message has been received, takes appropriate system action.

User Response: Correct the problem that relates to the device.

For the meaning of the sense codes, refer to the explanatory paragraph in message DFHZC2461.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3439 E *date time applid termid tranid* **Negative response received to SDT.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: A negative response has been received to the START DATA TRAFFIC (SDT) command.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: None.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3440 E *date time applid termid tranid* **Unable to send error message - session in free status.** *sense* **((***instance***) Module name: {DFHZEMW})**

Explanation: DFHZEMW was attempting to write a message to another node, but was unable to do so because the session was in "between bracket" status.

In this state, it is not possible to send the message in the normal way. The session was in free status, probably because the application program had issued a SEND command with the LAST option.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: Check to see why the other node sent its request EXCEPTION response mode. Change the response mode to DEFINITE if error messages are to be sent.

Destination: CSNE

Module: DFHZEMW

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZEMW, 2=DFHZEMW}*

DFHZC3441 I *date time applid* **Orderly termination of VTAM sessions requested.** *sense* **((***instance***) Module name: {DFHZSHU})**

Explanation: A request for an orderly close of VTAM sessions and subsequent close of CICS VTAM ACB has been received. The request may have been initiated by the CICS master terminal command or by the VTAM network closing down.

For the meaning of the sense data, see the explanation on page 678.

System Action: All nodes are quiesced and each session is closed as it becomes inactive. When all sessions have been closed, the ACB is closed.

User Response: None.

Destination: CSNE

Module: DFHZSHU

XMEOUT Parameters: *date, time, applid, sense, instance, {1=DFHZSHU}*

DFHZC3442 I *date time applid* **Immediate termination of VTAM sessions requested.** *sense* **((***instance***) Module name: {DFHZSHU | DFHZTPX | RESERVE})**

Explanation: A request for an immediate close of all VTAM sessions and subsequent close of CICS VTAM ACB has been received. The request may have been initiated by the CICS master terminal command or by the VTAM network closing down.

This message is also issued if V NET,ID=...,INACT is issued by the VTAM operator.

For the meaning of the sense data, see the explanation on page 678.

System Action: All requests on a VTAM session are abnormally terminated and the session is closed. The VTAM ACB is then closed.

If V NET,ID=...,INACT was issued by the VTAM operator, VTAM waits for all sessions to be closed before informing CICS. In this case there are no sessions to be abnormally terminated. This message may be issued twice, once by DFHZTPX and once by DFHZSHU. The messages will have different instance numbers.

User Response: None.

Destination: CSNE

Modules: DFHZSHU, DFHZTPX

XMEOUT Parameters: *date, time, applid, sense, instance, {1=DFHZSHU, 2=RESERVE, 3=RESERVE, 4=DFHZTPX, 5=DFHZSHU}*

DFHZC3443 I *date time applid* **VTAM has been cancelled or the ACB has been forceclosed. VTAM sessions terminated.***sense* **((***instance***) Module name: {DFHZSHU | DFHZSYX | DFHZTPX})**

Explanation: VTAM has been cancelled or force closed by the CICS/VTAM operator.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS will close its ACB. All transactions running on VTAM sessions are abnormally terminated.

User Response: None.

Destination: CSNE

Modules: DFHZSHU, DFHZTPX, DFHZSYX

XMEOUT Parameters: *date, time, applid, sense, instance, {1=DFHZSHU, 3=DFHZSYX, 4=DFHZTPX, 5=DFHZSHU}*

DFHZC3444 E *date time applid termid tranid* **Unexpected condition detected during RECEIVE processing.** *sense* **((***instance***) Module name: {DFHZRVS})**

Explanation: CICS has detected a data runaway condition while receiving data from terminal *termid*.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS terminates the session and places the terminal out of service. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: To determine the cause of this error,

- Check for a terminal malfunction, for example the device may be sending the same data repeatedly, or
- Check for a network problem.

Destination: CSNE

Module: DFHZRVS

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVS}*

DFHZC3445 E *date time applid termid tranid* **State error.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: CICS has received a state error negative response (VTAM sense code 20*yy*).

For the meaning of the sense data, see the explanation on page 678.

System Action:

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User Response: Determine the reason for the error before restarting the session.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3446 E *date time applid termid tranid* **Request error.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: CICS has received a request error negative response (VTAM sense code 10*yy*) for which it does not recognize the minor code *yy*.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User Response: Determine the reason for the error.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3447 E *date time applid termid tranid* **Request reject error.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: CICS has received a request reject negative response (VTAM sense code 08*yy*) for which it does not recognize the minor code *yy*.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User Response: Determine the reason for the error.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3448 E *date time applid termid tranid* **Security identification error.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: CICS has received a negative response to a request to access a resource because it was not authorized. If it was an OPNDST (BIND) request, CICS did not send the authorization sequence expected by a logical unit. CICS does not support the security feature in the bind.

For the meaning of the sense data, see the explanation on page 678.

System Action: The logical unit is placed out of service and the session is closed.

User Response: CICS does not support the security feature in the bind. Modify the authorization parameters in the remote logical unit so that it does not require authorization to initiate a session.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3449 I *date time applid termid tranid* **Leaving unattended mode.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: CICS has received a status message from a logical unit indicating that the terminal is now attended.

Note that this is the default mode of operation.

For the meaning of the sense data, see the explanation on page 678.

System Action: The mode of operation bit TCTEMOPU is reset in the TCTTE.

User Response: For logical units that can operate in unattended mode, the application programmer should test the mode of operation before starting a conversational sequence with the terminal operator. If the bit is on, no operator action can be expected.

For command level, use the EXEC CICS ASSIGN UNATTEND (data area) command to obtain the value of TCTEMOPU.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3450 I *date time applid termid tranid* **Entering unattended mode.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: CICS has received a status message from a logical unit indicating that the terminal is no longer attended.

For the meaning of the sense data, see the explanation on page 678.

System Action: The mode of operation bit TCTEMOPU is set in the TCTTE.

User Response: For logical units that can operate in unattended mode, the application programmer should test the mode of operation before starting a conversational sequence with the terminal operator. If the bit is on, no operator action can be expected.

For command level, use the EXEC CICS ASSIGN UNATTEND (data area) command to obtain the value of TCTEMOPU.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3451 I *date time applid termid tranid* **Currently no data to send.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: Following the issue of a READ command to a logical unit, or the completion of a transaction associated with the logical unit, CICS has received a status message from the logical unit indicating that it currently has no data to send.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a data interchange (DFHDI) receive request is outstanding, it will complete with DSSTAT condition and a response code X'15'.

If no task is active and no work is outstanding for the terminal, the soft CLSDEST action flag is set and DFHZNEP is called. Unless it is reset by DFHZNEP, the session is terminated.

User Response: Ensure that no more receive requests are issued to the terminal.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3452 E *date time applid termid tranid* **Signal received - Code** *xxxx. sense* **((***instance***) Module name: {DFHZASX})**

Explanation: CICS has received a SIGNAL command from a logical unit. The SIGNAL codes received with the SIGNAL command are made available to the DFHZNEP user program.

If a task is active, the SIGNAL condition is raised on return to the application program. This message is produced only when SIGNAL codes are passed to the node abnormal condition program (DFHZNAC). CICS does this for Type 4 logical units only.

For the meaning of the sense data, see the explanation on page 678.

System Action: If the SIGNAL code is 0001 0000 (request change direction), any further output request will cause the IGREQCD condition to be raised. All SIGNAL codes will cause the SIGNAL condition to be raised.

User Response: For logical units for which CICS enforces SIGNAL request change direction, if the code is 0001 0000, issue a receive request or terminate transaction *tranid*.

If the code is NOT 0001 0000, terminate transaction *tranid* and refer to the *VTAM Programming* manual for further guidance.

Destination: CSNE

Module: DFHZASX

XMEOUT Parameters: *date, time, applid, termid, tranid, xxxx, sense, instance, {1=DFHZASX, 2=DFHZASX}*

DFHZC3453 E *date time applid termid tranid* **RH usage error.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: CICS has received a request header (RH) usage error negative response for which it does not recognize the minor code *yy*.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User Response: None.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3454 E *date time applid termid tranid* **Session initiation failure. Bind response from node** *netname* **is unacceptable.** *sense* **((***instance***) Module name: {DFHZOPX})**

Explanation: A remote secondary's response to a negotiable bind contained unacceptable parameters.

For the meaning of the sense data, see the explanation on page 678.

System Action: Session initialization fails. The sent and received bind parameters are printed on the CSNE log.

User Response: Look at the parameters printed on the CSNE log. Ensure that the remote system has correctly specified its characteristics. If there is an invalid format, change it to LEN PSQ LEN SSQ.

Destination: CSNE

Module: DFHZOPX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPX, 2=DFHZOPX, 3=DFHZOPX, 4=DFHZOPX, 5=DFHZOPX, 6=DFHZOPX, 7=DFHZOPX, 8=DFHZOPX, 9=DFHZOPX, 10=DFHZOPX, 11=DFHZOPX, 12=DFHZOPX, 13=DFHZOPX, 14=DFHZOPX, 15=DFHZOPX, 16=DFHZOPX, 17=DFHZOPX, 18=DFHZOPX, 19=DFHZOPX, 20=DFHZOPX, 21=DFHZOPX, 22=DFHZOPX, 23=DFHZOPX, 24=DFHZOPX, 25=DFHZOPX, 26=DFHZOPX, 27=DFHZOPX, 28=DFHZOPX, 29=DFHZOPX, 30=DFHZOPX, 31=DFHZOPX, 32=DFHZOPX, 33=DFHZOPX, 34=DFHZOPX, 35=DFHZOPX, 36=DFHZOPX, 37=DFHZOPX, 38=DFHZOPX, 39=DFHZOPX, 40=DFHZOPX, 41=DFHZOPX, 42=DFHZOPX, 43=DFHZOPX, 44=DFHZOPX, 45=DFHZOPX}*

DFHZC3455 E *date time applid termid tranid* **Session initiation failure. Bind response from node** *netname* **contains an invalid session qualifier pair.** *sense* **((***instance***) Module name: {DFHZOPX})**

Explanation: A remote secondary's response to a negotiable bind contained an invalid session qualifier pair in the user data field. Either it had an invalid format, or the primary SQ had been altered.

For the meaning of the sense data, see the explanation on page 678.

System Action: Session initialization fails. The sent and received bind images are printed on the CSNE log.

User Response: Correct the error in the remote system. If there is an invalid format, change it to LEN PSQ LEN SSQ.

Destination: CSNE

Module: DFHZOPX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPX, 2=DFHZOPX, 3=DFHZOPX}*

DFHZC3456 E *date time applid termid tranid* **No outboard formats loaded.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: An outboard format has been referenced, but no outboard formats are loaded on this logical unit.

System Action: Transaction *tranid* is abnormally terminated with a transaction dump.

User Response: Load the necessary outboard formats.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3457 E *date time applid termid tranid* **Requested outboard format not loaded.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: An outboard format has been referenced, but the requested format is not loaded on this logical unit.

For the meaning of the sense data, see the explanation on page 678.

System Action: Transaction *tranid* is abnormally terminated with a transaction dump.

User Response: Load the requested outboard format.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3458 E *date time applid termid tranid* **Requested format group not loaded.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: An outbound format group has been referenced, but that format group is not loaded on this logical unit.

For the meaning of the sense data, see the explanation on page 678.

System Action: Transaction *tranid* is abnormally terminated with a transaction dump.

User Response: Load the required format group.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3459 E *date time applid termid tranid* **Unsupported data stream.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The data stream sent to the device contains control data for functions that the device does not support.

For the meaning of the sense data, see the explanation on page 678.

System Action: Transaction *tranid* is abnormally terminated.

User Response: Either ensure that transaction *tranid* is not run against the terminal, or change the terminal to one that supports the data stream.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3460 E *date time applid termid tranid* **Requested character set not present.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The Referenced Logical Character Set Identifier (LCID) specified in the define alternate character set is not known.

For the meaning of the sense data, see the explanation on page 678.

System Action: Transaction *tranid* is abnormally terminated with a transaction dump.

User Response: Ensure that the character set referenced by the LCID is loaded.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3461 I *date time applid termid tranid* **Node** *netname* **session started.** *sense* **((***instance***) Module name: {DFHZEV1 | DFHZEV2 | DFHZOPX})**

Explanation: CICS has successfully issued or received a bind to the node *netname*.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: None.

Destination: CSNE

Modules: DFHZOPX, DFHZEV1, DFHZEV2

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPX, 2=DFHZOPX, 3=DFHZEV1, 4=DFHZEV2}*

DFHZC3462 I *date time applid termid tranid* **Node** *netname* **session terminated.** *sense* **((***instance***) Module name: {DFHZCLS})**

Explanation: A session with node *netname* has been closed.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: None.

Destination: CSNE

Module: DFHZCLS

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZCLS, 2=DFHZCLS}*

DFHZC3463 I *date time applid* **VTAM ACB opened. VTAM Return Code =** *X'rc'***. Time =** *time sense* **((***instance***) Module name: {DFHZOPA})**

Explanation: The master terminal operator issued a CEMT or CSMT command to open the VTAM ACB.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: This depends on the return code:

- If the value is zero, VTAM sessions can be enabled.
- If the value is 1, this is not a VTAM return code. It is inserted by DFHZOPA if a VTAM OPEN is received when the ACB is already open.
- If the return code is some other value, the operation has failed. See the section on *Open Macroinstructions* in the *VTAM Programming* manual to determine why the VTAM ACB was not opened.

Destination: CSNE

Module: DFHZOPA

XMEOUT Parameters: *date, time, applid, X'rc', time, sense, instance, {1=DFHZOPA}*

DFHZC3464 I *date time applid termid tranid* **Node** *netname* **released by MT Operator/LU Services Manager.** *sense* **((***instance***) Module name: {DFHZSTU})**

Explanation: The master terminal operator issued a CEMT command to release the logical unit (LU).

For the meaning of the sense data, see the explanation on page 678.

System Action: The LU is closed. Any task associated with the LU is terminated either abnormally (if the master terminal operator so desired) or normally.

User Response: None.

Destination: CSNE

Module: DFHZSTU

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZSTU}*

DFHZC3465 E *date time applid termid tranid* **Unexpected response received.** *sense* **((***instance***) Module name: {DFHZRAC | DFHZRLP | DFHZRVX})**

Explanation: CICS received a positive response in one of the following circumstances:

- The response was to data sent with exception response
- The response was to a command sent with exception response
- The response was to a send to which a response has already been sent.

For the meaning of the sense data, see the explanation on page 678.

System Action: All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to CSNE.

User Response: Ensure that the application programs running concurrently do not alter the TCTTE. Check that the SNA flows on the session are valid and that the logical unit is not violating SNA protocols.

Destination: CSNE

Modules: DFHZRVX, DFHZRAC, DFHZRLP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRVX, 3=DFHZRVX, 4=DFHZRVX, 5=DFHZRVX, 6=DFHZRAC, 7=DFHZRAC, 8=DFHZRAC, 9=DFHZRAC, 10=DFHZRAC, 11=DFHZRAC, 12=DFHZRAC}*

DFHZC3466 E *date time applid termid tranid* **Out of session during session start up .***sense* **((***instance***) Module name: {DFHZSEX | DFHZSKR})**

Explanation: A CICS master terminal command was used to put terminal *termid* out of service while session startup was taking place.

For the meaning of the sense data, see the explanation on page 678.

System Action: The session is terminated and the TCTTE for terminal *termid* is left out of service.

User Response: To establish the session for use, the master terminal operator should issue the command CEMT SET TER (*XXXX*) INS ACQ. This puts the terminal back in service, and start up the session for use.

Destination: CSNE

Modules: DFHZSEX, DFHZSKR

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSEX, 2=DFHZSKR}*

DFHZC3467 E *date time applid termid tranid* **Permanent insufficient resource.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation: The PS buffer resource required by load PS is not available.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Look at the CSNE log. A second message with a sense received code of 084C should have been issued. Refer to this message in the *VTAM Programming* manual for full details.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3468 E *date time applid termid tranid* **CLEAR command received.** *sense* **((***instance***) Module name: {DFHZSCX})**

Explanation: An SNA clear command was received by the node. The other end of the session was unable to handle the current requests for some reason, and purged any outstanding messages on the session.

For the meaning of the sense data, see the explanation on page 678.

System Action: The session is canceled immediately, and any transaction executing on that session is also abnormally terminated and a transaction dump is produced.

User Response: Check the other end of the session to determine why the clear command was sent. It may be due to a lack of buffers in the VTAM region attached to the other session.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHZC3469 E *date time applid termid tranid* **Session re-establishment being awaited.** *sense* **((***instance***) Module name: {DFHZSCX})**

Explanation: The secondary LU is being passed to a new application program via CLSDST(PASS).

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump.

User Response: None.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHZC3470 E *date time applid termid tranid* **LU session failure caused by:** *{restart/takeover. LU does not support ACTLU(ERP). | route extension to cluster failed. | LU abend, discontact, DACTPU or ANS. }sense* **((***instance***) Module name: {DFHZSCX})**

Explanation: An LU session has failed because an UNBIND command has been received.

Possible reasons are:

- Restart or takeover. LU does not support ACTLU(ERP)
- Route extension to cluster failed
- Session failed due to LU abend, disconnect, DACTPU, or ANS.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump.

User Response: Use the symptom string, a VTAM trace, and the dump, if available, to determine the source of the UNBIND before attempting to reestablish the session.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, {1=restart/takeover. LU does not support ACTLU(ERP)., 2=route extension to cluster failed., 3=LU abend, discontact, DACTPU or ANS. }, sense, instance, {1=DFHZSCX, 2=DFHZSCX, 3=DFHZSCX, 4=DFHZSCX}*

DFHZC3471 E *date time applid termid tranid* **Virtual route inoperative.** *sense* **((***instance***) Module name: {DFHZSCX})**

Explanation: The session has been broken because the virtual route it was using has failed.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. For APPC sessions, CICS attempts to reestablish the failing session.

User Response: None.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHZC3472 E *date time applid termid tranid* **Device end received.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: Device end was received from a non-SNA VTAM supported 3270

For the meaning of the sense data, see the explanation on page 678.

System Action: The good morning message is displayed, unless the terminal is associated with an active task.

User Response: None.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSYX}*

DFHZC3474 E *date time applid termid tranid* **Virtual route deactivated.** *sense* **((***instance***) Module name: {DFHZSCX})**

Explanation: The session has had to be deactivated because of a forced deactivation of the virtual route being used.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. Afterwards CICS attempts to reestablish the session.

User Response: Determine the cause of the session failure and attempt to reestablish the session.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHZC3475 E *date time applid termid tranid* **Unrecoverable LU failure.** *sense* **((***instance***) Module name: {DFHZSCX})**

Explanation: The session has had to be deactivated because of an abnormal termination of an LU.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. Session reinitiation is not attempted.

User Response: None.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHZC3476 E *date time applid termid tranid* **Recoverable LU failure.** *sense* **((***instance***) Module name: {DFHZSCX})**

Explanation: The session has had to be deactivated because of an abnormal termination of an LU; recovery of the session may be possible.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. CICS attempts to reinitiate the session.

User Response: None.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHZC3477 E *date time applid termid tranid* **Cleanup received.** *sense* **((***instance***) Module name: {DFHZSCX})**

Explanation: The sending LU has reset its half-session before receiving a response from CICS; recovery of the session may be possible.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a task is attached, it is abnormally terminated with a transaction dump. CICS attempts to reinitiate the session.

User Response: None.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX}*

DFHZC3479 E *date time applid termid tranid* **Unbind received after session failure detected.** *sense* **((***instance***) Module name: {DFHZSCX})**

Explanation: The logical unit in session with CICS has detected a session failure, and has unbound the session with CICS.

For the meaning of the sense data, see the explanation on page 678.

System Action: The session is terminated, and the transaction using it is abnormally terminated or informed by return code.

User Response: Determine the reason for the session failure by using Trace. Check the CSNE log for a second error message associated with DFHZC3479. This message should be located immediately after DFHZC3479.

Refer to the sense code shown in the associated message.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSCX, 2=DFHZSCX}*

DFHZC3480 E *date time applid termid tranid* **Session could not be started due to insufficient CICS nucleus function - ISC not loaded.** *sense* **((***instance***) Module name: {DFHZBLX | DFHZLGX | DFHZSIM})**

Explanation: A session initiation has been attempted to an APPC system or terminal. The session cannot be established because the CICS ISC nucleus modules are required.

For the meaning of the sense data, see the explanation on page 678.

System Action: The session initiation request is rejected.

User Response: If APPC connections are to be used, ensure that ISC=NO is not used for CICS initialization.

Destination: CSNE

Modules: DFHZSCX, DFHZLGX, DFHZSIM

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSIM, 2=DFHZBLX, 3=DFHZLGX}*

DFHZC3481 E *date time applid termid tranid* **3270 Data Stream protocol error.** *sense* **((***instance***) Module name: {DFHZRAC | DFHZRVX})**

Explanation: CICS has received zero length data from a device defined in the TCT as a 3270 terminal. This violates the protocol for 3270 devices.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS cancels the session and any transactions attached to the terminal.

User Response: Determine why zero length data was received from a device purporting to be a 3270 terminal, and correct the error.

The most likely reasons are an incorrect TCT definition for the terminal, or incorrect programming of a terminal that is simulating 3270 protocols.

Destination: CSNE

Modules: DFHZRAC, DFHZRVX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVX, 2=DFHZRAC}*

DFHZC3482 E *date time applid tranid* **Logon from node** *nodeid* **rejected. Insufficient storage for autoinstall request.** *sense* **((***instance***) Module name: {DFHZBLX | DFHZLGX | DFHZSCX})**

Explanation: A node *nodeid*, unknown to CICS, attempted to logon. CICS could not obtain sufficient storage to complete autoinstall processing.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the logon request.

User Response: Retry the logon.

Destination: CSNE

Modules: DFHZLGX, DFHZSCX, DFHZBLX

XMEOUT Parameters: *date, time, applid, tranid, nodeid, sense, instance, {1=DFHZLGX, 2=DFHZLGX, 3=DFHZBLX, 4=DFHZSCX}*

DFHZC3484 I *date time applid netname* **is now connected to** *applid. sense* **((***instance***) Module name: {DFHZNSP})**

Explanation: By successful execution of an ISSUE PASS command, a VTAM logical unit whose network name is *netname* has been passed to the VTAM application whose VTAM APPLID (netname) is *applid*.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS processing continues.

User Response: None.

Destination: CSNE

Module: DFHZNSP

XMEOUT Parameters: *date, time, applid, netname, applid, sense, instance, {1=DFHZNSP}*

DFHZC3485 E *date time applid netname* **A CLSDST Pass Procedure error occurred at** *applid.* **Status byte** *xx* **Reason byte** *yy.sense* **((***instance***) Module name: {DFHZNSP})**

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of a VTAM logical unit whose network name is *netname*, to a system whose VTAM APPLID is *applid*. VTAM has notified CICS of an error at *applid*.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS saves the status byte *xx* and reason byte *yy* passed by VTAM in the Notify Request Unit. CICS processing continues.

User Response: The reason for the error can be determined by investigating the status byte *xx* and reason byte *yy* given in the message. These bytes are documented in the NSEXIT routine section of *VTAM Programming* (SC23-0115).

Destination: CSNE

Module: DFHZNSP

XMEOUT Parameters: *date, time, applid, netname, applid, xx, yy, sense, instance, {1=DFHZNSP}*

DFHZC3486 E *date time applid netname* **The named LU cannot be connected for sessions at** *applid***.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of a VTAM logical unit whose network name is *netname*, to a system whose VTAM APPLID is *applid*. VTAM has notified CICS that *applid* is currently not available.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: None.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, netname, applid, sense, instance, {1=DFHZSYX, 2=DFHZSYX}*

DFHZC3487 E *date time applid netname* **Unable to PASS to node** *nodeid***. CLSDST PASS is not authorized.** *sense* **((***instance***) Module name: {DFHZLEX})**

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of a VTAM logical unit whose network name is *netname*. VTAM has notified CICS that CICS is not authorized to use this function.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS continues.

CICS may or may not be able to display the *applid* it was being passed. If CICS can display this *applid*, it appears in the text of this message.

User Response: To use the ISSUE PASS command, you must code AUTH=PASS on the VTAM definition of the CICS APPL, then reactivate the APPL.

Destination: CSNE

Module: DFHZLEX

XMEOUT Parameters: *date, time, applid, netname, nodeid, sense, instance, {1=DFHZLEX, 2=DFHZLEX}*

DFHZC3488 E *date time applid netname* **ISC session connection failure.** *sense* **((***instance***) Module name: {DFHZSIX})**

Explanation: A simlogon request to an ISC system was rejected because the *netname* was not known. CICS has now issued the INQUIRE OPTCD=USERVAR command in order to determine if *netname* had been defined as a user variable. That INQUIRE command has been rejected because the user variable does not exist in the USERVAR table. This may be because the USERVAR is either not known or invalid, or the MODIFY USERVAR command has not been issued to define the user variable.

For the meaning of the sense data, see the explanation on page 678.

System Action: CLSDST is issued to reset the session.

User Response: Determine if the netname has been defined correctly to CICS. If the netname is to be used as a user variable then determine why the MODIFY USERVAR command has not been issued to set it.

Destination: CSNE

Module: DFHZSIX

XMEOUT Parameters: *date, time, applid, netname, sense, instance, {1=DFHZSIX}*

DFHZC3489 E *date time applid netname* **The LU is inhibited for sessions.** *sense* **((***instance***) Module name: {DFHZSYX})**

Explanation: CICS has attempted to acquire a session to the logical unit (LU), but VTAM has rejected the request because the LU is inhibited for sessions.

The partner LU could be inhibited because it has issued the VTAM macro SETLOGON OPTCD=QUIESCE.

For the meaning of the sense data, see the explanation on page 678.

System Action: The request is rejected and the session is set into NOINTLOG state to prevent further requests being issued.

User Response: After the partner LU has enabled itself, it can initiate the session request to CICS. Alternatively, the CICS master terminal operator could reset the NOINTLOG state and allow CICS to initiate the session request.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, netname, sense, instance, {1=DFHZSYX}*

DFHZC3490 E *date time applid netname* **Unable to pass to node** *nodeid***.** *sense* **((***instance***) Module name: {DFHZCLX | DFHZLEX | DFHZSYX})**

Explanation: In executing an ISSUE PASS command, CICS attempted to pass control of the named VTAM logical unit to a system identified as node *nodeid*. VTAM has notified CICS that this request has failed.

This may occur if the LUNAME specified is a generic resource name and this CICS is the only system registered under this name. You are effectively passing the terminal to yourself.

However, if there is more than one CICS registered under the generic resource name, the terminal should pass successfully to another member (chosen by VTAM) in the same resource.

For the meaning of the sense data, see the explanation on page 678.

System Action: A VTAM CLSDST macro is issued to halt communication with the node.

User Response: Ensure that the node *nodeid* is defined and active to VTAM.

Destination: CSNE

Modules: DFHZSYX, DFHZLEX, DFHZCLX

XMEOUT Parameters: *date, time, applid, netname, nodeid, sense, instance, {1=DFHZLEX, 2=DFHZSYX, 3=DFHZCLX}*

DFHZC3491 E *date time applid netname* **Unable to make session XRF capable.** *sense* **((***instance***) Module name: {DFHZLEX})**

Explanation: The active CICS system has attempted to OPNDST the session as "XRF capable", but has been refused because the Network Control Program (NCP) has insufficient space to hold the control blocks for a future backup session from the alternate CICS system.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS performs a SIMLOGON, but does not deem the session to be "XRF capable". CICS therefore treats the terminal as class 2.

User Response: No immediate action is necessary. You may need to increase the number of buffers in the NCP.

Destination: CSNE

Module: DFHZLEX

XMEOUT Parameters: *date, time, applid, netname, sense, instance, {1=DFHZLEX}*

DFHZC3492 E *date time applid tranid* **Logon for node** *nodeid* **contained invalid NIBUSER token.** *sense* **((***instance***) Module name: {DFHZLGX})**

Explanation: DFHZLGX has been driven for SIMLOGON with a token that is no longer a valid TCTTE address.

For the meaning of the sense data, see the explanation on page 678.

System Action: An unexpected condition has occurred during SIMLOGON. CICS will continue processing normally.

User Response: None.

Destination: CSNE

Module: DFHZLGX

XMEOUT Parameters: *date, time, applid, tranid, nodeid, sense, instance, {1=DFHZLGX}*

DFHZC3493 E *date time applid termid tranid* **Invalid device type for a print request.** *sense* **((***instance***) Module name : {DFHZARQ})**

Explanation: A print function was requested on a 3270 information display system. However, the print function was unable to find an eligible printer because the function does not support the device type.

For the meaning of the sense data, see the explanation on page 678.

System Action: If no other action is specified in the Network Error Program (NEP). the print request is halted. CICS processing continues.

User Response: Check that the printers specified for the information display system are valid. Valid devices are 3270P and LUTYPE3.

Destination: CSNE

Module: DFHZARQ

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARQ}*

DFHZC3494 E *date time applid termid tranid* **Request error** *sense* **((***instance***) Module name : {DFHZNAC})**

Explanation: The request unit (RU) received by the secondary logical unit (LU) contains a request which terminal *termid* cannot handle.

For the meaning of the sense data, see the explanation on page 678.

System Action: All send and receive requests are purged and transaction *tranid* is abnormally terminated with a dump.

User Response: Check that the TYPETERM specifications for terminal *termid* are valid. This error could occur if, for example, QUERY was sent to a nonqueriable 3270 defined with QUERY=COLD]ALL.

Destination: CSNE

Module: DFHZSYX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZNAC}*

DFHZC3495 E *date time applid* **Logon occurred for terminal with netname** *netname* **before Notify received** *sense* **((***instance***) Module name : {DFHZLGX})**

Explanation: A terminal with netname *netname* has logged on before a NOTIFY request was received for an outstanding CLSDST PASS with CLSDST=NOTIFY.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS processing continues. Any subsequent NOTIFY requests for the terminal identified will be ignored.

User Response: It is recommended that any user processing for CLSDST PASS messages incorporates this message.

Destination: CSNE

Module: DFHZLGX

XMEOUT Parameters: *date, time, applid, netname, sense, instance, {1=DFHZLGX}*

DFHZC3496 E *date time applid* **System dump has been taken for terminal** *termid* **((***instance***) Module name: {DFHZNAC})**

Explanation: Terminal *termid* has been found to be in error by terminal control.

As terminal *termid* had no task attached to it at the time of the error, DFHZNAC was unable to cause a transaction abend with a transaction dump.

The TWAODNTA flag in the DFHZNAC-DFHZNEP commarea is set ON and DFHZNAC produces a system dump for terminal *termid* instead.

System Action: An exception trace entry is made in the trace table at trace point FC73.

A system dump is produced unless you have specifically suppressed dumps in the dump table.

User Response: To determine the nature of the problem that caused the dump to be taken, refer to the CSNE log. There should be an associated CICS message which will provide further information.

For more information about TWAODNTA, refer to the *CICS Customization Guide*.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, termid, instance, {1=DFHZNAC}*

DFHZC3497 E *date time applid* **Link to module DFHZNEP from DFHZNAC failed because** *{module DFHZNEP is not AMODE 31. | module DFHZNEP could not be loaded. | module DFHZNEP could not be autoinstalled. | of an unexpected error.}* **((***instance***) Module name: {DFHZNAC})**

Explanation: While processing an error for a VTAM terminal, CICS attempted to link to user-replaceable module DFHZNEP. The link failed.

See message DFHZC3437 for the default action or actions taken.

System Action: The default action or actions set by DFHZNAC are taken.

User Response: The reason for the failure is specified in the message. Possible solutions are:

- Ensure that DFHZNEP is linked with AMODE 31.
- Ensure that DFHZNEP is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
- Ensure that there is a valid entry for DFHZNEP in the PPT, and that DFHZNEP can be successfully autoinstalled.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, {1=module DFHZNEP is not AMODE 31., 2=module DFHZNEP could not be loaded., 3=module DFHZNEP could not be autoinstalled., 4=of an unexpected error.}, instance, {1=DFHZNAC}*

DFHZC3498 E *date time applid* **Abend** *abcode* **has occurred in module DFHZNEP. ((***instance***) Module name: {DFHZNAC})**

Explanation: While processing an error for a VTAM terminal, user-replaceable module DFHZNEP was linked and the program abended with abend code *abcode*. See message DFHZC3437 for the default action or actions that are taken.

System Action: Control is passed back to the calling module, DFHZNAC. DFHZNAC reinstates the default actions set before DFHZNEP was called. The actions are then taken.

User Response: Refer to abend code *abcode* for details of the original error. Follow the user response given in the abend code to solve the problem.

Destination: CSNE

Module: DFHZNAC

XMEOUT Parameters: *date, time, applid, abcode, instance, {1=DFHZNAC}*

DFHZC3499 E *date time applid* **OS Getmain failure in module DFH***modname* **with return code** *X'return_code'* **while attempting to process message DFHZC***message_number***.** *sense* **((***instance***) Module name: {DFHZATA | DFHZLEX | DFHZLGX | DFHZRAC | DFHZSCX | DFHZSHU | DFHZSYX | DFHZTPX})**

Explanation: An error has been detected by module *modname*. The OS GETMAIN request by this module has failed with return code X'*return_code*', and as a result, the diagnostic information relating to the original error has not been saved and cannot be processed by DFHZNAC.

The only information available for diagnosis of the error is *message_number* which is the number of the message that would have been issued had the OS GETMAIN request not failed.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues normally.

User Response: Refer to message *message_number* for further guidance.

Refer to the *MVS System Programming Library: Macro Reference* for the meaning of the OS GETMAIN return code.

Destination: CSNE

Modules: DFHZATA, DFHZLGX, DFHZRAC, DFHZSCX, DFHZSHU, DFHZTPX, DFHZLEX, DFHZSYX

XMEOUT Parameters: *date, time, applid, modname, X'return_code', message_number, sense, instance, {1=DFHZLEX, 2=DFHZSHU, 3=DFHZSCX, 4=DFHZSCX, 5=DFHZSYX, 6=DFHZSYX, 7=DFHZTPX, 8=DFHZRAC, 9=DFHZRAC, 10=DFHZATA, 11=DFHZLGX, 12=DFHZLGX}*

DFHZC4900 I *date time applid termid tranid* **CNOS** *{sent to | received from}* **Node** *netname* **System** *sysid* **Modename** *modename***, Max =** *n1***, Win=***n2***,** *{race detected | successful | values amended | modename not recognized | modename closed}***. ((***instance***) Module name: {DFHZGCN})**

Explanation: A CHANGE-NUMBER-OF-SESSIONS command has been sent or received. The inserts are identified as follows:

- *sysid* is the system identifier.
- *modename* is the modename.
- *n1* is the maximum session count.
- *n2* is the maximum source contention winner sessions.

If the “values amended” option is displayed, the values of the *n1* (maximum session count) and *n2* (maximum source contention winner sessions) have been renegotiated by the target system.

If the “race detected” option is displayed, the CNOS command could not be implemented because the modename *modename* was already locked for a CNOS command from the other system.

System Action: The negotiated values are applied.

User Response: None.

Destination: CSNE

Module: DFHZGCN

XMEOUT Parameters: *date, time, applid, termid, tranid, {1=sent to, 2=received from}, netname, sysid, modename, n1, n2, {1=race detected, 2=successful, 3=values amended, 4=modename not recognized, 5=modename closed}, instance, {1=DFHZGCN}*

DFHZC4901 I *date time applid termid tranid* **Node** *netname* **System** *sysid* **Modename** *modename***, Negotiated values: Max=***n1***, Win=***n2***. ((***instance***) Module name: {DFHZGCN})**

Explanation:

- *modename* is the modename,
- *n1* is the maximum session count,
- *n2* is the maximum source contention winner sessions.

This message follows message DFHZC4900 when the maximum session count (*n1*) and the maximum source contention winner sessions (*n2*) have been renegotiated.

System Action: The negotiated values are applied.

User Response: None.

Destination: CSNE

Module: DFHZGCN

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sysid, modename, n1, n2, instance, {1=DFHZGCN}*

DFHZC4902 E *date time applid termid tranid* **Attach FMH or subfield length error.** *sense* **((***instance***) Module name: {DFHZATT})**

Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the function management header (FMH) length or in the length of one of the subfields. As a result, CICS is unable to determine which task to attach.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated with a dump.

User Response: The remote APPC system is sending an invalid attach header (FMH type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Destination: CSNE

Module: DFHZATT

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZATT, 2=DFHZATT, 3=DFHZATT, 4=DFHZATT, 5=DFHZATT, 6=DFHZATT, 7=DFHZATT}*

DFHZC4903 E *date time applid termid tranid* **Attach FMH not found.** *sense* **((***instance***) Module name: {DFHZATT})**

Explanation: A request to attach a task has been received across an APPC link. However, no APPC attach header has been found at the start of the input data stream.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated with a dump.

User Response: The remote APPC system is failing to send a valid attach header (FMH type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Destination: CSNE

Module: DFHZATT

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZATT, 2=DFHZATT}*

DFHZC4904 E *date time applid termid tranid* **Bracket FSM error.** *sense* **((***instance***) Module name: {DFHZRAC | DFHZRLP | DFHZSDL | DFHZSLX})**

Explanation: The bracket finite state machine (FSM) has reported an error in the use of APPC bracket protocols.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If this message occurs after a persistent sessions restart, look for associated messages for more guidance. The problem might be temporary.

If this message occurs during normal system execution, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHZRAC, DFHZRLP, DFHZSDL, DFHZSLX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP, 3=DFHZRLP, 4=DFHZRLP, 5=DFHZSDL, 6=DFHZSDL, 7=DFHZSLX, 8=DFHZSLX, 9=DFHZSLX, 10=DFHZSLX, 11=DFHZSLX, 12=DFHZSLX, 13=DFHZRAC, 14=DFHZRAC, 15=DFHZRAC}*

DFHZC4905 E *date time applid termid tranid* **Chain FSM error.** *sense* **((***instance***) Module name: {DFHZDET | DFHZERH | DFHZRAC | DFHZRLP | DFHZSDL | DFHZSLX})**

Explanation: The chain finite state machine (FSM) has reported an error in the use of APPC chaining protocols.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If this message occurs after a persistent sessions restart, look for associated messages for more guidance. The problem might be temporary.

If this message occurs during normal system execution, investigate any transactions running on the session at the time of failure because the error can be caused by using both the LAST and WAIT options on an EXEC CICS SEND command in an APPC DTP application. This combination of parameters is not recommended. See the *CICS Distributed Transaction Programming Guide* for more information. If this is not the cause of the problem, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

DFHZC4910 E *date time applid termid tranid* **Receive buffer too small.** *sense* **((***instance***) Module name: {DFHZRVL})**

Explanation: The receive buffer passed to DFHRVL is too small to accommodate a maximum size request unit.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task will be abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Module: DFHZRVL

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRVL, 2=DFHZRVL, 3=DFHZRVL, 4=DFHZRVL}*

DFHZC4911 E *date time applid termid tranid* **LU6.2 exception response received.** *sense* **((***instance***) Module name: {DFHZRLP})**

Explanation: A non-process-level exception response has been received.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated with a dump.

User Response: Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. Try to recreate the error by running a VTAM trace TYPE=IO/BUF to obtain complete details of the line flow.

Destination: CSNE

Module: DFHZRLP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP}*

DFHZC4912 E *date time applid termid tranid* **BID received with invalid DFC indicators.** *sense* **((***instance***) Module name: {DFHZRAC | DFHZRLP})**

Explanation: BID with data received, but not OIC.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated.

User Response: Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Destination: CSNE

Modules: DFHZRAC, DFHZRLP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRAC, 3=DFHZRAC}*

DFHZC4913 E *date time applid termid tranid* **BID with data received with invalid DFC indicators.** *sense* **((***instance***) Module name: {DFHZRLP})**

Explanation: A BID with data was received in an invalid state for rejection.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated.

User Response: Incorrect flows have been received on an APPC session. The CICS trace gives further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Destination: CSNE

Module: DFHZRLP

DFHZC4916 E *date time applid termid tranid* **Send response failed.** *sense* **((***instance***) Module name: {DFHZRLP})**

Explanation: A response, sent to acknowledge successful receipt of data, was rejected by VTAM.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Module: DFHZRLP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP}*

DFHZC4917 E *date time applid termid tranid* **BIS received with invalid DFC indicators.** *sense* **((***instance***) Module name: {DFHZRLP})**

Explanation: Bracket initiation stopped (BIS) received with invalid DFC flags.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated.

User Response: Incorrect flows have been received on an APPC session. The CICS trace will give further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Destination: CSNE

Module: DFHZRLP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP}*

DFHZC4918 E *date time applid termid tranid* **Unexpected response received.** *sense* **((***instance***) Module name: {DFHZRLP})**

Explanation: An unexpected response was received that was either a positive response to data of a previous bracket, or a response to a command that cannot be accepted when the logical unit is in “continue specific” mode.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated.

User Response: Incorrect flows have been received on a APPC session. The CICS trace will give further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

Destination: CSNE

Module: DFHZRLP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRLP, 2=DFHZRLP, 3=DFHZRLP, 4=DFHZRLP, 5=DFHZRLP}*

DFHZC4919 E *date time applid termid tranid* **Invalid indicators received.** *sense* **((***instance***) Module name: {DFHZARER | DFHZARL})**

Explanation: An indicator other than CD, CEB, RQD2, or error response has been received.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHZARL, DFHZARER, DFHZARL

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARL, 2=DFHZARL, 3=DFHZARL, 4=DFHZARL, 5=DFHZARER}*

DFHZC4920 E *date time applid termid tranid* **Invalid data received.** *sense* **((***instance***) Module name: {DFHZARER | DFHZARL | DFHZERH})**

Explanation: Data received from the remote system or terminal is not in correct generalized data stream (GDS) format.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated with a dump.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Modules: DFHZARL, DFHZARER, DFHZERH

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZERH, 2=DFHZERH, 3=DFHZERH, 4=DFHZERH, 5=DFHZERH, 6=DFHZERH, 7=DFHZARL, 8=DFHZARL, 9=DFHZARL, 10=DFHZARER, 11=DFHZARER, 12=DFHZARER}*

DFHZC4921 E *date time applid sysid* **LU services manager failure. R15 =***X'xxxxx'* **R0 =***X'yyyyy'*

Explanation: An error situation has been detected during the operation of the LU services manager transaction program (DFHLUP).

Registers 15 and 0 are set to indicate the nature of the error as shown below:

```
Register 15 = X'0'   Task invalidly started ...
  Register 0 = X'3'   ... via a perm transid.
  Register 0 = X'4'   ... by a TD trigger.
  Register 0 = X'5'   ... without data.
  Register 0 = >X'6'   ... or is out of range of
                       a valid start code for this service.

Register 15 = X'4'   Call code did not match a
                     supported function (1-5).
 Register 0 = call code

Register 15 = X'8'   Invalid parameters passed
                     for this function.
 Register 0 = keyword #

Register 15 = X'0C'  Function-specific checks
                     failed for this keyword.
 Register 0 = keyword #

Register 15 = X'10'  No input data supplied.
 Register 0 = ¬0     The IC_GET for the TS START
                     data failed.
 Register 0 = X'0'   The LUTYPE6.2 RECEIVE
                     returned data
                     length=0.

Register 15 = X'14'  The GDS-ID is not for XLN.
 Register 0 = GDS-ID
```

System Action: The task is allowed to complete but the required function is not executed.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: If one of the errors mentioned above has occurred, try to discover the reason for the failure. If you fail in this, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Module: DFHLUP

XMEOUT Parameters: *date, time, applid, sysid, X'xxxxx', X'yyyyy'*

DFHZC4922 E *date time applid termid tranid* **Single session shutdown with DRAIN=CLOSE.** *sense* **((***instance***) Module name: {DFHZERH | DFHZGDA | DFHZRAC})**

Explanation: The connected logical unit has sent Bracket Initiation Stopped (BIS) and can accept no more work.

For the meaning of the sense data, see the explanation on page 678.

System Action: If a conversation was active, it is treated as though rollback had occurred on it for full syncpoint (syncpoint level 2), or as session failure for confirm-level syncpoint (syncpoint level 1).

If there was no conversation, it is treated as a BID failure (as for 0813 sense code).

User Response: None.

Destination: CSNE

Modules: DFHZRAC, DFHZGDA, DFHZERH

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZGDA, 3=DFHZERH}*

DFHZC4923 I *date time applid termid tranid* **Conversation abnormally terminated by transaction end in system** *sysid*

Explanation: Transaction *tranid*, engaged in an SNA session with a CICS system, issued a command that was inconsistent with the transaction's current state in the conversation.

System Action: The conversation terminates and CICS sends this message to the connected logical unit at the nonfailing end of the conversation.

The application in system *sysid* abnormally terminates with an abend.

User Response: Correct the application program. To find the command in error, use the state diagrams in the *CICS Intercommunication Guide*.

Destination: CSMT

Module: DFHZARL

XMEOUT Parameters: *date, time, applid, termid, tranid, sysid*

DFHZC4924 E *date time applid termid tranid* **Bind security password missing or invalid.** *sense* **((***instance***) Module name: {DFHZBLX | DFHZOPX | DFHZSCX})**

Explanation: Bind-time security data sent to CICS by its partner LU is missing or invalid. CICS's password for the partner LU system differs from the partner's password for CICS. This can be caused by an attempt to sign on to CICS by an unauthorized user.

For the meaning of the sense data, see the explanation on page 678.

System Action: The bind is rejected.

User Response: Check that an unauthorized user has not tried to log on to CICS. Ensure that the unsuccessful connection is correctly defined to CICS (using RDO or the DFHTCT macro) and to its partner LU system. Ensure that the security requirements are equal at both partners, that is, both have security off, or both have security on. A mismatch is one cause of this message.

Destination: CSNE

Modules: DFHZSCX, DFHZOPX, DFHZBLX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZOPX, 2=DFHZBLX, 3=DFHZBLX, 4=DFHZBLX, 5=DFHZBLX, 6=DFHZOPX, 7=DFHZOPX, 8=DFHZOPX, 9=DFHZOPX, 10=DFHZSCX}*

DFHZC4925 E *date time applid termid tranid* **Inconsistent attach security required.** *sense* **((***instance***) Module name: {DFHZOPN | DFHZOPX})**

Explanation: This message can be issued for any of the reasons listed below.

1. CICS has received a bind request specifying attach time security requirements different from those specified in the first bind.
2. CICS has received a bind requesting persistent verification.
3. CICS has received a bind which does not include an SNA functional management header (FMH12).

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: CICS does NOT allow subsequent binds to specify different security requirements from the first bind. It will not support persistent verification on input either.

Where applicable, alter your applications to meet these requirements.

Destination: CSNE

Modules: DFHZOPX, DFHZOPN

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZOPX, 2=DFHZOPN, 3=DFHZOPN, 4=DFHZOPX}*

DFHZC4926 E *date time applid termid tranid* **Bind security encryption error.** *sense* **((***instance***) Module name: {DFHZEV1 | DFHZEV2})**

Explanation: CICS detected an error while verifying an encrypted bind security password.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: Investigate the CSNE and CSMT logs.

Find out whether an unauthorized user tried to log on to CICS, or whether an authorized user entered his password incorrectly.

Destination: CSNE

Modules: DFHZEV1, DFHZEV2

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZEV1, 2=DFHZEV2, 3=DFHZEV1}*

DFHZC4927 E *date time applid termid tranid* **Bind FMH response error.** *sense* **((***instance***) Module name: {DFHZRAC})**

Explanation: CICS received a bind with bind security without an FMH12.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: This is an error either in CICS or in SNA. Keep the CSNE and CSMT logs. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZRAC, 2=DFHZRAC, 3=DFHZRAC, 4=DFHZRAC}*

DFHZC4928 E *date time applid termid tranid* **Bind security GETMAIN of a TIOA failed.** *sense* **((***instance***) Module name: {DFHZEV1})**

Explanation: CICS required a TIOA work area for bind security validation, but the GETMAIN failed because insufficient storage was available.

System Action: CICS rejects the bind.

User Response: Consider increasing the size of the CICS region or reducing the number of concurrent CICS tasks (MXT parameter in the system initialization table).

Destination: CSNE

Module: DFHZEV1

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZEV1}*

DFHZC4929 *date time applid termid tranid* **Invalid or unsupported BIND for logmode** *logmode*. **Response** *X'response'*, **Reason** *X'reason'* **((***instance***) Module:** *{DFHZOPN}***)**

Explanation: CICS has detected an error while validating the BIND supplied by VTAM for a CICS typeterm definition defined with LOGMODE=0 or LOGMODE=*logmode*.

The *response* code indicates:

X'04' The BIND supplied does not match the TCTTE – detected by DFHZBANS.

X'08' The BIND supplied is unsupported – detected by DFHZBANV.

X'0C' The BIND supplied is invalid – detected by DFHZBANV.

The *reason* code for a response of X'04' is as follows:

X'1B' Unsupported TCTTE type or not VTAM

X'1C' No NIB descriptor chained from TCTTE

X'1D' No BMS extension chained from TCTTE

X'1E' Same as for reason code X'1D'

X'1F' LU6.2 BIND, but TCTTE does not match.

The *reason* code for a response of X'08' or X'0C' is as follows:

Reason Hex	Invalid byte	Explanation
1	3	Should be hex 02, 03, 04 or 07
2-8	4|5|6|7	Invalid for this FM profile
9	2	Should be hex 00, 02, 03, 04, 07, 13 or 14
0A,0D,10	1	Invalid for LUTYPE 1,2 or 3 - must be hex 01
0B	4|5|6|7	Invalid for LUTYPE 1
0C	22	Invalid for LUTYPE 1
0E	4|5|6|7	Invalid for LUTYPE 2
0F	24	Invalid for LUTYPE 2 should be hex 00, 01, 02, 03, 7E, or 7F
11	4|5|6|7	Invalid for LUTYPE 3
12	24	Invalid for LUTYPE 3 should be hex 00, 01, 02, 03, 7E, or 7F
13	16	Invalid for LUTYPE 6.2
14	23	Invalid for LUTYPE 6.2
15-18	24	Invalid for LUTYPE 6.2
19	15	Should be hex 00 or 02
1A	14	Should be hex 00, 01, 02, 03, 06
1B and over	User Data	The reason code matches the byte position in the BIND for the error detected. These can be: - Session ID length unsupported - should be 3 to 11 - PLU/SLU name length unsupported - should be 2 to 19 - PLU/SLU defined twice - Length invalid - Session qualifier pairs have inconsistent lengths.

System Action: CICS rejects the logon request. The BIND being validated is printed with this message.

User Response: Use the response and reason codes and the printed BIND, together with the VTAM definition of the BIND for the relevant LOGMODE to determine the reason for the rejection.

Either change the logmode or use a different one that matches CICS requirements.

Destination: CSMT

Module: DFHZOPN

XMEOUT Parameters: *date, time, applid, termid, tranid, logmode, X'response', X'reason', instance, {1=DFHZOPN}*

DFHZC4930 E *date time applid termid tranid* **Session unbound following read timeout.** *sense* **((***instance***) Module name: {DFHZARER | DFHZARL})**

Explanation: A READ timeout has occurred on the SNA link. SNA unbinds the session and CICS returns control to the application program. This allows the program to override the system action (for example, the program could free the APPC session).

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS abends the task abnormally with a dump.

User Response: This is probably a network problem caused by a high level of network traffic. To avoid this problem, increase the Read Timeout (RTIMOUT) to a sufficiently high value to compensate for the level of network traffic. Alternatively, this problem may have arisen simply because the partner application failed to respond due to a programming error. If this is the case, correct the partner application and retry the request.

Destination: CSNE

Modules: DFHZARL, DFHZARER.

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARL, 2=DFHZARL, 3=DFHZARER}*

DFHZC4931 E *date time applid termid tranid* **VTAM detected bad logmode name.** *sense* **((***instance***) Module name: {DFHZLEX})**

Explanation: Either a MODENAME passed to VTAM during an attempt to bind an APPC session is not known to VTAM, or the logmode name of a VTAM 3270-type terminal is not valid.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS places the session permanently out of service and for APPC, the mode entry is flagged unusable.

User Response: Either redefine the sessions using a MODENAME that is known to VTAM, or add the MODENAME to the VTAM LOGMODE table. Alternatively, if the logmode name specified for a VTAM terminal is invalid, redefine the terminal entry using the correct name.

Destination: CSNE

Module: DFHZLEX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZLEX}*

DFHZC4932 E *date time applid termid tranid* **Invalid conversation type requested.** *sense* **((***instance***) Module name: {DFHZSUP})**

Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the conversation type field. It must be TYPE=MAPPED or TYPE=UNMAPPED.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abended and a dump is produced. The session is unbound.

User Response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Destination: CSNE

Module: DFHZSUP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSUP}*

DFHZC4933 E *date time applid termid tranid* **Invalid DBA requested.** *sense* **((***instance***) Module name: {DFHZSUP})**

Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the DBA field.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task abends and a dump is produced. The session is unbound.

User Response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Destination: CSNE

Module: DFHZSUP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSUP}*

DFHZC4934 E *date time applid termid tranid* **Invalid syncpoint level requested.** *sense* **((***instance***) Module name: {DFHZSUP})**

Explanation: A request to attach a task has been received across an APPC link. However, the synchronization level requested is invalid.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task abends and a dump is produced.

User Response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Check the sync level in the ATTACH header against that in the BIND.

Destination: CSNE

Module: DFHZSUP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSUP}*

DFHZC4935 E *date time applid termid tranid* **Invalid UOWID supplied.** *sense* **((***instance***) Module name: {DFHZSUP})**

Explanation: A request to attach a task has been received across an APPC link and either the unit of work ID is invalid, or no UOWID was received when the sync point level required it.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task abends and a dump is produced. The session is unbound.

User Response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Destination: CSNE

Module: DFHZSUP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSUP, 2=DFHZSUP, 3=DFHZSUP, 4=DFHZSUP, 5=DFHZSUP, 6=DFHZSUP}*

DFHZC4936 E *date time applid termid tranid* **Attach FMH or subfield length error.** *sense* **((***instance***) Module name: {DFHZSUP})**

Explanation: A request to attach a task has been received across an APPC link. However, there is an error in the FMH length or in the length of one of the sub-fields. This results in CICS being unable to determine which task to attach.

The instance *instance* is one of the following:

1 The FMH Length is not equal to the length of the fixed length portion + the length of all the sub fields.

2 The Conversation Correlator length within the FMH is greater than 8.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task abends and a dump is produced.

User Response: The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Destination: CSNE

Module: DFHZSUP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSUP, 2=DFHZSUP}*

DFHZC4937 E *date time applid* **SAF request for LU6.2 bind has been rejected. Return Codes from the Security Manager are: RF=** *X'rf'* **and R0=** *X'r0' sense* **((***instance***) Module name: {DFHZEV1 | DFHZEV2 | DFHZOPN})**

Explanation: A security authorization facility (SAF) request to extract APPC bind-time security information from the external security manager (ESM) has been rejected with return code RF=X'*rf*'. and RO=X'*r0*'.

This is due either to the ESM being inactive or to the appropriate APPC profile not being defined to the ESM.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return codes which may have been produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for the meaning of the return codes.

If the appropriate APPC profile had not been defined to the ESM, define the profile, perform a CICS security rebuild and then attempt to reestablish the APPC connection.

Destination: CSNE

Modules: DFHZEV1, DFHZEV2, DFHZOPN

XMEOUT Parameters: *date, time, applid, X'rf', X'r0', sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZOPN, 4=DFHZOPN, 5=DFHZOPN, 6=DFHZOPN, 7=DFHZOPN, 8=DFHZOPN, 9=DFHZEV1, 10=DFHZEV1, 11=DFHZEV1, 12=DFHZEV1, 13=DFHZEV2, 14=DFHZEV2, 15=DFHZEV2, 16=DFHZEV2}*

DFHZC4938 E *date time applid* **SAF request for LU6.2 bind has failed with ESM return code RF=** *X'rf'* **and reason code R0=** *X'r0' sense* **((***instance***) Module name: {DFHZEV1 | DFHZEV2 | DFHZOPN})**

Explanation: The external security manager (ESM) was attempting to process a security authorization facility (SAF) request. Processing has failed with return code RF=X'*rf*' and reason code R0=X'*r0*'.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return codes or reason codes produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for the meaning of the return code and the reason code.

Destination: CSNE

Modules: DFHZEV1, DFHZEV2, DFHZOPN

XMEOUT Parameters: *date, time, applid, X'rf', X'r0', sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZEV1, 4=DFHZEV2}*

DFHZC4939 E *date time applid* **Extraction of LU6.2 security data has failed with ESM returncode RF=** *X'rf'* **and reason code R0=** *X'r0' sense* **((***instance***) Module name: {DFHZEV1 | DFHZEV2 | DFHZOPN})**

Explanation: A request to extract APPC bind-time security information has failed with return code RF=X'*rf*' and reason code R0=X'*r0*'. The profile information which was requested had not been previously defined to the external security manager (ESM).

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: Check the profiles defined to the ESM. Create the missing APPC profile entry.

Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return codes or reason codes produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for the meaning of the return code and the reason code.

Destination: CSNE

Modules: DFHZEV1, DFHZEV2, DFHZOPN

XMEOUT Parameters: *date, time, applid, X'rf', X'r0', sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZEV1, 4=DFHZEV2}*

DFHZC4940 E *date time applid* **Bind time failure. No session key found in LU6.2 profile.** *sense* **((***instance***) Module name: {DFHZEV1 | DFHZEV2 | DFHZOPN})**

Explanation: APPC bind-time validation has failed. No session key has been found in the requested APPC profile information. When bind-time security has been defined between two logical units (LUs), a valid session key must have been defined for the encryption process. A null session key (that is, when no key is defined) is regarded as an error.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: Check the profiles defined to the external security manager (ESM). Create a valid session key for the appropriate APPC profile entry. DO NOT use the NOSESSKEY ESM option for XAPPC security profiles when using RACF.

Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return and reason codes which produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for the meaning of the return code and the reason code.

Destination: CSNE

Modules: DFHZEV1, DFHZEV2, DFHZOPN

XMEOUT Parameters: *date, time, applid, sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZEV1, 4=DFHZEV2}*

DFHZC4941 E *date time applid* **Bind time failure. LU6.2 profile locked.** *sense* **((***instance***) Module name: {DFHZEV1 | DFHZEV2 | DFHZOPN})**

Explanation: The external security manager (ESM) has requested profile information during bind-time validation but the requested profile is locked. When a profile is locked no sessions can be established.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: Check the profiles defined to the ESM. The system administrator may have locked the profile. Request that the profile be unlocked. Try once more when the profile has been unlocked.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for further information.

Destination: CSNE

Modules: DFHZEV1, DFHZEV2, DFHZOPN

XMEOUT Parameters: *date, time, applid, sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZEV1, 4=DFHZEV2}*

DFHZC4942 E *date time applid* **Bind time failure. Expired LU6.2 profile found.** *sense* **((***instance***) Module name: {DFHZEV1 | DFHZEV2 | DFHZOPN})**

Explanation: The external security manager (ESM) has requested profile information during bind-time validation but the requested profile has expired.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: Check the profiles defined to the ESM. The system administrator needs to update the required profile. Request that the profile be updated. Try once more when the profile has been updated.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the *System Programming Library RACF* manual for further information.

Destination: CSNE

Modules: DFHZEV1, DFHZEV2, DFHZOPN

XMEOUT Parameters: *date, time, applid, sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZEV1, 4=DFHZEV2}*

DFHZC4943 E *date time applid termid tranid* **RPL B FSM error.** *sense* **((***instance***) Module name: {DFHZSDL})**

Explanation: The finite state machine (FSM), for the APPC alternate RPL (RPL 'B'), has detected an error in the use of the RPL.

For the meaning of the sense data, see the explanation on page 678.

System Action: The task is abnormally terminated with abend code ATNI and a dump is produced.

User Response: If this message occurs when VTAM is terminating, it is not a serious problem and usually no response is necessary.

If this message occurs during normal system execution, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSNE

Module: DFHZSDL

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSDL}*

DFHZC4944 *date time applid termid tranid* **Protocol Violation detected within bind security indicators.** *sense* **((***instance***) MODULE NAME: {DFHZBLX | DFHZOPX})**

Explanation: CICS has detected an error while validating the bind security specification. LOCAL security has been specified, but the bind contains data that indicates NON LOCAL security.

For the meaning of the sense data, see the explanation on page 678.

System Action: CICS rejects the bind.

User Response: Ensure that the correct data is sent in the bind for the required type of security.

Destination: CSMT

Modules: DFHZSCX, DFHZOPX, DFHZBLX

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZBLX, 2=DFHZBLX, 3=DFHZOPX, 4=DFHZOPX}*

DFHZC4945 E *date time applid termid tranid* **Session unbind request due to the forcepurge of a task.** *sense* **((***instance***) Module name: {DFHZARER})**

Explanation: A task was purged or forcepurged while it was suspended, waiting for an ISC request to complete.

For the meaning of the sense data, see the explanation on page 678.

System Action: An unbind is requested for the session against which the ISC request was waiting and the task is abended A FORCEPURGE command causes the task to be abended irrespective of the state of the session. Other VTAM error messages may result from this action.

User Response: Investigate the reasons the task was purged or forcepurged because it may have been the result of an application error. In addition, the partner task in the connected CICS system will have session failure notification returned on the next ISC request after the session has been unbound. Check that the partner task has handled the situation.

Destination: CSNE

Module: DFHZARER

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZARER}*

DFHZC4946 E *date time applid termid tranid* **Invalid attach parameter was received.** *sense* **((***instance***) Module name: {DFHZSUP})**

Explanation: A request to attach a task has been received across an APPC link. However there is an error in the FMH attach parameters. An attach parameter is present that is not authorized by the bind security indicators.

The *sense* data can take the following values:

Sense	Meaning
1	The bind security indicators show that the connection is defined as ATTACHSEC(LOCAL) indicating that this LU does not accept any security parameters in an attach from the partner LU. One or more of the following security parameters has been found: Userid, Password, Profile, AV, PV1 and PV2.
2	An already-verified (AV) indicator has been received in an attach from the partner LU, but the bind security indicators show that this LU does not support the receipt of the AV indicator.
3	A persistent verification signon (PV2) indicator, or a persistent verification signed-on (PV1) indicator, has been received in an attach from the partner LU, but the bind security indicators show that this LU does not support the receipt of the PV indicators.

System Action: The task abends and a dump is produced and the session is unbound. An exception trace point (number 1737) for component TF is issued, tracing the invalid attach header (FMH type 5).

User Response: Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace to determine why the remote system sent an invalid attach request.

Destination: CSNE

Module: DFHZSUP

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSUP, 2=DFHZSUP, 3=DFHZSUP, 4=DFHZSUP, 5=DFHZSUP}*

DFHZC4947 E *date time applid termid tranid* **Attach time security check has failed. Security not valid.** *sense* **((***instance***) Module name: {DFHZGXA | DFHZSUP})**

Explanation: A request to attach a task has been received over an APPC link. However the FMH5 attach parameters do not conform to the APPC protocol.

The *instance* data can take the following values:

Sense	Meaning
1	Unrecognized access security subfield
2	Multiple userid access security subfields present
3	Multiple profile access security subfields present
4	Multiple password access security subfields present
5	Userid required in FMH but not received
6	PV1 and PV2 security indicators both present in FMH5
7	Password received when AV indicator set
8	Password received when PV1 indicator set
9	Password required for PV2 but not received.

System Action: The attach request is rejected and the session is unbound. An exception trace point (number 1737) for component TF is issued tracing the invalid attach header (FMH type 5).

User Response: Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace, to determine why the remote system sent an invalid attach request.

If the remote system has an earlier release of CICS or CICS on another platform and the sense value given is 5 then you may need to set USEDFLTUSER. See 'Attach Time Security and the USEDFLTUSER option' in chapter 12 of the *CICS RACF Security Guide*.

Destination: CSNE

Modules: DFHZSUP, DFHZGXA

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZSUP, 2=DFHZSUP, 3=DFHZSUP, 4=DFHZSUP, 5=DFHZSUP, 6=DFHZSUP, 7=DFHZSUP, 8=DFHZSUP, 9=DFHZSUP, 10=DFHZSUP, 11=DFHZSUP, 12=DFHZSUP, 13=DFHZSUP, 14=DFHZSUP, 15=DFHZGXA, 16=DFHZGXA, 17=DFHZGXA, 18=DFHZGXA, 19=DFHZGXA, 20=DFHZGXA, 21=DFHZGXA, 22=DFHZGXA, 23=DFHZGXA, 24=DFHZGXA, 25=DFHZGXA, 26=DFHZGXA, 27=DFHZGXA, 28=DFHZGXA, 29=DFHZGXA}*

DFHZC4948 E *date time applid* **An error has been detected when processing an***{ unknown | inbound | outbound}{ request. | Persistent Verify Signoff request. | Persistent Verify Timeout request.}* **Transaction** *tranid* **is***{ continuing. | terminating. | terminating abnormally.}* **Error code:** *X'xxxxx'* **Connection:** *yyyy*

Explanation: An error has been detected during the execution of transaction CLS3. The error code indicates the nature of the error:

X'01' Transaction CLS3 issued an unsuccessful communications request on an APPC session.

X'02' Transaction CLS3 was started by a START command with data, but the format of the data was incorrect.

X'04' Transaction CLS3 is attempting to send a signoff request to a remote system, but the connection to the remote system is not an APPC connection.

X'06' Transaction CLS3 was not started by terminal input, nor by a START command.

X'09' Transaction CLS3 was started by a START command with data, but the data could not be retrieved.

X'0A' Transaction CLS3 is attempting to send a signoff request to a remote system, but there is no connection to the remote system.

X'0B' Transaction CLS3 unsuccessfully attempted to allocate an APPC session to a remote system.

System Action: Depending upon the nature of the event that gave rise to the message, the transaction continues execution, terminates normally, or terminates abnormally. The message text indicates which action is being taken.

User Response: This depends upon the error code:

X'01' Determine why the communications request on the APPC session failed. Possible reasons are:

- There has been a session failure.
- The connected transaction has abended.

This error produces an exception trace, which helps to determine the cause of the problem.

X'02' Ensure that transaction CLS3 was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.

X'04' Check the connection definition for the remote system. It should be an APPC connection.

X'06' Ensure that transaction CLS3 was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.

X'09' Determine why the data could not be retrieved. If you are unable to do so, contact your IBM Support Center

X'0A' Ensure that the connection has been correctly defined

X'0B' Ensure that the connection is acquired and in service

Destination: CSNE

Module: DFHCLS3

XMEOUT Parameters: *date, time, applid, {1= unknown, 2= inbound, 3= outbound}, {1= request., 2=Persistent Verify Signoff request., 3=Persistent Verify Timeout request.}, tranid, {1= continuing., 2= terminating., 3= terminating abnormally.}, X'xxxxx', yyyy*

DFHZC4949 E *date time applid termid tranid netname* **Receive Any stall -** *{data lost. | response lost. | command lost. }***CLSDST return code** *X'rc' sense* **((***instance***) Module name: {DFHZRAC})**

Explanation: All the CICS Receive Any RPLs have been posted but the TCTTE for each one is waiting for a response from a VTAM terminal or session. All the Receive Any RPLs have been stalled for 10 dispatches of the TCP task (CSTP). This message is produced for each session that is in this situation. A VTAM session has not responded to a command such as BID or SHUTD sent by CICS. This is typically caused by a protocol error.

System Action: CICS is running with system initialization parameter RAPOOL=(n,n,FORCE) causing CICS to issue a VTAM CLSDST against the session, which causes the TCTTE's RPL to be completed and the session to be unbound.

The default NEP action is CLSDST, which causes CICS to clean up the TCTTE after the pending command has been terminated.

The Receive Any data received is discarded and the RA RPL is reissued.

User Response: Investigate the reason why the command has not completed. The TCTTE RPL is printed with the message.

It is important to look at any earlier DFHZC4949 messages because of the asynchronous nature of DFHZNAC. If the CLSDST has not completed, the RPL printed will be active and will show the RPL that can not complete. If the CLSDST has completed when DFHZNAC runs, the RPL printed will have a RTNCD/FDB2 of X'0C0B' but RPLREQ still shows what command would not complete.

If the CLSDST return code *rc* is non 0, the CLSDST macro has failed in DFHZRAC and the session remains hung. You may be able to free the session by using VTAM command V NET,INACT,ID=netname,I. You can find the reason for the CLSDST failure by looking at the RPL in the AP FC90 trace point for the CLSDST.

Destination: CSNE

Module: DFHZRAC

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, {1=data lost. , 2=response lost. , 3=command lost. }, X'rc', sense, instance, {1=DFHZRAC, 2=DFHZRAC, 3=DFHZRAC}*

DFHZC4950 E *date time applid* **An error has occurred when attempting to attach the outbound Connection Quiesce Protocol transaction CQPO on session** *termid***. Release of connection** *sysid* **is continuing. ((***instance***) Module name: {DFHZCLS})**

Explanation: An error has been detected while attempting to attach the outbound transaction for the Connection Quiesce Protocol (CQPO) on an APPC session.

System Action: The release of the connection continues, but the Connection Quiesce Protocol will take place only if the partner system successfully initiates it.

User Response: Determine why transaction CQPO failed to attach. If you have installed the correct definition for the transaction, you should never see this message, and you may need to contact your IBM Support Center for assistance.

If the partner system did not initiate the Connection Quiesce Protocol, you may need to determine if there are units of work awaiting resync, or VTAM affinities to be ended before you can INITIAL start either of the connected systems.

Destination: CSNE

Module: DFHZCLS

XMEOUT Parameters: *date, time, applid, termid, sysid, instance, {1=DFHZCLS}*

DFHZC4951 E *date time applid* **An error has been detected when processing an***{ unknown | inbound | outbound}* **Connection Quiesce Protocol request. Transaction** *tranid* **is***{ continuing. | terminating. | terminating abnormally.}* **Error code:** *X'xxxxx'* **Connection:** *yyyy*

Explanation: An error has been detected during the execution of transaction *tranid*. The error code indicates the nature of the error:

X'01' Transaction *tranid* was not started by terminal input, nor by an internal CICS command.

X'02' Transaction *tranid* was started by an inbound FMH5, but the TPN was not the correct value for the Connection Quiesce Protocol.

X'03' Transaction *tranid* issued an unsuccessful communications request on an APPC session.

X'04' Transaction *tranid* has been attached by an inbound FMH5. The format of the data received from the remote system did not comply with the architecture for the Connection Quiesce Protocol.

X'05' Transaction *tranid* has received an unexpected response from the Recovery Manager.

X'06' Transaction *tranid* has been attached by an internal CICS command and has sent a Connection Quiesce Protocol request to the remote system. The format of the reply received from the remote system did not comply with the architecture for the Protocol.

X'07' Transaction *tranid* was started, but its principal facility is not a terminal or session.

System Action: Depending upon the nature of the event that gave rise to the message, the transaction continues execution, terminates normally, or terminates abnormally. The message text indicates which action is being taken.

User Response: This depends upon the error code:

X'01, 02, 07' Ensure that transaction *tranid* was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.

X'03' Determine why the communications request on the APPC session failed. Possible reasons are:

- There has been a session failure.
- The connected transaction has abended.

This error produces an exception trace, which helps to determine the cause of the problem.

In other cases, contact your IBM Support Center.

Destination: CSNE

Module: DFHCLS5

XMEOUT Parameters: *date, time, applid, {1= unknown, 2= inbound, 3= outbound}, tranid, {1=continuing., 2= terminating., 3=terminating abnormally.}, X'xxxxx', yyyy*

DFHZC5900 E *date time applid* **System** *sysid* **has shipped definitions but connection** *cccc* **is not known to this system.**

Explanation: CICS has received definitions from remote system *sysid*, but cannot find a connection named *cccc*.

System Action: CICS continues.

User Response: If you want these definitions to be accepted, install the necessary connection using CEDA, and retransmit the definitions from the remote system.

Destination: CSMT

Modules: DFHBSTZ1, DFHBSTZ2

XMEOUT Parameters: *date, time, applid, sysid, cccc*

DFHZC5901 E *date time applid* **Install for** *resource* **failed.** *xxxx* **could not obtain** *yyyy* **storage**

Explanation: When installing resource *resource*, CICS module *xxxx* could not get storage for the extent specified by the value of *yyyy*.

System Action: CICS continues.

User Response: If possible, increase the size of your CICS address space. Otherwise, consider reducing the number of resources used in one CICS run.

Destination: CSMT

Modules: DFHBSMIR, DFHBSMPP, DFHBSM62, DFHBSS, DFHBSSZM, DFHBSTB, DFHBSTB3, DFHBSTC, DFHBSTZ, DFHBSTZB, DFHBSTZO, DFHBSTZR, DFHBSTZV, DFHBSTZ1, DFHBSTZ2, DFHBSZZS

XMEOUT Parameters: *date, time, applid, resource, xxxx, yyyy*

DFHZC5902 E *date time applid* **Deletion of terminal** *termid* **failed. BMS Paging session still active**

Explanation: CICS cannot delete terminal *termid* because a BMS paging session is still active for the terminal.

System Action: CICS continues.

User Response: Sign on to terminal *termid* and purge the pages.

Destination: CSMT

Module: DFHBSTB

XMEOUT Parameters: *date, time, applid, termid*

DFHZC5903 E *date time applid* **Deletion of terminal** *termid* **failed. CICS logic error**

Explanation: CICS cannot delete the terminal *termid*, because the CICS batch data attach function (DIP) is still active for this terminal.

System Action: CICS continues. A system dump is taken with dumpcode ZC5903. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHBSTD

XMEOUT Parameters: *date, time, applid, termid*

DFHZC5904 E *date time applid* **Deletion of terminal** *termid* **failed. CEDF is still active**

Explanation: CICS cannot delete the terminal *termid* because an EDF session is still active for this terminal.

System Action: CICS continues.

User Response: Deactivate EDF for the terminal, and reinstall the group.

Destination: CSMT

Module: DFHBSTE

XMEOUT Parameters: *date, time, applid, termid*

DFHZC5905 E *date time applid* **Deletion of terminal** *termid* **failed. CICS logic error**

Explanation: CICS cannot delete terminal *termid* because the command level interface is still active for this terminal.

System Action: CICS continues. A system dump is taken with dumpcode ZC5905. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHBSTH

XMEOUT Parameters: *date, time, applid, termid*

DFHZC5906 E *date time applid* **Install failed because '***xxxx***' is not a permitted value for a terminal or connection name**

Explanation: A name of hexadecimal zeros has been used for a TERMINAL or CONNECTION definition.

This is a reserved value. CICS has failed to install the terminal or connection.

xxxx is the reserved value converted to printable hexadecimal. The error has probably been made using autoinstall.

System Action: CICS continues.

User Response: Correct the definition to use a valid name and reinstall the group.

Destination: CSMT

Modules: DFHBSS, DFHBSTZ, DFHBSTZ1, DFHBSTZ2 DFHBSMPP

XMEOUT Parameters: *date, time, applid, xxxx*

DFHZC5907 E *date time applid* **Deletion of remote shipped terminal failed for connection** *cccc***.**

Explanation: During the deletion of connection *cccc*, the connection was found to have shipped remote terminals. The deletion of one or more of these shipped remote terminals has failed.

System Action: CICS continues.

User Response: See message DFHZC5915 for further information.

Use CEMT to release the connection and put it OUT OF SERVICE, then retry the install of the connection.

Destination: CSMT

Module: DFHBSSZ

XMEOUT Parameters: *date, time, applid, cccc*

DFHZC5908 E *date time applid* **Install for terminal** *termid* **failed. The security manager gave return code** *retcode*

Explanation: CICS cannot install terminal *termid*. DFHXSMN gave the return code *retcode*.

System Action: CICS continues.

User Response: Check the value of the return code *retcode* in the *CICS Customization Guide*.

Destination: CSMT

Module: DFHBSTS

XMEOUT Parameters: *date, time, applid, termid, retcode*

DFHZC5909 E *date time applid* **Install of resource** *resource* **failed. Call to DFHIRP** *irp_function Return_code* **did not succeed, See DFHIRSDS for return code.**

Explanation: When installing resource *resource*, the CICS module DFHBSSZR made a call to an IR service *irp_function* which failed due to the specified return code,

System Action: CICS continues. The MRO connection *resource* is not installed.

User Response: For an explanation of the return code, see DFHIRSDS in the *CICS Data Areas* manual.

Also see the user response section of message DFHIR3780. This gives a list of reasons why starting IRC can fail. However, some of the reasons are now also applicable when adding an IRC connection when IRC is OPEN. For instance a return code of E8 is issued if you add an IRC connection when cross memory is requested on the new connection but is not being used on any existing connection and when the CICS DB2 attachment has been initialized.

Destination: CSMT

Module: DFHBSSZR

XMEOUT Parameters: *date, time, applid, resource, irp_function, Return_code*

DFHZC5911 E *date time applid* **Install for resource** *resource* **failed. Connection** *cccc* **not found**

Explanation: CICS could not find the connection *cccc* associated with resource *resource*.

System Action: CICS continues.

User Response: Install connection *cccc*.

Destination: CSMT

Module: DFHBSMIR

XMEOUT Parameters: *date, time, applid, resource, cccc*

DFHZC5912 E *date time applid* **Install for terminal** *termid* **failed. It is incompatible with connection** *cccc*

Explanation: The terminal *termid* and the connection *cccc* are mutually incompatible.

System Action: CICS continues.

User Response: Modify your definition of *termid* or *cccc*.

Destination: CSMT

Modules: DFHBSTZ, DFHBSTZ2

XMEOUT Parameters: *date, time, applid, termid, cccc*

DFHZC5913 E *date time applid* **Deletion of node** *id* **failed.** *{A table entry is locked. | A table entry was not found. | There was a logic error.}* **Table=***tabname* **Key(***key***) Module(***modname***) Instance=***inst***.**

Explanation: CICS cannot delete node *id*. The message explains the reason for the failure.

1. One of its TMP table entries is locked by other tasks.
2. A TMP table entry could not be found, possibly because the node was already deleted by another task.
3. There was a CICS logic error. A DFHTM0002 error message may have been issued as well.

The TMP table entry is identified by *tabname*. The key used in the table has a value *key*. The module that issued the message is identified by *modname* and the instance of the message in that module by *inst*.

System Action: The resource is not deleted. If the entry was locked, CICS issues one or more message DFHZC5980.

User Response: Choose the action which corresponds to the reason identified in the message:

1. See message DFHZC5980 for further information and guidance.
2. If the node is deleted, no action is needed. If the node exists, determine whether it was replaced while this request was running. If the entry exists and has not been replaced, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSS, DFHBSSZ, DFHBSTZ, DFHBSTZ1, DFHBSTZ2, DFHBSTZV, DFHBSTZS, DFHBSTZZ

XMEOUT Parameters: *date, time, applid, id, {1=A table entry is locked., 2=A table entry was not found., 3=There was a logic error.}, tabname, key, modname, inst*

DFHZC5914 E *date time applid* **Deletion of terminal** *termid* **found another deletion of it in progress**

Explanation: CICS has failed to delete terminal *termid* because it is already marked as pending deletion.

It is likely that a CEDA user is installing this terminal.

System Action: CICS continues.

User Response: Check if a CEDA user is installing the terminal.

Destination: CSMT

Modules: DFHBSMIR, DFHBSMPP, DFHBSS, DFHBSTZ

XMEOUT Parameters: *date, time, applid, termid*

DFHZC5915 E *date time applid* **Deletion of node** *id* **failed.** *{The node is still in service. | The system entry is still in service. | The node has a task attached.}* **Module(***modname***).**

Explanation: CICS cannot delete node *id* The reason is identified in the message.

1. The terminal or session is still in service.
2. The system entry of this session is still in service.
3. A task is still attached to this terminal or session.

The module issuing the message is identified as *modname*.

System Action: CICS continues and does not delete the node.

User Response: Before retrying the deletion or replacement, perform the action which corresponds to the reason given in the message.

1. Set the node OUT OF SERVICE
2. Set the system entry OUT OF SERVICE.
3. Wait for activity to cease for this node.

Destination: CSMT

Modules: DFHBSMIR, DFHBSTZ

XMEOUT Parameters: *date, time, applid, id, {1=The node is still in service., 2=The system entry is still in service., 3=The node has a task attached.}, modname*

DFHZC5916 E *date time applid* **Deletion of terminal** *termid* **failed. It has pending DFHZCP activity**

Explanation: CICS cannot delete resource *termid* because DFHZCP activity is pending for this terminal. The resource could be a session belonging to a connection or a terminal TCTTE.

System Action: CICS continues.

User Response: Use exception trace point AP FCDE to determine what sort of activity is pending.

If this indicates that the VTAM CLSDST command is in progress, VTAM could be trying to contact a nonexistent or unavailable resource (indicated by NETNAME in the CEDA defintion for the resource). In this case, wait for a few minutes and retry the reinstall or discard. If you have access to the JOBLOG, message DFHZC3462 for the resource in question indicates that the CLSDST has finished.

If the resource is a terminal, put the terminal briefly into service and then take it out of service again, using the CEMT transaction.

Destination: CSMT

Module: DFHBSTZA

XMEOUT Parameters: *date, time, applid, termid*

DFHZC5917 E *date time applid* **Deletion of terminal** *termid* **failed. Error message writer still active**

Explanation: CICS cannot delete terminal *termid* because the error message writer is still active for this terminal.

System Action: CICS continues.

User Response: Put the terminal briefly into service and then take it out of service again, using the CEMT transaction.

Destination: CSMT

Module: DFHBSTZE

XMEOUT Parameters: *date, time, applid, termid*

DFHZC5918 E *date time applid* **Deletion of terminal** *termid* **Console** *consname* **failed. It has pending DFHZCP activity.**

Explanation: The MVS console *consname* has outstanding activity that prevents its deletion.

System Action: CICS continues.

User Response: After replying to any outstanding replies requested of this console, put the console briefly into service and then take it out of service again, using the CEMT transaction.

Destination: CSMT

Module: DFHBSTZO

XMEOUT Parameters: *date, time, applid, termid, consname*

DFHZC5919 E *date time applid* **Deletion of terminal** *termid* **failed. CICS logic error**

Explanation: CICS cannot delete terminal *termid* because of an error in disconnecting remote terminals.

System Action: CICS continues. A system dump is taken with dumpcode ZC5919. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHBSSZ

XMEOUT Parameters: *date, time, applid, termid*

DFHZC5920 E *date time applid* **Install of terminal** *termid* **failed. CICS logic error**

Explanation: This CICS system failed to install terminal *termid*. No terminals can be accepted yet because the system does not have a local system entry. There was probably a failure during CICS initialization.

System Action: CICS continues. A system dump is taken with dumpcode ZC5920. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSTZ, DFHBSTZ2

XMEOUT Parameters: *date, time, applid, termid*

DFHZC5921 E *date time applid* **Install of terminal** *termid* **failed. VTAM support not loaded.**

Explanation: CICS failed to install terminal *termid* because CICS was initialized without VTAM support.

System Action: CICS continues processing.

User Response: To use VTAM, shut down CICS and restart with the system initialization parameter VTAM=YES, a TCT assembled with ACCESSMETHOD=VTAM, and appropriate RDO terminal definitions.

Destination: CSMT

Module: DFHBSZZV

XMEOUT Parameters: *date, time, applid, termid*

DFHZC5923 E *date time applid* **Install for terminal** *termid* **failed. CICS logic error**

Explanation: CICS failed to install terminal *termid* because the bind-image was invalid.

System Action: CICS continues. A system dump is taken with dumpcode ZC5923. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHBSZZV

XMEOUT Parameters: *date, time, applid, termid*

DFHZC5924 E *date time applid* **Install for terminal** *termid* **failed. CICS logic error**

Explanation: CICS failed to install terminal *termid* because the TCTTE contained no node information block (NIB) descriptor.

System Action: CICS continues. A system dump is taken with dumpcode ZC5924. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHBSZZV

XMEOUT Parameters: *date, time, applid, termid*

DFHZC5925 E *date time applid* **Deletion of connection** *cccc* **failed. Its AID-Chains are not empty**

Explanation: CICS did not delete connection *cccc* because the AID-chains for the remote system *cccc* are not empty.

System Action: CICS continues.

User Response: Using the CEMT transaction, put the connection into service to allow the outstanding AIDs to be processed. Then take the connection out of service to allow deletion.

Destination: CSMT

Module: DFHBSSA

XMEOUT Parameters: *date, time, applid, cccc*

DFHZC5926 E *date time applid* **Install for connection** *cccc* **failed. CICS logic error**

Explanation: CICS did not install the connection *cccc* because DFHZCP received no DATASTREAM operand.

System Action: CICS continues. A system dump is taken with dumpcode ZC5926. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHBSSZ6

XMEOUT Parameters: *date, time, applid, cccc*

DFHZC5927 E *date time applid* **Install for connection** *cccc* **failed. CICS logic error**

Explanation: CICS did not install the connection *cccc* because DFHZCP did not receive a RECORDFORMAT operand.

System Action: CICS continues. A system dump is taken with dumpcode ZC5927. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHBSSZ6

XMEOUT Parameters: *date, time, applid, cccc*

DFHZC5930 E *date time applid* **Remote connection (***sysid***) could not be deleted because it was in use by** *number* **sessions.**

Explanation: When remote connection *sysid* was being deleted, it was still in use by *number* of sessions.

System Action: The resource is not deleted. CICS continues.

User Response: Wait until access to this remote connection has quiesced and then retry the deletion.

Destination: CSMT

Module: DFHBSTZ2

XMEOUT Parameters: *date, time, applid, sysid, number*

DFHZC5931 E *date time applid* **Install for modename** *modename* **failed. Maximum number of APPC sessions would have been exceeded**

Explanation: CICS did not install a SESSIONS definition using MODENAME *modename* because it would have exceeded the maximum number of permitted sessions.

System Action: CICS continues.

User Response: Either wait for the system to become less busy, or delete some APPC sessions.

Destination: CSMT

Module: DFHBSM61

XMEOUT Parameters: *date, time, applid, modename*

DFHZC5932 E *date time applid* **Install for modename** *modename* **failed. Connection** *cccc* **not found**

Explanation: CICS did not install a SESSIONS definition using MODENAME *modename* because of an unknown name *cccc* in the CONNECTION parameter.

System Action: CICS continues.

User Response: Install connection *cccc.*

Destination: CSMT

Module: DFHBSM62

XMEOUT Parameters: *date, time, applid, modename, cccc*

DFHZC5933 E *date time applid* **Install for modename** *modename* **failed. Connection** *cccc* **is not valid here**

Explanation: CICS did not install a SESSIONS definition using MODENAME *modename* because the CONNECTION is not valid in this context.

System Action: CICS continues.

User Response: Modify your definition of remote system *cccc.*

Destination: CSMT

Module: DFHBSM62

XMEOUT Parameters: *date, time, applid, modename, cccc*

DFHZC5934 E *date time applid* **Install for modename** *modename* **failed. Single-session connection** *cccc* **is already in use.**

Explanation: CICS did not install a SESSIONS definition using MODENAME *modename* because the single-session CONNECTION *cccc* is already in use.

System Action: CICS continues.

User Response: Modify the definition of *cccc*.

Destination: CSMT

Modules: DFHBSM61, DFHBSM62

XMEOUT Parameters: *date, time, applid, modename, cccc*

DFHZC5936 E *date time applid* **Install for modename** *modename* **failed. Connection** *cccc* **has active modegroup** *xxxx*

Explanation: CICS has not installed a SESSIONS definition with MODENAME *modename* because the connection *cccc* already has an active MODEGROUP, *xxxx*.

System Action: CICS continues.

User Response: Put the connection briefly into service and then take it out of service again, using the CEMT transaction.

Destination: CSMT

Module: DFHBSM62

XMEOUT Parameters: *date, time, applid, modename, cccc, xxxx*

DFHZC5937 I *date time applid* **Deletion of modename** *modename* **found another deletion of it in progress**

Explanation: CICS has not deleted a SESSIONS definition with MODENAME *modename* because the definition is already pending deletion.

System Action: CICS continues.

User Response: Check if a CEDA user was installing the SESSIONS definition.

Destination: CSMT

Module: DFHBSM62

XMEOUT Parameters: *date, time, applid, modename*

DFHZC5938 E *date time applid* **Deletion of modename** *modename* **failed. Unable to delete session(s)**

Explanation: CICS is unable to delete a SESSIONS definition with MODENAME *modename* because of one or more errors reported in previous messages.

System Action: CICS continues.

User Response: Refer to any preceding messages for further information and guidance. Correct the reported errors.

Destination: CSMT

Module: DFHBSM61

XMEOUT Parameters: *date, time, applid, modename*

DFHZC5939 E *date time applid* **Install for** *name* **failed. Duplicate session- or modegroup-name for connection** *sysid*

Explanation: CICS is unable to install a session or modegroup as the session-name or modegroup-name *name* is duplicated. The duplicate might be another connection, session, modegroup or terminal. However it might also be the local connection which has the name specified by SYSIDNT in the system initialization table.

System Action: CICS continues processing, but the session or modegroup is not installed.

User Response: Change the duplicated session-name or modegroup-name.

Destination: CSMT

Modules: DFHBSMIR, DFHBSM62

XMEOUT Parameters: *date, time, applid, name, sysid*

DFHZC5940 E *date time applid* **Install for terminal** *termid* **failed. Error console cannot be deleted**

Explanation: You have tried to replace the error console, CERR. CICS does not allow this.

System Action: CICS continues with original error console.

User Response: Note this restriction.

Destination: CSMT

Module: DFHZCQDL

XMEOUT Parameters: *date, time, applid, termid*

DFHZC5941 E *date time applid* **Install for terminal** *termid* **failed. Console** *consname* **has a conversation outstanding**

Explanation: CICS was unable to install terminal *termid* because the console *consname* has posted an ECB.

System Action: Processing continues.

User Response: Put the terminal briefly into service and then take it out of service again, using the CEMT transaction.

Destination: CSMT

Module: DFHBSTZO

XMEOUT Parameters: *date, time, applid, termid, consname*

DFHZC5942 E *date time applid* **Node** *nodeid* **was not installed. The addition of key** *key* **to table** *tablename* **failed. RC=***X'return'***. Module(***modname***).**

Explanation: CICS cannot install the definition of node *nodeid* because an addition to a TMP table failed. CICS was trying to add the key *key* to the table *tablename*.

The return code from TMP is given in *return*. If the return code is 4, the entry was a duplicate. It is possible that another entry was added at the same time as this entry and used the same key. If this is not the case, CICS has suffered a logic error. The module that issued the message is indicated by *modname*.

System Action: CICS does not install the definition.

User Response: If the entry was not overlapped by another definition which conflicted with its key, or if the return code is not 4, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSS, DFHBSTZ, DFHBSTZZ, DFHBSTZ1, DFHBSTZ2

XMEOUT Parameters: *date, time, applid, nodeid, key, tablename, X'return', modname*

DFHZC5943 E *date time applid* **MRO connection** *conname* **could not be deleted because IRC is open.**

Explanation: CICS cannot delete the connection *conname* because it is an MRO connection and interregion communication (IRC) is open.

System Action: The connection is not deleted.

User Response: Close the IRC definition and retry the Delete or Replace.

Destination: CSMT

Module: DFHBSS

XMEOUT Parameters: *date, time, applid, conname*

DFHZC5944 E *date time applid* **Install for** *type***(***id***) has failed. It would make a loop of connection definitions. Module(***modname***).**

Explanation: CICS cannot install definition of *type* called *id* because it would make a loop of connection definitions. The connection *type* may be an indirect connection or a remote connection. Indirect connections point to other connections with the INDSYS field, and remote connections point to other connections with the REMOTESYSTEM field. The module that issued the message is identified by *modname*.

System Action: CICS does not install the definition.

User Response: Determine the source of the loop either in the already installed definitions or in this definition, and change it before attempting to reinstall this definition.

Destination: CSMT

Modules: DFHBSSZI, DFHBSTZ2

XMEOUT Parameters: *date, time, applid, type, id, modname*

DFHZC5945 E *date time applid* **Deletion of sessions** *ssss* **failed. Connection** *cccc* **is defined to IRC**

Explanation: CICS has not deleted the SESSIONS definition, *ssss*, because the CONNECTION is still defined to IRC.

System Action: CICS continues.

User Response: Issue a CEMT SET IRC CLOSED command.

Destination: CSMT

Module: DFHBSTZR

XMEOUT Parameters: *date, time, applid, ssss, cccc*

DFHZC5946 E *date time applid* **Install for sessions** *ssss* **failed. Connection** *cccc* **is defined to IRC**

Explanation: CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION is already defined to IRC.

System Action: CICS continues.

User Response: Issue a CEMT SET IRC CLOSED command.

Destination: CSMT

Module: DFHBSTZR

XMEOUT Parameters: *date, time, applid, ssss, cccc*

DFHZC5947 E *date time applid* **Install for sessions** *ssss* **failed. CICS logic error**

Explanation: CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION name is not specified.

System Action: CICS continues. A system dump is taken with dumpcode ZC5947. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSMIR, DFHBSTZR

XMEOUT Parameters: *date, time, applid, ssss*

DFHZC5948 E *date time applid* **Install for sessions** *ssss* **failed. Connection** *cccc* **is not suitable for IRC**

Explanation: CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION specified is not suitable for IRC.

System Action: CICS continues.

User Response: Modify your definition of *cccc*.

Destination: CSMT

Module: DFHBSTZR

XMEOUT Parameters: *date, time, applid, ssss, cccc*

DFHZC5949 E *date time applid* **Install for sessions** *ssss* **failed. It is incompatible with connection** *cccc*

Explanation: CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION specified does not support the required type of session. If you are replacing a connection of the same name but of a different type and the install fails for some other reason then this message may occur.

System Action: CICS continues.

User Response: Modify your definition of *cccc*.

Destination: CSMT

Modules: DFHBSMIR, DFHBSTZS, DFHBSTZR

XMEOUT Parameters: *date, time, applid, ssss, cccc*

DFHZC5950 E *date time applid* **Install for terminal** *termid* **failed. Console** *consname* **already exists**

Explanation: CICS has not installed the CONSOLE definition *termid* because the console ID, *consname*, already exists.

System Action: CICS continues without installing the terminal.

User Response: Use the CEDA transaction to define a different console ID and reinstall the terminal.

Destination: CSMT

Modules: DFHBSS, DFHBSTZ, DFHBSTZO

XMEOUT Parameters: *date, time, applid, termid, consname*

DFHZC5951 E *date time applid* **Deletion of connection** *ssss* **failed. Unable to delete sessions**

Explanation: CICS has not deleted the CONNECTION definition, *ssss*, because it cannot delete one or more sessions. A preceding message or messages should explain this failure.

System Action: CICS continues.

User Response: Refer to the preceding message for further information and guidance.

Destination: CSMT

Modules: DFHBSSZR, DFHBSSZ6

XMEOUT Parameters: *date, time, applid, ssss*

DFHZC5952 E *date time applid* **Deletion of terminal** *termid* **failed. It needs to be SET RELEASED**

Explanation: CICS cannot delete terminal *termid* because of its current state.

System Action: CICS continues.

User Response: Use the CEMT transaction to set terminal *termid* released and out of service.

Destination: CSMT

Module: DFHBSTZV

XMEOUT Parameters: *date, time, applid, termid*

DFHZC5953 E *date time applid* **CICS logic error**

Explanation: An object being installed did not have a bind-image.

System Action: CICS continues. A system dump is taken with dumpcode ZC5953. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHBSM62

XMEOUT Parameters: *date, time, applid*

DFHZC5954 E *date time applid* **Install for resource** *resource* **failed. Unable to install sessions component**

Explanation: CICS has failed to install resource *resource*. Previous message(s) should give the reason for the failure.

System Action: CICS continues.

User Response: Refer to any preceding messages for further information and guidance.

Destination: CSMT

Module: DFHBSTZC

XMEOUT Parameters: *date, time, applid, resource*

DFHZC5957 E *date time applid* **Arch. User-Data ID X'***xx* **occurs in bind. CICS logic error**

Explanation: The APPC SESSIONS object being installed is invalid because architected user-data IDs greater than X'02' occur in bind.

System Action: CICS does not install the object. A system dump is taken with dumpcode ZC5957. Message DFHME0116 is normally produced containing the symptom string for this problem. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

User Response:

Destination: CSMT

Module: DFHBSM62

XMEOUT Parameters: *date, time, applid, xx*

DFHZC5958 E *date time applid* **Install failed for** *xxxx***. This is the name of the local system which must not be replaced.**

Explanation: A terminal or a connection was defined with the same name as the local system entry during the last run of CICS. This is not allowed as the local system entry cannot be replaced.

During cold or initial start of the current run of CICS, CICS attempted to install the group which included the invalid definition. CICS then issued this message.

System Action: CICS continues, but this terminal or connection is not installed.

User Response: Use the CEDA transaction to correct the terminal or connection name and install the group.

Destination: CSMT

Module: DFHBSSZL

XMEOUT Parameters: *date, time, applid, xxxx*

DFHZC5961 E *date time applid* **Deletion of surrogate** *xxxx* **failed. CICS logic error**

Explanation: CICS cannot delete a surrogate TCT entry.

System Action: CICS continues. A system dump is taken with dumpcode ZC5961. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSTZ1, DFHBSTZ2

XMEOUT Parameters: *date, time, applid, xxxx*

DFHZC5962 E *date time applid* **Install for resource** *resource* **failed. Modename parameter not found**

Explanation: CICS has failed to install resource *resource* because the MODENAME parameter is missing.

System Action: CICS continues.

User Response: Supply the missing parameter.

Destination: CSMT

Module: DFHBSTZS

XMEOUT Parameters: *date, time, applid, resource*

DFHZC5963 E *date time applid operation* **RUSIZE** *xxxx* **from terminal** *termid* **was greater than TYPETERM RUSIZE** *yyyy***.**

Explanation: An autoinstall has been attempted with terminal *termid* that has a VTAM RECEIVESIZE greater than the corresponding TYPETERM RECEIVESIZE|SENDSIZE.

System Action: CICS continues. The autoinstall is rejected.

User Response: Increase the TYPETERM RECEIVESIZE or the TYPETERM SENDSIZE, OR decrease the RECEIVESIZEs in the VTAM LOGMODE table.

Destination: CSMT

Module: DFHBSZZV

XMEOUT Parameters: *date, time, applid, operation, xxxx, termid, yyyy*

DFHZC5964 E *date time applid* **Install for sessions** *ssss* **failed. CICS logic error.**

Explanation: CICS has failed to install SESSIONS *ssss* because the length of the BINDPASSWORD exceeds the limit of 8.

System Action: CICS continues. A system dump is taken with dumpcode ZC5964. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHBSSZS

XMEOUT Parameters: *date, time, applid, ssss*

DFHZC5965 *date time applid* **Pool delete for pool** *poolid* **failed. Terminal** *termid* **was being replaced at the same time.**

Explanation: CICS failed in an attempt to install or delete POOL definition *poolid*. A terminal *termid* in the pool was being deleted at the same time as the pool was being installed or deleted. This probably due to changing the terminal from a pooled terminal to a non-pooled terminal, or changing the pool name for a terminal in the same group. CICS cannot continue to modify the pool until the change to the terminal has completed.

System Action: CICS continues.

User Response: Once the deletion or modification of the terminal has succeeded, retry the installation.

Destination: CADL

Module: DFHBSMPP

XMEOUT Parameters: *date, time, applid, poolid, termid*

DFHZC5966 I *date time applid {INSTALL | DELETE | RESTORE}* **started for** *resource* **(***termid***) (Module name:** *modname***).**

Explanation: CICS is starting to install, delete or restore *resource*. The *resource* may be either a terminal, a connection, a modegroup, a session, or a pool_entry. Other messages are issued after this one if this installation, deletion or restoration fails.

System Action: CICS continues.

User Response: None.

Destination: CADL

Modules: DFHBSTZ, DFHBSMPP, DFHBSM62, DFHBSS, DFHBSMIR

XMEOUT Parameters: *date, time, applid, {1=INSTALL, 2=DELETE, 3=RESTORE}, resource, termid, modname*

DFHZC5967 E *date time applid* **Install for modename** *modename* **failed. Unable to install sessions**

Explanation: CICS has failed to install a SESSIONS definition using MODENAME *modename*. Previous message(s) should give the reason for the failure.

System Action: CICS continues.

User Response: Refer to the preceding message for further information and guidance.

Destination: CSMT

Module: DFHBSM61

XMEOUT Parameters: *date, time, applid, modename*

DFHZC5968 E *date time applid* **Unable to install LU Services Manager for modename** *modename*

Explanation: CICS has failed to install a CONNECTION definition for MODEGROUP *modename*. Previous message(s) should give the reason for the failure.

System Action: CICS continues.

User Response: Refer to any preceding messages for further information and guidance.

Destination: CSMT

Module: DFHBSSZP

XMEOUT Parameters: *date, time, applid, modename*

DFHZC5969 E *date time applid* **Deletion of dependent modename(s) failed for connection** *modename*

Explanation: CICS has failed to replace a CONNECTION definition for MODEGROUP *modename*. Previous message(s) should give the reason for the failure.

System Action: CICS continues.

User Response: Refer to any preceding messages for further information and guidance.

Destination: CSMT

Module: DFHBSSZS

XMEOUT Parameters: *date, time, applid, modename*

DFHZC5971 E *date time applid* **Delete of resource** *resource* **failed. CICS logic error**

Explanation: CICS failed to delete resource *resource* because of an unexpected signon state during the destroy operation.

System Action: CICS continues. A system dump is taken with dumpcode ZC5971. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHBSTS

XMEOUT Parameters: *date, time, applid, resource*

DFHZC5972 E *date time applid* **Delete of resource** *resource* **failed. It is still signed on**

Explanation: CICS failed to delete a TERMINAL or SESSIONS resource *resource* because a terminal or session is still signed on.

System Action: CICS continues.

User Response: Run the signoff transaction CESF and retry.

Destination: CSMT

Module: DFHBSTS

XMEOUT Parameters: *date, time, applid, resource*

DFHZC5973 E *date time applid* **Install for sessions** *ssss* **failed. Max session-count reached for modename** *modename*

Explanation: CICS failed to delete a SESSIONS definition *ssss* because the maximum session-count was reached for MODENAME *modename*.

System Action: CICS continues.

User Response: Delete some sessions in *modename*, or redefine *modename* with a higher maximum session-count.

Destination: CSMT

Module: DFHBSTZS

XMEOUT Parameters: *date, time, applid, ssss, modename*

DFHZC5974 E *date time applid* **Deletion of pool** *pppp* **failed. Unable to delete pool entries**

Explanation: CICS failed to delete a POOL *pppp*. Previous messages(s) should explain the cause of this failure.

System Action: CICS continues.

User Response: Refer to any previous messages for further guidance and information.

Destination: CSMT

Module: DFHBSMPP

XMEOUT Parameters: *date, time, applid, pppp*

DFHZC5975 E *date time applid* **Install for resource** *pppp* **failed. CICS logic error**

Explanation: CICS failed to install the POOL definition *pppp* because the required POOLID parameter was missing. This is a CICS logic error (probably in DFHTRZPP).

System Action: CICS continues. A system dump is taken with dumpcode ZC5975. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHBSMPP, DFHBSTZP

XMEOUT Parameters: *date, time, applid, pppp*

DFHZC5976 E *date time applid* **CICS logic error**

Explanation: CICS failed to install a POOL definition because the required POOLCNT parameter was missing. This is a CICS logic error (probably in DFHTRZPP).

System Action: CICS continues. A system dump is taken with dumpcode ZC5976. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHBSMPP

XMEOUT Parameters: *date, time, applid*

DFHZC5977 E *date time applid* **Failure building pool entries**

Explanation: CICS failed to install a POOL definition, because of a failure in building pool entries. Previous messages should explain the cause of this failure.

System Action: CICS continues.

User Response: Refer to any previous messages for further information and guidance.

Destination: CSMT

Module: DFHBSMPP

XMEOUT Parameters: *date, time, applid*

DFHZC5978 E *date time applid* **Unable to replace pool** *pppp*

Explanation: CICS failed in an attempt to install or delete a POOL definition. Previous messages should explain the cause of this failure.

System Action: CICS continues.

User Response: Refer to previous messages for further information and guidance.

Destination: CSMT

Module: DFHBSMPP

XMEOUT Parameters: *date, time, applid, pppp*

DFHZC5979 E *date time applid* **Deletion of pool** *pppp* **failed. It still has session** *termid*

Explanation: CICS has failed to delete pool *pppp* because the pool still has an active session for terminal *termid*.

System Action: CICS continues.

User Response: Put the terminal out of service (using the CEMT transaction) and retry.

Destination: CSMT

Module: DFHBSTZP

XMEOUT Parameters: *date, time, applid, pppp, termid*

DFHZC5980 E *date time applid* **Resource** *resource* **is in use by task** *taskid* **Transaction** *tranid*

Explanation: The resource *resource* is in use. *taskid* is the task number, and *tranid* is the transaction ID.

System Action: CICS continues.

User Response: Wait for the termination of task *taskid*, and retry the operation.

Destination: CSMT

Modules: DFHBSS, DFHBSSZ, DFHBSTZ, DFHBSTZ1, DFHBSTZ2 DFHBST2V

XMEOUT Parameters: *date, time, applid, resource, taskid, tranid*

DFHZC5981 E *date time applid* **Pool** *pppp* **not found**

Explanation: CICS has failed to install a resource because POOL *pppp* does not exist. Previous messages should explain the cause of this failure.

System Action: CICS continues.

User Response: Refer to the previous messages for further information and guidance.

Destination: CSMT

Module: DFHBSTZP

XMEOUT Parameters: *date, time, applid, pppp*

DFHZC5982 E *date time applid* **Deletion of pool** *pppp* **failed. Pool entry is in use for** *termid*

Explanation: CICS has failed to delete POOL *pppp* because the pool still has an entry in use for terminal *termid*.

System Action: CICS continues.

User Response: Put the terminal out of service (using the CEMT transaction) and retry.

Destination: CSMT

Module: DFHBSMPP

XMEOUT Parameters: *date, time, applid, pppp, termid*

DFHZC5983 E *date time applid* **Unable to replace** *resource*

Explanation: CICS failed to install resource *resource* either because it already exists, or for reasons explained in previous messages.

Possible causes are:

- Non-VTAM and VTAM terminals defined with the same name. If a non-VTAM terminal is installed, CICS will not autoinstall a VTAM terminal with the same name.
- An attempt to replace your own terminal, or a terminal with the same name as the terminal being used to issue the CEDA command.
- An attempt to replace a terminal with the same REMOTENAME and REMOTESYSTEM as an earlier definition in the same group.

System Action: CICS continues.

User Response: Refer to previous messages for further information and guidance.

If no previous messages were issued, check your terminal identifiers.

Destination: CSMT

Modules: DFHBSS, DFHBSTZ, DFHBSS2, DFHBSTZ1, DFHBSTZ2

XMEOUT Parameters: *date, time, applid, resource*

DFHZC5984 E *date time applid* **The installation or deletion of** *restype1 resname1* **has failed. Task** *taskname taskid* **is updating related system definition** *sysname***. Module** *modname***.**

Explanation: The installation or deletion of the communications resource, *resname1* of resource type *restype1* has failed. This resource refers to a system entry, *sysname*, which is being updated by another task. The other task is identified by *taskname* and *taskid*. The resource type *restype1* can be terminal, remote terminal, connection, remote connection, or indirect connection. The message is issued by module *modname*.

System Action: CICS continues but reverses the effects of the installation or deletion.

User Response: Wait until the other task has completed then retry the action.

Destination: CSMT

Modules: DFHBSTZ, DFHBSTZ1, DFHBSTZ2, DFHBSSZI

XMEOUT Parameters: *date, time, applid, restype1, resname1, taskname, taskid, sysname, modname*

DFHZC5985 E *date time applid* **Install for resource** *resource* **failed. Unable to install connection component**

Explanation: CICS has failed to install resource *resource*. Previous message(s) should give the reason for the failure.

System Action: CICS continues.

User Response: Refer to previous messages for further information and guidance.

Destination: CSMT

Module: DFHBSTZC

XMEOUT Parameters: *date, time, applid, resource*

DFHZC5986 E *date time applid* **CICS logic error**

Explanation: Either the warm keypoint program (DFHWKP), or the query transaction (DFHQRY), made an invalid request which could not be implemented.

System Action: CICS continues. A system dump is taken with dumpcode ZC5986. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHZCQCH

XMEOUT Parameters: *date, time, applid*

DFHZC5987 E *date time applid* **The install or delete of** *restype1 resname1* **has failed. Task** *taskname taskid* **is changing a definition which uses the** *restype2 resname2***. Module** *modname* **.**

Explanation: The installation or deletion of communications resource *resname1* of resource type *restype1* has failed. Table builder services cannot complete the change because another task is updating a definition which uses the resource *resname2* of resource type *restype2*. The other task is identified by *taskid* and *taskname*. *Restype2* can be a termid, netname, a unique network-qualified ID, or a pipeline terminal pool_name *Restype1* can be a terminal, a session, a remote terminal, a connection, a remote connection, or a pipeline terminal. The message was issued by module *modname*.

System Action: CICS continues but reverses this install or delete.

User Response: Wait until the other task has completed and then retry the action.

Destination: CSMT

Modules: DFHBSS, DFHBSTZ, DFHBSTZS, DFHBSTZV, DFHBSTZZ, DFHBSTZ1, DFHBSTZ2, DFHBSMPP, DFHBSTZP

XMEOUT Parameters: *date, time, applid, restype1, resname1, taskname, taskid, restype2, resname2, modname*

DFHZC5988 E *date time applid* **Install for resource** *resource* **failed. VTAM support not generated**

Explanation: CICS failed to install resource *resource* because CICS was initialized without VTAM support.

System Action: CICS continues.

User Response: If you want to install VTAM resources urgently, shut down CICS, and restart it with the system initialization parameter ACCESSMETHOD=VTAM, and appropriate TCT or RDO terminal definitions.

Destination: CSMT

Modules: DFHBSSZS, DFHBSSZ6, DFHBSTZV

XMEOUT Parameters: *date, time, applid, resource*

DFHZC5989 E *date time applid* **Deletion of resource** *resource* **failed. Remote deletion in connection** *cccc* **failed**

Explanation: CICS failed to delete resource *resource* because a remote delete in system *cccc* failed.

Previous messages should explain the cause of this failure.

System Action: CICS continues.

User Response: Refer to the previous message for further information and guidance.

Destination: CSMT

Modules: DFHBSTZ1, DFHBSTZ2

XMEOUT Parameters: *date, time, applid, resource, cccc*

DFHZC5990 E *date time applid* **CICS logic error**

Explanation: CICS rejected an INSTALL or DELETE request because it does not recognize the request code.

System Action: CICS continues. A system dump is taken with dumpcode ZC5990. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHZCQ00

XMEOUT Parameters: *date, time, applid*

DFHZC5991 E *date time applid* **CICS logic error**

Explanation: CICS rejected a VALIDATE BIND request because no BIND was supplied.

System Action: CICS continues. A system dump is taken with dumpcode ZC5991. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHZCQ00

XMEOUT Parameters: *date, time, applid*

DFHZC5992 E *date time applid* **Resource Types Table does not support recovery record**

Explanation: CICS rejected RESTORE request because the resource types table (DFHZCQRT) in DFHZCQ is incompatible with the recovery record from the log or CICS catalog.

System Action: CICS continues. A system dump is taken with dumpcode ZC5992. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: CICS is unable to warm start correctly. You should therefore shut CICS down and perform a cold or initial start.

Destination: CSMT

Module: DFHZCQRS

XMEOUT Parameters: *date, time, applid*

DFHZC5993 E *date time applid* **CICS logic error**

Explanation: CICS rejected a RESTORE request because the resource types table (DFHZCQRT) in DFHZCQ is incompatible with the recovery record from the log or CICS catalog.

System Action: CICS continues. A system dump is taken with dumpcode ZC5993. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHZCQRS

XMEOUT Parameters: *date, time, applid*

DFHZC5994 E *date time applid* **CICS logic error**

Explanation: CICS rejected a RESTORE request because no recovery record was passed.

System Action: CICS continues. A system dump is taken with dumpcode ZC5994. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHZCQRS

XMEOUT Parameters: *date, time, applid*

DFHZC5995 E *date time applid* **CICS logic error. Resource Type Code** *xxxx* **Subtype** *yyyy* **not recognized with associated bind image**

Explanation: CICS failed to install a resource with resource type code (RTC) *xxxx* and subtype *yyyy* (from the Builder Parameter Set) because a resource with type code *xxxx*, sub-type *yyyy*, and the associated BIND-image, is not a builder resource type. The RTC and subtype are defined in module DFHZCQRT.

This is a CICS logic error (probably in DFHTRZ*x*P).

System Action: CICS continues. A system dump is taken with dumpcode ZC5995. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHZCQIS

XMEOUT Parameters: *date, time, applid, xxxx, yyyy*

DFHZC5996 E *date time applid* **CICS logic error**

Explanation: CICS has rejected an INSTALL request because the resource type code in the request is zero.

System Action: CICS continues. A system dump is taken with dumpcode ZC5996. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHZCQIS

XMEOUT Parameters: *date, time, applid*

DFHZC5997 E *date time applid* **CICS logic error**

Explanation: CICS has rejected an INQUIRE request because no TCT entry was passed.

System Action: CICS continues. A system dump is taken with dumpcode ZC5997. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHZCQIQ

XMEOUT Parameters: *date, time, applid*

DFHZC5998 E *date time applid* **Install specified a resource that cannot be replaced**

Explanation: CICS rejected a DELETE request because the entry passed is of a type that cannot be deleted, for example, a non-VTAM terminal.

System Action: CICS continues.

User Response: The failing delete/replace was necessitated by an INSTALL request. Correct the resource type in that request.

Destination: CSMT

Modules: DFHZCQCH, DFHZCQDL

XMEOUT Parameters: *date, time, applid*

DFHZC5999 E *date time applid* **CICS logic error.**

Explanation: If DFHZCQCH issues this message, CICS has rejected a CATALOG request because the required entry parameter was not passed.

If DFHZCQDL issues this message, CICS has rejected a DELETE request because the required entry parameter was not passed.

System Action: CICS continues. A system dump is taken with dumpcode ZC5999. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHZCQCH, DFHZCQDL

XMEOUT Parameters: *date, time, applid*

DFHZC6201 E *applid* **CICS table builder services has detected a severe error in module** *modname* **code** *X'code'***.**

Explanation: While executing a request, CICS table builder services detected a severe error. The error is identified by the error code *code* and the module *modname*.

System Action: CICS rejects the request and takes a dump. CICS writes an exception trace record identified by *code*, then issues message DFHZC6208 either to the user of the CEDA transaction, or if the request did not originate from CEDA, to the CSMT transient data queue

User Response: This failure indicates either an error in CICS, or a storage overlay. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Modules: DFHTBSB, DFHTBSD, DFHTBSBP, DFHTBSDP, DFHTBSL, DFHTBSLP, DFHTBSS

XMEOUT Parameters: *applid, modname, X'code'*

DFHZC6202 E *date time applid* **Pattern** *pattern* **not valid for builder**

Explanation: While executing a request, CICS table builder services has detected that the pattern *pattern* cites a builder that is not declared with DFHBSHDR(ENTRY). *pattern* is the name of the pattern as coded in the DFHBSPTE macro.

System Action: CICS rejects the request. A system dump is taken with dumpcode ZC6202. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHTBSB, DFHTBSL, DFHTBSQ, DFHTBSR

XMEOUT Parameters: *date, time, applid, pattern*

DFHZC6204 E *date time applid* **Illegal subpattern definition** *pattern*

Explanation: While executing a request, CICS table builder services has detected that the subpattern *pattern* cites a builder that is not declared with DFHBSHDR(ENTRY). *pattern* is the name of the subpattern as coded in the DFHBSPTE macro.

System Action: CICS rejects the request. A system dump is taken with dumpcode ZC6204. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHTBSBP, DFHTBSDP

XMEOUT Parameters: *date, time, applid, pattern*

DFHZC6205 E *date time applid* **Illegal subpattern definition** *pattern*

Explanation: While executing a request, CICS table builder services has detected that the subpattern *pattern* is invalidly defined. *pattern* is the name of the subpattern as coded in the DFHBSPTE macro.

System Action: CICS rejects the request. A system dump is taken with dumpcode ZC6205. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHTBSBP, DFHTBSDP

XMEOUT Parameters: *date, time, applid, pattern*

DFHZC6206 E *date time applid* **Pattern** *pattern* **not valid for destroy**

Explanation: While executing a DESTROY request, CICS table builder services has detected that the pattern *pattern* is not valid for a DESTROY request. *pattern* is the name of the pattern as coded in the DFHBSPTE macro.

System Action: CICS rejects the request. A system dump is taken with dumpcode ZC6206. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHTBSD

XMEOUT Parameters: *date, time, applid, pattern*

DFHZC6207 E *date time applid* **Catalog key too long or zero. Pattern** *pattern*

Explanation: While executing a request, CICS table builder services has detected that builder cited in the pattern *pattern* has returned an invalid CC key on MAKEKEY. *pattern* is the name of the pattern as coded in the DFHBSPTE macro.

System Action: CICS rejects the request. A system dump is taken with dumpcode ZC6207. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHTBSBP, DFHTBSDP, DFHTBSL

XMEOUT Parameters: *date, time, applid, pattern*

DFHZC6208 E *date time applid* **CICS table builder services has detected a severe error in module** *modname***, code(***X'code'***.**

Explanation: While executing a request, CICS table builder services detected a severe error. The error is identified by the error code *code* and the module *modname*.

System Action: CICS rejects the request. It has already issued message DFHZC6201, written an exception trace record identified by *code*, and taken a dump.

User Response: This failure indicates either an error in CICS, or a storage overlay. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Modules: DFHTBSB, DFHTBSD, DFHTBSBP, DFHTBSDP, DFHTBSL, DFHTBSLP, DFHTBSS

XMEOUT Parameters: *date, time, applid, modname, X'code'*

DFHZC6209 E *date time applid* **Invalid ZC catalog request code** *xxxx*

Explanation: While executing a request, CICS table builder services has detected that the code, *xxxx*, for a catalog request is invalid.

System Action: CICS rejects the request. A system dump is taken with dumpcode ZC6209. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CSMT

Module: DFHTBSL

XMEOUT Parameters: *date, time, applid, xxxx*

DFHZC6210 E *date time applid* **Table builder could not obtain storage for control block code** *X'code'***, module** *modname***.**

Explanation: While executing a BUILD, a DESTROY or a RESTORE request, CICS table builder services could not obtain storage for a control block. The control block could be a RRAB, a RABN, an action_block, a recovery record, or a recovery segment. The error code *code* identifies the element that could not be obtained by the module *modname*.

System Action: CICS rejects the request. It has already written an exception trace record identified by *code*.

User Response: This failure may be a symptom of a expanded dynamic storage area (EDSA) that is too small. If so, you can solve the problem by increasing the size of your CICS region. For guidance on estimating the size of the DSA and the CICS region, see the *CICS System Definition Guide* and the *CICS Performance Guide*. You can identify which control block that could not be obtained by formatting the exception trace record.

The failure may also be caused by an error in another transaction, for example, a looping program with an EXEC CICS GETMAIN within the loop.

Destination: CSMT

Modules: DFHTBSB, DFHTBSD, DFHTBSL, DFHTBSBP, DFHTBSDP, DFHTBSLP, DFHTBSS

XMEOUT Parameters: *date, time, applid, X'code', modname*

DFHZC6212 E *date time applid* **Level mismatch with catalog record. DFHBS** *xxx*

Explanation: While executing a request during a warm or emergency start, CICS Table Builder Services has detected that the CC record is not compatible with the pattern it names. *xxx* is the builder ID.

System Action: CICS rejects the request.

User Response: The CC record was probably written by an earlier level of CICS. That is, you have applied one or more PTF maintenance fixes to the system since the CC record was written. Assuming this is the case, you must either:

- Cold or initial start CICS, **or**
- Remove the maintenance to enable a warm start or emergency restart.

Destination: CSMT

Modules: DFHTBSR, DFHTBSRP

XMEOUT Parameters: *date, time, applid, xxx*

DFHZC6213 E *date time applid* **Recovery record abandoned. Key is** *key*

Explanation: While processing a RESTORE request, CICS Table Builder Services detected an error reported in a previous message. *key* is the catalog key for the abandoned record, or, if the key is unknown to CICS, *key* is the single character **?**.

System Action: See the previously issued message for the cause of the problem, and follow the recommended user action.

Destination: CSMT

Module: DFHTBSR

XMEOUT Parameters: *date, time, applid, key*

DFHZC6214 E *date time applid* **Unable to obtain recovery record storage**

Explanation: While processing a CATALOG request, CICS Table Builder Services could not obtain recovery record storage.

System Action: CICS rejects the request.

User Response: This failure may be a symptom of a dynamic storage area (DSA) that is too small. If so, you can solve the problem by increasing the size of your CICS region. For advice on estimating the size of the DSA and the CICS region, see the *CICS System Definition Guide* and the *CICS Performance Guide*.

The failure may also be caused by an error in another transaction, for example, a looping program with an EXEC CICS GETMAIN within the loop.

Destination: CSMT

Module: DFHTBSLP

XMEOUT Parameters: *date, time, applid*

DFHZC6216 E *date time applid* **Install for** *restype1* **(***resname1***) failed and caused the backout of the whole set of RDO resources for** *restype2* **(***resname2***).**

Explanation: The RDO definition for a resource of type *restype1* named *resname1* could not be installed because of an error. This causes the installable set of RDO definitions associated with *restype2* named *resname2* to be backed out.

The resource type of the definition that failed *restype1* can be connection, session, modegroup, pool, or pooled terminal. The resource type of the associated definition *restype2* can be connection, or a pool_name for pipeline terminals.

System Action: CICS backs out the installation of the set of associated RDO definitions and continues without them.

User Response: Correct the reason for the failure of the definition, identified by previous DFHZX*nnnn* messages, and then retry the install.

Destination: CSMT

Module: DFHTBSB

XMEOUT Parameters: *date, time, applid, restype1, resname1, restype2, resname2*

DFHZC6301 E *date time applid* **Install for** *tttt* **failed. Duplicate netname** *netname* **for resource** *rrrr* **found.**

Explanation: A resource *tttt* was being installed but was found to have the same network name *netname* as resource *rrrr*.

System Action: The resource is not installed, CICS continues.

User Response: If you want the definitions to be installed, use CEDA to correct the network name and reinstall the definition.

Destination: CSMT

Module: DFHBSTZV

XMEOUT Parameters: *date, time, applid, tttt, netname, rrrr*

DFHZC6302 E *date time applid* **Install for connection** *cccc* **failed. Duplicate netname** *netname* **for resource** *rrrr* **found.**

Explanation: A connection *cccc* was being installed but was found to have the same network name *netname* as resource *rrrr*.

System Action: The resource is not installed, CICS continues.

User Response: You cannot have an APPC connection with the same network name as another APPC connection or an LU6.1 connection. That is, you cannot have more than one APPC connection between two systems and an APPC connection cannot be installed with an LU6.1 connection between two systems.

Neither APPC or LU6.1 network names can be the same as a terminal's network name.

Also you cannot have an IRC (or XM) connection with the same network name as another IRC (or XM) connection. However, an IRC network name can be the same as any VTAM network name (APPC or LU61 connection or terminal).

If you want the definitions to be installed, use CEDA to correct the network name and then reinstall the definition.

If you need to replace a connection with a different network name, it must have the same connection name as the one you are replacing.

Destination: CSMT

Module: DFHBSS

XMEOUT Parameters: *date, time, applid, cccc, netname, rrrr*

DFHZC6303 E *date time applid* **Install for** *tttt* **failed. Duplicate netname** *netname* **found.**

Explanation: A resource *tttt* was being installed but was found to have a duplicate network name *netname*.

This message occurs:

- If the duplicate NETNAME occurred in the same group as this definition, or
- If two CEDA transactions were run at the same time and the other CEDA transaction added a NETNAME between the BUILD and CONNECT routines of DFHBSTZV.

System Action: The resource is not installed; CICS continues.

User Response: If you want the definitions to be installed, use CEDA to correct the network name and then reinstall the definition.

Destination: CSMT

Module: DFHBSTZV

XMEOUT Parameters: *date, time, applid, tttt, netname*

DFHZC6304 W *date time applid* **Deletion of remote terminal** *termid* **failed because it is in use by another transaction.**

Explanation: CICS has issued a logoff transaction to the remote terminal *termid* but this terminal cannot be deleted because it is in use by another transaction.

System Action: The remote terminal can be reused. CICS continues.

User Response: This situation usually occurs because the remote CICS is under stress. Consider allocating more resources. For example, you might need to allocate more storage.

Destination: CSMT

Module: DFHBSTZ

XMEOUT Parameters: *date, time, applid, termid*

DFHZC6305 E *date time applid* **Install for EXCI generic connection** *cccc* **failed. Duplicate EXCI generic connection** *rrrr* **found.**

Explanation: A connection *cccc* specifying protocol(exci) and conntype(generic) was being installed but an existing EXCI generic connection *rrrr* was found.

System Action: The resource is not installed. CICS continues.

User Response: There can be only one EXCI generic connection installed in a CICS system. Determine which EXCI generic connection definition is required and remove the duplicate definition.

If you need to replace the EXCI generic connection definition, it must have the same connection name as the one you are replacing.

Destination: CSMT

Module: DFHBSS

XMEOUT Parameters: *date, time, applid, cccc, rrrr*

DFHZC6307 E *date time applid* **Install for connection** *cccc* **failed. Netname** *netname* **is the same as the generic resource name.**

Explanation: A connection *cccc* was being installed but the netname *netname* is the same as the generic resource name for this CICS (as defined in the SIT GRNAME parameter).

Communication within a SYSPLEX (intra-plex) must be done using member names.

System Action: The resource is not installed, CICS continues.

User Response: If this connection is for communication within a sysplex, use CEDA to change the NETNAME to the member name of the connection with which you wish to communicate.

If this is for communication between two sysplexes, change the NETNAME to the generic resource name of the partner sysplex.

Destination: CSMT

Module: DFHBSS

XMEOUT Parameters: *date, time, applid, cccc, netname*

DFHZC6308 E *date time applid* **Restore for connection** *cccc* **failed. Netname** *netname* **is the same as the generic resource name.**

Explanation: During an emergency or warm restart CICS tried to restore connection *cccc*. However its netname *netname* is the same as the generic resource name for this CICS (as defined in the GRNAME system initialization parameter).

This is probably because the GRNAME specified in the SIT has been changed. It should only be changed at INITIAL start time.

System Action: Processing continues. The resource is not installed.

User Response: If this connection is for communication within a sysplex, use CEDA to change the NETNAME to the member name of the connection with which you wish to communicate.

If this is for communication between two sysplexes, change the NETNAME to the generic resource name of the partner sysplex.

If you need to change the GRNAME parameter, remember to do so only during an INITIAL start.

Destination: CSMT

Module: DFHBSS

XMEOUT Parameters: *date, time, applid, cccc, netname*

DFHZC6310 E *date time applid* **Install for terminal** *termid* **failed. Console** *consname* **must be defined by ID not name.**

Explanation: CICS has not installed the CONSOLE definition *termid* because the console *consname* is defined by name. The console must be defined by ID, as CICS is running under a release of MVS that does not support console names.

System Action: CICS continues without installing the terminal.

User Response: Use the CEDA transaction to define the console by ID and reinstall the terminal.

Destination: CSMT

Module: DFHBSTZO

XMEOUT Parameters: *date, time, applid, termid, consname*

DFHZC6311 E *date time applid* **Install for terminal** *termid* **failed. Console ID** *conslid* **does not map to a console name known to MVS.**

Explanation: CICS has not installed the CONSOLE definition *termid* because the console ID *conslid* does not map to a console name known to MVS.

System Action: CICS continues without installing the terminal.

User Response: Use the CEDA transaction to define a different console ID, or a console name, and reinstall the terminal.

Destination: CSMT

Module: DFHBSTZO

XMEOUT Parameters: *date, time, applid, termid, conslid*

DFHZC6315 E *date time applid* **User** *userid* **is not authorized to install terminal** *tttt* **with preset security.**

Explanation: User *userid* was attempting to install terminal *tttt* but the userid does not have sufficient authority. This is because the terminal has preset authority (the definition for terminal *tttt* specifies a *userid* value.) Installing a resource with preset security requires special authorization.

System Action: Resource security violation messages are logged to the CSCS transient data queue and to the system console. The resource is not installed. CICS continues.

User Response: In order to install this resource, do one of the following:

- Use the CESN transaction to sign on with a userid that is permitted to install terminals with preset security.
- Ask your security administrator to authorize userid *userid* to install terminals with preset security. See the *CICS System Definition Guide* for guidance.
- Remove the USERID specification from the resource definition and install the resource without preset security.

Destination: CSMT

Module: DFHBSTS

XMEOUT Parameters: *date, time, applid, userid, tttt*

DFHZC6330 E *date time applid* **Install for** *tttt* **failed. LDCLIST parameter** *ldclist* **not found.**

Explanation: A resource *tttt* was being installed but was found to have an invalid LDCLIST *ldclist*.

System Action: The resource is not installed, CICS continues.

User Response: If you want the definition to be installed, use the DFHTCT TYPE=LDCLIST macro to define the listname.

Destination: CSMT

Module: DFHBSTBL

XMEOUT Parameters: *date, time, applid, tttt, ldclist*

DFHZC6331 E *date time applid* **Install for connection** *tttt* **failed. Non-VTAM terminal with same name already exists.**

Explanation: A connection *tttt* was being installed but a non-VTAM terminal with the same name already exists.

System Action: The resource is not installed; CICS continues.

User Response: Change the name of the connection and reinstall.

Destination: CSMT

Module: DFHBSS

XMEOUT Parameters: *date, time, applid, tttt*

DFHZC6332 E *date time applid* **Install for terminal** *tttt* **failed. Non-VTAM terminal with same name already exists.**

Explanation: A terminal *tttt* was being installed but a non-VTAM terminal with the same name already exists.

System Action: The resource is not installed; CICS continues.

User Response: Change the name of the terminal and reinstall.

Destination: CSMT

Module: DFHBSTZ

XMEOUT Parameters: *date, time, applid, tttt*

DFHZC6333 E *date time applid* **INSTALL for modename** *modename* **failed. Zero sessions specified**

Explanation: CICS has not installed a mode group *modename* because the maximum number of sessions specified was 0. The CEDA SESSION MAXIMUM parameter cannot be set to 0, so this was possibly caused by a storage overwrite, or by an invalid builder parameter set being shipped into CICS.

System Action: The install fails, but CICS continues.

User Response: Find the offending builder parameter set and set ZC_MAXSESS_1 to a minimum value of 1.

Destination: CSMT

Module: DFHBSM62

XMEOUT Parameters: *date, time, applid, modename*

DFHZC6340 E *date time applid* **CICS has detected an error in delete processing for** *termid***. Module name:** *modname***.**

Explanation: CICS has found terminal input output areas (TIOAs) chained to a TCTTE during deletion of a terminal. This is a CICS logic error.

System Action: A system dump is taken, the TCTTE is deleted and CICS continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

It would aid IBM support if you used the system dump to determine why TIOAs are still chained to the TCTTEs. The TIOAs are normally freemained before deletion.

Answers to the following questions would also be helpful:

- Is this is a shipped TCTTE?
- Why is the TCTTE being deleted?
- Is the correct TCTTE being deleted?

Destination: CADL

Module: DFHBST

XMEOUT Parameters: *date, time, applid, termid, modname*

DFHZC6341 E *date time applid* **Loop or ABEND has been detected in** *inmodule* **by module** *bymodule***.**

Explanation: CICS has previously detected a loop or abend. Module *bymodule* called module *inmodule* which looped or abended.

System Action: CICS issues message DFHZC0001 if an abend is detected or DFHZC0004 if a loop is detected. The install or delete being performed is backed out. CICS continues. Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: See the associated message for more guidance.

Destination: CADL

Modules: DFHBSM61 DFHBSTZS

XMEOUT Parameters: *date, time, applid, inmodule, bymodule*

DFHZC6350 I *date time applid* **The** *type* **session name BITMAP was corrupt and has been rebuilt. Error code: AP FB05.**

Explanation: A connection was being installed but the APPC or MRO session name BITMAP which is used to create a session name, was corrupt. The corrupt BITMAP has been rebuilt.

The APPC session name BITMAP is always used for an APPC session, however the MRO session name BITMAP is only used if the session name is prefixed with '<' or '>'.

System Action: A dump is taken with dumpcode ZC6350. Trace point ID AP X'FB05' is produced. The install continues. CICS continues.

User Response: Use the dump provided to determine the cause of the storage overwrite. See the *CICS Problem Determination Guide* for guidance on dealing with storage problems.

Destination: CSMT

Module: DFHZGBM

XMEOUT Parameters: *date, time, applid, type*

DFHZC6360 W *date time applid* **A GETMAIN failed to obtain storage for a message set.**

Explanation: A ZCP install has failed. This would normally result in a message being issued. However, the GETMAIN attempting to obtain storage from the CDSA for use as a message area has failed. This means that there is no more free storage available in the CDSA.

System Action: The message which should have reported the ZCP install failure cannot be issued. Subsequent messages also cannot be issued while there is no free storage available in the CDSA. However, subsequent messages can be issued if storage becomes available on subsequent GETMAIN attempts.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User Response: Use trace to determine the source of the problem. Trace point AP FCDD, the TBSM entry, gives the message number which should have been issued and the message insert data. Refer to the description of this message for further guidance.

Destination: CSMT

Modules: DFHBSMSG, DFHZATA2

XMEOUT Parameters: *date, time, applid*

DFHZC6361 E *date time applid {Install | Signon}* **for** *{netname | console | terminal }portname* **with userid** *userid* **failed because the preset userid is invalid.**

Explanation: The resource could not be installed or signed on with preset userid *userid* because the userid is not known to the external security manager (ESM).

System Action: CICS continues.

User Response: Correct the userid, or contact your security administrator to have the unknown userid added to your ESM. Then either reinstall the resource definition, or attempt to send a command to CICS via this console.

Destination: CSMT

Module: DFHBSTS

XMEOUT Parameters: *date, time, applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHZC6362 E *date time applid {Install | Signon}* **for** *{netname | console | terminal }portname* **with userid** *userid* **failed because the preset userid has been revoked.**

Explanation: The resource could not be installed or signed on with preset userid *userid* because the userid has been revoked by the external security manager (ESM).

System Action: CICS continues.

User Response: Contact your security administrator, who can reauthorize the revoked userid by issuing the ALTUSER RESUME function. Then reinstall the resource definition or try another command from the affected console.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: *date, time, applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHZC6363 E *date time applid {Install | Signon}* **for** *{netname | console | terminal }portname* **with userid** *userid* **failed because the preset userid's group access has been revoked.**

Explanation: The resource could not be installed or signed on with preset userid *userid* because the access of that userid to the group containing it has been revoked by the external security manager (ESM).

System Action: CICS continues.

User Response: Contact your security administrator who can restore the access of the preset userid to its group by issuing the CONNECT RESUME function. Then reinstall the resource definition or try another command from the console.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: *date, time, applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHZC6364 E *date time applid {Install | Signon}* **for** *{netname | console | terminal }portname* **with userid** *userid* **failed because the external security manager returned an unrecognized response.**

Explanation: The resource could not be installed or signed on with preset userid *userid* because of unexpected return codes from the external security manager (ESM).

System Action: CICS continues. Either message DFHSN1401 or DFHSN1801 is issued.

User Response: See the accompanying message for further guidance. Reinstall the resource definition or try another command from the console when you have corrected the problem.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: *date, time, applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHZC6365 E *date time applid {Install | Signon}* **for** *{netname | console | terminal }portname* **with userid** *userid* **failed because the external security manager is inactive.**

Explanation: The resource could not be installed or signed on with preset userid *userid* because the external security manager (ESM) is no longer active.

System Action: CICS continues.

User Response: Contact your security administrator to restart the ESM. Reinstall the resource definition or try the command from a console again when the ESM is active again.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: *date, time, applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHZC6366 E *date time applid {Install | Signon}* **for** *{netname | console | terminal }portname* **with userid** *userid* **failed because the userid is not authorized to access this CICS system.**

Explanation: The resource could not be installed or signed on with a preset userid because the preset userid is not authorized to use application *applid*.

System Action: CICS continues.

User Response: Contact your security administrator who can authorize the preset userid to access the application *applid* by issuing the PERMIT function for the APPL resource class. Then reinstall the resource definition or try the command again from the console.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: *date, time, applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHZC6367 E *date time applid {Install | Signon}* **for** *{netname | console | terminal }termid* **with userid** *userid* **failed because the SECLABEL check failed.**

Explanation: The resource could not be installed or signed on with preset userid *userid* because the security label associated with the userid in the external security manager (ESM) does not have the necessary authority.

System Action: CICS continues.

User Response: Contact your security administrator to assign a new security label to the preset userid. Then reinstall the resource definition or try the command from the console again.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: *date, time, applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, termid, userid*

DFHZC6368 E *date time applid {Install | Signon}* **for** *{netname | console | terminal }portname* **with userid** *userid* **failed because the external security manager is quiesced.**

Explanation: The resource could not be installed or signed on with preset userid *userid* because the external security manager (ESM) has been placed in a “tranquil” state and is not allowing new users to be added to the system.

System Action: CICS continues.

User Response: Contact your security administrator to establish when the ESM will be fully available again. When it is, reinstall the resource definition or try the command from the console again.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: *date, time, applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3= terminal }, portname, userid*

DFHZC6369 E *date time applid {Install | Signon}* **for** *{netname | console | terminal }portname* **failed because national language** *langcode* **is invalid.**

Explanation: The resource could not be installed or signed on because the national language *langcode* specified in the resource definition is not recognized.

System Action: CICS continues.

User Response: Change the national language on the resource definition to a valid value and reinstall the resource definition.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: *date, time, applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, langcode*

DFHZC6370 E *date time applid {Install | Signon}* **for** *{netname | console | terminal }portname* **failed because national language** *langcode* **is unavailable.**

Explanation: The resource could not be installed or signed on because the national language *langcode* specified in the resource definition is not supported in this run of CICS.

System Action: CICS continues.

User Response: Change the national language in the resource definition to one that has been initialized. Then reinstall the resource definition.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: *date, time, applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, langcode*

DFHZC6371 E *date time applid {Install | Signon}* **for** *{netname | console | terminal }portname* **with userid** *userid* **failed because the userid is not authorized to use this p ortname.**

Explanation: The resource could not be installed or signed on with preset userid *userid* because the specified userid is not authorized to use that resource.

System Action: CICS continues. Either message DFHSN1401 or DFHSN1801 is issued.

User Response: See the accompanying message for further guidance. Reinstall the resource definition or retry the command from the console when you have corrected the problem.

Destination: CSMT

Modules: DFHBSTS, DFHZCNA

XMEOUT Parameters: *date, time, applid, {1=Install, 2=Signon}, {1=netname , 2=console , 3=terminal }, portname, userid*

DFHZC6380 E *date time applid* **Install for connection** *cccc* **failed. Netname** *netname* **is the same as the member name of a generic resource connection** *grcon* **which is already in use.**

Explanation: A connection *cccc* was being installed but the netname *netname* is the same as the member name of a generic resource connection *grcon* which is already in use.

System Action: The resource is not installed. CICS continues.

User Response: If the NETNAME is incorrect, use CEDA to change it. Alternatively if you wish to communicate with the generic resource member by its member name, discard the generic resource connection after ending the VTAM affinity and try again.

Destination: CSMT

Module: DFHBSS

XMEOUT Parameters: *date, time, applid, cccc, netname, grcon*

DFHZC6590 I *date time applid termid tranid* **Node** *netname* **conversation restarted.** *sense* **((***instance***) Module name: {DFHZXRC})**

Explanation: The node specified has been switched to this system following an XRF takeover.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: None.

Destination: CSNE

Module: DFHZXRC

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZXRC, 2=DFHZXRC, 3=DFHZXRC, 4=DFHZXRC, 5=DFHZXRC}*

DFHZC6591 E *date time applid termid tranid* **Error processing XRF switch command.** *sense* **((***instance***) Module name: {DFHZXRC})**

Explanation: The terminal has been switched to this CICS system following an XRF takeover, but an error was encountered processing the response data.

For the meaning of the sense data, see the explanation on page 678.

System Action: The state of the session at takeover is uncertain and the session is unbound in order to reset the states. The session is simlogged on, and proceeds as a normal emergency restart.

User Response: Proceed as for a normal emergency restart.

Destination: CSNE

Module: DFHZXRC

XMEOUT Parameters: *date, time, applid, termid, tranid, sense, instance, {1=DFHZXRC, 2=DFHZXRC, 3=DFHZXRC, 4=DFHZXRC, 5=DFHZXRC, 6=DFHZXRC, 7=DFHZXRC, 8=DFHZXRC, 9=DFHZXRC, 10=DFHZXRC, 11=DFHZXRC}*

DFHZC6593 I *date time applid termid tranid* **Node** *netname* **backup session started.** *sense* **((***instance***) Module name: {DFHZOPX})**

Explanation: Node *netname* has successfully issued an OPNDST OPTCD=BACKUP command to the connected LU.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues.

User Response: None.

Destination: CSNE

Module: DFHZOPX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPX, 2=DFHZOPX}*

DFHZC6594 I *date time applid termid tranid* **Node** *netname* **backup session reset - active session ended.** *sense* **((***instance***) Module name: {DFHZSCX})**

Explanation: The backup system has received a “hierarchical reset” UNBIND on the backup session to the named terminal. This implies that the active session has ended normally.

For the meaning of the sense data, see the explanation on page 678.

System Action: CLSDST the backup session.

User Response: None.

Destination: CSNE

Module: DFHZSCX

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZSCX}*

DFHZC6595 I *date time applid termid tranid* **Node** *netname* **backup session not attempted.** *sense* **((***instance***) Module name: {DFHZOPN})**

Explanation: Before the OPNDST is issued, the backup system has abandoned the attempt to establish a backup session for one of the following reasons:

- There is no XRF support in VTAM (TCTVXRFS), or
- the TCTTE is flagged as a secondary. This CICS receives the BIND, but does not send it (TCTE2RY), or
- the TCTTE indicates that the LOGMODE keyword was specified on the terminal definition.

For the meaning of the sense data, see the explanation on page 678.

System Action: If this system takes over, the autoconnect process attempts to acquire a session. In this case, it probably takes longer for the session to become available for use.

User Response: Do not attempt a backup session.

Rectify error, or downgrade the recovery option specified for this terminal.

Destination: CSNE

Module: DFHZOPN

XMEOUT Parameters: *date, time, applid, termid, tranid, netname, sense, instance, {1=DFHZOPN, 2=DFHZOPN, 3=DFHZOPN}*

DFHZC6596 *applid* **CICS terminal control program cannot support XRF functions.** *sense* **((***instance***) Module name: {DFHZSEX | DFHZSLS})**

Explanation: The VTAM ACB has been opened, and the function level of the terminal control program (ZCP) and VTAM has been examined. It has been determined that XRF terminal functions cannot be supported in this execution of CICS.

This can be because one of the DFHZC*x* modules, or the TCT, was assembled against a version of VTAM earlier than 3.1, or because the level of VTAM that has just been opened is pre-3.1.

For the meaning of the sense data, see the explanation on page 678.

System Action: Processing continues. Processing continues, but no VTAM XRF functions can be supported.

User Response: If VTAM XRF functions are required, check the assembly of each of the DFHZC*x* modules and the TCT.

If a pre-3.1 release of VTAM was used in the assembly process, then a warning MNOTE will have been issued.

The relevant modules should then be reassembled against the correct level of VTAM.

If the assembly of all modules is correct, then the VTAM used in this execution is at a pre-3.1 level.

Destination: Console

Module: DFHZSEX,DFHZSLS

XMEOUT Parameters: *applid, sense, instance, {1=DFHZSEX, 2=DFHZSLS}*

DFHZC6598 *applid* **VTAM Shutdown in XRF Alternate system. CICS will abend.** *sense* **((***instance***) Module name: {DFHZTPX})**

Explanation: The TPEND exit has been driven because VTAM has been shutdown. This is an XRF Alternate system and it cannot continue without VTAM.

For the meaning of the sense data, see the explanation on page 678.

System Action: The system is abnormally terminated.

User Response: Determine why and how VTAM was shutdown.

Destination: Console

Module: DFHZTPX

XMEOUT Parameters: *applid, sense, instance, {1=DFHZTPX}*

DFHZC6901 W *date time applid* **Autoinstall BIND for NETNAME** *netname* **is invalid. Internal RC:***X'response'***.**

Explanation: The bind passed for AUTOINSTALL of a resource has shown an error in the bind image check call. The fixed part of the BIND is printed (this is the part on which the validation code operates — see the *SNA Network Protocol Formats* for details of the BIND RU). The internal return code X'*code*' identifies the location within the module that invalidated the BIND.

System Action: CICS continues but the session is not installed. The request is rejected and message DFHZC2411 is issued. The terminal is not usable until a VTAM LOGOFF command is issued.

User Response: Investigate the fixed part of the BIND data to determine the reason for the rejection. The internal return code gives more information that can be used by IBM to help you to determine the cause of the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CADL

Module: DFHZATA

XMEOUT Parameters: *date, time, applid, netname, X'response'*

DFHZC6902 E *date time applid* **Autoinstall failed because no** *{terminal | console}* **models are defined.**

Explanation: An attempt was made to autoinstall either a VTAM device or a console; however, there are no appropriate autoinstall models defined.

System Action: CICS processing continues, but the autoinstall logon attempt is rejected.

User Response: Use CEDA to define autoinstall model(s). For further information, refer to the *CICS Resource Definition Guide*.

Destination: CADL

Modules: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, {1=terminal, 2=console}*

DFHZC6903 W *date time applid* **Autoinstall for** *resource resid*, *{netname | consolename} id* **using model** *model* **failed.**

Explanation: The connection or terminal or console build process failed. The reason is given in a following DFHZC59xx, DFHZC62xx or DFHZC63xx message referring to the same *resid*. These messages are followed by message DFHZC6942.

System Action: Processing continues.

User Response: Refer to following messages for further information.

Modules: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, resource, resid, {1=netname, 2=consolename}, id, model*

DFHZC6904 W *date time applid* **Autoinstall for** *{netname | consolename} id* **failed. CATA task abended (abend** *abend*).

Explanation: Transaction CATA was autoinstalling a terminal or console, *id*, when the task abended with abend *abend*. If the resource being autoinstalled was a terminal, then the issuing module was DFHZATA. Otherwise, the issuing module was DFHZATA2 if the resource was a console. The *id* can be either a netname or a consolename.

System Action: CICS continues but the resource is not installed.

User Response: Retry the logon attempt. If the abend indicates a TIMEOUT and this occurs frequently, increase the CATA DTIMOUT value. If you do not want the CATA transaction to time out, remove the DTIMOUT parameter from the CATA DEFINE TRANSACTION command. However, if you do this, and if the system is short on storage, a large number of CATA transactions running at the some time with no other transactions present could cause a deadlock.

Destination: CADL

Modules: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, {1=netname, 2=consolename}, id, abend*

DFHZC6905 W *date time applid* **Autoinstall delete for** *resource resid*, *{netname | consolename} id* **failed. CATD task abended (abend** *abend*).

Explanation: Transaction CATD, program DFHZATD was deleting an autoinstalled *resource resid*, when the task abended with abend *abend*.

System Action: CICS continues. If the resource still exists, it is reused next time the same TERMID or SYSID is used.

User Response: See the description of abend *abend* for further guidance.

If the abend indicates a TIMEOUT and this occurs frequently, increase the CATD DTIMOUT value. If you do not want the CATD transaction to time out, remove the DTIMOUT parameter from the CATD DEFINE TRANSACTION command. However, a large number of CATD tasks running at the same time with no purgeable tasks present could cause a deadlock if the system is also short on storage.

Destination: CADL

Module: DFHZATD

XMEOUT Parameters: *date, time, applid, resource, resid, {1=netname, 2=consolename}, id, abend*

DFHZC6906 *date time applid* **Install or delete of remote terminal** *termid* **failed.** *tranid* **task abended (abend** *abend*).

Explanation: One of the functions of DFHZATS (transaction CITS, CDTS, CMTS or CFTS) has abended with abend *abend*.

System Action: CICS continues.

For CITS (remote install), if the remote terminal (skeleton) was actually built, CICS might use it.

For CDTS (remote delete), If the remote terminal (skeleton) has not been deleted, it might be reused.

For CMTS (remote mass delete), terminals which have not been deleted by CMTS might be deleted at a later stage.

For CFTS (remote mass flag), terminals which have been flagged for deletion might be deleted at a later stage. If any terminals have not been flagged, attempts might be made to reuse them. This can have unpredictable results.

User Response: See the description of abend *abend* for further guidance.

The most likely reason for this message is a timeout of CITS or CDTS. In the case of CITS, reissue your transaction if necessary.

If the TIMEOUTs occur frequently, consider increasing the CITS or CDTS DTIMOUT values. If you do not want the transactions to time out, remove the DTIMOUT parameter from the CITS or CDTS DEFINE TRANSACTION command. However, a large number of CITS tasks running at the same time with no purgeable tasks present could cause a deadlock if the system is also short on storage.

Note that CFTS and CMTS do not have a DTIMOUT parameter and should not be given one because they only run once after a warm or emergency restart and should not be allowed to time out.

Destination: CADL

Module: DFHZATS

XMEOUT Parameters: *date, time, applid, termid, tranid, abend*

DFHZC6910 W *date time applid* **Install for remote terminal** *termid* **failed.**

Explanation: An INSTALL for the remote terminal *termid* has failed. The reason for the failure is specified in associated DFHZC59xx and DFHZC62xx messages.

System Action: DFHZATS terminates abnormally with a CICS transaction dump.

User Response: See the associated messages for further guidance.

Destination: CADL

Module: DFHZATS

XMEOUT Parameters: *date, time, applid, termid*

DFHZC6911 W *date time applid* **Delete for remote terminal** *termid* **failed.**

Explanation: A DELETE for remote terminal *termid* has failed. Possible causes are that the terminal has already been deleted or that it is in use by another task.

If this message is repeated a number of times, there could be a more serious problem.

System Action: If the message is associated with message DFHZC6912, CICS continues normally. If message DFHZC6912 is not issued, DFHZATS is abnormally terminated with a transaction dump.

User Response: If the message is associated with message DFHZC6912, no action is necessary. If DFHZC6912 is not issued, see the associated DFHZC59xx, DFHZC62xx and DFHZC63xx messages for the reason for the DELETE failure.

Destination: CADL

Module: DFHZATS

XMEOUT Parameters: *date, time, applid, termid*

DFHZC6912 I *date time applid* **Unable to delete remote terminal.**

Explanation: This message is issued during a mass delete of remote terminals following a warm or emergency restart. A terminal which had been flagged for deletion could not be deleted. The most likely explanation is that the terminal has already been deleted by another task.

An associated DFHZC6911 message gives the identity of the terminal. This might be associated with one or more DFHZC59xx and DFHZC62xx messages giving the reason for the failure.

System Action: Processing continues normally.

User Response: See the associated messages for further information.

Destination: CADL

Module: DFHZATS

XMEOUT Parameters: *date, time, applid*

DFHZC6913 I *date time applid* **Remote delete of terminal** *termid* **failed. Terminal not found.**

Explanation: A remote DELETE has been attempted for a terminal which has already been deleted by another task.

System Action: Processing continues normally.

User Response: None.

Destination: CADL

Module: DFHZATS

XMEOUT Parameters: *date, time, applid, termid*

DFHZC6914 E *date time applid* **Autoinstall for resource** *termid***,** *{netname | consolename} id* **failed. Bad Return Code (RC =** *X'retcode'* **) from an internal function call.**

Explanation: The TCTTE build process failed due to the failure of an internal function call.

System Action: The terminal autoinstall process fails. CICS processing continues.

User Response: Retry the logon attempt.

Destination: CADL

Modules: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, termid, {1=netname, 2=consolename}, id, X'retcode'*

DFHZC6915 E *date time applid* **Unable to sign off remote terminal** *termid***. Bad Return Code (RC =** *X'SNUS_RESPONSE'* **) from signon domain call.**

Explanation: An unexpected response (INVALID, DISASTER or EXCEPTION) has been received on a call by DFHZATS to function SIGNOFF_TERMINAL_USER during sign-off processing for a remote terminal session running under CRTE.

System Action: The terminal sign-off process fails to complete and the terminal user remains signed on. CICS processing continues.

User Response: See the related message produced by the domain that detected the original error.

Destination: CADL

Module: DFHZATS

XMEOUT Parameters: *date, time, applid, termid, X'SNUS_RESPONSE'*

DFHZC6920 E *date time applid* **APPC autoinstall for NETNAME** *netname* **failed. RC** *x*

Explanation: An autoinstall attempt to install APPC NETNAME *netname* has failed. The autoinstall program call to the autoinstall control program failed with return code *x*.

The return codes are mapped from the program manager LINK_URM response and reason. More precise reasons for failure can be obtained from trace point PG 0A02.

System Action: CICS continues.

User Response: The appropriate response depends on the return code as follows:

1 The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.

2 The user exit program has no PPT entry. Ensure that the PPT entry for the user exit program exists and is valid.

3 The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.

4 The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.

5 Loading of the user exit program failed for some other reason. Check the DFHPGLU exit trace entry (PG 0A02) to see why the program manager was unable to load the program.

Destination: CADL

Module: DFHZGAI

XMEOUT Parameters: *date, time, applid, netname, x*

DFHZC6921 W *date time applid* **Autoinstall for NETNAME** *netname* **has been disallowed by the autoinstall control program. Code** *X'code'*

Explanation: An APPC connection not known to CICS has attempted to connect to CICS. However, the autoinstall control program has given a nonzero return code indicating that the install cannot go ahead.

If you do not support APPC autoinstall, the autoinstall control program (DFHZATDX is the default name) automatically returns a nonzero return code to disallow this function.

System Action: The exception trace entry *code* shows the parameter list for the autoinstall control program. The session is terminated. CICS continues.

User Response: The failure code X'*code*' is as follows:

X'FA07' If APPC autoinstall is not supported, use the *netname* to determine which device is attempting autoinstall.

If APPC autoinstall is supported, examine the autoinstall control program to determine why it has not set the return code to allow the install.

Destination: CADL

Module: DFHZGAI

XMEOUT Parameters: *date, time, applid, netname, X'code'*

DFHZC6922 E *date time applid* **Parameter list error during autoinstall for NETNAME** *netname***. Code** *X'code'*

Explanation: An APPC connection not known to CICS has attempted to connect to CICS. However, the autoinstall control program has returned an invalid parameter, or a parameter that has led to an invalid template being used.

System Action: The exception trace entry *code* shows the parameter list for the autoinstall control program. The session is terminated. CICS continues.

User Response: The failure code X'*code*' is one of the following:

X'FA08' No netname or sysid was supplied for the template. Change the autoinstall control program to supply either the netname or the sysid.

X'FA09' The sysid for the new connection has invalid characters. It can only contain A-Z a-z 0-9 and £#@ (where £ is X'5B') Redefine the connection name in the autoinstall control program.

X'FA0A' The sysid for the new connection already exists. Change the autoinstall control program to supply a unique name.

X'FA0B' CICS is unable to locate the supplied template netname. Change the autoinstall control program to supply the correct template name, or use CEDA to install the template connection.

X'FA0C' CICS is unable to locate the supplied template sysid. Change the autoinstall control program to supply the correct template sysid or use CEDA to install the template connection.

X'FA0D' The template is not an APPC connection. Change the autoinstall control program to supply the correct template name, or use CEDA to reinstall the template correctly.

X'FA0E' The bind indicates that a parallel session connection is required. The template is a single session connection. Change the autoinstall control program to supply the correct template name, or use CEDA to reinstall the template correctly.

X'FA0F' The bind indicates that a single session connection is required. The template is a parallel session connection. Change the autoinstall control program to supply the correct template name or use CEDA to reinstall the template correctly.

X'FA10' The modename in the bind does not match the modename in the connection.

For parallel sessions, the SNASVCMG modegroup is missing. The install for the template may have failed - check for any CADL messages mentioning the template name. The template connection may have been corrupted. Try and re-install the template.

For single sessions, the user modegroup name does not match. Change the autoinstall control program to supply the correct template name or use CEDA to reinstall the template correctly.

X'FA11' The program that attempted to INQUIRE on the template has detected an error in the template and is unable to create a BPS with which to install the new connection. This problem may be caused by a failure in the initial install of the template. Check the console and CADL log to determine whether the template installed correctly. Also, use CEMT to ensure that the CONNECTION is correct.

X'FA12' The program that attempted to INQUIRE on a user modegroup for the named template has detected an error in the template and is unable to create a BPS with which to install a user modegroup. This problem may be caused by a failure in the initial install of the template. Check the console and CADL log to determine whether the template installed correctly. Also use CEMT to ensure that the MODEGROUP is correct.

X'FA13' The template connection has no user modegroup. This problem may be caused by a failure in the initial install of the template. Check the console and the CADL log to determine whether the template installed correctly. Also, use CEMT to ensure that the MODEGROUP is correct.

X'FA14' The template connection is out of service so this install cannot continue. If the install should have been allowed to continue, put the relevant template connection INSERVICE using CEMT.

X'FA15' The incoming bind user data does not have a PLUNAME Network Name subfield (id 04). This is required and should have been supplied by the PLU.

X'FA16' The incoming bind user data does not have a MODENAME Network Name subfield (id 02). This is required and should have been supplied by the PLU.

Destination: CADL

Module: DFHZGAI

XMEOUT Parameters: *date, time, applid, netname, X'code'*

DFHZC6923 E *date time applid* **Unacceptable bind parameter during autoinstall for NETNAME** *netname***. Code** *X'code'*

Explanation: CICS has received a BIND from an unknown APPC node. The autoinstall process was initiated, but an invalid bind parameter has been detected. The parameter in error is indicated by the failure code X'*code*' which is one of the following:

X'FA18' There was no session instance ID field in the bind user data.

X'FA19' There was no primary logical unit (PLU) name in the bind user data.

X'FA1A' The PLU name in the bind user data is the same as the LU name of this CICS.

X'FA1B' Security information (an encryption seed) was expected, but not present, in the bind user data.

X'FA1C' Security information (an encryption seed) was found in the bind user data but its length was too high for it to be valid.

X'FA1D' Security information (an encryption seed) was found in the bind user data when none was expected.

X'FA1E' The received bind indicated that it was not negotiable. This is not acceptable for an APPC connection.

X'FA1F' The received bind specified a primary RU size of zero.

X'FA20' The received bind specified a secondary RU size of zero.

X'FA21' The received bind contained inconsistent access security indicators.

X'FA22' Two security information fields (seed and nonce field) were found in the received BIND where only one was expected.

X'FA23' The received BIND contained a nonce field with an incorrect length.

X'FA24' The received BIND did not contain a nonce field.

X'FA25' The received BINDs security mechanisms field length was smaller than the minimum defined by the Architecture.

X'FA26' The received BINDs security mechanisms field contained an invalid length for the mechanism identifier field.

System Action: The exception trace entry with trace point ID 'AP xxxx' (where xxxx is X'*code*') shows the bind that was received. The session is terminated. CICS continues.

User Response: Change the definitions on the connecting LU so that the bind parameters are acceptable to CICS.

Destination: CADL

Module: DFHZGAI

XMEOUT Parameters: *date, time, applid, netname, X'code'*

DFHZC6935 I *date time applid* **Autoinstall for** *restype resid* **with** *{netname | consolename} id* **using model or template** *model* **successful.**

Explanation: CICS has successfully installed resource *restype resid*, with id *id*, using model or template *model*. The *restype* can be TERMINAL or CONNECTION or CONSOLE depending on whether a terminal, an APPC connection, or a console has just been autoinstalled.

System Action: CICS continues.

User Response: None.

Destination: CADL

Modules: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, restype, resid, {1=netname, 2=consolename}, id, model*

DFHZC6936 I *date time applid* **Autoinstall for NETNAME** *netname***, model** *modelname* **in MTS control vector not known to CICS.**

Explanation: The VTAM MTS control vector contained a model name *modelname* not defined to CICS.

System Action: CICS continues. This message is informational.

User Response: There are four possible ways of correcting this problem:

- Use the CEDA transaction to define and install the autoinstall model
- Change the VTAM MTS MDLTAB MODEL= entry to the name of an existing autoinstall model.
- Logon to CICS with a MODEL= parameter that defines an existing autoinstall model.
- Code an Autoinstall User Program. Examples are given in the Customization Guide in the Sample Programs and Copybooks section.

Destination: CADL

Module:
DFHZATA

XMEOUT Parameters: *date, time, applid, netname, modelname*

DFHZC6937 I *date time applid* **Autoinstall for NETNAME** *netname***, MTS model** *modelname* **and bind image mismatch.**

Explanation: An autoinstall attempt occurred using the modelname printed. The MODEL BIND (from the CICS model definition) did not match with the incoming bind in CINIT. The MISMATCH_BITS show which bind bits did not match.

System Action: CICS continues.

User Response: There are four possible ways of correcting this problem:

- Change the CICS autoinstall MODEL *modelname* to produce a bind that matches the incoming CINIT.
- Change the MTS MDLTAB MODEL= entry to a model name defined to CICS whose bind matches the CINIT defined in the LOGMODE for this terminal.
- Change the VTAM LOGMODE for this terminal to match the chosen CICS MODEL_BIND.
- Code an autoinstall user program. Examples are given in the Sample Programs and Copybooks section of the *CICS Customization Guide*.

Destination: CADL

Module: DFHZATA

XMEOUT Parameters: *date, time, applid, netname, modelname*

DFHZC6939 W *date time applid* **Autoinstall for NETNAME** *netname*, **Invalid length** *nn* **found in cinit control vector at offset** *offset*

Explanation: CICS verification checks on the format of the control vectors in the CINIT have failed.

offset indicates the first point of failure. This is either a length field greater than 128, or a length field which would cause CICS to overrun the end of a CINIT vector or subvector.

This is either due to incorrect format of the CINIT RU (and therefore probably a VTAM logic error), or due to incorrect parsing of the CINIT RU by DFHZATD, which is a CICS logic error.

System Action: CICS continues. The logon request is rejected.

User Response: Inspect the format of the CINIT RU as captured by the autoinstall program for all rejected logon requests. The first point of failure may be at *offset* or before it since CICS verification checks are permissive.

If the format is incorrect, the origin of the invalid CINIT should be tracked and the problem resolved there.

If the format is correct, this is a CICS logic error. In this case you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: CADL

Module: DFHZATA

XMEOUT Parameters: *date, time, applid, netname, nn, offset*

DFHZC6942 W *date time applid* **Autoinstall for** *resource resid* **failed.**

Explanation: An AUTOINSTALL attempt to install *resource resid* has failed.

System Action: CICS continues.

User Response: For the cause of the failure, look for a previous message containing the same *resid*.

Destination: CADL

Modules: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, resource, resid*

DFHZC6943 W *date time applid* **Autoinstall delete for** *resource resid*, *{netname | consolename} id* **failed.**

Explanation: An AUTOINSTALL attempt to delete *resource resid* has failed.

System Action: CICS continues.

User Response: For the cause of the failure, look for a previous message containing the same *resid*.

Destination: CADL

Module: DFHZATD

XMEOUT Parameters: *date, time, applid, resource, resid, {1=netname, 2=consolename}, id*

DFHZC6944 W *date time applid* **Autoinstall for** *{netname | consolename} id* **failed. RC** *x*

Explanation: An autoinstall attempt to install terminal *id* has failed. The autoinstall program call to the user exit program failed with return code *x*. The *id* is either a netname or a consolename.

System Action: CICS continues.

User Response: Possible causes of the problem and an indication of how to solve them are given in the following list of return code meanings:

Return Code	***Meaning and solution***
1	The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.
2	The user exit program has no PPT entry. Ensure that the PPT entry for the user exit program exists and is valid.
3	The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
4	The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.

Destination: CADL

Modules: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, {1=netname, 2=consolename}, id, x*

DFHZC6945 W *date time applid* **Autoinstall delete for** *{netname | consolename} id* **failed. RC** *x*

Explanation: An autoinstall attempt to install resource *id* has failed. The issuing module, either DFHZATA or DFHZATA2, called the user exit program for DELETE but the user exit failed for reasons given in return code *x*. If the resource being installed was a terminal, the issuing module was DFHZATA. Otherwise, if a console was being installed, DFHZATA2 was the issuing module.

System Action: CICS continues.

User Response: Possible causes of the problem and an indication of how to solve them are given in the following list of return code meanings:

Return Code	***Meaning and solution***
1	The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.
2	The user exit program has no PPT entry. Ensure that the PPT entry for the user exit program exists and is valid.
3	The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
4	The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.

Destination: CADL

Modules: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, {1=netname, 2=consolename}, id, x*

DFHZC6946 W *date time applid* **Delete user exit for autoinstalled** *resource resid*, *{netname | consolename} id* **failed. RC** *x*.

Explanation: CICS has deleted the autoinstalled *resource resid*. The call to the delete user exit program failed for reasons given in return code *x*.

System Action: CICS continues.

User Response: Possible causes of the problem and an indication of how to solve them are given in the following list of return code meanings:

Return Code	***Meaning and solution***
1	The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.
2	The user exit program has no PPT entry. Ensure that the PPT entry for the user exit program exists and is valid.
3	The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
4	The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.

Destination: CADL

Module: DFHZATD

XMEOUT Parameters: *date, time, applid, resource, resid, {1=netname, 2=consolename}, id, x*

DFHZC6948 W *date time applid* **Delete for connection** *sysid*, **NETNAME** *netname* **failed due to CATD initiation failure. Module** *module*.

Explanation: CICS was attempting to delete an autoinstalled APPC connection *sysid* but the attempt failed because CICS was unable to initiate the CATD transaction. The specific circumstances depend on the module:

DFHZATR After a CICS restart transaction, DFHZATR was driven to delete autoinstalled connections but CATD failed to initate.

DFHZCLS Connection *sysid* was released and DFHZCLS was attempting to initiate the CATD transaction to delete the connection but CATD failed to initiate.

DFHZGCH An attempt was made to delete *sysid* after a sucessful CHANGE ENDAFFIN request however CATD failed to initiate.

System Action: The connection is left in a released state. CICS continues.

User Response: Ensure that the definitions for transaction CATD and program DFHZATD are correct. If you still wish to delete this connection, use CEMT DISCARD CONNECTION or EXEC CICS DISCARD CONNECTION.

Destination: CADL

Modules: DFHZATR, DFHZCLS, DFHZGCH

XMEOUT Parameters: *date, time, applid, sysid, netname, module*

DFHZC6950 W *date time applid* **Autoinstall for terminal** *termid* **failed with RC** *x*.

Explanation: An autoinstall attempt to install terminal *termid* has failed. The autoinstall program call to the user exit program failed with return code *x*.

System Action: CICS continues.

User Response: Possible causes of the problem and an indication of how to solve them are as follows:

Return Code	***Meaning and solution***
1	The user exit program is not linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.
2	The user exit program has no PPT entry. Ensure that the PPT entry for the user exit program exists and is valid.
3	The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
4	The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.

Destination: CADL

Module: DFHZATS

XMEOUT Parameters: *date, time, applid, termid, x*

DFHZC6951 W *date time applid* **Autoinstall for terminal** *termid* **failed with RC** *x*.

Explanation: An autoinstall attempt to install terminal *termid* has failed. The autoinstall program call to the user exit program failed with return code *x*.

System Action: CICS continues.

User Response: Possible causes of the problem and an indication of how to solve them are as follows:

Return Code	***Meaning and solution***
1	The user exit program is not linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.
2	The user exit program has no PPT entry. Ensure that the PPT entry for the user exit program exists and is valid.
3	The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.

Destination: CADL

Module: DFHZATMD

XMEOUT Parameters: *date, time, applid, termid, x*

DFHZC6958 W *date time applid* **Autoinstall for** *{netname | consolename} id***, resource** *X'termid'* **failed.** *{RESOURCE | PRINTER | ALTPRINTER}* **ID is invalid. RC=***n***.**

Explanation: The *RESOURCE*, *PRINTER*, or *ALTPRINTER* ID supplied by the AUTOINSTALL exit program is invalid. The return code *n* can be one of the following:

n	Meaning
1	Invalid blank in column one
2	Invalid imbedded blank
3	Invalid character used.

System Action: CICS continues but does not install the object.

User Response: Change the AUTOINSTALL exit program to create IDs that contain only valid characters. These are specified in the *CICS Customization Guide*.

Destination: CADL

Modules: DFHZATA, DFHZATA2

XMEOUT Parameters: *date, time, applid, {1=netname, 2=consolename}, id, X'termid', {1=RESOURCE, 2=PRINTER, 3=ALTPRINTER}, n*

DFHZC6966 I *date time applid* **Autoinstall delete for** *restype resid* **with** *{netname | consolename} id* **was successful.**

Explanation: CICS has successfully deleted the autoinstalled resource *restype resid*. The *restype* can be a terminal, an APPC connection, or a console.

System Action: CICS continues.

User Response: None.

Destination: CADL

Module: DFHZATD

XMEOUT Parameters: *date, time, applid, restype, resid, {1=netname, 2=consolename}, id*

DFHZC6987 W *date time applid* **Autoinstall best failure for NETNAME** *netname* **was model** *model***.**

Explanation: An autoinstall attempt has failed for lack of an exact match.

netname is the netname of the LU which failed to logon,

model is the name of the model that gave the best failure (that is, the one that had the fewest bits different from the BIND image supplied by VTAM).

The following associated information is also written to CADL:

xxxxxxxx... is a string of hexadecimal digits, where *xx* represents one byte, and each byte position represents the corresponding byte position in the BIND image.

CINIT BIND: *xxxxxxxx* is the bind image supplied by VTAM.

MODEL BIND: *xxxxxxxx* is the best model.

MISMATCH BITS: *xxxxxxxx* represents a comparison of the relevant bits from above. A bit set to '1' indicates a mismatch in that position between the BIND image from VTAM and the BIND image associated with the model.

System Action: CICS continues.

User Response:

1. Determine whether the model *model* is suitable. If there are several models which have options, such as TRANSECKEYS, then only the first such model is named in the above message. It will be up to the user-program to make the choice, when the logmode table entry is corrected.
2. Identify the entry in the VTAM logmode table that is being used.
3. Check that this logmode table entry is not successfully in use with other applications, so that to change it might cause this other use of it to fail.
4. Amend the logmode table entry by switching the bits corresponding to '1' bits in the mismatch string. That is, if the bit in the VTAM bind image corresponding to the bit position set to '1' in *xxxxxxxx*... is '1', set it to '0'. If it is '0', set it to '1'.

For further information, refer to the *CICS Customization Guide*.

More on the meaning of the various bits in a bind image may be found in *ACF/VTAM Programming* manual, (SC27-0611).

Details of the preparation of VTAM logmode table entries are given in *ACF/VTAM Customization* manual, (SC27-0613).

XMEOUT Parameters: *date, time, applid, netname, model*

DFHZExxxx messages

DFHZE2600 Syst.sense *systsense***,***termid***,***taskid***, Unidentified sense information**

Explanation: The error message writer (DFHEMW) was scheduled to send an error message, but could not identify the system sense code.

System Action: The task is abnormally terminated.

User Response: Refer to the associated messages that were issued previously for further information and guidance.

Destination: Terminal End User

Module: DFHZEMW

DFHZE2604 Syst.sense 0811,*termid***,***taskid***, Unprocessed data at detach**

Explanation: The task to be detached did not completely process the inbound data chain.

System Action: Purging of data is done until end-of-chain (EOC) or CANCEL has been received.

User Response: None.

Destination: Terminal End User

Module: DFHZDET

DFHZNxxxx messages

DFHZN2130 *date time applid* **A unit of work has been shunted but the connection with the remote system does not support the shunt protocols. Resources on the remote system may be out of sync with those on this CICS after the UOW is resynchronized. Failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *netname* **transaction** *tranid* **task number** *trannum* **operator terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuow'***.**

Explanation: This message is preceded by message DFHAC2231. An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction *tranid* has lost contact with its coordinator system during the indoubt period.

System Action: In accordance with the transaction definition, the unit of work is not completed. It is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

As part of this processing, CICS has attempted to pass on the shunt request to another partner system. However, this partner does not support the shunting protocols, and so this partner may backout or commit changes to its resources independently of this shunted unit of work.

User Response: Following resynchronization with the coordinator system, determine whether the remote function shipped resources are out of synchronization. The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the *CICS Intercommunication Guide* for information on design considerations in a distributed environment.

Destination: CSMT

Module: DFHCR2U

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, netname, tranid, trannum, termid, userid, netuowid, X'localuow'*

DFHZN2131 *date time applid* **Intersystem session failure during CICS synclevel one commit. Local resources may be out of sync with those on the remote system. Failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *netname* **transaction** *tranid* **task number** *trannum* **operator terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, a session failure occurred at a critical time during the synclevel 1 commit processing, and the synclevel 1 function shipped resources may have committed successfully or may have backed out.

System Action: CICS synclevel 1 commit processing continues, with the intention of committing as many synclevel 1 resources as possible. For APPC synclevel 1, CICS does not attempt to resolve the situation any further.

On completion of the syncpoint, CICS abends the user task.

User Response: Determine whether the remote function shipped resources are out of synchronization. The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the *CICS Intercommunication Guide* for information on design considerations in a distributed environment.

Destination: CSMT

Module: DFHCR2U

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, netname, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHZN2132 *date time applid* **Rollback received in response to CICS synclevel one commit. Local resources are out of sync with those on the remote system. Failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *netname* **transaction** *tranid* **task number** *trannum* **operator terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, when a commit message was sent to a synclevel 1 function shipped resource, the resource voted to backout.

System Action: Synclevel 1 commit processing continues with the intention of committing as many synclevel 1 resources as possible. For APPC synclevel 1, CICS does not attempt to resolve the situation any further.

On completion of the syncpoint, CICS abends the user task.

User Response: The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the *CICS Intercommunication Guide* for information on design considerations in a distributed environment.

Destination: CSMT

Module: DFHCR2U

XMEOUT Parameters: *date, time, applid, mm/dd/yy, hh:mm:ss, netname, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHZN2133 *date time applid* **Error detected during CICS synclevel one commit. Reason code** *rc***. Local resources may be out of sync with those on the remote system. Failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *sysid* **transaction** *tranid* **task number** *trannum* **operator terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'***.**

Explanation: A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, when a commit message was sent to a synclevel 1 function shipped resource, the reply indicated that an error has occurred. The reason code provides details of the error and has the following values:

01 Protocol violation by partner system – unexpected FMH data
02 Protocol violation by partner system – unexpected syncpoint message data
03 Abend received

04 Deadlock or read timeout.

System Action: CICS synclevel 1 commit processing continues, with the intention of committing as many synclevel 1 resources as possible.

For reason code 01, a transaction dump with dump code ASPI is taken. For reason code 02, a transaction dump with dump code ASPJ is taken. On completion of the syncpoint, CICS abends the user task.

User Response: The action to take depends on local procedures.

For reason codes 01 and 02, examine the dump to determine what message data was received from the partner. This information is held in one of the terminal input/output areas. A failure in the communication system might have caused corruption of the data.

Reason code 03 indicates that the partner system has sent an abend. There is an error in the partner system which may need to be investigated.

Reason code 04 indicates that the partner system took too long to respond to the synclevel 1 commit. There could be a problem with the remote system, or the communication system. It may be necessary to increase the deadlock timeout or read timeout values to prevent this recurring.

Destination: CSMT

Module: DFHCR2U

XMEOUT Parameters: *date, time, applid, rc, mm/dd/yy, hh:mm:ss, sysid, tranid, trannum, termid, userid, netuowid, X'localuowid'*

DFHZN2701 *date time applid* **Log data sent on ISC session is** *xxxxxxxx*

Explanation: This is an informational message. The transaction is communicating with a logical unit type LU6.2. It has sent an FMH (function management header) which carries log data.

System Action: The transaction continues processing.

User Response: None.

Destination: CSNE

Module: DFHZERH

XMEOUT Parameters: *date, time, applid, xxxxxxxx*

Chapter 2. AXM server environment messages

The following messages are issued by the authorized cross-memory (AXM) server environment, which is a package of run-time services used by the CICS shared temporary storage (TS) queue pool server. See the *CICS System Definition Guide* for more information about AXM and the CICS TS queue pool server.

Notes:

1. AXM messages are not issued by a CICS region and hence do not use the CICS message domain. They cannot be viewed with the CMAC transaction, suppressed with the XMEOUT user exit, or changed with the message editing utility.
2. These messages are normally displayed in mixed case English. If your terminals cannot display lowercase English characters, see the *CICS Customization Guide* for guidance on converting the messages to uppercase.

AXM error recovery messages

AXMER0001 ABEND *xxx-rr* **occurred at** *address***, data** *word1 word2 word3***.**

Explanation: The AXM error recovery routine has intercepted an abend in a task running under an AXM server region TCB. The abend code is shown as three hexadecimal digits for a system completion code or four decimal digits for a user completion code. The data consists of the twelve bytes around the PSW address as provided by MVS in the SDWA.

System Action: The error recovery routine will first call AXMWH which attempts to identify the module and procedure in which the abend occurred and writes out a further message if successful. After this, if recovery is allowed, the error recovery routine terminates the affected AXM internal task and resumes normal processing, otherwise it percolates the error, causing the server region to be abnormally terminated.

The system will normally produce a symptom dump message on the job log, and a full dump may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the server region JCL.

User Response: Look up the completion code to identify the cause of the abend.

Destination: Console and print file

Module: AXMER

AXMER0002 TRAP occurred at offset *offset* **in** *procname***.**

Explanation: An internal logic error in a server resulted in a TRAP macro being executed at the specified location.

The system will normally produce a symptom dump message on the job log, and a full dump may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the server region JCL.

System Action: The AXM task is abnormally terminated.

User Response: This probably indicates a logic error in server code, or an attempt to use some internal component of the server outside its correct context.

If the procedure name in the message begins with AXM, this probably indicates that the server code which called it has passed inconsistent parameters, such as an invalid address when releasing main storage.

Destination: Console and print file

Module: AXMER

AXM event management messages

AXMEV0001 AXM only supports operating system WAIT on MVS.

Explanation: An attempt has been made to issue an operating system WAIT within an AXM server, but the server is not running on MVS. In this case, the MVS POST exit mechanism used by AXM is unavailable and operating system waits cannot be supported.

System Action: The program is abnormally terminated.

User Response: None.

Destination: Console

Module: AXMEV

AXMEV0003 The AXM POST exit could not be created because AXM system services are not available.

Explanation: AXM server region initialization needed to define the MVS POST exit used by AXM for operating system waits, but AXM system services were not available within the current MVS image.

System Action: The server region is terminated with return code 8.

User Response: Start up AXM system services first then restart the server region. AXM system services are normally started at IPL using a subsystem definition in IEASSNxx specifying AXM as the subsystem name and AXMSI as the initialization routine. They can also be started up without an IPL by defining the subsystem dynamically using the SETSSI command.

Destination: Console and print file

Module: AXMEV

AXMEV0004 The AXM POST exit could not be created, return code was *rc***.**

Explanation: The MVS POST exit used by AXM for operating system waits could not be created because the AXM system services routine gave a non-zero return code. The only known reason for this is that AXM system services have been withdrawn, which should not be possible in a production environment.

System Action: The server region is terminated with return code 8.

User Response: None.

Destination: Console and print file

Module: AXMEV

AXMEV0005I The AXM POST exit had already been created for this address space.

Explanation: During server initialization, AXM system services found that the MVS POST exit used by AXM for operating system waits had already been created for this address space. AXM therefore bypassed trying to create the same POST exit again as this would have resulted in an abend 702-04.

This can occur when a previous server execution in the same address space was terminated abnormally.

System Action: Processing continues

User Response: None.

Destination: Console and print file

Module: AXMEV

AXMEV0006I The AXM POST exit could not be deleted, return code was *rc*.

Explanation: The MVS POST exit used by AXM for operating system waits could not be deleted because the AXM system services routine gave a non-zero return code. The only known reason for this is that AXM system services have been withdrawn, which should not be possible in a production environment.

System Action: Processing continues.

User Response: None.

Destination: Console.

Module: AXMEV

AXM stack (LIFO) storage messages

AXMLF0001S LIFO storage cannot be set up because the PRV size exceeds 4K.

Explanation: AXM initialization has detected that the total link-edited size of the pseudo-register vector (PRV) for the server application load module exceeds the maximum size of 4096 supported by AXM. The PRV contains task-related variables used by AXM resource management plus any task-related data areas defined by server code using the Assembler DXD operation code or Q-type address constants.

System Action: The server is abnormally terminated.

User Response: The server programmer needs to decrease the size of task-related variables defined in the PRV. When a large amount of task-related information needs to be stored, it is better to store the information in some separately acquired storage area (such as AXM heap storage) and put only a pointer to it in the PRV.

Destination: Console

Module: AXMLF

AXM lock management messages

AXMLK0001 Lock at *address* is already owned for shared use by this task.

Explanation: An AXM server program attempted to acquire exclusive ownership of an AXM lock which was already in shared ownership for the current task. This is not allowed, as the task cannot wait for itself.

System Action: The AXM lock request is rejected.

User Response: The server programmer needs to modify the program logic. It could for example use an AXM lock PROMOTE to convert the shared lock to an exclusive lock.

Destination: Console and print file

Module: AXMLK

AXMLK0002 *function* failed because lock at *address* is not owned by this task.

Explanation: An AXM server program tried to release, demote or promote an AXM lock but the lock was not owned by the current AXM task.

System Action: The AXM lock request is rejected.

User Response: The server program logic is in error.

Destination: Console and print file

Module: AXMLK

AXM operating system interface messages

AXMOS0001I The main procedure entry point is *name* at address *address*.

Explanation: This message is written to the print file during AXM initialization to indicate the name and entry point address of the server main procedure. This is primarily for debugging purposes.

System Action: Processing continues.

User Response: None.

Destination: Print file

Module: AXMOS

AXMOS0002 The main procedure is missing, or the END statement does not name the entry point.

Explanation: The AXM server load module which is being executed does not contain a procedure which has been identified as the AXM main procedure.

System Action: The server region is terminated with return code 16.

User Response: Check that the main procedure was correctly included in the link edit. If it was, make sure that its entry point name was correctly specified on the END statement and that it was assembled using AXM macros with the macro AXMSET appearing before the MODULE statement and the option ENVIRON=AXM specified on the MODULE statement.

Destination: Console and SYSPRINT

Module: AXMOS

AXM storage page pool management messages

AXMPG0001I The main free area above 16M was at address *xxxxxx*, size *nnnn*K.

Explanation: This message is written to the print file during AXM initialization to indicate the size of the largest area of 31-bit addressable private region storage available at that time.

System Action: Processing continues.

User Response: None.

Destination: Print file

Module: AXMPG

AXMPG0002I The main free area below 16M was at address *xxxxxx1*, size *nnnn*K.

Explanation: This message is written to the print file during AXM initialization to indicate the size of the largest area of 24-bit addressable private region storage available at that time.

System Action: Processing continues.

User Response: None.

Destination: Print file

Module: AXMPG

AXMPG0003I Storage page pool *areaname* created, address *xxxxxx*, size *nnnn*K.

Explanation: This message is written to the print file during AXM initialization to show the size and address of each storage page pool as it is created. Once this has been done, most AXM storage requests are allocated from this page pool rather than with MVS GETMAIN.

System Action: Processing continues.

User Response: None.

Destination: Print file

Module: AXMPG

AXMPG0004I Usage statistics for storage page pool *areaname*:

Explanation: This message shows statistics for the named storage page pool (since the most recent statistics reset, if any). It is automatically written to the print file at AXM region termination, and may also be requested at other times by the server.

The detailed message layout is as follows:

```
    Size    In Use  Max Used      Free  Min Free
      nK        nK        nK        nK        nK
    100%        n%        n%        n%        n%
              Gets     Frees   Retries     Fails
                 n         n         n         n
```

Each of the storage statistics is shown in two forms, as a number of kilobytes and as a percentage of the total size.

The individual fields have the following meanings:

Size	Total size of the storage pool.
In Use	The amount of storage which is currently in use.
Max Used	The highest amount of storage which has been in use.
Free	The amount of storage within the pool which is current free.
Min Free	The lowest amount of storage which has been free.
Gets	The number of requests to obtain storage within the pool.
Frees	The number of requests to release storage within the pool.
Retries	The number of times that a storage request initially failed and was retried after merging any adjacent small free areas to form larger areas.
Fails	The number of times that a storage request was unable to obtain the requested amount of storage even after a retry.

System Action: Processing continues.

User Response: None.

Destination: Print file

Module: AXMPG

AXM resource tracking messages

AXMRS0001 Tidy-up routine at *address* failed to free resource tracking cell.

Explanation: A server routine established an AXM resource tracking element specifying that a procedure was to be called to release the resource if the task was terminated without releasing the resource. The AXM task is now terminating, and the procedure identified in the tracking element was called, but the resource tracking element was still in existence when it returned. The entry point address of the relevant procedure is indicated in the message.

System Action: The tracking element is released on the assumption that the resource has now been deleted, and AXM task termination continues.

User Response: The server programmer needs to ensure that the procedure to release the resource also frees the resource tracking element.

Destination: Console and print file

Module: AXMRS

AXM server connection and system services messages

AXMSC0011I AXM system services initialization is in progress.

Explanation: AXM system services are being started up, normally as a result of being called by the AXM subsystem initialization routine.

System Action: Processing continues.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0012I AXM system services initialization has completed.

Explanation: AXM system services are now fully available in the current MVS image.

System Action: AXM cross-memory server connection requests and requests for the POST exit system services will now be accepted.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0013 AXM system services have already been initialized.

Explanation: An attempt was made to set up AXM system services again when they are already active in the current MVS image.

System Action: The attempt is ignored.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0021I AXM system services termination is in progress.

Explanation: AXM system services are being withdrawn. This is only possible if they were initialized using the AXM system region program AXMSR instead of being set up via subsystem initialization.

System Action: The AXM system services program call table is deleted and all entry points in the AXM system services anchor are replaced with dummy routines which return an indication that the service are not available.

User Response: Note that the results of attempting to call any AXM system service around this time are unpredictable. AXM system services should never be withdrawn in a production environment at any time when it is possible that they could be in use.

Destination: Console

Module: AXMSC

AXMSC0022I AXM system services termination has completed.

Explanation: AXM system services have been closed down for this MVS image.

System Action: AXM system services are no longer available.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0031I Connection to server *prefix.name* **has been opened.**

Explanation: The current region has established an AXM connection to the AXM server *prefix.name*.

System Action: Processing continues.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0032 Connection to server *prefix.name* **failed because the server was not found.**

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but could not do so because there is no active server of that name enabled for AXM connections.

System Action: The connection attempt is rejected with return code 8, reason code 32.

User Response: Ensure that the server is started and that its name was specified correctly.

Destination: Console

Module: AXMSC

AXMSC0033 Connection to server *prefix.name* **was rejected by the security system.**

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the request was rejected by the security system.

System Action: The connection attempt is rejected with return code 8, reason code 33.

User Response: See the previous AXM message giving details of the results of the security check.

Destination: Console

Module: AXMSC

AXMSC0034 Connection to server *prefix.name* **failed because all AXM connections are in use.**

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the maximum number of AXM connections supported within an MVS image (currently 4096) has been reached.

System Action: The connection is rejected with return code 8, reason code 34.

User Response: If you anticipate a need for more than 4096 AXM server connections within a single MVS image, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Destination: Console

Module: AXMSC

AXMSC0035 Connection to server *prefix.name* **failed because request limit** *reqs* **exceeds 9999.**

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the connection parameter specifying the maximum number of concurrent requests to be supported exceeds 9999.

System Action: The connection is rejected with return code 8, reason code 35.

User Response: Check whether the server interface program is specifying the correct value for the maximum number of concurrent requests.

Destination: Console

Module: AXMSC

AXMSC0036 Connection to server *prefix.name* was rejected by the server.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the server-defined connection exit rejected the request.

System Action: The connection is rejected with return code 8, reason code 36.

User Response: The reason for the rejection depends on the server code, but this typically occurs if the server is preparing to close down or has insufficient resources to accept another connection.

Destination: Console

Module: AXMSC

AXMSC0037 Connection to server *prefix.name* failed because the server is terminating.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but the server entered termination processing while the connection request was in progress.

System Action: The connection is rejected with return code 8, reason code 37. The instance of the server that was being terminated will no longer be visible to any new connection attempts.

User Response: Retry the connection when the server has been restarted.

Destination: Console

Module: AXMSC

AXMSC0038 Connection to server *prefix.name* failed because this address space is already connected to it.

Explanation: The current region tried to establish an AXM connection to the AXM server *prefix.name* but it already has a connection to the same server region. AXM does not support multiple connections from the same region to the same server region.

System Action: The connection is rejected with return code 8, reason code 38.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0041I Connection to server *prefix.name* has been closed.

Explanation: An AXM connection from the current region to the named server has been terminated, either as a result of being explicitly closed by this region or as a result of the termination of the MVS TCB which originally established the connection.

System Action: Processing continues.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0042 Connection close failed for token *xxxxxxxx*, reason is *n*.

Explanation: An attempt was made to close an AXM connection explicitly but the specified connection token did not refer to an active connection owned by the current region, or the connection could not be closed for some other reason.

The reason code indicates which validity check failed within procedure AXMSCCLS. Reason code 9 indicates that a request issued via the connection has not yet completed. Any other reason code probably indicates an incorrect token.

System Action: The attempt is rejected with return code 8, reason code 42.

User Response: Check that the connection close request is specifying the correct connection token and that there are no incomplete requests for the connection.

Destination: Console

Module: AXMSC

AXMSC0051I Server *prefix.name* is now enabled for connections.

Explanation: This AXM server has completed initialization and is now available for connections from other address spaces.

System Action: Processing continues.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0052 Server *prefix.name* cannot be enabled because it is already active in another address space.

Explanation: Only one instance of a given AXM server name can be active in an MVS image at a time.

System Action: The attempt to enable the server interface is rejected with return code 8, reason code 52.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0053 Server *prefix.name* cannot be enabled because caller is not APF authorized.

Explanation: AXM requires that an AXM server region must be running APF authorized in order to be allowed to enable its server interface.

System Action: The attempt to enable the server interface is rejected with return code 8, reason code 53.

User Response: Ensure that the server program is executed from an APF authorized library and is link-edited with AC(1).

Destination: Console

Module: AXMSC

AXMSC0054 Server *prefix.name* **cannot be enabled because the security system rejected the request.**

Explanation: The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System Action: The attempt to enable the server interface is rejected with return code 8, reason code 54.

User Response: See the previous AXM message giving details of the results of the security check.

Destination: Console

Module: AXMSC

AXMSC0061I Server *prefix.name* **is now disabled for connections.**

Explanation: This AXM server is terminating and is no longer available for connections from other address spaces. This occurs either when the server explicitly disables its interface or when the server job step task terminates.

System Action: Processing continues.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0062 Server disable failed for token *xxxxxxxx***, reason is** *n***.**

Explanation: An attempt to disable the server interface failed because the specified server interface token did not correctly identify an active server interface established by the current address space.

The reason code provides an internal indication of which validity check failed within procedure AXMSCDIS. All reason codes probably indicate an incorrect token.

System Action: The attempt to disable the server interface is rejected with return code 8, reason code 62. If the server interface is still enabled, it will be disabled automatically when the job step task terminates.

User Response: As the server interface token is stored internally by AXM, the only known possible reason for this message is storage overwriting within the server region.

Destination: Console

Module: AXMSC

AXMSC0063 Server *prefix.name* **cannot be disabled because caller is not APF authorized.**

Explanation: AXM requires that an AXM server region must be running APF authorized in order to be allowed to disable its server interface.

System Action: The attempt to disable the server interface is rejected with return code 8, reason code 63.

User Response: Ensure that the server program is executed from an APF authorized library and is link-edited with AC(1).

Destination: Console

Module: AXMSC

AXMSC0071 Server name *prefix.name* **has incorrect syntax for access checks.**

Explanation: The security checking routine has detected that the AXM server name specified on a connection request or on a server enable request is not in the correct form, for example because either the prefix or name is blank. This means that the security check cannot be performed.

System Action: A return code is set to indicate that the security check failed.

User Response: Check that the server prefix and name are specified correctly. The prefix is normally defined by the server, but the name may be set from a user-specified server parameter.

Destination: Console

Module: AXMSC

AXMSC0072 *level* **access authorization was denied for FACILITY** *facility***.**

Explanation: The external security manager has indicated that the current region is not authorized for the required level of access to the specified facility.

System Action: A return code is set to indicate that the security check failed.

User Response: Check whether the userid for the region has been authorized to access the specified facility resource name.

Destination: Console

Module: AXMSC

AXMSC0073 *level* **access authorization is unavailable for FACILITY** *facility***.**

Explanation: The external security manager has indicated that it is unable to determine whether the current region is authorized for the required level of access to the specified facility. This message is only issued if it is not possible for the security routine to determine whether security checking is actually required. In cases where it is obvious that no security check is required (for example because no external security manager is installed), access is granted anyway.

System Action: A return code is set to indicate that the security check failed.

User Response: Check whether the external security manager is available and whether the security definitions for the specified facility have been provided.

Destination: Console

Module: AXMSC

AXMSC0074 RACROUTE REQUEST=AUTH gave R15=*xxxxxxxx***, SAFPRRET=***xxxxxxxx***, SAFPRREA=***xxxxxxxx***.**

Explanation: This message provides additional details about the results of a security check in any case where access is not granted. See the documentation of the RACROUTE macro for further information.

System Action: Processing continues.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0075 RACROUTE REQUEST=STAT gave R15=*xxxxxxxx*, SAFPRRET=*xxxxxxxx*, SAFPRREA=*xxxxxxxx*.

Explanation: This message provides additional details about the results of a security check in any case where access is not granted. See the documentation of the RACROUTE macro for further information.

System Action: Processing continues.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0991I Creating new AXM system services anchor at *address*.

Explanation: This message is issued during AXM system services initialization to enable the system services anchor to be located if necessary for diagnostic purposes.

System Action: AXM system services initialization processing continues.

User Response: None.

Destination: Console

Module: AXMSC

AXMSC0992I Deleting old AXM system services anchor at *address*.

Explanation: This message is issued during AXM system services initialization if AXM system services were previously active but had been terminated (which is not possible in normal production environment). The old system services anchor is retained after AXM termination because it contains the system LX to be used if AXM is restarted. This message gives the address of the old system services anchor for diagnostic purposes.

System Action: AXM system services initialization processing continues.

User Response: None.

Destination: Console

Module: AXMSC

AXM subsystem initialization messages

AXMSI0001I AXM subsystem initialization is in progress.

Explanation: The AXM subsystem initialization program has been started in order to initialize AXM system services.

System Action: AXM system services will be loaded and initialized.

User Response: None.

Destination: Console

Module: AXMSI

AXMSI0002I AXM subsystem initialization has completed.

Explanation: The AXM subsystem initialization program has completed execution.

System Action: The program returns control to MVS.

User Response: None.

Destination: Console

Module: AXMSI

AXMSI0003 AXM subsystem initialization return code *retcode*, reason code *rsncode*.

Explanation: The AXM subsystem initialization routine has not completed normally. This message indicates the final return code and reason code. This is normally the return code from AXM system services initialization.

System Action: The subsystem initialization routine returns control to MVS.

User Response: See the previous AXM message describing the cause of the problem. The reason code will normally be the number of an error message issued by AXMSC.

Destination: Console

Module: AXMSI

AXMSI0004 AXM subsystem initialization can only run in Master Scheduler address space.

Explanation: An attempt has been made to invoke the AXM subsystem initialization program AXMSI in some other way than as an MVS subsystem initialization program running in the Master Scheduler region (ASID 0001).

System Action: The subsystem initialization program is abnormally terminated.

User Response: None.

Destination: Console

Module: AXMSI

AXM system region messages

AXMSR0001I AXM system region initialization is in progress.

Explanation: An AXM system region is being started. This is used to initialize AXM system services in a testing environment for development purposes, and allows AXM system services to be closed down and restarted without an IPL.

System Action: Processing continues.

User Response: None.

Destination: Console

Module: AXMSR

AXMSR0002I AXM system region initialization has completed.

Explanation: AXM system services have been successfully initialized from the AXM system region.

System Action: Processing continues.

User Response: The system region may be closed down again using the MVS STOP command but this should only be done when it is certain that no AXM services are being used within the MVS image.

Destination: Console

Module: AXMSR

AXMSR0003I AXM system region termination is in progress.

Explanation: The operator has requested termination of the AXM system region using the MVS STOP command.

System Action: AXM system services are terminated.

User Response: None.

Destination: Console

Module: AXMSR

AXMSR0004I AXM system region termination has completed.

Explanation: The AXM system region has completed termination.

System Action: Control is returned to MVS and the job step ends.

User Response: None.

Destination: Console

Module: AXMSR

AXMSR0011 AXM system region can only run under MVS/ESA.

Explanation: An attempt was made to execute the AXM system region program AXMSR in a non-MVS environment.

System Action: The system region program terminates.

User Response: None.

Destination: Console

Module: AXMSR

AXMSR0012 AXM system region program AXMSR needs to be APF authorized.

Explanation: An attempt was made to execute the AXM system region program AXMSR without APF authorization.

System Action: The system region program terminates.

User Response: Ensure that the module AXMSR is stored in an APF-authorized library and is link-edited with AC(1).

Destination: Console

Module: AXMSR

AXMSR0013 AXM system region LOAD for *name* failed with completion code *xxx-nn*.

Explanation: The attempt to LOAD the system services module (AXMSC) failed.

System Action: The system region program terminates.

User Response: See the description of the system completion code *xxx* in *MVS/ESA System Codes* for the reason that the LOAD failed.

Destination: Console

Module: AXMSR

AXMSR0021 AXM system region does not support this command: *text*

Explanation: An attempt was made to issue a command to the AXM system region using the MVS MODIFY command. The AXM system region only supports the MVS STOP command, and does not support commands entered via MODIFY.

System Action: The command is ignored.

User Response: If the intention was to close down the system region, use the MVS STOP command instead.

Destination: Console

Module: AXMSR

AXMSR0022I AXM system region STOP command has been accepted.

Explanation: An operator has issued a STOP command to close down the AXM system region.

System Action: AXM system services will be terminated.

User Response: None.

Destination: Console

Module: AXMSR

AXM trace and print file management messages

AXMTR0001 The *ddname* **print file could not be opened.**

Explanation: The AXM trace and print file with the specified ddname (usually AXMPRINT or SYSPRINT) could not be opened during AXM initialization.

System Action: Print file output requests will be ignored.

User Response: Ensure that the appropriate DD statement is present. The default ddname is AXMPRINT, but this may be overridden to SYSPRINT by an AXMTRDEF definition within the server code if the server does not need to reserve the name SYSPRINT for any other purpose.

Destination: Console

Module: AXMTR

AXM address lookup (WHERE) messages

AXMWH0001I Address *address* **is at +***offset* **in** *modtype* **module** *modname***.**

Explanation: This message may be produced after an abend or TRAP message to identify the module containing the error address, if the module is known to MVS. The information about the module and type is obtained using the MVS macros CSVQUERY or NUCLKUP.

System Action: Processing continues.

User Response: None.

Destination: Console and print file

Module: AXMWH

AXMWH0002I Address *address* **is at +***offset* **in procedure** *procname***.**

Explanation: This message may be produced after an abend or TRAP message to identify the procedure containing the error address, if the storage is within a known module and a standard SAVE sequence including a procedure identifier appears at some point before the error address.

System Action: Processing continues.

User Response: None.

Destination: Console

Module: AXMWH

AXM cross-memory interface messages

AXMXM0011 Server *prefix.name* **cannot be enabled because AXM system services are not available.**

Explanation: An attempt has been made to enable a server interface but AXM system services have not been initialized within this MVS image.

System Action: The server enable request is rejected.

User Response: Ensure that AXM system services are started then start the server again.

Destination: Console and SYSPRINT

Module: AXMXM

AXMXM0012 Enable failed for server *prefix.name***, return code** *retcode***, reason** *rsncode***.**

Explanation: The server interface could not be enabled. The specific reason will have been indicated by an earlier AXMSC message.

System Action: The server enable request is rejected.

User Response: None.

Destination: Console and SYSPRINT

Module: AXMXM

AXMXM0021 ABEND *xxx-rr* **occurred at** *address***, data** *word1 word2 word3***.**

Explanation: The ARR routine for an AXM cross-memory program call routine has intercepted an abend in a cross-memory mode AXM task and has passed the associated SDWA to a task in the server address space to issue the appropriate diagnostic messages. The abend code is shown as three hexadecimal digits for a system completion code or four decimal digits for a user completion code. The data consists of the twelve bytes around the PSW address as provided by MVS in the SDWA.

System Action: The ARR will already have completed processing when this message is issued, as the message is written out by the server region. If recovery is allowed, the ARR terminates the affected AXM internal task, in which case the return code from the cross-memory request will consist of the completion code in the usual MVS format but with the high-order bit set to indicate an abend. If recovery is not allowed, the ARR percolates the error, passing the abend to the requesting region.

The diagnostic routine which writes this message will call AXMWH which attempts to identify the module and procedure in which the abend occurred and writes out a further message if successful. It then releases the MVS SDWA. Server execution is not directly affected by an abend in cross-memory mode.

User Response: Look up the completion code to identify the cause of the abend.

Destination: Console and SYSPRINT

Module: AXMXM

AXMXM0022 TRAP occurred at offset *offset* **in** *procname***.**

Explanation: An internal logic error in a server module or invalid parameters on a server request resulted in a TRAP macro being executed at the specified location in cross-memory mode.

The system will normally produce a symptom dump message on the job log, and a full dump of the connected region may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the JCL for the connected region.

System Action: The AXM task is abnormally terminated.

User Response: This probably indicates a logic error in server code, or an attempt to use some internal component of the server outside its correct context.

If the procedure name in the message begins with AXM, this probably indicates that the server code which called it has passed inconsistent parameters, such as an invalid address when releasing main storage.

Destination: Console

Module: AXMXM

Chapter 3. Transaction abend codes

When abnormal conditions occur, CICS can send a message to the CSMT transient data destination containing the transaction ID, the program name and the abend code. Here is an example:

DFHAC2236 *date time applid* **Transaction** *tranid* **abend** *primary abcode* **in program** *program name* **term** *termid* **backout successful**
{ batchid = }batchid. message

Alternatively, the application can intercept abends by including an active EXEC CICS HANDLE ABEND command. The actual abend code can be determined by issuing the EXEC CICS ASSIGN command with the ABCODE option.

The transaction identification code *tranid* usually consists of the 4 characters defined to CICS. However, when a transaction is initiated by using a light pen, an operator identification (OPID) card reader, or 3270 PA or PF keys (specified in the TASKREQ= operand), CICS creates an internal transaction identification in the form of a 1-byte 3270 attention identification (AID) code followed by 3 bytes of X'FF'.

The code that may actually appear in the message in place of the internally-created transaction identification will be **xx**, where *xx* is the character translation of the 3270 AID code. To prevent ambiguity, the user should avoid using these codes as transaction identifiers.

The keys, the light pen (LPA), and OPID, and their corresponding printed AID codes are given in the following list:

PF1	*F1*	PF13	*C1*	LPA	*7E*
PF2	*F2*	PF14	*C2*	OPID	*E6*
PF3	*F3*	PF15	*C3*	PA1	*6C*
PF4	*F4*	PF16	*C4*	PA2	*6E*
PF5	*F5*	PF17	*C5*	PA3	*6B*
PF6	*F6*	PF18	*C6*		
PF7	*F7*	PF19	*C7*		
PF8	*F8*	PF20	*C8*		
PF9	*F9*	PF21	*C9*		
PF10	*7A*	PF22	*4A*		
PF11	*7B*	PF23	*4B*		
PF12	*7C*	PF24	*4C*		

An abend code indicates the cause of an error that may have been originated by CICS or by a user program. For most of the abend codes described, a CICS transaction dump is provided at abnormal termination.

All CICS transaction abend codes *abcode* are 4-character alphanumeric codes of the form **A***xxy*, where:

Aack 'M' is the IBM-assigned designation of a CICS transaction abend.

xx is the 2-character code assigned by CICS to identify the module that detected an error.

y is the 1-character alphanumeric code assigned by CICS.

Format of information

For each transaction abend code, the following information is given:

- An explanation of events leading to or following the message.
- The action that has been or will be taken by CICS (system action).
- The action recommended for the user (console or terminal operator).
- The module or modules that can determine that the message should be sent (not necessarily the module or modules that can issue the macro to write the message.)

AACA

Explanation: An invalid error code has been passed to the DFHTFP or DFHACP programs.

System Action: CICS terminates the task abnormally with a dump.

User Response: Notify the system programmer.

Module: DFHTFP,DFHACP

AALM

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the log manager (LM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHAMLM

AALN

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the TD manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMTD

AALO

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the CICS/DB2 table manager DFHD2TM. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMD2

AALP

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Program Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMPG

AALQ

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Business Application Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMBA

AALR

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Temporary Storage Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMBA

AALS

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Global Enqueue Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMBA

AALT

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Internet Inter-Orb Protocol Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMOP

AALU

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the Sockets Domain Manager. The domain that detected the original error provides a trace entry and possibly a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMSO

AAL1

Explanation: DFHALP was processing a request that deadlocked. The most likely reason for the abend is that an ALLOCATE QUEUE request has been suspended because there are no contention-winning links available.

System Action: CICS terminates the task abnormally. A dump is taken only if the abend is nontime-out related. A dump is not taken for stall purges and deadlock time-outs.

User Response: Ensure that there are enough contention-winning sessions available to satisfy the ALLOCATE QUEUE request.

If you are running with modegroups, ensure that there are contention-winning sessions available to satisfy the ALLOCATE request in that modegroup.

It might be necessary to increase the deadlock timeout (DTIMEOUT) value for the transaction to prevent this abend from recurring.

Module: DFHALP

AAL2

Explanation: Either an incorrect response (other than PURGED) was returned from the suspend of the allocated task, or an incorrect response was returned from the resume.

System Action: The transaction is abnormally terminated with a dump.

User Response: Check the return code from the resume or the suspend to determine the cause of the error.

Module: DFHALP

AAL3

Explanation: The task has been purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of a deadlock timeout.

Module: DFHALP

AAL4

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHALP

AAL6

Explanation: An error (INVALID, DISASTER or EXCEPTION response) has occurred on a call to SIGNOFF_TERMINAL_USER by DFHALP during sign-off for a surrogate terminal session running CRTE. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHALP

AAL7

Explanation: An error (INVALID, DISASTER or EXCEPTION response) has occurred on a call to schedule a remote terminal delete by DFHALP during sign-off for a surrogate terminal session running CRTE. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHALP

AAMA

Explanation: There is an internal logic error in DFHAMP.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMC

Explanation: The task was purged before a GETMAIN request to the storage manager domain was able to complete successfully.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate the reason the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

Module: DFHAMP

AAMD

Explanation: An unexpected return code has been received from DFHDMP. This is due to an internal logic error.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMF

Explanation: An unexpected return code has been received following a call to the kernel (KE) domain. This might be due to an internal logic error.

System Action: CICS terminates the task abnormally with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMG

Explanation: An unexpected return code has been received following a call to DFHAFMT. This might be due to an internal logic error.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMH

Explanation: An unexpected return code has been received following a call to DFHFCMT. This might be due to an internal logic error.

System Action: CICS terminates the task abnormally with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMI

Explanation: An unexpected return code has been received following a call to DFHFCRL. This might be due to an internal logic error.

System Action: CICS terminates the task abnormally with a dump. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

User Response:

Module: DFHAMP

AAMJ

Explanation: While installing a file, using RDO, a call was made to DFHFCFS to enable the file. An irrecoverable error was returned from DFHFCFS.

System Action: The task is abnormally terminated with a CICS transaction dump.

At the time the error is detected, CICS writes a message to the console, records an exception trace entry and takes a system dump.

User Response: Inform the system programmer. Examine the trace and the dump to identify the point of error.

Module: DFHAMP

AAMK

Explanation: While installing a file, using RDO, a call was made to DFHFCDN. An irrecoverable error was returned from DFHFCDN.

System Action: The task is abnormally terminated with a CICS transaction dump. At the time the error is detected, CICS writes a message to the console, records an exception trace entry, and takes a system dump.

User Response: Inform the system programmer, Examine the trace and dump to identify the point of error.

Module: DFHAMP

AAMN

Explanation: There has been an unexpected return code from a call to DFHPRPT. This might be due to an internal logic error.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMO

Explanation: An invalid return code was returned from DFHTOR, the CICS terminal object resolution program.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMP

Explanation: An unexpected return code has been received from DFHPUP. This might be due to an internal logic error.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMQ

Explanation: An attempt has been made to install a partner using RDO. However, the partner resource manager (PRM) is unavailable having failed to initialize during CICS initialization.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: If you need to use the PRM, correct the problem which prevented the PRM from initializing, and restart CICS.

Module: DFHAMP

AAMS

Explanation: There has been an unexpected return code following a GETMAIN request to the storage manager. This is due to an internal logic error.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMT

Explanation: There is an internal logic error in DFHAMP due to an unexpected return code from DFHTMP.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAMZ

Explanation: An unexpected return code has been received from DFHZCP. This is due to an internal logic error.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMP

AAM1

Explanation: DFHXMCL has returned an unexpected response during the install of a transaction class. This can be caused by the task being purged during the install.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

If an error has occurred, at the time the error is detected, CICS issues a DFHXM*nnnn* console message, records an exception trace entry and takes a system dump.

User Response: Determine why the task has failed. If there is a system dump, use it together with the trace entry and the console message to resolve the problem. If there is no system dump, the task has been purged either by the master terminal operator or as a result of deadlock timeout.

Module: DFHAMP

AAM2

Explanation: DFHXMXD has returned an unexpected response during the install of a transaction definition. This can be caused by the task being purged during the install.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

If an error has occurred, at the time the error is detected, CICS issues a DFHXM*nnnn* console message, records an exception trace entry and takes a system dump.

User Response: Determine why the task has failed. If there is a system dump, use it together with the trace entry and the console message to resolve the problem. If there is no system dump, the task has been purged either by the master terminal operator or as a result of deadlock timeout.

Module: DFHAMP

AAOA

Explanation: An application has issued a CPI verb which CICS does not support. The entry point referenced in the application program was resolved in the link edit stub, but the function requested could not be resolved when control passed to CICS.

There are two possible reasons for this:

- You have linkedited your application program with a CPI stub which supports more function than this release of CICS.
- The linkedit stub has been corrupted.

System Action: The transaction is abnormally terminated with a CICS transaction dump. An exception trace entry is also written.

User Response: At the time of the error, general register 0 points to an 8-byte character string which should match the name of the issued CPI call. Use the trace or the dump to verify that this character string is the name of a CPI function which is supported.

If the character string is not an intelligible character string, the stub has probably been corrupted.

Module: DFHCPI

AAOB

Explanation: An application has issued a CPI verb which specifies more than eight parameters.

System Action: The transaction is abnormally terminated with a CICS transaction dump and an exception trace entry is also written.

User Response: Change your application program so that the correct number of parameters is specified on the CPI call.

Module: DFHCPI

AAOC

Explanation: CPI Communications is invoked with an invalid number of parameters for call

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: The exception trace point produced with this abend contains the incorrectly issued CPI Communications verb name. Use this to determine where the application program was in error and amend it accordingly.

The *SAA CPI Communications Reference* manual, SC26-4399, provides a detailed description of all the CPI Communications verbs and how they should be called.

Module: DFHCPARH

AAOD

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate the reason the task was purged. It

was purged either by the master terminal operator or as a result of deadlock timeout.

Module: DFHCPCBI

AAOE

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate the reason the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

Module: DFHCPCBA

AAOF

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate the reason the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

Module: DFHCPCBS

AAOG

Explanation: During the processing of CMACCP (accept conversation), CPI Communications detected that the application was attached with an unsupported sync level.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This condition is caused by a back-end CPI Communications transaction being attached with a sync level that is not CM_NONE (0) or CM_CONFIRM (1).

Change the front-end transaction, (that is, the initiator of the conversation in the other system) so that it defines the sync level correctly.

Module: DFHCPCBA

AAOH

Explanation: Journaling of data sent on a CPI communications mapped conversation has failed. This condition is caused by a nonzero response from the CICS log manager.

Problem Determination: Register 12 addresses the current TCA and field TCAJCAAD and register 4 address the JCA. The log manager request is contained in JCATR2 and the response code is in JCAJCRC.

Possible request codes are:

```
X'8001' - WRITE
X'8003' - PUT
```

Possible response codes are:

```
X'01' - IDERROR - Journal identification error
X'02' - INVREQ  - Invalid request
X'03' - STATERR - Status error
X'05' - NOTOPEN - Journal not open
X'06' - LERROR  - Journal record length error
X'07' - IOERROR - I/O error.
```

The address of the TIOA is contained in register 8 and its data length is in TIOATDL.

Analysis:

Register	Label	Description
R4=@JCA	TCZARQPJ	JCAJCRC is nonzero.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the dump to ascertain why the journal or log record could not be written correctly. If a journal record length error is indicated, TIOATDL may have been corrupted.

Module: DFHCPCOJ

AAOI

Explanation: The journaling of data received on a CPI Communications mapped conversation has failed.

Problem Determination: Register 12 addresses the current TCA and field TCAJCAAD and register 4 address the JCA. The CICS log manager request is contained in JCATR2 and the response code is in JCAJCRC.

Possible request codes are:

X'8001' WRITE
X'8003' PUT

Possible response codes are:

X'01' IDERROR Journal identification error
X'02' INVREQ Invalid request
X'03' STATERR Status error
X'05' NOTOPEN Journal not open
X'06' LERROR Journal record length error
X'07' IOERROR I/O error.

The address of the TIOA is contained in register 8 and its data length is in TIOATDL.

Analysis:

Register	Label	Description
R4=@JCA	TCZARQPJ	JCAJCRC is nonzero.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This condition is caused by an invalid response from the log manager. Use the dump to ascertain why the journal or log record could not be written correctly. If a journal record length error is indicated, TIOATDL may have been corrupted.

Modules: DFHCPCRI, DFHCPCRW

AAOJ

Explanation: CPI Communications has detected an unexpected response from one of its internal routines.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This is a CICS internal logic error.

A level 2 trace for 'CP' of the transaction shows the course of events prior to this error. For example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPIC

AAOK

Explanation: CPI Communications has detected an unexpected call to one of its internal routines.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This is a CICS internal logic error.

A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPIC

AAOL

Explanation: CPI Communications has made an invalid call to DFHLUC.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This is a CICS internal logic error.

A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCLR

AAOM

Explanation: The CPI Communications and the DFHZUSR state machines are out of synchronization.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This is a CICS internal logic error.

A level 2 trace for 'CP' of the transaction shows the course of events prior to this error. For example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCPCLR, DFHCPSRH

AAON

Explanation: CPI Communications has detected an unexpected response from DFHLUC.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This is a CICS internal logic error.

A level 2 trace for 'CP' of the transaction shows the course of events prior to this error. For example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHCPCLR, DFHCPCLC

AAOO

Explanation: CPI Communications has been invoked with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: A level 2 trace for 'CP' of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPARH

AAOP

Explanation: The CPI Communications state machine has been requested to perform a state transition request that is considered to be an 'impossible' situation. (The *SAA CPI Communications Reference* manual, (SC26-4399) documents all these situations.)

There are two possible causes of this error:

- The CPC (conversation control block) has been overwritten in such a way that the conversation state has been altered, or
- There is an error in the CPI Communications state machine.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

The transaction dump shows the CPC. You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCFS

AAOQ

Explanation: The return code generated by CPI Communications does not have an entry in the state table against the current CPI Communications verb. This error is detected by the CPI Communications state machine.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This is a CICS internal logic error.

A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCFS

AAOR

Explanation: CPI Communications has detected an invalid value in the CPC (conversation control block).

There are 2 possible causes of this error:

- The CPC (conversation control block) has been overwritten, or
- There is an error in CPI Communications which causes it to reject valid values.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

Module: DFHCPIC

AAOS

Explanation: CPI Communications has detected that the conversation state is RESET for a situation where this should not occur. That is, the conversation control block (CPC) is about to be deleted.

There are two possible causes of this error:

- The CPC has been overwritten, or
- There is an error in CPI communications.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself. You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPIC

AAOT

Explanation: While chaining through the CPCs (conversation control blocks) for a given conversation, CPI Communications detected that the chain was broken.

There are two possible causes of this error.

1. The CPC chain has been overwritten, or
2. There is an error in the CPI Communications chaining mechanism.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Determine which of the above caused the error.

A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCBI

AAOU

Explanation: CPI Communications has detected an error in the TP_name or partner_LU_name while processing an initialize conversation request. The TP_name or partner_LU_name is obtained by lookup of the sym_dest_name in the partner resource table (PRT).

There are two possible causes of this error.

1. The entry in the PRT contains invalid data, or
2. There is an error in the mechanism that returns the data from the PRT and interprets it.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCBI

AAOV

Explanation: CPI Communications has detected that its internal state table is corrupted.

This error is detected by the CPI Communications state machine.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This is a CICS internal logic error.

A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCFS

AAOW

Explanation: CPI Communications has detected an internal logic error in DFHCPCLC.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This is a CICS internal logic error.

A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCLC

AAOX

Explanation: CPI Communications has detected a bad syncpoint return code which has been set on a synclevel 0 or 1 conversation. The bad return code is only expected on a synclevel 2 conversation.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This is a CICS internal logic error.

A level 2 trace for 'CP' of the transaction shows the course of events prior to this error, for example, the modules called and their parameters. The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPIC

AAOY

Explanation: CPI Communications detected an invalid LL field in the GDS records from which it was receiving on a mapped conversation.

Although it is possible that the remote system is sending invalid records, it is more likely to be an error in the receive logic because DFHZARRC (a lower level receive module) also checks the LLs before passing them to CPI Communications.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use CICS traces and, possibly a VTAM trace, to determine the data that was sent between both systems.

A level 2 CICS trace for 'CP' of the transaction documents the course of events prior to this error (such as the modules called and their parameters). The level 2 trace also provides details of the error itself.

You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCRB

AAOZ

Explanation: CPI Communications has detected an invalid ID field in the GDS records it was receiving on a mapped conversation. The exception trace point that accompanies this abend gives the ID field in data 3. The valid IDs are '12FF'X for application data and '12F1'X for null data.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use CICS traces and, possibly, a VTAM trace to determine the data that was sent between both systems.

A level 2 CICS trace for 'CP' of the transaction documents the course of events prior to this error (such as the modules called and their parameters). The level 2 trace also provides details of the error itself.

You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCRB

AAO2

Explanation: CPI Communications has detected an unexpected response from DFHLUC.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This is a CICS internal logic error.

A level 2 CICS trace for 'CP' of the transaction documents the course of events prior to this error (such as the modules called and their parameters). The level 2 trace also provides details of the error itself.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCBA

AAO3

Explanation: The CPI interface detected that a call was made to a CPI Communications function without CPI Communications being initialized. This implies that CPI Communications initialization failed while CICS was initializing.

System Action: The transaction is abnormally terminated with a CICS transaction dump. An exception trace entry is also written when this event occurs.

User Response: Check the console listing to determine the reason why CPI Communications failed to initialize during CICS initialization. Correct the problem and restart CICS.

If the console listing indicates that CPI Communications initialized successfully, you need further assistance to resolve the problem. Collect the console listing, the traces and the transaction dump. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPI

AAO4

Explanation: DFHZARL, or a module called by DFHZARL, has detected a logic error. This error is almost certainly caused by the module receiving invalid data or indicators from VTAM.

System Action: Before returning to the CPI Communications layer, DFHZARL calls DFHZNAC to clean up the session and put out messages on the CSNE log. CPI Communications abnormally terminates the transaction with a CICS transaction dump, and produces an exception trace entry.

User Response: Check the CSNE log to determine the type of error. You may need further assistance from IBM to fully resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPCLR

AAO5

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

Modules: DFHCPCBA, DFHCPCBI, DFHCPCBS

AAO7

Explanation: The CPI Communications syncpoint request handler has been passed an invalid DFHLUC parameter list. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: A level 2 trace for 'CP' of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPSRH

AAO8

Explanation: The CPI Communications syncpoint request handler has been passed an invalid conversation control block (CPC). This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: A level 2 trace for 'CP' of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPSRH

AAO9

Explanation: A task has been purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged.

If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

Module: DFHCPCLR

ABAC

Explanation: An activity issued EXEC CICS RETURN (without the ENDACTIVITY option) but no events were processed during the activation. The activity was executed with a RUN command.

System Action: The task is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

User Response: Investigate why the activity did not process any events.

Module: DFHBASP

ABAD

Explanation: An activity issued EXEC CICS RETURN ENDACTIVITY while there were activity completion events pending. The activity was executed with a RUN command.

System Action: The task is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

User Response: Investigate why the activity had pending activity completion events.

Module: DFHBASP

ABAE

Explanation: An activity issued EXEC CICS RETURN (without the ENDACTIVITY option) but no events were processed during the activation. The activity was executed with a LINK command.

System Action: The task which issued the LINK is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

User Response: Investigate why the activity did not process any events.

Module: DFHEIBAM

ABAF

Explanation: An activity issued EXEC CICS RETURN ENDACTIVITY while there were activity completion events pending. The activity was executed with a LINK command.

System Action: The task which issued the LINK is abnormally terminated with a CICS transaction dump. The EXEC CICS HANDLE ABEND command cannot handle this abend.

User Response: Investigate why the activity had pending activity completion events.

Module: DFHEIBAM

ABLA

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. It was purged either by the master terminal operator or as a result of deadlock timeout.

If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

Modules: DFHMCP, DFHMCPE, DFHM32, DFHPBP, DFHRLR

ABLB

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Please see the related message produced by the domain that originally detected the error.

Modules: DFHMCP, DFHMCPE, DFHM32, DFHPBP, DFHRLR

ABMA

Explanation: The user has supplied a terminal I/O area (TIOA) with an invalid data length that was either equal to zero or greater than the storage accounting length minus 12.

Alternatively, the length field of a header or trailer area provided by the application program is invalid (that is, not positive).

Problem Determination: The output services work area (OSPWA) is in user storage and will be printed in a transaction dump. It is addressed by register 2 at the time of the abend. Relevant fields are:

- OSPTR7
- OSPHDRA
- OSPTRLA

Register 4 or OSPTIOA points to the TIOA. In the TIOA, the following fields are relevant:

TIOATDL TIOASAL

Analysis:

Register	Label	Description
R4=@TIOA	PBCKTDL	TIOATDL is zero or greater than TIOASAL-12.
R2=@OSPWA R0=length of trailer R8=@trailer	PBD20080	R0 (= first halfword of trailer) is zero. R8=OSPTRLA. OSPTR7 has X'20' bit set.
R2=@OSPWA R8=@header R0=length of header.	PBDTXHDR	R0 (= first halfword of header) is zero. R8=OSPHDRA. OSPTR7 has X'40' bit set.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Correct the program that supplied the erroneous data length.

Check the TIOA. If either of the conditions described is present, check the application program. For programs using command-level interface, the TIOA is obtained by CICS using the length of the data item passed in the FROM option on an EXEC CICS SEND MAP or EXEC CICS SEND TEXT command, or in the TRAILER or HEADER option on an EXEC CICS SEND TEXT or an EXEC CICS SEND PAGE command. Check the data item for zero length.

Header and trailer records have a special format described in the *CICS Application Programming Reference*. An ABMA abend occurs if the first halfword (the length) is not positive. Check the remainder of the header/trailer record for validity when the length is checked.

Modules: DFHPBP, DFHMCP

ABMB

Explanation: The user has specified a cursor position in the BMS output request. It is larger than the current screen size for the 3270 for which output is being built.

Problem Determination: If the abend occurs in DFHPBP:

At the time of the abend, register 2 points to the OSPWA and register 1 to the TTP. Relevant fields are:

- OSPTR3 has X'10' bit set to indicate a user-specified cursor position
- OSPCP contains a halfword cursor position specified by user
- TTPSCSZ contains the halfword value of the screen size to compare against.

If the abend occurs in DFHMCP or DFHMCX:

- Register 6 points to the OSPWA (in LIFO storage)
- OSPCP contains a halfword cursor position specified by user
- OSPTR3 has X'10' bit set to indicate a user-specified cursor position
- OSPSCSZ contains the halfword value of the screen size to compare against.

Analysis:

Register	Label	Description
In DFHPBP:		
R2=@OSPWA	PBDBADC	OSPTR3 X'10' bit set indicates the user-
R1=@TTP		specified cursor position.
		TTPSCSZ halfword screen size.
		OSPCP halfword cursor position.
In DFHKCP or DFHMCX:		
R6=@OSPWA	MCENEAU2	OSPTR3 X'10' bit set indicates the user-
		specified cursor position.
		OSPSCSZ halfword screen size.
		OSPCP halfword cursor position.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Correct the program that specified the incorrect cursor location.

Use trace to identify the statement issuing the request. Check that the cursor position is being correctly set. The program may have been designed to run in alternate screen size mode but is being run in default screen size mode, or it may have been designed to run on a 3270 model different from the one in use. If the program is routing a message, the route list should be checked. If the program is to run with various 3270 models, the cursor position should be within the size of the smallest screen.

Modules: DFHPBP, DFHMCP (for minimum-function BMS), DFHMCX

ABMC

Explanation: The CMSG transaction is attempting to send a message to a greater number of terminals than is possible. There is no fixed maximum because the value depends on the other operands specified on the routing command.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Redefine the route list.

Module: DFHMCP

ABMD

Explanation: DFHTPR or DFHTPP has issued a DFHDI TYPE=SEND and has received a return code other than “FUNCERR-REQUEST FOR CHANGE DIRECTION SIGNALED” or “NORESP”

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Inform your system programmer.

Modules: DFHTPP, DFHTPR

ABME

Explanation: DFHTPR or DFHTPP has detected an invalid datastream while processing a basic mapping support (BMS) request.

System Action: The transaction is abnormally terminated with a CICS transaction dump in which register 7 indicates the location at which the abend was detected.

User Response: Examine the transaction dump for bad data in the TIOA. If the origin of the bad data is an application program, correct the program.

Modules: DFHTPP, DFHTPR

ABMF

Explanation: The value specified for the length option of the basic mapping support (BMS) send map is greater than the length of the ‘from’ area.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Redefine the value for the length option.

Module: DFHPBP

ABMG

Explanation: The user has requested a basic mapping support (BMS) service that was not specified at system generation, or at initialization.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Correlate services requested against options specified in the system generation of BMS.

Follow this procedure:

1. Scan the trace table for the transaction ID that issued the abend. If this is CSPQ (page cleanup), module DFHTPQ abnormally terminated because a message purge delay of zero has been specified and CSPQ has been entered via a terminal. The message purge delay is specified in the PRGDLAY of the DFHSIT macro, and its value can be found in SITPRGD.
2. Scan the trace table for the last BMS request (code ‘FA’). Use the option bytes at the start of the failing module to see if the requested functions have been generated. For example, paging may have been requested, but standard or minimum BMS was specified in the SIT.
3. If the BMS request is compatible with the BMS options in the CICS system generation, some incompatible suffixing amongst BMS modules must have occurred. This can happen if the DFHSIT macro specified individual suffixes for the BMS modules.

The following modules differ between standard and full-function BMS:

DFHMCP DFHRLR DFHPBP DFHTPP

Modules: DFHMCP, DFHTPQ

ABMI

Explanation: The map specified for a BMS input mapping request was not an input map.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Either define another input map or redefine the existing map.

Modules: DFHMCP, DFHMCX, DFHMCY

ABML

Explanation: The terminal control locate routine received invalid data from DFHRLR and returns with an error return code. DFHRLR is attempting to scan the TCT for a BMS ROUTE request with LIST=ALL or operator class or operator ID specified in the route list. The terminal control table may have been corrupted.

Problem Determination: Register 11 points to the current TCTTE in the search.

The TCT prefix (DFHTCTFX) can be located from CSATCTBA.

The first terminal entry (TCTTE) in the TCT is addressed by TCTVTEBA.

TCTTETEL is the halfword offset from current TCTTE to the next.

Analysis: The current TCTTE address is either not on a full-word boundary or is not within the limits of the TCT, or the address of the next TCTTE, obtained by adding TCTTETEL to the current address, is invalid. This check is made by locate code (DFHZLOC) in DFHZCX.

```
Register    Label    Description
R11=@TCTTE  RLRLOCN  Issue DFHTC CTYPE=LOCATE
```

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

The terminal control table has probably been corrupted during execution. Attempt to scan through the TCT in a dump. (Because the system dump uses the same technique for printing all TCTTEs, the system dump fails at the same point.)

Determine which entry is incorrect. It may be that the TCTTE has been overwritten by user data that is recognizable in the dump.

Check the application program for references to the TCTTE pointer. Check for user data that may be addressed from the same pointer.

In an assembler program, there may be multiple equates for the TCTTE base register.

It may be that the TCT is being overwritten by some earlier transaction. If this is so, it is probably one associated with the terminal whose TCTTE is overwritten.

Modules: DFHRLR for full-function BMS

ABMM

Explanation: An invalid map was specified.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the supplied dump to diagnose the problem. Register 6 contains the address of the BMS instruction being executed when the error was recognized.

Module: DFHPBP

ABMO

Explanation: The map specified for a BMS output mapping request was not an output map.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Either define another output map or redefine the existing map.

Modules: DFHMCP, DFHMCX, DFHMCY

ABMQ

Explanation: The query transaction (CQRY) has been initiated and either the task is not terminal-oriented, or the associated terminal is not defined to CICS as a 3270 or SCSPRINT device. This abend will occur if CQRY is entered at a console, even when the console is a 3270 device, since the console has the appearance to CICS of a keyboard/printer device. The CQRY transaction does not have an operator interface, and under normal conditions there is no need for an operator to invoke CQRY or for a user transaction to START the CQRY transaction. CQRY is run automatically by CICS when a 3270 or SCSPRINT device connects. In the transaction dump, register 8 contains the address of the TCTTE for the associated terminal. If register 8 contains zero, this indicates that the task is not terminal-oriented.

System Action: The task is abnormally terminated with a CICS dump.

User Response: Ensure that the terminal associated with CQRY is of the 3270 or SCSPRINT family of devices.

Module: DFHQRY

ABMR

Explanation: The Page Retrieval transaction (CSPG) has been initiated but the task is not terminal-oriented.

System Action: The task is abnormally terminated with a CICS dump.

User Response: Ensure that a terminal is associated with the CSPG transaction.

Module: DFHTPR

ABMU

Explanation: The application program supplied an address that is not within region boundaries. The low-order 3 bytes of general register 1 in the transaction dump contain the erroneous address. The high-order byte of register 1 indicates the address type as follows:

```
X'01'  Title address (TCAMSTA)
X'02'  Alternate I/O area address (TCAMSIOA)
X'03'  Map address (TCABMSMA)
X'04'  Header address (TCAMSHDR)
X'05'  Route list address (TCAMSRLA)
X'06'  Trailer address (TCAMSTRL)
X'07'  Map set address (TCAMSMSA)
X'08'  TIOA address (TCTTEDA)
```

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Correct the application program that is supplying the erroneous address.

Modules: DFHMCP, DFHEMS

ABMV

Explanation: DFHRLR has detected an invalid route list entry.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Check that the route list is correctly built with reserved field in the entry containing blank and a stopper of halfword X'FFFF' to terminate the list.

Module: DFHRLR

ABMX

Explanation: A text string passed to BMS contained a set attribute order that was invalid for one of the following reasons:

1. The set attribute sequence was less than three characters.
2. The attribute type was invalid.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the application program.

Module: DFHPBP

ABMZ

Explanation: The address of the terminal I/O area (TIOA) in TCTTEDA was found to be zero.

When using BMS fast path as a result of an EXEC CICS RECEIVE MAP, DFHEMS always initializes TCTTEDA with the address of the TIOA. If TCTTEDA is subsequently found to be zero by DFHMCX, an overwrite must have occurred.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Investigate why TCTTEDA is zero.

Scan the trace table for the last BMS request (code FA) for the failing task and try to determine which user programs have been given control since that BMS request.

Modules: DFHMCP, DFHMCX, DFHMCY

ABM0

Explanation: The map specified for a basic mapping support (BMS) request could not be located.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Check if the map has been defined. If it has, check that it has been specified correctly.

Modules: DFHMCP, DFHMCX, DFHMCY

ABM1

Explanation: A basic mapping support (BMS) service is requested by a task associated with a terminal that is not supported by BMS. The request is not a routing request.

Problem Determination: At the time of the abend, register 11 addresses the TCTTE, and TCTTETEA and register 6 address the TCTTE extension, TCTETTE.

Relevant fields are:

```
TCTTEDDS  the device dependent suffix.
TCTTEMSS  the map set suffix.
```

Analysis: DFHRLR tests the device dependent suffix and the map set suffix in the TCTTE extension. If both of these are zero, the terminal is not supported by BMS and DFHRLR abends the task with the abend code ABM1.

Register	Label	Description
R4=	RLRSFXCK	TCTEDDS=X'00' and TCTEMSS=X'00'.
@TCTTETE		The device dependent suffix and the map set suffix have loaded into the lower two bytes of register 3 by the subroutine RLRSUFXS.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Do not use terminals not supported by BMS for applications using BMS services.

Check the terminal type and model number. Confirm that it is a terminal that is not supported by BMS. A list of terminals supported by BMS is given in the *CICS Application Programming Guide*. Check that the TCT macro for the terminal accurately describes the physical terminal.

Module: DFHRLR

ABM2

Explanation: No user data was supplied for this BMS request. That is, the address of a user data area was not found in either TCTTEDA or TCAMSIOA.

When a BMS macro level output request is issued, the user must have placed the address of the data to be passed to BMS in TCTTEDA or TCAMSIOA before issuing the macro. The choice is made on the following criteria:

- If the data is to be passed in a TIOA by a terminal-oriented task, the address of this TIOA may be placed either at TCTTEDA, or in TCAMSIOA together with the setting of binary zeros into TCTTEDA.
- If the data is being passed by a terminal-oriented task but not in a TIOA, the address of the TIOA-like area of this data must be placed in TCAMSIOA and binary zeros set into TCTTEDA.
- If the data is being passed by a non-terminal-oriented task, the address of the TIOA-like area of this data must be placed in TCAMSIOA. TCTTEDA cannot be referenced, because there is no TCTTE associated with this task.

If a task attempts to pass addresses from both TCTTEDA and TCAMSIOA, the address in TCTTEDA is the one selected.

Problem Determination: The output services work area (OSPWA) is addressed by register 9. The TCTTE is addressed by register 11. The TCA is addressed by register 12.

The relevant fields are:

Field	Description
OSPIND01	OSPWA indicator byte 1
OSPIOA	Alternate I/O area address
OSPSIOA	Address of address of data (TCTTEDA/TCAMSIOA)
OSPTIOA	Address of user data found by BMS
OSPTR1-8	BMS request data saved from the TCA
TCTTEDA	Terminal data area address
TCAFCI	Facility control indicator
TCAMSIOA	Alternate I/O area address

Analysis: The ABM2 abend is invoked at one point in DFHMCP, at label MCPABEND. There are five regions in DFHMCP in which the user's data is sought:

	Labels
TYPE=MAP	MCPMAP
TYPE=PAGEBLD,DATA=YES/ONLY	MCPPGBLD MCPGTIOA
TYPE=TEXTBLD,DATA=YES/ONLY	MCPPGBLD MCPGTIOA
Mapping but not PAGEBLD,DATA=YES/ONLY	MCPMAPNG
No (mapping,PAGEBLD,TEXTBLD,PAGEOUT)	MCPDFALT

"Mapping" refers to BMS requests that specify maps, that is OSPTR3 bits 5 or 6 or 7 or OSPTR4 bit 3 set on.

Each of these functional regions does a BAL to subroutine MCPFTIOA to search for a user data area. If a valid area (abend ABMU if not) is found, its address is put into OSPTIOA and the address of the data address (of TCAMSIOA or TCTTEDA) is set into OSPSIOA. If a data area is not found, OSPTIOA is cleared and OSPSIOA is now loaded with the address of OSPTIOA as a null data area.

On the BAL return, OSPTIOA is tested for a nonzero value. If it is zero, a branch to MCPABEND is taken.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: The programmer must place the address of the data into TCTTEDA or TCAMSIOA, whichever is appropriate.

Firstly, check that the user has loaded TCTTEDA or TCAMSIOA with the address of the user data, by checking the application listing and the contents of TCTTEDA and/or TCAMSIOA.

Next, check that the BMS request has been correctly decoded by CICS by referring to the OSPWA request bytes (OSPTR1-8) or decoding the last BMS entry in the trace table. See OSPIND01 to check correct decoding of PAGEBLD or TEXTBLD, and TCAFCI bit 7 to identify whether the task is terminal-oriented or not.

At the abend point, register 1 contains the user data address last loaded, and register 4 the address of OSPTIOA as an address of null data.

If a CICS error is suspected, concentrate initially on subroutine MCPFTIOA, because this is a simple piece of code that shows the data-fetch logic. ABM2 condition is trapped early in the CICS decoding of the DFHBMS request and involves module DFHMCP only.

Case/Register	Label	Description
R9=@OSPWA	MCPMAP	OSPTR4 has OSPTRM (X'04') bit set for TYPE=MAP.
R9=@OSPWA	MCPPGBLD	OSPTR5 has OSPTRB (X'80') bit set and BMS sets bit OSPLMPB (X'08') in OSPIND01 for TYPE=PAGEBLD. OSPTR4 has X'40', X'80', or X'C0' set for DATA=NO, ONLY, or YES respectively, so should be X'80' or X'C0'.
R9=@OSPWA	MCPTXBLD	OSPTR7 has OSPTRX (X'80') bit set and BMS sets bit OSPLMTB (X'04') in OSPIND01 for TYPE=PAGEBLD. OSPTR4 has X'40', X'80', or X'C0' set for DATA=NO, ONLY, or YES respectively, so should be X'80' or X'C0'.
R9=@OSPWA	MCPMAPNG	OSPTR3 has OSPTSN (X'01'), OSPTSA (X'02'), or OSPTMN (X'04') bits set, or OSPTR4 has OSPTMA (X'10') bit set for mapping. OSPTR4 has X'04' or X'80' or X'C0' set for DATA=NO, ONLY, or YES respectively, so should be X'80' or X'C0'.
All R12=@TCA	MCPFTIOA	TCAFCI has TCAFCTRM (X'01') bit set if the task is terminal-oriented.
All R11=@TCTTE	MCPFTIOA	TCTTEDA could point to a use TIOA but does not, thus causing the abend.
All R12=@TCA	MCPFTIOA	TCAMSIOA could point to a user data area (TIOA or otherwise), but does thus causing the abend.
All R9=@OSPWA	MCPNTOTM	OSPTIOA contains the address of the user area found, so is zero. OSPSIOA points to OSPIOA (which is copied from TCAMSIOA) as being the second-dry data area sought by BMS for data . OSPIA (TCAMSIOA) was also zero so causing the abend.

Module: DFHMCP

ABM3

Explanation: A BMS input or output request has been issued from a task that is not terminal-oriented.

System Action: The task is abnormally terminated with a CICS dump.

User Response: The task issuing a BMS input or output request must be attached to a terminal.

Module: DFHMCP

ABM4

Explanation: An invalid request response has been received to a temporary storage PUT or PUTQ request issued by BMS. The data passed to the temporary storage program has an invalid length.

Problem Determination: Abend in DFHMCP (see Analysis)

The OSPWA (output services work area) is in user storage and is printed in a transaction dump. It is addressed by register 9 at the time of the abend. Relevant fields are:

```
OSPTITLE
OSPTTCNT
OSPPLTI
OSPTOTPG
```

The message control record (MCR) is an area of user storage obtained by BMS. It is addressed by register 8 at the time of the abend. The first 8 bytes contain storage accounting information. MCRLLBB contains the length of the MCR (halfword) abend in DFHTPP.

The page buffer is addressed by register 7 at the time of the abend. It contains storage accounting fields in the first 8 bytes and a halfword length at offset 8 (TSIOAVRL).

In both cases, the temporary storage use map (DFHTSMAP) is addressed from CSATSATA. TSMAPCOM contains the number of available bytes in a control interval on the temporary storage data set.

Analysis: If the temporary storage request preceding the abend is a DFHTS PUT, the abend occurred in DFHMCP. If the temporary storage request preceding the abend is a DFHTS PUTQ, the abend occurred in DFHTPP. If the abend occurred in DFHMCP, DFHMCP is attempting to put the message control record to temporary storage. Check the length of the MCR (MCRLLBB). It may be negative.

The length of the MCR is calculated by code following label MCPNODDS and is:

```
28 + 21 * OSPTTCNT + (length of title record)
                   + (space for page/LDC table,
                      if needed)
```

The address of the title record is at OSPTITLE and the length is contained in the first halfword. Space for the page/LDC table is required if OSPPLT1 is nonzero, which should occur only for messages routed to LDC devices (3600, 3650, 3767, 3770, 3790). The number of entries is in OSPTOTPG. 2 bytes are required per entry.

If the abend occurred in DFHTPP, BMS is attempting to add a page to the temporary storage queue, and the page buffer will not fit in the control interval. TSIOAVRL contains the length of the page buffer.

For messages directed to 3270 devices, the page buffer consists of a 3270 data stream with a 4-byte page control area following it (a 3270 data stream may be larger than the number of characters available on the screen, particularly if extended 3270 attributes are used). For messages directed to other devices, the page buffer consists of a message formatted with NL characters, a 4-byte page control area following it. The length in TSIOAVRL should be less than the length in the preceding storage accounting area, otherwise an error has occurred in constructing the page, possibly in prior BMS requests.

In either of the above cases, if the length of the area being output appears valid, it is necessary to increase the control interval size for the temporary storage data set.

Register	Label	Description
DFHMCP		
R8=@MCR	MCPMCRTS	The MCR is too long or has invalid length ($4).
DFHTPP		
R7=@pgbuf	TPNOPGL or TPNODDS	The page buffer is too large.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Determine from the trace table whether the abend occurred in DFHMCP or DFHTPP.

Check the length of the appropriate area.

If the MCR length is invalid, possible reasons are:

- The title record specified in the TITLE option on a BMS ROUTE request has an invalid format, that is, it does not begin with a halfword length field or is more than 64 characters.
- The message is being routed to more terminals than intended. OSPTTCNT is very large, for example, if LIST=ALL is specified on a ROUTE request and there are a large number of terminals in the TCT.

If the page buffer length is too large, this may be because more data than intended is being built into the page. If the page buffer length is greater than the length of the storage area indicated in the preceding storage accounting area, an error has occurred in page or text building, and the page buffer extends beyond the area allocated to it (that is, storage violation).

Modules: DFHMCP, DFHTPP

ABM5

Explanation: A DFHTS TYPE=PURGE request has been issued with an invalid REQID. This incorrect request was issued by basic mapping support (BMS).

DFHTPR cannot find the terminal identifier for the current terminal in the terminal list in the message control record (MCR).

Problem Determination: The TS identifier is built in TCATSDI before the TS purge is issued, although this has probably been overwritten before the dump is taken. The trace table entry for the DFHTS TYPE=PURGE contains the TS identifier in the last 8 bytes.

The OSPWA is addressed by register 9.

OPSTSID temporary storage identifier (8 bytes).

Register 8 points to the MCR.

Register 5 points to the current entry.

Register 0 points to the end of table.

Register 9 points to the TCTTE.

The terminal list starts at MCRIDLST and the terminal identifier is at the start of the terminal entry. Each terminal entry is X'15' bytes long.

Analysis: DFHMCP uses the temporary storage identifier in OSPTSID.

Cannot find the terminal identifier for this terminal in the terminal list in the MCR.

Register	Label	Description
R9=@(OSPWA)	MCPCKPGS	Code builds the temporary storage code in TCATSDI and issues DFHTS TYPE=PURGE macro, specifying IDERROR exit of MCPTSIDE, where the abend is raised.
R8=@(MCR)	TPRCKID	Code scans terminal list for a terminal entry that has the id of the current terminal, and if it cannot be found, links to TPRSNH to raise the abend.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Check the trace table and find the preceding PUT/PUTQ TS requests. Check whether the identifier for the PUT/PUTQ is the same as that for the PURGE. If it is not, find out how they differ. Check to see if the OSPWA has been corrupted.

This error is very unlikely, as the label indicates (TPRSNH - "Should Not Happen"). DFHTPS has scanned the MCR to identify the terminals to which this message is directed, and has created an AID to initiate CSPG (DFHTPR) at each of them. However, when DFHTPR retrieves the MCR, it cannot find the current terminal identifier in the list of terminals. Presumably the MCR has been corrupted between creation of the AID and dispatching of CSPG at the terminal. Check back through the trace table to find the instance of DFHTPS that built the AID for this terminal (transaction CSPS); it will have issued a TC LOCATE request to verify that the terminal identifier is valid, and this identifier can be seen in the trace entry.

Modules: DFHMCP, DFHTPR

ABM6

Explanation: Transaction CSPS, scheduled internally by BMS, has not been installed.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Install the transaction CSPS (Group DFHBMS).

Module: DFHMCP

ABM7

Explanation: The trailer specified to be used while building pages of text data is longer than the page.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Correct the application program that issues the request with too long a trailer.

Module: DFHPBP

ABM8

Explanation: A BMS text request specified a value for the JUSTIFY option which is zero or too large for the page being built.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Correct the application program that specified too large or zero value for the JUSTIFY option.

Module: DFHPBP

ABM9

Explanation: The text data overflow routines have been reentered while text overflow was in process. This condition occurs when the line requirements for the text header and/or trailer exceed the line capacity of the page for which data is being formatted.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Reduce the number of lines required for the header and/or trailer or increase the page size of the terminal.

Module: DFHPBP

ABNA

Explanation: No route list was supplied with a route request received from the remote system.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPS

ABNB

Explanation: Either the principal facility of the task is not a TCTTE of the correct type, or the task has no principal facility.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Ensure that DFHTPS has not been specified as the initial program of a transaction other than CSPS. Check that the operator did not enter CSPS from the terminal.

Module: DFHTPS

ABNC

Explanation: An attempt to access a temporary storage queue failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Ensure that temporary storage is correctly generated.

Module: DFHTPS

ABNE

Explanation: An error response was received from an invocation of a BMS TYPE=ROUTE or TYPE=STORE request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that BMS was correctly generated.

Module: DFHTPS

ABNF

Explanation: The transaction was not in send mode when it sent data to the remote system.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPS

ABNG

Explanation: An attach request was received from the remote system without any data indicating the reason for the request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPS

ABNH

Explanation: An attempt to ship data to the remote system failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPS

ABNI

Explanation: CICS could not find a profile for an LU6.2 transaction routing request.

System Action: CICS terminates the task abnormally.

User Response: Either you have specified an incorrect name in the PROFILE parameter of an EXEC CICS ALLOCATE command, or you have not installed the profile. Correct the error before resubmitting the transaction.

Module: DFHTPS

ABNJ

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of a deadlock timeout.

Module: DFHTPS

ABNK

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHTPS

ABRC

Explanation: The bridge exit is not defined and could not be autoinstalled.

System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User Response: Either define the program using RDO or change the program autoinstall exit to allow it to be autoinstalled.

Modules: DFHBRMS, DFHBRTC

ABRD

Explanation: The bridge exit is disabled.

System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User Response: Identify why the bridge exit is disabled. Enable the bridge exit and retry the action.

Modules: DFHBRMS, DFHBRTC

ABRE

Explanation: The bridge exit could not be loaded.

System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User Response: Investigate why it cannot be loaded. It may not have been defined in the DFHRPL library.

Modules: DFHBRMS, DFHBRTC

ABRF

Explanation: The bridge exit is defined as remote.

System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User Response: Define the bridge exit as a local program.

Modules: DFHBRMS, DFHBRTC

ABRG

Explanation: An invalid bridge facility token was specified

System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User Response: This error was probably caused by the incorrect data being sent to the bridge exit from the client application.

Check the data set by tracing the data sent from the client application.

Ensure that the bridge facility token in the data transmitted by the application is correct.

Module: DFHBRXM

ABRH

Explanation: The bridge facility token specified is not known to CICS.

System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User Response: The most likely error is that the client application specified too small a keep time for the bridge facility. Before the client reused the bridge facility token, CICS had already discarded it. Check the bridge facility keep time in the outbound messages. CICS will use the keep time value specified in the last message used by a transaction. Alternatively use the trace or CEDX to look at the keep time in the BRXA passed back on the terminate call to the bridge exit.

Another possible error is that the client application passed a request to a CICS system other than that on which the original request was sent. Bridge facilities are only valid on a single CICS system.

Module: DFHBRXM

ABRI

Explanation: There are no free bridge facility tokens available. This is probably due to excessive keep time values being specified on the bridge exit termination call.

System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User Response: Review the keep time values used by the client applications. If some client applications are returning excessive values, modify the bridge exit to specify a limit to the values.

Module: DFHBRXM

ABRJ

Explanation: An invalid FACILITYLIKE value was specified.

The FACILITYLIKE value can be specified on the bridge exit initialization call. If the default value (blanks) is returned, the value in the user transaction profile definition is used. If no FACILITYLIKE value is specified in the profile definition, a value of CBRF is used.

The name must be that of an installed VTAM 3270 terminal.

System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User Response: Define the terminal specified by FACILITYLIKE, change the value on the profile definition, change the value supplied by the client application, or install a terminal definition for CBRF

Module: DFHBRXM

ABRK

Explanation: The USERID check failed following the call to the bridge exit.

System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction will not be started.

User Response: Enter the correct password. If the password is correct or was not supplied, review the RACF definitions.

Module: DFHBRXM

ABRN

Explanation: The bridge exit returned a value in BRXA_RESP that is not valid for the command for which it was invoked.

System Action: The transaction is backed out.

User Response: Change the bridge exit to only return valid response settings.

Modules: DFHBRIC, DFHBRMS, DFHBRSP, DFHBRTC

ABRQ

Explanation: The bridge exit issued an abend.

System Action: The transaction is backed out.

User Response: Identify why the bridge exit abended.

Modules: DFHBRMS, DFHBRTC

ABRR

Explanation: The user transaction's profile could not be found.

System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction is not started.

User Response: Check that the profile name in the user transaction definition is correct, and that this profile has been defined.

Module: DFHBRXM

ABRS

Explanation: CICS was unable to obtain storage to create the bridge facility.

System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction is not started.

User Response: Identify why CICS is running short on storage.

Module: DFHBRXM

ABRY

Explanation: CICS returned an unexpected error running the bridge exit. This is a CICS internal error.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHBRMS, DFHBRTC

ABRZ

Explanation: The bridge exit returned invalid data in the BRXA.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: If a user supplied bridge exit was used, review the format of the data returned by the exit.

If a CICS supplied exit was used, this is a CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHBRIC, DFHBRMS, DFHBRSP, DFHBRTC, DFHXMBR

ABR3

Explanation: An unsupported BMS request was received by the bridge exit.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: The bridge only supports minimum function BMS and SEND TEXT. This transaction cannot be used in a bridge environment.

Module: DFHEMS

ABSA

Explanation: A message passed to DFHBSMSG is too long. This is a CICS internal error.

System Action: CICS terminates the task abnormally with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTBS

ABXA

Explanation: A next BRMQ vector in the input message passed to the formatter is the wrong type of a RECEIVE vector. RECEIVE and RECEIVE MAP have separate vectors.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: This may just indicate that the transaction has gone down an error path which should result in a transaction backout. If not, the input message should have a BRMQ vector for this command. Change the client application, recompile and retry.

Module: DFH0CBRF

ABXC

Explanation: An error occurred when a SYNCPOINT request was issued by the bridge exit.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check for other CICS messages and exception trace entries to investigate the cause of the SYNCPOINT error.

Module: DFH0CBRE

ABXD

Explanation: An error occurred when a SYNCPOINT ROLLBACK request was issued by the bridge exit.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check for other CICS messages and exception trace entries to investigate the cause of the SYNCPOINT ROLLBACK error.

Module: DFH0CBRE

ABXE

Explanation: The bridge exit was expecting data to be passed on the BRDATA parameter of the START command. No data was found.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the transaction which issued the START. Recompile, reload and retry.

Module: DFH0CBAE,DFH0CBRE

ABXF

Explanation: An error was detected by the bridge exit when it tried to input the next message.

System Action: An exception trace is made of any error information. The task is abnormally terminated with a CICS transaction dump.

User Response: Check for other CICS messages and exception trace entries to investigate the cause of the input error.

Module: DFH0CBAE,DFH0CBRE,DFH0CBAI

ABXG

Explanation: An error was detected by the bridge exit when it tried to output the next message.

System Action: An exception trace is made of any error information. The task is abnormally terminated with a CICS transaction dump.

User Response: Check for other CICS messages and exception trace entries to investigate the cause of the output error.

Module: DFH0CBAE,DFH0CBRE

ABXH

Explanation: The user transaction issued a request which requires more data (such as a RECEIVE request). No data was available in the message, and mqcih-conversationaltask was set to mqcct-no which specifies that the transaction is non conversational.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: This may be correct behaviour as defined by the client application. If it is not, the client application should either supply additional data, or be redesigned to allow the transaction to be conversational.

Module: DFH0CBRF

ABXI

Explanation: A message received by the bridge exit, exceeded the maximum message size.

System Action: An exception trace is made of the first 4K of data in error. The task is abnormally terminated with a CICS transaction dump.

User Response: Check that the client application is passing the correct data. If it is, it will be necessary to change the size of the buffer. This is in field block-length in the sample exit. Recompile and reload the exit and retry.

Module: DFH0CBAE,DFH0CBRE

ABXJ

Explanation: The bridge exit detected an error in the MQCIH header passed by the client application.

System Action: An exception trace is written containing the MQCIH header. The task is abnormally terminated with a CICS transaction dump.

User Response: The client application has either not set the MQCIH header, or is using a version of the header which is incompatible with the bridge exit. Correct the client application. Recompile, reload and retry.

Module: DFH0CBAE,DFH0CBRE

ABXK

Explanation: The bridge exit detected an error in the data passed on the BRDATA parameter of the START command.

System Action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the transaction which issued the START. Recompile, reload and retry.

Module: DFH0CBAE,DFH0CBRE

ABXM

Explanation: The bridge exit or formatter was called with a function or command which it doesn't support. This either indicates a storage overwrite, or that the bridge exit is not designed for this command.

System Action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

User Response: Check the BRXA data in the trace to see if there has been a storage overwrite, or whether the exit supports this command.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

ABXN

Explanation: The formatter detected that the input message was truncated.

System Action: An exception trace is made of the first 4K of the message. The task is abnormally terminated with a CICS transaction dump.

User Response: Check that the transport mechanism allows for messages of this length. If this is correct, it indicates that the client application is issuing an incorrect message. Trace the outbound message on the client application. Recompile, reload and retry.

Module: DFH0CBRF

ABXO

Explanation: The formatter detected an error in a BRMQ vector passed by the client application.

System Action: The field MQCIH-ERROROFFSET is set to indicate the position of the error in the message An exception trace is made of the MQCIH and BRMQ vector. The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the client application. Recompile, reload and retry.

Module: DFH0CBRF

ABXP

Explanation: The formatter detected an error in a BRMQ vector header passed by the client application.

System Action: The field MQCIH-ERROROFFSET is set to indicate the position of the error in the message An exception trace is made of the MQCIH and BRMQ vector. The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the client application. Recompile, reload and retry.

Module: DFH0CBRF

ABXQ

Explanation: The formatter could not find an ADSD vector as part of the BRMQ-RM vector when MQCIH-ADSDESCRIPTOR specified MQCADSD-MSGFORMAT.

System Action: An exception trace is made of the request. The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the client application. Recompile, reload and retry.

Module: DFH0CBRF

ABXS

Explanation: An error was detected by the bridge exit when it tried to open the queue for the input or output message.

System Action: An exception trace is made of any error information. The task is abnormally terminated with a CICS transaction dump.

User Response: Check for other CICS messages and exception trace entries to investigate the cause of the open error.

Module: DFH0CBRE

ABX1

Explanation: The bridge exit or formatter was called with an invalid BRXA-HEADER. This indicates a storage overwrite.

System Action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

As CICS also does a check of the BRXA on return from the call to the exit, there will probably be a subsequent ABRZ abend.

User Response: Investigate the cause of the storage error, and retry.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

ABX2

Explanation: The bridge exit or formatter was called with an invalid BRXA-TRANSACTION-AREA. This indicates a storage overwrite.

System Action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

As CICS also does a check of the BRXA on return from the call to the exit, there will probably be a subsequent ABRZ abend.

User Response: Investigate the cause of the storage error, and retry.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

ABX3

Explanation: The bridge exit or formatter was called with an invalid BRXA-COMMAND-AREA. This indicates a storage overwrite.

System Action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

As CICS also does a check of the BRXA on return from the call to the exit, there will probably be a subsequent ABRZ abend.

User Response: Investigate the cause of the storage error, and retry.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

ABX5

Explanation: The bridge exit or formatter was called without a user-area. This probably indicates an error in the bridge exit.

System Action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate the cause of the storage error, and retry.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

ABX6

Explanation: The bridge exit or formatter was called with an invalid user-area. This indicates a storage overwrite or an error in the bridge exit.

System Action: An exception trace is made of the data in error. The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate the cause of the storage error, and retry.

Module: DFH0CBAE,DFH0CBRE,DFH0CBRF

ABX7

Explanation: A TC command passed to the formatter, exceeded the maximum message size.

System Action: An exception trace is made of the first 4K of data in error. The task is abnormally terminated with a CICS transaction dump.

User Response: Check that the user transaction is passing the correct data. If it is, it will be necessary to change the size of the buffer. This is in field block-length in the sample exit. Recompile and reload the exit and retry.

Module: DFH0CBRF

ABX8

Explanation: A next BMS BRMQ vector in the input message passed to the formatter does not contain the mapset requested to answer a RECEIVE MAP request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: This may just indicate that the transaction has gone down an error path which should result in a transaction backout. If not, the input message should have a BRMQ vector for this mapset. Change the client application, recompile and retry.

Module: DFH0CBRF

ABX9

Explanation: A next BMS BRMQ vector in the input message passed to the formatter does not contain the mapname requested to answer a RECEIVE MAP request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: This may just indicate that the transaction has gone down an error path which should result in a transaction backout. If not, the input message should have a BRMQ vector for this mapname. Change the client application, recompile and retry.

Module: DFH0CBRF

ACAA

Explanation: This explanation applies to the two transaction abend codes, ACAA and ACAD. CICS cannot find a match for a function code in the language definition table because the parameterized resource definition contains an unrecognized resource type code. The abend code issued depends on the DFHCAP operation that was invoked before the error occurred:

Abend	DFHCAP operation
ACAA	ANALYZE
ACAD	DEFAULTS

The cause of the abend is either:

- The language definition table, DFHEITCU, in the library is invalid for the release of CICS you are running, **or**
- A CICS logic error has occurred.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: Ensure that the DFHEITCU module is in the library and is valid for this release of CICS.

If a valid version of DFHEITCU is already in the library, a CICS logic error has occurred. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

ACAD

Explanation: See **ACAA**.

Module: DFHCAP

ACAI

Explanation: An internal error has occurred when module DFHCAP was invoked. There was an invalid function code for a domain call to DFHCAP.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

ACAJ

Explanation: An internal error has occurred when module DFHCAP was invoked while processing an EXEC CICS CREATE command. The preallocated dynamic storage area was too small.

System Action: The transaction executing the EXEC CICS CREATE command is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCAP

ACAM

Explanation: An internal error has occurred when module DFHECBAM was invoked while processing a CBAM transaction.

System Action: CBAM is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHECBAM

ACCx

Explanation: Abend codes with 'ACC' as the first three characters are issued by the C/370 compiler running under CICS. These are documented in the *C/370 User's Guide*.

ACFA

Explanation: During the loading of a Coupling Facility Data Table by the CFCL transaction, an abend was detected or a domain call returned a response (such as DISASTER) after which normal processing could not continue.

System Action: A message is issued (one of DFHFC7100, DFHFC7101, DFHFC7103 or DFHFC7104). Loading of the data table is terminated and CFCL abends.

User Response: If this abend is produced as a result of an abend during loading, message DFHFC7103 is issued. If it is a result of a domain call failure, depending on which domain the failure was returned by, one of the messages DFHFC7100, DFHFC7101 or DFHFC7104 is issued. Refer to the description of the message for further information and guidance.

Module: DFHFCDL

ACFB

Explanation: A transaction has issued a request to a coupling facility data table for which it holds an active lock, but after the lock was acquired, the coupling facility data table server for the pool in which this coupling facility data table resides failed and was restarted. This request is of a type which cannot continue against a new instance of the server, because it is reliant on the lock which was acquired before the server failed.

System Action: The requesting transaction abends with a transaction dump.

CICS continues normally.

User Response: Retry the failed transaction.

Module: DFHEIFC

ACFC

Explanation: A transaction has issued a request to a coupling facility data table which was last accessed using a previous instance of the coupling facility data table server (that is, the server for the pool in which this coupling facility data table resides has failed and been restarted one or more times since the last access). We therefore need to reopen the access between this CICS file and the coupling facility data table, but the attempt to reopen access has failed.

System Action: The requesting transaction abends with a transaction dump.

CICS continues normally.

User Response: Retry the failed transaction. If the error continues to occur, issue an explicit close request for the file, followed by an explicit open request.

Module: DFHEIFC

ACFD

Explanation: During the loading of a Coupling Facility Data Table by the CFCL transaction, a call to the CICS Transaction Manager has returned a response (such as DISASTER) after which normal processing could not continue.

System Action: Message DFHFC7121 is issued. Loading of the data table is terminated and CFCL abends.

User Response: Refer to the description of the message for further information and guidance.

Module: DFHFCDL

ACFE

Explanation: An attempt was made to attach a transaction specifying DFHFCDL as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCDL is for use by CICS system transaction CFCL. This loads a Coupling Facility Data Table.

System Action: The transaction is abnormally terminated. CICS processing continues.

User Response: Establish why an attempt was made to attach CFCL illegally, or why a transaction definition specified DFHFCDL as the program to be given control.

Module: DFHFCDL

ACHA

Explanation: The remote server transaction, CEHS, is not at a compatible level to operate with the CICS/CMS system. This usually indicates that the service levels of CICS/CMS and the remote server are different.

Problem Determination: To diagnose a problem with the remote server, it is generally helpful to obtain a trace of the remote server's activity up to the point of failure.

A remote server trace is obtained by invoking the remote server with the TRACE option, (type CEHS TRACE). The remote server operates as normal but causes entries to be written to a trace log in temporary storage. Note that main storage, not auxiliary, is used for this queue hence large amounts of memory can be used up if this trace is left on for long.

The trace is found in a queue whose name is 'CEHS*xxxx*', where '*xxxx*' is the four-character terminal identifier. The queue can be browsed in text form or in hexadecimal form using CEBR. To find the terminal identifier, invoke CEBR on the terminal that has run CEHS, without giving a queue name. The queue name will default to 'CEBR*xxxx*', where '*xxxx*' is the terminal identifier.

Note: CEBR requires the queue name to be in UPPER CASE.

For a description of the remote server and its trace entries and abend codes, see the *CICS/VS Remote Server Diagnosis Manual* (LC33-0438).

System Action: CICS terminates the remote server transaction abnormally with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHB

Explanation: The remote server has received a data frame from CICS/CMS that is out of sequence. A frame may have been lost in transmission.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHC

Explanation: The remote server did not receive the expected acknowledgement type data frame from CICS/CMS.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHD

Explanation: The remote server did not receive the expected response type data frame from CICS/CMS.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHE

Explanation: The remote server received an unexpected data frame from CICS/CMS. This indicates a logic error in the remote server.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHF

Explanation: The remote server attempted to send one of a series of data frames to CICS/CMS when, at this time, only a single frame is allowed. This indicates a logic error in the remote server.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHG

Explanation: The remote server attempted to send data to CICS/CMS. However, it was not set to the correct mode to do so. This indicates a logic error in the remote server.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHH

Explanation: A TIOA has not been created from the data received by the remote server from CICS/CMS.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHI

Explanation: The remote server has received an unexpected return code from the Transformer 2 program.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: For further information, see the 'Problem Determination' section for abend code ACHA.

Module: DFHCHS

ACHJ

Explanation: An error has occurred processing a request from CICS/CMS which had the 'No-Reply' option. The remote server cannot, therefore, return the error condition to CICS/CMS.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the remote server and diagnose the problem by executing the same command from CECI under CICS/CMS without the NOCHECK option. For further information, see the 'Problem Determination' section for abend code ACHA.

Module: DFHCHS

ACHK

Explanation: The transformer program has requested neither EIP nor DLI to execute the request received from CICS/CMS. This indicates a logic error because the request has to be destined for either EIP or DLI.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: For further information, see the 'Problem Determination' section for abend code ACHA.

Module: DFHCHS

ACHL

Explanation: CICS/CMS has supplied a buffer to the remote server which is not large enough to hold the reply that the remote server has to return.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHM

Explanation: The remote server has tried to receive a response from CICS/CMS which failed repeatedly until the retry limit was exceeded.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHN

Explanation: The remote server has tried to receive a request from CICS/CMS which failed repeatedly until the retry limit was exceeded.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHO

Explanation: The remote server has tried to receive a reply from CICS/CMS which failed repeatedly until the retry limit was exceeded.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: Reestablish the connection between CICS/CMS and the remote CICS system and try to use the remote server again. For further information, see the 'Problem Determination' section for abend code ACHA.

If the problem persists, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCHS

ACHP

Explanation: CICS/CMS has made a request to the remote server for which the reply would need more than the maximum storage allowed (32660 bytes). This indicates that a logic error has occurred.

System Action: CICS terminates the remote server abnormally with a dump.

User Response: For further information, see the 'Problem Determination' section for abend code ACHA.

Module: DFHCHS

ACHR

Explanation: The CICS/CMS remote server transaction (CEHS) has been initiated and either the task is not terminal-oriented, or the associated terminal is a console.

System Action: CICS abnormally terminates the remote server with a dump.

User Response: Ensure the transaction is initiated with an associated terminal and that the terminal is not defined as a console. For further information, see the 'Problem Determination' section for abend code ACHA.

Module: DFHCHS

ACHS

Explanation: The CICS/OS2 remote server transaction (CEHP) has been initiated and either the task is not terminal-oriented, or the associated terminal is a console.

System Action: CICS abnormally terminates the remote server with a dump.

User Response: Ensure the transaction is initiated with an associated terminal and that the terminal is not defined as a console. For further information, see the 'Problem Determination' section for abend code ACHA.

Module: DFHCHS

ACL0

Explanation: The new operator failed to allocate storage whilst creating an object. This problem will occur if there is insufficient storage available to the CICS region to satisfy the request.

System Action: CICS abnormally terminates the transaction.

User Response: This abend may occur if you are in a loop creating objects and not deleting them. Alternatively CICS might be short on storage and you should try resubmitting the transaction.

Module: ICCGLBIC

ACL1

Explanation: The CICS Foundation Classes have thrown an exception which the application programmer failed to catch.

System Action: CICS abnormally terminates the transaction.

User Response: Check that you have coded your application to catch exceptions. Interrogate the message object contained within the exception object to establish the cause of the exception being thrown.

Another possible cause of this abend is that you are running a Foundation Classes program on a machine that does not have the C++ runtime installed. Check that your machine has the C++ runtime installed.

Module: ICCGLBIC

ACL2

Explanation: The CICS Foundation Classes invoked the default handleEvent method (defined in class IccResource) in order to handle a CICS condition because the application programmer did not implement his own handleEvent method.

System Action: CICS abnormally terminates the transaction.

User Response: Implement your own handleEvent method or customize your resource objects so they do not call the handleEvent method for any of the possible CICS conditions.

Module: ICCRESEC

ACL3

Explanation: The CICS Foundation Classes responded to an application programmer's request to abend a CICS task.

System Action: CICS abnormally terminates the transaction.

User Response: The application programmer requested that the CICS Foundation Classes abend the transaction using the appropriate return enumeration from the handleEvent method (see IccResource class).

Module: ICCRESIC

ACL4

Explanation: The CICS Foundation Classes detected an internal error.

System Action: CICS abnormally terminates the transaction.

User Response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLIBC

ACL5

Explanation: The CICS Foundation Classes received an error from a CICS storage request (GETMAIN). In response to a new operator request the CICS Foundation Classes issued a CICS GETMAIN request to allocate storage which CICS was unable to satisfy.

System Action: CICS abnormally terminates the transaction.

User Response: This abend may occur if you are in a loop creating objects and not deleting them. Alternatively CICS might be short on storage and you should try resubmitting the transaction.

Module: ICCBASEC

ACL6

Explanation: The CICS Foundation Classes detected an error while processing a storage release request.

System Action: CICS abnormally terminates the transaction.

User Response: This abend can occur if you try to delete an object that does not exist (that is, it has already been deleted). It may also indicate a CICS memory management problem, or a storage corruption problem. If the error persists, please contact your support organization.

Module: ICCBASEC

ACL7

Explanation: The CICS Foundation Classes have thrown an exception which the application programmer failed to catch.

System Action: CICS abnormally terminates the transaction.

User Response: Check that you have coded your application to catch exceptions. Interrogate the message object contained within the exception object to establish the cause of the exception being thrown.

Another possible cause of this abend is that you are running a Foundation Classes program on a machine that does not have the C++ runtime installed. Check that your machine has the C++ runtime installed.

Module: ICCGLBIC

ACL8

Explanation: The CICS Foundation Classes have thrown an exception which the application programmer failed to catch.

System Action: CICS abnormally terminates the transaction.

User Response: Check that you have coded your application to catch exceptions. Interrogate the message object contained within the exception object to establish the cause of the exception being thrown.

Another possible cause of this abend is that you are running a Foundation Classes program on a machine that does not have the C++ runtime installed. Check that your machine has the C++ runtime installed.

Module: ICCGLBIC

ACL9

Explanation: The CICS Foundation Classes responded to an application programmer's request to abend a CICS task.

System Action: CICS abnormally terminates the transaction.

User Response: A resource object was customized to cause a transaction abend if a particular CICS condition was raised, and this condition was subsequently raised by CICS.

Module: ICCRESIC

ACLA

Explanation: The CICS Foundation Classes detected an internal error.

System Action: CICS abnormally terminates the transaction.

User Response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLIBC

ACLB

Explanation: The CICS Foundation Classes detected an internal error.

System Action: CICS abnormally terminates the transaction.

User Response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLIBC

ACLC

Explanation: The CICS Foundation Classes detected an internal error.

System Action: CICS abnormally terminates the transaction.

User Response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLIBC

ACLD

Explanation: The CICS Foundation Classes detected an internal error.

System Action: CICS abnormally terminates the transaction.

User Response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLIBC

ACLE

Explanation: The CICS Foundation Classes detected an internal error.

System Action: CICS abnormally terminates the transaction.

User Response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLIBC

ACLF

Explanation: The CICS Foundation Classes detected an internal error.

System Action: CICS abnormally terminates the transaction.

User Response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLIBC

ACLG

Explanation: The CICS Foundation Classes detected an internal error.

System Action: CICS abnormally terminates the transaction.

User Response: This abend indicates a CICS Foundation Classes internal problem. Please contact your support organization.

Module: ICCGLIBC

ACLH

Explanation: The CICS Foundation Classes detected an error while processing a storage release request.

System Action: CICS abnormally terminates the transaction.

User Response: This abend can occur if you try to delete an object that does not exist (that is, it has already been deleted). It may also indicate a CICS memory management problem, or a storage corruption problem. If the error persists, please contact your support organization.

Module: ICCBASEC

ACNA

Explanation: The table DFHCNV cannot be loaded. This is a general purpose abend code indicating that the LOAD request for the conversion table, DFHCNV, has failed.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Examine the transaction dump to determine the exact condition returned from LOAD request.

Module: DFHCCNV

ACNB

Explanation: The program DFHUCNV cannot be linked This is a general purpose abend code indicating that the LINK request for the conversion program DFHUCNV, has failed.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Examine the transaction dump to determine the exact condition returned from LINK request.

Module: DFHCCNV

ACN1

Explanation: The table DFHCNV cannot be loaded. This is probably because a table has not been pregenerated. It could also occur if the table DFHCNV has been linked above 16MB but DFHCCNV has been linked below 16MB.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Check that the DFHCNV module is in the library and is valid for this release of CICS. Check the linkage of DFHCNV and relink it with the correct AMODE if necessary.

Module: DFHCCNV

ACN2

Explanation: The table DFHCNV has been loaded but the first record is in the wrong format. This is probably due to an error during assembly or linkedit, but could also be the result of a storage overwrite.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: The table should be reassembled and linked. Check the assemble and linkedit output. Check for any messages issued from CICS indicating that storage overwrites have occurred.

Module: DFHCCNV

ACN3

Explanation: The program DFHUCNV cannot be linked. A user conversion program must be available (even if it only returns).

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Check that the DFHUCNV module is in the library and is valid for this release of CICS. Check the linkage of DFHUCNV and relink it with the correct AMODE if necessary.

Module: DFHCCNV

ACN4

Explanation: An unrecognized format of a DFHCNV table has been encountered.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Re-assemble and re-link edit the DFHCNV macro.

Module: DFHCCNV

ACN5

Explanation: An override for the default client code page has been received; however the value is not recognized.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Check that the client system is using one of the client code pages supported by CICS/390.

Module: DFHCCNV

ACN6

Explanation: The conversion between client code page and server code page is not supported by CICS/390; for example conversion has been requested between Japanese code page 932 and Latin-1 code page 500.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Ensure that the Client codepage, both default and overrides are in the same group as the Server codepage. for example client code page 852 from Latin-2 group, is only supported to server code page 870.

Module: DFHCCNV

ACN7

Explanation: An override for the default binary format has been received; however the value is not recognized.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Data formats should be either S/370 or INTEL, anything else is unsupported by CICS/390.

Module: DFHCCNV

ACN8

Explanation: CICS data conversion is processing a FIELD defined as containing GRAPHIC characters (which are only DBCS): that is

```
DFHCNV TYPE=FIELD,DATATYP=GRAPHIC,...
```

However the client code page (defined in the CLINTCP operand), and the server code page (defined in the SRVERCP operand) imply that the FIELD contains only SBCS characters, for example

```
DFHCNV TYPE=ENTRY,CLINTCP=437,SRVERCP=037
```

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Correct the FIELD definition.

Module: DFHCCNV

ACN9

Explanation: The table DFHCNV cannot be loaded. This abend code is issued following a NOTAUTH condition being raised during loading of the DFHCNV table.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Ensure the resource security definitions are correct.

Module: DFHCCNV

ACP1

Explanation: DFHIC TYPE=GET response code is other than the normal response during print key processing.

System Action: The transaction is abnormally terminated with a CICS transaction dump. The keyboard of the terminal on which the print key was depressed remains locked to indicate the failure of the operation.

User Response: Analyze the dump. The response code is in the low order byte of register 0.

Module: DFHCPY

ACP2

Explanation: DFHIC TYPE=INITIATE response code is other than the normal response during print key processing.

System Action: The transaction is abnormally terminated with a CICS transaction dump. The keyboard of the terminal on which the print key was depressed remains locked to indicate the failure of the operation.

User Response: Analyze the dump. The response code is in low-order byte of register 0.

Module: DFHCPY

ACQA

Explanation: The Connection Quiesce Protocol transaction has been initiated by user action, such as a START command or by typing the transaction identifier at a terminal. The transaction is not intended to be initiated in this way.

System Action:

1. If the transaction was not initiated by terminal input, message DFHZC4951 is written to destination CSNE.
2. An exception trace record is written to all active trace destinations.
3. The transaction is abnormally terminated with a CICS transaction dump.

User Response: Determine what caused the transaction to be initiated. The exception trace record contains information which will help you.

Module: DFHCLS5

ACQB

Explanation: The Connection Quiesce Protocol transaction has encountered an error when communicating with another system on an APPC session.

System Action:

1. Message DFHZC4951 is written to destination CSNE.
2. An exception trace record is written to all active trace destinations.
3. The transaction is abnormally terminated with a CICS transaction dump.

User Response: Determine what caused the failure. A likely cause is a failure of the session with the partner system.

Module: DFHCLS5

ACQC

Explanation: The Connection Quiesce Protocol transaction has encountered an unexpected error.

System Action:

1. Message DFHZC4951 is written to destination CSNE.
2. An exception trace record is written to all active trace destinations.
3. The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCLS5

ACRA

Explanation: The relay program has been invoked without a terminal as its principal facility.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Ensure that DFHAPRT has not been specified as the initial program of a task that is not terminal-related.

Module: DFHAPRT

ACRB

Explanation: The relay program has been invoked by a transaction that is not defined as remote.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that the relay program is defined correctly. Determine why DFHAPRT was invoked if the transaction is not a remote transaction.

Module: DFHAPRT

ACRC

Explanation: The relay program received an invalid response from DFHZCX.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAPRT

ACRD

Explanation: The system entry for the system to which routing is to be performed could not be found.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check the installed transaction definition to confirm that the system was correctly specified. Check that the system entry is defined in the TCT.

Module: DFHAPRT

ACRE

Explanation: A transaction invoked from an APPC terminal and specified in the installed transaction definition as remote has abnormally terminated because the link is out of service.

System Action: The task is abnormally terminated.

User Response: Wait until the link is available. The CICS supplied transaction CEMT INQUIRE CONNECTION can be used to check the states of the links.

Module: DFHAPRT

ACRF

Explanation: The relay program received a nonzero return code from the dynamic router following its first invocation.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the dump to determine why the dynamic routing program has failed by checking the contents of the passed COMMAREA DFHDYE for correctness. The COMMAREA address can be found from field TCACOMM in the system TCA for the task. The COMMAREA fields are mapped via the DFHDYPDS DSECT.

Module: DFHAPRT

ACRG

Explanation: An ATI initiated remote transaction defined with DYNAMIC(YES) has failed because there is no matching entry in the AID chain.

Each AID in the chain has been checked and none has been found where

- The AID terminal ID matches that of the TCTTE
- The installed transaction definition and the AID transaction IDs match
- The AID is for a remote transaction
- The AID has not been canceled.

System Action: The task is abnormally terminated with a CICS system dump.

User Response: The dump can be used to help ascertain the mismatch. Check the transactions listed in the TCTTE and PCT fields of the system dump against the AID chain.

Module: DFHAPRT

ACRH

Explanation: The profile for the session that will carry intersystem flows during transaction routing could not be found.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check the installed transaction definition to confirm that TRPROF is correctly specified.

Module: DFHAPRT

ACRI

Explanation: An error occurred when attempting to link to the dynamic routing program.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

A message in the range DFHRT4417 to DFHRT4420 is written to the CSMT log.

User Response: Refer to the message sent to the CSMT log. It identifies the cause of the link failure and provides further user guidance.

Modules: DFHAPRT, DFHEPC

ACRJ

Explanation: An abend has occurred in the dynamic routing program after a link has been executed from DFHAPRT or DFHEPC.

System Action: The transaction is abnormally terminated with a CICS transaction dump. Message DFHRT4416 is written to the CSMT log.

User Response: Refer to message DFHRT4416. It identifies the abend in the dynamic routing program and provides further user guidance.

Modules: DFHAPRT, DFHEPC

ACRK

Explanation: The relay program has been invoked with no address for the principal facility.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAPRT

ACRL

Explanation: The task does not own the facility.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAPRT

ACRM

Explanation: In response to a request from the dynamic routing program, DFHAPRT has attempted an INITIAL_LINK to a program that is not the initial program of the transaction for which the dynamic router has been invoked. The attempt has failed.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Examine the following possibilities:

- The autoinstall user-replaceable module (URM) was called but is unable to do the autoinstall.
- The autoinstall URM was called but data supplied by the autoinstall URM is invalid.
- The autoinstall URM was called, but there is no processing program table (PPT) entry for the autoinstall model.
- There is a problem with the autoinstall URM.
- There is no PPT entry for the program, and either autoinstall is not active or the autoinstall URM indicated that the program should not be autoinstalled.
- The program is disabled.
- The program cannot be loaded.
- The program is defined as remote.

Module: DFHAPRT

ACRO

Explanation: An attempt has been made to invoke the CRSQ transaction from a terminal. CRSQ is an internal CICS transaction and cannot be invoked in this way.

System Action: The task is abnormally terminated.

User Response: None. You can use CEMT and EXEC CICS commands to cancel AIDs.

Module: DFHCRQ

ACRP

Explanation: The dynamic routing program has supplied a sysid that does not support a routable START. The backend system does not support this function.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: An alternative sysid should be given or revert to the old style START.

Module: DFHAPRT

ACSA

Explanation: The remote scheduler task (CRSR) does not own an intersystem link TCTTE as its principal facility.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Ensure that DFHCRS is not specified as the initial program of a task other than CRSR. Check that the terminal operator did not enter CRSR.

Module: DFHCRS

ACSB

Explanation: An unexpected reply was received from a remote system in response to a request to schedule a task on that system.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACSC

Explanation: An unexpected request was received from a remote system when expecting a request to schedule a task.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACSD

Explanation: An internal logic error has been detected.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACSE

Explanation: Module DFHCRS has been attached in an unsupported manner.

System Action: CICS abnormally terminates the transaction with a transaction dump.

User Response: Module DFHCRS should be executed only by transaction CRSR, which executes with an MRO session, an LU6.1 session or an LU type 6.2 conversation as its principal facility. Ensure that the transaction is being attached by a CRSR transaction in the connected system, and not by a user transaction.

If the transaction is being attached by a CRSR transaction, you will need assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACSF

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detects the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate the reason why the task was purged. It was purged either by the master terminal operator or as a result of a deadlock timeout.

Module: DFHCRS

ACSG

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Please see the related error message produced by the domain that detected the original error.

Module: DFHCRS

ACSH

Explanation: The processing of APPC mapped data requires the generation of an LU6.2 attach FMH with default values. In particular, the sync level requested is defaulted to 2. However, the session that is to be used has been bound with a sync level of 1.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that:

- The entry in the TCT for the remote system has been defined with parallel sessions
- The remote system can support a sync level of 2
- The correct sync level has been requested.

Module: DFHCRS

ACSI

Explanation: An APPC conversation failure occurred when an attach between CICS systems was issued.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check the connection to the remote CICS system and try to reestablish it.

Module: DFHCRS

ACSJ

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table). This failure is either the result of a task purge, or a CICS logic error.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related diagnostic material produced by the recovery manager domain and determine the reason for the failure.

In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACSL

Explanation: CICS has been unable to attach a transaction to perform a mass flag (CFTS) or mass remote delete (CDTS) request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACSM

Explanation: Transaction CFTS has abended. The mass flagging of terminals for deletion has failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACSN

Explanation: Transaction CFTS has stalled. The mass flagging of terminals for deletion has exceeded the expected time and is therefore assumed to have failed.

System Action: The task is abnormally terminated with a CICS transaction dump. A flag is set in the remote work element (RWE) to indicate that the mainline transaction has assumed that CFTS has failed.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRS

ACTA

Explanation: The relay program running in the terminal-owning region has received an unexpected request from the application owning region. The request received is in violation of CICS transaction routing protocols.

The request will be in the DFHLUCDS DSECT in DFHZTSP's LIFO – field LUCOPN0

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

ACTB

Explanation: The relay program running in the terminal-owning region issued a terminal control WRITE,LAST request to the application-owning system, and received a nonzero return code from terminal control.

This is the usual return code from terminal control in TCATPAPR.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why terminal control was unable to process the request.

Module: DFHZTSP

ACTC

Explanation: The relay program running in the terminal-owning region issued a terminal control request to free its session to the application-owning system, and received a nonzero return code from terminal control.

This is the usual return code from terminal control in TCATPAPR.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why terminal control was unable to process the request.

Module: DFHZTSP

ACTD

Explanation: The relay program running in the terminal-owning region issued a terminal control WRITE,WAIT,READ request to the application-owning system, and received a nonzero return code from terminal control.

This is the usual return code from terminal control in TCATPAPR.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why terminal control was unable to process the request.

Module: DFHZTSP

ACTE

Explanation: The relay program running in the terminal-owning region attempted to free its session with the APPC terminal, and received a nonzero return code from terminal control.

The return code will be in the DFHLUCDS DSECT in DFHZTSP's LIFO field, LUCRCODE.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. The terminal session may have failed.

Module: DFHZTSP

ACTF

Explanation: The relay program running in the terminal-owning region issued a terminal control request to free its session to the application-owning system, and received a nonzero return code from terminal control.

This return code can be found in the TCA field, TCATPAPR.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. The transaction on the application-owning region may have abnormally terminated or the session may have failed.

Module: DFHZTSP

ACTG

Explanation: The relay program running in the terminal-owning region issued a request to attach a transaction in the application-owning region, but the response received from that region was invalid.

The return code in the TCA (field TCATPAPR) will be nonzero, and either there will be no TIOA (field TCTTEDA in the TCTTE is zero) or there will be no FMH7 at the start of the TIOA.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. The transaction on the application-owning region may have abnormally terminated or the session may have failed.

Module: DFHZTSP

ACTH

Explanation: A privileged allocate was issued against a remote LU 6.2 system.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZISP

ACTI

Explanation: The relay transaction has an ISC or MRO session as its principal facility. However the TCTTE for that session is not owned by the task.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRT

ACTJ

Explanation: The principal facility of the relay transaction is not a TCTTE.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Task CXRT should only be started in a terminal-owning region by an ALLOCATE request issued in an application-owning region against a remote APPC device. The principal facility of the task should be an ISC or MRO link. Check that your CICS system is defined in such a way that this will always be the case. Also ensure that program DFHCRT is started only by task CXRT.

Module: DFHCRT

ACTK

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate the reason why the task was purged. It was either purged by the master terminal operator or as a result of a deadlock timeout.

Module: DFHZISP

ACTL

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHZISP

ACUA

Explanation: DFHZXRL was called with a request which is not supported for transaction routing.

The request is located in the DFHLUC parameter list which is printed in the exception trace. DFHZXRL is called from DFHZARL, which will put details of the request in its trace entry.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUB

Explanation: The parameter list passed to DFHZXRL for an ALLOCATE request does not contain the TCTSE address of a remote APPC terminal.

The TCTSE address is located in the DFHLUC parameter list which is printed in the exception trace. DFHZXRL is called from DFHZARL, which will put details of the request in its trace entry.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUC

Explanation: The TCTSE address passed to DFHZXRL is not that of a remote LU 6.2 terminal.

The TCTSE address is located in the DFHLUC parameter list which is printed in the exception trace. DFHZXRL is called from DFHZARL, which will put details of the request in its trace entry.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUD

Explanation: The profile DFHCICSR could not be located as an installed profile definition.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Check that the IBM-supplied profile DFHCICSR is correctly defined and installed to CICS.

Module: DFHZXRL

ACUE

Explanation: A request to DFHZTSP to build a surrogate TCTTE was not satisfied.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUF

Explanation: A session between the application-owning region and the terminal-owning region was not allocated because the request was incorrectly specified.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUG

Explanation: A request to allocate a session between the application-owning region and the terminal-owning region failed. The return code from the ALLOCATE request indicated that the profile could not be located as an installed transaction definition, although an earlier attempt to locate it was successful.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUH

Explanation: A request to allocate a session between the application-owning region and the terminal-owning region failed. The return code from the ALLOCATE request indicated that the requested session is already owned by the TCA.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUI

Explanation: An ISC session between the application-owning region and the terminal-owning region was not allocated because the MODENAME named in the profile could not be found. The profile DFHCICSR as supplied by IBM does not specify a MODENAME. Therefore, this error will occur when a MODENAME has been added to the IBM-supplied profile, but that MODENAME is not defined in the SESSIONS definition for the terminal-owning region.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Ensure that the MODENAME specified in profile DFHCICSR was also specified when defining the SESSIONS to the terminal-owning region.

Module: DFHZXRL

ACUJ

Explanation: A session between the application-owning region and the terminal-owning region was not allocated because the maximum session count for the mode group specified in profile DFHCICSR is zero.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the CEMT transaction to set sessions in the required mode group available for use.

Module: DFHZXRL

ACUK

Explanation: No TCT entry was found for the terminal-owning region specified in the TCTSE for the remote terminal.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Ensure that the terminal-owning region defined in the remote system entry is also defined with a system entry in the TCT.

Module: DFHZXRL

ACUL

Note: The description of this abend also applies to ACUX and ACUZ.

Explanation: The transaction routing program in the application-owning region issued a terminal control WRITE,WAIT,READ request to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Module: DFHZXRL

ACUM

Explanation: A request to DFHZTSP to free a surrogate TCTTE was not satisfied.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUO

Note: The description of this abend also applies to ACUQ, ACUS and ACU1.

Explanation: A terminal control READ request has failed. The transaction routing program in the application-owning region attempted to receive data from the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Module: DFHZXRL

ACUP

Note: The description of this abend also applies to ACUR.

Explanation: The transaction routing program in the application-owning region did not receive a rollback from the terminal-owning region. This violates CICS transaction routing protocols.

The trace from the terminal-owning region will show its response to the application-owning region.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUQ

Explanation: Refer to the description of abend ACUO.

Module: DFHZXRL

ACUR

Explanation: Refer to the description of abend ACUP.

Module: DFHZXRL

ACUS

Explanation: Refer to the description of abend ACUO.

Module: DFHZXRL

ACUT

Explanation: The transaction routing program in the application-owning region did not receive either a syncpoint or a rollback from the terminal-owning region. This violates CICS transaction routing protocols.

The trace from the terminal-owning region will show its response to the application-owning region.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACUV

Explanation: The transaction routing program in the application-owning region issued a terminal control ISSUE ABEND request on an MRO link to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Module: DFHZXRL

ACUW

Explanation: The transaction routing program in the application-owning region issued a terminal control ISSUE ERROR request on an MRO link to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Module: DFHZXRL

ACUX

Explanation: Refer to the description of abend ACUL.

Module: DFHZXRL

ACUY

Explanation: The transaction routing program in the application-owning region issued a terminal control WRITE,WAIT request to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Module: DFHZXRL

ACUZ

Explanation: Refer to the description of abend ACUL.

Module: DFHZXRL

ACU0

Explanation: The transaction routing program in the application-owning region issued a terminal control WRITE,LAST,WAIT request to the terminal-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The relay program in the terminal-owning region terminates abnormally. In this case, determine the reason why the relay program has abnormally terminated.
- The session has failed.

Module: DFHZXRL

ACU1

Explanation: Refer to the description of abend ACUO.

Module: DFHZXRL

ACU2

Explanation: The transaction routing program in the application-owning region received a response from the terminal-owning region which violates CICS transaction routing protocols.

The trace from the terminal-owning region will show its response to the application-owning region.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACU3

Explanation: The transaction routing program in the application-owning region attempted to set the conversation state machine to a state which violates CICS transaction routing protocols.

The register containing the state can be determined from the assembler listing.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACU4

Explanation: The transaction routing program in the application-owning region issued a SET request to the conversation state machine and received a nonzero return code. This violates CICS transaction routing protocols.

The trace entry on return from DFHZUSR will show the request type and current state.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACU5

Explanation: An program running in an application-owning region has issued an ALLOCATE against an APPC device attached to a terminal owning region, but the connection between the two systems is not installed.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Install the connection between the two regions.

Module: DFHZXRL

ACU6

Explanation: A request to DFHRTSU to prepare the surrogate TCTTE for syncpoint gave an unexpected response and reason code. The response and reason code are included in DFHRTSU's parameter list which is printed in the exception trace.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACU7

Explanation: A request to allocate a session between the application-owning region and the terminal-owning region was issued, but the connection with the remote system is not an APPC or MRO connection.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Redefine the connection as APPC or MRO, or avoid using transaction routing on this connection.

Module: DFHZXRL

ACU8

Explanation: A request to DFHRTSU to get the recovery status of a surrogate TCTTE gave an unexpected response and reason code. The response and reason code are included in DFHRTSU's parameter list which is printed in the exception trace.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACU9

Explanation: A request to recovery manager to set the recovery status of a link gave an unexpected response and reason code. The response and reason code are included in DFHRMLN's parameter list which is printed in the exception trace.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRL

ACVA

Explanation: The transaction routing program in the terminal-owning region issued a terminal control WRITE,WAIT,READ request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVB

Explanation: The transaction routing program in the terminal-owning region attempted to issue an ISSUE SIGNAL request on an MRO link to the application-owning region. This violates CICS transaction routing protocols.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRT

ACVC

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE SIGNAL request on an LU 6.2 link to the application-owning region, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVD

Explanation: The transaction routing program in the terminal-owning region issued a READ,WAIT request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVE

Explanation: The transaction routing program in the terminal-owning region issued a WRITE request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- the program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- the session has failed.

Module: DFHZXRT

ACVF

Explanation: The transaction routing program in the terminal-owning region issued a WRITE,LAST,WAIT request to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVG

Explanation: The transaction routing program in the terminal-owning region issued a FREE request to free the session with the LU 6.2 terminal, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. The terminal session may have failed.

Module: DFHZXRT

ACVH

Explanation: The transaction routing program in the terminal-owning region issued a FREE request to free the session with the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZARQ.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVK

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE ABEND request on an LU 6.2 link, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the connected region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVL

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE ABEND request on an MRO link to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVM

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE ERROR request on an LU 6.2 link, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the connected region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVN

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE ERROR request on an MRO link to the application-owning region, and received a nonzero return code from terminal control.

The return code is located both in TCATPAPR and in the trace entry on return from DFHZIS1.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. This abend code may result when:

- The program in the application-owning region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Module: DFHZXRT

ACVO

Explanation: The transaction routing program in the terminal-owning region issued an ISSUE PREPARE request and received either a nonzero return code or a response which violates CICS transaction routing protocols.

The return code is located in TCASPRC and the response is located in TCASPSN1.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine whether the problem is caused by the return code or the response. If terminal control was unable to process the request, the abend may occur when:

- The program in the connected region terminates abnormally. In this case, determine the reason why the program has abnormally terminated.
- The session has failed.

Otherwise the distributed application programs may have violated APPC conversation protocols.

Module: DFHZXRT

ACVP

Explanation: The transaction routing program in the terminal-owning region did not receive an FMH43 from the application-owning region. This violates CICS transaction routing protocols.

The trace from the application-owning region will show its response to the terminal-owning region.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZXRT

ACVQ

Explanation: The transaction routing program in the terminal-owning region issued a request to the APPC terminal, and received a nonzero return code from terminal control.

Both the request and the return code are located in the DFHLUC parameter list which is printed in the exception trace.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. The terminal session may have failed or be in the wrong state, for example, as the result of both the terminal and application issuing SYNCPOINT ROLLBACK at the same time.

Module: DFHZXRT

ACVR

Explanation: The transaction routing program in the terminal-owning region issued a SEND,LAST,WAIT request to the LU 6.2 terminal, and received a nonzero return code from terminal control.

The return code is located in the DFHLUC parameter list which is printed in the exception trace.

System Action: The task is abnormally terminated with a transaction dump and an exception trace entry.

User Response: Use the transaction dump to determine why terminal control was unable to process the request. The terminal session may have failed.

Module: DFHZXRT

ACWA

Explanation: CICS CWTO transaction has failed because the task does not own a terminal (TCTTE) as its principal facility. This has probably happened because CWTO has been started as an EXEC CICS START transid without a terminal ID.

System Action: The transaction is abnormally terminated without a transaction dump.

User Response: Retry with a terminal ID value or enter CWTO from a terminal.

Module: DFHCWTO

ACXA

Explanation: The catch-up transaction, CXCU, has failed. CXCU runs either in response to a transaction request from an end-user, or is run automatically by an active CICS system in response to the appearance of an alternative CICS system. Its purpose is to inform the alternate system of the active system's state regarding terminals and DBCTL connection.

System Action: The catch-up transaction, CXCU, is abnormally terminated with a CICS transaction dump. Both active and alternate CICS systems continue, but the alternate CICS system is less effective in the event of a takeover. For example, terminal back-up sessions may not be established. This abend is accompanied by DFHDX8313.

User Response: Retry by entering 'CXCU' from a terminal. If the error persists, diagnose the problem from the dump.

Module: DFHCXCU

ADCA

Explanation: This abend is issued if DBCTL returns a non-zero response code when a DL/I request has been issued from an application program.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Look up accompanying message DFHDB8109 that appears on the CDBC transient data destination.

Module: DFHDLIDP

ADCB

Explanation: This abend occurs when DBCTL has notified CICS that a task has issued a DL/I request, but it did not have a PSB scheduled. If your application does have a PSB scheduled then a possible cause for this abend is that the DBCTL STOP THREAD command may have been used to terminate the DBCTL thread that corresponds to this task.

System Action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User Response: Check if the DBCTL operator has issued a STOP THREAD command for the task that has abnormally terminated. Look up DBCTL response code 28 in the DBCTL return code section of the *IMS Messages and Codes* manual.

Module: DFHDLIDP

ADCC

Explanation: This abend occurs when DBCTL has notified CICS that a task has issued program specification block (PSB) request, but it has a PSB already scheduled. CICS prevents a task from issuing a PSB schedule request to DBCTL when it has already issued a PSB schedule request by returning a PSBSCH response in UIBDLTR. However, in this case it is DBCTL that has rejected the subsequent PSB schedule request. A possible cause for this abend is a storage over-write.

System Action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User Response: Check for any messages issued from your CICS system indicating that storage over-writes have taken place. Look up DBCTL response code 32 in the DBCTL return code section of the *IMS Messages and Codes* manual.

Module: DFHDLIDP

ADCD

Explanation: This abend is issued when a deadlock has been detected by IMS and this transaction has been selected for abnormal termination.

This abend can occur when a transaction is accessing IMS resources via DBCTL or via a remote DLI request to a remote CICS region. The remote CICS region can be accessing IMS via DBCTL, or if it is a pre CICS 4.2 region, accessing IMS via local DLI.

System Action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User Response: If ADCD abends occur infrequently in your system, no action is required although you may like to consider setting your system up in such a way that, after an ADCD abend is issued, the transaction is automatically restarted. See the *CICS Recovery and Restart Guide* for further information.

If ADCD abends are occurring frequently in your system, you may need to review the design of your applications. Some general techniques for deadlock avoidance are described in the *CICS Recovery and Restart Guide*.

Module: DFHDLIDP

ADCE

Explanation: This abend is issued when the module DFHDBAT returns a nonzero return code in reply to a DL/I request issued from an application program to DBCTL. DFHDBAT is a task related user exit and forms part of the CICS-DBCTL interface. This abend is accompanied by message DFHDB8110.

System Action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User Response: Look up the accompanying message DFHDB8110 that appears on the CDBC transient data destination.

Module: DFHDLIDP

ADCI

Explanation: This abend is issued when IMS returns a user abend 3303 response for a DL/I request issued from an application program.

System Action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User Response: Check the description in the *IMS Messages and Codes* manual for the meaning of IMS user abend 3303.

Module: DFHDLIDP

ADCJ

Explanation: This abend is issued when an application has been using DBCTL, and while the application was still scheduled to DBCTL, the CICS-DBCTL interface was terminated.

System Action: CICS abnormally terminates the transaction with a transaction dump. CICS processing continues.

User Response: Check the CDBC transient data destination for messages indicating the reason for termination of the CICS-DBCTL interface. If you do not know where the CDBC transient is, then please check with your system programmer. Check for messages issued from the DBCTL system.

Module: DFHDLIDP

ADCP

Explanation: When checking the DBCTL program specification block (PSB), the external security manager checked the usage of the PSB, and found that:

- The user was unauthorized to access the PSB, or
- The PSB was unknown to the external security manager, or
- The user was set to the capability of the default user.

The meaning of the term “user” in the above context depends on the way the transaction was invoked.

- If the transaction is being run from a local terminal, or has been routed from a remote terminal, the user is the terminal user. (For a routed transaction, if PSBCHK=NO is specified in the SIT, or RESSEC=NO is specified in the transaction definition (CEDA DEFINE TRANSACTION command), the security manager does *not* check the terminal user.)
- If the transaction is being run as a result of a request from another CICS MRO region, the user is the owner of the other CICS system (as defined to the external security manager in the JOB statement of the initializing JCL).
- If the transaction is being run as a result of a request from a connected ISC system, the user is defined in the SECURITYNAME operand of the installed CONNECTION definition that defines the link between the remote system and the local system. Ensure that the name in the SECURITYNAME operand is the same as that supplied by the connected CICS system. This will depend upon the type of CONNECTION between the two systems. For further information about this, refer to the *CICS Intercommunication Guide*.

Notes.

By the above definitions, a PSB used by a routed transaction has two users, the terminal user and the communicating region. Therefore, for routed transactions, the external security manager makes two checks, on the terminal user (as qualified in 1 above), and on the communicating region (2 or 3 above).

System Action: CICS abnormally terminates the task attempting to schedule the PSB. CICS processing continues.

User Response: Ensure that the PSB is defined to the external security manager, and that all users have the correct level of authorization. If the system setup is correct, note the security violation.

Module: DFHDLIDP

ADCQ

Explanation: This abend occurs when an application has issued an EXEC DLI SCHD request for a PSB that contains no DBPCBs, and the SYSSERVE keyword was not specified. This abend also occurs when an application has issued a PCB request for a PSB that contains no DBPCBs, and the IOPCB option was not specified.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Check that the application program has scheduled the appropriate PSB.

Module: DFHDLIDP

ADCR

Explanation: This abend occurs when an application has issued a DL/I request other than a schedule request, and the DBCTL DRA return code of 40 indicates that there was no active communication with DBCTL.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Check the CDBC transient data destination for messages indicating the reason for termination of the CICS-DBCTL interface. If you do not know where the CDBC transient data destination is, check with your system programmer. Check for messages issued from the DBCTL system.

Module: DFHDLIDP

ADCS

Explanation: CICS issued a single-phase commit request to DBCTL and an unexpected response was returned from DBCTL.

System Action: CICS issues message DFHDB8119 to transient data queue CDBC, then terminates the task abnormally with a CICS transaction dump.

User Response: Message DFHDB8119 shows the unexpected response from DBCTL, along with the recovery token of the LUW involved. The explanation of message DFHDB8119 indicates how the outcome of the LUW can be determined.

Module: DFHDBAT

ADCT

Explanation: A user has attempted to invoke the CICS-DBCTL control transaction from a terminal.

System Action: CICS rejects the request.

User Response: Do not try to invoke CICS internal transactions directly.

Module: DFHDBCT

ADDA

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the storage manager domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User Response: See related message from the domain that detected the original error.

Modules: DFHDBME, DFHDLI, DFHDLIDP

ADDB

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the catalog (CC) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User Response: See related message from the domain that detected the original error.

Modules: DFHDBCON, DFHDBDSC

ADDC

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the loader (LD) domain. The domain that detected the original error will have provided an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User Response: See related message from the domain that detected the original error.

Modules: DFHDBCON, DFHDBDI

ADDI

Explanation: CICS has been notified of a DBCTL failure. However, it has been unable to complete the search for a DBCTL alternate. This is possibly due to an unexpected return code from an IEFSSREQ request.

System Action: A CICS transaction dump is produced. CICS continues as if no XRF DBCTL alternate has been found. This abend is accompanied by message DFHDX8323.

User Response: Refer to message DFHDX8323 for further information. It may be necessary to restart DBCTL manually.

Module: DFHDBCT

ADDJ

Explanation: CICS has failed to connect to DBCTL because program DFHDBAT could not be ENABLED.

System Action: A CICS transaction dump is produced. The state of the CICS/DBCTL interface remains not connected.

User Response: Refer to the transaction dump to determine why the ENABLE failed.

Module: DFHDBCON

ADEF

Explanation: A severe error has been encountered when executing transaction CLS3.

System Action: CLS3 is abnormally terminated with a transaction dump. CICS issues message DFHZC4948.

User Response: See message DFHZC4948 for further guidance.

Module: DFHCLS3

ADIR

Explanation: The abend code is issued for either of the following reasons:

- A DFHDI or DFHBMS request was issued when the DFHDIP program was generated as a dummy.
- A DFHDI TYPE=RECEIVE or TYPE=NOTE was attempted but the transaction identification did not specify either INBFMH=DIP or INBFMH=ALL.

System Action: A CICS transaction dump is provided to assist in problem determination.

User Response: Either generate a DFHDIP program into the system or specify INBFMH correctly on the profile definition.

Module: DFHDIP

ADLE

Explanation: A DL/I request was made for a remote database, but the system named in the remote PDIR entry was unknown to CICS, that is, not specified in a DFHTCT TYPE=SYSTEM macro or CEDA DEFINE CONNECTION command.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Either correct the SYSIDNT parameter in the relevant DFHDLPSB entry, or define the remote system to CICS with a DFHTCT TYPE=SYSTEM macro or a CEDA DEFINE CONNECTION command.

Module: DFHDLIRP

ADLF

Explanation: A DL/I request was made for a remote database, but the link to the system on which the database resides was down.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer. Once the link to the remote system has been reestablished, resubmit the transaction.

Module: DFHDLIRP

ADLG

Explanation: A DL/I request was made for a remote database, but there were errors in the DL/I argument list that was provided by the user.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Ensure that any errors in the DL/I argument are corrected.

Module: DFHDLIRP

ADLP

Explanation: When checking the DLI program specification block (PSB), the external security manager checked the usage of the PSB, and found that:

- The user was unauthorized to access the PSB, or
- The PSB was unknown to the external security manager, or
- The user was set to the capability of the default user.

The meaning of the term “user” in the above context depends on the way the transaction was invoked.

- If the transaction is being run from a local terminal, or has been routed from a remote terminal, the user is the terminal user. (For a routed transaction, if PSBCHK=NO is specified in the SIT, or RESSEC=NO is specified in the transaction definition (CEDA DEFINE TRANSACTION command), the security manager does *not* check the terminal user.)
- If the transaction is being run as a result of a request from another CICS MRO region, the user is the owner of the other CICS system (as defined to the external security manager in the JOB statement of the initializing JCL).
- If the transaction is being run as a result of a request from a connected ISC system, the user is defined in the SECURITYNAME operand of the installed CONNECTION definition that defines the link between the remote system and the local system. Ensure that the name in the SECURITYNAME operand is the same as that supplied by the connected CICS system. This will depend upon the type of CONNECTION between the two systems. For further information about this, refer to the *CICS Intercommunication Guide*.

Note: By the above definitions, a PSB used by a routed transaction has two users, the terminal user and the communicating region. Therefore, for routed transactions, the external security manager makes two checks, on the terminal user (as qualified in 1 above), and on the communicating region (2 or 3 above).

System Action: The task attempting to schedule the PSB abnormally terminates.

User Response: Ensure that the PSB is defined to the external security manager, and that all users have the correct level of authorization. If the system setup is correct, note the security violation.

Module: DFHDLIRP

ADMA

Explanation: The alternate CICS task responsible for tracking the DBCTL connection status of the active CICS has received an error from the CICS Availability Manager (CAVM) message input service.

System Action: The tracking transaction terminates with a CICS transaction dump. No further action is taken in response to DBCTL status changes. The global exits, XXDFB and XXDTO, are never invoked and no attempt at a DBCTL restart is made in the event of a takeover. This abend is accompanied by DFHDX8331.

User Response: Check for any other messages relating the CAVM dataset problems. In the event of a takeover, it may be necessary to restart DBCTL manually.

Module: DFHDBCR

ADMB

Explanation: The CICS/XRF DBCTL tracking task has received an unrecognizable message from the CICS/XRF message manager. This abend is preceded by message DFHDX8333.

System Action: The CICS/XRF DBCTL tracking task abends.

User Response: Refer to the instructions for message DFHDX8333.

Module: DFHDBCR.

ADMD

Explanation: The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has been unable to complete its search for a DBCTL alternate, possibly due to an unexpected return code from an IEFSSREQ request.

System Action: A CICS transaction dump is produced. The tracking transaction continues as if no DBCTL alternate had been found. This abend is accompanied by message DFHDX8335.

User Response: Refer to message DFHDX8335 for further information. It may be necessary to restart DBCTL manually.

Module: DFHDBCR.

ADPL

Explanation: A server program has issued a command which is restricted in the distributed program link (DPL) environment. Certain API and CPI-RR requests, and the DL/I terminate request are not allowed in the DPL environment. See the *CICS Application Programming Guide* for a list of these restricted commands.

A server program is a program which has been remotely linked, or a program defined to run with the DPL subset.

System Action: CICS abends the transaction with a transaction dump.

User Response: Remove the restricted commands from the server program, or run the server program locally.

Module: DFHEIP, DFHCPIR, DFHDLI

ADPM

Explanation: An application program has issued a CALL AIBTDLI request for a function type that is not supported by CICS. The CALL AIBTDLI interface can only be used to issue operator commands to DBCTL in CICS with function types of ICMD, RCMD and GMSG. For all other function types, the EXEC DLI, CALL ASMTDLI, CALL CBLTDLI or CALL PLITDLI interfaces must be used.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Correct the application program to use the correct application programming interface.

Module: DFHDLI

ADXA

Explanation: The XRF DBCTL state catch-up transaction, DXCU, has failed.

System Action: DXCU is abnormally terminated with a CICS transaction dump. This abend is accompanied by DFHDX8319.

User Response: Diagnose the error from the CICS transaction dump. Refer to DFHDX8319 for further information.

Module: DFHDXCU

ADXB

Explanation: The XRF DBCTL state catch-up transaction, DXCU, has failed.

System Action: DXCU is abnormally terminated with a CICS transaction dump. This abend is accompanied by DFHDX8318.

User Response: Use the dump to help diagnose the problem. Refer to DFHDX8318 for further information. Check for any other messages relating to CICS availability manager (CAVM) data set problems.

Module: DFHDXCU

AD2A

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2B

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2C

Explanation: An unexpected EXCEPTION response has occurred on a locate call to directory manager (DD) domain to locate a DB2TRAN control block. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2D

Explanation: An error (INVALID or DISASTER response) has occurred on a locate call to directory manager (DD) domain to locate a DB2TRAN control block. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2E

Explanation: An unexpected EXCEPTION response has occurred on a locate call to directory manager (DD) domain to locate a DB2ENTRY control block. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2F

Explanation: An error (INVALID or DISASTER response) has occurred on a locate call to directory manager (DD) domain to locate a DB2ENTRY control block A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2G

Explanation: A transaction attempted to use a DB2ENTRY that is DISABLED or is DISABLING. The DISABLEDACT attribute of the DB2ENTRY specified ABEND meaning that new transactions that attempt to use the DB2ENTRY should be abended.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use CEMT INQ DB2TRAN TRANSID(tttt) where tttt is the transid, to determine the name of the DB2ENTRY involved. Re-enable the DB2ENTRY or discard the DB2ENTRY so that the transid will use a pool thread.

Module: DFHD2EX1

AD2H

Explanation: The CICS-DB2 attachment facility detected that a dynamic plan exit program abended.

System Action: CICS trapped the abend from the dynamic plan exit, issued message DFHDB2050, and then abnormally terminated the task with a CICS transaction dump.

User Response: See the associated DFHDB2050 transient data message to determine the abend code with which the dynamic plan exit program abended. Determine why the exit program abended.

Module: DFHD2EX1

AD2I

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because it was not link edited AMODE 31.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the associated DFHDB2051 transient data message to determine the name of the dynamic plan exit program involved. Re-linkedit the dynamic plan exit program AMODE 31.

Module: DFHD2EX1

AD2J

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because it is disabled.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the associated DFHDB2053 transient data message to determine the name of the dynamic plan exit program involved. Enable the dynamic plan exit program.

Module: DFHD2EX1

AD2K

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because no program definition was found.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the associated DFHDB2057 transient data message to determine the name of the dynamic plan exit program involved. Ensure that the dynamic plan exit program has been correctly defined to CICS.

Module: DFHD2EX1

AD2L

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because the program could not be loaded.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the associated DFHDB2058 transient data message to determine the name of the dynamic plan exit program involved. Ensure that the dynamic plan exit program has been correctly defined and is in a load library accessible to CICS.

Module: DFHD2EX1

AD2M

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program because the program is defined as remote.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the associated DFHDB2066 transient data message to determine the name of the dynamic plan exit program involved. Correct the program definition for the dynamic plan exit program so that it is defined as local.

Module: DFHD2EX1

AD2N

Explanation: The CICS-DB2 attachment facility failed to link to a dynamic plan exit program.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the associated DFHDB2054 transient data message to determine the name of the dynamic plan exit program involved. Examine the transaction dump to determine why the link failed.

Module: DFHD2EX1

AD2O

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an WAIT_MVS call to the dispatcher (DS) domain. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2P

Explanation: The transaction was unable to obtain a DB2 thread from a DB2ENTRY or the pool. See the associated transient data message DFHDB2011 to determine which DB2ENTRY was involved or whether it was the pool. The transaction was abended because the DB2ENTRY or the pool specified threadwait(no) meaning do not wait for a thread if all threads are currently in use. Note if message DFHDB2011 indicates that the pool was being used, it means the transaction was using the pool directly rather than overflowing to the pool. (An abend AD3T is produced when a transaction overflows to the pool and no pool threads are available.)

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Determine whether more threads should be allocated to the DB2ENTRY or the pool, or whether the number of instances of this transaction should be limited using TRANCLASS.

Module: DFHD2EX1

AD2Q

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an getmain call to the storage manager (SM) domain. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2R

Explanation: The CICS-DB2 subtask processing the DB2 request for this transaction has abended. An exception trace is written containing the MVS abend code and reason code as well as the relevant CICS-DB2 control blocks used by the CICS task and the CICS-DB2 subtask.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Examine the trace in the CICS transaction dump to determine why the CICS-DB2 subtask abended.

Module: DFHD2EX1

AD2S

Explanation: The subtask servicing the DB2 request for the transaction issued a sign-on request to DB2 which failed. The installed DB2CONN specifies THREADERROR(N906D) or THREADERROR(ABEND).

System Action:

If THREADERROR(N906D) is specified in the DB2CONN, processing continues. A -906 sqlcode is returned to the application, and a transaction dump is taken with abend code AD2S.

If THREADERROR(ABEND) is specified in the DB2CONN, the task is abnormally terminated with a CICS transaction dump.

User Response: Examine the AUTHID or AUTHTYPE parameter of the DB2ENTRY or pool used for the transaction. Ensure the id is authorised to access the plan in DB2.

Module: DFHD2EX1

AD2T

Explanation: An attempt to create a DB2 thread by the subtask servicing the DB2 request for the transaction failed with DB2 reason code 00F30040. The installed DB2CONN specifies THREADERROR(N906D) or THREADERROR(ABEND).

System Action:

If THREADERROR(N906D) is specified in the DB2CONN, processing continues. A -906 sqlcode is returned to the application and a transaction dump is taken with abend code AD2T.

If THREADERROR(ABEND) is specified in the DB2CONN, the task is abnormally terminated with a CICS transaction dump.

User Response: Either the plan is unavailable or is not known to DB2.

Module: DFHD2EX1

AD2U

Explanation: An attempt to create a DB2 thread by the subtask servicing the DB2 request failed. The installed DB2CONN specifies THREADERROR(N906D) or THREADERROR(ABEND).

System Action:

If THREADERROR(N906D) is specified in the DB2CONN, processing continues. A -906 sqlcode is returned to the application and a transaction dump is taken with abend code AD2U.

If THREADERROR(ABEND) is specified in the DB2CONN, the task is abnormally terminated with a CICS transaction dump.

User Response: Examine the dump to determine why the create thread failed.

Module: DFHD2EX1

AD2V

Explanation: The CICS-DB2 attachment facility issued a commit or end request to DB2 but received an 00F30805 reason code indicating that connection to DB2 has been lost. This is due to DB2 terminating abnormally or being in the process of terminating abnormally. The commit or end request may have been processed or DB2 may not have received the request and hence is still indoubt. The CICS-DB2 attachment facility instructs CICS to remember the outcome of the UOW pending resynchronisation which will happen when CICS and DB2 are reconnected.

System Action: The transaction completes normally but a transaction dump is taken with abend code AD2V. If DB2 is indoubt about the outcome of the UOW it will be resolved when CICS and DB2 are reconnected.

User Response: Contact your system programmer to restart the DB2 subsystem.

Module: DFHD2EX1

AD2W

Explanation: The CICS-DB2 attachment facility issued a single-phase commit call to DB2 but received an unexpected response. Transient data message DFHDB2055 details the DB2 reason code received. The commit request may have been processed or it may have been ended. There is no resynchronisation needed, as no CICS recoverable resources were updated.

System Action: The CICS-DB2 attachment facility abnormally terminates the transaction with abend code AD2W. The CICS recovery manager will supersede the AD2W abend code with abend code ASPR. A transaction dump is taken.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2X

Explanation: The CICS-DB2 attachment facility detected that the CICS task and thread subtask were in an invalid state. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD2Y

Explanation: The transaction was unable to obtain a DB2 thread from a DB2ENTRY or the pool because there were no TCBs available on which to create the thread. The number of subtask TCBs currently running is at the TCBLIMIT defined in the DB2CONN. Message DFHDB2010 is output to transient data. The transaction was abended because either:

- The DB2ENTRY specifies threadwait(no), meaning do not wait for a thread, including having to wait to create a thread because a TCB is not available - that is, do not wait for a TCB either.
- The DB2ENTRY specified threadwait(pool), but the pool definition within the DB2CONN specifies threadwait(no), and again there were no TCBs available.
- The transaction was using the pool directly, the pool specifies threadwait(no) and no TCB was available.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Determine whether TCBLIMIT should be increased or whether the number of transactions using DB2 at any one instance should be limited using transaction classes.

Module: DFHD2EX1

AD2Z

Explanation: DB2 detected a deadlock and the CICS-DB2 attachment facility attempted a syncpoint rollback command for the transaction as DROLLBACK(YES) was specified for the DB2ENTRY or POOL. The syncpoint rollback command failed. Message DFHDB2070 is output to transient data detailing the transid involved and the EIBRESP2 from the failed syncpoint rollback command.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Examine the eibresp2 value to determine why the syncpoint rollback request failed. One possible reason could be that the transaction running is a DPL server transaction which was DPLed to by a client transaction without specifying the SYNCONRETURN parameter. In this case syncpoints, or syncpoint rollbacks, cannot be taken by the server transaction, so DROLLBACK(YES) is invalid in this case.

Module: DFHD2EX1

AD21

Explanation: The CICS-DB2 attachment facility received a request for a resource manager with the incorrect name. Message DFHDB2045 is output to transient data detailing the invalid name.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD22

Explanation: The CICS-DB2 attachment facility EDF processor was unable to interpret the SQL request.

System Action: The command is not interpreted by EDF. A CICS transaction dump is taken with abend code AD22.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EDF

AD23

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility service transaction CEX2. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The CICS-DB2 service task initiates a force shutdown of the CICS-DB2 interface.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX2

AD24

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility service transaction CEX2. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The CICS-DB2 Service task initiates a force shutdown of the CICS-DB2 interface.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX2

AD25

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility while processing a DSNC command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The DSNC command fails and the transaction is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CC

AD26

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility while processing a DSNC command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The DSNC command fails and the transaction is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CC

AD27

Explanation: The CICS-DB2 attachment facility attempted to attach a subtask on which a DB2 thread was to be created to service the SQL request from the application. The attach of the subtask failed due to lack of storage.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Increase the size of the CICS region or lower the TCBLIMIT value specified in the DB2CONN.

Module: DFHD2EX1

AD28

Explanation: The CICS-DB2 attachment facility attempted to attach a subtask on which a DB2 thread was to be created to service the SQL request from the application. The attach of the subtask failed.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD29

Explanation: The CICS-DB2 attachment facility was unable to link to its EDF processor DFHD2EDF.

System Action: The command is not interpreted by EDF. Message DFHDB2048 is output to transient data and a transaction dump is taken with abend code AD29.

User Response: Examine the trace in the CICS transaction dump to determine why the link to module DFHD2EDF failed.

Module: DFHD2EDF

AD3A

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a LOCK call to the lock manager (LM) domain made by the CICS-DB2 attachment facility startup program. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2STR

AD3B

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on an UNLOCK call to the lock manager (LM) domain made by the CICS-DB2 Attachment facility startup program. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2STR

AD3D

Explanation: An unexpected response was received while attempting to delete a record from a temporary storage queue during processing of a DSNC STRT command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The DSNC STRT command fails. The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3G

Explanation: An unexpected response was received from an EXEC CICS GETMAIN issued during processing of a CICS-DB2 DSNC command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The DSNC command fails. The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3I

Explanation: An unexpected response was received from an EXEC CICS INQUIRE DB2CONN command issued during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3M

Explanation: An unexpected error occurred during processing of a DSNC MODIFY command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The DSNC MODIFY command fails. The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3P

Explanation: An unexpected error occurred during processing of a DSNC STOP command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The DSNC STOP command fails. The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3Q

Explanation: An unexpected response was received while attempting to read a record from a temporary storage queue during processing of a DSNC STRT command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The DSNC STRT command fails. The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3R

Explanation: An unexpected response was received while attempting to read a record from a temporary storage queue during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: Startup of the CICS-DB2 interface is terminated, the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2STR

AD3S

Explanation: An unexpected response was received from an EXEC CICS SET DB2CONN command issued during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3T

Explanation: The transaction was unable to obtain a DB2 thread from the pool. Message DFHDB2011 is output to transient data. The transaction was abended because the transaction tried using a DB2ENTRY but all threads were in use on the DB2ENTRY, and despite threadwait(pool) being specified, all threads in the pool were also in use. The pool definition within the DB2CONN specifies threadwait(no).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Determine whether more threads should be allocated to the DB2ENTRY or the pool, or whether the number of instances of this transaction should be limited using TRANCLASS.

Module: DFHD2EX1

AD3U

Explanation: An error (INVALID or DISASTER response) has occurred on a locate call to transaction manager (XM) domain to locate a transaction definition. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2EX1

AD3W

Explanation: An unexpected response was received while attempting to write a record to a temporary storage queue during startup of the CICS-DB2 interface. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: Startup of the CICS-DB2 interface is terminated, and the interface is closed. The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2STR

AD3X

Explanation: An unexpected response was received while attempting to write a record to a temporary storage queue during processing of a DSNC STRT command. A console message is output, an exception trace written and, possibly, a system dump taken (depending on the options specified in the dump table).

System Action: The DSNC STRT command fails. The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHD2CM1

AD3Z

Explanation: The CICS-DB2 subtask processing the DB2 request for this transaction has abended because the DB2 adapter is being shutdown.

System Action: The task is abnormally terminated.

User Response: If this abend should occur at CICS or DB2 shutdown then it can be ignored, because the DB2 adapter is abending the task as part of shutdown processing, otherwise you will need assistance from IBM.

Module: DFHD2EX1

AEC1

Explanation: An attempt has been made to use the Command Level Interpreter (CECI) or the Enhanced Master Terminal (CEMT) or an RDO (CEDA, CEDB, CEDC) transaction on a terminal that is not supported.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use a terminal that is supported by the Command Level Interpreter, Enhanced Master Terminal, or RDO transaction.

Modules: DFHECIP, DFHECSP, DFHEMTP, DFHESTP, DFHEOTP, DFHEDAP

AEC2

Explanation: An attempt has been made to use the Command Level Interpreter (CECI) or the Enhanced Master Terminal (CEMT) or an RDO (CEDA, CEDB, CEDC) transaction on a display terminal of size less than 24 X 80.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use a display terminal that is supported by the Command Level Interpreter or Enhanced Master Terminal or RDO transaction.

Modules: DFHECIP, DFHECSP, DFHEMTP, DFHESTP, DFHEOTP, DFHEDAP

AEC3

Explanation: An unsuccessful attempt has been made to call VS COBOL II to initialize a thread (for the first VS COBOL II program in a CICS transaction).

System Action: The transaction is abnormally terminated. The program is disabled.

User Response: Check your library setup to ensure that all of the VS COBOL II interface modules are present.

Module: DFHAPLI

AEC4

Explanation: An unsuccessful attempt has been made to call VS COBOL II to initialize a run-unit (for any VS COBOL II program in a CICS transaction).

System Action: The transaction is abnormally terminated. The program is disabled.

User Response: Check your library setup to ensure that all of the VS COBOL II interface modules are present.

Module: DFHAPLI

AEC5

Explanation: An unexpected error has been encountered by C/370 during the THREAD INITIALIZATION phase while attempting to execute a C language program.

System Action: The return code received from C/370 is placed into the field EIBRESP2; then the transaction is abnormally terminated. The program is disabled.

User Response: Refer to the error message(s) provided by C/370 to determine the cause of the problem.

Module: DFHAPLI

AEC6

Explanation: An unexpected error has been encountered by C/370 during the RUNUNIT INITIALIZATION phase while attempting to execute a C language program.

System Action: The return code received from C/370 is placed into the field EIBRESP2; then the transaction is abnormally terminated. The program is disabled.

User Response: Refer to the error message(s) provided by C/370 to determine the cause of the problem.

Module: DFHAPLI

AEC7

Explanation: Language Environment/370 has encountered an unexpected error during the THREAD INITIALIZATION phase while attempting to execute a Language Environment/370 enabled program. The return code received from Language Environment/370 is placed into the field EIBRESP2.

System Action: Message DFHAP1200 is issued and the transaction is abnormally terminated. The program is disabled.

User Response: Refer to the error message or messages issued by Language Environment/370 to determine the cause of the problem.

Module: DFHAPLI

AEC8

Explanation: Language Environment/370 has encountered an unexpected error during the RUNUNIT INITIALIZATION phase while attempting to execute a Language Environment/370 enabled program.

System Action: The return code received from Language Environment/370 is placed into the field EIBRESP2. Message DFHAP1200 is issued and the transaction is abnormally terminated. The program is disabled.

User Response: Refer to the error message or messages issued by Language Environment/370 to determine the cause of the problem.

Module: DFHAPLI

AEC9

Explanation: Language Environment/370 has encountered an unexpected error during the RUNUNIT BEGIN INVOCATION phase while attempting to execute a Language Environment/370 enabled program.

System Action: The return code received from Language Environment/370 is placed into the field EIBRESP2. Message DFHAP1200 is issued and the transaction is abnormally terminated. The program is disabled.

User Response: Refer to the error message or messages issued by Language Environment/370 to determine the cause of the problem.

Module: DFHAPLI

AEDA

Explanation: The CEDF transaction has been started with an invalid start code. This could be the result of attempting to start the execution diagnostic facility (EDF) with EXEC CICS START(CEDF).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why the start has failed.

Module: DFHEDFX

AEDB

Explanation: DFHEDFP has been passed an invalid EDFXA. This is an internal CICS error.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEDFX

AEDC

Explanation: The program EDF has terminated because a GETMAIN request to the storage manager failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why the request has failed.

Module: DFHEDFX

AEDD

Explanation: CICS has attempted to attach the EDF task to display the user request but the attach has failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why the attach has failed.

Module: DFHEDFX

AEDE

Explanation: CICS has suspended the user task to allow the EDF task to complete but an error has occurred while performing the suspend.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why the suspend has failed.

Module: DFHEDFX

AEDF

Explanation: CICS has suspended the user task to allow the EDF task to complete. The user task has been purged while suspended, before control was returned from EDF.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: The task was probably purged by the master terminal operator.

Investigate the reason why the task was purged. This may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

Module: DFHEDFX

AEDG

Explanation: CICS has suspended the user task to allow the EDF task to complete. The user task has gone away while suspended, before control was returned from EDF.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine the reason why the task finished before being resumed.

Module: DFHEDFX

AEDH

Explanation: An error occurred when CICS called the Program Manager in order to discover details of the user program that has invoked EDF.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why the call has failed.

Module: DFHEDFX

AED1

Explanation: This abend is produced as a result of either:

- An attempt to use the execution diagnostic facility (EDF) on an unsupported terminal,
- Using the temporary storage browse transaction (CEBR) on an unsupported device, or
- An attempt to initiate the temporary storage browse transaction (CEBR) with a non-terminal principal facility.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use a terminal or device that is properly supported.

Modules: DFHEDFP, DFHEDFBR

AED2

Explanation: The program EDF has terminated a task and placed this abend code in the terminated task's TCA. This occurs because execution of EDF is about to be abnormally terminated. A probable reason for EDF being terminated is that a line, control unit, or a terminal has been put out of service.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use a terminal that is supported as a display terminal by EDF. A CICS transaction dump of the task terminated with this abend code is available for review.

Module: DFHEDFX

AED3

Explanation: The program EDF has terminated a task and placed this abend code in the terminated task's TCA. The termination occurs because execution of EDF is about to be abnormally terminated.

One possible cause of an abend in EDF is incorrect data being sent to the terminal by the user task.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: A CICS transaction dump of the terminated task and also a similar dump for EDF, when its termination was abnormally terminated, are available for review.

Module: DFHEDFX

AED4

Explanation: An internal logic error has been detected in EDF module DFHEDFP.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: This indicates a CICS logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEDFP

AED5

Explanation: An internal logic error was been detected in EDF. Insufficient dynamic storage was pre-allocated.

System Action: EDF is terminated abnormally with dumps having dump codes CXSP, RMIN, PAGE, LDIN. The user task continues.

User Response: The problem may be avoided by less complex user interactions with EDF. If the problem persists, you may need further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEDFD

AED6

Explanation: An internal logic error was detected in EDF.

System Action: EDF is terminated abnormally with dumps having dump codes CXSP, RMIN, PAGE, LDIN. The user task continues.

User Response: The problem may be avoided by less complex user interactions with EDF. If the problem persists, you may need further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEDFU

AED7

Explanation: The installed definition of the transaction CEDF has a TWA size which is too small.

System Action: CICS abnormally terminates the transaction with a CICS transaction dump.

User Response: If you have an updated copy of the CEDF transaction installed, ensure that you have a TWA size at least as big as the one defined by the IBM supplied definition. If you do not have an updated CEDF you may need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEDFP

AED8

Explanation: A terminal control error has occurred in DFHEDFX.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEDFX

AED9

Explanation: A temporary storage error has occurred in EDF. This could be caused by an input/output error on temporary storage or because temporary storage data is full.

System Action: EDF is abnormally terminated with a CICS transaction dump.

User Response: Investigate the reason for the temporary storage request failure. Ensure that the definition of the temporary storage data set is correct.

See the *CICS Problem Determination Guide* for further guidance in dealing with temporary storage problems.

Module: DFHEDFD

AEIA

Note: The description of this abend also applies to AEID to AEI9, AEXC, AEXF, AEXG, AEXI to AEXL, AEXV to AEXX, AEX0 to AEX9, AEYA to AEYC, AEYE to AEY3, AEY7, and AEZE to AEZQ.

Explanation: The EXEC interface program issues an abend when an exceptional condition has occurred but the command does not have the RESP option (or NOHANDLE option), or the application program has not executed an EXEC CICS HANDLE CONDITION command for that condition. This will cause DFHEIP to take the system action for the condition in question. In most cases, the system action will be to abend the transaction.

Because of their similar characteristics, the above-named abend codes for the EXEC interface program are described as a group. The codes and their corresponding exceptional conditions are as follows:

Code	Condition
AEIA	ERROR
AEID	EOF
AEIE	EODS
AEIG	INBFMH
AEIH	ENDINPT
AEII	NONVAL
AEIJ	NOSTART
AEIK	TERMIDERR
AEIL	FILENOTFOUND
AEIM	NOTFND
AEIN	DUPREC
AEIO	DUPKEY
AEIP	INVREQ
AEIQ	IOERR
AEIR	NOSPACE
AEIS	NOTOPEN
AEIT	ENDFILE
AEIU	ILLOGIC
AEIV	LENGERR
AEIW	QZERO
AEIZ	ITEMERR
AEI0	PGMIDERR
AEI1	TRANSIDERR
AEI2	ENDDATA
AEI3	INVTSREQ
AEI4	EXPIRED
AEI8	TSIOERR
AEI9	MAPFAIL
AEXC	RESIDERR
AEXF	ESCERROR
AEXG	UOWLNOTFOUND
AEXI	TERMERR
AEXJ	ROLLEDBACK
AEXK	END
AEXL	DISABLED
AEXV	VOLIDERR
AEXW	SUPPRESSED
AEXX	TASKIDERR
AEX0	TCIDERR
AEX1	DSNNOTFOUND
AEX2	LOADING
AEX3	MODELIDERR
AEX4	UOWNOTFOUND
AEX5	PARTNERIDERR
AEX6	PROFILEIDERR
AEX7	NETNAMEIDERR
AEX8	LOCKED

AEZJ	CONTAINERERR
AEZK	EVENTERR
AEZL	TOKENERR
AEZM	NOTFINISHED
AEZN	POOLERR
AEZO	TIMERERR
AEZP	SYMBOLERR
AEZQ	TEMPLATERR

Problem Determination: The function code of the command that produced the exceptional response and the response code can be found in the EXEC interface block (EIB). The EIB is part of a larger control block, used by DFHEIP, known as the EXEC interface storage block (EIS). The EIS is addressed by the TCAEISA, which is the system part of the TCA + X'90' The EIB is pointed to from the EIS + X'8'.

The function code may be located at offset X'1B' in the EIB while the response codes may be one of the following at the given offsets:

EIBRCODE X'1D'

EIBRESP X'4C'

EIBRESP2 X'50'

The *CICS Application Programming Reference* gives translations of the encoded functions and their responses.

Analysis: Because these abend codes are directly related to exceptional conditions that can be specified in HANDLE CONDITION commands, the application programmer should decide whether the condition is one that should be handled by the application (for example ENDFILE), or one that requires modifications to the application or CICS tables.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Change the application program either to prevent the condition recurring, to check it by using the RESP option, or to handle the condition when it does occur (by using the EXEC CICS HANDLE CONDITION command). If necessary, use the contents of the EIBRESP2 field or the EIBRCODE in the EIB to assist in determining the cause of the exceptional condition.

Module: DFHEIP

AELA

Explanation: The executing function has been purged before control could be returned.

System Action: The transaction is marked to be abnormally terminated with abend code AELA.

User Response: Investigate the reason the task was purged. It was purged either by the master terminal operator, or as a result of a deadlock timeout.

If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased then the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

Module: DFHETL

AELB

Explanation: The executing function has been purged before control could be returned.

System Action: The transaction is marked to be abnormally terminated with abend code AELB.

User Response: Investigate the reason the task was purged. It was purged either by the master terminal operator, or as a result of a deadlock timeout.

If the task was purged by the master terminal operator, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased then the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

Module: DFHEGL

AEMA

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the application (AP) domain when a request for set user exit active could not be serviced.

System Action: The task is abnormally terminated. The domain that detected the original error issues a console message and might provide an exception trace, and depending on the options specified in the dump table, a system dump.

User Response: See the associated console message for further guidance.

Module: DFHUEM

AEMB

Explanation: An error (INVALID or DISASTER response) has occurred on a call to the loader (LD) domain. The domain that detected the original error will have provided an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User Response: See the related message from the domain that detected the original error.

Module: DFHUEM

AEMP

Explanation: The task was purged before a set active request to the application (AP) domain was able to complete successfully. The domain that first detected the purged condition may provide an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting

for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHUEM

AEMQ

Explanation: The task was purged before an IDENTIFY_PROGRAM request to the loader (LD) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump (depending on the options in the dump table).

User Response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHUEM

AETA

Explanation: A CICS transaction has issued a non-CICS command via an application “stub” (an expansion of a DFHRMCAL macro). Program DFHERM has determined that the exit has been disabled since the previous DFHRMCAL request was issued from the transaction.

System Action: The task is abnormally terminated with a transaction dump

User Response: Notify your system programmer.

Module: DFHERM

AETC

Explanation: A CICS transaction has issued a non-CICS command via an application “stub” (an expansion of a DFHRMCAL macro). However, the task-related user exit (TRUE) is not known to program manager.

System Action: The task is abnormally terminated with a transaction dump

User Response: Ensure that the TRUE as identified to the DFHRMCAL macro has been correctly defined to CICS.

Module: DFHERM

AETF

Explanation: The task was purged before a request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHERM

AETG

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHERM

AETH

Explanation: The task was purged before a request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHERM

AETI

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHERM

AETJ

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an ADD_LINK call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHERM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHERM

AETK

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an SET_LINK call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHERM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHERM

AETL

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an SET_UOW call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHERM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHERM

AETM

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INQUIRE_TRANSACTION call to the transaction manager (XM) domain. For errors other than EXCEPTION, the XM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRMSY

AETN

Explanation: An EXCEPTION response with an unexpected reason occurred on an INITITIATE_RECOVERY call to recovery manager (RM) domain. DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRMSY

AETO

Explanation: An error (DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INITIATE_RECOVERY call to the recovery manager (RM) domain. The RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

DFHRMSY also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRMSY

AETP

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an TERMINATE_RECOVERY call to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRMSY

AETQ

Explanation: An EXCEPTION response with an unexpected reason occurred on an INQUIRE_UOW call to the recovery manager (RM) domain. DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRMSY

AETR

Explanation: An error (DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INQUIRE_UOW call to the recovery manager (RM) domain. The RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

DFHRMSY also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRMSY

AETS

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INQUIRE_STARTUP call to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRMSY provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRMSY

AEXU

Explanation: During execution of an EXEC CICS command, a NOTPOSS condition has been raised on encountering an invalid parameter. This is probably caused by a previous storage overlay.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Refer to abend AEIA for an explanation of how to determine the function code of the CICS command that caused the abend.

It is not possible to set an EXEC CICS HANDLE CONDITION for NOTPOSS.

The system programmer should investigate the cause of the storage overlay.

Modules: DFHEIDTI, DFHEIQDS, DFHEIQSA, DFHEIQSC, DFHEIQSM, DFHEIQSP DFHEIQST, DFHEIQSX

AEXY

Explanation: The executing transaction has been purged before control could be returned.

This can arise when the transaction is purged while

- A CICS command was being processed
- The transaction was waiting to be dispatched

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Contact your system programmer to determine why the transaction has been purged.

Modules: DFHACP, DFHBEP, DFHBREX, DFHBRIC, DFHBRMS, DFHBRSP, DFHBRTC, DFHBSTS, DFHBSTZO, DFHD2CC, DFHD2EX1, DFHD2EX2, DFHD2STR, DFHEDCP, DFHEDFP, DFHEDI, DFHEEI, DFHEGL, DFHEICRE, DFHEIIC, DFHEIP, DFHEIPA, DFHEIPRT, DFHEIPSE, DFHEIPSH, DFHEIQDE, DFHEIQDN, DFHEIQDS, DFHEIQDU, DFHEIQD2, DFHEIQIR, DFHEIQMS, DFHEIQMT, DFHEIQPF, DFHEIQPN, DFHEIQRQ, DFHEIQSA, DFHEIQSC, DFHEIQSJ, DFHEIQSK, DFHEIQSL, DFHEIQSM, DFHEIQSP, DFHEIQSQ, DFHEIQST, DFHEIQSX, DFHEIQTM, DFHEIQTR, DFHEIQTS, DFHEIQUE, DFHEIQVT, DFHEIUOW, DFHEKC, DFHEMS, DFHEOP, DFHEPC, DFHERM, DFHESC, DFHESE, DFHESN, DFHETC, DFHETL, DFHETRX, DFHPCPC2, DFHTACP, DFHTFP, DFHTIEM, DFHUEM, DFHWBTC, DFHXMBR, DFHXTP, DFHZATS, DFHZNCA, DFHZNCE, DFHZTSP, DFHZXQO, DFHZXST

AEXZ

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System Action: The transaction is abnormally terminated with abend code AEXZ. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User Response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Modules: DFHACP, DFHBEP, DFHBREX, DFHBRIC, DFHBRMS, DFHBRSP, DFHBRTC, DFHBSTS, DFHBSTZO, DFHEDCP, DFHEDFP, DFHEDI, DFHEEI, DFHEGL, DFHEIACQ, DFHEICRE, DFHEIIC, DFHEIP, DFHEIPA, DFHEIPRT, DFHEIPSE, DFHEIPSH, DFHEIQDE, DFHEIQDN, DFHEIQDS, DFHEIQDU, DFHEIQD2, DFHEIQIR, DFHEIQMS, DFHEIQMT, DFHEIQPF, DFHEIQPN, DFHEIQRQ, DFHEIQSA, DFHEIQSC, DFHEIQSJ, DFHEIQSK, DFHEIQSL, DFHEIQSM, DFHEIQSP, DFHEIQSQ, DFHEIQST, DFHEIQSX, DFHEIQTM, DFHEIQTR, DFHEIQTS, DFHEIQUE, DFHEIQVT, DFHEIUOW, DFHEKC, DFHEMS, DFHEOP, DFHEPC, DFHESC, DFHESE, DFHESN, DFHETC, DFHETL, DFHETRX, DFHFCFL, DFHPCPC2, DFHTACP, DFHTFP, DFHTIEM, DFHUEH, DFHUEM, DFHWBTC, DFHXMBR, DFHXTP, DFHZATS, DFHZNCA, DFHZNCE, DFHZTSP, DFHZXQO, DFHZXST

AEYD

Explanation: A transaction has requested that CICS access a storage area that the transaction itself could not access. This occurred when an invalid storage area was passed to CICS as an output parameter on an EXEC CICS command.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Examine the trace to find the exception trace entry created by DFHEISR and then identify the parameter in error. If the abend is handled, EXEC CICS ASSIGN ASRASTG, ASRAKEY, ASRASPC, and ASRAREGS give additional information about the abend. At the time of the abend, register 2 points to the storage area at fault.

Change one or more of the following:

- Correct the code in error in the transaction issuing the EXEC CICS command in order to supply a valid storage area.
- If storage protection is active, change the EXECKEY on the CEDA definition for the program that issued the EXEC CICS command from USER to CICS.
- If storage protection is active, change the TASKDATAKEY attributes on the transaction definition from CICS to USER.
- If transaction isolation is active, change the ISOLATE attribute on the transaction definition from YES to NO.

Modules: DFHSRP

AEY6

Explanation: Internal logic error in DFHUEM. This arises when using EXITALL to DISABLE an exit program from all exit points for which it has been enabled. The entire user exit table has been scanned and all associations of the program have been found. But the activation count for the program in its exit program block indicates there should be more associations (for example, the activation count has not been reduced to zero). The user exit table and associated control blocks (EPBs and EPLs) are out of step and have probably been corrupted.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHUEM

AEY8

Explanation: No DSA was found on the chain while trying to free dynamic storage for an assembler language program using an EXEC CICS command.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Ensure that the DFHEIENT, DFHEISTG, and DFHEIEND macro invocations are correctly positioned and retry. If the error persists, you will need further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHEIP

AEY9

Explanation: One of the following:

- An EXEC CICS command has been issued that is not supported by the EXEC interface program DFHEIP.
- A transaction has issued an EXEC CICS command which is supported in principle by the EXEC interface program DFHEIP, but for which the prerequisite function has not been included in the current CICS start-up.
- A non-CICS command has been issued via an application “stub” (expansion of a DFHRMCAL macro), and the program DFHERM has detected that the necessary non-CICS support is not available.
- An attempt has been made to use remote resources, but the local SYSID has been specified in an EXEC CICS command, or vice versa.
- An attempt has been made to use remote resources, but ISC is not supported.
- An EXEC CICS command contains an invalid AID or CONDITION identifier. This indicates that the EXEC CICS command has become corrupted.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Check that the sysid specified and the resource names were correct. If not, notify the system programmer. Either the command (or an application stub) has become corrupted, or the unavailable function needs to be generated (CICS command), ENABLEd (non-CICS command), or exceptionally the non-CICS support has suffered damage and is attempting to withdraw itself from the CICS system.

Modules: DFHEIP, DFHEEI

AEZA

Explanation: A transaction has been defined with a TASKDATALOC(ANY), but the programs within the transaction are running amode 24. The exec interface program is therefore is unable to access the TCA for the application. Furthermore, any reference to the EIB would cause the transaction to fail with an OC4 protection exception.

System Action: The transaction is abnormally terminated.

User Response: Either redefine and install a new definition for the transaction with TASKDATALOC(BELOW), or relink the programs as amode 31.

Module: DFHEIP

AEZB

Explanation: A transaction has been defined with a TASKDATALOC(ANY), and the application is attempting to call a task related user exit. However the task related user exit has been linkedited AMODE 24 and enabled with the LINKEDITMODE option, thereby directing CICS to invoke it in AMODE 24. An AMODE 24 task related user exit cannot run when the calling application is running with TASKDATALOC(ANY), as this would cause a protection exception, or a storage overwrite.

System Action: The transaction is abnormally terminated.

User Response: Either redefine and install a new definition for the transaction with TASKDATALOC(BELOW), or modify the task related user exit so that it is invoked in AMODE 31.

Module: DFHERM

AEZC

Explanation: A transaction has been defined with a TASKDATALOC(ANY), but a program within the transaction is defined to run AMODE 24. CICS cannot invoke the AMODE 24 program when the transaction is running with TASKDATALOC(ANY), as this would cause a protection exception, or a storage overwrite.

System Action: The transaction is abnormally terminated.

User Response: Either redefine and install a new definition for the transaction with TASKDATALOC(BELOW), or relink the program as AMODE 31.

Module: DFHAPLI

AEZD

Explanation: An attempt has been made to run a program defined as EXECKEY(USER) as part of a transaction defined as TASKDATAKEY(CICS). These attributes are incompatible and the transaction is abended. This incompatibility could occur as a result of the program definition being autoinstalled. See the CICS Customization Guide and the CICS Resource Definition Guide for more information about program autoinstall.

System Action: The transaction is abnormally terminated.

User Response: Redefine and install a new definition either for the transaction with TASKDATAKEY(USER), or for the program with EXECKEY(CICS).

If this abend occurs when running a CICS transaction, a possible cause is that you are not using the CICS-supplied definition for the program. If you are using your own copies of CICS-supplied program definitions, they must be defined as EXECKEY(CICS).

Module: DFHAPLI

AEZE

Explanation: CHANGED condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEZF

Explanation: PROCESSBUSY condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AEZG

Explanation: ACTIVITYBUSY condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

AEZQ

Explanation: TEMPLATERR condition not handled.

This is one of a number of abends issued by the EXEC interface program. Because of their similar characteristics these abends are described as a group.

See the description of abend AEIA for further details.

Module: DFHEIP

AFCB

Explanation: Module DFHEIFC issued a resource level security check (RSLC) request to module DFHXSRC and received a response other than OK or EXCEPTION.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Examine the trace to find the exception trace entry created by DFHXSRC at the time of the error. Use this trace entry to determine the cause of the return code from DFHXSRC.

Module: DFHEIFC

AFCC

Explanation: An internal logic error was detected when calling the file control request processing module DFHFCFR. Either DFHFCFR returned an INVALID response to its caller indicating an error in the caller's parameter list, or DFHFCFR passed back a return code that was not recognized by its caller.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHEIFC, DFHDMPCA

AFCD

Explanation: During an attempt to locate an AFCT entry, the table manager program DFHTMP has returned a “disastrous error” response that could not be handled by its caller.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEIFC

AFCE

Explanation: A GETMAIN for FFLE storage has failed.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Retry the failed transaction.

Module: DFHEIFC

AFCF

Explanation: A deadlock has been detected between two or more tasks issuing file control requests.

System Action: The task that would have entered deadlock is abended with a CICS transaction dump.

User Response: Examine this transaction and other transactions in the system that update the same files to find the cause of the deadlock, then correct the error.

When transactions update several files within the same unit of work, all transactions should update these files in the same order. A transaction that abends AFCF may be retried by specifying RESTART(YES) in the transaction definition and by coding a suitable DFHREST program.

Modules: DFHEIFC, DFHDMPCA

AFCG

Explanation: A transaction has issued a sequence of file control requests that would cause the file to deadlock itself. This response arises for different reasons depending upon the file type.

If the file is being accessed in non-RLS mode, the response is caused by the transaction making conflicting requests against the same CI. For example, if the file is being accessed using LSR, a self deadlock will arise when an attempt is made to read a record that is in the same CI as a record that is the subject of a READ UPDATE or WRITE MASSINSERT request issued by the same transaction.

If the file is accessed in RLS mode there is no CI locking, but self deadlock responses can still arise. They are caused by sequences of requests that are either logically meaningless or which cannot be performed by VSAM RLS.

With VSAM RLS the most likely causes of this abend are as follows:

- Two successive READ UPDATE requests against the same record by the same transaction without an intervening REWRITE, DELETE or UNLOCK command.

  This is an incorrect use of file control requests.
- A transaction has created a record by WRITE MASSINSERT and then, without terminating the WRITE MASSINSERT sequence by issuing an UNLOCK request, the same transaction has attempted to modify the same record by issuing a READ UPDATE or DELETE request.

  This sequence of requests fails if VSAM has not written the record out to disk. The only way to guarantee that the record has been written to disk is to issue the UNLOCK request.
- A transaction has updated or deleted a record using a browse for update sequence and then, without terminating the browse for update sequence by issuing an ENDBR request, the same transaction has attempted to modify the same record by issuing a separate READ UPDATE or DELETE or WRITE request.

  This sequence of requests fails if VSAM has not written the record out to disk. The only way to guarantee that the record has been written to disk is to issue the ENDBR request.

If the file is used to access a coupling facility data table, then self deadlock responses are caused by sequences of requests that are either logically meaningless or which cannot be performed by coupling facility data tables support.

For coupling facility data tables, the most likely cause of this abend is as follows:

- Two successive READ UPDATE requests have been issued against the same record by the same transaction without an intervening REWRITE, DELETE or UNLOCK command.

  This is an incorrect use of file control requests.

System Action: The task that would have entered deadlock is abended with a CICS transaction dump.

User Response: Examine the previous requests made by this transaction against this file to identify the cause of the deadlock, then correct the error. In some cases (particularly when the file is being accessed in RLS mode or is using a coupling facility data table) this abend may indicate a programming error in the program that issued the file control requests.

Modules: DFHEIFC, DFHDMPCA

AFCH

Explanation: The transaction has issued a request for a remote shared data table for which it has an active browse, but in the meantime the table has been disabled or closed by the owning CICS system, or the owning CICS system has failed.

System Action: The requesting transaction abends with a transaction dump.

CICS continues normally.

User Response: In the application owning region, take whatever action normally follows the issue of a FORCE request in, or the failure of, the file owning CICS system.

See the *CICS Shared Data Tables Guide* for further guidance. guidance.

Module: DFHEIFC

AFCJ

Explanation: DFHFCU issued a call to DFHFCFS to open a file. A purged error was returned from DFHFCFS because the task has been waiting for a resource longer than the DTIMEOUT interval specified for the CSFU transaction.

System Action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User Response: Examine the dump to determine the cause of the error. A system dump can be produced by adding the appropriate dump table entry using the CEMT SET TRDUMPCODE command.

Module: DFHFCU

AFCK

Explanation: The transaction issued a file update request (READ UPDATE, WRITE or DELETE) against an RLS mode data set for which a DFSMSdss non-BWO backup was in progress.

System Action: The transaction is abnormally terminated with a CICS transaction dump. CICS processing continues.

User Response: All new file update requests are prohibited when a non-BWO backup is in progress for an RLS mode data set. This restriction is automatically lifted when the backup completes. (A non-BWO backup is any type of backup operation other than a Backup While Open backup.) When the backup has completed, retry the transaction.

Modules: DFHDMPCA, DFHEIFC

AFCL

Explanation: During the loading of a Shared Data Table by the CFSL transaction, a call to the CICS Transaction Manager has returned a response (such as DISASTER) after which normal processing could not continue.

System Action: Message DFHFC0949 is issued. Loading of the data table is terminated and CFSL abends.

User Response: Refer to the description of the message for further information and guidance.

Module: DFHDTLX

AFCM

Explanation: During the loading of a data table by the CFSL transaction, an abend was detected, or a domain call returned a response (such as DISASTER) after which normal processing could not continue.

System Action: A message is issued (one of DFHFC0945, DFHFC0946, or DFHFC0947). Loading of the data table is terminated and CFSL abends.

User Response: If this abend is produced as a result of an abend during loading, message DFHFC0945 is issued. If it is a result of a domain call failure, depending on which domain the failure was returned by, one of the messages DFHFC0946 or DFHFC0947 is issued. Refer to the description of the message for further information and guidance.

Module: DFHDTLX

AFCN

Explanation: The transaction issued a file request that caused file control to attempt to create a journal record but the record was too large for the journal buffer to accommodate. This indicates that a journal referenced in the file definition is using an MVS logstream, which in turn, is using a coupling facility structure which has been defined with a MAXBUFSIZE parameter less than the recommended 64000.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Redefine the coupling facility structure that the logstream is using with a MAXBUFSIZE parameter of 64000. The journal in error can be the forward recovery log or the journal used for auto-archiving.

If the module that detected the error is DFHDMPCA, the error is associated with a journal referenced in the definition of the CSD (DFHCSD).

Modules: DFHDMPCA, DFHEIFC

AFCO

Explanation: An attempt was made to attach a transaction specifying DFHDTLX as the program to be given control, but the transaction was not internally attached by CICS.

DFHDTLX is for use by CICS system transaction CFSL. This loads a Shared Data Table.

System Action: The transaction is abnormally terminated. CICS processing continues.

User Response: Establish why an attempt was made to attach CFSL illegally, or why a transaction definition specified DFHDTLX as the program to be given control.

Module: DFHDTLX

AFCR

Explanation: The program issued a file control request against a file opened in RLS mode. While executing this request, CICS detected that the SMSVSAM server address space had failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

CICS disables all further RLS accesses and initiates error recovery.

User Response: Retry the transaction when the server is available again

If the SMSVSAM server fails, it should normally automatically restart itself as quickly as possible. If this does not happen, consult the VSAM documentation which provides further guidance on debugging problems in the SMSVSAM server.

Modules: DFHEIFC, DFHDMPCA

AFCS

Explanation: The program issued a file control request against a file opened in RLS mode. VSAM was unable to perform this request because the SMSVSAM server address space was inactive.

However, if an offsite restart is being performed (that is, OFFSITE=YES was specified as a system initialization override), this transaction abend is also issued even if the SMSVSAM server address space is active. This is because RLS access is not allowed during an offsite restart for any RLS file control requests other than those issued by transactions which have been attached by CICS to perform RLS recovery work.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Retry the transaction when the server is available again.

If the SMSVSAM server fails, it should normally automatically restart itself as quickly as possible. If this does not happen, consult the VSAM documentation which provides further guidance on debugging problems in the SMSVSAM server.

If an offsite restart is being performed, retry the transaction after RLS recovery has been completed when RLS access by user transactions is allowed again.

Modules: DFHEIFC, DFHDMPCA

AFCT

Explanation: The program has made a file control request against a file opened in RLS mode. The SMSVSAM server has been recycled since an earlier RLS request from the same unit of work. The same unit of work cannot issue requests against two different instances of the SMSVSAM server. Note that this abend will occur even if the earlier request was not successful.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Resubmit the transaction.

Modules: DFHEIFC, DFHDMPCA

AFCU

Explanation: A program made a file control request against a file that is being accessed in VSAM RLS mode. The underlying data set is in lost locks state. File control requests are not allowed against a data set that is in lost locks state.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Recovery from lost locks is normally automatic. See the *CICS Recovery and Restart Guide* for a full explanation of lost locks recovery. You will not be able to issue any file control requests against this data set until all systems that owned locks at the time of the lock structure failure have completed their lost locks recovery.

See the *CICS Recovery and Restart Guide* for guidance on how to determine which CICS systems still have lost locks recovery pending, for information on commands that allow you to find the work that these systems have outstanding, and on commands that allow you to force a system to immediately complete lost locks recovery. The commands that force immediate completion of lost locks recovery should only be used as a last resort as they may cause loss of data integrity. It is better to allow the automatic recovery procedures to complete normally.

Modules: DFHEIFC, DFHDMPCA

AFCV

Explanation: A request made against a file opened in RLS mode was unable to acquire a record lock. It waited for the lock, but the wait time exceeded the maximum wait time applicable to that request.

System Action: The task is abnormally terminated with a CICS transaction dump.

CICS prints message DFHFC0164 and message DFHFC0165 which identify the transaction or transactions that were immediately in front of this transaction in the queue for the lock. Normally this transaction or these transactions are the owners of the lock, although this is not the case if a chain of requests for the record has built up.

User Response: Retry the transaction.

If the problem recurs, see messages DFHFC0164 and DFHFC0165 to determine the transaction that is holding the lock. In most cases the problem lies with the lock owner rather than the transaction that has failed.

Examples of causes of timeouts are as follows:

- The transaction that holds the lock has a design error. For example:
  - A conversational transaction updates a recoverable record and then issues a terminal control read. It does not issue syncpoint (and therefore does not release the lock) until the end user has responded to the terminal control read. It may therefore hold the lock for a considerable period.
  - A transaction updates very many records in recoverable files before issuing syncpoint. You are recommended to keep the number of updates made within a unit of work small and to issue frequent syncpoints to ensure that locks are released regularly.
- The system in which the lock holder is running is experiencing severe performance degradation. Investigate the reason for the performance degradation.
- There is a deadlock between RLS and another resource manager. For example one transaction may be holding an RLS lock and waiting for a lock on a transient data queue. The transaction that times out may hold the lock on the transient data queue and be waiting for the RLS lock. RLS can detect deadlocks only when all the locks involved in the deadlock are RLS locks. A deadlock such as this can appear to RLS to be a long wait for a lock and is reported as a time out. Examine the design of the transactions to determine whether resource manager deadlocks can occur.
- It may be possible for RLS deadlocks to be reported as RLS timeouts if VSAM does not perform deadlock detection until after the time out value for the request occurred. For example, assume that DEADLOCK_TIMEOUT in specified as (15,4) in SYS1.PARMLIB. This means that VSAM does not attempt to detect cross-MVS deadlocks until 4 periods of 15 (that is, 60) seconds have elapsed. If DTIMOUT was not active for the transaction and the SIT specified FTIMEOUT=30, the RLS request times out after 30 seconds, before VSAM has attempted to detect cross-MVS deadlocks. Adjust FTIMEOUT, DTIMOUT, and DEADLOCK_DETECTION to avoid such effects.

Modules: DFHEIFC, DFHDMPCA

AFCW

Explanation: The program issued a file control request against a file opened in RLS mode. VSAM RLS detected that this request would cause a deadlock. This transaction is abended in order to break the deadlock chain.

System Action: The task is abnormally terminated with a CICS transaction dump.

CICS prints message DFHFC0166 and message DFHFC0167 which identify the other transactions in the deadlock chain.

User Response: Retry the transaction.

Examine the logic of all the programs involved in the deadlock chain to determine whether they could be improved to avoid possible sources of deadlock. See the *CICS Application Programming Guide* for guidance on how to write programs that avoid deadlocks.

Modules: DFHEIFC, DFHDMPCA

AFCY

Explanation: The transaction issued a file request resulting in a call to the main file control program (DFHFCFR). During the processing of the request the transaction was purged (that is, was the subject of an explicit PURGE or FORCEPURGE request, was timed out, or was selected by CICS for termination in an attempt to alleviate an SOS condition). A “purged” response was returned from DFHFCFR to its caller.

System Action: The task is abnormally terminated with a CICS transaction dump.

Exception trace entries are made between the point at which the purge is detected and the issuing of the abend.

User Response: In some instances, for example if the transaction was explicitly purged, no further action is necessary.

Otherwise examine the exception trace and the transaction dump to identify the point at which the purge occurred.

Modules: DFHDMPCA, DFHEIFC

AFCZ

Explanation: The transaction issued a file request resulting in a call to the main file control program (DFHFCFR). A “disastrous error” response was returned from DFHFCFR to its caller.

System Action: At the time the error is detected, CICS writes a message to the console, records an exception trace entry, and takes a system dump. The trace and dump identify the point of error.

Subsequently, the task is abnormally terminated with a CICS transaction dump.

User Response: The system programmer should use the trace and dumps to determine what the error is, and why it has occurred.

Modules: DFHDMPCA, DFHEIFC

AFC0

Explanation: An attempt has been made to update a file after file control restart failed.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Determine the cause of the failure in file control restart. Restart CICS.

Modules: DFHEIFC, DFHDMPCA

AFC2

Explanation: DFHFCU issued a call to DFHFCFS to open a file. A disastrous error was returned from DFHFCFS.

System Action: The task is abnormally terminated with a CICS transaction dump.

At the time the disastrous error is detected, CICS writes a message to the console, records an exception trace entry and takes a system dump.

CICS processing continues.

User Response: The system programmer should examine the trace, the system dump and any related CICS messages to identify the cause of the error.

Module: DFHFCU

AFC7

Explanation: The CICS definition file (CSD) manager (DFHDMPCA) issued a request to DFHFCFS to enable, open or close the DFHCSD file. A “disastrous error” response was returned from DFHFCFS to DFHDMPCA.

System Action: The task is abnormally terminated with a CICS transaction dump.

At the time the disastrous error is detected, CICS writes a message to the console, records an exception trace entry and takes a system dump.

CICS processing continues.

User Response: The system programmer should examine the trace, the system dump and any related CICS messages to identify the cause of the error.

Module: DFHDMPCA

AFDA

Explanation: An attempt was made to attach a transaction specifying DFHFCQT as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCQT is for use by CICS system transactions CFQS and CFQR. These provide support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss BWO and non-BWO backups, and certain other data set related operations.

System Action: The transaction is abnormally terminated. CICS processing continues.

User Response: Establish why an attempt was made to illegally attach CFQS or CFQR, or why a transaction definition specified DFHFCQT as the program to be given control.

Module: DFHFCQT

AFDB

Explanation: An attempt was made by CICS to internally attach a transaction specifying DFHFCQT as the program to be given control, and the transaction id was other than CFQS or CFQR.

DFHFCQT is for use by CICS system transactions CFQS and CFQR. These provide support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss BWO and non-BWO backups, and certain other data set related operations.

System Action: The transaction is abnormally terminated with a CICS transaction dump. CICS processing continues but it is probable that VSAM RLS data set quiesce support has been lost.

User Response: Restart CICS. If the problem reoccurs, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCQT

AFDC

Explanation: CICS system transaction CFQS has failed due to a serious error. An attempt will be made to reattach the transaction. CICS messages should indicate the cause of the error.

CFQS provides support for the initiation of VSAM RLS data set quiesce and unquiesce operations.

System Action: CFQS is abnormally terminated with a CICS transaction dump. CFQS is reattached and CICS processing continues.

User Response: Check Transient Data Queue CSFL for message DFHFC6028, indicating that the reattach of CFQS was successful. If the reattach fails, VSAM RLS data set quiesce initiation support is lost. If this support is required, CICS must be restarted.

If it is not possible to restore VSAM RLS quiesce initiation support, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCQT

AFDD

Explanation: CICS system transaction CFQR has failed due to a serious error. An attempt will be made to reattach the transaction. CICS messages should indicate the cause of the error.

CFQR provides support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss BWO and non-BWO backups, and certain other data set related operations.

System Action: CFQR is abnormally terminated with a CICS transaction dump. CFQR is reattached and CICS processing continues.

User Response: Check Transient Data Queue CSFL for message DFHFC6028, indicating that the reattach of CFQR was successful. If the reattach fails, VSAM RLS data set quiesce support is lost. If this happens, CICS must be restarted.

If it is not possible to restore VSAM RLS quiesce support, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHFCQT

AFDE

Explanation: An attempt was made to attach a transaction specifying DFHFCRD as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCRD is for use by CICS system transaction CSFR. This provides support for error recovery after a failure of the SMSVSAM server.

System Action: The transaction is abnormally terminated. CICS processing continues.

User Response: Establish why an attempt was made to illegally attach CSFR, or why a transaction definition specified DFHFCRD as the program to be given control.

Module: DFHFCRD

AFDF

Explanation: An attempt was made to attach a transaction specifying DFHFCOR as the program to be given control, but the transaction was not internally attached by CICS.

DFHFCOR is for use by CICS system transaction CFOR. This provides part of the RLS offsite recovery support.

System Action: The transaction is abnormally terminated. CICS processing continues.

User Response: Establish why an attempt was made to illegally attach CFOR, or why a transaction definition specified DFHFCOR as the program to be given control.

Module: DFHFCOR

AFDG

Explanation: CICS system transaction CFOR has failed due to a serious error. CICS messages should indicate the cause of the error.

DFHFCOR provides part of the RLS offsite recovery support.

This abend indicates that this CICS system has completed its RLS offsite recovery, but an error occurred either in attempting to issue message DFHFC0575D which reports this fact, or in attempting to process the reply to message DFHFC0575D.

System Action: CFOR is abnormally terminated with a CICS transaction dump. CICS processing continues.

User Response: If you are using an automated procedure to check for and reply to message DFHFC0575D, then you should shut this CICS down and restart it specifying OFFSITE=YES again. If you are using manual procedures to check for completion of all RLS offsite recovery and to reply to message DFHFC0575D then you can "tick" this CICS off the list of systems which have completed their recovery, but you must ensure that it is not restarted with OFFSITE=NO until all other CICS systems have completed their RLS offsite recovery. Also note that until the system is restarted, RLS access will not be allowed by this system.

Module: DFHFCOR

AFDH

Explanation: VSAM has returned a response indicating that the RLS lock structure in the coupling facility is full. VSAM RLS is unable to create any new locks.

This abend code is usually issued from various CICS systems residing within the same sysplex.

System Action: The transaction which issued the VSAM RLS request is abnormally terminated with a CICS transaction dump. CICS processing continues.

User Response: Allocate a larger VSAM RLS lock structure and rebuild the RLS structure into the new larger structure. See *OS/390 MVS Setting up a Sysplex*, (GC28-1779) and *DFSMS/MVS DFSMSdfp Storage Administration Reference*, (SC26-4920) for further details on creating RLS lock structures and rebuilding lock structures.

Modules: DFHEIFC, DFHDMPCA

AGMA

Explanation: An attempt to initiate the good morning message transaction was made without specifying a termid for it to be displayed.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the dump to determine how the attempt to start the transaction was made. Ensure that no EXEC CICS STARTs are made for the good morning message transaction where no termid is specified.

Module: DFHGMM

AICA

Explanation: A task has been executing for longer than the runaway time interval (defined by the ICVR operand on the system initialization table macro, DFHSIT) without giving up control. The runaway task condition indicates a possible loop in the application.

System Action: The task is terminated with an AICA transaction dump.

User Response: See the *CICS Problem Determination Guide* for guidance on dealing with loops.

Module: DFHSRP

AICB

Explanation: A RETRIEVE WAIT request has been reissued in system shutdown.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: None

Module: DFHICP

AICC

Explanation: An incorrect response was returned from a timer (TI) domain request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHTAJP, DFHICP

AICD

Explanation: A incorrect response was returned from a kernel (KE) domain request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHICP

AICE

Explanation: An incorrect response was returned from a dispatcher (DS) domain request (other than AICG).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHICP

AICF

Explanation: An incorrect response was returned from a transaction manager (TM) domain request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHICP

AICG

Explanation: A PURGED response was returned from a dispatcher domain (DS) request, with a reason code of TASK_CANCEL. TASK_CANCEL was returned as the transaction had been explicitly canceled.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Notify your system programmer to determine why the task has been purged.

Module: DFHICP

AICH

Explanation: The task was purged before a request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Modules: DFHICP, DFHEIIC

AICJ

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHICP

AICK

Explanation: Module DFHEIIC has issued a resource level security check (RSLC) request to module DFHXSRC and received a response other than OK or EXCEPTION.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Examine the trace to find the exception trace entry created by DFHXSRC at the time of the error. Use this trace entry to determine the cause of the return code from DFHXSRC.

Module: DFHEIIC

AICL

Explanation: DFHEIIC detected an invalid function code in the command level parameter list. This is caused either by a storage overwrite or a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 trace of the IC and EI components would aid problem determination. Look in the program storage section of the transaction dump and compare argument 0, the exec interface descriptor (EID), for the command being processed with the argument 0 produced by the translator for the same command. Any differences mean that an overwrite of the application program may have occurred. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEIIC

AICN

Explanation: An incorrect response has been returned from a user domain (US) request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHICP

AICO

Explanation: An unexpected EXCEPTION response was received from a call to the user (US) domain.

The call was issued during initialization of a transaction that was started without a terminal. The call was made as part of processing to associate the transaction with its intended user. The attempt to associate the intended user with the transaction has failed.

The userid for the intended user of the transaction may not be correctly defined.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Determine why the intended user of the transaction is not correctly defined.

Examine messages produced for the CICS job by the external security manager (ESM). This may require the assistance of a security administrator.

It may be necessary to examine the transaction dump to determine why the external security manager has informed CICS that the user is not correctly defined.

When the user has been correctly defined, consider rerunning the transaction.

Module: DFHICXM

AICQ

Explanation: Module DFHDFST is executing at a terminal which is not permitted.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Determine why this transaction is executing at a terminal.

Module: DFHDFST

AICS

Explanation: Module DFHDFST has encountered an error during Retrieve processing.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Use level 1 trace entries to determine the cause of the failure.

Module: DFHDFST

AICT

Explanation: Module DFHDFST has encountered an error during START processing.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Use level 1 trace entries to determine the cause of the error.

Module: DFHDFST

AICR

Explanation: A DFHTC write request has failed for IRC. The return codes within TCATPAPR and TCTEIRET should be examined to determine the cause of failure.

System Action: The CSNC transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRR

AINA

Explanation: An application program has issued an EXEC CICS LINK command to the indoubt testing tool program DFHINDT but has failed to pass a commarea containing the request to be executed, Valid requests are: ON, OFF, RESYNC COMMIT or RESYNC BACKOUT

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the application program so that it passes a commarea to DFHINDT containing a valid request for DFHINDT.

Module: DFHINDT

AINB

Explanation: An application program has issued an EXEC CICS LINK command to the indoubt testing tool program DFHINDT passing a commarea that did not contain a valid request to be executed, Valid requests are: ON, OFF, RESYNC COMMIT or RESYNC BACKOUT

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the application program so that it passes a commarea to DFHINDT containing a valid request for DFHINDT.

Module: DFHINDT

AINC

Explanation: The indoubt testing tool issued a EXEC CICS INQUIRE EXITPROGRAM command to inquire on the status of the indoubt testing tool task related user exit program DFHINTRU, and the command failed with a NOTAUTH response.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: The indoubt testing tool can be run under transaction CIND , under a user transaction where the program EXEC CICS LINKs to DFHINDT. or under a transaction where the program EXEC CICS LINKs to DFHINDAP. If command security checking is active for the transaction (CMDSEC=YES), check that the user has read access to resource EXITPROGRAM. If resource security checking is active for the transaction (RESSEC=YES), check that the user has read access to resource DFHINTRU.

Modules: DFHINDT, DFHINDAP

AIND

Explanation: The indoubt testing tool issued a EXEC CICS INQUIRE EXITPROGRAM command to inquire on the status of the indoubt testing tool task related user exit program DFHINTRU, and the command failed with an unexpected response.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHINDT, DFHINDAP

AINE

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an START_LINK_BROWSE command issued by the indoubt tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINF

Explanation: An EXCEPTION response with an unexpected reason occurred on an GET_NEXT_LINK call issued by the indoubt testing tool to recovery manager (RM) domain. DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AING

Explanation: An error (DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an GET_NEXT_LINK call issued by the indoubt testing tool to recovery manager (RM) domain. The RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

DFHINDT also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINH

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an END_LINK_BROWSE command issued by the indoubt tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINI

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an INQUIRE_UOW command issued by the indoubt testing rtool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINJ

Explanation: An EXCEPTION response with an unexpected reason occurred on an INITIATE_RECOVERY call issued by the indoubt testing tool to recovery manager (RM) domain. DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINK

Explanation: An error (DISASTER, INVALID, KERNERROR, or PURGED) has occurred on an INITIATE_RECOVERY call issued by the indoubt testing tool to recovery manager (RM) domain. The RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

DFHINDT also provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINL

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an SET_RECOVERY_STATUS command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINM

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an TERMINATE_RECOVERY command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINDT provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINDT

AINN

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an ADD_LINK command issued by the indoubt testing tool to recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHINTRU provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINTRU

AINO

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TRANSACTION command to inquire whether the current transaction was in the indoubt transaction class DFHTCIND. The command failed with a NOTAUTH response.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: When the indoubt testing tool is active, the task related user exit DFHINTRU is invoked whenever a CICS transaction is started. For all transactions for which command security checking is active, ensure that the user has read access to resource TRANSACTION. If started transaction resource security checking is specified, for all transactions for which resource security checking is active, ensure that the user has read access to the transaction name in the specified RACF resource class.

For more information on command security and resource security see the *CICS RACF Security Guide*.

Module: DFHINTRU

AINP

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TRANSACTION command to inquire whether the current transaction was in the indoubt transaction class DFHTCIND. The command failed with an unexpected response.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINTRU

AINQ

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TASK command to inquire on the current task to obtain the unit of work ID to include in message DFHIN1009. The command failed with a TASKIDERR response.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINTRU

AINR

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TASK command to inquire on the current task to obtain the unit of work ID to include in message DFHIN1009. The command failed with a NOTAUTH response.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: When the indoubt testing tool is active, the task related user exit DFHINTRU is invoked whenever a CICS transaction is started. For all transactions for which command security checking is active (CMDSEC=YES), ensure that the user has read access to resource TASK.

Module: DFHINTRU

AINS

Explanation: The indoubt testing tool task related user exit DFHINTRU issued an EXEC CICS INQUIRE TASK command to inquire on the current task to obtain the unit of work ID to include in message DFHIN1009. The command failed with an unexpected response.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHINTRU

AIOA

Explanation: The main method within CICSMain has been invoked with a null COMMAREA.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJIIOP

AIOB

Explanation: The checkBytes method within CICSCommareaMapping has detected an error while trying to map the COMMAREA passed from DFHIIOPA. The COMMAREA length or commareaLength field is invalid.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJIIOP

AIOC

Explanation: The setBytes method within CICSCommareaMapping has detected an error while trying to map the COMMAREA passed from DFHIIOPA. Either the hostnameLength or the commareaLength field is invalid.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJIIOP

AIOD

Explanation: The setIIOPDataFromTSQ method within CICSCommareaMapping has detected an error reading input data from a Temporary Storage queue. The number of items expected, set by DFHIIOPA, does not match the numItems returned by the TSQ readNextItem method.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJIIOP

AIOE

Explanation: The setIIOPDataFromTSQ method within CICSCommareaMapping has detected an error reading input data from a Temporary Storage queue. An unexpected CICS condition was thrown by the TSQ readNextItem method.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJIIOP

AIOF

Explanation: The setIIOPDataFromTSQ method within CICSCommareaMapping has detected an error creating its IIOP data buffer from a Temporary Storage queue. This is probably due to a mismatch between the length of data expected, set by DFHIIOPA, and the length of data read from the Temporary Storage queue.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJIIOP

AIOG

Explanation: The main method within CICSMain has failed to initialize the ORB. This may be due to invalid data in the COMMAREA passed from DFHIIOPA.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJIIOP

AIOH

Explanation: The main method within CICSMain has received an unexpected return code from ProcessMessage.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFJIIOP

AIOI

Explanation: The setBytes method within CICSCommareaMapping has detected an error while trying to map the COMMAREA passed from DFHIIOPA. An UnsupportedEncodingException has been caught during conversion of the hostname to a String using codepage 8859_1.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFJIIOP

AIOJ

Explanation: The writeIIOPDataToTSQ method within CICSCommareaMapping has detected an error while trying to return a reply to DFHIIOPA in a Temporary Storage queue. An unexpected item number has been returned by the TSQ writeItem method.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFJIIOP

AIOK

Explanation: The writeIIOPDataToTSQ method within CICSCommareaMapping has detected an error while trying to return a reply to DFHIIOPA in a Temporary Storage queue. An unexpected CICS condition has been thrown by the TSQ writeItem method.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFJIIOP

AIOV

Explanation: The setBytes method within CICSCommareaMapping has detected an error while trying to map the COMMAREA passed from DFHIIOPA. The COMMAREA version is not supported by this level of DFJIIOP.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Ensure that the service level of the CICS region running the IIOP application is at least as high as that of the region running the reader transaction, CIOR.

Modules: DFJIIOP

AIO0

Explanation: When the IIOP/CORBA call was processed it resulted in an abend; probably in the CORBA object or DFJIIOP.

System Action: An IIOP SYSTEM_EXCEPTION reply is sent to the client and the task is abnormally terminated with a CICS transaction dump.

User Response: Check the system log to determine the reason for the original abend. Resolve the problem and resubmit the request.

Modules: DFHIIOP DFHIIOPA

AIO1

Explanation: A call to the Socket domain has failed when the IIOP code was attempting to send or receive data.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHIIOP DFHIIOPA

AIO2

Explanation: The IIOP/CORBA data stream contained an invalid header or data structure.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHIIOP DFHIIOPA

AIO3

Explanation: The WRITEQ/READQ TS call detected that the queue has been modified by another process.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHIIOP DFHIIOPA

AIO4

Explanation: The IIOP transaction CIOF etc. has been started incorrectly, e.g. by CECI START TR(CIOF)

System Action: The task is terminated.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHIIOP DFHIIOPA

AISA

Explanation: The mirror transaction (CSMI) has been attached from some facility other than a terminal. This is not permitted.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Using the dump, check the field TCAFCAAA to identify the invalid attach.

Module: DFHMIRS

AISB

Explanation: The mirror transaction (CSMI) has detected errors in the data passed to it from the attaching transaction.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: The invalid input will be visible in the transaction dump. This error is likely to be caused by some mismatch between the two systems. A typical example might be a DL/I request received on a system generated without DL/I.

Module: DFHMIRS

AISC

Explanation: The mirror transaction (CSMI) has not received a TIOA from the terminal.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Use the trace in the dump and the dumped TCTTE to analyze the problem further.

Module: DFHMIRS

AISD

Explanation: The mirror program executed the request and received a nonzero return code as a result. The data flow control state of the intersystem link being used was such that this information could not be returned normally.

System Action: The mirror task is abnormally terminated with a CICS transaction dump.

User Response: The transaction dump provided will provide information required to analyze the source of the nonzero return code at its point of origin.

Module: DFHMIRS

AISF

Explanation: The CICS mirror program DFHMIRS has been attached in an unsupported manner. The principal facility for the mirror transaction is defined as APPC, however the conversation is unmapped.

System Action: CICS abnormally terminates the transaction with a transaction dump.

User Response: There is a problem with the system that caused the mirror transaction to be attached. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMIRS

AISG

Explanation: The mirror program executed the request and produced the reply. This would not be sent because the data flow control state of the intersystem link was such that this could not be done.

System Action: The task (CSMI) is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump provided to analyze the problem.

Module: DFHMIRS

AISH

Explanation: The new connection task, CSNC, has been invoked in an incorrect manner (for example, from a terminal or via an EXEC CICS START request).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: None.

Module: DFHCRNP

AISI

Explanation: A function shipping request was passed by DFHEIP to DFHISP. This was found to be invalid by the transformer, DFHXFP.

System Action: The transaction issuing the function shipping request is abnormally terminated with a CICS transaction dump.

User Response: The transaction dump will provide information to further analyze the problem.

Module: DFHISP

AISJ

Explanation: The IRC control task CSNC has abended because the attempt to LINK to DFHCRR failed.

System Action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated. All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abnormally terminated.

User Response: Ensure that program DFHCRR is available.

Module: DFHCRNP

AISK

Explanation: The user transaction has been abnormally terminated during the execution of a function shipping request on an APPC session. This has happened because the mirror transaction on the remote system has abnormally terminated, and caused a request for syncpoint rollback to be sent across the session. CICS abends the user transaction in these circumstances so that function shipping remains transparent to the transaction.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check the log on the mirror system to determine the reason for the original abend of the mirror task.

Module: DFHISP

AISL

Explanation: The LU services manager transaction has been started directly from a user terminal. This is not permitted.

System Action: The task is abnormally terminated with a transaction dump.

User Response: None. The LU services manager transaction must be started internally by CICS.

Modules: DFHLUP, DFHCLS3, DFHCLS4, DFHZLS1

AISN

Explanation: Task CSNC attempted to acquire a SUSPEND TOKEN to enable it to suspend itself until further work arrives. The attempt failed.

System Action: CSNC is abnormally terminated with a dump. The IRC facility is disabled.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRNP

AISO

Explanation: Task CSNC attempted to suspend itself, awaiting further work. The attempt failed.

System Action: CSNC is abnormally terminated with a dump. The IRC facility is disabled.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRNP

AISP

Explanation: A mirror transaction (transaction identifiers CSHR, CSM1, CSM2, CSM3, CSM5, or CSMI) has been invoked with an invalid principal facility. The mirror transaction executes with an MRO session, an LU6.1 session or an APPC session as its principal facility.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Do not attempt to invoke the mirror transaction by entering the transaction identifier at a terminal.

Module: DFHMIRS

AISQ

Explanation: An EXEC CICS command has been issued against a CPI Communications session. A CPI Communications session is one that has a CPI-Communications Control Block (CPC) associated with it.

System Action: The mirror task is abnormally terminated with a CICS transaction dump.

User Response: Do not mix EXEC commands with CPI Communications calls on the same end of a conversation.

Module: DFHMIRS

AISR

Explanation: The CICS Inter-Region Session Recovery Program (DFHCRR) has been invoked in an incorrect manner, for example, from a terminal.

System Action: The program DFHCRR is abnormally terminated with a CICS transaction dump.

User Response: None.

Module: DFHCRR

AISS

Explanation: A security violation has occurred while CICS was attempting to start a conversation with a remote APPC system. The security access level of the requestor was insufficient to access the transaction on the connected APPC system. Depending on the nature of the request and the way security has been set up, the requestor with an insufficient access level can be the local CICS system, the requesting transaction, or the terminal user.

Note: DTP programs do not abend with code AISS after a security failure in the remote region.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: First, verify that the access was correctly denied. Then, if required, change the access level.

Module: DFHZARM

AIST

Explanation: An unexpected return code has been returned after a DFHTC TYPE=LOCATE command.

System Action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated. All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User Response: The trace in the system dump should be used to analyze the problem further.

Module: DFHCRNP

AISU

Explanation: An INVALID, DISASTER, or EXCEPTION condition has occurred on a call to the storage manager domain (SM) to FREEMAIN a FCENT control block.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System Action: The task is abnormally terminated with a transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHMIRS

AISV

Explanation: A PURGED condition has occurred on a call to the storage manager domain (SM) to FREEMAIN a FCENT control block.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System Action: The task is abnormally terminated with a transaction dump.

User Response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHMIRS

AISW

Explanation: An INVALID, DISASTER, or EXCEPTION condition has occurred on a call to the storage manager domain (SM) to GETMAIN or FREEMAIN a CRB control block.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System Action: The task is abnormally terminated with a transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHCRSP

AISX

Explanation: A PURGED condition has occurred on a call to the storage manager domain (SM) to GETMAIN or FREEMAIN a CRB control block.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System Action: The task is abnormally terminated with a transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHCRSP

AISY

Explanation: The LU services manager transaction has been started, but invalid parameters have been detected.

System Action: The task is abnormally terminated with a transaction dump.

User Response: See message DFHZC4921 for further guidance.

Module: DFHLUP

AISZ

Explanation: DFHMXP has received an unexpected reply when committing START PROTECT NOCHECK requests sent on a LUTYPE6.2 synclevel 1 conversation.

System Action: The task is abnormally terminated.

User Response: Determine what happened to transaction CVMI in the partner system. If the START PROTECT NOCHECK requests had been committed, no further action is necessary. If they had not been committed, user-defined action is required to recover from the error.

Module: DFHMXP

AIS1

Explanation: An unexpected return code has been returned after a DFHMROQM FUNC=ENQ command was issued.

This command was issued when enqueueing work for the IRC control task (CSNC) during IRC initialization.

System Action: If IRC is being initialized during CICS initialization (as a result of IRCSTRT being specified in the DFHSIT or override parameters), then CICS is abnormally terminated.

If IRC is being initialized during the execution of a CEMT SET IRC OPEN command, then the CEMT transaction is abnormally terminated.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRSP

AIS2

Explanation: An unexpected return code has been returned after a DFHMROQM FUNC=WAIT_Q command was issued.

This command was issued when waiting for more IRC work to process.

System Action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated.

All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRNP

AIS3

Explanation: An attempt to issue a STCK (Store Clock) instruction failed.

System Action: CSNC is abnormally terminated with a system dump.

All tasks using MRO links to other systems are abnormally terminated.

All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User Response: Repair or enable the system clock.

Module: DFHCRNP

AIS4

Explanation: An unexpected return code has been returned after a DFHMROQM FUNC=ENQUEUE command. This command was issued when enqueueing work to the IRC ‘delayed work’ queue.

System Action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated.

All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRNP

AIS5

Explanation: An unexpected return code has been returned after a DFHMROQM FUNC=ENQUEUE command was issued.

This command was issued when enqueueing work to the IRC ‘immediate work’ queue.

System Action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated.

All tasks in other CICS regions (including shared database batch regions) that are currently communicating with this system are also abended.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRNP

AIS6

Explanation: An INVALID, DISASTER or EXCEPTION condition has occurred on a call to the storage manager domain (SM) to GETMAIN or FREEMAIN a file control read set buffer.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System Action: The task is abnormally terminated with a transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHMIRS

AIS7

Explanation: A PURGED condition has occurred on a call to the storage manager domain (SM) to FREEMAIN a file control read set buffer.

The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump.

System Action: The task is abnormally terminated with a transaction dump.

User Response: Investigate the reason why the task was purged. It was purged either by the master terminal operator , or as a result of a deadlock timeout.

Module: DFHMIRS

AIS8

Explanation: An internal logic error has been detected in module DFHMIRS.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMIRS

AIS9

Explanation: The mirror program has detected that a DPL server program has returned in an invalid state following the completion of the LINK command. The server program or a program it linked to has initiated a synclevel 2 conversation with another program which in turn has issued a syncpoint. The server program has not responded to the syncpoint request which is still outstanding when control returns to the mirror program.

The mirror program only issues this abend code if the LINK request did not specify SYNCONRETURN.

System Action: The task is abnormally terminated with a transaction dump.

User Response: Correct the design of the DTP application or applications initiated by the server program. If the SYNCONRETURN option is not specified on the LINK request, only the client program should initiate the syncpoint. If it is necessary to issue syncpoint requests from the DTP applications, consider using the SYNCONRETURN option on the LINK request. See the *CICS Intercommunication Guide* for further details of the LINK command and its options.

Module: DFHMIRS

AITA

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain to initialize the recovery status of an IRC session. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This failure is either the result of a task purge, or a CICS logic error,

System Action: The CSNC task is abnormally terminated with a CICS transaction dump.

User Response: See the related diagnostic material produced by the recovery manager domain and determine the reason for the failure. In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRNP

AITB

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This failure is either the result of a task purge, or a CICS logic error,

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related diagnostic material produced by the recovery manager domain and determine the reason for the failure. In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHISP

AITC

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This failure is either the result of a task purge, or a CICS logic error,

System Action: The mirror task is abnormally terminated with a CICS transaction dump.

User Response: See the related diagnostic material produced by the recovery manager domain and determine the reason for the failure. In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMIRS

AITD

Explanation: The mirror program has received an unexpected response from the RX domain.

There are several reasons why this error may occur:

- A request received from an EXCI client is inconsistent with an earlier request in the same Unit of Work
- CICS has received an unexpected response from the Recoverable Resource Management Services component of MVS.
- There has been an internal error in the RX domain.

System Action: The mirror task is abnormally terminated with a CICS transaction dump.

User Response: Use the exception trace provided by the RX domain to determine the reason for the failure. If the error is caused by an inconsistent request from an EXCI client, there may be an error in the client program.

In the other cases, you might need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMIRS

AITE

Explanation: A transaction has executed a transactional EXCI request from a batch region, and has been waiting for one of the following events for longer than the interval specified in the RTIMOUT value for the transaction.

- A further transactional EXCI request from the batch region
- A syncpoint initiated by Resource Recovery Management Services (RRMS).

System Action: The mirror task is abnormally terminated with a CICS transaction dump.

User Response: Determine why the expected event has not occurred:

If a further transactional EXCI request is expected

- The batch program may be suspended

If a syncpoint is expected

- The batch program may be suspended before reaching syncpoint
- RRMS may have started syncpoint processing but is waiting for another Resource Manager to respond to the syncpoint request.

See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMIRS

AITF

Explanation: A transaction has executed a transactional EXCI request from a batch region, and has been purged while waiting for one of the following events:

- A further transactional EXCI request from the batch region
- A syncpoint initiated by Resource Recovery Management Services (RRMS).

System Action: The mirror task is abnormally terminated with a CICS transaction dump.

User Response: Determine why the expected event has not occurred:

If a further transactional EXCI request is expected

- The batch program may be suspended

If a syncpoint is expected

- The batch program may be suspended before reaching syncpoint
- RRMS may have started syncpoint processing but is waiting for another Resource Manager to respond to the syncpoint request.

See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMIRS

AITG

Explanation: A transaction has executed a transactional EXCI request from a batch region, and both of the following events has occurred:

- A further transactional EXCI request from the batch region
- A syncpoint initiated by Resource Recovery Management Services (RRMS).

Normally, only one event should occur, and not both.

System Action: The mirror task is abnormally terminated with a CICS transaction dump.

User Response: Determine why both events have occurred. This situation may arise when an EXCI client times out on a DPL request that CICS is not ready to receive and then proceeds to take a syncpoint. If this is not the case, you may need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMIRS

AJA0

Explanation: The native method SetAbendForCondition has been passed an Resp value by the Wrapper class.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCICS

AJCD

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHJCP

AJCE

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHJCP

AJCS

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the log manager (LM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHJCP

AJCT

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain that detected the original error provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHJCP

AJCU

Explanation: A purge response has been received from either the log manager or or the recovery manager. The domain that detected the original purge condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHJCP

AJ01

Explanation: The main method of the java environment setup class, Wrapper, has been invoked without an an argument. Wrapper main expects the class name of the user's main to be passed as the first argument.

The callUserClass method of Wrapper detects this, sets return code INVALID_ARGUMENTS and invokes native method SetAbend to abend the task.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCICS

AJ02

Explanation: A CICS AbendError has been caught by the java environment setup class, Wrapper.

The callUserClass method of Wrapper detects this, sets return code ABEND_RECEIVED and invokes native method SetAbend to abend the task.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See related messages to determine the reason for the original abend.

Module: DFJCICS

AJ03

Explanation: A CicsConditionException has been caught by the java environment setup class, Wrapper.

The callUserClass method of Wrapper detects this, sets return code CONDITION_RECEIVED and invokes native method SetAbendForCondition to abend the task. The appropriate default abend code for the condition should be issued but, if for some reason this is not possible, an AJ03 abend may be issued.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See related messages to determine the reason for the original CicsConditionException.

Module: DFJCICS

AJ04

Explanation: An unexpected error has been caught by the java environment setup class, Wrapper, attempting to invoke the user class.

The callUserClass method of Wrapper detects this, sets return code UNEXPECTED_EXCEPTION and invokes native method SetAbend to abend the task.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCICS

AJ05

Explanation: An unhandled exception has been caught by the java environment setup class, Wrapper, as an InvocationTargetException from the user class.

The callUserClass method of Wrapper detects this, sets return code INVOCATION_TARGET_EXCEPTION and invokes native method setAbend to abend the task.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFJCICS

AJ07

Explanation: The java environment setup class, Wrapper, has been unable to invoke the user's main method. The class whose name was passed as an input parameter to its CallUserClass method was not found.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: If your java program has been bound using ET/390, check that the -main option correctly specifies, or defaults to, the name of the class containing your main method.

Module: DFJCICS

AJ09

Explanation: The java environment setup class, Wrapper, has been unable to invoke the user's main method. A public static method, taking either a CommAreaHolder or a String array as input, was not found in the class whose name was passed as an input parameter to the CallUserClass method of Wrapper.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that you have provided a main method, with an appropriate method signature, in the specified class. If your java program has been bound using ET/390, check that the

-main option correctly specifies, or defaults to, the name of the class containing your main method.

Module: DFJCICS

AJ99

Explanation: The java environment setup class, Wrapper, has detected an AbendException and issued setAbend. The abend code extracted from the AbendException is too long.

System Action: Task abnormal termination continues with the abend code set to AJ99

User Response: Correct the abend code String used to create the AbendException.

Module: DFJCICS

AJMA

Explanation: The CICS JVM interface attempted to change the HFS working directory to the pathname specified in the CICS_HOME environment variable. The change directory request failed.

System Action: Message DFHAP1216 output to destination CSMT contains the pathname specified and the reason why the request failed. The task is abnormally terminated with a CICS transaction dump.

User Response: Examine message DFHAP1216 to determine why the change directory request failed. If necessary correct the setting of environment variable CICS_HOME in the DFHJVM member of the SDFHENV dataset.

Module: DFHCJVM

AJMB

Explanation: The CICS-JVM interface has rejected an attempt to invoke a Java program to run under control of a JVM because a previous JVM for the same CICS task terminated abnormally. The CICS-JVM interface is unable to create a JVM to run the Java program.

This error occurs when the previous JVM was terminated because of a Java program invoking the Java system.exit method and because errors occurred during the subsequent JVM termination. A system.exit invocation causes a forced termination of the JVM and the LE/370 runtime environment.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Examine why the previous JVM termination failed. Wherever possible avoid the use of system.exit to return from Java programs.

Module: DFHAPLJ

AJM1

Explanation: The CICS JVM interface issued a JNI_CreateJavaVM request to create a Java Virtual Machine (JVM) under which to run the Java program. The JNI_CreateJavaVM request failed.

DFHCJVM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Examine error messages output by language environment/370 and the Java Native Interface (JNI) to destination CEEMSG to determine why the creation of the JVM failed.

One reason for the creation of a JVM to fail is due to lack of available storage within the CICS region but outside of the CICS DSAs, resulting in a error message from the JNI stating that classes cannot be found. The JVM executes inside CICS but runs under a CICS J8 TCB and uses MVS getmained storage. There must be adequate storage available below and above the line within the region but outside if the CICS DSAs to allow the MVS JVM to execute and load the Java code.

Module: DFHCJVM

AJM2

Explanation: The CICS JVM interface invoked the JVM to locate the CICS Wrapper class used to set up the operating environment before executing the user Java class. The JVM failed to find the CICS Wrapper class on the HFS.

Message DFHAP1218 output to destination CSMT contains the CICS Wrapper classname. DFHCJVM provides an exception trace containing the name of CICS Wrapper class and the current setting for CLASSPATH.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Examine the value set for CLASSPATH in the DFHJVM member of the SDFHENV dataset. The pathname for the CICS supplied dfjwrap.jar must be present in CLASSPATH.

Module: DFHCJVM

AJM3

Explanation: The CICS JVM interface invoked the JVM to find the main method of the CICS Wrapper class used to set up the operating environment before executing the user Java class. The JVM failed to find the main method of the CICS Wrapper class.

DFHCJVM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Examine the HFS files used for stdout and stderr (as named by the environment variables STDOUT & STDERR, whose default names are dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by language environment/370 and the Java Native Interface (JNI). You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCJVM

AJM4

Explanation: The CICS JVM interface invoked the JVM to build an Java argument string needed to pass to the CICS Wrapper class. The build argument string request failed.

DFHCJVM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Examine the HFS files used for stdout and stderr (as named by the environment variables STDOUT &

STDERR, whose default names are dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by language environment/370 and the Java Native Interface (JNI). You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCJVM

AJM5

Explanation: The CICS Wrapper class threw an exception.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Examine the HFS file used for stderr (as named by the environment STDERR, whose default name is dfhjvmerr) to determine the exception thrown by the Wrapper.

Module: DFHCJVM

AJM6

Explanation: The CICS JVM interface issued a call to setup CICS Recovery facilities prior to issuing a call to CICS, for example prior to invoking CICS trace domain. The call to setup CICS Recovery facilities failed.

DFHCJVM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCJVM

AJM7

Explanation: The CICS JVM interface issued a call to delete CICS Recovery facilities after issuing a call to CICS, for example after invoking CICS trace domain. The call to delete CICS Recovery facilities failed.

DFHCJVM provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCJVM

AJM8

Explanation: The CICS JVM interface invoked the JVM to execute the CICS Wrapper class and then the user Java class. A severe error occurred whilst the JVM was executing causing the JVM to abend, the language environment/370 ESTAE to be run, and control to return abnormally to DFHAPLJ.

DFHAPLJ provides an exception trace, console message DFHAP0002, and possibly a system dump (depending on the options in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Examine the HFS files used for stdout and stderr (as named by the environment variables STDOUT & STDERR, whose default names are dfhjvmout and dfhjvmerr) for error messages output by the JVM. Also examine destination CEEMSG for error messages output by language environment/370 and the Java Native Interface (JNI). You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAPLJ

AJM9

Explanation: The CICS JVM interface issued a fetch to load user replaceable module DFHJVMAT. The native C fetch request failed.

System Action:

Message DFHAP1217 is output to destination CSMT and the task is abnormally terminated with a CICS transaction dump.

User Response: Ensure that C program DFHJVMAT is present in a dataset in the CICS STEPLIB concatenation. Examine destination CEEMSG for messages output by language environment/370 to determine why the fetch request failed.

Module: DFHCJVM

AKCB

Explanation: The CICS transaction manager restart task could not complete because a necessary step failed. The task has done some essential recovery operations and abnormally terminated itself with code AKCB.

System Action: CICS writes a transaction dump for the transaction manager restart task.

CICS sends three messages to the console, one to identify the error detected by the transaction manager restart task, one to say that the task has failed, and one that gives you the option of canceling CICS or letting it continue. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

User Response: Use the messages and dumps to find out the cause of the failure.

Module: DFHKCRP

AKCC

Explanation: The CICS transaction manager has abended the transaction because the purge threshold of its TRANCLASS has been reached. This is specified by the PURGETHRESH parameter on CEDA DEFINE TRANCLASS. See the *CICS Resource Definition Guide* manual for more details of this parameter.

System Action: The transaction is abended and messages DFHAC2004 and DFHAC2236 are issued. The transaction dump is suppressed for this abend code.

User Response: Resubmit the transaction. The cause of the abend may be a temporary stress condition in the system.

If the problem persists, determine why the TRANCLASS purge threshold has been reached. Ensure that PURGETHRESH has been specified correctly. Also, ensure that the MAXACTIVE value of the TRANCLASS has not been set too low. Transactions attached after the MAXACTIVE limit has been reached are immediately queued subject to the PURGETHRESH limit.

If PURGETHRESH and MAXACTIVE are set correctly, look for a more general problem which has caused a decrease in the capacity of the system to execute transactions in the TRANCLASS. The

decrease might, for example, be caused by a connected CICS region which processes requests for transactions in the TRANCLASS, if this connected region has slowed down.

Examine all resources (files, links, storage, and so on) used by the transactions in the TRANCLASS which is reaching the purge threshold and determine why the capacity of the system is reduced.

Modules: DFHXMAT, DFHXMCL

AKCE

Explanation: While CICS transaction manager was recording changes to a transaction or profile definition, a write to the system log failed.

System Action: CICS terminates the transaction with a transaction dump.

User Response: Use the dumps to find out why the write to the log failed.

Module: DFHKCQ

AKCF

Explanation: While CICS transaction manager was recording changes to a profile definition, a write to the catalog failed.

System Action: CICS terminates the transaction with a transaction dump.

User Response: Use the dumps to find out why the write to the catalog failed.

Module: DFHKCQ

AKCR

Explanation: Transaction manager has received an invalid request code. The last AP F000 trace entry before the program control program (PCP) ABEND TRACE entry (TRACE ID 'F2', request code X'6000') will contain the invalid transaction manager request code in the fifth byte of the first section of the trace.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Determine the cause of the invalid request code and correct the problem.

Module: DFHXCP

AKCS

Explanation: A deadlock timeout condition has been detected. This condition may occur within a transaction that specifies DTIMOUT to be nonzero on its installed transaction definition. Deadlock timeout occurs when a transaction has been waiting or has been suspended for longer than the time specified in DTIMOUT.

The abend may be driven by a variety of internal CICS events, for example:

- A short on storage condition
- A temporary storage shortage
- ENQUEUE
- An ALLOCATE request
- A RETRIEVE WAIT request.

The abend can also occur if CICS stops running for a time, for example while an sdump is taken. This is because deadlock timeout is based on total elapsed time, and not just the time CICS is executing.

Analysis: The transaction receiving the AKCS abend must have been suspended or must be waiting for a reason such as a short on storage, enqueued on a lock, a short on temporary storage, a suspend after RETRIEVE WAIT, a suspend after ALLOCATE, or an implicit ALLOCATE within function shipping or terminal sharing support. If none of these apply, the trace might reveal some event that has caused CICS to stop running for a time.

System Action: The transaction is abnormally terminated. A dump is not provided (even if a dump table entry has been set up) unless install/delete processing causes this abend, in which case a transaction dump is taken.

User Response: The transaction should be reexecuted, and the situation causing the SUSPEND to occur may clear itself.

The AKCS abend is to be expected occasionally, unless DTIMOUT is set to zero. No special action is necessary.

Module: DFHXCP

AKCT

Explanation: A terminal read-time-out condition has been detected. The transaction has been waiting for a terminal input message for an interval longer than specified in the RTIMOUT value for that transaction.

If an EXEC CICS HANDLE ABEND has been issued for this task, the read that was timed-out is still outstanding. To cancel this read you should issue an EXEC CICS ABEND at the end of the user exit routine so that CICS can clean up the terminal's TCTTE.

System Action: The transaction is abnormally terminated. A transaction dump is not provided.

User Response: This abend is a normal one. Coding RTIMOUT in the PROFILE entry asks for the task to be abnormally terminated if the terminal does not send input within the specified time.

Module: DFHXCP

AKCV

Explanation: A bad return code was passed as a result of the resume of a task suspended by ICP.

System Action: The transaction is terminated with a dump.

User Response: Check the response from the resume in the trace to determine the cause of the error.

Module: DFHALP

AKC0

Explanation: An attempt has been made to run the CICS internal task CSSY as a user transaction.

System Action: CICS terminates the task with a transaction dump.

User Response: Investigate why the attempt was made to run CSSY as a user transaction.

Module: DFHAPATT

AKC1

Explanation: A DFHKC WAIT request was issued when the ECB was already marked as waiting.

System Action: There is a probable user error. The transaction is abnormally terminated.

User Response: Correct the program that issued the request.

Module: DFHXCP

AKC2

Explanation: A bad response has been received from a dispatcher (DS) domain call.

System Action: The transaction is abnormally terminated with a transaction dump and a trace entry.

User Response: Examine the trace entry for further information.

Module: DFHXCP

AKC3

Explanation: The task has been purged, probably due to operator action such as a CEMT TASK PURGE command. The task might also have been purged as a result of CICS issuing a purge request.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Use the transaction dump to determine why the task was purged. In particular, if the purge was operator initiated, the dump should be useful in determining why this task needed to be explicitly purged.

Modules: DFHXCP, DFHXMAT, DFHXMCL, DFHXMIQ, DFHXMTA

AKC6

Explanation: DFHKC RESUME should always be preceded by DFHKC SUSPEND. If this protocol is violated then the transaction is abnormally terminated with abend code AKC6.

System Action: Transaction is abnormally terminated with abend code AKC6.

User Response: Examine the trace entry for further information.

Module: DFHXCP

AKC8

Explanation: A bad response has been received from a call to the kernel (KE) domain during the processing of a task purge request.

System Action: The transaction is abended with a transaction dump.

User Response: Examine the dump and any exception trace entries for further information.

Module: DFHXCP

AKC9

Explanation: An incorrect response has been received from a call to the enqueue (NQ) domain during the processing of a DFHKC TYPE=ENQ or a DFHKC TYPE=DEQ request.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Examine the dump and any exception trace entries for further information. Since the DFHKC service is only used for internal enqueues, this abend indicates an error in CICS. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXCP

AKEA

Explanation: A program check has been detected by the kernel (KE) domain.

System Action: If an application is in control, the ASRA abend is presented to the application. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User Response: Look at the kernel domain section of the system dump to determine where the program check has occurred.

Module: DFHKESTX

AKEB

Explanation: An operating system abend has been detected by the kernel (KE) domain.

System Action: If an application is in control, the ASRB abend is presented to the application. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User Response: Check the console for any MVS messages that may have caused this abend.

Look at the kernel domain section of the system dump to determine where the abend has occurred.

Module: DFHKESTX

AKEC

Explanation: The kernel (KE) domain has detected runaway.

System Action: If an application is in control, the AICA abend is presented to the application. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User Response: Look at the kernel domain section of the system dump to determine where the runaway has occurred.

Modules: DFHKESTX, DFHKERRU

AKED

Explanation: The kernel (KE) domain has been requested to initiate abend processing as a result of a deferred abend request.

System Action: Abend processing starts for the task that is subject to the deferred abend request.

User Response: The task is not abended with AKED but by an abend code specified by the requestor of the deferred abend. See the description of this abend for further guidance.

Module: DFHKEEDA

AKEF

Explanation: The kernel (KE) domain has detected an error while processing a domain call. The error may have been caused by a domain gate that was not yet active during initialization

System Action: If an application is in control, the transaction terminates with a system dump. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User Response: See any related messages from the kernel domain.

Look at the kernel domain section of the system dump to determine where the error has occurred. Check that a call has not been made to a domain gate that has not yet been made active. Check that the caller has NOT specified KERNERROR(YES).

Module: DFHKERKE

AKEG

Explanation: The kernel (KE) domain issued an MVS GETMAIN for kernel stack storage, but the GETMAIN request failed.

System Action: If an application is in control, the transaction terminates with a system dump. Otherwise, the functional recovery routine of the CICS module in control at the time is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

User Response: Look at the kernel domain section of the system dump to determine why sufficient storage was not available.

Check that the REGION parameter for the CICS job is large enough. For information about how to do this, refer to the *OS/390 MVS JCL Reference*.

Module: DFHKESGM

AKEH

Explanation: The transaction was purged while running outside the control of CICS.

System Action: CICS terminates the transaction abnormally.

The EXEC CICS HANDLE ABEND command can not handle this abend.

User Response: Investigate the reason the transaction was purged.

Module: DFHKESTX

AKEI

Explanation: The kernel (KE) domain has detected runaway while the transaction is running outside the control of CICS.

System Action: If an application is in control, the AICA abend is presented to the application. Otherwise, the functional recovery routine of the CICS module which was last in control at the time of runaway detection is given control. This recovery routine produces suitable diagnostics and may terminate CICS.

The EXEC CICS HANDLE ABEND command can not handle this abend.

User Response: See the *CICS Problem Determination Guide* for guidance on dealing with loops.

Module: DFHKESTX

AKEZ

Explanation: A user attach has failed because there are insufficient kernel tasks available. This indicates an internal logic error.

System Action: Message DFHKE0001 is issued and a system dump is taken. The attach of the user transaction fails.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHKETA

AKSE

Explanation: A user has generated an addition to the keyword table, but code has not been added to process this keyword.

System Action: The transaction is abnormally terminated and a dump is taken.

User Response: Add code to process the keyword.

Module: DFH99KC

ALGA **An error has occurred obtaining a lock within the log manager domain.**

System Action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User Response: See the description of message DFHLG0002 for further guidance.

Modules: DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

ALGB

Explanation: An error has occurred releasing a lock within the log manager domain.

System Action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User Response: See the description of message DFHLG0002 for further guidance.

Modules: DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

ALGC

Explanation: A disaster response has been detected when processing the building block code used by the log manager.

System Action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User Response: See the description of message DFHLG0002 for further guidance.

Modules: DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

ALGD

Explanation: A disaster response has been detected when processing the building block storage interface code used by the log manager.

System Action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User Response: See the description of message DFHLG0002 for further guidance.

Modules: DFHLGCM, DFHLGGL, DFHLGJN, DFHLGLD, DFHLGST

ALGE

Explanation: An unexpected error has occurred while the log manager was attempting to find a journal model definition.

System Action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User Response: See the description of message DFHLG0002 for further guidance.

Module: DFHLGJN

ALGF

Explanation: An unexpected error occurred when the log manager was attempting an enqueue or dequeue operation.

System Action: The recovery routine of the module in control is invoked which issues message DFHLG0002 with a system dump. DFHLG0002 reports the module in control at the time of the error.

User Response: See the description of message DFHLG0002 for further guidance.

Modules: DFHLGGL, DFHLGJN, DFHLGST

ALGG

Explanation: Transaction CSQC has been issued from a terminal. This is not permitted. The transaction can only be started internally by CICS.

System Action: The transaction is abnorminally terminated.

User Response: Do not try to invoke CSQC from a terminal.

Module: DFHLGQC

ALIA

Explanation: CICS has issued a GETMAIN request during the initialization phase for an OS/VS COBOL application program in order to get run time storage for the task global table and working storage areas. However insufficient storage was available to satisfy the request.

System Action: CICS abnormally terminates the task. CICS processing continues.

User Response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALIB

Explanation: CICS has issued a GETMAIN request during the initialization phase for a C/370 application program in order to obtain run time execution storage. However insufficient storage was available to satisfy the request.

System Action: CICS abnormally terminates the task. CICS processing continues.

User Response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALIC

Explanation: CICS has issued a GETMAIN request during the initialization phase for an LE/370 application program in order to obtain run time execution storage above the 31-bit line. However insufficient storage was available to satisfy the request.

System Action: CICS abnormally terminates the task. CICS processing continues.

User Response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALID

Explanation: CICS has issued a GETMAIN request during the initialization phase for an LE/370 application program in order to obtain run time execution storage below the 31-bit line. However insufficient storage was available to satisfy the request.

System Action: CICS abnormally terminates the task. CICS processing continues.

User Response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALIE

Explanation: CICS has issued a GETMAIN request during the initialization phase for a C/370 application program in order to obtain thread storage. However insufficient storage was available to satisfy the request.

System Action: CICS abnormally terminates the task. CICS processing continues.

User Response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALIF

Explanation: CICS has issued a GETMAIN request during the initialization phase for an LE/370 application program in order to obtain thread storage. However insufficient storage was available to satisfy the request.

System Action: CICS abnormally terminates the task. CICS processing continues.

User Response: See the related message from the Storage Manager domain where the original error was detected.

Module: DFHAPLI

ALIG

Explanation: CICS has been unable to determine the language of the user application program about to be executed. Either the program was compiled against an old level of compiler that is no longer supported by CICS, or the language of the program is not supported by CICS.

System Action: CICS abnormally terminates the task and disables the program. CICS processing continues.

User Response: Ensure that the program to be run is written in one of the languages and compiled against a level of compiler supported by CICS. See the *CICS Application Programming Guide* for details of the languages and compilers currently supported.

Module: DFHAPLI

AMI1

Explanation: When the mirror task is resumed, a bad response other than a time out or a cancellation was given by the dispatcher.

System Action: The mirror transaction is abnormally terminated with a transaction dump.

User Response: Use the dump and the trace to determine the cause of the error.

Module: DFHMIRS

AMNA

Explanation: An exception response has been received from the monitoring (MN) domain while processing a user event monitoring point (EMP) request. The exception response is produced when the 4-byte DATA1 field in the user parameter contains an invalid address.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why the DATA1 value passed to the monitoring (MN) domain was invalid.

Module: DFHCMP

AMNB

Explanation: An exception response has been received from the monitoring (MN) domain whilst processing a user event monitoring point (EMP) request. The exception response is produced when the 4-byte DATA2 field in the user parameter contains invalid data.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to determine why the DATA2 value passed to the monitoring (MN) domain was invalid.

Module: DFHCMP

AMNZ

Explanation: An unexpected error response has been received from the monitoring (MN) domain while processing a user event monitoring point (EMP) request.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This indicates a possible error in CICS code. An earlier CICS message is issued from the monitoring domain. Follow the user response for that message.

Module: DFHCMP

AMSA

Explanation: An input data stream received from a 3270 begins with a set buffer address (SBA) order but is not followed by two 1-byte address fields. This is probably due to a hardware error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: It may be possible to bypass the problem by entering two spaces before the data to be entered.

If the problem persists, you need further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHMSP

AMSB

Explanation: An internal logic error has been detected in module DFHMSP.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Retry the CMSG transaction, specifying operands in a different order. If this fails, keep the dump and contact your IBM Support Center.

Module: DFHMSP

AMSC

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHMSP

AMSD

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related error message produced by the domain that detected the original error.

Module: DFHMSP

ANQA

Explanation: An error has occurred obtaining a lock within the enqueue domain.

System Action: The recovery routine of the module in control is invoked which issues message DFHNQ0002 with a system dump. DFHNQ0002 reports the module in control at the time of the error.

User Response: See the description of message DFHNQ0002 for further guidance.

Modules: DFHNQED, DFHNQIB, DFHNQNQ, DFHNQST

ANQB

Explanation: An error has occurred releasing a lock within the enqueue domain.

System Action: The recovery routine of the module in control is invoked. This routine issues message DFHNQ0002 with a system dump. DFHNQ0002 reports the module in control at the time of the error.

User Response: See the description of message DFHNQ0002 for further guidance.

Modules: DFHNQED, DFHNQIB, DFHNQNQ, DFHNQST

ANQC

Explanation: An error has occurred obtaining a sysplex enqueue. The limit for the number of concurrent sysplex resource ENQ requests has been reached.

System Action: Module DFHNQED issues message DFHNQ0103 and the task issuing the EXEC ENQ request is abended.

User Response: See the description of message DFHNQ0103 for further guidance.

Module: DFHNQED

ANQD

Explanation: An error has occurred obtaining a sysplex enqueue. An unexpected environmental error has been detected.

System Action: Module DFHNQED issues message DFHNQ0104 and the task issuing the EXEC ENQ request is abended.

User Response: See the description of message DFHNQ0104 for further guidance.

Module: DFHNQED

ANQE

Explanation: An EXEC ENQ has been issued on a resource for wich the enqmodel is either disabled or in the waiting state.

System Action: Module DFHNQRN issues message DFHNQ0105 and the task issuing the EXEC ENQ request is abended.

User Response: See the description of message DFHNQ0105 for further guidance.

Module: DFHNQRN

APCF

Explanation: A CICS task has invoked a program which was defined as PL/I, but the program was not compiled with a supported PL/I compiler.

System Action: CICS terminates the task, and disables the program.

User Response: Check that the program is PL/I. If the program is PL/I, recompile it with the PL/I optimizing compiler; you may need to change the source program. If the program is not PL/I, redefine it correctly.

Module: DFHAPLI

APCG

Explanation: The transaction was purged either by master terminal actions or due to deadlock timeout actions as part of a request to the loader for a usable program copy. Deadlock timeout could be caused by a program whose size exceeds the available space in the DSAs or EDSAs.

System Action: CICS terminates the task with a transaction dump.

User Response: Use the dump to investigate why the transaction was purged. This may be due to waiting for loader resources or for program storage. Check the program size. It may be necessary to increase the overall size limits of the DSAs or EDSAs.

Modules: DFHACP, DFHCRNP, DFHCRSP, DFHDBCT, DFHDBDSC, DFHEDFP, DFHEIP, DFHEIPSH, DFHEIQIR, DFHEIQSJ, DFHFCRP, DFHFEP, DFHICP, DFHKCQ, DFHMCP, DFHMCPE, DFHMCY, DFHMSP, DFHPCPG, DFHPHP, DFHPSIP, DFHPUP, DFHRDCAL, DFHRTC, DFHSII1, DFHSIJ1, DFHSPP, DFHSTP, DFHTACP, DFHTBSGB, DFHTCRP, DFHTDX, DFHTFP, DFHTSPA, DFHTSRP, DFHUSBP, DFHXRCP, DFHXRE, DFHXRSP, DFHZATA, DFHZATD, DFHZCPLN, DFHZGAI, DFHZQ00, DFHZNCA, DFHZOPA, DFHZXCU

APCH

Explanation: A request for a VS COBOL II program could not be executed because a problem has occurred during system initialization for VS COBOL II. This is probably due to the absence of VS COBOL II or Language Environment support.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Redefine the program or ensure that the correct Language Environment or VS COBOL II support is present.

Module: DFHAPLI

APCI

Explanation: A request for a PL/I program could not be executed because execution of PL/I programs has been disabled.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Ensure that the PL/I libraries are included in DFHRPL.

Module: DFHAPLI

APCJ

Explanation: A request for a C program could not be executed either because C/370 was unable to recognize the program as having been compiled under the C/370 Compiler, or because the program was not link-edited with the attribute AMODE(31).

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Ensure that the program is correctly defined to CICS; or, if necessary, recompile the program using the current level of the C/370 Compiler.

Module: DFHAPLI

APCK

Explanation: A request for a C program could not be honored; execution of C programs has been disabled either because CICS was unable to load the required C/370 support module EDCCICS, or because C/370 initialization failed. This abend may be accompanied by message DFHFC0410.

System Action: The transaction is terminated abnormally and the program is disabled.

User Response: Refer to the explanation for message DFHFC0410 and, in particular, check that C/370 has been installed correctly.

Module: DFHAPLI

APCL

Explanation: An attempt to run the program failed because Language Environment/370 was unable to determine its language.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Ensure that the program is correctly defined to CICS.

Module: DFHAPLI

APCN

Explanation: An attempt to release an internal CICS program, a mapset, or a partitionset because the program, mapset or partitionset has not been loaded or has already been deleted. This is probably an internal CICS error.

System Action: The transaction is abnormally terminated with a CICS transaction dump. The name of the program for which the RELEASE was attempted can be found in the abend dump at TCAPCPI.

User Response: This is either an internal CICS error or is due to the overwriting of CICS internal control blocks. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHAMPEN, DFHFEP, DFHMCP, DFHMCPE, DFHMCY, DFHPHP, DFHTBSSP, DFHZCPLN

APCO

Explanation: A GETMAIN of storage for LEVEL 2 trace failed during transaction initialization.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHAPXM

APCS

Explanation: An attempt to run the program failed because CICS was unable to make a successful connection with Language Environment/370 to determine the run-time characteristics of the program. This abend is accompanied by message DFHAP1200 which gives the reason code set by Language Environment/370 indicating the nature of the error.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Refer to the Language Environment/370 *Debugging Guide and Runtime Messages* manual for the meaning of the reason code, and take whatever action is necessary to correct the error.

Module: DFHAPLI

APCT

Explanation: One of the following has occurred:

1. The program name in the EXEC CICS HANDLE ABEND program is not usable at the time an abend occurs because:
   - The program is not on the relocatable program library (RPL).
   - The program is disabled.
   - The program cannot be loaded.
2. An attempt to load a mapset or partitionset failed because although the program is defined to CICS
   - It is not available on the RPL, or
   - It is disabled, or
   - It cannot be autoinstalled.
3. An attempt to link to, load, or release an internal CICS program failed because:
   - The program is not on the RPL.
   - The program is disabled.
   - The program cannot be loaded.

Problem Determination: The trace preceding the abend indicates the program, mapset, or partitionset that could not be loaded, linked to, or released. The name is also in TCAPCEPI.

System Action: The transaction requiring the program is abnormally terminated with a CICS transaction dump.

User Response: In cases 1 and 2, define the program, mapset partitionset to CICS using CEDA and ensure it is enabled.

In case 3, the definition of a CICS-provided module is incorrect. Check for associated messages issued during CICS start up.

Modules: DFHACP, DFHAMPEN, DFHCRSP, DFHEDFP, DFHEIP, DFHEIPSH, DFHEIQSJ, DFHFEP, DFHICP, DFHMCP, DFHMCPE, DFHMCY, DFHMELDE, DFHPCPG, DFHPHP, DFHPUP, DFHRDCAL, DFHSII1, DFHTBSGB, DFHTFP, DFHTSRP, DFHZCPLN, DFHZQ00, DFHZXCU

APCW

Explanation: The program language is defined as COBOL but the level of the compiler under which it was originally compiled cannot be determined. Most probably, the program was compiled under an OS/VS COBOL II compiler but the required level of support for that compiler is not present in the system.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Check that OS/VS, COBOL II or Language Environment/370 support is present in the system and that the required interface modules (IGZECIC or CEECCICS) have been correctly loaded during system startup.

Module: DFHAPLI

APCY

Explanation: In an MVS/ESA environment, a CICS macro request has been issued from a PL/I or COBOL application. Alternatively, it is possible that the application program has been link edited without the EXEC interface module (for example, DFHECI or DFHELII) which is used by the CICS high-level language programming interface. See the *CICS System Definition Guide* for details of what has to be done to include this module.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Remove the macro request from the application program.

Module: DFHAPLI

APCZ

Explanation: An attempt has been made to run either an 'old-style' application program (that is, a program with a pre-release 1.6 or a DFHE program stub) or an OS/VS COBOL program, either having been link-edited with the RENT or REFR attributes. These types of programs are not reentrant and therefore cannot be loaded into read-only storage.

System Action: The transaction is abnormally terminated.

User Response: Relink the program without the RENT and REFR attributes.

Module: DFHAPLI

APC0

Explanation: A serious error occurred in a call to the program manager domain when trying to link a system program.

System Action: CICS terminates the task with a transaction dump.

User Response: Use the dump to investigate why the error occurred. Look at the trace records prior to the error for abnormal conditions in processing the PGLK domain call. This may be due to a problem with directory manager, loader, or storage manager. Check the program size. It may be necessary to increase the overall size limits of the DSAs or EDSAs.

Modules: DFHPCP, DFHMCY

APC1

Explanation: A request for a TGT exceeding 64KB has been detected.

System Action: CICS abnormally terminates the transaction and disables the installed program definition.

User Response: Change the application program to reduce the working storage requirement. Perform CEMT NEWCOPY and ENABLE for the program when it has been corrected.

Module: DFHAPLI

APC2

Explanation: An illegal branch has been attempted by a Language Environment/370 user program following an abend condition with an active handle label abend. Usually an Out-Of-Block GOTO will have resulted, implying that the program tried to branch to, for example, an inactive block. This abend is accompanied by message DFHAP1200 which gives the reason code set by Language Environment/370 indicating the nature of the error.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Refer to the Language Environment/370 *Debugging Guide and Runtime Messages* manual for the meaning of the reason code, and amend the program to avoid the GOTO in error.

Module:

Module: DFHAPLI

APC3

Explanation: An attempt to run the program failed because the program appeared to be defined to CICS as Language Environment/370 but no Language Environment/370 support was present in the system and no other language environment was able to run the program.

System Action: The transaction is abnormally terminated and the program is disabled.

User Response: Redefine the program to CICS in a language other than Language Environment/370.

Module: DFHAPLI

APC4

Explanation: A call to the loader domain to define program ILBOCOM failed.

System Action: The transaction is abnormally terminated.

User Response: Check that the library containing the OS/VS COBOL runtime library modules is named in the DFHRPL DD concatenation.

Module: DFHPCPC2

APC5

Explanation: A call to the loader domain to load program ILBOCOM failed.

System Action: The transaction is abnormally terminated.

User Response: Check that the library containing the OS/VS COBOL runtime library modules is included in the DFHRPL concatenation. If it is, obtain and check a trace of the failure. If no reasonable explanation is found (such as lack of storage), you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPCPC2

APC6

Explanation: An internal error has occurred.

System Action: The transaction is abnormally terminated.

User Response: See the associated X'F230' Exception trace entry for further diagnostic information. For an ACQUIRE error ensure the associated module is in a library in the CICS DFHRPL concatenation. For an IDENTIFY error make sure that the associated module has not been MVS LOADed for example by the inadvertent link-editing of a VS COBOL II program with a COBOL subprogram.

Module: DFHPCPC2

APC7

Explanation: An MVS IDENTIFY call has given a non zero return code. The IDENTIFY call was being used to make the entry point ILBOCOM0 known to MVS.

System Action: The transaction is abnormally terminated.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPCPC2

APC8

Explanation: An MVS LOAD of ILBOCOM0 has given a non zero return code.

System Action: The transaction is abnormally terminated.

User Response: Ensure the library containing the OS/VS COBOL runtime modules is available to STEPLIB.

Module: DFHPCPC2

APC9

Explanation: An MVS LOAD of ILBOCOM has given a non zero return code.

System Action: The transaction is abnormally terminated.

User Response: Ensure the library containing the OS/VS COBOL runtime modules is available to STEPLIB.

Module: DFHPCPC2

APLx

Explanation: Abend codes with 'PL' as the middle two characters are issued by PL/I, and are described in further detail in the *OS PL/I Optimizing Compiler: Programmer's Guide*.

APP1

Explanation: The DFHIC TYPE=GET response code was not a normal response.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Analyze the dump. The response code is in the low-order byte of register 0.

Module: DFHP3270

APP2

Explanation: The length of data that has been passed to DFHP3270 via temporary storage is less than or equal to 5.

Problem Determination: Register 6 points to the data retrieved from temporary storage via a DFHIC TYPE=GET macro invocation. The layout of this data is:

- Terminal data area length (2 bytes)
- Write control indicator (1 byte)
- Write control or carriage control character (1 byte)
- Data (variable length)

Analysis: DFHP3270 has been called to handle a print request from a 3270 Information Display System terminal. It obtains from temporary storage the data to be printed, via a DFHIC TYPE=GET invocation. It ensures that some data to be printed is present. The area returned from temporary storage contains the data to be printed preceded by 4 bytes as described above. DFHP3270 has found that, because the length of data passed to it is less than or equal to 5, there is no data to be printed.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Check the user DFHTEP. If it is not at fault, submit an APAR.

If this abend has occurred, the data that DFHP3270 obtained from temporary storage was probably put there with an incorrect length. The user may have requested indirectly that this data be placed in temporary storage either by an application request for printing (for example ISSUE PRINT) or by pressing the Print Request key. However, CICS should control the data length for this request. Under normal circumstances, the only way the user could have requested directly that data is to be placed in temporary storage is in the user's TEP. The user should check any invocations of DFHIC TYPE=PUT in handling print requests, particularly when dealing with the "printer unavailable or busy" condition, and ensure that the length field is set correctly.

Module: DFHP3270

APP3

Explanation: An attempt to request data has been sent to a nonprinter or unsupported device type by either:

- A terminal operator entering CSPP as a transaction code, **or**
- A transaction issuing a DFHTEP request.

System Action: The transaction is abnormally terminated. A CICS transaction dump **is not** provided.

User Response:

1. Ensure that the terminal operator ceases to use CSPP as a transaction code, or
2. Correct the user DFHTEP program.

Module: DFHP3270

APR1

Explanation: An abnormal DFHIC TYPE=PUT response code was received during print key processing.

System Action: The transaction is abnormally terminated with a CICS transaction dump. The keyboard of the terminal on which the print key was depressed remains locked to indicate the failure of the operation.

User Response: Analyze the dump. The response code is in low-order byte of register 0.

Module: DFHPRK

APSJ

Explanation: The abending transaction invoked the system spooler initialization program (DFHPSIP) illegally, that is from a program other than the CICS module, DFHSIJ1.

System Action: CICS terminates the transaction abnormally. The EXEC CICS HANDLE ABEND command can not handle this abend.

User Response: Remove any calls or links to DFHPSIP from your application programs. If you can find no invocation of DFHPSIP in your application, you need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPSIP

APST

Explanation: A task issued a SPOOL command without the mandatory NOHANDLE operand.

System Action: CICS terminates the task abnormally with a dump.

User Response: Correct the syntax of the command, specifying NOHANDLE.

Module: DFHEPS

APSU

Explanation: The CICS SVC passed an invalid JES interface return code to the CICS system spooler (an MVS subtask).

System Action: CICS terminates the task abnormally.

User Response: This is an internal error – check any JES failures that occurred at the same time.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPSPST

APSV

Explanation: A storage area for VSAM macro return codes contained an invalid value.

System Action: CICS terminates the task abnormally with a dump.

User Response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

Module: DFHPSPST

APSW

Explanation: An abend occurred within a CICS system spooler subtask.

System Action: CICS terminates the task abnormally with a dump.

User Response: This is an internal CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPSPST

APSX

Explanation: A CICS storage area used for notification of invalid parameters contained an invalid value.

System Action: CICS terminates the task abnormally with a dump.

User Response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

Module: DFHPSPST

APSY

Explanation: A CICS storage area for MVS macro return codes contained an invalid value.

System Action: CICS terminates the task abnormally with a dump.

User Response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

Module: DFHPSPST

APSZ

Explanation: A CICS area, used to store a JES interface return code, contained an invalid value.

System Action: CICS terminates the task abnormally with a dump.

User Response: Check the syntax and input data of the spool commands issued by the failing transaction. Check any JES failures that occurred at the same time.

This is an internal CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPSPST

APTI

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHPSPST

APTJ

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHPSPST

APUA

Explanation: An internal error was detected when module DFHPUP was invoked. The GETSTG parameter is missing on a call to DFHPUP (PUPF).

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUB

Explanation: An internal error was detected when module DFHPUP was invoked. The GETSTG parameter is missing on a call to DFHPUP (PUPU).

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUC

Explanation: An internal error was detected when module DFHPUP was invoked. An invalid function code was supplied for a domain call to DFHPUP.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUD

Explanation: The RDO language definition table (DFHEITSP) could not be located in the library.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: Ensure that module DFHEITSP is in the library and is valid for this release of CICS.

Module: DFHPUP

APUE

Explanation: The RDO language definition table (DFHEITSP) could not be loaded because of a lack of available storage.

System Action: Processing is abnormally terminated with an operating system dump.

User Response: Allocate more storage and resubmit the offline COPY or APPEND command(s) that failed.

Modules: DFHPUP (Batch environment)

APUF

Explanation: Either the RDO language definition table is invalid or it is missing from the library.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: Ensure that module DFHEITSP is in the library and is valid for this release of CICS.

Module: DFHPUP

APUG

Explanation: An internal error was detected in module DFHPUP. Storage could not be obtained for the CSD record buffer.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUH

Explanation: An internal error was detected in module DFHPUP. Storage could not be obtained for the argument list.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUI

Explanation: An internal error was detected in module DFHPUP. Storage cannot be freed for the argument list.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUJ

Explanation: An internal error was detected in module DFHPUP. Storage cannot be freed for the CSD record buffer.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUK

Explanation:

- In a CICS environment, storage could not be acquired for a buffer to contain logged RDO commands in the CEDA transaction.
- In a batch environment, storage could not be acquired for a buffer to contain back-translated resource definitions from the CSD.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUL

Note: The description of this abend also applies to APUM, APUN and APUO.

Explanation: CICS cannot find a match for a function code in the language definition table, because the parameterized resource definition contains an unrecognized resource type code.

The abend code issued depends on the DFHPUP operation that was invoked before the error occurred:

Abend	DFHPUP operation
APUL	FLATTEN
APUM	TRANCASE
APUN	COMPARE
APUO	BACKTRANS

The cause of the abend is either:

1. A language definition table (DFHEITSP or DFHEITCU) in the library is invalid for the CICS release you are running, **or**
2. A CICS logic error has occurred.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: Your response depends on which of the two possible reasons apply:

1. Ensure that the DFHEITSP and DFHEITCU modules in the library are valid for this release of CICS.
2. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUM

Explanation: Refer to the description of abend APUL.

Module: DFHPUP

APUN

Explanation: Refer to the description of abend APUL.

Module: DFHPUP

APUO

Explanation: Refer to the description of abend APUL.

Module: DFHPUP

APUP

Explanation: An internal error occurred in DFHPUP processing of the language definition table for RDO. There was a stack error building a keyword list for the syntax tree.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUQ

Explanation: An internal error occurred in DFHPUP processing of the language definition table for RDO. Too many keywords found in syntax expansion.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APUR

Explanation: An internal error occurred in DFHPUP processing of an argument list or a CSD record buffer. The data type for a keyword field conflicts with the data type specified in the language definition table.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: Ensure that the module DFHEITSP is in the library and is valid for this release of CICS.

Module: DFHPUP

APUS

Explanation: An internal error occurred in DFHPUP processing of a CSD record buffer. The integer data length for a keyword field is invalid.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: Ensure that the module DFHEITSP is in the library and is valid for this release of CICS.

Module: DFHPUP

APUT

Explanation: An internal error occurred in DFHPUP processing of an argument list or a CSD record buffer. The keyword existence bit number, which is the KEP(1) value in language definition table DFHEITSP, is not valid.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump.
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: Ensure that the module DFHEITSP is in the library and is valid for this release of CICS.

Module: DFHPUP

.*---

APUZ

Explanation: CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This abend can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System Action:

- In a CICS environment, the CEDA transaction is abnormally terminated with a CICS transaction dump
- In a batch environment, processing is abnormally terminated with an operating system dump.

User Response: Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:

1. Avoid operations on groups containing definition-types that are unsupported by the CICS release you are running.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHPUP

APXA

Explanation: The user transaction's profile could not be found.

System Action: The task is abnormally terminated with a CICS transaction dump. The user transaction is not started.

User Response: Check that the profile name in the user transaction definition is correct, and that this profile has been defined.

Module: DFHAPXM

ARCB

Explanation: CICS has attempted to enable a task-related user exit, or a global user exit during initialization, but failed because the exit program could not be found.

On all types of start, CICS attempts to enable DFHEDP, the EXEC DLI task-related user exit. On an emergency restart, CICS enables transaction backout exit programs as specified by the first two TBEXITS system initialization parameters.

On all types of start, CICS attempts to enable file control backout programs as specified by the third, fourth, fifth and sixth TBEXITS system initialization parameters.

System Action: CICS issues a message to the console indicating which exit program is involved. CICS initialization then terminates abnormally with a system dump.

User Response: If the associated message indicates that program DFHEDP could not be found, check that IBM-supplied group DFHEDP is included in the group list used at CICS cold or initial start time.

For transaction backout exit programs, including the file control backout programs, ensure the program has been defined and is in a library available to CICS.

If necessary, use the dump to find out why the exit program could not be enabled.

Module: DFHRCEX

ARHA

Explanation: The SAA resource recovery interface has been invoked with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: A level 2 trace for 'CP' of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPIR

ARHB

Explanation: The SAA resource recovery interface has been invoked with an invalid number of parameters for the call.

System Action: the transaction is abnormally terminated with a CICS transaction dump.

User Response: The exception trace point produced with this abend contains the SAA resource recovery verb name that was issued incorrectly. Use this to determine where the application program was in error and amend application program accordingly. The *SAA Resource Recovery Reference Manual*, SC31-6821, provides a detailed description of the SAA resource recovery verbs and how they should be called.

Module: DFHCPIR

ARHC

Explanation: The SAA resource recovery interface has detected an unexpected return code from the syncpoint program. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: A level 2 trace for 'CP' of the transaction shows the course of events before this error occurred (such as the modules called and their parameters) plus details of the error itself. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCPIR

ARM0

Explanation: An attempt was made to attach a transaction specifying DFHRMXN3 as the program to be given control, but the transaction was not internally attached by CICS.

DFHRMXN3 is for use by CICS system transaction CSKP. This provides support for activity keypoints,

System Action: The transaction is abnormally terminated. CICS processing continues.

User Response: Establish why an attempt was made to attach CSKP incorrectly, or why a transaction definition specified DFHRMXN3 as the program to be given control.

Module: DFHRMXN3

ARPA

Explanation: An unexpected response from DFHSUSN has occurred when trying to sign off a user of the CRTE transaction in the target system when processing a CANCEL request.

This abend can be caused by incorrect use of the VTAM VARY INACT command. Otherwise it indicates that there may be an error in CICS.

System Action: The CSSF transaction (CRTE cancel processor transaction) is terminated with an ARPA abend.

User Response: Ensure that the VTAM VARY inact command is used correctly. If this is not the cause of the abend, you need further assistance from IBM to correct this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRTC

ARPF

Explanation: The alias could not be initialized.

System Action: One of the following messages is issued: DFHRP0103, DFHRP0104, DFHRP0106, DFHRP0108, DFHRP0109.

User Response: See the user response for the message.

Module: DFHRPAS

ARPG

Explanation: The alias was not able to link to the CICS program or the **Encode** function of the converter one of the following reasons:

- The userid supplied for the alias was not valid.
- The CICS program is not defined as a resource to the external security manager.
- The CICS program name is not valid.
- The CICS program was on a different system from CICS ONC RPC, and the specified system name was not valid.
- The converter program name was not valid.
- The converter program is defined as remote.
- The alias is not authorized to use the converter

System Action: One of the following messages is issued: DFHRP0121, DFHRP0131, DFHRP0138, DFHRP0139, DFHRP0141, DFHRP0156, DFHRP0157, DFHRP0159.

User Response: See the user response for the message.

Module: DFHRPAS

ARPH

Explanation: The alias detected a global work area error.

System Action: The following message is issued: DFHRP0118.

User Response: See the user response for the message.

Module: DFHRPAS

ARPI

Explanation: The alias detected a logic error.

System Action: One of the following messages is issued: DFHRP0107, DFHRP0133, DFHRP0135, DFHRP0137, DFHRP0143, DFHRP0144, DFHRP0148, DFHRP0149, DFHRP0155, DFHRP0164, DFHRP0168, DFHRP0170.

User Response: See the user response for the message.

Module: DFHRPAS

ARPJ

Explanation: The alias ends for one of the following reasons:

- An unexpected response was received from CICS during transaction initialization.
- The external security manager is no longer available.
- The remote CICS region in which the CICS program was running abended.
- The CICS program, which was running in a remote CICS region, abended.
- The reply could not be sent to the client.

System Action: One of the following messages is issued: DFHRP0105, DFHRP0132, DFHRP0136, DFHRP0140, DFHRP0145, DFHRP0146, DFHRP0147, DFHRP0150, DFHRP0165, DFHRP0166, DFHRP0167.

User Response: See the user response for the message.

Module: DFHRPAS

ARPK

Explanation: The alias detected a CICS logic error.

System Action: One of the following messages is issued: DFHRP0102, DFHRP0122, DFHRP0142, DFHRP0160.

User Response: See the user response for the message.

Module: DFHRPAS

ARPL

Explanation: The alias detected an authorization error.

System Action: One of the following messages is issued: DFHRP0119, DFHRP0120, DFHRP0132, DFHRP0134.

User Response: See the user response for the message.

Module: DFHRPAS

ARPM

Explanation: The alias detected an error in user code.

System Action: One of the following messages is issued: DFHRP0161, DFHRP0162, DFHRP0163, DFHRP0169.

User Response: See the user response for the message.

Module: DFHRPAS

ARPN

Explanation: The alias detected an error while trying to switch TCBs.

System Action: The following message is issued: DFHRP0151.

User Response: See the user response for the message.

Module: DFHRPAS

ARPO

Explanation: The alias program detected an abend.

System Action: One of the following messages is issued: DFHRP0181, DFHRP0182, DFHRP0183.

User Response: See the user response for the message.

Module: DFHRPAS

ARPU

Explanation: The connection manager could not access the CICS ONC RPC data set, and received an error response when it tried to send message DFHRP1512.

System Action: None.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRPC01

ARPV

Explanation: The connection manager received an unexpected response from CICS following an EXEC CICS command.

System Action: One of the following messages is issued: DFHRP1540, DFHRP1651, DFHRP1954.

User Response: See the user response for the message.

Module: DFHRPC0E

ARPW

Explanation: The connection manager received an unexpected response from CICS following an EXEC CICS command.

System Action: The following message is issued: DFHRP1969.

User Response: See the user response for the message.

Module: DFHRPC0E

ARPX

Explanation: The connection manager was started against an invalid terminal.

System Action: The following message is issued: DFHRP1522.

User Response: See the user response for the message.

Module: DFHRPC01

ARPZ

Explanation: The connection manager has insufficient authority.

System Action: The following message is issued: DFHRP1902.

User Response: See the user response for the message.

Module: DFHRPC0B

ARP2

Explanation: The server controller detected an internal error during CICS ONC RPC enable processing.

System Action: One of the following messages is issued: DFHRP0508, DFHRP0509, DFHRP0528, DFHRP0529, DFHRP0590, DFHRP0591.

User Response: See the user response for the message.

Module: DFHRPMS

ARP4

Explanation: The server controller has performed an exception disable because of an internal error.

System Action: One of the following messages is issued: DFHRP0503, DFHRP0559, DFHRP0697, DFHRP0726, DFHRP0728, DFHRP0730, DFHRP0741.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRPMS

ARP5

Explanation: An invalid attempt was made to start the server controller.

System Action: The following message is issued: DFHRP0640.

User Response: See the user response for the message.

Module: DFHRPMS

ARP9

Explanation: There was not enough storage for the connection manager.

System Action: None.

User Response: You need further assistance from IBM to resolve this problem. See the *CICS External Interfaces Guide* and Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRPC01

ARTA

Explanation: The task does not own a terminal as its principal facility.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Ensure that DFHRTE has not been specified as the program for a task other than CRTE. Ensure that CRTE has not been initiated by means other than terminal input.

Module: DFHRTE

ARTB

Explanation: There is no input TIOA or the data length is zero.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Ensure that DFHRTE has not been specified as the program for a task other than CRTE. Ensure that CRTE has not been initiated by means other than terminal input.

Module: DFHRTE

ARTC

Explanation: The link to the required system is not usable for an unknown reason.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRTE

ARTD

Explanation: An internal logic error has been detected.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRTE

ARTE

Explanation: An error was encountered when attempting to read from or write to temporary storage.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Determine the cause of the temporary storage problem and correct it.

Module: DFHRTE

ARTF

Explanation: An attempt has been made to use the routing transaction (CRTE) from a terminal that has a permanent transaction code set.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Inform the system programmer.

Module: DFHRTE

ARTG

Explanation: CICS could not find the profile specified for a transaction being routed.

System Action: CICS terminates the task abnormally with a dump.

User Response: Check your transaction and profile definitions.

Module: DFHRTE

ARTH

Explanation: An error (INVALID, DISASTER or EXCEPTION response) has occurred on a call to schedule a remote terminal delete by DFHRTE during sign-off for a surrogate terminal session running CRTE. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: CICS terminates the task abnormally with a dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHRTE

ARUA

Explanation: An exception condition was returned on the ADD_LINK during the BIND phase of ATTACH for the transaction invoked by the RUN command.

System Action: CICS terminates the invoked transaction abnormally with a dump. The RUN SYNCHRONOUS command that was issued by the application returns with an error response of INVREQ (RESP2 28).

User Response: More details can be found in the trace.

Module: DFHXMRU

ARUB

Explanation: A RUN SYNCHRONOUS command caused an attempt to attach a transaction defined as remote. Only transactions defined as local may be run synchronously.

System Action: CICS terminates the invoked transaction abnormally with a dump. The RUN SYNCHRONOUS command that was issued by the application returns with an error response of ACTIVITYERR or PROCESSERR (RESP2 27).

User Response: More details can be found in the trace.

Module: DFHXMXM

ARUC

Explanation: A RUN SYNCHRONOUS command caused an attempt to attach a transaction with an invalid USERID.

System Action: CICS terminates the invoked transaction abnormally with a dump. The RUN SYNCHRONOUS command that was issued by the application returns with a resp2 value of 27.

User Response: More details can be found in the trace.

Module: DFHXMRU

ARXA

Explanation: A transactional EXCI request has been received from a batch region. CICS has encountered an error when attempting to express interest in an RRMS Unit of Recovery.

DFHRXUW provides an exception trace, console message DFHRX0002, and possibly a system dump (depending on the options in the dump table).

System Action: The transaction is terminated with a CICS transaction dump.

User Response: Resource Recovery Services (RRS) may have been shut down after the request was received by CICS. If this is the case, retry the EXCI request once RRS has been restarted.

If this is not the case, use the exception trace provided by the RX domain to determine the reason for the failure. You might need further assistance from IBM in this situation. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRXUW

ARXB

Explanation: An error (EXCEPTION, DISASTER, INVALID, KERNERROR or PURGED) has occurred on an ADD_LINK call to the recovery manager (RM) domain. For errors other than EXCEPTION, the RM domain provides an exception trace, a console message, and possibly a system dump (depending on the options in the dump table).

For all errors, DFHRXUW provides an exception trace, console message DFHRX0002, and possibly a system dump (depending on the options in the dump table).

System Action: The transaction is terminated with a CICS transaction dump.

User Response: See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRXUW

ARXC

Explanation: A transactional EXCI request has been received from a batch region when either:

- CICS did not register as a resource manager with Recoverable Resource Management Services (RRMS) because system initialization parameter RRMS=NO was specified.
- the RX domain did not succesfully complete its initialization.

System Action: The transaction is terminated with a CICS transaction dump.

User Response: If CICS was started with system initialization parameter RRMS=NO, restart CICS specifying RRMS=YES (or route transactional EXCI requests to another CICS system).

Otherwise, investigate why the RX domain did not initialize succesfully. A failure during initialization of the domain is accompanied by a console message and a system dump. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHRXUW

ASCA

Explanation: A DFHSC TYPE=GETMAIN request has resulted in a call to the storage manager (SM) domain which has returned an INVALID or DISASTER response.

System Action: The transaction is terminated with a CICS transaction dump.

User Response: There has been an earlier failure which led to the response from the storage manager domain. Investigate the earlier failure (which is accompanied by a console message and a system dump).

Module: DFHSMSCP

ASCB

Explanation: A DFHSC TYPE=FREEMAIN request has resulted in a call to the storage manager (SM) domain which has returned an INVALID or DISASTER response.

System Action: The transaction is terminated with a CICS transaction dump.

User Response: There has been an earlier failure which led to the response from the storage manager domain. Investigate the earlier failure (which is accompanied by a console message and a system dump).

Module: DFHSMSCP

ASCP

Explanation: A task which has issued an unconditional DFHSC TYPE=GETMAIN request has been purged while waiting for sufficient contiguous main storage to become free.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. This will either have been as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the task was purged by the master terminal operator then this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded then this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased then the number of tasks in the system should be reduced to avoid short-on-storage situations. Another possibility would be to increase the value of the DTIMOUT option for the transaction.

Module: DFHSMSCP

ASCR

Explanation: A DFHSC macro request has been issued with an invalid request type.

System Action: The transaction is terminated with a CICS transaction dump.

Detection of the invalid request by DFHSMSCP causes a console message and a system dump to be produced.

User Response: Use the associated console message and system dump to investigate the problem.

Module: DFHSMSCP

ASDA

Explanation: The default shutdown transaction (CESD) has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: None.

Module: DFHCESD

ASFA

Explanation: An internal logic error occurred in DFHSFP because of an unexpected response from EXEC CICS. This abend code is usually accompanied by message DFHCE3598 which contains the associated return codes.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHSFP

ASFB

Explanation: An attempt was made to execute the CICS signoff program without an associated terminal.

System Action: CICS terminates the transaction with a dump. This abend code is usually accompanied by message DFHCE3598.

User Response: Only use the signoff program when there is a related terminal.

Module: DFHSFP

ASFC

Explanation: An attempt was made to execute the CICS signoff program against an APPC session.

System Action: CICS terminates the transaction with a dump. This abend code is usually accompanied by message DFHCE3598.

User Response: Only use the signoff program when there is a related terminal.

Module: DFHSFP

ASHA

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System Action: The transaction is abnormally terminated with abend code ASHA. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User Response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHDM

ASHB

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System Action: The transaction is abnormally terminated with abend code ASHB. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User Response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHDM

ASHR

Explanation: A command has failed due to a serious failure in a CICS component (resource manager).

System Action: The transaction is abnormally terminated with abend code ASHR. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User Response: Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHRSP

ASHU

Explanation: In the process of transferring the request from one region to another an abend occurred due to a routing failure. The Request cannot be routed to a suitable region. The request is unserviceable.

System Action: The transaction is abnormally terminated with abend code ASHU. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User Response: Check the links between regions are available. Check the Distributed Routing Program name is correct and the program is usable. Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHRSP

ASH2

Explanation: An attempt to service a Scheduler Services request failed due to required resources being unobtainable. This may result in a request being unserviceable or an Activity being marked abended depending on the nature of the failure.

System Action: The transaction is abnormally terminated with abend code ASH2. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User Response: Check that any required links between regions are available. Check the Distributed Routing Program name is correct and the program is usable. Use the transaction dump to determine the cause of the failure. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHXM

ASH3

Explanation: A transaction bound to a Scheduler Services request has backed out. No other abend code has been set. The SH abend request uses this abend code by default.

System Action: The transaction continues backing out. A subsequent task will process the SH abend request.

User Response: None.

Module: DFHSHRM

ASH4

Explanation: A Scheduler Services request attempted to attach a transaction that is currently disabled.

System Action: The transaction is abnormally terminated with abend code ASH4. CICS takes a transaction dump, unless module DFHDUIO is not loaded.

User Response: Check the status of the transaction. For further assistance, or if module DFHDUIO is not loaded and no transaction dump is available, contact your system programmer.

Module: DFHSHXM

ASIA

Explanation: An error has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump. CICS then terminates abnormally.

User Response: See the related message from the domain that detected the original error.

Module: DFHSII1

ASIB

Explanation: An attempt has been made to run the CICS internal task CPLT as a user transaction.

System Action: CICS terminates the task with a transaction dump.

User Response: Investigate why the attempt was made to run CPLT as a user transaction.

Module: DFHSIPLT

ASNA

Explanation: An internal logic error occurred in DFHSNP because of an unexpected response from EXEC CICS.

System Action: CICS terminates the transaction with a dump. This abend code is usually accompanied by message DFHCE3548.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHSNP

ASNB

Explanation: An attempt was made execute the CICS sign on program without an associated terminal. This abend code is usually accompanied by message DFHCE3548.

System Action: CICS terminates the transaction with a dump.

User Response: Only use the sign on program when there is a related terminal.

Module: DFHSNP

ASNC

Explanation: The signon program attempted to send a request to the user but failed to do so.

System Action: CICS terminates the transaction with a dump. This abend code is usually accompanied by message DFHCE3548.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHSNP

ASND

Explanation: A request from DFHSNTU to ENQ on the address of the SNEX has failed during signoff terminal user.

System Action: A transaction dump is taken and the task which issued the signoff is abended.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHSNTU

ASOA

Explanation: The TCP/IP listener task CSOL has been incorrectly started from a terminal. It can only be enabled by the Sockets Domain at CICS system initialization or by using CEMT SET TCPIP OPEN or the equivalent SPI function.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: None.

Module: DFHSOL

ASPA

Explanation: The task was purged before a request to recovery manager (RM) domain was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump. If processing is at a point where data integrity might not be maintained, CICS is abnormally terminated.

User Response: Investigate why the task was purged. This is either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

If CICS is abnormally terminated, it should be emergency restarted to ensure that data integrity is maintained.

Module: DFHAPAC

ASPB

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump. If processing is at a point where data integrity might not be maintained, CICS is abnormally terminated.

User Response: See the related message from the domain that detected the original error. If CICS was abnormally terminated, it should be emergency restarted to ensure that data integrity is maintained.

Module: DFHAPAC

ASPC

Explanation: An error (INVALID or DISASTER) has occurred on a call to the bridge syncpoint routine (DFHBRSP). The domain that detected the original error will have provided an exception trace, and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHSPP

ASPF

Explanation: CICS issued an internal syncpoint request resulting in a syncpoint with an intersystem session which has returned ROLLEDBACK to recovery manager (RM) domain. As a result, the transaction is abnormally terminated because the unit of work which was being syncpointed has been backed out.

This could result from shutting down IRC or from the failure of a connected CICS region.

System Action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work are backed out and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2215 is sent to the terminal end user if possible, and message DFHAC2245 is sent to transient data destination CSMT.

User Response: Determine why the remote intersystem session returned a ROLLEDBACK response to the syncpoint request. Once this has been corrected retry the transaction.

To avoid ASPF abends in future, ensure that no in-flight units of work exist before shutting down IRC.

Module: DFHAPAC

ASPI

Explanation: During CICS synchronization level 1 (synclevel 1) commit, an unexpected FMH or no data has been received from the partner system. Local resources and synclevel 2 partners have been committed, but synclevel 1 function-shipped resource updates may have been backed out.

System Action: The transaction does not abend. CICS synclevel 1 commit processing continues, with the aim of committing as many synclevel 1 resources as possible.

User Response: Examine the transaction dump to determine why the FMH was invalid or missing, It is likely that the error is in the remote system.

See the *CICS Family: Communicating from CICS on System/390* for more information about syncpointing.

Module: DFHCR2U

ASPJ

Explanation: During CICS synchronization level 1 (synclevel 1) commit, unexpected syncpoint message data has been received from the partner system. Local resources and synclevel 2 partners have been committed, but synclevel 1 function-shipped resource updates may have been backed out.

System Action: The transaction does not abend. CICS synclevel 1 commit processing continues, with the aim of committing as many synclevel 1 resources as possible.

User Response: Examine the transaction dump to determine why the message data was invalid. It is likely that the error is in the remote system.

See the *CICS Family: Communicating from CICS on System/390* for more information about syncpointing.

Module: DFHCR2U

ASPN

Explanation: A transaction has issued an EXEC CICS RETURN in backout required program state. The backout required program state is set when an application receives or issues an abend, or receives a backout request on a protected conversation.

System Action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work are backed out and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2216 is sent to the terminal end user if possible, and message DFHAC2246 is sent to transient data destination CSMT.

User Response: To avoid the transaction abend, the application should code an EXEC CICS SYNCPOINT command before the EXEC CICS RETURN. A syncpoint issued in 'backout required' program state results in a backout being performed, and the ROLLEDBACK condition returned on the EXEC CICS SYNCPOINT command. If this condition is then handled, a subsequent EXEC CICS RETURN will complete successfully.

Module: DFHAPAC

ASPO

Explanation: An intersystem session failed while a syncpoint was being taken. The intersystem session that failed was the link to the coordinator system. The failure occurred during the indoubt period of syncpoint processing. As a result this CICS system is in doubt as to the outcome of the unit of work for the transaction.

The unit of work is not shunted to await the return of the coordinator system, but is instead unilaterally committed. The unit of work is not shunted for one of the following reasons:

- The transaction definition specifies WAIT(NO).
- The unit of work includes an MRO session to a back-level CICS system which does not support the WAIT(YES) option, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work includes an LU6.1 session, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work involves a task related user exit which is not enabled with the INDOUBTWAIT option.
- The unit of work has updated a recoverable transient data destination, which is defined with WAIT(NO).
- The unit of work involves the installation of CICS resource definitions from the CSD (CICS system definition) file.

The unit of work is committed, rather than backed out, because the transaction definition specifies ACTION(COMMIT).

The fact that the unit of work is committed is remembered by the recovery manager (RM) domain until the unit of work is resynchronized with the coordinator system. At this time, according to whether the coordinator system committed or backed out, the recovery manager domain issues resynchronization messages reporting whether or not the resolution of the unit of work in the subordinate system was consistent with the coordinator system.

System Action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work are committed and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2202 is sent to the terminal end user if possible, and message DFHAC2232 is sent to transient data destination CSMT.

User Response: Any updates performed by the unit of work are committed. There is a danger that recoverable resources will be inconsistent with the coordinator system if the coordinator system has backed out. If the reason for the failure is the first of those listed above and if you wish CICS to ensure that data integrity is maintained, change the indoubt transaction definition to specify WAIT(YES) so that CICS automatically handles indoubt failures and resynchronizes the unit of work when the link to the coordinator system is reestablished.

Module: DFHAPAC

ASPP

Explanation: An intersystem session failed while a syncpoint was being taken. The intersystem session that failed was the link to the coordinator system, and the failure occurred during the critical indoubt period of syncpoint processing. As a result this CICS system is in doubt as to the outcome of the unit of work for the transaction.

The unit of work is not shunted to await the return of the coordinator system. Instead it is unilaterally backed out. The unit of work is not shunted for one of the following reasons:

- The transaction definition specifies WAIT(NO).
- The unit of work includes an MRO session to a back-level CICS system which does not support the WAIT(YES) option, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work includes an LU6.1 session, and the role of the session in the unit of work is such that it cannot await the return of the coordinator system.
- The unit of work involves a task related user exit which is not enabled with the INDOUBTWAIT option.
- The unit of work has updated a recoverable transient data destination, which is defined with WAIT(NO).
- The unit of work involves the installation of CICS resource definitions from the CSD (CICS system definition) file.

The unit of work is backed out, rather than committed, because the transaction definition specifies ACTION(BACKOUT).

The fact that the unit of work is backed out is remembered by recovery manager (RM) domain until the unit of work is resynchronized with the coordinator system. At this time, according to whether the coordinator system backed out or committed, the recovery manager domain issues resynchronization messages

reporting whether or not the resolution of the unit of work in the subordinate system was consistent with the coordinator system.

System Action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work are backed out and locks released. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2203 is sent to the terminal end user if possible, and message DFHAC2233 is sent to transient data destination CSMT.

User Response: Any updates performed by the unit of work are backed out. There is a danger that recoverable resources will be inconsistent with the coordinator system if the coordinator system has committed. If the reason for the failure is the first of those listed above and if you wish CICS to ensure that data integrity is maintained, change the indoubt transaction definition to specify WAIT(YES) so that CICS automatically handles indoubt failures and resynchronizes the unit of work when the link to the coordinator system is reestablished.

Module: DFHAPAC

ASPQ

Explanation: During phase 2 of the two phase syncpoint protocol an error occurred while communicating with a remote system. The error occurred after the recoverable resources were committed or backed out, so data integrity is not in danger.

System Action: The transaction is abnormally terminated. Recoverable resources updated by the unit of work will have backed out or committed depending on the decision taken by the recovery manager (RM) domain, which was not influenced by this later problem. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2221 is sent to the terminal end user if possible, and message DFHAC2251 is sent to transient data destination CSMT.

User Response: Refer to earlier messages issued by the communication or remote resource management components of CICS to determine the cause of the intersystem communication problem.

Module: DFHAPAC

ASPR

Explanation: Intersystem communication failed while a syncpoint was being taken. Communication with the coordinator system has been interrupted, and the failure occurred during the critical indoubt period of syncpoint processing. As a result this CICS system is in doubt as to the outcome of the unit of work for the transaction.

However, this CICS system has not updated any recoverable resources in the unit of work and hence does not require the unit of work to be shunted to await resynchronization of its resources later. The coordinator system commits or backs out its resources. No resources on this system need to be kept in step.

This error can occur with external resource managers connected to CICS via the resource manager interface (RMI) as well as CICS systems connected via LU 6.2, and MRO. If an external resource manager such as DB2 is the only recoverable resource updated in the transaction, the recovery manager (RM) domain can optimize the syncpoint protocol. In this instance, the external resource manager becomes the syncpoint coordinator. If the link to the external resource manager is lost during this time, CICS will be indoubt as to whether the external resource manager updates were committed or backed out.

System Action: The transaction is abnormally terminated. There are no recoverable resources affected in this CICS system. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2222 is sent to the terminal end user if possible, and message DFHAC2252 is sent to transient data destination CSMT.

User Response: Refer to messages on the remote system to determine if the remote resources were backed out or committed.

Module: DFHAPAC

ASP1

Explanation: Intersystem communication failed while a syncpoint was being taken. Communication with the coordinator system has been interrupted, and the failure occurred during the critical indoubt period of syncpoint processing. As a result this CICS system is in doubt about the outcome of the unit of work for the transaction.

Alternatively, a transaction may have timed out while waiting for Recoverable Resource Management Services (RRMS) to provide the outcome of the unit of work, or RRMS may have failed during the critical indoubt period.

The transaction definition specifies WAIT(YES) as an indoubt attribute. Therefore the unit of work is not completed but is shunted and allowed to wait for resynchronization with the coordinator system. If the WAITTIME attribute is specified on the transaction definition, the unit of work waits for the specified time. If after that time the coordinator system has not resynchronized, a unilateral decision is made about the unit of work as specified by the ACTION keyword on the transaction definition. A WAITTIME of zero, the default, means an indefinite wait. The unit of work can also be forced to take a unilateral decision by means of a CEMT SET UOW command.

System Action: The transaction is abnormally terminated. The EXEC CICS HANDLE ABEND command cannot handle this abend.

The associated unit of work is shunted awaiting the return of the coordinator system. Recoverable resources updated by the unit of work remain locked. The locks are released when the unit of work is backed out or committed at resynchronization time, or when a unilateral decision is made by this system.

Message DFHAC2201 is sent to the terminal end user if possible, and message DFHAC2231 is sent to transient data destination CSMT.

User Response: None. Any updates performed by the unit of work are resolved automatically when resynchronization with the coordinator system takes place.

Alternatively, the user can force resolution of the updates independently of the coordinator system by making a CEMT request to commit or back out the unit of work.

Module: DFHAPAC

ASP2

Explanation: A syncpoint has been attempted when an intersystem conversation is in a state in which the EXEC CICS SYNCPOINT command is not allowed.

System Action: The task is abnormally terminated with a CICS transaction dump which includes terminal control information. In particular, the dump contains state information for the links used by this transaction. The EXEC CICS HANDLE ABEND command cannot handle this abend.

User Response: Ensure that the application issues an EXEC CICS SYNCPOINT command only when its sync level 2 conversations are in the correct state. The EXEC CICS

SYNCPOINT command may be issued only when each conversation is in one of the following states:

SEND
PEND-RECEIVE (Not for MRO)
PEND-FREE
SYNC-RECEIVE
SYNC-SEND (Not for MRO)
SYNC-FREE

Module: DFHAPAC

ASP3

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote. During the syncpoint protocol the remote coordinator has decided that the unit of work cannot be committed and must be backed out.

This error can occur with external resource managers connected to CICS via the resource manager interface (RMI) as well as CICS systems connected via LU 6.2, and MRO. If an external resource manager such as DB2 is the only recoverable resource updated in the transaction, the recovery manager (RM) domain can optimize the syncpoint protocol. In this instance, the external resource manager becomes the syncpoint coordinator. In this instance if the external resource manager returns with a backed out response, an ASP3 abend results.

System Action: The transaction is abnormally terminated and recoverable resources updated by the unit of work are backed out. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2220 is sent to the terminal end user if possible, and message DFHAC2250 is sent to transient data destination CSMT.

User Response: Refer to the remote coordinator system to determine why the unit of work was backed out.

Module: DFHAPAC

ASP7

Explanation: A resource manager involved in syncpoint protocols has replied 'No' to a request to 'Prepare'. The resource manager may be local to this CICS system, or may be a remote resource manager on another CICS system, or an external resource manager communicating through the resource manager interface (RMI).

System Action: CICS terminates the transaction abnormally. Recoverable resources updated by the unit of work are backed out. The EXEC CICS HANDLE ABEND command cannot handle this abend.

If it is a local resource manager that has voted no, message DFHAC2218 is sent to the terminal end user if possible, and message DFHAC2248 is sent to transient data destination CSMT.

If it is a remote resource manager that has voted no, message DFHAC2219 is sent to the terminal end user if possible, and message DFHAC2249 is sent to transient data destination CSMT.

User Response: This abend is caused by a prior problem. For example, the resource manager cannot flush its buffers because of an I/O error, or it cannot communicate with CICS because of a TP failure. Correct the earlier problem.

Module: DFHAPAC

ASP8

Explanation: The transaction requested syncpoint rollback, but was using a type of processing for which syncpoint rollback is not supported.

System Action: CICS terminates the transaction abnormally. The EXEC CICS HANDLE ABEND command cannot handle this abend.

Message DFHAC2217 is sent to the terminal end user if possible, and message DFHAC2247 is sent to transient data destination CSMT.

User Response: This error may be an application error or a configuration error. Some communication sessions, (for example, LU6.1) do not support syncpoint rollback, and if CICS detects such a session during rollback processing, the task is abended. This restriction is described in the *CICS Intercommunication Guide*. To resolve the problem, either:

- Change the application so that it does not issue syncpoint rollback commands while the non-supporting sessions are allocated, or
- Change the configuration so that either APPC or MRO sessions are used for communication. These are the only two session types which support syncpoint rollback.

Alternatively, following a session failure during a previous syncpoint, CICS may have decided to rollback this unit-of-work in order to preserve data integrity. Since the unit-of-work contains a session which does not support syncpoint rollback, this abend ensues. In this case, no action is required in response to this abend, although action may be requried to deal with the original failure.

Module: DFHAPAC

ASP9

Explanation: The transaction requested syncpoint via EXEC CICS SYNCPOINT, but this is not allowed in a transaction that is acting on behalf of an Activity.

System Action: CICS terminates the transaction abnormally. EXEC CICS HANDLE ABEND command cannot handle this abend.

User Response: The error indicates an invalid attempt to syncpoint the transaction.

Module: DFHEISP

ASQA

Explanation: The CLS2 transaction was processing resynchronization work but the communications session which it was using has failed.

System Action: The work is reexecuted on a new session. If reexecution has has already been attempted, the transaction terminates.

User Response: The error may be caused by the failure of several sessions between communicating systems during the resynchronization process. To confirm this, examine the CSMT transient data queue for the relevant period.

Another cause could be logic errors within the resynchronization program, either on this system or on the partner system, which caused the session to be terminated. In this case, CSMT transient data messages indicate the nature of the error.

Module: DFHCRRSY

ASQB

Explanation: The CLS2 transaction was executing exchange log names or resynchronization with a remote system when a logic error occurred.

System Action: The transaction is abnormally terminated with a transaction dump.

Message DFHRS2158 may also be issued.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRRSY

ASQC

Explanation: The CLS2 transaction was attached with an unexpected start code. The transaction can be attached due to terminal input (on a communications session), or via a system attach. Neither of these methods was used.

System Action: The transaction is abnormally terminated.

User Response: The error indicates an invalid attempt to start the transaction.

Module: DFHCRRSY

ASQD

Explanation: The CLS2 transaction was attached but could not use the transaction manager interface to obtain input parameters.

System Action: The transaction is abnormally terminated.

User Response: The error indicates a failure in the transaction manager. See the exception trace entries produced by the transaction managed to determine the reason for the error.

Module: DFHCRRSY

ASQG

Explanation: The CLS2 transaction was executing resynchronization work and has failed during the receipt of data from remote system via an MRO session. The data was longer than expected.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: The abend indicates a CICS logic error, possibly in the remote system. The transaction storage in the dump shows the data received. The transaction trace shows the preceding flows between the systems, which should match those documented in the *SNA LU6.2 Reference: Peer Protocols* manual, SC30-6808.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRRSY

ASQH

Explanation: The CLS2 transaction was executing resynchronization work and has failed during the receipt of data from remote system via an MRO session. The data was shorter than the minimum length expected.

System Action: The transaction is anormally terminated with a transaction dump.

User Response: This indicates a CICS logic error, possibly in the remote system. The transaction storage in the dump shows the data received. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRRSY

ASQI

Explanation: The CLS2 transaction was executing the exchange lognames process as part of the initialization sequence for an APPC connection. An attempt to invoke the CICS recovery manager to save a logname failed.

System Action: The transaction is abnormally terminated with a transaction dump.

Message DFHRS2157 may also be issued.

User Response: This indicates an error in the CICS recovery manager which has produced its own exception trace records. Look at the trace records and the CSMT message log for further information about the error.

Module: DFHCRRSY

ASQK

Explanation: The CLS2 transaction was processing exchange lognames or resynchronization for a connected partner identified by a netname. The connection entry associated with the netname was located and locked, but could not be unlocked in subsequent processing. This indicates a CICS internal logic error.

System Action: The transaction is abnomally terminated with a transaction dump.

Message DFHRS2156 may also issued.

User Response: This indicates an error either in the CICS table manager, (which may have produced its own exception trace records) or in the resynchronization program itself. Look at the trace records and the CSMT message log for further information which might have indicated an error in the table manager program or in the table entry for the connection. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRRSY

ASQL

Explanation: The CLS2 transaction was executing the resynchronization of a unit of work with a connected partner, and has locked the associated data managed by the CICS recovery manager. The invocation of the TERMINATE_RECOVERY command to unlock the data failed.

System Action: The transaction is abnormally terminated with a transaction dump.

Message DFHRS2154 is also issued.

User Response: This indicates an error either in the CICS recovery manager (which may have produced its own exception trace records) or in the resynchronization program itself. Look at the trace records and the CSMT message log for further information. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRRSY

ASQM

Explanation: A CICS internal logic error has occurred in the management of dynamic storage for the resynchronization program.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: This indicates that the resynchronization program has exhausted the available space for recording storage areas. The symptoms may indicate that the program was looping without executing the error recovery process. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCRRSY

ASRA

Explanation: The task has terminated abnormally because of a program check.

System Action: The task is abnormally terminated and CICS issues either message DFHAP0001 or DFHSR0001. Message DFHSR0622 may also be issued.

User Response: Refer to the description of the associated message or messages to determine and correct the cause of the program check.

Module: DFHSRP

ASRB

Explanation: An operating system abend has occurred and CICS has been able to abend the current transaction.

System Action: The task is abnormally terminated and CICS issues either message DFHAP0001 or DFHSR0001

User Response: Refer to the description of the associated message to determine the cause of the original operating system abend, and take the necessary corrective action.

Module: DFHSRP

ASRD

Explanation: The task has been abnormally terminated for one of these reasons:

- A program contains an assembler macro call which is no longer supported by CICS.
- An invalid attempt has been made to access the CSA or TCA. This abend could be caused by an attempt to address the CSA through OS/VS COBOL BLL cells. For example:

  When an OS/VS COBOL program is invoked by CICS for MVS, CICS inserts the address of the fetch-protected dummy CSA into the first of the application-managed BLL cells. If an attempt is made to access this storage before the application has reinitialized the BLL cell, abend ASRD will occur.
- A non-assembler program has been wrongly defined to CICS as an assembler program.

This error appears as a program check.

System Action: The task is abnormally terminated and CICS issues message DFHSR0618, followed by either DFHAP0001 or DFHSR0001.

User Response: Refer to the description of the associated messages to determine and correct the error.

It is likely that either R12 which usually addresses the TCA or R13 which usually addresses the CSA is pointing to an area of storage that you are not allowed to access.

For more infomation about OS/VS COBOL BLL cells and associated problems, see the *CICS Problem Determination Guide*

Module: DFHSRP

ASRE

Explanation: The task has been abnormally terminated because an attempt has been made to access a CICS-DB2 RCT load module.

The RCT nolonger exists as a load module and cannot be accessed directly.

To access information held in the RCT use the CICS SPI commands EXEC CICS INQUIRE/SET DB2CONN, EXEC CICS INQUIRE/SET DB2ENTRY and EXEC CICS INQUIRE/SET DB2TRAN.

This error appears as a program check.

System Action: The task is abnormally terminated and CICS issues message DFHSR0619, followed by either DFHAP0001 or DFHSR0001.

User Response: Change the application to use the CICS SPI commands to retrieve data from, or set fields in, the RCT.

Module: DFHSRP

ASRK

Explanation: The AP domain recovery stub, DFHSR1, has been invoked to deal with a program check, operating system abend, or another error within a transaction environment. However, DFHSR1 has been unable to call the system recovery program, DFHSRP, because register 12, which should be pointing to the task control area (TCA), is null. This indicates that the caller of DFHSR1, has not set the address of the TCA..

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHSR1

ATCA

Explanation: The system was in a final quiesce mode when the CICS application program issued a DFHTC macro.

System Action: The task requesting the I/O is abnormally terminated with a CICS transaction dump.

User Response: None.

Module: DFHZARQ

ATCB

Explanation: The CICS application program issued two consecutive DFHTC writes or two consecutive DFHTC reads, but in either case did not issue an intervening wait.

Problem Determination: A transaction dump is provided with this abend. In the dump, register 12 addresses the current TCA, and register 10 and the field TCAFCAAA address the TCTTE associated with this task. In TCATPOS2, bit TCATPOWR (X'01') indicates that a write is requested by the DFHTC macro, and bit

TCATPORR (X'10') indicates that a read is requested. In TCTTEOS, bit TCTTEOWR (X'01') indicates that a write is in progress, and bit TCTTEORR (X'10') indicates that a read is in progress.

Analysis:

Register	Label	Description
R10=@TCTTE R12=@TCA	TCZARQ05 (TCZAQ1W)	Bit TCATPOWR is on in byte TCATPOS2, and bit TCTTEOWR is on in byte TCTTEOS.
R10=@TCTTE R12=@TCA	TCZARQ05 (TCZAQ2W)	Bit TCATPOWR is on in byte TCATPOS2, and bit TCTTEORR is on in byte TCTTEOS.
R10=@TCTTE R12=@TCA	TCZARQ12	Bit TCATPORR is on in byte TCATPOS2, and bit TCTTEORR is on in byte TCTTEOS.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Take corrective action within the program being executed.

This is almost certainly an application program error. Determine the flow of control through the application and determine why an intervening wait is not issued. The trace table may be useful to discover where the application is issuing the read and write requests. If necessary, start trace or auxiliary trace using the master terminal command and rerun the transaction to obtain a trace. The output of the auxiliary trace can be printed using the trace utility program, DFHTU520.

Module: DFHZARQ

ATCC

Explanation: An application program, using a pipeline session, has either issued more than one write request or issued a read request.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Correct the application program so that it will not issue more than one consecutive WRITE to a pipeline session terminal.

Module: DFHZARQ

ATCD

Explanation: This abend code is used whenever a CTYPE request or a QUEUE request is issued and VTAM or a ZCP function has not been included in the system.

It is also used to abend a task that issues an APPC command when the CICS system is not at a level to support APPC.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Correct the transaction so that it does not issue a CTYPE macro instruction if VTAM is not generated into the system, or include the ZCP function for which the CTYPE or QUEUE request was issued.

Modules: DFHZDSP, DFHZERH

ATCE

Explanation: A CICS application program has issued a DFHTC request without specifying the address of a TIOA, but the request is not an ERASE ALL UNPROTECTED or a READBUF request for a 3270 data stream terminal.

Problem Determination: A transaction dump is provided with this abend. In the dump, register 12 addresses the current TCA, and register 10 and the field TCAFCAAA addresses the TCTTE associated with this task. Register 8 and TCTTEDA should contain the address of the TIOA to be used in the I/O request, but actually they contain zero. For a 3270 data stream terminal, byte TCTETDST has bit TCTETTSI (X'01') set. An erase-all-unprotected request is indicated by the setting of bit TCTTEEUI (X'40') in byte TCTTEEUB, and a read buffer request is indicated by the setting of bit TCTTERBI (X'80') in byte TCTTERBB. **Analysis:**

Register	Label	Description
R10=@TCTTE	TCZARQ41	NIOABAR (register 8) contains zero.
R8=0		Register 8 has been loaded field TCTTEDA of the TCTTE associated with this task.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Correct the error in the user program by ensuring that a terminal input/output area (TIOA) is provided at write time.

This is almost certainly an application program error. Determine the flow of control through the application and determine why a TIOA has not been specified.

Module: DFHZARQ

ATCF

Explanation: A DFHTC CTYPE macro was issued to a non-VTAM terminal control table terminal entry (TCTTE), or a DFHTC CTYPE=COMMAND or RESPONSE macro was issued to a VTAM 3270 TCTTE.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Ensure that the program issues CTYPE macros to VTAM terminals only, and does not issue CTYPE=COMMAND or RESPONSE to a VTAM 3270.

Module: DFHZCRQ

ATCG

Explanation: A CICS application program has issued a DFHTC request for a terminal that it does not own. The problem of ownership may be because the task previously issued a WRITE,LAST request (which would have detached the terminal from that task) or because the task incorrectly specified the terminal to which the request is directed.

Problem Determination: Register 12 addresses the current TCA and register 10 contains the address of the TCTTE. The address of the TCTTE was obtained either from TCAFCAAA in the case of a non-ISC transaction, or from TCATPTA if bit TCATPTTA (X'40') is on in byte TCATPOC3 (this indicates that TERM=YES was specified on the DFHTC request and that this is an ISC transaction). In the TCTTE thus located, the field TCTTECA does not contain the address of the TCA, indicating that this TCA is not owned by this task.

Analysis: A DFHTC request has been issued specifying a TCTTE in which the field TCTTECA does not contain the address of the TCA.

```
Register    Label     Description

R10=@TCTTE  TCZARQ05  TCTTECA is not equal
                      to register 12.
```

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This is most probably an application error (unless storage has been completely overwritten). Determine the flow from the trace table and when a request to the DFHZCP detach routine, DFHZDET, or a DFHTC WRITE,LAST was issued.

Module: DFHZARQ

ATCH

Explanation: The task was purged before a domain call was able to complete successfully. The task that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction, or by CICS issuing a purge request.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

When CICS purges a task, it does so to allow an operation to complete which would be held up by the presence of active tasks, or to ensure data integrity. For example, CICS will purge a task which has made recoverable updates to a coupling facility data table if it determines that the coupling facility data table server for the pool in which that table resides has recycled, to ensure that all updates in the unit of work will be backed out.

Modules: DFHBSM62 DFHBSS DFHBSSZ DFHBSTZ DFHBSTZV DFHBSTZ1 DFHBSTZ2 DFHTBSB DFHTBSBP DFHTBSD DFHTBSDP DFHTBSL DFHTBSLP DFHTBSQ DFHTBSR DFHTBSRP DFHTBSSP DFHTCRP DFHTOASE DFHTOATM DFHTOLCR DFHTOLUI DFHTRZCP DFHTRZIP DFHTRZPP DFHTRZXP DFHTRZYP DFHTRZZP DFHZCQCH DFHZCQDL DFHZCQIQ DFHZCQIS DFHZCQRS DFHZCQ00 DFHMRXM DFH62XM

ATCI

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to module DFHRTSU. The module that detected the original error provides an exception trace, a console message and, possibly a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the module that detected the original error.

Modules: DFHZSUP DFHMRXM DFH62XM

ATCJ

Explanation: This abend is issued by DFHZATA in the following circumstances:

- Transaction CATA is issued from a terminal
- The address of the AWE (TCAFCAAA) is 0
- The AWE is invalid (TCTWETYP should be TCTTEAWE)
- An abend is issued early in DFHZATA.

This abend is issued by DFHZATD in the following circumstances:

- Transaction CATD is issued from a terminal
- The address of the AWE (TCAFCAAA) is 0
- TCAFCAAA is an AWE and not a terminal
- An abend is issued early in DFHZATD.

This abend is issued by DFHZATR in the following circumstances:

- Transaction CATR is issued from a terminal
- An abend is issued early in DFHZATD.

System Action: CICS rejects the request.

User Response: Determine the issuing program and the reason for the abend and take the appropriate action as follows:

Do not try to invoke CATA, CATD or CATR from a terminal.

If the address in TCAFCAAA is incorrect, the calling mechanism has failed. This is a CICS logic error.

If an abend has been issued, use the transaction dump to determine where the abend occurred. This is a CICS logic error.

Modules: DFHZATA DFHZATD DFHZATR

ATCK

Explanation: An application program has issued a WRITE to a VTAM terminal specifying CCOMPL=NO without being authorized to do so.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Specify CHAINCONTROL in the transaction profile.

Module: DFHZARQ

ATCL

Explanation: An error has occurred either during automatic journaling or automatic logging of terminal messages to or from this transaction. The message being logged will be one associated with an explicit READ or WRITE in the application program.

Problem Determination: Register 12 addresses the current TCA and field TCAJCAAD and register 4 address the JCA. The log manager request is contained in JCATR2 and the response code is in JCAJCRC.

Possible request codes are:

```
X'8001' - WRITE
X'8003' - PUT
```

Possible response codes are:

```
X'01' - IDERROR - Journal identification error
X'02' - INVREQ  - Invalid request
X'03' - STATERR - Status error
X'05' - NOTOPEN - Journal not open
X'06' - LERROR  - Journal record length error
X'07' - IOERROR - I/O error.
```

The address of the TIOA is contained in register 8 and its data length is in TIOATDL.

Analysis:

Register	Label	Description
R4=@JCA	TCZARQPJ	JCAJCRC is nonzero.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the dump to ascertain why the journal or log record could not be written correctly. If a journal record length error is indicated, TIOATDL may have been corrupted.

Modules: DFHETL, DFHTCPCM, DFHZARQ

ATCN

Explanation: An error has occurred during the automatic journaling or automatic logging of the initial input message of this transaction. This input message is the message that actually caused the transaction to be invoked.

Problem Determination: Register 12 addresses the current TCA and field TCAJCAAD and register 4 address the JCA. The log manager request is contained in JCATR2 and the response code is in JCAJCRC.

Possible request codes are:

```
X'8001' - WRITE
X'8003' - PUT
```

Possible response codes are:

```
X'01' - IDERROR - Journal identification error
X'02' - INVREQ  - Invalid request
X'03' - STATERR - Status error
X'05' - NOTOPEN - Journal not open
X'06' - LERROR  - Journal record length error
X'07' - IOERROR - I/O error.
```

Analysis:

Register	Label	Description
R4=@JCA	TCZARQJP	JCAJCRC is nonzero.
	TCZSUPJW	Journal error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the dump to ascertain why the log record could not be written correctly. For a guide to analyzing the dump, see abend code ATCM.

If a journal record length error is indicated, TIOATDL (X'08') may have been corrupted.

Modules: DFHZSUP DFH62XM DFHTFXM

ATCO

Explanation: An application program has attempted to perform a function not supported by a terminal or system.

Possible errors are:

1. **SIGNAL not supported**.

   A DFHTC TYPE=SIGNAL request with the WAIT=YES option was issued to a VTAM logical unit that CICS does not support for the receipt of the SIGNAL indicator.

2. **WRITE STRUCTURED FIELD not supported**.

   This write may have been attempted as a result of a SEND command with the STRFIELD keyword to a device that does not support this function.

3. **APPC mapped conversation not supported**.

   The application has attempted to perform a normal terminal control command on a session that is in use for an APPC unmapped conversation. (Only EXEC CICS GDS commands are permitted.)

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Correct the application program.

Module: DFHZARQ

ATCQ

Explanation: The application program issued a write operation to a terminal that was in send status. In order to allow this write to proceed, a signal command was sent, and DFHZCP started to read data from the terminal waiting for the change direction indication. As each data record is received, it is placed on temporary storage and, for one of these operations, a temporary storage error has occurred.

Problem Determination: Register 12 addresses the current TCA. TCACCSV1 contains a saved copy of TCATSTR containing the temporary storage response code. The temporary storage response code may be one of:

```
X'04' - IOERROR - I/O error
X'08' - NOSPACE - No temporary storage space
X'20' - INVREQ  - Invalid request.
```

The temporary storage identification is constructed by concatenating the character string “DFHQ” with the terminal identification from TCTTETI. The temporary storage identification is placed in TCATSDI.

Register 8 and field TCTTEDA address the TIOA that is being written to temporary storage. The address passed to temporary storage is that of TIOATDL.

Analysis: After the DFHTS TYPE=PUTQ, the temporary storage response code was not zero.

Register	Label	Description
R12=@TCA	ZRAQ60	TCATSTR is nonzero.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Check that temporary storage has been included in the system and that it has sufficient space.

If an invalid request is indicated, check that the length of the data being written to temporary storage is not greater than the VSAM control interval size minus 84. The length of the data is in TIOATDL (which is 8 greater than the length of the data that is read in by DFHZCP).

Module: DFHZRAQ

ATCR

Explanation: An application program has issued a read operation, after a previous write operation has caused DFHZCP to read-ahead data from the terminal in order to avoid a lock-out. DFHZCP has now issued a DFHTS GETQ to retrieve the saved data from temporary storage, and an error has occurred.

Problem Determination: Register 12 addresses the current TCA. TCACCSV1 contains a saved copy of TCATSTR that contains the temporary storage response code. The temporary storage response code may be one of:

```
X'01' - ENERROR - Entry error
X'02' - IDERROR - Identification error
X'04' - IOERROR - I/O error
X'20' - INVREQ  - Invalid request
```

The temporary storage identification is constructed by concatenating the character string “DFHQ” with the terminal identification from TCTTETI. The temporary storage identification is placed in TCATSDI.

Analysis: After the DFHTS TYPE=GETQ, the temporary storage response code was not zero.

Register	Label	Description
R12=@TCA	ZRAR90	TCATSTR is not zero.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Determine the cause of the temporary storage error and correct it.

If a temporary storage identification error is indicated, examine TCTTETI for a valid terminal identification.

Module: DFHZRAR

ATCS

Explanation: An application program attempted to send data to a logical unit after a SIGNAL data flow command with an RCD (request change direction) has been received. This condition arises when the application handles the IGREQCD exceptional condition incorrectly.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Handle the IGREQCD exceptional condition correctly.

Module: DFHZARQ

ATCT

Explanation: An attempt to build a surrogate TCTTE to represent a remotely-owned terminal failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZSUP DFHMRXM DFH62XM

ATCU

Explanation: An application program attempted to send data to a logical unit, but was in receive mode (EIBRECV is set), and read-ahead queuing was not specified in installed profile definition (RAQ=NO).

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Either change the application program to issue receives until EIBRECV is not set, or specify RAQ=YES in the installed profile definition (If RAQ=YES is specified, ensure that all input messages are read before the transaction is terminated.)

Module: DFHZARQ

ATCV

Explanation: An application attempted an operation on a logical unit, but was not in the correct mode for one of the following reasons:

1. When issued by DFHZARQ, CICS cannot perform the current request because another request is outstanding (EIBSYNC is set). This holds for APPC or non-APPC systems
2. When issued by DFHETL, the application is communicating with an APPC system, and is not in the correct state to perform the attempted operation. This holds for APPC systems only
3. When issued by DFHZISP, a TCTTE free was requested, and there is an outstanding sync point request. This holds for non-APPC systems only
4. When issued by DFHZISP, a TCTTE free was requested, the TCTTE is in receive mode, and RAQ=NO was specified in the installed profile definition. This holds for non-APPC systems only.

Problem Determination: Register 12 addresses the current TCA. Register 10 and field TCAFCAAA address TCTTE. The terminal byte TCTTECRE has bit TCTEUCOM (X'02') set if sync point is required, and TCTEUFRT (X'04') set if Free Session is required; TCTESMDI has TCTEUSMD (X'02') set if the application is in SEND mode. TCTERCVI has TCTEURCV (X'01') set if the application is in RECEIVE mode. Bit TCTESRAQ (X'80') in byte TCTEIRAQ indicates that read-ahead queuing is coded on the installed profile definition for this transaction.

The type-of-request bits in the TCA are set as follows:

- TCATPOS1 TCATPIS (X'01') Signal requested.
  - TCATPFRE (X'03') Free TCTTE.
- TCATPOS2 TCATPORR (X'10') Receive requested.
  - TCATPOWR (X'01') Send requested.

Analysis:

Number	Label	Description
DFHZARQ		
1.	TCZAQW8	Attempting to receive when sync point or Free Session outstanding.
2.	TCZAQ2W	Attempting to send while in receive mode.
3.	ZARQNOPG	Issuing SIGNAL while in send mode.
DFHZISP		
4.	ZISPVTCK	Attempting to free session while sync point request is outstanding.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: The response depends on the reason for the error as follows:

1. Issue a sync point and then issue the request.
2. Issue the free request and reallocate the session.
3. Either change the application to issue receives until EIBRECV is not set, or specify RAQ=YES in the installed profile definition. (If you specify RAQ=YES in the installed profile definition, ensure that all input messages are read before the transaction is terminated.)
4. See the *CICS Distributed Transaction Programming Guide* where rules for the correct use of commands are given. Then correct the application.

The application program has attempted an operation on a logical unit that is invalid, because the program's current status on the session with that logical unit does not permit it. An investigation of the TCTTE (that is, Session), status bytes, and TCA type of request bytes will reveal which of the above problems are relevant.

When the cause of the problem has been ascertained, the application program should be changed to ensure that the session-oriented information is acted upon before any further requests are sent across that session. The session status information is made available to the application program in the exec interface block (EIB) immediately following the execution of RECEIVE, CONVERSE, or RETRIEVE requests across the session. The relevant bytes must be tested, strictly in the order shown, and acted upon, before any further operations are attempted on the session. In addition, the status information bytes themselves are necessarily volatile in that they are reset before the execution of every EXEC CICS... statement. Thus it is good programming practice to save them into application user storage after a RECEIVE, CONVERSE, or RETRIEVE for later testing. The states are:

1. EIBSYNC the application must take a syncpoint

2. EIBFREE the application must free the session (or terminate when the session will be freed automatically)

3. EIBRECV the application must continue receiving data by issuing further RECEIVE commands; by definition, data cannot be sent while in this state.

Some of these status tests can sometimes be omitted (for example, testing of the EIBSYNC status is not essential if it is known that the application program on the remote system never issues sync point requests itself). However, the tests should always be carried out, particularly if the remote application might be amended at a future date, in which event the session handling logic may well be altered. Also, it may be that the remote transaction itself causes an unsuspected flow on the session. For example, if the remote program issues EXEC CICS SEND..... LAST across the session, followed by RETURN, a syncpoint request (RQD2) will be added onto the transmitted data. (The application programmer is referred to the *CICS Distributed Transaction Programming Guide* for a discussion of this topic). As a result of this addition, an unsuspected syncpoint request is received by the local application, which abend if the session is freed without the sync point request being honored.

Note: An ATCV abend is also raised by module DFHETL if a state error occurs during processing of an APPC mapped application (that is, the program attempts to perform an operation while in the wrong state). The handling of APPC mapped applications is described in the *CICS Diagnosis Reference*. Some commands are processed by DFHZARQ, as above, and others by various other modules invoked by DFHETL. Rules for using commands for APPC are given in the *CICS Distributed Transaction Programming Guide*. Reference to this guide should reveal the programming error.

Modules: DFHETL, DFHZARQ, DFHZISP

ATCW

Explanation: The system has been generated without an installed profile definition for an LU6.1 or APPC session.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer of the error.

Modules: DFHZSUP DFHMRXM DFH62XM

ATCX

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

An application program that issues terminal control requests after an ATCX abend may cause further problems.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Modules: DFHBSMIR, DFHBSMPP, DFHBSM62, DFHBSS, DFHBSTB, DFHBSTB3, DFHBSTC, DFHBSTZ, DFHBSTZB, DFHBSTZO, DFHBSTZR, DFHBSTZV, DFHBSTZ1, DFHBSTZ2, DFHBSZZS, DFHAPRT, DFHCRP, DFHQRY, DFHZARL, DFHZARQ, DFHZERH, DFHZGET, DFHZFRE, DFHZNAC, DFHZRVS, DFHZSUP, DFHMRXM, DFH62XM DFHZTSP, DFHZXST

ATCY

Explanation: An error has occurred during the processing of an inbound function management header (FMH). Either a length error has been detected, for example, incomplete FMH received, or an invalid field has been detected within the FMH.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer of the error. The problem is probably in the remote system that has sent the invalid FMH.

If the inbound FMH is from a system with an earlier release of CICS then you may need to set USEDFLTUSER. See 'Attach Time Security and the USEDFLTUSER option' in chapter 12 of the *CICS RACF Security Guide*.

Modules: DFHZARQ, DFHZSUP DFHMRXM DFH62XM

ATCZ

Explanation: An error (INVALID, DISASTER or EXCEPTION response) has occurred on the SET_NETWORK_IDENTIFIER call to the security domain as part of opening the CICS VTAM ACB (for example, EXEC CICS SET VTAM OPEN or CEMT SET VTAM OPEN). The domain that detected the original error provides an exception trace, a console message, and depending on the options specified in the dump table, a system dump.

System Action: The task is abnormally terminated with a CICS transaction dump. The VTAM ACB is closed.

User Response: Use the dump, the trace and the console message to diagnose and correct the original error. Retry the command when the earlier error is resolved.

Module: DFHZSLS

ATC1

Explanation: The CICS terminal control restart task could not complete because a necessary step failed. The task has done some essential recovery operations and abnormally terminated itself with code ATC1.

System Action: CICS writes a transaction dump for the terminal control restart task.

CICS sends two messages to the console, one to identify the error detected by the terminal control restart task, and DFHTC1001 to report that the task has failed. A third message follows either to say that CICS has terminated abnormally with a dump, or to ask you to reply GO or CANCEL. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

User Response: First, if CICS has requested a response, you must reply. If you reply 'GO', CICS continues processing, but without terminal control. If you reply 'CANCEL', CICS terminates abnormally with a dump.

Use the messages and dumps to find out the cause of the failure.

Module: DFHTCRP

ATC2

Explanation: A CICS SET VTAM OPEN command has failed due to VTAM rejecting a CICS request.

System Action: Message DFHZC2302, DFHZC2304 or DFHZC2307 is sent to the console, and CICS terminates the transaction abnormally with a transaction dump.

User Response: The RPL with the VTAM request code and return code can be found in the RA pool addressed from TCTVRVRA. Use the *VTAM Programming* manual, to determine the cause of the error and the actions necessary to correct it. After correcting the error, either retry the request or terminate CICS and restart the network in your own time.

Module: DFHZSLS

ATC3

Explanation: A write to a TLX device was issued with a data length of 0 causing TIOA data length (TIOATDL) to be 0.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Correct the error in the user program by ensuring that a data length for data to be placed in the Terminal Input/Output area (TIOA) is provided at write time.

Module: DFHZARQ

ATC4

Explanation: A serious CAVM error has occurred. The XRF TCB has abended.

System Action: CICS abnormally terminates with a system dump.

User Response: Use the dump and the guidance in any messages issued by other system components to diagnose and correct the original error.

See the *CICS Problem Determination Guide* for further guidance on using system dumps.

Module: DFHTCRP

ATC5

Explanation: An internal logic error has been detected during APPC mapped processing. The conversation state maintained by DFHZARL does not match the state which is jointly maintained by DFHETL and DFHZARM.

This problem could also arise when CICS is receiving application data. CICS may receive and end of chain notification before receiving all the data expected.

System Action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHETL

ATC6

Explanation: DFHETL has a SEND DATA request with a data length greater than 65 528 bytes which is the maximum that it can process.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This is a CICS internal logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHETL

ATC7

Explanation: DFHZSUP has detected a bad response from an INITIAL-CALL request to DFHZARL. This response is returned to DFHZSUP in the DFHLUC parameter list.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Examine field LUCCDRCD in the DFHLUC parameter list. This appears in the ENTRY/EXIT trace points for DFHZARL. If trace is switched off, then it can be found in DFHZSUP's LIFO entry in the transaction dump.

- LUCCDRCD = 'A0000100' - session failure
- LUCCDRCD = 'A0010100' - read timeout
- LUCCDRCD = 'A0010000' - deadlock timeout.

(The offset for LUCCDRCD can be found in *CICS Data Areas*).

If LUCCDRCD is X'00000000', the error is the result of a connection failure. In this case examine the CSMT log for further diagnostic information.

Module: DFHZSUP

ATC8

Explanation: An error has occurred during the processing of an inbound function management header (FMH). Either a length error has been detected, for example, incomplete FMH received, or an invalid field has been detected within the FMH.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer of the error. The problem is probably in the remote system that has sent the invalid FMH.

Module: DFHETL

ATC9

Explanation: A DFHKC RESUME macro call has been issued for a task without first issuing DFHKC SUSPEND. DFHKC RESUME must be preceded by DFHKC SUSPEND.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Examine the trace entry to locate the error.

Module: DFHZNCE

ATDC

Explanation: A transaction has issued an EXEC CICS READQ, WRITEQ or DELETEQ command against a logically recoverable transient data queue. The task was enqueued because another task currently owns the enqueue. While waiting to obtain the enqueue, the task was purged.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the transaction was purged. It may have been purged via CEMT or automatically, by DTIMEOUT for example.

Module: DFHETD

ATDY

Explanation: Transient data initialization has failed. A console message, DFH12*xx*, gives the reason for the failure.

System Action: Transient data initialization terminates abnormally. This abend is always followed by an ATDZ abend for the failing function, and by message DFHSI1521 (if CICS abends unconditionally), or message DFHSI1522, which prompts you to reply GO or CANCEL.

User Response: See the associated console message for information regarding the cause of the failure. Then respond to message DFHSI1522, if it has been issued.

Module: DFHTDRP

ATDZ

Explanation: A CICS function invoked by transient data initialization has failed. If the failing function is a transient data routine, this abend is preceded by a console message and an ATDY abend.

System Action: Transient data initialization terminates abnormally. This abend is always followed by message DFHSI1521 (if CICS abends unconditionally), or message DFHSI1522, which asks you to reply GO or CANCEL.

User Response: Refer to the associated console message for further information regarding the cause of the failure. Then respond to message DFHSI1522, if it has been issued.

Module: DFHTDRP

ATFE

Explanation: A FREEMAIN request to the storage manager has failed while CICS was executing a CEDA CHECK or CEDA INSTALL command.

System Action: CICS abnormally terminates the task with a transaction dump.

User Response: Use the dump and any associated messages issued by the storage manager to investigate the FREEMAIN failure.

Module: DFHTOUT1

ATGE

Explanation: A GETMAIN request to the storage manager has failed while CICS was executing a CEDA CHECK or CEDA INSTALL command.

System Action: CICS abnormally terminates the task with a transaction dump.

User Response: Use the dump and any associated messages issued by the storage manager to investigate the GETMAIN failure.

Module: DFHTOUT1

ATMA

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The domain that first detected the purged condition will have provided an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction, or by CICS issuing a purge request.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

When CICS purges a task, it does so to allow an operation to complete which would be held up by the presence of active tasks.

Module: DFHTMP

ATMB

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHTMP

ATNA

Explanation: A terminal operator entered the transaction identification for NACP.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Do not reenter the NACP transaction identification (CSNE).

Module: DFHZNAC

ATND

Explanation: The node error program (NEP) or NACP decides that a task should abnormally terminate, but the task is at a critical point of processing and immediate termination would put the integrity of the system at risk.

System Action: The task is abnormally terminated with a CICS transaction dump when the task next requests any action against the terminal, or issues a sync point request involving the terminal.

User Response: Check destination CSMT for possible further information. Use the dump to determine why the task was abnormally terminated by NEP.

Modules: DFHZARQ, DFHZARL, DFHZSUP

ATNI

Explanation: There are two forms of this abend:

VTAM form
The node error program (NEP) or NACP decides the task should be abnormally terminated. DFHZNAC informs the request module to abend the transaction after the TC unit has completed.

Non-VTAM form
The terminal error program (TEP) or terminal abnormal condition program (TACP) decides the task should be abnormally terminated. DFHTACP informs DFHZARQ to abend the transaction after the TC unit has completed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: This usually occurs when, due to a hardware failure, a network device rejects the data stream sent to it. The device itself may indicate an error code that will give a specific reason for the rejection. Check the CSMT log for further information.

This abend can also result from an error in a connected system such as a mirror transaction abend.

Abend ATNI can occur if a user application does not correctly handle an error return code from an external resource manager, such as DB2.

For the NEP (VTAM) form, run a VTAM trace type=BUF for the logical unit and repeat the error.

For the TEP (non-VTAM) form, run a link trace for the line or local channel address for the device.

Examine the data stream and error response to determine the cause of the error.

This type of error occurs if the definitions in the TCT do not match the attributes of the actual device.

Modules: DFHZARL, DFHZARM, DFHZARQ, DFHZRAQ, DFHZSUP

ATOA

Explanation: You have attempted to invoke the CESC transaction with a terminal as principal facility. This is not allowed.

System Action: CICS terminates the CESC transaction. No dump is produced.

User Response: Ensure that the CESC transaction is not run against a terminal.

Module: DFHCESC

ATOB

Explanation: CICS has received an abnormal response from an EXEC CICS START TRANSACTION(CESC) request. This is caused by an internal error.

System Action: CICS terminates the CESC transaction with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCESC

ATOC

Explanation: CICS has received an abnormal response from a request to DFHZCUT to timeout a local userid table (LUIT). This is caused by an internal error in DFHZCUT.

System Action: CICS terminates the CESC transaction with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCESC

ATOD

Explanation: CICS has received an abnormal response from an EXEC CICS CANCEL TRANSACTION(CESC) request.

System Action: CICS terminates the CESC transaction with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCESC

ATOE

Explanation: CICS cannot determine the time at which an XRF takeover began.

System Action: CICS terminates the CESC transaction with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCESC

ATOF

Explanation: CICS has received an abnormal response from an EXEC CICS DELAY TRANSACTION(CESC) request.

System Action: CICS terminates the CESC transaction with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCESC

ATOG

Explanation: CICS has received an abnormal response from an EXEC CICS START TRANSACTION(CEGN) request. This is caused by an internal error.

System Action: CICS terminates the CEGN transaction with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCESC

ATOH

Explanation: An attempt has been made to invoke the CESC transaction with an invalid function code. The CESC transaction should only be invoked by CICS. Valid codes are TERM_TIMEOUT, XRF_TIMEOUT, and ENABLE_TIMEOUT.

The most likely cause of this error is an invalid attempt by a user to invoke CESC.

System Action: CICS terminates the CESC transaction with a transaction dump.

User Response: Determine how CESC was invoked. If it was invoked by CICS, you will need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCESC

ATOT

Explanation: An error has occurred in the invocation of the CEGN transaction. CEGN has issued an EXEC CICS RETRIEVE command to retrieve the CEGN parameter list. Either the EXEC CICS RETRIEVE command has failed or it has succeeded but the retrieved data is invalid.

The most likely cause of this error is an invalid attempt by a user to invoke CEGN (for example, from a terminal or via an EXEC CICS START request).

System Action: CICS terminates the CEGN transaction with a transaction dump.

User Response: Determine how CEGN was invoked. If it was invoked by CICS, you will need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCEGN

ATOU

Explanation: The CEGN transaction has attempted to issue an EXEC CICS RETURN but the command has failed.

System Action: CICS terminates the transaction with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCEGN

ATOV

Explanation: The CEGN transaction has attempted to issue an EXEC CICS GETMAIN, ASSIGN, or SEND but the command has failed.

System Action: CICS terminates the transaction with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCEGN

ATPA

Explanation: An error occurred when trying to estimate the length of a CICS message owned by the message domain.

System Action: CICS terminates the transaction with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPR.

ATPB

Explanation: An error occurred when trying to retrieve a CICS message from the message domain.

System Action: CICS terminates the transaction with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPR.

ATPC

Explanation: An error occurred when trying to estimate the length of a CICS message owned by the message domain.

System Action: CICS terminates the transaction with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPQ.

ATPD

Explanation: An error occurred when trying to retrieve a CICS message from the message domain.

System Action: CICS terminates the transaction with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTPQ.

ATPE

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction, or by CICS issuing a purge request.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

When CICS purges a task, it does so to allow an operation to complete which would be held up by the presence of active tasks.

Modules: DFHTPQ, DFHTPR.

ATPF

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error will have provided an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Modules: DFHTPQ, DFHTPR.

ATRA

Explanation: The field engineering global trap exit program, DFHTRAP, requested task abnormal termination. However, the currently active task was **not** a system task (for example, task dispatcher) and it was not about to abend.

System Action: CICS disables the trap exit so that it will not be reentered, and terminates the currently active task abnormally.

User Response: This is a user-requested task abend.

If you want to use the trap again, you must reactivate it as follows:

CSFE DEBUG,TRAP=ON

You should use the global trap exit only in consultation with an IBM support representative.

Module: DFHTRP

ATSA

Explanation: The transaction CTSD was attached other than by an internal request from the TS domain.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the CTSD transaction was started. This transaction is intended for CICS internal use only and should not be started by a user or from a terminal.

Module: DFHTSDQ

ATSB

Explanation: The transaction CTSD was attached with invalid parameters.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHTSDQ

ATSC

Explanation: The task was canceled during execution of a temporary storage command.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Investigate the reason the task was canceled. The task has been canceled by the master terminal operator or automatically by either the deadlock timeout (DTIMEOUT) mechanism or the read timeout (RTIMOUT) mechanism.

Modules: DFHEITS, DFHICP, DFHTSP

ATSD

Explanation: An INVALID or DISASTER response was received from a request to the Temporary Storage (TS) Domain.

System Action: The transaction is terminated with a CICS transaction dump.

User Response: There has been an earlier failure which lead to the response from TS. Investigate the earlier failure (which is accompanied by a console message and a system dump).

Modules: DFHEITS, DFHICP, DFHTSP

ATSP

Explanation: A task has attempted to issue a WRITEQ TS or a DELETEQ TS request for a recoverable TS queue that has already been deleted in the same unit of work.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the application to avoid issuing a WRITEQ TS or a DELETEQ TS to a recoverable queue in a unit of work in which the queue has already been deleted.

Modules: DFHEITS, DFHTSP

ATSQ

Explanation: A move of data to or from temporary storage has failed. The probable reason is that the size of the area being passed to CICS is inconsistent with the data length being used.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Identify the failing temporary storage request in the application and verify whether the length supplied on the request agrees with the data area size. Correct the application as appropriate.

Note: If the error occurs in DFHTSP and not in DFHETS, there is probably an internal logic error in temporary storage. In this case you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEITS

ATUF

Explanation: Insufficient space exists to build the parameter list for the DYNALLOC SVC.

System Action: The task is abnormally terminated and a dump is taken.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFH99KO

AUEL

Explanation: Internal logic error in CICS user exit management. This arises when an attempt to obtain or release the lock on the chain of EPB's fails unexpectedly.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHUEM, DFHERM.

AUEP

Explanation: The task has been abnormally terminated because a return code of UERCPURG has been sent to the User Exit Handler by a User Exit Program. The value of UERCPURG is defined by the macro DFHUEXIT TYPE=EP, ID=*xxxxxxxx*, where *xxxxxxxx* is the exit point by which the exit program is enabled. This code does not apply to exit points in domains. The exit program returns this value when it has made a request for CICS services using the exit programming Interface (XPI) and when the XPI call has had a RESPONSE code of PURGED. Exit programs must not set UERCPURG return code under any other circumstance.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Refer to the *CICS Customization Guide* for the use of this return code.

Module: DFHUEH

AUXA

Explanation: An unexpected error occurred when one of the Transaction Affinities Utility Detector exit programs called Detector program CAUTABM. Transaction CAFB issues this abend on behalf of the exit program.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU4100.

Module: CAUCAFB1

AUXB

Explanation: The Transaction Affinities Utility Detector dataspace has filled up. If the situation was detected by a Detector exit program, transaction CAFB issues this abend on its behalf.

System Action: The Detector is stopped.

User Response: message DFHAU4200.

Modules: CAUCAFF3, CAUCAFF6, CAUCAFB1

AUYA

Explanation: The Transaction Affinities Utility Detector transaction CAFB received an unrecognizable request from another Detector component (CAFF or a Detector exit program).

System Action: The Detector is stopped.

User Response: Refer to message DFHAU3302.

Module: CAUCAFB1

AUYC

Explanation: The Transaction Affinities Utility Detector transaction CAFB received a request from another Detector component (CAFF or an exit program) to abend because of an unexpected error.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU3304.

Module: CAUCAFB1

AUYE

Explanation: A Transaction Affinities Utility Detector program found an invalid affinity file number in an internal array in the Detector global work area (GWA).

System Action: The Detector is stopped.

User Response: Refer to message DFHAU3310.

Modules: CAUCAFB2, CAUCAFF3

AUYF

Explanation: The Transaction Affinities Utility Detector transaction CAFB was not started by transaction CAFF.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU3311.

Module: CAUCAFB1

AUYG

Explanation: The Transaction Affinities Utility Detector transaction CAFB was still running at CICS termination.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU3312.

Module: CAUCAFB1

AUYH

Explanation: A Transaction Affinities Utility Detector program has found that the address held in the Detector global work area (GWA) for one of the Detector internal modules is invalid.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU3313.

Modules: CAUCAFF4, CAUCAFF5, CAUCAFB1

AUYI

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB called Detector program CAUTABM to access affinity table data in the dataspace.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU3314.

Modules: CAUCAFB2, CAUCAFF6

AUYJ

Explanation: One of the Transaction Affinities Utility affinity data files is full.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU3315.

Module: CAUCAFB2

AUZA

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB issued an EXEC CICS command.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2201.

Modules: CAUCAFF1, CAUCAFF2, CAUCAFF3, CAUCAFF4, CAUCAFF5, CAUCAFF6, CAUCAFF7, CAUCAFB1, CAUCAFB2, CAUCAF41

AUZB

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB issued a VSAM file control EXEC CICS command.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2202.

Modules: CAUCAFF1, CAUCAFF2, CAUCAFF3, CAUCAFF4, CAUCAFF5, CAUCAFF6, CAUCAFB1, CAUCAFB2

AUZC

Explanation: The internal field holding the Transaction Affinities Utility Detector state has an invalid value.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2203.

Modules: CAUCAFF1, CAUCAFF2

AUZD

Explanation: One of the Transaction Affinities Utility files contains a CICS APPLID that does not match the APPLID of the CICS system.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2205.

Modules: CAUCAFF1, CAUCAFF2

AUZF

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB issued a Detector user exit related EXEC CICS command. The command is either ENABLE, DISABLE or EXTRACT EXIT.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2206.

Modules: CAUCAFF1, CAUCAFF2, CAUCAFF3, CAUCAFF4, CAUCAFF5, CAUCAFF6, CAUCAFB1

AUZH

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to create the MVS dataspace to hold the affinity data.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2210.

Module: CAUCAFF3

AUZI

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to create an affinity table in the dataspace.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2211.

Modules: CAUCAFF3, CAUCAFF6

AUZJ

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to add an element to an affinity table in the dataspace.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2212.

Module: CAUCAFF3

AUZK

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF was attempting to initialize the internal trace table.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2234.

Module: CAUCAFF3

AUZL

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF was attempting to release the internal trace table.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2235.

Module: CAUCAFF4

AUZN

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to destroy the dataspace.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2216.

Module: CAUCAFF4

AUZO

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUTABM to destroy a table in the dataspace.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2217.

Module: CAUCAFF6

AUZQ

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUCAFP to create its MVS CPOOL storage.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2220.

Module: CAUCAFF3

AUZR

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB called Detector program CAUCAFP to access its MVS CPOOL storage.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2221.

Modules: CAUCAFF4, CAUCAFF5, CAUCAFB1

AUZS

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called Detector program CAUCAFP to destroy its MVS CPOOL storage.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2222.

Module: CAUCAFF4

AUZU

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF calculated what percentage of the dataspace is occupied by affinity data.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2224.

Module: CAUCAFF1

AUZV

Explanation: The method of initiating Transaction Affinities Utility Detector transaction CAFF is incorrect.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2225.

Module: CAUCAFF1

AUZY

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF or CAFB called Detector program CAUTABM to replace a table element in the dataspace.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2228.

Modules: CAUCAFF3, CAUCAFB2

AUZZ

Explanation: An unexpected error occurred when Transaction Affinities Utility Detector transaction CAFF called a Detector subroutine to update the termid table (TT) or userid table (UT).

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2229.

Modules: CAUCAFF3, CAUCAFF6

AUZ1

Explanation: When the Transaction Affinities Utility Detector was being started by transaction CAFF, the header record could not be found on one of the VSAM affinity data files.

System Action: The Detector is stopped.

User Response: Refer to message DFHAU2230.

Module: CAUCAFF3

AWBA

Explanation: CICS Web Receive process has received an exception response from the Web Send Receive function, DFHWBSR, which could be one of the following errors:

- An error in the Analyzer program
- No Analyzer program specified
- Unable to link to Analyzer program
- An Analyzer data length error
- An Analyzer header length error
- A codepage conversion error
- A storage error occurred
- An error that the connection has been closed
- A sockets receive error

System Action: An error message is sent to the client and the CWBO transient data queue.

User Response: Refer to any error messages accompanying this abend to determine why the abend has occurred.

Module: DFHWBXN

AWBB

Explanation: The incoming parameter list to the CICS Web Business Logic Interface program is not in the expected format. At present, the structure is assumed to be fixed and only a single version level is recognized.

System Action: The CICS Web Business Logic Interface program is not executed.

User Response: Ensure that the program receives a parameter list in the correct format.

Module: DFHWBBLI

AWBC

Explanation: No commarea was passed to a CICS Web Interface utility program. One of the utility programs supplied with the CICS Web Interface was executed, but the commarea that was passed was absent or was too short to contain valid information.

System Action: The CICS Web Interface utility is not executed.

User Response: Ensure that the program passes a commarea that is long enough to contain the expected parameters for the utility you are invoking.

Modules: DFHWBENV, DFHWBTL

AWBE

Explanation: The CICS Web Interface detected that a Converter program attempted to change the address of the response buffer when it was not allowed to do so.

System Action: The data in the new response buffer is not returned to the Web browser. A CICS transaction dump is taken.

User Response: The Converter program is only allowed to replace the response buffer if the `converter_volatile` flag in the Converter parameter list is set to '1'. Check that your Converter program is not trying to return a new response buffer when this flag is set to '0'.

Module: DFHWBBLI

AWBF

Explanation: The CICS Web Interface alias detected an error in its initialization. The alias was not started by EXEC CICS START, or there was an error in the EXEC CICS RETRIEVE command for the start data.

System Action: If there is an error in EXEC CICS RETRIEVE, message DFHWB0103 is written to the CWBO destination. A CICS transaction dump is taken.

User Response: If the alias was not started by EXEC CICS START, check if it is being started from a terminal. This is not allowed. Otherwise, see the associated message for guidance.

Module: DFHWBA

AWBH

Explanation: The CICS Web Interface alias detected a logic error.

System Action: An exception trace entry 454F is written. Message DFHWB0106 is written to the CWBO destination. A CICS transaction dump is taken.

User Response: Use related diagnostics to determine the user response.

Module: DFHWBA

AWBI

Explanation: The CICS Web Interface alias received an unexpected response from EXEC CICS ASSIGN STARTCODE

System Action: An exception trace entry 4544 is written. Message DFHWB0102 is written to the CWBO destination.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBA

AWBJ

Explanation: The CICS Web Interface alias received an unexpected response when it switched to the RP TCB.

System Action: An exception trace entry 454E is written. Message DFHWB0105 is written to the CWBO destination. A transaction dump is taken.

User Response: See the associated message for guidance.

Module: DFHWBA

AWBK

Explanation: The CICS Web Interface alias detected an abend in the converter or the CICS program servicing the request.

System Action: An exception trace entry 4550 is written. Message DFHWB0108 is written to the CWBO destination.

User Response: Use related diagnostics to determine the user response.

Module: DFHWBA

AWBL

Explanation: The CICS Web Interface alias detected an error in an EXEC CICS LINK command for program DFHWBBLI.

System Action: An exception trace entry 4543 is written. Message DFHWB0100 is written to the CWBO destination. A transaction dump is taken.

User Response: See the associated message for guidance.

Module: DFHWBA

AWBM

Explanation: The CICS Web Interface alias detected error response from the Business Logic Interface program DFHWBBLI.

System Action: Message DFHWB0101 is written to the CWBO destination. A transaction dump is taken.

User Response: See the associated message for guidance.

Module: DFHWBA

AWBQ

Explanation: The CICS Web Business Logic Interface program detected an error in its parameter list.

System Action: If the abend was issued from the Business Logic Interface program, DFHWBBLI, an exception trace entry '4581' is made and message DFHWB0119 is written to the CWBO transient data destination. If the abend was issued from the Web Interface program, DFHWBA1, an exception trace entry '4560' is written and message DFHWB0124 is sent to the CWBO destination. A transaction dump is taken.

User Response: See the associated message for guidance.

Modules: DFHWBA1, DFHWBBLI

AWBR

Explanation: The CICS Web Business Logic Interface program detected a logic error.

System Action: If the abend was issued from the Business Logic Interface program, DFHWBBLI, an exception trace entry '4583' is made and message DFHWB0118 is written to the CWBO transient data destination. If the abend was issued from the Web Interface program, DFHWBA1, an exception trace entry '4558' is written and message DFHWB0123 is sent to the CWBO destination.

User Response: Use related diagnostics to determine the user response.

Modules: DFHWBA1, DFHWBBLI

AWBU

Explanation: The CICS Web Interface connection manager could not get storage to send a message to the terminal.

System Action: Processing continues.

User Response: Use related diagnostics to determine the user response.

Module: DFHWBC01

AWBV

Explanation: The CICS Web Interface connection manager detected an error response on EXEC CICS DEQ.

System Action: An exception trace entry 4345 is written. Message DFHWB1651 is written to the CWBO destination.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBC04

AWBX

Explanation: The CICS Web Interface connection manager was started against an invalid terminal type.

System Action: An exception trace entry 4308 is written. Message DFHWB1522 is written to the CWBO destination.

User Response: See the associated message for guidance.

Module: DFHWBC01

AWBZ

Explanation: The CICS Web Interface connection manager detected a NOTAUTH response to EXEC CICS EXTRACT EXIT.

System Action: Message DFHWB1902 is written to the CWBO destination.

User Response: See the associated message for guidance.

Module: DFHWBC0B

AWB2

Explanation: The CICS Web Interface has encountered an error while performing a transaction attach call for the alias task.

System Action: Message DFHWB0727 describing the error is written to the CWBO transient data destination and a trace entry is made.

User Response: See the associated message for guidance.

Module: DFHWBXN

AWB3

Explanation: CICS Web transaction, CWXN, has been illegally started either with data, or by a user at a terminal, with the wrong start code.

System Action: The CICS Web Interface is not started.

User Response: CICS Web Transaction Execution should only ever be started by Sockets Domain using DFHXMAT ATTACH, not by a user at a terminal or with data.

Module: DFHWBXN

AWB4

Explanation: The CICS Web Transaction Execution has received a bad response from an INQUIRE_TRANSACTION call to determine the start code for the CWXN transaction.

System Action: The CICS Web Interface is not started.

User Response: CICS Web Transaction Execution should only ever be started by Sockets Domain using DFHXMAT ATTACH, not by a user at a terminal or with data.

Module: DFHWBXN

AWB5

Explanation: The CICS Web Interface Server Controller could not continue with enable processing because the requested port is not available.

System Action: An exception trace entry 4106 is written, and message DFHWB0131 is issued.

User Response: Terminate the TCP/IP application which is using the requested port, and use CBWB to enable the feature again, or use CWBC to enable the CICS web Interface using a different port number.

Module: DFHWBM

AWB7

Explanation: The CICS Web Interface environment variables program was invoked, but the invoking transaction does not appear to be executing in a valid Web environment.

System Action: The program writes an exception trace point 4623.

User Response: Determine how the environment variables program was invoked. It is only meaningful to execute the program from a transaction that has been initiated from the Web, either through the CICS Web Interface or through the Business Logic Interface.

Module: DFHWBENV

AWB8

Explanation: The CICS Web Interface environment garbage collection task CWBG has been started directly from a terminal. This is not permitted.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: None.

Module: DFHWBGB

AWB9

Explanation: The CICS Web Interface connection manager failed due to lack of storage.

System Action: A transaction dump is taken.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHWBC01

AWC1

Explanation: The CICS Web Interface 3270 bridge exit DFHWBLT could not establish a partnership with the Web terminal translation task which started the abended transction.

System Action: An exception trace entry 4106 is written, and message DFHWB0131 is issued.

User Response: Use related diagnostics to determine the user response.

Module: DFHWBLT

AWC2

Explanation: The CICS Web Interface 3270 bridge exit DFHWBLT was passed an invalid state token by attach processing.

System Action: An exception trace entry 410C is written, and message DFHWB0130 is issued.

User Response: Use related diagnostics to determine the user response. On a busy CICS region, the most likely cause is that the bridged transaction started after the state data had been discarded by Web 3270 garbage collection process.

Module: DFHWBLT

AWC3

Explanation: An application using the CICS Web 3270 function issued an unsupported combination of BMS and Terminal Control commands.

System Action: An exception trace entry is written.

User Response: Use related diagnostics to determine the user response.

Module: DFHWBLT

AWC4

Explanation: The CICS Web Interface 3270 bridge exit DFHWBLT has been reinvoked after returning an earlier error.

System Action: An exception trace entry is written.

User Response: Use related diagnostics to determine the user response.

Module: DFHWBLT

AWC5

Explanation: The CICS Web Interface 3270 bridge exit DFHWBLT abended during attach processing because it could not getmain a brxa user area.

System Action: Message DFHWB0132 is issued, and an exception trace entry 410D is written.

User Response: Use related diagnostics to determine the user response. The most likely cause of this abend is that CICS is having storage problems.

Module: DFHWBLT

AWC6

Explanation: The CICS Web Interface 3270 bridge exit DFHWBLT has detected an inconsistency in its request parameters or state data.

System Action: Message DFHWB0133 is issued, and an exception trace entry is written.

User Response: Use related diagnostics to determine the user response. The most likely cause of this abend is a storage overwrite.

Module: DFHWBLT

AWKY

Explanation: A request to PURGE or WRITE a record using the global catalog during warm keypointing has failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check for problems with the global or local catalog. See any DFHCC*nnnn* messages issued by the CICS catalog domain for further guidance.

Module: DFHWKP

AXFA

Explanation: The key length for a file control request that is to be sent to a remote system has to be obtained from the file control table, and has proved to be zero.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Ensure that the key length has been defined either in the remote file definition that is being used, or as a length option from the application program that is using it.

Module: DFHXFP

AXFB

Explanation: An unacceptable function management header (FMH) type has been found. It must be type 05, type 06, or type 43.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFC

Explanation: The request passed to the data transformation program is unknown to CICS. This abend can also occur in an MRO/IRC system as a result of an invalid EXEC CICS START request issued from the user's node error program (DFHZNEP).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the *CICS Customization Guide* for restrictions on the use of EXEC CICS commands from within an NEP. If this is not the cause of the abend, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFD

Explanation: The request that is passed to the data transformation program cannot be sent to a remote system; for example, a storage control request.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFE

Explanation: The transformation requested does not exist; for example, a DL/I schedule reply is not recognized by the outbound request processor in the data transformation program.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFF

Explanation: An unacceptable queue organization has been found in a queue model function management header (FMH).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFG

Explanation: An unacceptable argument number has been found in the data following a function management header (FMH) of type 43.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFH

Explanation: The argument number in the data following a function management header (FMH) of type 43 is acceptable, however, the argument itself is not expected.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFI

Explanation: The data length for a WRITEQ TD or READQ TD, which is determined from the destination control table, is zero. The abend can also occur when determining the length for file control requests from the file control table.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer.

Module: DFHXFP

AXFJ

Explanation: The error code held in UIBFCTR and UIBDLTR cannot be converted to an equivalent SNA error code.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFL

Explanation: Transformers 2 and 4 expect to receive a function management header (FMH), possibly followed by user data. A null chain of data has been received.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFM

Explanation: The ISCINVREQ condition has been raised. This can happen when the resource proves to be on yet another remote system, that is, when daisy-chaining is active.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that daisy-chaining of requests is intended and that all relevant intersystem links are in service.

Module: DFHXFP

AXFO

Explanation: The check on the DS and DBA parameters in an attach function management header (FMH) has failed. This abend represents a user error resulting from a mismatch in the system definitions for both ends of an intersystem link.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer.

Module: DFHXFP

AXFP

Explanation: CICS requires a second function management header (FMH) to follow an attach FMH. No second FMH was received.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer.

Module: DFHXFP

AXFQ

Explanation: Either the function management header (FMH) just received is too short or too long to be a valid FMH, or an expected FMH is not present.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that the transaction profile parameter, INBFMH, is set to ALL. If communicating across a distributed program link, ensure that the requested function is supported on the partner system.

Module: DFHXFP

AXFR

Explanation: The CICS command level interface imposes a maximum length of 32 767 for data. The length of the data just received exceeds this limit.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer.

Module: DFHXFP

AXFS

Explanation: A PSB has been scheduled successfully. However, the maximum possible length of an I/O area exceeded 65 535. This abend is likely to occur if path calls are used to retrieve large segments, and/or if FLS causes excessive expansion of segments.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer.

Module: DFHXFP

AXFT

Explanation: An estimate of the size of the output I/O area has been made, and it exceeds the maximum possible size of 65 535.

Note: While the estimated size may exceed the actual size, the difference will only be a few bytes.

This abend is likely to occur if a database calls, inserts, or replaces multiple segments, and many qualified segment search arguments are specified.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Notify the system programmer.

Module: DFHXFP

AXFU

Explanation: A two-level cursor is present in a function management header (FMH) relating to a linear (temporary storage) queue. However, these cursors are valid only for hierarchical queues that are not supported by CICS.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXFP

AXFW

Explanation: An invalid length specification has been given in a CICS command-level request corresponding to one of the data variables.

The CICS-architected FMH is followed by zero or more self-describing data variables for each parameter specified.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check for an invalid or zero length specified in a CICS command-level request, or for data truncation in a user-written node error program (NEP).

Module: DFHXFP

AXFX

Explanation: A function shipping request by an APPC link failed because

- the remote system does not support full syncpoint protocols, or
- the exchange log name sequence could have failed, resulting in a mismatch, or
- the request has not completed within the allocated time (10 seconds).

System Action: CICS terminates the task abnormally.

User Response: Check that the request was directed to the correct remote system, and that the remote system is set up to support full syncpoint protocols (synclevel 2).

Module: DFHXFP

AXFY

Explanation: An APPC conversation failure has occurred when an attach between CICS systems was issued.

System Action: The task is abnormally terminated with a transaction dump.

User Response: Check the connection to the remote CICS system and try to reestablish it.

Module: DFHXFP

AXF0

Explanation: A task has been purged due to lack of storage in a dynamic storage area (DSA).

System Action: The task is abnormally terminated with a transaction dump.

User Response: Try the transaction again later.

If the short-on-storage condition persists, consider increasing the size limit of the CICS DSAs. You can vary the DSAs dynamically using the DSALIM and EDSALIM parameters on the CEMT master terminal command.

Module: DFHXFP

AXF1

Explanation: The storage manager module, DFHSMGF, has returned a condition not expected by DFHXFP.

System Action: The task is abnormally terminated with a transaction dump.

User Response: Look for any related CICS messages and abends to determine if there has been a prior failure in CICS storage.

Module: DFHXFP

AXF2

Explanation: A task has been purged due to lack of storage in the DSA.

System Action: The task is abnormally terminated with a transaction dump.

User Response: Try the transaction again later.

If the short-on-storage condition persists, increase the size of the dynamic storage area using the DFHSIT DSA parameter.

Module: DFHXFP

AXF3

Explanation: The storage manager module DFHSMMC has returned a condition not expected by DFHXFP.

System Action: The task is abnormally terminated with a transaction dump.

User Response: Look for any related CICS messages and abends to determine if there has been a prior failure in CICS storage.

Module: DFHXFP

AXF4

Explanation: The task was purged before a GET_BUFFER request to the EXEC interface service routines module (DFHEISR), was able to complete successfully. The domain that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHXFX

AXF5

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the EXEC interface service routines module(DFHEISR). The domain that detected the original error provides an exception trace, a console message, and possibly, a system dump (depending on the options specified the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message from the domain that detected the original error.

Module: DFHXFX

AXF8

Explanation: A keyword such as TOKEN, CONSISTENT, REPEATABLE, UNCOMMITTED, or NOSUSPEND has been specified on a file control command for shipping to a system which does not support these functions.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Ensure that CICS in the file-owning region is at the correct level.

Module: DFHXFX

AXMA

Explanation: An error has occurred obtaining a lock within the transaction manager domain.

System Action: The recovery routine of the module in control is invoked which issues message DFHXM0002 with a system dump. DFHXM0002 reports the module in control at the time of the error.

User Response: See the description of message DFHXM0002 for further guidance.

Modules: DFHXMAT, DFHXMBD, DFHXMCL, DFHXMDD, DFHXMFD, DFHXMLD, DFHXMQD, DFHXMST, DFHXMTA, DFHXMXD, DFHXMXE

AXMB

Explanation: An error has occurred releasing a lock within the transaction manager domain.

System Action: The recovery routine of the module in control is invoked. This routine issues message DFHXM0002 with a system dump. DFHXM0002 reports the module in control at the time of the error.

User Response: See the description of message DFHXM0002 for further guidance.

Modules: DFHXMAT, DFHXMBD, DFHXMCL, DFHXMDD, DFHXMFD, DFHXMLD, DFHXMQD, DFHXMST, DFHXMTA, DFHXMXD, DFHXMXE

AXMC

Explanation: An severe error has occurred allocating a unique transaction number to a new transaction.

System Action: The recovery routine of the module in control is invoked. This routine issues message DFHXM0002 with a system dump. DFHXM0002 reports the module in control at the time of the error.

User Response: See the description of message DFHXM0002 for further guidance.

Modules: DFHXMAT, DFHXMXE

AXMD

Explanation: An attempt has been made to run the CICS internal task CSXM as a user transaction.

System Action: CICS terminates the task with a transaction dump.

User Response: Investigate why the attempt was made to run CSXM as a user transaction.

Module: DFHXMAB

AXMY

Explanation: During transaction attach an unexpected error occurred obtaining transaction class membership.

System Action: The transaction is no longer considered for class membership. It is then abnormally terminated with a CICS transaction dump.

User Response: Use the dump to determine why the transaction failed to obtain membership of its transaction class.

Module: DFHXMAT

AXMZ

Explanation: A serious failure in another component has been detected by the transaction manager domain.

System Action: The task in control is abnormally terminated with a transaction dump. Further diagnostics should have been taken by the failing component.

User Response: Look for earlier messages identifying the source of the problem. Refer to the descriptions of these messages for further guidance.

Module: DFHXMTA

AXSA

Explanation: The CICS security control task could not complete because a necessary step failed. The task has done some essential recovery operations and abnormally terminated itself with code AXSA.

System Action: CICS writes a transaction dump for the security control restart task.

CICS sends messages to the console, one to identify the error detected by the security control task, and, if the error occurred during initialization, one to say that security initialization or CEMT PERFORM SECURITY REBUILD has failed. A third message follows either to say that CICS has terminated abnormally with a dump, or to ask you to reply GO or CANCEL. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

User Response: First, if CICS has requested a response, you must reply. If you reply 'GO', CICS continues processing, but without support for the external security manager. CICS security still operates. If you reply 'CANCEL', CICS terminates abnormally with a dump.

Use the messages and dumps to find out the cause of the failure.

Module: DFHXSMN

AXSC

Explanation: The task was purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition will have provided an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHXSMN

AXSD

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHTCRP

AXTA

Explanation: The calculation of the length of data to be shipped has failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTB

Explanation: An attempt to obtain a TIOA to ship data has failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTC

Explanation: An attempt to transform data ready for shipment has failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTD

Explanation: No TIOA received message was received from a remote system.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTE

Explanation: Incorrect data was received from a remote system. The data was not long enough.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTF

Explanation: No relay process function management header (FMH) was received from the remote system.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTG

Explanation: Transformation of data received from remote system failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that the reason for failure of the transformation process was not incorrect definition of the remote terminal. In particular check that the user area length specified for the terminal is the same in both local and remote systems. If the terminal definitions are correct, you need further assistance to resolve this problem. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTH

Explanation: An attempt to locate terminal identifier failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTI

Explanation: The major request byte LUCOPN0 of the DFHLUC parameter list specified to the transaction-routing transformer is invalid, or corresponds to a request that is not shipped to a remote system. The parameter list will be found in the dynamic storage of XTP's caller and may be located using the output from auxiliary trace.

System Action: The task is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTJ

Explanation: An unexpected combination of bit settings in the fields XTSSTAT and XTSTCOPC in the parameter list of the transaction-routing transformer was made.

System Action: The task is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTK

Explanation: An APPC conversation failure occurred when an attach between CICS systems was issued.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check the connection to the remote CICS system and try to reestablish it.

Module: DFHXTP

AXTL

Explanation: The processing of APPC mapped data requires the generation of an APPC attach FMH with default values. In particular, the sync level requested is defaulted to 2. However, the session that is to be used has been bound with a sync level of 1.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that:

- The entry in the TCT for the remote system has been defined with parallel sessions
- The remote system is capable of supporting a sync level of 2.
- Exchange lognames has completed for the connection. You can use the command CEMT INQUIRE CONNECTION to do this. See the *CICS Intercommunication Guide* for more details of the exchange lognames process.
- The correct sync level has been requested.

Module: DFHXTP

AXTM

Explanation: An attempt has been made to route a message-protected transaction over an APPC link bound at sync level 1. The attempt has failed because such transactions can be routed only over an APPC link that has been bound at sync level 2.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: If the transaction is to be routed to CICS OS/2 (which is bound at synclevel 1), remove the message protection option. If the transaction is to be routed to another host system and message protection is required, the link must be redefined so that it can be bound at synclevel 2.

Module: DFHXTP

AXTN

Explanation: Module DFHXTP detected that the application buffer chained off a TCTTE at offset TCTERCSA has a corrupted header. This is caused either by a CICS logic error or by a storage overwrite.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This is a CICS internal logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHETL

AXTO

Explanation: An exception response has been returned to the DFHXTP module from the CICS security manager. Prior to the call to the CICS security manager, the DFHXTP module detected that a shipped terminal definition had preset security. DFHXTP then invoked the CICS security manager in order to perform a preset security signon for the userid sent with the shipped terminal information. It is this preset security signon attempt which failed.

System Action: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security manager issues a DFHSNxxxx message to the transient data queue, CSCS.

User Response: The most likely cause of this abend is that the terminal being shipped to the application owning region (AOR) has preset security with a userid which is not valid in the AOR. To confirm this, check the associated DFHSNxxxx message on the CSCS transient data queue in the AOR which gives the precise reason for the failure of the preset security signon request. This could be the result of an unauthorized transaction routing request.

Module: DFHXTP

AXTP

Explanation: An exception response has been returned to the DFHXTP module from DFHCCNV FUNCTION(CONVERT_DS3270_FOR_SBCS). The module was called for a CICS client virtual terminal which requested conversion from ASCII to EBCDIC for data coming from the client. However, the conversion failed.

System Action: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security

manager issues a DFHSN*nnnn* message to the transient data queue, CSCS.

User Response: Examine the response and reason returned in the DFHCCNV commarea DFHC32. The client and server codepages will have already been validated so this may be a CICS error. You may need to contact IBM for further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTQ

Explanation: An exception response has been returned to the DFHXTP module from DFHCCNV FUNCTION(CONVERT_DS3270_FOR_SBCS). The module was called for a CICS client virtual terminal which requested conversion from EBCDIC to ASCII for data to be sent to the client. However the conversion failed.

System Action: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security manager issues a DFHSN*nnnn* message to the transient data queue, CSCS.

User Response: Examine the response and reason returned in the DFHCCNV commarea DFHC32. The client and server codepages will have already been validated so this may be a CICS error. You may need to contact IBM for further assistance. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHXTP

AXTR

Explanation: An exception response has been returned to the DFHXTP module from DFHPGLE FUNCTION(LOAD_EXEC) whilst trying to load EXEC program DFHCCNV.

System Action: The transaction routing request is terminated and a message is sent to the terminal owning region (TOR) to indicate that the transaction routing request has failed. The CICS security manager issues a DFHSN*nnnn* message to the transient data queue, CSCS.

User Response: Examine the response and reason returned from DFHPGLE to determine why CICS was unable to call DFHCCNV.

Module: DFHXTP

AZAB

Explanation: DFHZARM has a SEND DATA request with a data length greater than 65 528 bytes which is the maximum that it can process.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: This is a CICS internal logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARM

AZAD

Explanation: DFHZCN1 has been started from an unexpected system. The CCIN transaction can only be issued by a client.

System Action: The transaction is abnormally terminated. Exception trace point AP3008 is written. Data1 holds the XMIQ start type.

User Response: Issue the CCIN transaction only from a client.

Module: DFHZCN1

AZAE

Explanation: DFHZCN1 was started from a terminal facility, but not an LU6.2 session. The CCIN transaction may only be issued by a client.

System Action: The transaction is abnormally terminated.

User Response: Issue the CCIN transaction only from a client.

Module: DFHZCN1

AZAF

Explanation: DFHZCN1 was started for transaction CCIN. However either the environment is wrong or the client architecture has been violated. This abend is always issued in conjuction with a DFHZC32nn message which explains the problem in more detail.

System Action: Exception trace point AP30xx is written. The transaction is abnormally terminated.

User Response: Look for a DFHZC32nn message on the console or CSNE and look for exception trace points AP30xx. Use these to diagnose the problem.

Module: DFHZCN1

AZAG

Explanation: DFHZCT1 has been started from an unexpected system. The CTIN transaction can only be issued by a client.

System Action: The transaction is abnormally terminated with a CICS transaction dump. Exception trace point AP302A is written. Data1 holds the XMIQ start type.

User Response: Issue the CTIN transaction only from a client.

Module: DFHZCT1

AZAH

Explanation: DFHZCT1 was started from a terminal facility, but not an LU62 session. The CTIN transaction can only be issued by a client.

System Action: The transaction is abnormally terminated with a CICS transaction dump. Exception trace point AP3032 is written. Data1 holds the principal facility address.

User Response: Issue the CTIN transaction only from a client.

Module: DFHZCT1

AZAI

Explanation: DFHZCT1 was started for transaction CTIN. However either the environment is wrong or the client architecture has been violated. This abend is always issued in conjuction with a DFHZC32nn message which explains the problem in more detail.

System Action: Exception trace point AP30xx is written. The transaction is abnormally terminated.

User Response: Look for a DFHZC32nn message on the console

or CSNE and look for exception trace points AP30xx. Use these to diagnose the problem.

Module: DFHZCT1

AZAJ

Explanation: DFHZCN1 was started for transaction CCIN. However, the CCIN transaction is being started on a surrogate, which means that it has been defined as a remote transaction. CCIN must be a local transaction and be run on a CICS region which is directly connected to a client.

System Action: Exception trace point AP3041 is written. The transaction is abnormally terminated.

User Response: Either use the default definitions for CCIN or ensure that it is defined as a local transaction.

Module: DFHZCN1

AZAK

Explanation: DFHZCT1 was started for transaction CTIN. However, the CTIN transaction is being started on a surrogate, which means that it has been defined as a remote transaction. CTIN must be a local transaction and be run on a CICS region which is directly connected to a client.

System Action: Exception trace point AP3039 is written. The transaction is abnormally terminated.

User Response: Either use the default definitions for CTIN or ensure that it is defined as a local transaction.

Module: DFHZCT1

AZCA

Explanation: An internal logic error has been detected during APPC mapped processing. The conversation state maintained by DFHZARL does not match that maintained jointly by DFHETL and DFHZARM.

The problem may also arise when CICS is assembling application data and receives end of chain before receiving all of the data that is expected.

System Action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARM

AZCB

Explanation: CICS has received sense code X'088901*xx*' during APPC mapped processing. This should be followed by an error data GDS (generalized data stream) variable.

CICS has attempted to receive the error data. However this attempt has failed because no data has been received or because the data received is not for an CICS ISSUE ERROR of the correct length.

CICS expects the error data to indicate that the other system does not recognize GDS ID X'12F2' (function management data).

System Action: The task is abnormally terminated with a CICS transaction dump.

The erroneous GDS ID is returned to the remote system for further analysis there.

User Response: Check for session failure and for abend by the transaction in the other system.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARM

AZCC

Explanation: The failing transaction has sent function management data to a transaction running in a system that does not provide support for application function management data.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that the remote system can support application function management data.

Module: DFHZARM

AZCD

Explanation: A possible intersystem logic error has been detected during APPC mapped processing. The length of application data that is to be received (as determined from the LL fields and concatenation flags) does not match the length actually received. CICS determines the length of application data that is to be received from the LL fields and concatenation flags. However, CICS has not received all of the data that is expected.

This abend can be caused by a loss of data following the failure of a persistent sessions restart in a partner system. In this case, no logic error has occurred because any updates are backed out.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: If this abend is not caused by the failure of a persistent sessions restart in a partner system, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHETL, DFHZARM

AZCE

Explanation: An intersystem error has been detected during APPC mapped processing. The length of application data that is to be received (as determined from the LL fields and concatenation flags) exceeds the CICS implementation limit of 32 767, for receive and converse commands, or 65 000 for CICS transaction routing or function shipping requests.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Reduce the amount of data that the transaction in the remote system is transmitting to CICS.

Modules: DFHETL, DFHZARM

AZCF

Explanation: An internal logic error has been detected during APPC mapped processing. An invalid request has been passed to DFHZARL.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARM

AZCG

Explanation: An internal logic error has been detected during APPC mapped processing. DFHZARM expects the TCTTE passed to have been defined as APPC, TCTEILUC (TCTELUC) set on, and TCTECVT set to TCTEMAPD (to indicate a mapped conversation).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARM

AZCH

Explanation: Sense code X'0889*xxxx*' has been received unexpectedly during the processing of APPC mapped data.

This represents a violation of the APPC architecture by the remote system.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHETL, DFHZARM

AZCI

Explanation: The processing of APPC mapped data requires generation of an APPC attach function management header (FMH) with default values. In particular, the sync level requested is defaulted to 2. However, the session that is to be used has been bound with a sync level of 1.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check that:

- The entry in the TCT for the remote system has been defined with parallel sessions.
- The remote system is capable of supporting a sync level of 2.
- Exchange lognames has completed for the connection. You can use the CEMT INQUIRE CONNECTION to do this. See the *CICS Intercommunication Guide* for details of the exchange lognames process.

Modules: DFHETL, DFHZARM, DFHZARQ

AZCJ

Explanation: An APPC structured field with GDS ID X'12F1' (null data) has been sent to a remote system that does not support the receipt of these fields. The remote system has responded negatively and has terminated the conversation.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: The problem is in the remote system. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARM

AZCK

Explanation: An internal logic error has been detected during error recovery for APPC mapped processing. The conversation was being switched to RECEIVE state by an internal CICS SEND INVITE, but the conversation had already been FREEd by the partner.

System Action: The task is abnormally terminated with a CICS transaction dump. CICS processing continues.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARM

AZCL

Explanation: CICS has received sense code X'088901xx' during APPC mapped processing. The generalized data stream (GDS) should contain a valid GDS identity in the error data but CICS does not recognize the value. The values recognized by CICS are:

```
X'12F1'    null data
X'12F2'    function management data
X'12FF'    application data.
```

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check for session failure and for an abend by the transaction in the other system.

Module: DFHZARM

AZCM

Explanation: An error (INVALID, DISASTER, or unexpected EXCEPTION response) has occurred on a call to the storage manager (SM) domain. The domain that detected the original error provides an exception trace, a console message and, possibly, a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the related message produced by the domain that detected the original error.

Module: DFHZARM

AZCN

Explanation: The task has been purged before a GETMAIN request to the storage manager (SM) domain was able to complete successfully. The task that first detected the purged condition provides an exception trace.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHZARM

AZCO

Explanation: The VTAM persistent sessions initialization transaction CGRP has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: None.

Module: DFHZCGRP

AZCP

Explanation: A logic error has been detected in ZCP. An allocation request for a starting task cannot be satisfied.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Modules: DFHZSUP DFH62XM

AZCQ

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain to change the recovery status of an intercommunication session. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: This failure is either the result of a task purge, or it represents a CICS logic error and you will need assistance from IBM.

See the related diagnostic material produced by the recovery manager domain.

Modules: DFHZSUP DFHMRXM DFH62XM

AZCR

Explanation: A logic or protocol error has been detected during processing of an APPC SYNCPOINT ROLLBACK request. An attempt has been made to restore the conversation state to what it was after completion of the last successful unit of work. This saved state does not match flows received from the partner.

The problem arises during rollback in one of the following situations:

- The saved state is receive, and the partner sent change direction on the last flow, indicating that the partner expects CICS to be in send state
- The saved state is send, and the partner did not send the change-direction indicator on the last flow, indicating that the partner expects CICS to be in receive state.

System Action: The task is abnormally terminated with a CICS transaction dump. Other processing continues.

User Response: The problem can arise because of a failure in CICS, or a failure in the partner. To determine which is failing, analyze the flows at the last successful syncpoint. Try to determine the states the two LUs were in at this point. Look at the last syncpoint flow into CICS from the partner, before the abend. From this flow, calculate whether the change-direction indicator on the SPCMOD modifier byte is on. (See the *SNA Formats* manual for further information on the SPCMOD modifier byte.) The indicator must only be set when the saved CICS conversation state is send. If the last CICS state was send, and the indicator is on, CICS is at fault. Similarly, if the last CICS state was receive, and the indicator is off, CICS is at fault.

If the last CICS state was send and the indicator is off, or the last CICS state was receive, and the indicator is on, CICS has received a change-direction indicator when it was not expecting one. In this case, examine the partner for a logic error.

Module: DFHZARL

AZCT

Explanation: A terminal read-time-out condition has been detected. The transaction has been waiting for a terminal input message for an interval longer than specified in the RTIMOUT value for that transaction.

Coding RTIMOUT in the PROFILE entry causes the task to be abnormally terminated if the terminal does not send input within the specified time.

System Action: The transaction is abnormally terminated. A dump is not provided unless the dump table entry for transaction dump code AZCT indicates that one should be taken.

User Response: If a DFHPC TYPE=SETEXIT macro has been issued for this task, the read that was timed-out is still outstanding. In order to cancel this read, issue a DFHPC TYPE=ABEND at the end of the user exit routine so that CICS can clean up the terminal's TCTTE.

Module: DFHZARQ

AZCU

Explanation: The COVR transaction has been started directly from a terminal, or by a START command. This is not permitted. This transaction can only be started internally by CICS.

System Action: The transaction is abnormally terminated. No transaction dump is taken.

User Response: None.

Module: DFHZCOVR

AZCV

Explanation: A logic error has been detected in the COVR transaction while trying to connect to VTAM.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZCOVR

AZCW

Explanation: An attempt has been made to run the CICS internal task CSTP as a user transaction.

System Action: CICS terminates the task with a transaction dump.

User Response: Investigate why the attempt was made to run CSTP as a user transaction.

Module: DFHZCSTP

AZIA

Explanation: The transaction attempted to acquire or free storage during MRO processing. The response from the CICS storage manager (SM) domain indicated that the request was invalid.

System Action: The task is abnormally terminated with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZIS2

AZIB

Explanation: The transaction was purged whilst waiting for storage to receive MRO data from a connected subsystem. The purge may have been the result of operator action, such as CEMT SET TASK PURGE, or as the result of the waiting time exceeding the DTIMOUT value for the transaction.

System Action: The task is abnormally terminated with a dump.

User Response: If the condition is caused by time-out, examine the DTIMOUT value for the failing transaction and increase it if it is too low.

Module: DFHZIS2

AZIC

Explanation: An INVALID, DISASTER, or EXCEPTION condition has occurred on a call to the storage manager domain (DFHSMGFM) to FREEMAIN a CRB control block.

The domain that detected the original error provides an exception trace, a console message, and possibly a system dump.

System Action: The task is abnormally terminated with a transaction dump.

User Response: Please see the related message from the domain that detected the original error.

Module: DFHZIS2

AZID

Explanation: A PURGED condition has occurred on a call to the storage manager domain (DFHSMGFM) to FREEMAIN a CRB control block.

The domain that detected the original error provides an exception trace.

System Action: The task is abnormally terminated with a transaction dump.

User Response: Investigate why the task was purged. It was purged either as a result of a purge from the master terminal operator via the CEMT transaction, or by the task being timed out after waiting for longer than the DTIMOUT (deadlock timeout) value specified for the transaction.

If the master terminal operator purged the task, this may have been in an attempt to clear the system which appeared to be deadlocked for some reason.

If the task was timed out automatically as a result of the DTIMOUT value being exceeded, this may be due to insufficient main storage being available for the number of tasks in the system. If the amount of main storage cannot be increased, reduce the number of tasks in the system to avoid short-on-storage situations. Another possibility is to increase the value of the DTIMOUT option for the transaction.

Module: DFHZIS2

AZIE

Explanation: An interregion communication (IRC) ISSUE-ERROR or ISSUE-ABEND flow has been received in violation of IRC protocols. This can be caused by:

- A CICS logic error. IRC protocols are not available to MRO distributed transaction processing applications. They are for CICS internal use only.
- A transaction abend on a connected system. This results in an FMH 7 flow over an LU6.2 connection and causes this abend to be issued.

System Action: The task is abnormally terminated with a transaction dump.

User Response: Check whether a mixture of mapped and unmapped conversations are being used as this can cause this abend. Check for any other reasons for transactions to be abending on the attached system.

If a CICS logic error is involved, you will need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARQ

AZIF

Explanation: An error (INVALID, DISASTER or unexpected EXCEPTION response) has occurred on a call to the recovery manager (RM) domain to change the recovery status of an intercommunication session. The domain provides an exit trace, and possibly a console message and a system dump (depending on the options specified in the dump table).

This is either the result of a task purge, a CICS logic error, or of the inappropriate use of the indoubt test transaction, CIND. CIND should be activated only on the CICS system where the syncpoint processing was initiated. In particular, CIND should not be used on any of the CICS mirror transactions.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Determine whether CIND has been activated for a transaction that did not initiate the syncpoint processing. If CIND is not being used see the related diagnostic material produced by the recovery manager domain and determine the reason for the failure.

In the case of a CICS logic error, you need further assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARQ

AZI1

Explanation: An IRC data transmission request has been issued, but cannot be completed because the transmission protocol has been violated.

If the session is not used for distributed transaction processing, that is if it is used for function shipping or transaction routing, then the problem is caused by a CICS logic error.

If the session is used for distributed transaction processing, then the following are possible causes of the abend:

- An invalid terminal control command, such as ISSUE SIGNAL, was issued
- A send request was issued but the session was not in send state, or a read request was issued but the session was not in receive state.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Determine the cause of the abend and if appropriate, correct the application. For further guidance, refer to the section on the EXEC Interface block (EIB) in the *CICS Intercommunication Guide*. The EIB describes the state of the session after a request has been issued.

Module: DFHZARQ

AZI2

Explanation: An IRC data transmission request has been issued but cannot be completed. Possible causes of the problem include:

- The transaction running in the connected system has been purged, or
- The transaction running in the connected system has been timed out, or
- The abending transaction has attempted to SEND while in RECEIVE state, or
- The abending transaction has attempted to RECEIVE while in SEND state.

If the abend was caused by DFHIRP rejecting the transmission request, the dump will contain DFHIRP's return code in the field TCTEIRET for the TCTTE representing the failed IRC session. The address of this TCTTE is in field B of the trace entry representing the DFHTC data transmission request.

The meanings of the DFHIRP return codes are given in the copybook, DFHIRSDS.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: If the cause of the error was a purge or a time-out, no further action is required.

If the error was caused by a condition such as an attempted SEND while in RECEIVE state or vice versa, analyze the dump and correct the protocol violation.

Module: DFHZARQ

AZI3

Explanation: A terminal control request issued by an application to a remotely-owned terminal failed because the conversation with the other system failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARQ

AZI4

Explanation: An IRC data transmission request has been issued, but cannot be completed because the other system has become unavailable for interregion communication.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Rerun the transaction when IRC is available.

Module: DFHZARQ

AZI5

Explanation: An IRC data transmission request has been issued, but the data sent by the connected system in response to the request violated IRC protocols.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARQ

AZI6

Explanation: The transaction was connected to another transaction in another CICS system via an IRC link. This other transaction has abnormally terminated.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Correct the cause of the abend in the connected transaction.

Module: DFHZARQ

AZI7

Explanation: The transaction was processing an MRO request which involved waiting for a response from a connected subsystem. The 'wait' request was rejected by the CICS dispatcher.

System Action: The transaction is abnormally terminated with a dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZIS2

AZI8

Explanation: The error log data received with an ISSUE-ABEND flow on an IRC connection was not in the correct format.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZIS1

AZI9

Explanation: The transaction was processing an MRO request which involved waiting for a response from a connected subsystem. During the wait, the failing transaction was purged. The purge can only have been the result of operator action, such as a CEMT SET TASK PURGE.

System Action: The task is abnormally terminated with a dump.

User Response: Investigate the reason the transaction was purged.

Module: DFHZIS2

AZRA

Explanation: DFHZARRC detected that the address of an FMH in the APPC was not in the receive buffer. The cause could either be a storage overwrite or a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Module: DFHZARRC

AZRB

Explanation: Module DFHZARR0 was called with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR0

AZRD

Explanation: The logical and physical APPC receive buffers have become out of step. This problem is caused either by a storage overwrite or by a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Module: DFHZARR0

AZRE

Explanation: The logical APPC receive buffer (addressed by TCTERBLA) starts before or after the physical receive buffer (addressed by TCTERBLA). This is not valid as the logical receive buffer is the part of the physical receive buffer that is yet to be processed. This problem could be caused either by a storage overwrite or by a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible then a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Module: DFHZARR0

AZRF

Explanation: The DFHZUSR state machine has returned an invalid state error at a point where it should not be possible. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRF

AZRG

Explanation: The DFHZUSR state machine has returned an invalid state error at a point where it should not be possible. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR

AZRH

Explanation: The DFHZARR state variable RECEIVE_TYPE, used to control receive processing, has been set to an invalid value. The only other module that has access to this variable is DFHZARRF. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR

AZRI

Explanation: One of the parameters passed to DFHZARR1. was invalid. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR1

AZRJ

Explanation: The length of a record that DFHZARR0 has been requested to remove from the APPC receive buffer, is longer than the buffer itself. This problem could be caused either by a storage overwrite or by a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Module: DFHZARR0

AZRK

Explanation: The DFHLUC parameter list passed back from DFHZERH to DFHZARRF contained an invalid combination of LUCCIERR, LUCCIFRE, and LUCCIRBK fields. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRF

AZRL

Explanation: Module DFHZARRF was called with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRF

AZRM

Explanation: Module DFHZARR called one of its own internal routines at the wrong time. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR

AZRN

Explanation: The DFHLUC parameter list passed back from DFHZERH to DFHZARRF did not have LUCCIERR set on. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRF

AZRO

Explanation: Module DFHZARER was called with an invalid first parameter. The first parameter should be the code of the function to be performed. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARER

AZRP

Explanation: Module DFHZARER detected an invalid response from DFHZNAC. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARER

AZRQ

Explanation: Module DFHZARRA was called with an invalid parameter. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRA

AZRR

Explanation: Module DFHZARRA detected that the application buffer chained off of a TCTTE at offset TCTERCSA had a corrupted header. This is caused either by a CICS logic error or by a storage overwrite. The exception trace point that accompanies this abend code gives the TCTTE address.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Module: DFHZARRA

AZRS

Explanation: Module DFHZARRA is unable to acquire main memory for a new application buffer into which it is supposed to copy some data. This is because the DFHLUC receive request is SUBTYPE=LLID, SET=YES and DFHZARRA does not know the length to acquire on the GETMAIN. DFHZARRA requires the length of the record currently being received, but it has been set to 0 in error. This is a CICS logic error. The exception trace point that accompanies this abend code gives the TCTTE address.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRA

AZRT

Explanation: Module DFHZARRA has detected that the application buffer, into which it is supposed to copy some data, is invalid. This is either because the address of the buffer is zero or because its length is less than that of the data to be copied into it. This is a CICS logic error. The exception trace point that accompanies this abend code gives the buffer address and length plus the data address and length.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRA

AZRU

Explanation: Module DFHZARRF detected an unexpected response from DFHZARR0. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, then a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARRF

AZRV

Explanation: Module DFHZARR1 detected an unexpected response from DFHZARR0. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: One of the parameters passed to DFHZARR1

AZRW

Explanation: Module DFHZARRA detected a negative record length in the TCTTE (field TCTELLC). This is caused either by a CICS logic error or by a storage overwrite. The exception trace point that accompanies this abend code gives the TCTTE address and the value of TCTELLC.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. Check the TCTTE in the transaction dump for printable characters or other signs of a storage violation error.

Module: DFHZARRA

AZRY

Explanation: Module DFHZARR detected an unexpected response from DFHZARRC. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR

AZRZ

Explanation: Module DFHZARR detected an unexpected response from an internal subroutine. This is a CICS logic error. The exception trace point that accompanies this abend code gives the invalid response code.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: If this problem is reproducible, a level 1 and 2 trace of the TC component would aid problem determination. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR

AZR2

Explanation: Module DFHZARRA is unable to acquire main memory for a new application buffer because the storage manager GETMAIN failed.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the trace to identify the failing return from the storage manager and analyze the reason for failure.

Module: DFHZARRA

AZR3

Explanation: During a GETMAIN request, the storage domain detected that the task has been purged.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the trace to investigate why the task was purged. Check if the master terminal operator was responsible.

Module: DFHZARRA

AZR4

Explanation: An unexpected response has been received from a dispatcher domain call.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARER

AZR5

Explanation: An unexpected response has been received from a dispatcher domain call.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARR1

AZR6

Explanation: An exception condition was raised as the result of a request from the APPC communications routine DFHZARL to the CICS recovery manager domain. This is either caused by a CICS logic error or by the inappropriate use of the indoubt test transaction, CIND. CIND should be activated only on the CICS system where the syncpoint processing was initiated. In particular, CIND should not be used on any of the CICS mirror transactions.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: Determine whether CIND has been activated for a transaction that did not initiate the syncpoint processing. If CIND is not being used, you will need further assistance from IBM to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZARER

AZS0

Explanation: An invalid request was passed via the DFHZSTAM macro to the processing DFHZSTAP program. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSTAP

AZS1

Explanation: No TCTTE pointer was passed via the DFHZSTAM macro to the processing DFHZ program. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSTAP

AZS2

Explanation: The TCTTE passed via the DFHZSTAM macro to the processing DFHZSTAP program does not relate to an MRO or an APPC Conversation. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSTAP

AZS3

Explanation: The TCTTE passed via the DFHZSTAM macro to the processing DFHZSTAP program for an APPC Conversation, but the LUC Extension Control Block was not located. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSTAP

AZS4

Explanation: While processing a DFHZSTAM request in DFHZSTAP, the DFHZUSRM LUC State Machine was found to have an invalid setting. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSTAP

AZS5

Explanation: Whilst processing a DFHZSTAM request in DFHZSTAP, the Internal State number was found to have an invalid setting. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSTAP

AZS6

Explanation: Whilst processing a DFHZSTAM request in DFHZSTAP, the Internal State number was found to have an invalid setting. This is a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZSTAP

AZTA

Explanation: The task does not own a terminal as its principal facility.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTB

Explanation: An attempt to install or delete a remote terminal in this CICS system has failed. This abend can also occur if the CITS/CDTS/CMTS/CFTS transactions are not available (that is , if the transactions have not been installed).

System Action: DFHZTSP is abnormally terminated with a CICS transaction dump.

User Response: Verify that the listed transactions exist and have been installed. If they have, you need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTC

Explanation: An attempt to install or delete a remote terminal in this system has failed. This is because a short-on-storage (SOS) condition has caused the failure of a GETMAIN for the attach of CITS, CDTS, or CFTS.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Investigate the reason for the SOS condition. See the *CICS Problem Determination Guide* for guidance on dealing with the SOS condition.

Retry the transaction later.

Module: DFHZTSP

AZTF

Explanation: DFHZTSP tried to GETMAIN or FREEMAIN a TCTTE whose length (TCTTETEL) is longer than the largest TCTTE SUBPOOL and is therefore invalid. This implies a storage violation or a CICS internal logic error.

System Action: The transaction is abnormally terminated with a CICS transaction dump.

User Response: Use the transaction dump to identify the TCTTE in error. First, check whether this is a storage overwrite. If so, check in your statistics to see if you are getting a number of storage violations caused by the same transaction. If this is the case, then a user-supplied application is probably causing the problem.

If it is not a storage violation problem, or if there is a random storage violation, there might be an error in CICS. In this case, you need further assistance to resolve the problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTG

Explanation: An attempt has been made to attach a task on a remotely-owned terminal without an intersystem TCTTE as its principal facility.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTH

Explanation: An error response was received from the remote terminal control macro.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTI

Explanation: An attempt has been made to attach a task on a remotely-owned terminal, but the terminal is not defined in this system as a remotely-owned terminal.

Alternatively, another task holds a lock on this terminal.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check the terminal control table definitions in the systems involved. If the definitions are correct, check that no other tasks have locks held on the terminal (CECI, for example).

Module: DFHZTSP

AZTL

Explanation: An attempt has been made to attach a task to a remotely-owned terminal that cannot be used to run this transaction.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Inform the system programmer. Check the terminal control table definitions in the systems involved.

Module: DFHZTSP

AZTM

Explanation: The data received from the remote system does not contain an FMH (function management header).

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTN

Explanation: Conversation with a remote system has been unexpectedly terminated.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTO

Explanation: The TCTTE ownership chain is in error.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTP

Explanation: A BMS TYPE=STORE request issued on behalf of a remote transaction failed.

System Action: The task abnormally terminates with a CICS transaction dump.

User Response: Inform the system programmer. Check that the required BMS support has been generated.

Module: DFHZTSP

AZTQ

Explanation: Invalid BMS data received from remote system.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTR

Explanation: A BMS TYPE=PAGEOUT request issued on behalf of a remote system failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Ensure that the required BMS support has been generated.

Module: DFHZTSP

AZTS

Explanation: An attempt to ship data to a remote system failed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Investigate why the conversations with the remote system failed. The transaction on the remote system has probably been abnormally terminated or the session has failed.

Module: DFHZTSP

AZTT

Explanation: An attempt was made to attach a task on a remote system, but the connection with the remote system is not an APPC or MRO connection.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Redefine the connection as APPC or MRO, or avoid using transaction routing on this connection.

Module: DFHZTSP

AZTU

Explanation: The task does not own the link TCTTE after a sync point has been taken.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTV

Explanation: An invalid function management header (FMH) has been received from the remote system.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZTW

Explanation: An attempt was made to attach a task on a remotely-owned terminal that was already running a task.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check the terminal control table definitions in the systems involved.

Module: DFHZTSP

AZTY

Explanation: A session TCT entry for a remotely owned APPC terminal or connection could not be created because to do so would exceed the maximum number of APPC sessions permitted.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Inform the system programmer. Either wait for the system to become less busy, or delete some APPC sessions.

Module: DFHZTSP

AZTZ

Explanation: The CICS relay program DFHCRT has been attached in an unsupported manner.

System Action: CICS abnormally terminates the transaction with a transaction dump.

User Response: The relay transaction executes with an MRO session or an LU type 6.2 conversation as its principal facility. Ensure that the transaction is being attached by APPC terminal sharing logic and not directly by a user transaction.

If the transaction is being attached by APPC terminal sharing logic, you need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZT1

Explanation: The task has been attached improperly in the application-owning region when transaction routing.

System Action: CICS abnormally terminates the transaction with a transaction dump.

User Response: The conversation with the routing system should be an MRO session or an LU type 6.2 conversation. Ensure that the transaction is being attached by the CICS relay program in the connected system and not by a user program.

If the transaction is being attached by the CICS relay program in the connected system, you need further assistance to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZT3

Explanation: The task is being routed back to the region from where it came.

System Action: CICS abnormally terminates the transaction with a transaction dump.

User Response: Correct the transaction definition.

Module: DFHZTSP

AZT6

Explanation: The task in the application-owning region has received a ROLLBACK request from the terminal-owning region, but the conversation is continuing. The terminal-owning region has violated the transaction routing protocol.

System Action: CICS abnormally terminates the transaction with a transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZT7

Explanation: A session terminal control table (TCT) entry for a remotely owned APPC terminal or connection could not be added to the TCT.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZT8

Explanation: A session terminal control table (TCT) entry for a remotely owned APPC terminal or connection could not be deleted from the TCT.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZTSP

AZT9

Explanation: A session terminal control table (TCT) entry for a remotely owned APPC terminal or connection could not be deleted from the TCT because it is locked by another task.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: The other task may be transitory in nature, and if so, another attempt will succeed.

Module: DFHZTSP

AZVA

Explanation: DFHZTSP has timed out waiting for service transaction CITS to complete during the creation of a remote terminal while attaching a task in the application-owning region.

The probable cause of this is that the application-owning region is very busy, so the CITS transaction has been waiting to be dispatched for longer than the timeout value allowed by DFHZTSP. Lack of storage on the target system is one possible reason why CITS has not been dispatched, or has been dispatched but has not completed.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Retry the transaction when the system becomes less busy. For more information on improving transaction throughput on the target system, see the *CICS Performance Guide*.

Module: DFHZATS

AZVB

Explanation: DFHZCQ has failed to create the remote terminal definition. A previous message or messages should indicate the reason for the failure.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: See the previous message or messages for further guidance.

Module: DFHZATS

AZVC

Explanation: An unexpected error has occurred in DFHZATS. This is probably caused by DFHZATS being unable to address the CSA, EIB or the TCA. It can also occur if DFHZATS is called with an EXEC CICS START command for transactions CITS, CFTS, CMTS or CDTS. These are internal CICS transactions and should not be called in this way.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZVD

Explanation: An unexpected error has occurred in the install procedure of DFHZATS.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: This is a CICS logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZVE

Explanation: DFHZATS is trying to install a remote terminal with the same terminal id as an existing TCT entry.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Change the terminal names to ensure that a duplicate does not occur in the same system.

Module: DFHZATS

AZVF

Explanation: One of the remote install or delete transactions of DFHZATS (CITS, CFTS, CMTS or CDTS) has been started directly from a terminal. This is not permitted. These transactions can only be started internally by CICS.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: None.

Module: DFHZATS

AZVG

Explanation: An error has occurred in the remote delete routines.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZVH

Explanation: An error has occurred in the remote delete routine during the mass deletion of remote terminals.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZVI

Explanation: An error has occurred in the remote delete routine while an attempt was being made to delete a single remote terminal.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Check the CADL transient data queue for any associated messages indicating the reason for the error. If you cannot resolve the problem, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZVJ

Explanation: An error has occurred during the mass deletion of remote terminals. This is caused by a CICS logic error.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZVK

Explanation: An unexpected return code has been received from the remote delete routine during the deletion of a single remote terminal.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Look for an accompanying DFHZC6911 message indicating the reason for the delete failure, and take appropriate action.

Module: DFHZATS

AZVL

Explanation: An error has occurred during the mass flagging of remote terminals for deletion.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZVM

Explanation: An error has occurred in DFHZATMF. This is probably caused by DFHZATMF being unable to address the CSA, EIB, or the TCA.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATMF

AZVN

Explanation: The remote delete flag transaction of DFHZATMF (CRMF) has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: None.

Module: DFHZATMF

AZVO

Explanation: The remote delete transaction of DFHZATMD (CRMD) has been started directly from a terminal. This is not permitted. This transaction can only be started internally by CICS.

System Action: The transaction is abnormally terminated with a transaction dump.

User Response: None.

Module: DFHZATMD

AZVP

Explanation: An error has occurred in DFHZATMD. This is probably caused by DFHZATMD being unable to address the CSA, EIB, or the TCA.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATMD

AZVQ

Explanation: A request to install a shipped terminal definition has been rejected by the autoinstall user program.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Retry the transaction when the system is less busy.

Module: DFHZATS

AZVR

Explanation: An attempt to install a shipped terminal definition has failed because the autoinstall user program has issued an unexpected return code.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Examine the autoinstall user program to determine why this return code was issued.

Module: DFHZATS

AZVS

Explanation: An attempt to install a shipped terminal definition has failed because an error has occurred in the autoinstall user program.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: Examine the autoinstall user program to determine the reason for the failure.

Module: DFHZATS

AZVU

Explanation: DFHZATS was attempting to autoinstall a shipped terminal, a virtual terminal or a shipped connection and the autoinstall URM was called. However the autoinstall failed for one of the following reasons:

- The name returned by the URM in SELECTED_SHIPPED_TERMID started with one of these characters:

  <
  >
  -

- The value in the SIT VTPREFIX parameter contained imbedded blanks or a character that is not allowed for terminal names.

System Action: The task is abnormally terminated with a CICS transaction dump.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHZATS

AZXA

Explanation: An unexpected error, with reason code 5, has been detected in the catchup program, DFHZXCU. See the description of message DFHXG6492 for further details.

System Action: Console message DFHXG6492 is issued, and CICS continues after abending the transaction.

User Response: Refer to message DFHXG6492.

Module: DFHZXCU

AZXB

Explanation: An unexpected error, with reason code 4, has been detected in the catchup program, DFHZXCU. See the description of message DFHXG6492 for further details.

System Action: Console message DFHXG6492 is issued, and CICS continues after abending the transaction.

User Response: Refer to message DFHXG6492.

Module: DFHZXCU

System dump codes

Whenever a CICS system dump is requested, CICS references a system dump code that corresponds to the event that caused the dump request to be made. This is done in order to see what further action should be taken. More information about this can be found in the *CICS Problem Determination Guide*.

In most cases, system dump codes correspond to a DFH message with the DFH tag stripped off. For example, system dump code DM0001 corresponds to message DFHDM0001 with the DFH tag removed. For further information, look up the relevant message where appropriate.

However, there are some exceptions to this format, as shown in the following list.

System dump code	*Corresponding message or exception condition*
ABNDU603	This system dump code refers to a USER abend code and is associated with message DFHSR0603.
ABNDU605	This system dump code refers to a USER abend code and is associated with message DFHSR0605.
APTRAPPC	This system dump code is associated with message DFHTR1001.
APTRAPUS	This system dump code is associated with message DFHTR1000.
APUSER	This system dump code is issued through the use of the CEBT transaction when performing a PERFORM SNAP command.
APXRFTO	This system dump code has no DFH message associated with it. An error in the currently active CICS system has occurred. An alternate CICS system is now taking control and is requesting that the active CICS system produces a dump of itself.
MT0001	This system dump code has no DFH message associated with it. It indicates that a dump was requested by a user of CEMT, issuing either a PERFORM SNAP or a PERFORM DUMP.

DHxx (IMS/ESA) abend codes

If the IMS high-level programming interface (HLPI) has found a condition caused by a programming error, or if DL/I has returned a status code to HLPI which indicates an error, IMS/ESA returns a status code *xx* to CICS Transaction Server for OS/390. These codes are described in the *IMS/ESA Application Programming: EXEC DLI Commands* manual.

DHTA

Explanation: A task has issued a program specification block (PSB) schedule request but the PSB could not be found.

See the description of the DL/I status code TA in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTC

Explanation: A task has issued a program specification block (PSB) schedule request but the PSB has already been scheduled.

See the description of the DL/I status code TC in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTE

Explanation: A task has issued a program specification block (PSB) schedule request but a PSB initializaton error occurred.

See the description of the DL/I status code TE in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTG

Explanation: A task has issued a terminate request but the request failed because the program specification block (PSB) is not scheduled.

See the description of the DL/I status code TG in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTH

Explanation: A task has issued a DL/I request but the request failed because the program specification block (PSB) is not scheduled.

See the description of the DL/I status code TH in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTJ

Explanation: A task has issued a program specification block (PSB) schedule request but the request failed because CICS is not connected to DBCTL.

See the description of the DL/I status code TJ in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

DHTQ

Explanation: A task has issued a program specification block (PSB) schedule request but the request failed.

See the description of the DL/I status code TQ in the *IMS/ESA Application Programming: EXEC DLI Commands* manual for guidance.

01xx (translator) abend codes

0100 LISTING FILE CANNOT BE OPENED

Explanation: The listing data set has not opened successfully.

System Action: The CICS command level translator terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

User Response: Ensure correct JCL or determine what is causing the open error.

Modules: DFHEAP (for assembler language), DFHECP (for COBOL), DFHEDP (for C), DFHEPP (for PL/I)

0101 UNRECOVERABLE TRANSLATOR ERROR

Explanation: The translator encountered a program check from which it could not recover.

System Action: The CICS command-level translator terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHEAP (for assembler language), DFHECP (for COBOL), DFHEDP (for C), DFHEPP (for PL/I)

02xx (DFHPD520) abend codes

0211 RECURSIVE PROGRAM CHECK

Explanation: A program check has occurred while the system dump formatting program was handling an earlier program check.

System Action: The system dump formatting program terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

User Response: The program check preceding the abend is accompanied by message DFHPD0123. See the description of this message for more guidance.

Module: DFHPD520

0212 TOO MANY PROGRAM CHECKS

Explanation: A sixth program check has occurred during execution of the system dump formatting program.

System Action: The system dump formatting program terminates abnormally. A system dump is produced if a SYSABEND or SYSUDUMP DD statement is provided.

User Response: This abend is preceded by five DFHPD0123 messages, one for each of the five earlier program checks. See the description of this message for more guidance.

Module: DFHPD520

03xx (DFHCSDUP) abend codes

0300

Explanation: The SYSIN data set has not opened successfully.

System Action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSDUMP DD statement is provided, a system dump is produced.

User Response: Ensure that the JCL is correct and that the SYSIN data set exists in sequential form. If necessary, examine the SYSIN DD statement to determine the cause of the error.

Module: DFHCSDUP

0301

Explanation: The RECFM parameter specified in the SYSIN data set is invalid.

System Action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: Ensure that the RECFM parameter in the SYSIN data set is either F or V.

Module: DFHCSDUP

0302

Explanation: The record length specified in the SYSIN data set is invalid.

System Action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: Ensure that the record length specified in the SYSIN data set is no greater than 80.

Module: DFHCSDUP

0303

Explanation: The SYSPRINT data set did not open successfully.

System Action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: Ensure that the SYSPRINT data set exists. If necessary, examine the SYSPRINT DD statement to determine the cause of the error.

Module: DFHCSDUP

0304

Explanation: DFHCSDUP has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System Action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:

1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0305

Explanation: An unexpected return code was received either while trying to close the alternate SYSIN and SYSPRINT DCBs (CLOSEDCB) or while trying to free the task local storage (FREETLS).

System Action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0307

Explanation: An attempt to print the input command failed. Since messages cannot be issued, the utility must terminate.

System Action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0308

Explanation: During the migration of a TCT table, a bad command sequence was found. This can occur for one of the following reasons:

- TYPETERM was not preceded by TERMINAL
- TERMINAL was not followed by TYPETERM

System Action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: Correct the TCT table to be migrated and rerun the job.

Module: DFHCSDUP

0309

Explanation: DFHCSDUP has found an unrecognized function code in a command. This is a CICS internal logic error.

System Action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0321

Explanation: An internal error has occurred in module DFHCSDUP when invoked by a CSD utility command.

System Action: Message DFH5100 is issued and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0322

Explanation: While processing a MIGRATE command, the specified table to be migrated could not be loaded.

System Action: Message DFH5601 is issued and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0323

Explanation: While processing a command, VSAM detected an error.

System Action: Message DFH5179 is issued preceded by either DFH5177 or DFH5178 depending on the error and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: See the description of the issued messages to determine the cause of the error.

Module: DFHCSDUP

0325

Explanation: When the LIST command invoked DFHDMP to scan the objects on the CSD file, an error occurred during execution of the DFHDMP function.

System Action: Message DFH5180 is issued and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0326

Explanation: There has been an internal logic error in the DFHCSDUP utility program. The data in the back-translated output buffer is invalid. The length code may be out of range or the data fields in the wrong sequence. One or more of the data fields may be invalid.

System Action: Message DFH5184 is issued and the CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0327

Explanation: The language table DFHEITCU could not be loaded.

System Action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: Refer to the preceding message which should specify the reason for the failure. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0328

Explanation: The language table DFHEITCU could not be unloaded.

System Action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP DD statement is provided, a system dump is produced.

User Response: Refer to the preceding message which should specify the reason for the failure. You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0330

Explanation: The cross reference table size for the table being migrated is too small.

System Action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP statement is provided, a system dump is produced.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0331

Explanation: DFHCSDUP was invoked to perform an EXTRACT command using a Language Environment-conforming HLL user exit, but the utility failed to initialize the CEE environment successfully.

System Action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP statement is provided, a system dump is produced. Register 15 contains the initialization return code.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

0332

Explanation: DFHCSDUP was invoked to perform an EXTRACT command using a Language Environment-conforming HLL user exit, but during execution the utility recived a bad return code from the Language Environment.

System Action: The CSD batch update utility terminates abnormally. If a SYSABEND or SYSUDUMP statement is provided, a system dump is produced. Register 15 contains the Language Environment return code. code.

User Response: You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: DFHCSDUP

04xx (external CICS interface) abend codes

0401

Explanation: An external CICS interface (EXCI) request was issued using the CALL API or the EXEC API, and the EXCI stub DFHXCSTB link-edited with the application detected that it was running in AMODE 24. The external CICS interface only supports calls made in AMODE 31.

System Action: The application terminates abnormally.

User Response: Change the application so that EXCI calls are made in AMODE 31, or relink-edit the application AMODE 31.

Module: DFHXCSTB.

0402

Explanation: The external CICS interface module DFHXCPRH issued an MVS ESTAE macro to establish a recovery environment, but a nonzero return code was returned from MVS.

System Action: The application terminates abnormally with a dump.

User Response: Examine the dump and any associated MVS messages produced to determine why the MVS ESTAE request failed.

If the error occurred while processing an INITIALIZE_USER request on behalf of the application, an attempt to format the dump using the CICS IPCS dump formatter does not produce any formatted output. This is because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0403

Explanation: The external CICS interface module DFHXCPRH issued an MVS GETMAIN request to obtain storage for its XCGLOBAL block, but a nonzero return code was returned from MVS.

System Action: Module DFHXCPRH issues an MVS abend with abend code 0403 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(XCGLOBAL_GETMAIN_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(602).

User Response: Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0404

Explanation: The external CICS interface module DFHXCPRH needed to take an MVS SDUMP for an earlier reported problem. However the error has occurred too early in EXCI initialization for EXCI dump services to be available.

System Action: Module DFHXCPRH issues an MVS abend with abend code 0404 which invokes its ESTAE routine from which a SYSMDUMP is taken instead of an SDUMP to capture the earlier reported problem.

User Response: Examine the SYSMDUMP to determine the cause of the earlier reported problem.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0405

Explanation: The external CICS interface module DFHXCPRH issued an IEFSSREQ SSI verify request to MVS to determine the number of the CICS SVC type 3 SVC to use. The SSI VERIFY request failed.

System Action: Module DFHXCPRH issues an MVS abend with abend code 0405 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(SSI_VERIFY_FAILED) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the SSI verify failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(606).

User Response: Use the MVS R15 return code obtained from the application or from the dump to determine why the SSI VERIFY request failed.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0406

Explanation: The external CICS interface module DFHXCPRH called the CICS SVC to initialize the EXCI environment. The CICS SVC call failed.

System Action: Module DFHXCPRH issues an MVS abend with abend code 0406 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(CICS_SVC_CALL_FAILURE) in its return area. The subreason1 field of the return area contains the R15 return code from the CICS SVC indicating why it failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(607).

User Response: Use the MVS R15 return code obtained from the application or from the dump to determine why the CICS SVC call failed.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0407

Explanation: The external CICS interface module DFHXCPRH issued a call to the CICS SVC to check whether the SVC in use is at the correct level to be used with the external CICS interface. The check failed indicating that the CICS SVC is not at the correct level.

System Action: Message DFHEX0100 is output, and module DFHXCPRH issues an MVS abend with abend code 0407 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(INCORRECT_SVC_LEVEL) in its return area. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(627).

User Response: See the explanation of message DFHEX0100 for guidance.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0408

Explanation: The external CICS interface module DFHXCPRH issued an MVS GETMAIN request for its working storage but a nonzero return code was returned from MVS.

System Action: Module DFHXCPRH issues an MVS abend with abend code 0408 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(WS_GETMAIN_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(601).

User Response: Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0409

Explanation: The external CICS interface module DFHXCPRH issued an MVS GETMAIN request for storage required for its SSI VERIFY request, but a nonzero return code was returned from MVS.

System Action: Module DFHXCPRH issues an MVS abend with abend code 0409 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(VERIFY_BLOCK_GM_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(605).

User Response: Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCPRH

0410

Explanation: The external CICS interface module DFHXCPRH issued an MVS GETMAIN request for an XCUSER block but a nonzero return code was returned from MVS.

System Action: Module DFHXCPRH issues an MVS abend with abend code 0410 which invokes its ESTAE routine to clear up its environment. A SYSMDUMP is taken before returning control to the application. An application using the EXCI CALL API receives RESPONSE(SYSTEM_ERROR) REASON(XCUSER_GETMAIN_ERROR) in its return area. The subreason1 field of the return area contains the R15 return code from MVS indicating why the GETMAIN failed. An application using the EXCI EXEC API receives RESP(LINKERR) RESP2(603).

User Response: Use the MVS R15 return code obtained from the application or from the dump to determine why the MVS GETMAIN request failed. If the reason is insufficient storage, increase the region size of the batch application.

Module: DFHXCPRH

0411

Explanation: The external CICS interface dump module DFHXCDMP was attempting to call the CICS SVC in order for an MVS SDUMP to be taken to capture an earlier problem. DFHXCDMP was unable to call the SVC as no SVC number was available. DFHXCDMP issued an 0411 abend in order that the callers ESTAE routine is invoked which takes a SYSMDUMP instead.

System Action: A SYSMDUMP is taken instead of an SDUMP for an earlier reported problem.

User Response: Use the SYSMDUMP produced to diagnose the earlier reported problem.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCDMP

0412

Explanation: The external CICS interface dump module DFHXCEIP was processing an EXCI EXEC API request and detected that the EXEC parameter list passed to it contained a function that is not supported by the external CICS interface.

System Action: The application is abnormally terminated with a dump.

User Response: This error indicates the parameter list being passed to the EXCI has not been generated by the CICS translator. The translator should always be used. Correct the application to specify the correct EXCI EXEC API command.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter may not produce any formatted output for the job if this was the first EXCI request for this TCB.

Module: DFHXCEIP

0413

Explanation: The external CICS interface dump module DFHXCEIP was processing an EXCI EXEC API request and detected that the EXEC parameter list passed to it did not require the mandatory RETCODE parameter in which return codes are returned to the application.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter may not produce any formatted output for the job if this was the first EXCI request for this TCB.

System Action: The application is abnormally terminated with a dump.

User Response: This error indicates the parameter list being passed to the EXCI has not been generated by the CICS translator. The translator should always be used. Correct the application to specify RETCODE.

Module: DFHXCEIP

0414

Explanation: The external CICS interface module DFHXCEIP issued an MVS ESTAE macro to establish a recovery environment but a nonzero return code was returned from MVS.

System Action: The application terminates abnormally with a dump.

User Response: Examine the dump and any associated MVS messages to determine why the MVS ESTAE request failed.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter may not produce any formatted output for the job if this was the first EXCI request for this TCB.

Module: DFHXCEIP

0415

Explanation: The external CICS interface module DFHXCEIP detected an error early in EXCI initialization before EXCI dump services were available. DFHXCEIP issues abend 0415 so that its ESTAE routine is invoked from where an SYSMDUMP is taken instead to capture the error.

System Action: The application terminates abnormally with a dump.

User Response: Examine the SYSMDUMP to determine the cause of the earlier reported error.

An attempt to format the SYSMDUMP produced with the CICS IPCS dump formatter does not produce any formatted output for the job because the error occurred too early in EXCI initialization for there to be any control blocks.

Module: DFHXCEIP

05xx CICS JVM Interface abend codes

0501

Explanation: A JCICS Java Class method was invoked from a Java application running under control of a JVM and executing on a thread other than the initial process thread (IPT). JCICS requests can only be issued when executing under the initial process thread.

System Action: The thread is abended with a MVS 0501 user abend code causing the initial process thread to be abnormally terminated. Language environment recovery processing is driven causing a 4xxx abend to be issued under the J8 TCB on which the JVM is running. CICS recovery processing terminates the JVM and abnormally terminates the transaction with an ASRB abend code.

User Response: Change the application so that JCICS requests are issued when running under the initial process thread.

Modules:

DFHCALLA, DFHMSGIF, DFHTRCIF

0555

Explanation: A program check occurred, or an operating system or CICS abend was issued within the CICS JVM interface. CICS recovery processing issues an MVS 555 user abend in order to drive the language environment ESTAE routine, which is still active, as part of its cleanup and termination of the CICS task.

System Action: The 555 abend code drives language environment recovery processing. The JVM is terminated and the CICS task is abnormally terminated with the abend code that first initiated CICS recovery processing.

User Response: None. The 555 abend is an internal mechanism to ensure that CICS and Language environment recovery facilities correctly terminate the CICS task and the JVM environment.

Module: DFHAPLJ

1xxx - 9xxx (COBOL II) abend codes

Abend codes with 1 through 9 as the first character are issued by COBOL II applications running on CICS. The last three digits of the abend code, *xxx*, correspond to the digits *xxx* in the associated COBOL II run-time message, IGZ*xxx*I. For example, if you receive an abend code of 1001, the associated run-time message is IGZ001I.

COBOL II run-time messages are described in *VS COBOL II Application Programming Debugging*.

4xxx LE/370 abend codes

Abend codes in the range 4000 to 4095 are issued by LE/370 runtime library modules for LE enabled applications running on CICS.

When LE/370 detects an unrecoverable error, LE/370 terminates the transaction with an EXEC CICS abend with an abend code numbered from 4000-4095. A write-to-operator (WTO) is performed to write a CEE1000S message to the system console. This message contains the abend code and the reason code associated with the abend.

Some of these abends can occur when the system is under stress and LE/370 is unable to acquire the resources required to report a previous abend or failure. In this case there will usually be other symptoms that the system is under stress (for example short on storage messages or other transactions being purged with AEXY or AKC3 abends), and inspection of the transaction dump should allow identification of the original abend.

LE/370 abend codes and run-time messages are described in *IBM Language Environment for MVS and VM Debugging Guide and Run-Time Messages* .

Chapter 4. Transaction Dump Codes

A transaction dump is normally taken as a result of one of two events:

- When an application abends, or issues an EXEC CICS ABEND request.

  In this case, the dump code is the same as the transaction abend code.

- When either CICS or an application issues an EXEC CICS DUMP TRANSACTION request.

  In this case, the dump code is the value specified in the DUMPCODE operand of the request.

CICS-requested Transaction Dump Codes

AUTO

Explanation: The IBM-supplied sample PL/I terminal autoinstall program DFHZPTDX issues an EXEC CICS DUMP TRANSACTION request with this dump code if the autoinstall program is called with an unexpected request.

System Action: DFHZPTDX is ended.

User Response: Check and correct the request made to the sample autoinstall program.

Module: DFHZPTDX

CSXP

Explanation: The CEDF transaction has abended.

System Action: CEDF captures diagnostic information which may be used by IBM.

User Response: Check for a previous message which will indicate which abend caused CEDF to end abnormally. Investigate this abend.

See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

Module: CEDF

ERRS

Explanation: A CICS sample program has encountered an error and issued an EXEC CICS DUMP TRANSACTION request.

System Action: The sample program terminates abnormally.

User Response: Ceck and correct the source of the sample program which issued the DUMP TRANSACTION request.

Module: DFH£AAL, DFH£ABRW, DFH£ACOM, DFH£AREN, DFH£DALL, DFH£DBRW, DFH£DCOM, DFH£DREN, DFH£PALL, DFH£PBRW, DFH£PCOM, DFH£PREN, DFH0CALL, DFH0CBRW, DFH0CCOM, DFH0CREN

LDIN

Explanation: See dump code CSXP.

PAGE

Explanation: See dump code CSXP.

RMIN

Explanation: See dump code CSXP.

Appendix. Summary of changes

This appendix lists messages and abends changed between CICS Transaction Server for OS/390 Release 3 and CICS Transaction Server for OS/390 Release 2.

Sending your comments to IBM

CICS® Transaction Server for OS/390®

CICS Messages and Codes

GC33-1694-02

If you want to send to IBM any comments you have about this book, please use one of the methods listed below. Feel free to comment on anything you regard as a specific error or omission in the subject matter, and on the clarity, organization or completeness of the book itself.

To request additional publications, or to ask questions or make comments about the functions of IBM products or systems, you should talk to your IBM representative or to your IBM authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate, without incurring any obligation to you.

You can send your comments to IBM in any of the following ways:

- By mail:

  IBM UK Laboratories
  Information Development
  Mail Point 095
  Hursley Park
  Winchester, SO21 2JN
  England

- By fax:
  - From outside the U.K., after your international access code use 44 1962 870229
  - From within the U.K., use 01962 870229
- Electronically, use the appropriate network ID:
  - IBM Mail Exchange: GBIBM2Q9 at IBMMAIL
  - IBMLink: HURSLEY(IDRCF)
  - Email: idrcf@hursley.ibm.com

Whichever method you use, ensure that you include:

- The publication number and title
- The page number or topic to which your comment applies
- Your name and address/telephone number/fax number/network ID.

Printed in the United States of America
on recycled paper containing 10%
recovered post-consumer fiber.
