## A41 Exploring OTMA User Exits

Virgil Aguilar

**VIEW** 

How do you tell IMS to send your output messages to legacy applications from OTMA? Do I need to code user exit DFSYPRX0 and user exit DFSYDRU0? How do I provide additional security validation? Would transaction user exit DFSCTRN0 provide me the userid? Who can issue IMS commands? Do I need to code user exit DFSCCMD0 to verify the userid? Come to this session to get the answers to these questions! The topic covers purpose, input parmlist, output return codes, sample code and example applications. It also discusses user input/output exits, DFSNPRT0, DFSYIOE0 and DFSNDMX0.
