B04   An Intro to IMS e-business Solutions
Joy Hwang

With much of the world's corporate data residing in high-performance IMS systems, e-business enablement is a hot topic for IMS users. This session provides an overview of IMS e-business enablement tools and solutions involving WebSphere. These solutions extend IMS applications and data out to the Internet/Intranet and into the world of Java, EJBs, and XML. This session explores the architecture used to "Web-enable" IMS using WebSphere, and introduces you to the IMS Web-enabling tools and their interfaces. It covers the IMS role in the e-business framework and focuses on the currently available IMS WebSphere connectors. Many IMS users are using WebSphere today to access IMS data directly or via IMS transactions. The session also explains the direction the IMS connectors will be taking in the future as they help users implement their solutions across the Web.
