Session Abstract

S45   Migrating to HALDB
Rich Lewis

High Availability Large Database (HALDB) is a new capability introduced with IMS V7. Other sessions at this conference describe how HALDB allows a database to grow to many terabytes. HALDB databases also provide increased availability by dramatically shortening reorganization times and allowing parallel processing of multiple partitions of a database. So, how do we migrate an existing IMS database to HALDB? This session describes the process and the options for doing this migration. This topic also includes a discussion on migrations of databases that were partitioned by other means.
