E08 Using IMS and DB2 Together

Helene Lyon, IMS Software Specialist, IBM France

VIEW

IMS, as a transaction manager, can execute application programs which access IMS databases as well as DB2 tables. This session explains how the External Subsystem Attach Facility (ESAF) works and how IMS and DB2 can work together. IMS, as a database manager, can be accessed by DB2 Stored Procedures or by other environments using JDBC. Investigate new ways to access IMS databases, possible with IMS V7 or V8 and ODBA.
