Session Abstract

E56   IMS V8 DBRC Enhancements
Karen Ranson, IBM Silicon Valley Laboratory

Several long awaited DBRC requirements have been satisfied in IMS Version 8. Command authorization support helps protect the RECON by allowing you to control which users can issue specific DBRC commands. DBRC now supports RECON records greater than the physical RECON record size, so no more outages due to PRILOG record size growth. And notification of the loss of a RECON data set is now automatic. Hear the details of the enhancements in this session.
