High Availability Large Database (HALDB) is a new capability introduced with IMS V7. Other sessions at this conference describe how HALDB allows a database to grow to many terabytes. HALDB databases also provide increased availability by dramatically shortening reorganization times and allowing parallel processing of multiple partitions of a database. So, how do we migrate an existing IMS database to HALDB? This session describes the process and the options for doing this migration. Migrations of databases that were partitioned by other means are included.

Before attending this session, you should understand basic HALDB concepts, which can be obtained by attending session E04, Introduction to HALDB, or by prior training or experience.
