Risaris Limited

SOA Gateway

IBM

Solution Description

The SOA Gateway solution uses proven Service Oriented Architecture (SOA) standards and a unique back-to-front approach to address the gap between logic and data across all platforms. This provides organizations with instant access to legacy data and information affecting business and IT operations. The out-of-the-box connectivity to legacy data and information reduces IT investment by eliminating the need for custom code development every time there is a need to access new data. This efficient, secure data and information transfer across the corporate structure reduces data and process duplication enterprise-wide.

Features & Benefits

- Reduce time to access legacy data and information

- Increase re-use of legacy data and information across organizations

- Platform independent

- Access to operational data

- Non-proprietary, enabling standards to be adopted across multiple platforms and data sources

- Secure single point of data entry across all channels and business applications eliminates data duplication

Value Proposition

The SOA Gateway solution adopts the view that data and business logic can be exposed in a simple, open and logical fashion that requires no coding on the platform where the data and business logic resides. This is achieved with no client installation or footprint where business process management software is running, resulting in less testing, less maintenance, and less time to install. Companies see improved productivity across the organization's value chain and reduced cost of specialist data integration skills. By gaining access to existing data and business logic within days, not months, companies enjoy cost savings at all levels in a project.

Company Description

Risaris Limited, founded in 2003, has worked with leading organizations in the financial services, educational, aerospace and manufacturing industries, making legacy data and information resources available in a secure, cost-effective manner while protecting the integrity of data. Risaris has the experience and domain expertise to enable organizations to integrate their existing software systems into new and emerging technology standards. It understands the investment made in IT systems, data and security, and helps organizations maximize both the efficiency and effectiveness of their systems.
