IBM

Business Challenge

The customer needs to track the life cycle of items purchased, inventoried and sold. The time from inventory to sales on the Web needs to be reduced to near real-time.

Solution Description

Saturn will allow all types of orders to be tracked and traced from requisition to sales. The life cycle of items from requisition, purchasing, receiving, inspection, inventory, quoting, sales and shipping are available over the web. This hosted solution allows items to be available, in real-time, on the customer's e-commerce site with the ability to schedule special pricing and item availability.

Value Proposition

Rightsizing of the system hardware is not required. The customer can start out economically with WebSphere Application Server Express and Informix Workgroup and scale as necessary to multiple terabytes. Because the system is completely thin client, users can access data from locations anywhere in the world. Mobile applications are being developed and can be customized as required by the customer to allow users to interact at a moment's notice.

Company Description

The eStar Technologies staff has been producing rapid application development for many industries for 25 years. Our expertise is in our ability to get a project completed and implemented in an expedited manner. We know what we know and can help our customers use the Internet to its full potential.

IBM Segment
- Data Management

Business Function
- Order Tracking

Target Industry
- Cross Industry
