

Kingland Systems

Kingland 360DATA

Solution Description

Powered by IBM InfoSphere, the Kingland Systems 360 Data™ is a suite of enterprise data management solutions optimized for the financial services industry. 360 Data provides clients with a definitive source of global reference data, with higher accuracy and deeper coverage, and more flexibility to integrate with key operational, risk and compliance functions.

Features & Benefits

The combination of Kingland Systems and IBM in 360 Data is taking MDM to another level for financial services. Most major firms have similar requirements, such as:

- Integrating data from hundreds of major third party data sources (Interactive Data, Bloomberg, SEC).
- Integrating data from and to legacy systems that often support hundreds of other downstream systems.
- Identifying internal sources of data that can be used and trusted to meet business needs.
- Reducing data errors, exceptions, and overall data management costs.
- Establishing data integrity rules and maintaining data quality.
- Managing a “golden copy” while catering to specific source preferences from business functions.
- Responding quickly to new data needs from business functions.

Data 360 is comprised of three key financial services solutions:

1) Enterprise Hub: An MDM platform that enables the integration, management and distribution of many types of data that are foundational for the financial services industry. Enterprise Hub uses an innovative three-stage approach for managing the integration, management and distribution needs that are unique to the financial services industry.

2) Reference Desk: A customizable, ad-hoc data cleansing request service. Clients leverage this solution to support critical business functions with highly accurate data through a simple request and response data service. Data types include client, counterparty, hierarchy, securities, accounts and other client-specific data needs.

3) Master Files: A client-customized database of securities, business entities and hierarchies managed and maintained by Kingland Systems. Most legacy securities and client databases contain significant data quality challenges. To meet today's quality requirements of risk and compliance throughout leading financial services firms, Master File quality is targeted for 99 percent accuracy and successfully integrates specific business rules for clients.

Value Proposition

An effective MDM strategy requires that firms have the right expertise with MDM, the right technology to support their strategy, and data they can rely upon. Kingland Systems is one of the only providers of a suite of enterprise data management solutions that includes the three essential components of enterprise data management (Expertise, Technology and Data), and which is specifically focused on the financial services industry. In addition to the Enterprise Hub and Master File solutions, Kingland's teams of professionals are available to provide targeted services to help major data initiatives, including managed data research services, implementation and strategy consulting.

Company Description

Kingland Systems is a leader in solving complex business problems, providing world class technology services, solutions, and outsourcing to global financial and accounting institutions. Put simply, we like solving problems and have the experience and capabilities to do so for you.
