#### IBM WEBSPHERE BUSINESS MONITOR 6.2 - LAB EXERCISE

# WebSphere Business Monitor V6.2 User defined functions lab

What this exercise is about	1
Lab requirements	1
What you should be able to do	1
Introduction	2
Part 1: Import the Clips And Tacks monitor model	3
Part 2: Import the user defined function project	5
Part 3: Review the user defined functions and create the jar file	6
Part 4: Import the user defined functions into the monitor model	8
Part 5: Add expressions that reference user defined functions	11
Part 6: Publish the model to the server	13
Part 7: Run events to exercise the model	15
Part 8: Create a dashboard	17
What you did in this exercise	19

#### What this exercise is about

The objective of this lab is to show you how to use user defined functions in the monitor model. You will review the Java project that contains the user defined functions. You will edit the monitor model and add expressions which reference the user defined functions. You will also use the instances view to see the results in the dashboard.

# Lab requirements

List of system and software required for the student to complete the lab.

- Rational Application Developer 7.5 or WebSphere Integration Developer V6.2.
- WebSphere Business Monitor V6.2 Toolkit installation including the monitor model editor and Monitor server

# What you should be able to do

At the end of this lab you should be able to:

- Use Rational Application Developer or WebSphere Integration Developer to edit the monitor model to add references to user defined functions.
- Define a dashboard to view monitoring context instances.

### Introduction

In this lab you will build on the Clips And Tacks model which is described in another lab document titled 'WebSphere Business Monitor V6.2 Clips And Tacks business activity monitoring lab'. You will import the full Clips And Tacks model, then update the monitor model, deploy the changed model and submit events to the monitor model.

The user defined functions have been created for you so you can just import them into the workspace.

In the monitor model, you will define a new metric to track the cost of the ordering process. You will use an existing metric 'Order Fulfillment Duration' which is the duration of the order process. You will use a user defined function to calculate the cost of the process using the order fulfillment duration as an input parameter. The cost function could retrieve the average unit cost from a database or another system, but for simplicity in this lab, the Java function is implemented using a random number generator.

#### **Useful URLs**

The following URLs may be helpful to you as you exercise this lab. Note that the port numbers in the URL of your installation may be different depending on your configuration.

Server administrative console

https://localhost:9044/ibm/console

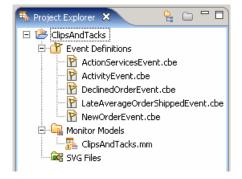

Business space dashboard

https://localhost:9444/BusinessSpace

# Part 1: Import the Clips And Tacks monitor model

In this section, you will import the Clips And Tacks monitor model into the workspace. If you already have the ClipsAndTacks model in your workspace after completing the Clips And Tacks lab, then you may skip this section.

 1.	Start Rational Application Developer or WebSphere Integration Developer and setup the environment.
-	a. Start Rational Application Developer or WebSphere Integration Developer, and when prompted point to a new workspace such as c:\workspaces\ClipsAndTacks
-	b. Close the Welcome tab.
-	c. Open the Business Monitoring perspective. Select <b>Window &gt; Open Perspective &gt; Business Monitoring</b> .
_	d. If it asks you to Confirm Enablement, then click <b>OK</b> .
_ 2.	Create a new monitoring project.
-	a. Right click the Project Explorer, then select <b>New &gt; Business Monitoring Project</b>
-	b. For Project name, enter ClipsAndTacks
_	c. Click <b>Finish</b> . You will see the new project in the Project Explorer view.
_ 3.	Import the supplied mm and cbe files.
-	a. Right click ClipsAndTacks in the Project Explorer view, and then select Import
-	b. Select <b>General &gt; File system</b> , click <b>Next</b> .
-	c. Browse to the location containing the files, for example, c:\Labfiles62\ClipsAndTacks
_	d. Select ActivityEvent.cbe
_	e. Select ClipsAndTacks.mm
-	f. Select DeclinedOrderEvent.cbe
_	g. Select LateAverageOrderShippedEvent.cbe
_	h. Select <b>NewOrderEvent.cbe</b>
_	_ i. Click <b>Finish</b> .
 4.	Expand the project in the Project Explorer view, then expand the Event Definitions and you will see the new events listed. Expand Monitor Models and you will see the new ClipsAndTacks model listed.

# Part 2: Import the user defined function project

the project interchange containing the cost functions.
1. Switch to the Java EE perspective.
a. Click Window > Open Perspective > Other
b. Click <b>Show all</b> , then select <b>Java EE</b>
c. Click <b>OK</b>
2. Import the cost function project interchange file.
a. Right click in the Project Explorer view, and then select <b>Import &gt; Import</b>
b. Select Other > Project Interchange, click Next.
c. For the .zip file, browse to the location containing the file, for example, c:\Labfiles62\UDF\CostFunctionPI.zip
d. Click <b>Select All</b>
e. Click <b>Finish</b> .
f. You will see the costFunctions project in the Enterprise Explorer.
Enterprise Explo  ClipsAndTacks  costFunctions
3. Check for any errors in the Problems view. You should resolve any errors before continuing. Warnings and informational messages may be present but these will not be a problem.

In this section you will use Rational Application Developer or WebSphere Integration Developer to import

## Part 3: Review the user defined functions and create the jar file

In this section you will review the user defined functions that you imported in the previous section. Then you will export a jar file which will be imported into the monitor model.

\_\_\_\_\_ 1. Expand the costFunctions project in the Enterprise Explorer.

- Double click CostFunctions.java to open the Java editor.
- \_\_\_\_\_ 3. Notice the annotations in the file to specify the user defined functions to Monitor.

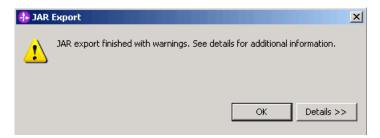

```
@XPathFunction(
    namespaceName = NAMESPACE,
    localName = "cost1",
    description = "calculate the cost based on task duration days",
```

- 4. You will use the cost1 function in the monitor model.
- 5. Take a look at the code in the cost1 function. It receives a parameter which is the number of days duration for order fulfillment. It multiplies the duration by a random number between 0 and 1, then multiplies that by 10. It returns this number as a decimal number, which is the calculated cost for the supplied duration. This is a simple example for the lab, but you could easily reference a database or Web service to retrieve the cost. Notice the Java types which are used for the function, argument and return types. Since you are implementing a Java method that will be used as an XPath function, you need to be aware of the mappings from Java to XML data types. Refer to the Information Center for all the available data types and mappings.

```
BigDecimal cost1(BigInteger numberDays) {
    // here you could get the cost from a database,
    // but we use a random function for simplicity for this example.
    // random returns a double between 0 and 1.
    return new BigDecimal(numberDays.doubleValue() * (random() * 10));
}
```

- 6. There is another function cost2 which is defined in this file, but it will not be used in the monitor model. There is also another file MoreCostFunctions.java which contains other cost functions. This file will be imported into the model to show how multiple files can be referenced in the workspace.
- 7. Export the user defined functions to a jar file.
  - \_\_ a. Right click the **costFunctions** folder (not the CostFunctions.java) in the Enterprise Explorer, and select **Export...**
  - \_\_ b. Select **Java > Jar** file, and click **Next**.

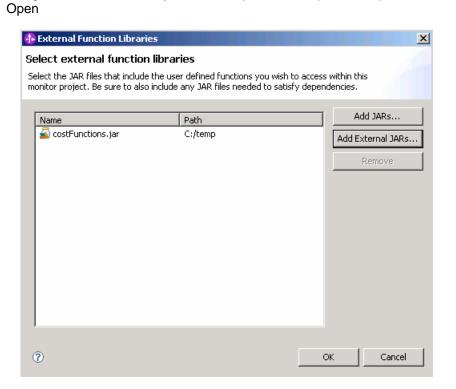

- \_\_ c. For the JAR file, click **Browse**... and navigate to a destination such as c:\temp.
- \_\_ d. Then specify a name for the jar file, such as costFunctions.jar, and click **Save**.
- \_\_ e. Click Finish.
- \_\_ f. You may get a popup indicating warnings, but this is fine, so just click **OK**.

## Part 4: Import the user defined functions into the monitor model

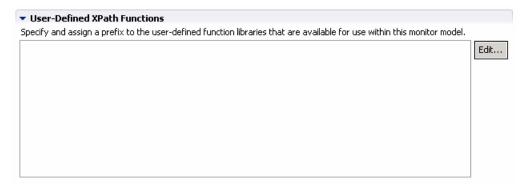

In this section you will import the user defined functions jar into the monitor model.

_ 1. Switch to the Business Monitoring perspective.
a. Click Window > Open Perspective > Business Monitoring
b. Click <b>OK</b>
 _ 2. Define an external function library.
a. Right click the ClipsAndTacks project in the project explorer, then select External Function Libraries
b. Click Add External JARs
c. Navigate to the location of your function jar, for example, c:\temp\costFunctions.jar, then clic

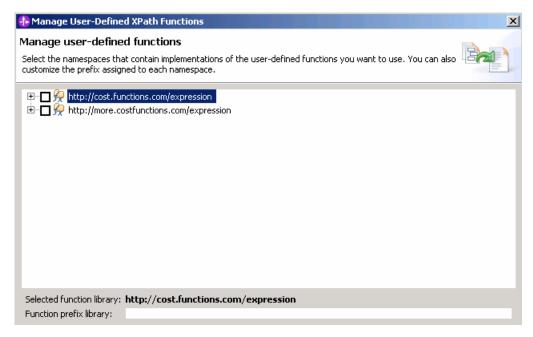

- \_\_ d. Click OK.
- \_\_\_\_\_ 3. Define the cost functions to the monitor model.
  - \_\_ a. Double click ClipsAndTacks > Monitor Models > ClipsAndTacks.mm in the project explorer.
  - \_\_ b. The monitor model editor opens.
  - \_\_ c. On the Monitor Model Details tab, notice the area for user defined functions:

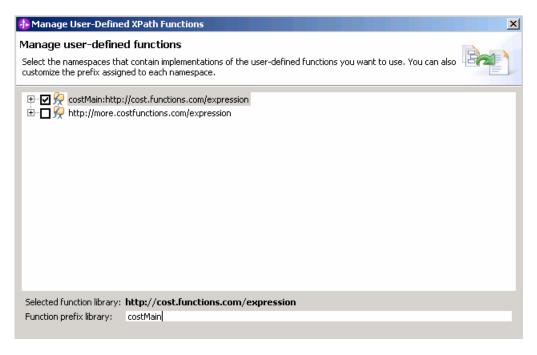

25 February 2009

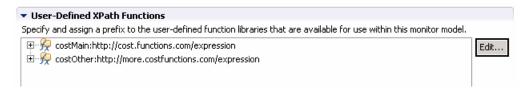

- \_\_ d. Click Edit...
- \_\_ e. You should see a list of the function files in the library.

- \_\_ f. You need to assign a prefix to each namespace.
- \_\_ g. Check the box for the first one in the list, then type a name for the function prefix down below, for example, **costMain**.

- \_\_ h. Check the box for the second one in the list, then type a name for the function prefix down below, for example, **costOther**.
- \_\_ i. Click **Finish**, then you should see the two listings on the Monitor Model Details tab in the user defined functions list.

- \_\_ j. Now the functions are available for use in the monitor model.
- \_\_ k. Press **Ctrl-S** to save your work.
- \_\_ I. Check for any errors in the Problems view. You should resolve any errors before continuing. Warnings and informational messages may be present but these will not be a problem.

25 February 2009

# Part 5: Add expressions that reference user defined functions

In this section you will use Rational Application Developer or WebSphere Integration Developer to edit the monitor model. You will create a new metric and add expressions which use the cost functions. You will be calculating the cost based on the order fulfillment duration metric which is already defined in the model. Since the order fulfillment duration metric is calculated based on two triggers, one for the order shipment and one for the order cancellation, you will use the same triggers to fire the calculation of this cost metric.

	1.	If not already open, switch to the Business Monitoring perspective.
	2.	Double click the monitor model <b>ClipsAndTacks.mm</b> in the project explorer to open the model editor.
	3.	Create a new metric in the monitor model for order fulfillment cost.
	_	a. In the model navigator in the model editor, right click 'ClipsAndTacks MC', then select New > Metric.
	_	b. For name, enter: Order Fulfillment Cost
	_	c. For ID, accept default: Order_Fulfillment_Cost
	_	d. For type, select: Decimal
	_	e. Click OK
	_	f. For Metric Value Expressions, click Add
	<ul> <li>g. In the first row of the Metric Value Expressions table, select the cell under column Trigger, then a button is shown, then click the button and select Trigger type &gt; ClipsAndTacks MC &gt; Ship Order to Customer Trigger, click OK</li> <li>h. In the first row of the Metric Value Expressions table, select the cell under column Expression, then bring up content assist by pressing Ctrl-space. Expand Functions and notice that your cost user defined functions are listed here with the prefixes costMain and costOther that you defined earlier:</li> </ul>	
		Functions  Functions
		▼ Metric Value Expressions  Specify the expressions that set the value of the metric. If a trigger is specified, the map is evaluated when the trigger fires.

Trigger

Ship Order to Customer Trigger 👺

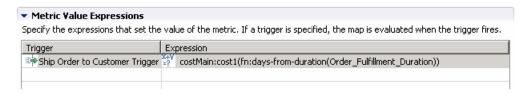

Expression

2:00 costMain:cost1()

\_\_ j. Now you need to define the integer duration input to the function. There is a metric in the model, Order Fulfillment Duration, that you can use, but it is type duration so you will also need to use a function to convert the duration to an integer number of days. Use content assist, or type the expression manually so that it looks like this:

costMain:cost1(fn:days-from-duration(Order\_Fulfillment\_Duration))

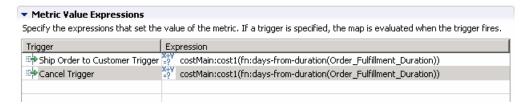

k. Press **Ctrl-S** to save your work.

- \_\_ I. For Metric Value Expressions, click Add
- \_\_ m. In the second row of the Metric Value Expressions table, select the cell under column Trigger, then a button is shown, then click the button and select Trigger type > ClipsAndTacks MC > Cancel Trigger, click OK
- \_\_ n. In the second row of the Metric Value Expressions table, select the cell under column Expression. Use content assist, or type the same expression as above so that it looks like this:

costMain:cost1(fn:days-from-duration(Order\_Fulfillment\_Duration))

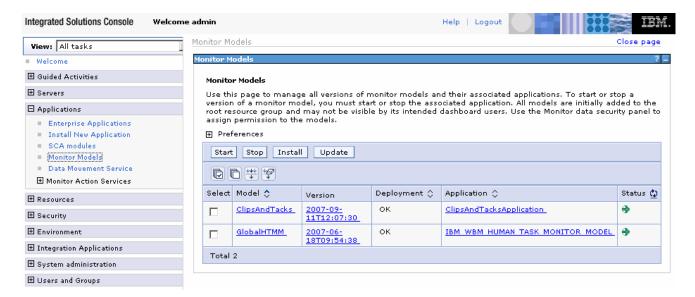

\_\_ o. Press Ctrl-S to save your work.

4. Check for any errors in the Problems view. You should resolve any errors before continuing. Warnings and informational messages may be present but these will not be a problem.

## Part 6: Publish the model to the server

	s section you will use Rational Application Develop nonitor model to the monitor server.	er or WebSphere Integrati	on Developer to publish		
1.	In Project Explorer, expand ClipsAndTacks → Moover ClipsAndTacks.mm and then select Generate				
2.	If you have already generated the ClipsAndTacks model for another lab, then you may need to select 'overwrite existing projects'. Then click <b>Finish</b> .				
3.	A progress dialog shows the status of the operation and it closes when the operation is complete. Check for errors in the Problems view. There may be warnings, but there should not be any errors. you see errors, then try to perform a clean to see if the errors can be removed: Project > Clean > select 'Clean all projects', then click OK.				
4.	server WebSphere				
<b>=</b>	Monitoring Flow 🔳 Properties 🚷 Problems 👭 Servers 🛭 📮 C	Console 🔓 Asset Repositories			
	Server A	State	Status		
		ver Started Stopped	Synchronized		
5.	Right click in the servers view, then select 'Add an	nd Remove Projects'.			
6.	Click Add to move the ClipsAndTacksApplication configured projects. Click Finish. Note: If the app then you may have run another lab and published this window and select the 'Publish' option from the configuration of th	lication is already in the lis I this application already, s	t of configured projects,		
7.	A progress message is displayed in the lower right	nt corner of the window.			
8.	Check the messages in the console view. You sh application has been started:	ould see the following mes	ssage when the		
	Application started: ClipsAndTacksApplicati	on			
9.	In the servers view, right click, then select <b>Run ac</b> a separate tab. It will prompt you for user ID and ID, then enter 'admin' without the quotes for pass	password. Enter 'admin' wi			
10.	Click Log in				
11.	Click <b>Applications &gt; Monitor Models</b> . The applications is successfully.	cation should show green	status if it started		

- 12. If the model shows red (stopped), then wait a moment, then refresh by clicking on the icon to the right of Status in the last column of the table. You should see green (started) for the model. If it does not show green, be patient and keep refreshing until it does show green.
- \_\_\_\_ 13. Check the server log to ensure there are no problems. You can check this in the console view.
- 14. If you are using the integrated server within WebSphere Integration Developer or Rational Application Developer, then you do not need to setup Monitor data security, since the administrative user is automatically authorized to all models. If you are using a different server, then you should open the administrative console, navigate to Security > Monitor Data Security, then add the model, role and user information to a resource group.

## Part 7: Run events to exercise the model

Rather than installing a J2EE application to actually create the events that you want to monitor, you are going to use a program to simulate the submission of events from the application.

The supplied program is 'BatchCBEWriter61' and it will submit the events to the Common Event Infrastructure. Look for the program in \Labfiles62\ClipsAndTacks\BatchCBEWriter. This program reads XML files which

represent the Common Base Events for the model. Update BatchCBEWriter61.bat to point WAS HOME to the monitor server home, for example 'set WAS\_HOME=C:\IBM\WebSphere\AppServer'. If you are using the integrated monitor server in WebSphere Integration Developer, the path would be <WID-Install-Path>\pf\WBMonSrv wps. If you are using the integrated monitor server in Rational Application Developer, the path would be <RAD-Install-Path>\pf\WBMonSrv. Update config.properties, setting the serverName and portNumber. You can find the port number by browsing the server log and finding 'bootstrap port'. For example, check for the log at C:\IBM\WebSphere\AppServer\profiles\WBMon01\logs\server1\SystemOut.log . For the integrated server in WebSphere Integration Developer, the path would be <WID-Install-Path>\pf\WBMonSrv\_wps\logs\server1\SystemOut.log and the portNumber should be 2810. For the integrated server in Rational Application Developer, the path would be <RAD-Install-Path>\pf\WBMonSrv\logs\server1\SystemOut.log and the portNumber should be 2810. Here is an example of the config.properties settings: \_\_a.connect.serverName = localhost \_\_b.connect.portNumber = 2810 3. Open a command window, then change directory to the folder containing BatchCBEWriter61, for example, type this command \_\_ a. cd \Labfiles62\ClipsAndTacks\BatchCBEWriter 4. Run commands to load the common base events to the server. \_\_ a. batchcbewriter61 -Dsource.filename="c:/labfiles62/clipsandtacks/cbe/allevents.xml" \_\_ b. When it prompts you for user identity and password, enter 'admin' for both (without the quotation marks)

When you run BatchCBEWriter61, you should see results such as:

```
C:\drivers\events>batchcbewriter61 -Dsource.filename="c:/drivers/events/clipsand tacks/allevents.xm1"
Getting CBEs.

### Part 8: Create a dashboard

In this section you will build a dashboard in business space. You will add widgets to the dashboard and configure them.

- Create the dashboard.
  - \_\_ a. The default browser is 'Internal Web Browser', but you should not use this one since some standard functions are not provided that you may need. Select Window > Preferences > General > Web browser > select 'Use external Web browser'. Select an external browser. Click OK.
  - \_\_ b. In WebSphere Integration Developer, in the servers view, right click and select Business Space
  - \_\_ c. When prompted, enter admin for the user ID and enter admin for the password. You must log in with 'admin' so that you can view the alerts which were setup in action manager to be sent to this particular user ID. Also, in the toolkit environment, this is the user that is automatically defined on the secured server.
  - \_\_ d. Click the icon to create a new space.

- \_\_ e. Enter a name such as Dashboard, select Empty, then click **OK**.
- f. Click the icon to create a new page in the Dashboard space.

- \_\_ g. Enter a name such as Page1, select Empty, then click **OK**.
- h. Click Page1 to open it.

- \_\_\_i. Now you can add widgets to the page by clicking on 'Add widgets' in the upper right corner

  the layout or remove the page from display, use the icons to the right of the page name on the tab

  Page1 \*\*

  To return to the business space list, click 'Manage Business Spaces' in the upper right corner

  Manage Business Spaces.
- \_\_\_\_\_ 7. Add the instances widget to the dashboard.
  - \_\_ a. Click **Add widgets**, then select **Instances** and drag it to the page.
  - \_\_ b. Click **Configure** on the widget menu.
    - 1) To Access the menu, hover the mouse over the right corner of the widget and then click the down arrow. On this menu you can configure the widget, refresh the widget and delete the widget.

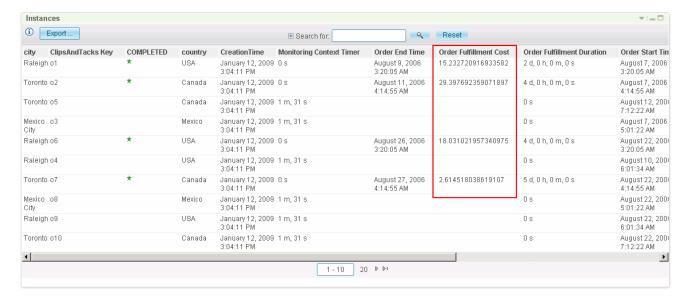

\_\_ c. Click the **Show/Hide** tab, and select monitoring context 'ClipsAndTacks MC'.

E-ClipsAndTacks(Across all versions)

ClipsAndTacks MC

Click button >> to move all the fields to the Selected box. Also, click button 'Set as default' which will make this the default monitoring context to display.

- \_\_ d. Then click **OK**. You should see a list of monitoring context instances for the events that you just processed.
- \_\_ e. Notice the new metric Order Fulfillment Cost. For shipped or cancelled orders, you see that the cost1 function has been used to calculate the cost based on the Order Fulfillment Duration.

# What you did in this exercise

In the lab, you imported user defined functions into a monitor model, and you created a cost metric which referenced the functions in expressions.

Then you published the model to the monitor server.

You used the supplied program to simulate the submission of events from the monitored application.

You configured dashboards to view the new cost metric in the instances widget.
