

IBM Proventia Management SiteProtector system

Highlights

- Helps simplify security management and generate cost efficiencies
- Enhances communication of security and regulatory risk
- Designed to provide immediate and strong resilience in case of a disaster

Extending security management capabilities to ease reporting

Heightening security threats and compliance requirements can translate into multiple management systems to learn, patterns to analyze and reports to create. Over time, the cost and complexity of managing security can rise substantially, without a corresponding decrease in exposure to security risks and noncompliance.

IBM Internet Security Systems[™] (ISS) offers a flexible, one-stop security management solution that can scale as your needs evolve. From a single interface,

IBM Proventia® Management
SiteProtector™ system helps you command the security devices and policies required to monitor your exposure to vulnerabilities and accurately report your security posture. Greatly expanded analyzing and reporting capabilities can enable you to customize templates, analyze threat patterns and quickly generate proof of compliance. And in the event of a hardware failure, superior resiliency capabilities can help you maintain policies and settings.

Simplifying security while improving cost-effectiveness

By consolidating management of your entire security infrastructure, the SiteProtector system extends the reach and ability of a single administrator to perform numerous functions on multiple devices from one console—including allowing you to add devices as your needs grow. In addition to helping you save time and money on security management, the SiteProtector system enables you to perform more complex security analyses and reports to enhance your business intelligence. For example, you can create a specific analysis of critical information based on any number of filters, and then immediately convert it into a report to share internally or prepare it for auditors.

The SiteProtector dashboard provides at-a-glance status on current threat events, their severity, their sources and your overall system health, as shown in Figure 1.

Enabling flexible, customizable reporting to enhance communication

The business intelligence and reporting toolkit (BIRT) allows you to literally do more with less: more detailed and extensive reporting creation and design

Figure 1. At-a-glance status of your overall system security from a single console

with far less effort. Carefully designed around the user experience to empower security teams to quickly, easily and recurrently meet compliance requirements, BIRT functions as an open user community where reports can be posted, modified and shared to leverage the intelligence gathered from and the creativity of the user community. The SiteProtector reporting solution combined with the BIRT community provides flexibility and customization, enabling you to:

- · Build your own or use default reports
- Customize the report perspective (for example, where attacks originated)

- Share report templates with the SiteProtector user community
- Re-label and describe reports for different audiences
- Select appropriate asset groups to report on
- Filter and sort based on all available criteria

From the SiteProtector dashboard, you can create a custom report or use one of the default templates to create a report based on any number of criteria, such as top events as shown in Figure 2.

You can create detailed reports to analyze your security posture and use the intelligence to proactively defend your system against attacks. Figure 3 shows part of a report that indicates the top 10 specific sources of attack.

Providing resiliency and robust growth capability

For security and compliance officers who need the highest level of resiliency, the SiteProtector system provides an effective means to help quickly recover policies and settings in case of a hardware failure or other disaster-and the flexibility to evolve as needs change. SiteProtector can automatically transfer the latest configuration settings to a secondary instance with minimal downtime. In addition, SiteProtector preallocates disk space to archive security events using a structured file format that enables easy migration, storage, backup and recovery. As your security or compliance requirements expand, SiteProtector can help protect your investment through the ability to add security controls and devices as your business dictates, without increasing your total cost of ownership.

Why IBM

Unlike other vendors, IBM offers a broad array of security products, an established track record of protection that is backed by the IBM ISS X-Force® research and development team and the ability to expand security coverage with virtually no increase in operational cost.
