

TransGrid

Decreases data recovery time

Optimizes storage management

An IBM® Tivoli® Storage Manager and IBM Storwize® V7000 storage solution, implemented by IBM Business Partner Meridian IT, helps TransGrid:

Decrease data recovery time by

Shorten the data backup window by nearly

Ease system management by consolidating backup & recovery on a single system

We've achieved a deduplication ratio of **5:1** and our recovery times have decreased by **400 percent**, and with the incremental backup capabilities, we've shortened our backup window by almost **50 percent**. We've also moved from tape to disk.

Stuart Barber

Information & Communications Technology Operations Manager
TransGrid

TransGrid owns & operates the high-voltage electricity transmission network in the Australian state of New South Wales. It operates a network of more than **12,000 kilometers** of transmission lines & **11,000 volts** of electricity, connecting generators of electricity to retail distributors. The company employs approximately **1,100 people**.

To **reduce costs** and **increase efficiencies**, TransGrid sought to consolidate its **discrete data backup and storage environments onto a single solution**.

Using the IBM Suite for Unified Recovery offering as a single backup and restore system, with a single console for management, TransGrid achieved a **deduplication ratio of 5:1**, decreasing recovery times by **400 percent** & shortening its backup window by almost **50 percent**.

It provides [TransGrid] with an easier, more effective way of managing backups and all of the virtual environments, for us, we've saved operationally and we've given ourselves a better, quicker time to recover. The Tivoli **UNIFIED RECOVERY SUITE** is a complete solution.

The move to a single backup and restore system and a central management console has also produced operational savings in the form of reduced infrastructure costs and less demand on an outsourced service provider for system management.
