The Gold Standard for Enterprise Computing

Unique Innovations that make zEnterprise Superior

Today's agenda

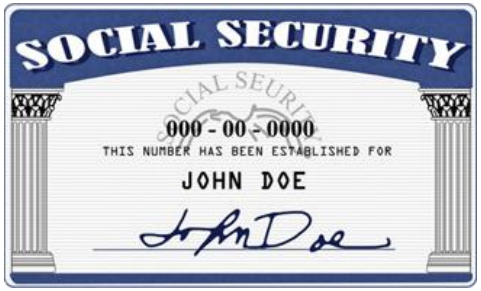
9:15am	Unique innovations that make zEnterprise superior
10:15am	Business analytics on the ultimate data platform
11:15am	Advantages of a private cloud on zEnterprise
12:00pm	*Lunch*
1:00pm	Is your enterprise ready for the mobile revolution?
2:00pm	Mainframe skills - the myths and the reality
3:00pm	The enterprise server for the 21st century

Fifty years ago, IBM introduced the first mainframe computer…

System 360 – April 7, 1964

It helped put men on the moon…

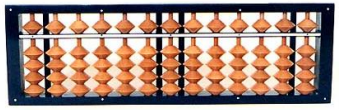
It touched all of us from the day we were born…



It was revolutionary…

It was innovative…

It changed the world!



It changed the way we live and work…

Source: IBM

Fifty years ago, IBM introduced the first mainframe computer…

System 360 – April 7, 1964

It was revolutionary…

It was innovative…

It changed the world!

…Did mainframe innovation *stop* when PCs came along?

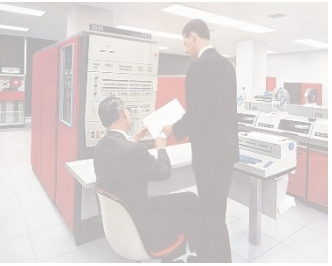
IBM model 5150 – c.1981

NO! Customer demand and technical leadership have lead to *continuous* re-invention of the mainframe

Hardware carry-forward + Continuous application compatibility

S/360 — 1964

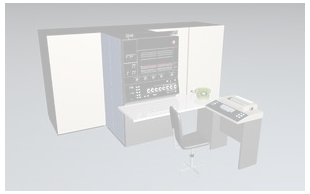
- 24-bit addressing (32-bit architecture)
- 1 or 2 cores
- 16MB storage
- 24K core memory



- VM operating system

S/370 — 1970

- 24-bit or 31-bit virtual addressing
- Fully integrated monolithic memory
- 256 channel architecture
- Virtual storage



- MVS, IMS, CICS, and DB2

S/390 — 1990

- CMOS processors
- More than 1,000 MIPS
- Parallel sysplex
- Enterprise Systems Architecture (ESA)

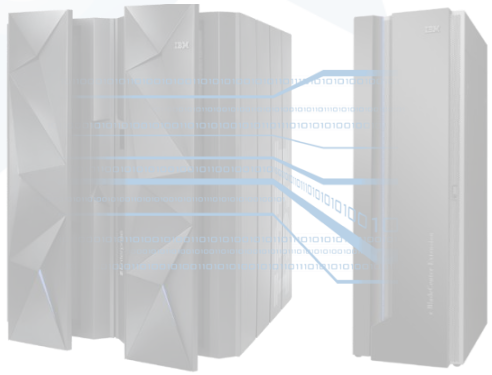
zSeries — 2000

- Specialty engines
- Hardware-assisted compression and encryption
- Decimal floating point
- 64-bit superscalar architecture

- WebSphere

zEnterprise — 2010

- zEC12: up to 120 cores, 5.5GHz speed, 78,000+ MIPS
- zBC12 for mid-range
- Hybrid computing
- zBladeCenter extension and zManager



- Rational Development & Test

The IBM zEnterprise server – ready for the business challenges of today and the future

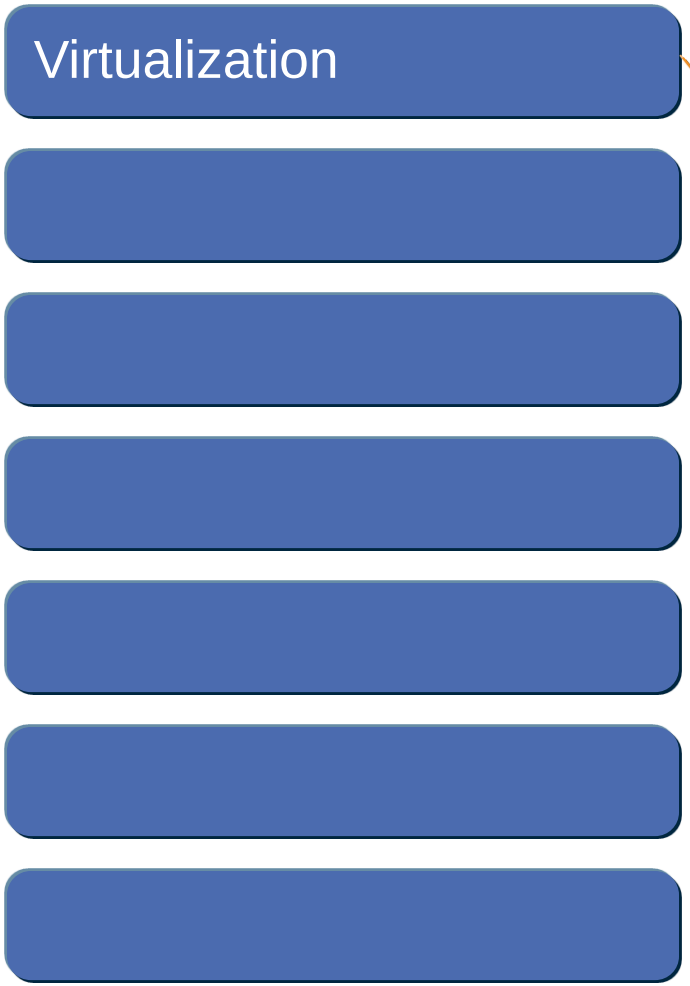
IBM zEnterprise EC12

IBM zEnterprise BC12

- The most available and secure platform commercially available
- Supports today's newest workloads
  - Data and analytics
  - Cloud
  - Mobile
- A multi-architecture platform for hybrid workloads
- Provides the lowest total cost of ownership for most enterprise workloads

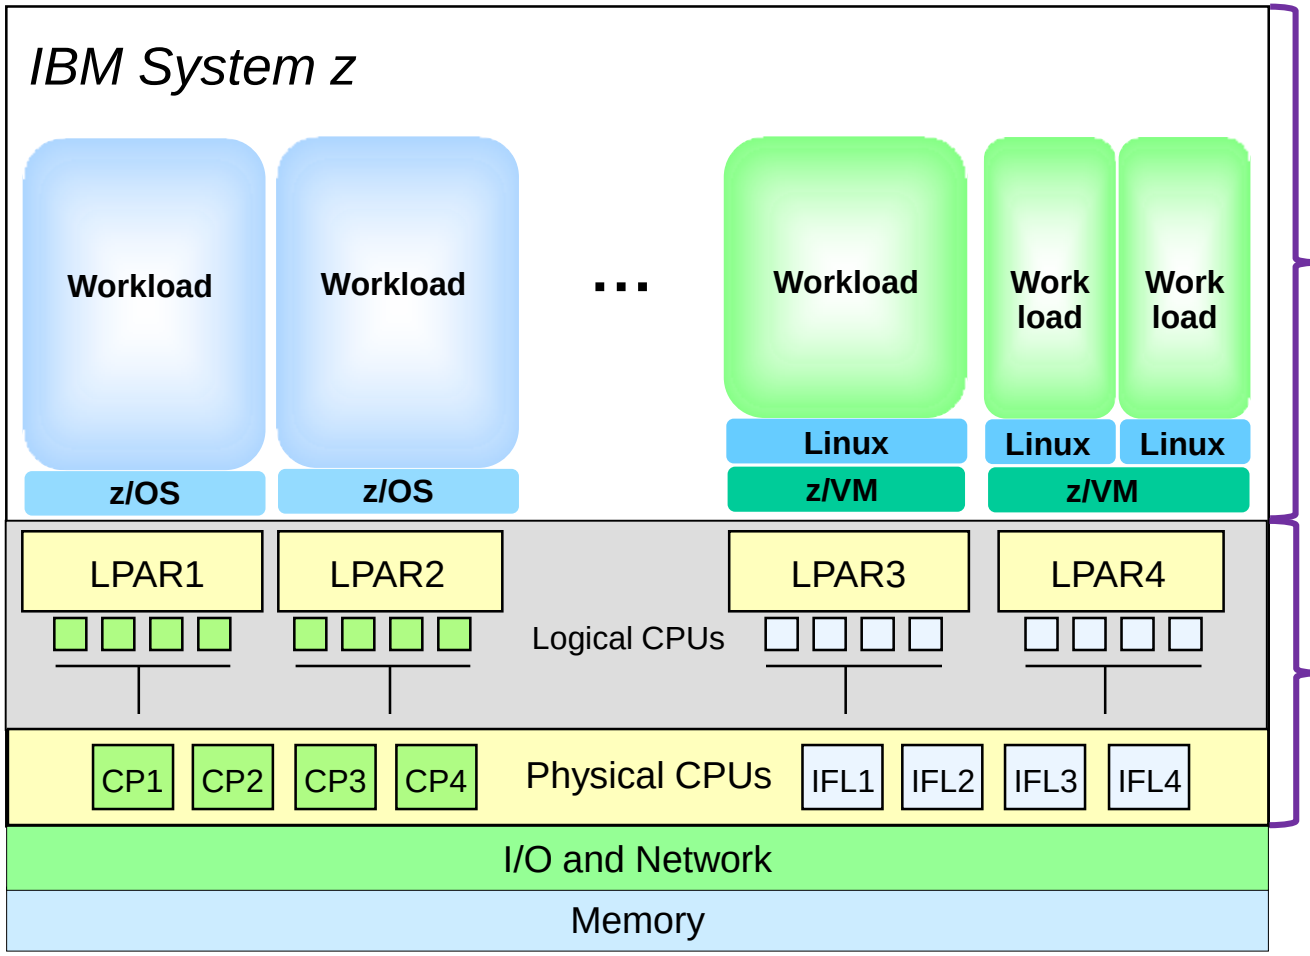
Let's look at some of the key mainframe innovations from the last 50 years…

The IBM mainframe was the world's first virtualized server



- Shared everything design
- Virtualization built into the microcode
- Thousands of virtual guests
- Promotes near 100% utilization
- Ideal choice for cloud deployments

IBM System z virtualization is built-in (at two levels), not added-on, to give the best workload isolation



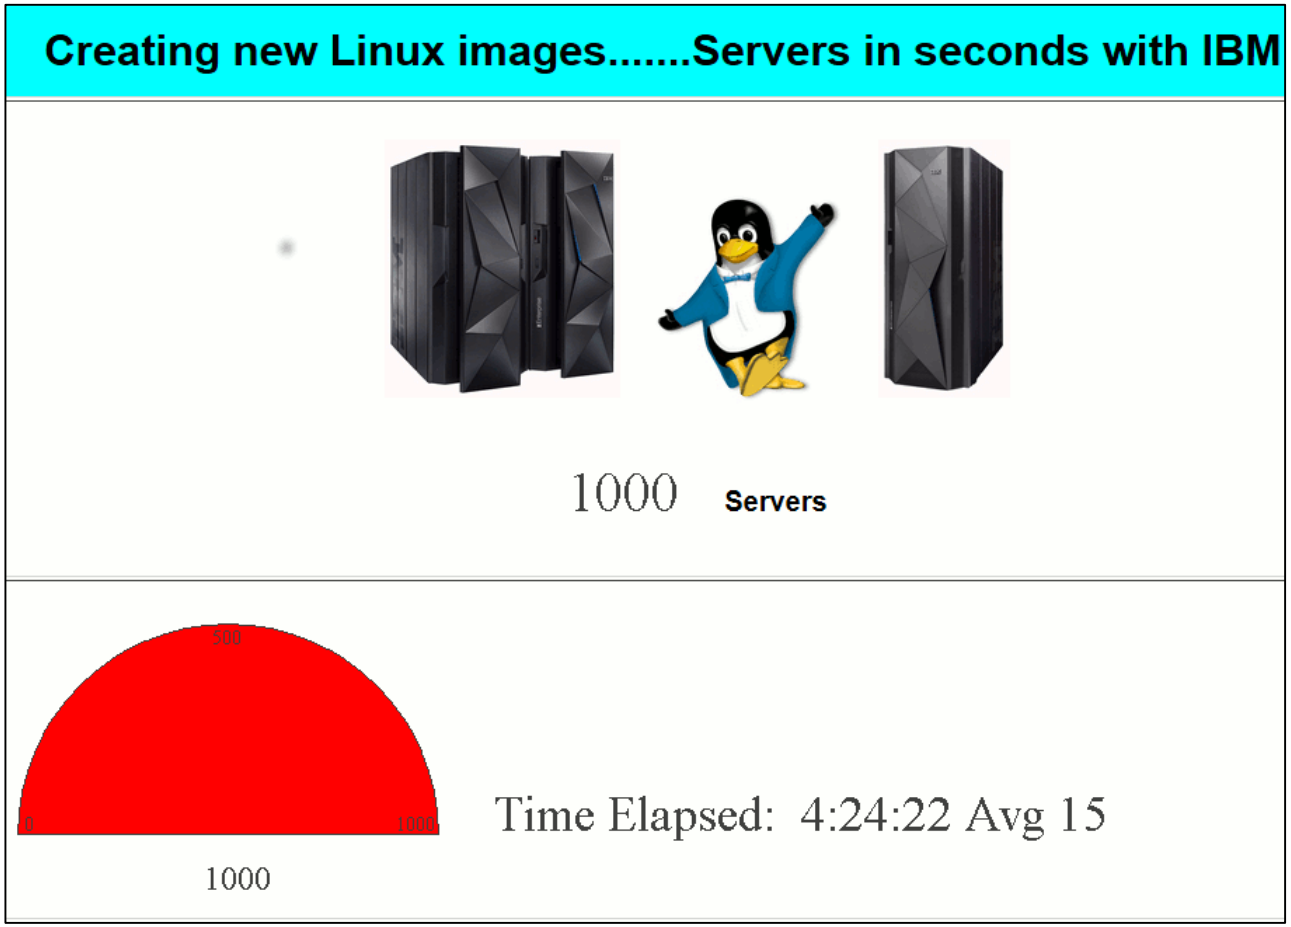
z/VM – a **software** virtualization hypervisor layer supporting 1,000s of Linux guests; up to 32 physical IFLs per z/VM LPAR

PR/SM – virtualization hypervisor layer in **firmware**; each **LPAR** is 1 virtual machine; workloads in LPARs are completely **isolated**

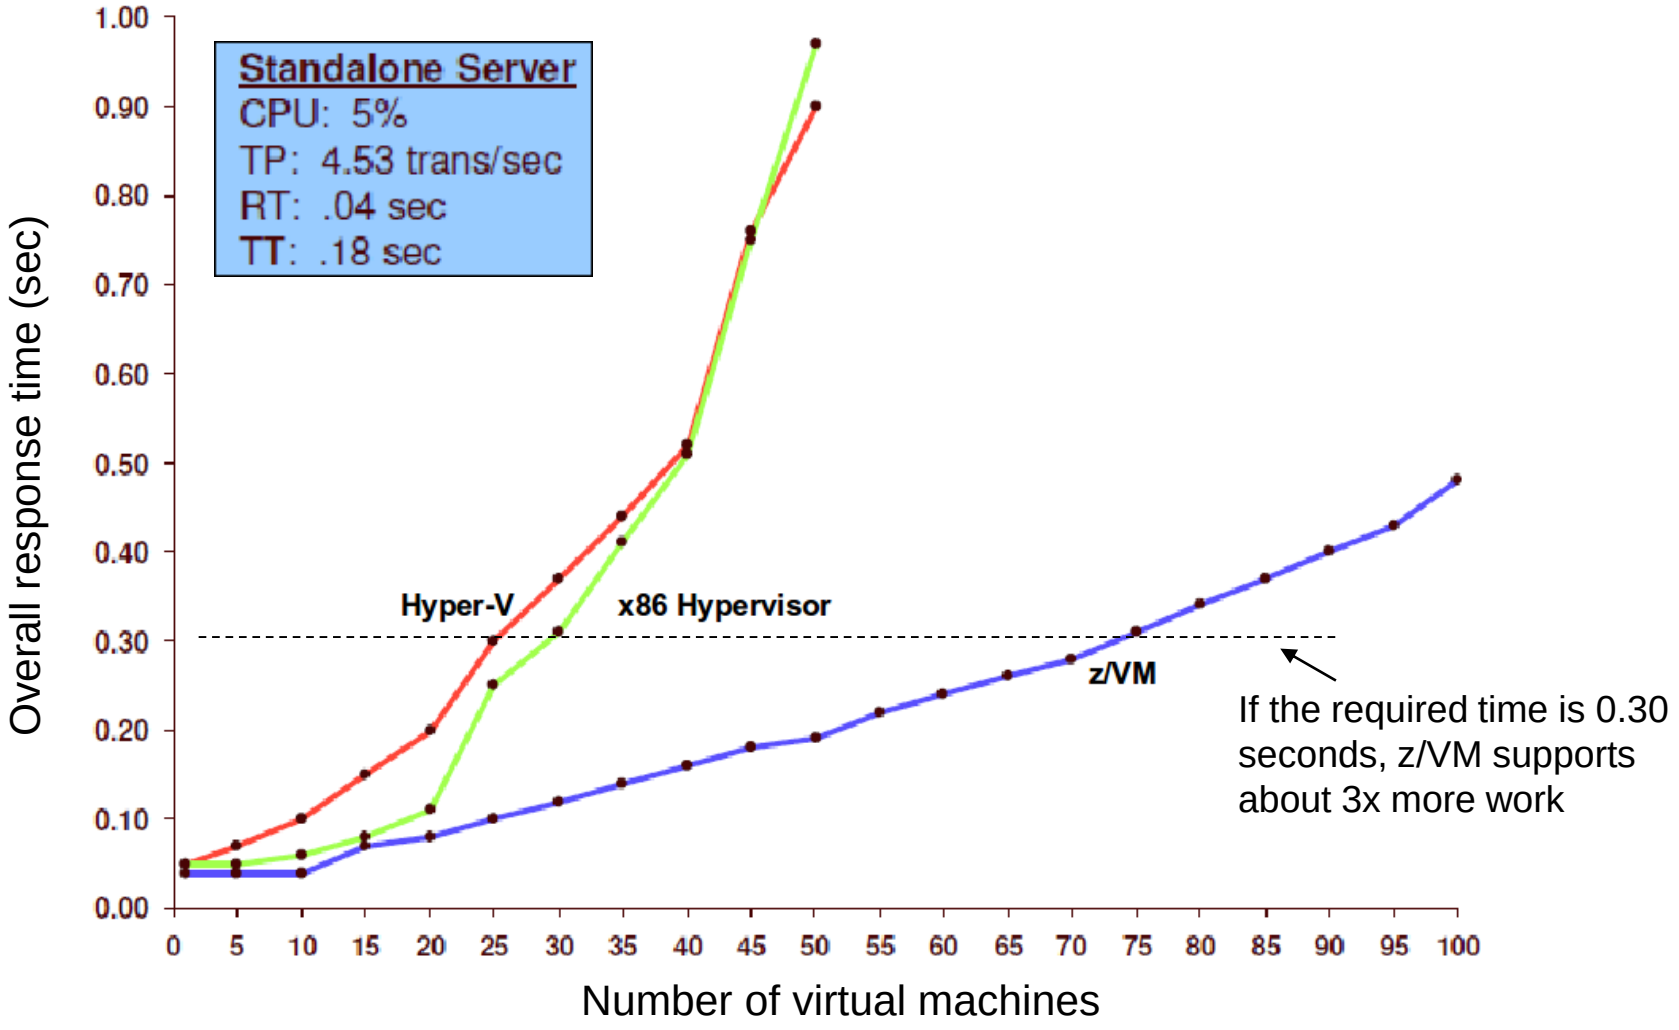
Shared-everything architecture

Hardware-enforced isolation: 10% of circuits support virtualization

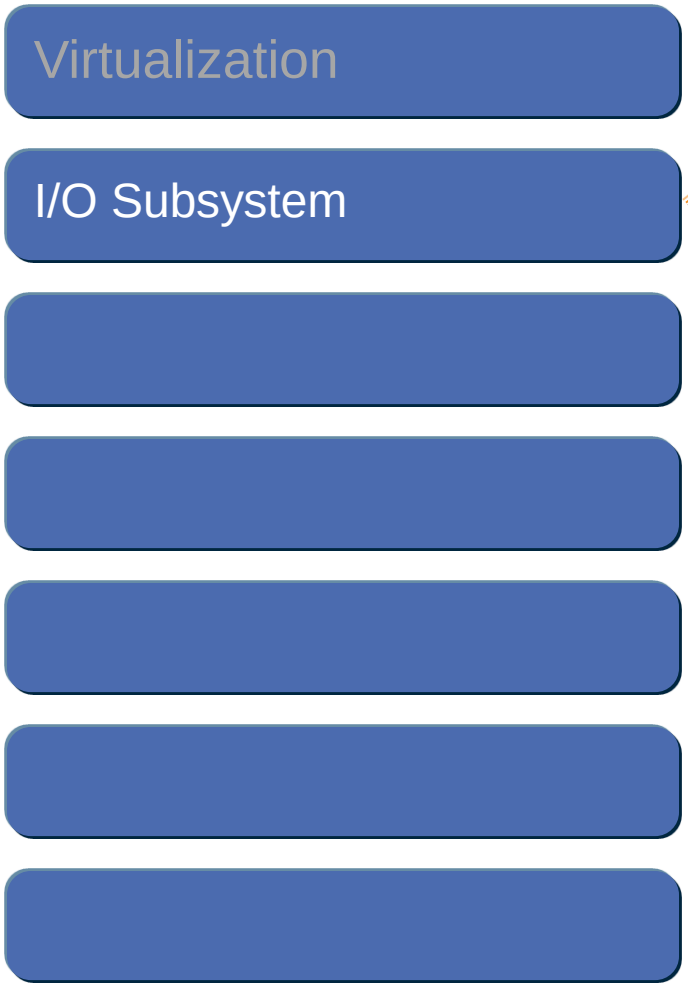
DEMO: How many virtual machines can zEnterprise create?



Compared to leading distributed hypervisors, z/VM demonstrates better scalability

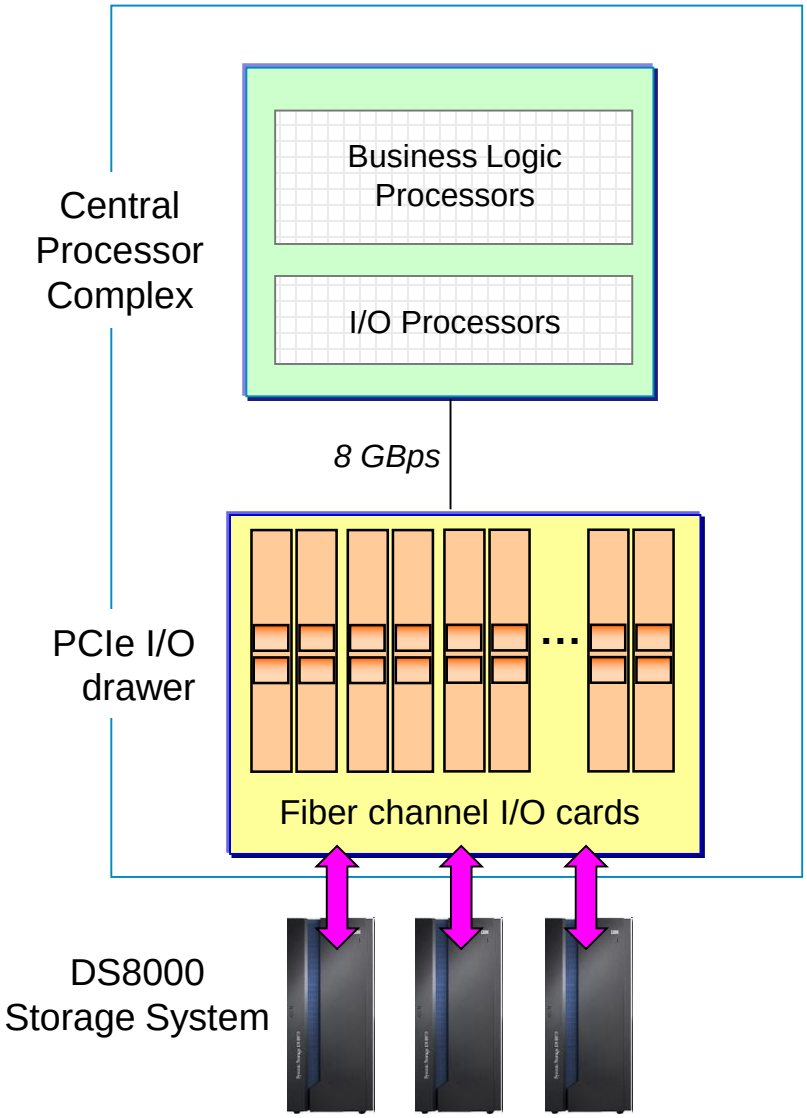


A unique zEnterprise feature not found on other servers is the I/O subsystem



- Improves CPU usage by offloading I/O overhead
- Reduces number and cost of software licenses
- Improves I/O performance for batch and high performance OLTP
- Allows introduction of new facilities into existing I/O subsystem

The dedicated I/O subsystem supports high I/O bandwidth workloads, and provides redundancy and high availability

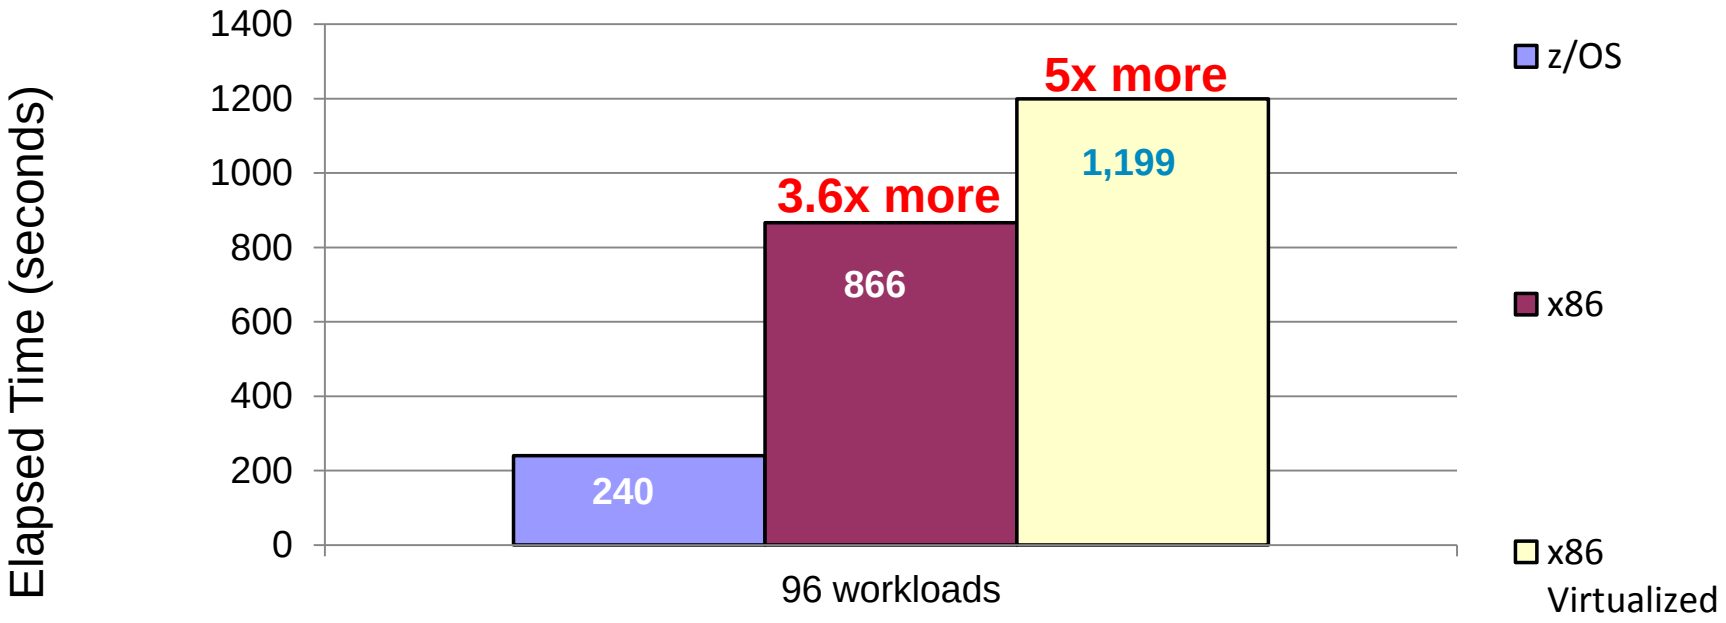


- I/O processing logic can be offloaded to specialty engines – System Assist Processors (SAPs)
- I/O transfers processed by PCIe fiber channel cards

- SAPs drive I/O virtualization via Logical Channel Subsystem
- Virtualization enables optimal physical I/O path to be used, and ensures transparent failover
- Delivers optimized I/O efficiency
- Intel servers have no dedicated I/O subsystem

* Recommend 70% max utilization

In comparison tests of I/O load capacity, Intel times were significantly slower



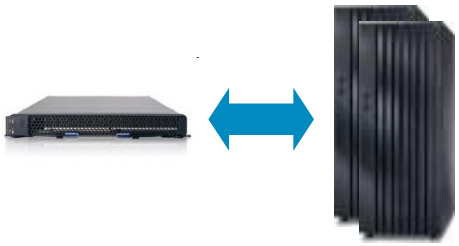
Performance comparison test of an I/O intensive workload with identical enterprise class storage. zEC12 had **8** core. Westmere EX server had **40** core @2.4GHz. Each system connected via 4 x 8Gb links to DB8800. zEC12 running against 8 SSD DASD CKD volumes. Intel server running against 8 SSD LUNs FB volumes. Note: Storage limitations came into effect at workload counts greater than 96.

Source: IBM CPO

Batch workloads take advantage of zEnterprise capability to support high I/O capacity

Intel Xeon E7-4870 + DS8300

40 processors
128 GB RAM
Linux Sort



Sorting
Average CPU
89%

z/OS + DS8800

8 processors
128 GB RAM
DFSORT

Sorting
Average CPU
72%

SORT *Job: Sort a 3 GB transaction file – Repetitions: 300*

Total Elapsed	2,657 secs	Total Elapsed	515 secs
Bytes Per Sec	**240 MB**	Bytes Per Sec	**3,000 MB**

13x more I/O bandwidth than Intel

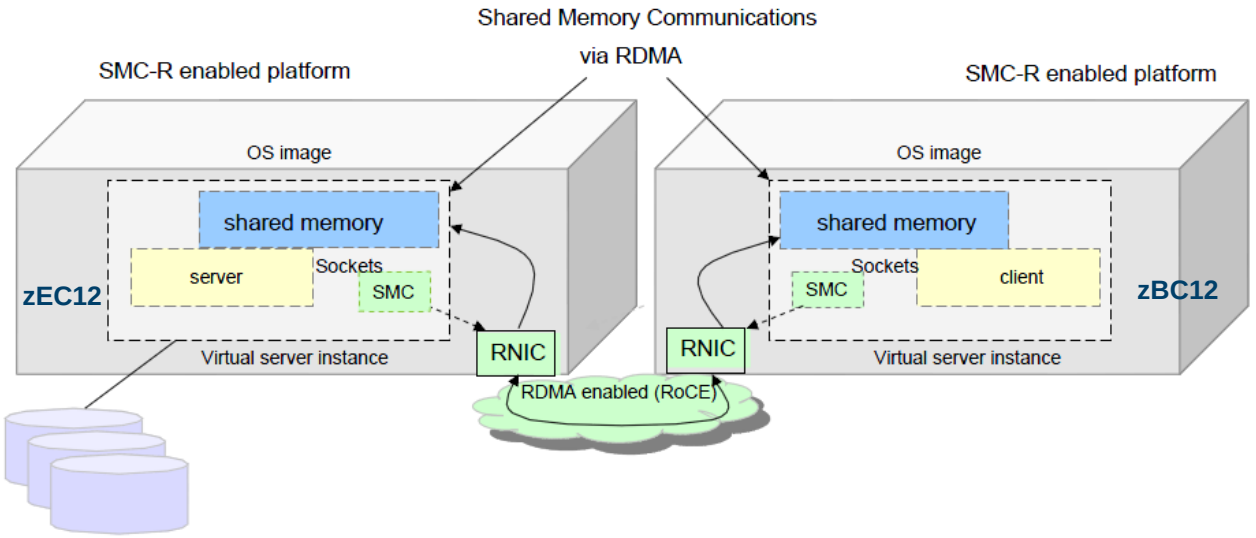
MERGE *Job: Merge 30 sorted files into a 90 GB master file – Repetitions: 10*

Total Elapsed	4,051 secs	Total Elapsed	446 secs
Bytes Per Sec	**157 MB**	Bytes Per Sec	**3,460 MB**

Intel Batch window is 7x longer than z/OS

Source: IBM Internal Study. Results may vary based on customer workload profiles/characteristics.

IBM continues to innovate with new PCIe features – Shared Memory Communications (SMC-R) introduced in 2013



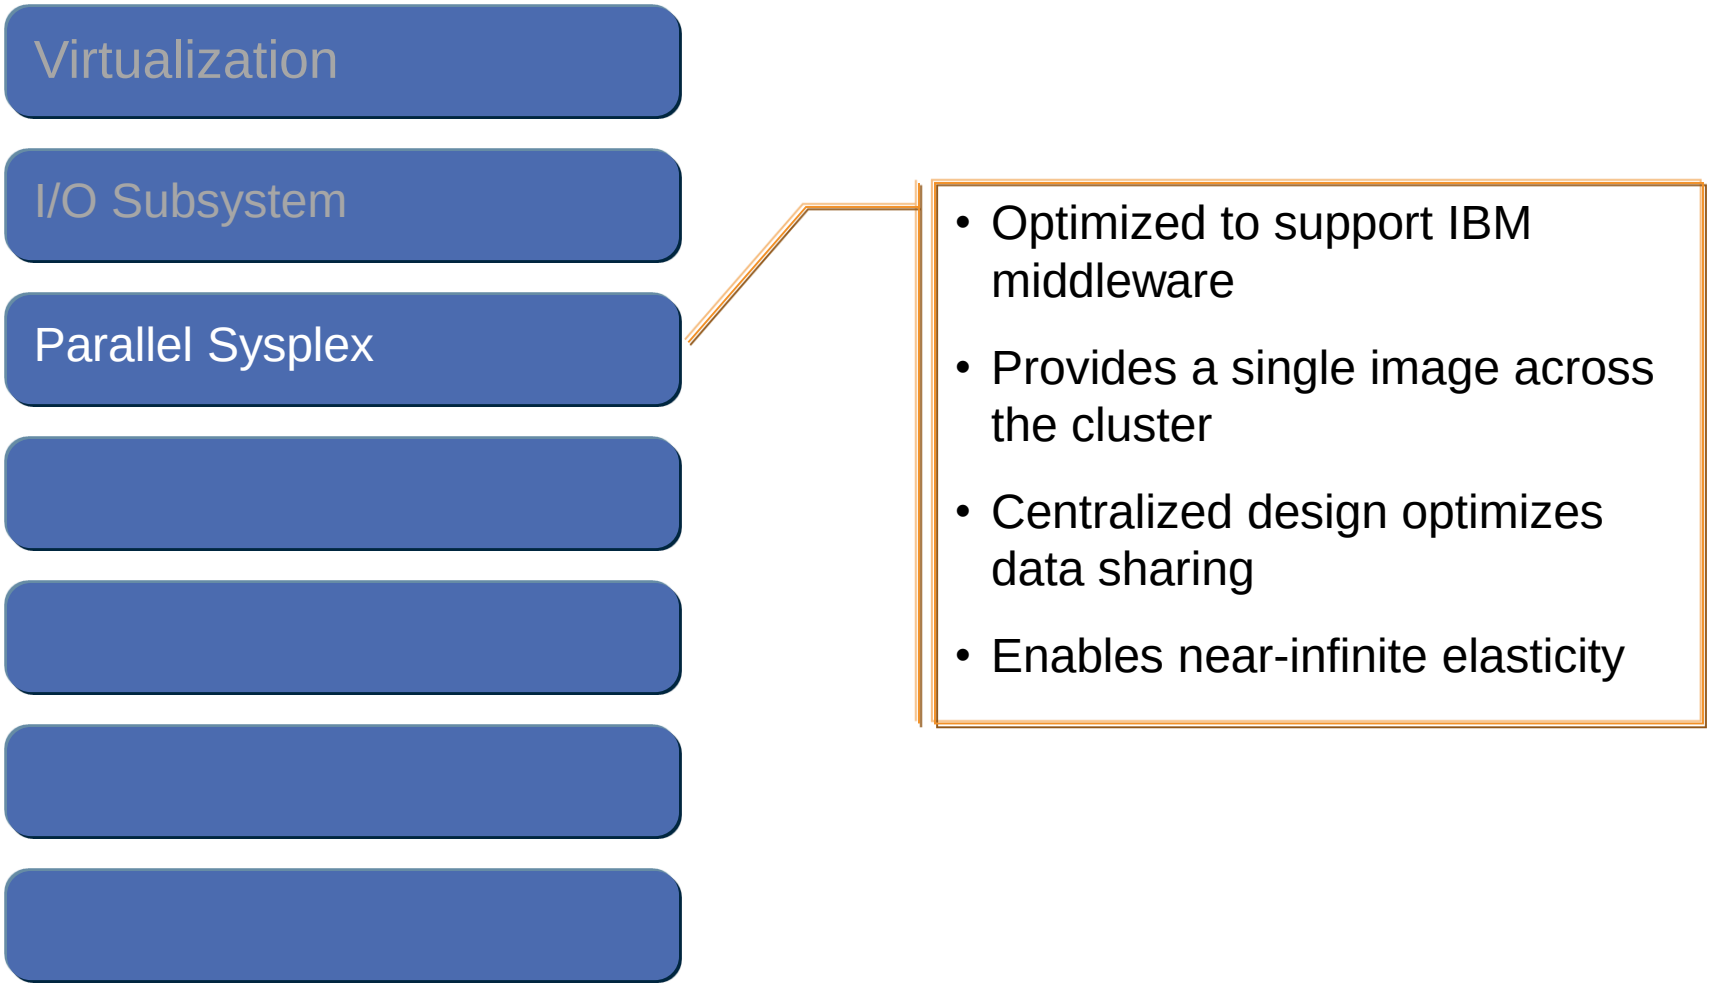
Network latency reduced up to

*80%**

- 10GbE RDMA over Converged Ethernet (RoCE) Express card
- Helps reduce latency and CPU resource consumption
- Runs over TCP/IP across z/OS systems
- Can be used seamlessly by *any* z/OS TCP sockets-based without any changes

* Based on internal IBM benchmarks of modeled z/OS TCP sockets-based workloads with request/response traffic patterns using SMC-R vs. TCP/IP. The actual throughput that any user will experience will vary.

Parallel sysplex gives zEnterprise continuous availability with near linear scalability

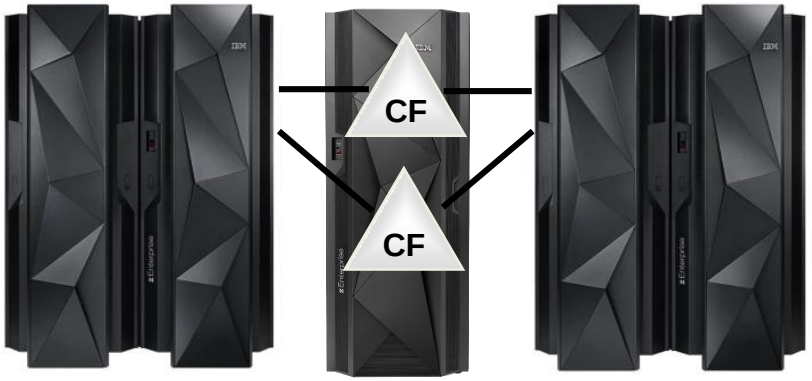


zEnterprise parallel sysplex clusters provide unmatched processing power and availability

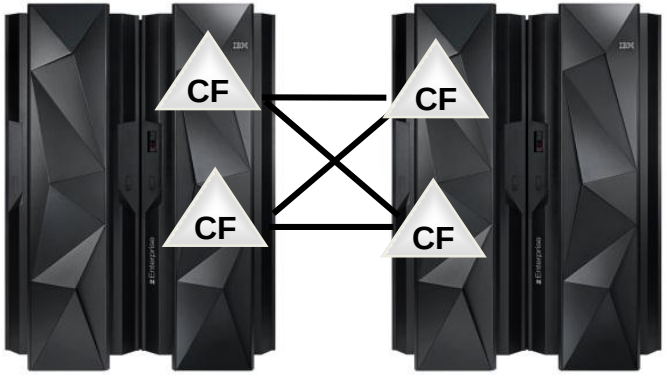
Single System Sysplex

- Clustering driven by specialty engines (Coupling Facility)
- Presents a single system image of a z/OS workload
- Potentially **2.5M MIPS** per 32-way cluster*

*Equivalent to about 240 of the largest Oracle servers



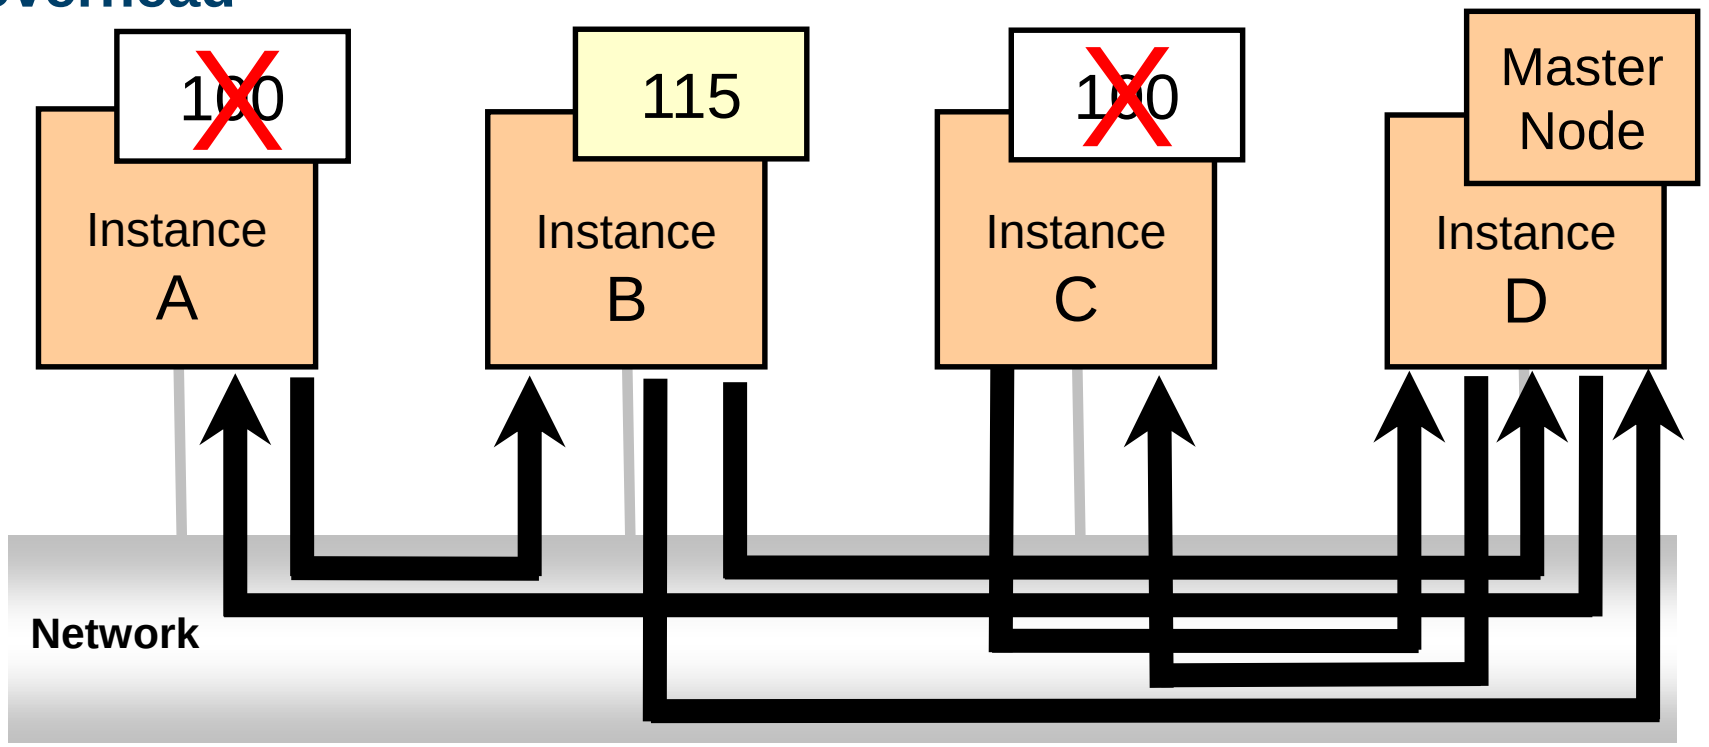
External Coupling Facility
(Can be different class server)



Cross Connected Servers with internal Coupling Facilities

- Enables rolling updates
- Supports continuous access to business services and data – from anywhere, at anytime
- Designed for **99.999%** availability

Oracle RAC's distributed lock management design causes overhead



Lock assume

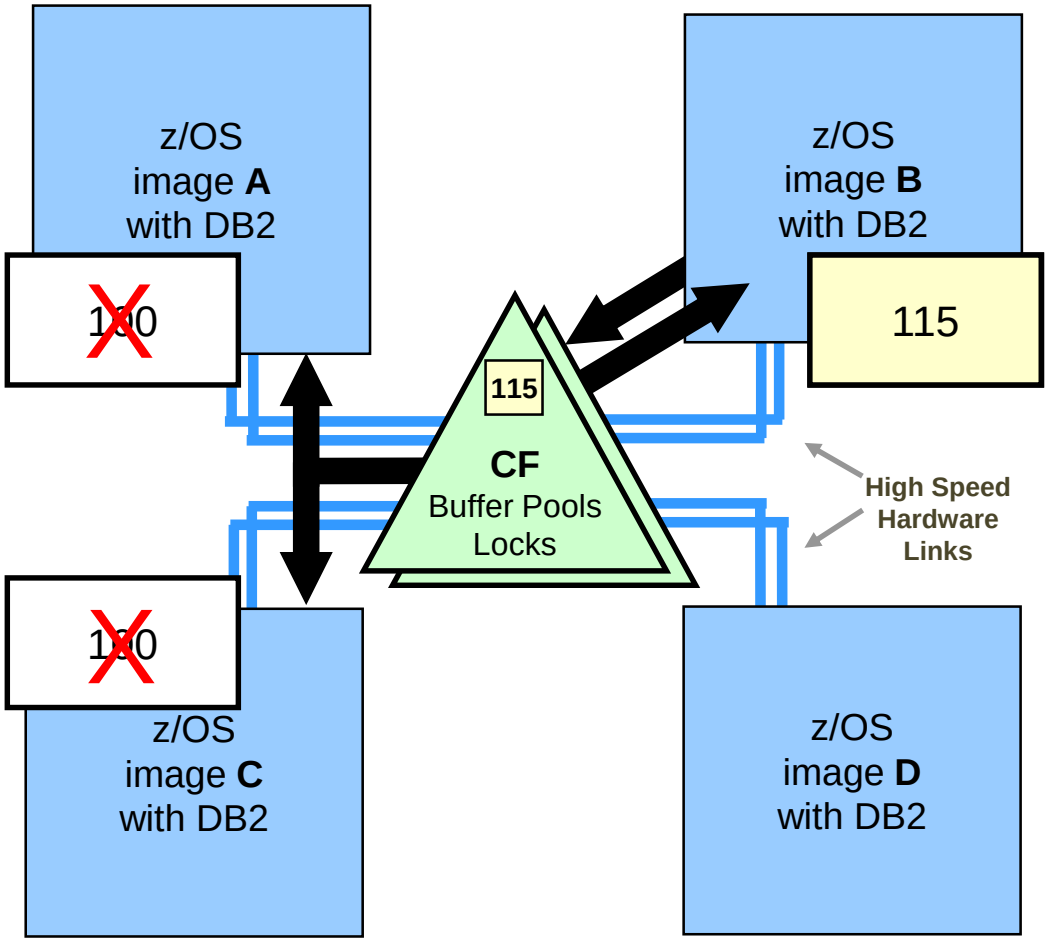
7. B updates local copy

Inter-node connections: **6**

In a cluster with 4 nodes, an update operation may need 6 network connections and two in-memory calls (not shown).

Example based on Oracle's US Patent 7,107,319 B2.

zEnterprise's centralized Coupling Facility permits efficient lock and cache management in DB2



A and C have data in local buffer pool without locks

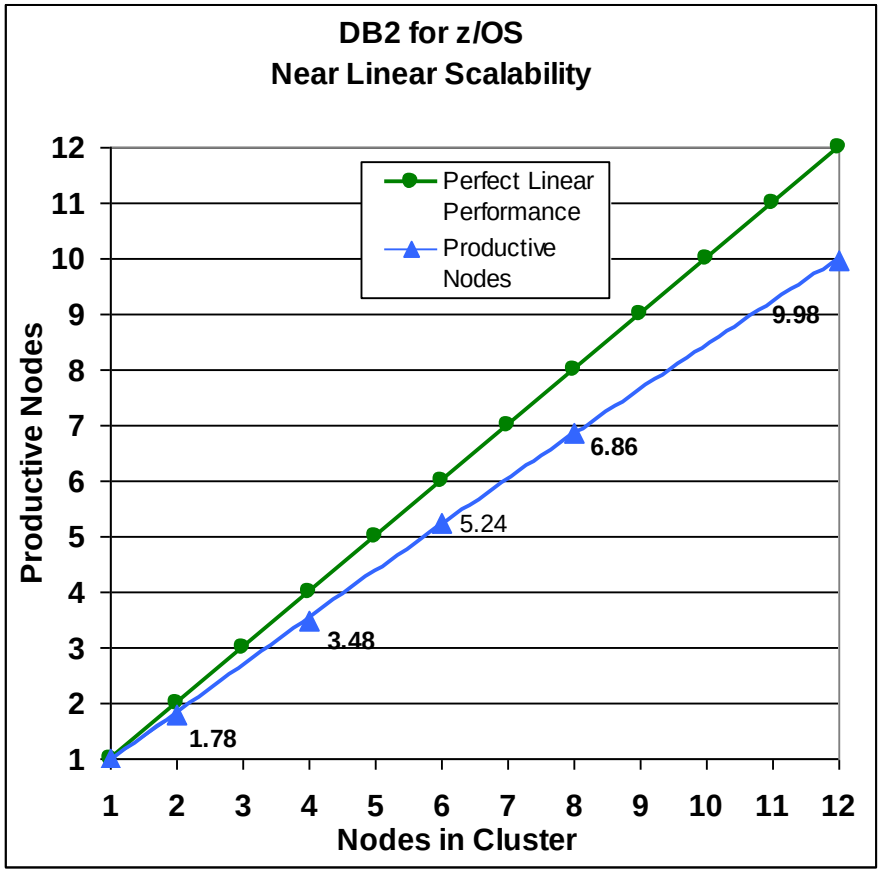
1. B registers page to CF and obtains write lock
2. B updates data
3. B commits update

B caches update in group buffer pool

CF invalidates all cached copies without interrupting processors

Cache and locks are maintained with no inter-node disturbance!

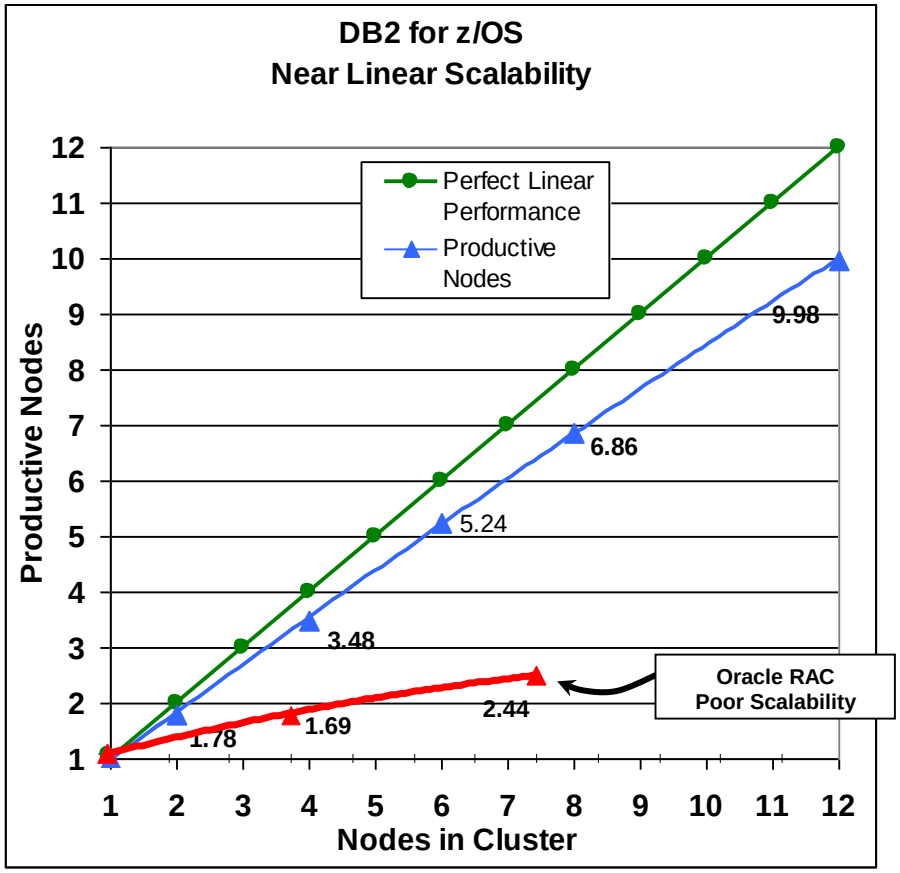
DB2 for z/OS in a parallel sysplex scales efficiently and transparently



- DB2 leverages unique Parallel Sysplex clustering design to achieve near linear scaling
  - No data partitioning required
  - No transaction routing required
  - No cluster awareness required in applications
- Elastic processing capacity
  - Applications are not tied to database partitioning schemes
  - Automatically balances workload across cluster

DB2 for z/OS OLTP result (ITG '03)

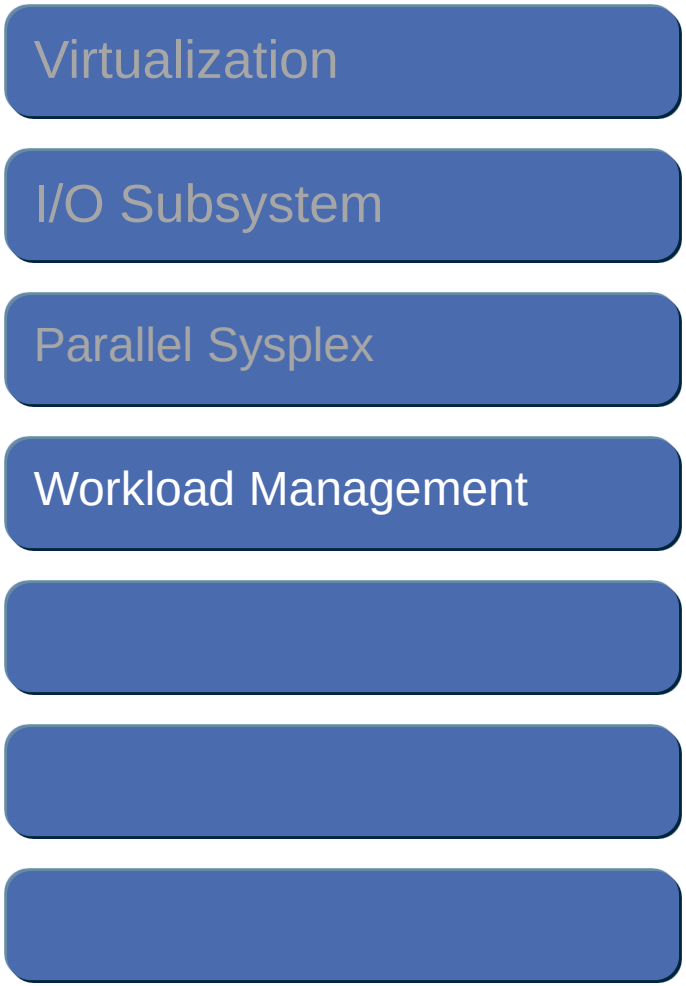
The only option for Intel-based servers is Oracle RAC



- Oracle RAC's lock and cache system is inefficient by design
  - Scaling RAC requires complex tuning and partitioning
  - Application partition awareness makes it difficult to add or remove nodes
- Published studies demonstrate difficult or poor scalability
  - Dell (shown in chart): Poor scalability despite using InfiniBand for RAC interconnect
  - CERN: Four month team effort to tune RAC, change database, change application
  - Insight Technology: Even a simple application on two node RAC requires complex tuning and partitioning to scale

Oracle RAC characteristics as shown in Dell RAC InfiniBand Study http://www.dell.com/downloads/global/power/ps2q07-20070279-Mahmood.pdf
CERN (European Organization for Nuclear Research) http://www.oracleracsig.org/pls/apex/RAC_SIG.download_my_file?p_file=1001900
Insight Technology http://www.insight-tec.com/en/mailmagazine/vol136.html

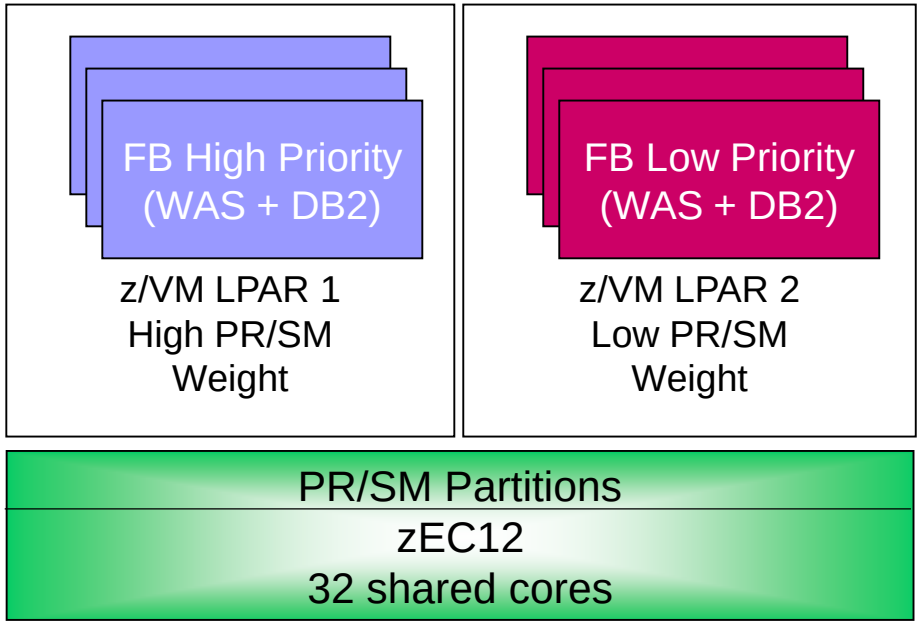
The zEnterprise demonstrates “perfect” workload management

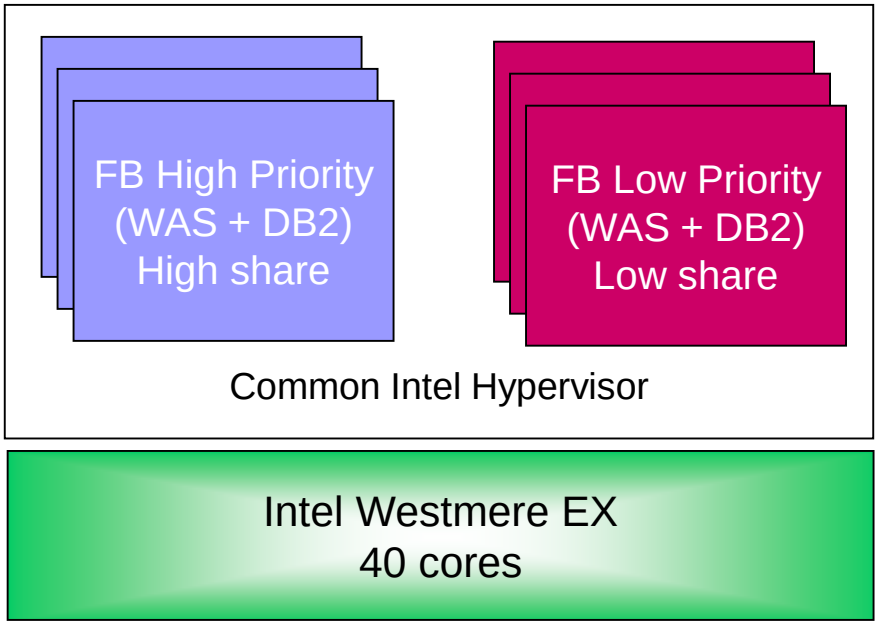


- Applies across all resources, not just CPU
- Ensures priority workloads meet service level agreements
- Cross platform
- Covers heterogeneous platforms

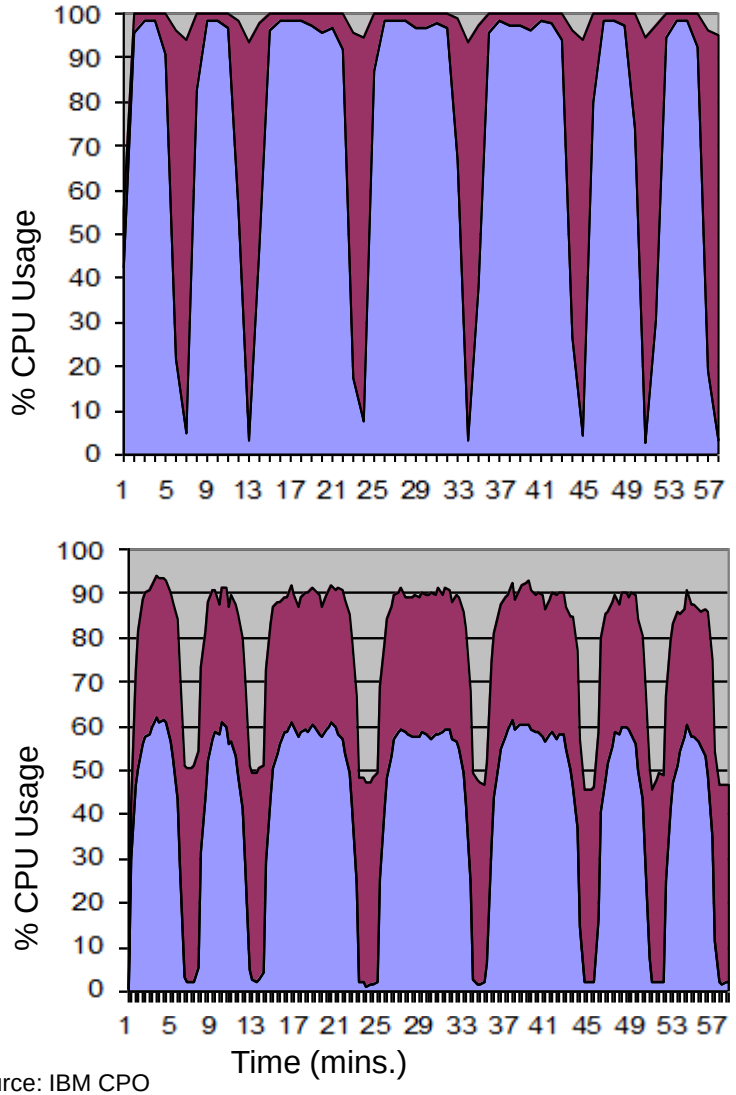
Tests demonstrate comparison of System z PR/SM virtualization to a common hypervisor

- High Priority web workload has defined demand over time
- Service level agreement requires that response time does not degrade
- Low Priority web workload has unlimited demand
- It “soaks up” unused CPU minutes





System z virtualization enables mixing of high and low priority workloads without penalty



System z

- No degradation of high priority workloads
- Low priority workloads use up all but 2% of available resources (high utilization)
- **Result**: Consolidate workloads of different priorities on the same platform and still meet service level agreement

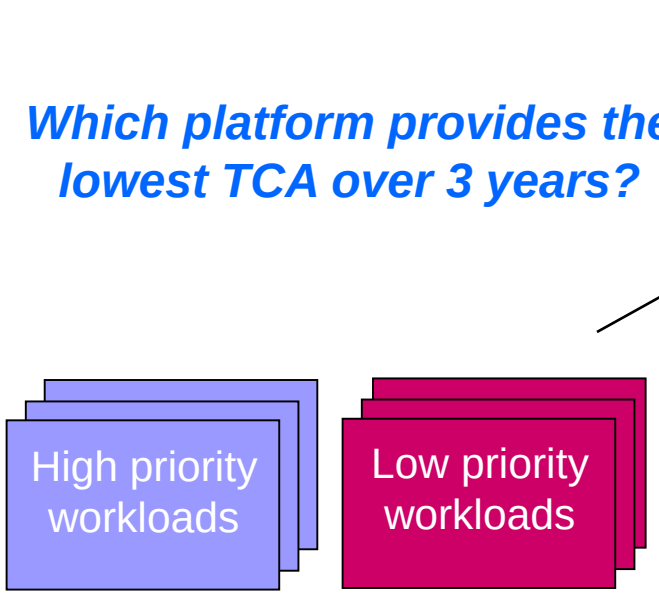
Common Intel hypervisor

- High priority workloads degrade when low priority workloads were added
- Low priority workloads used too much resources, and overall CPU utilization was not nearly as high
- **Result**: Inefficient, unreliable workload management means separate servers are required to insure service level agreement is met

Source: IBM CPO

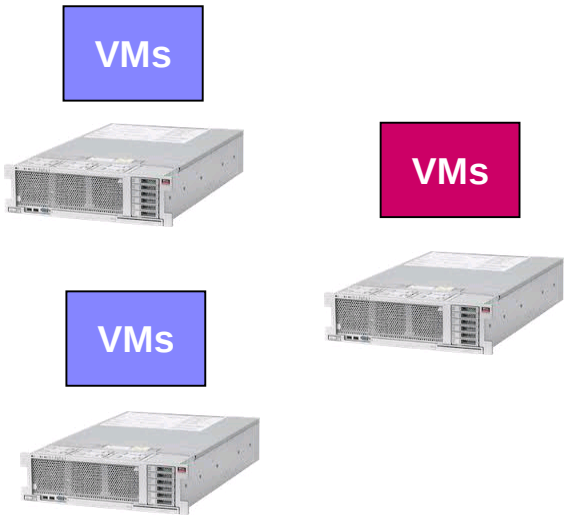
zEnterprise easily manages mixed priority workloads and lowers costs

Which platform provides the lowest TCA over 3 years?



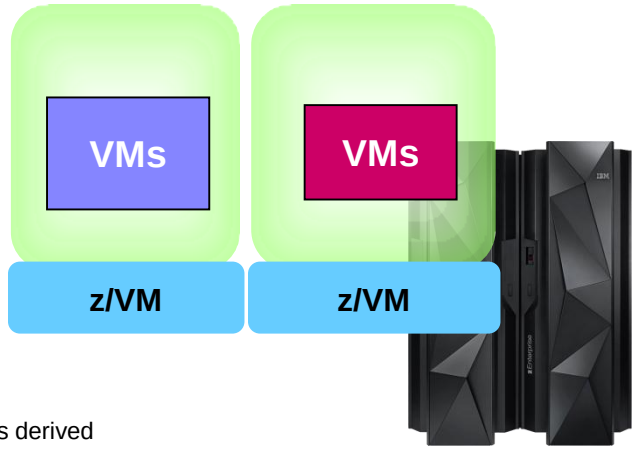
- **IBM WebSphere 8.5 ND**
- **IBM DB2 10 AESE**
- **Monitoring software**

High priority online banking workloads driving a total of **9.1M** transactions per hour and low priority discretionary workloads driving **2.8M** transactions per hour



Virtualized on 3 Intel 40 core servers

$13.7M (3 yr. TCA)



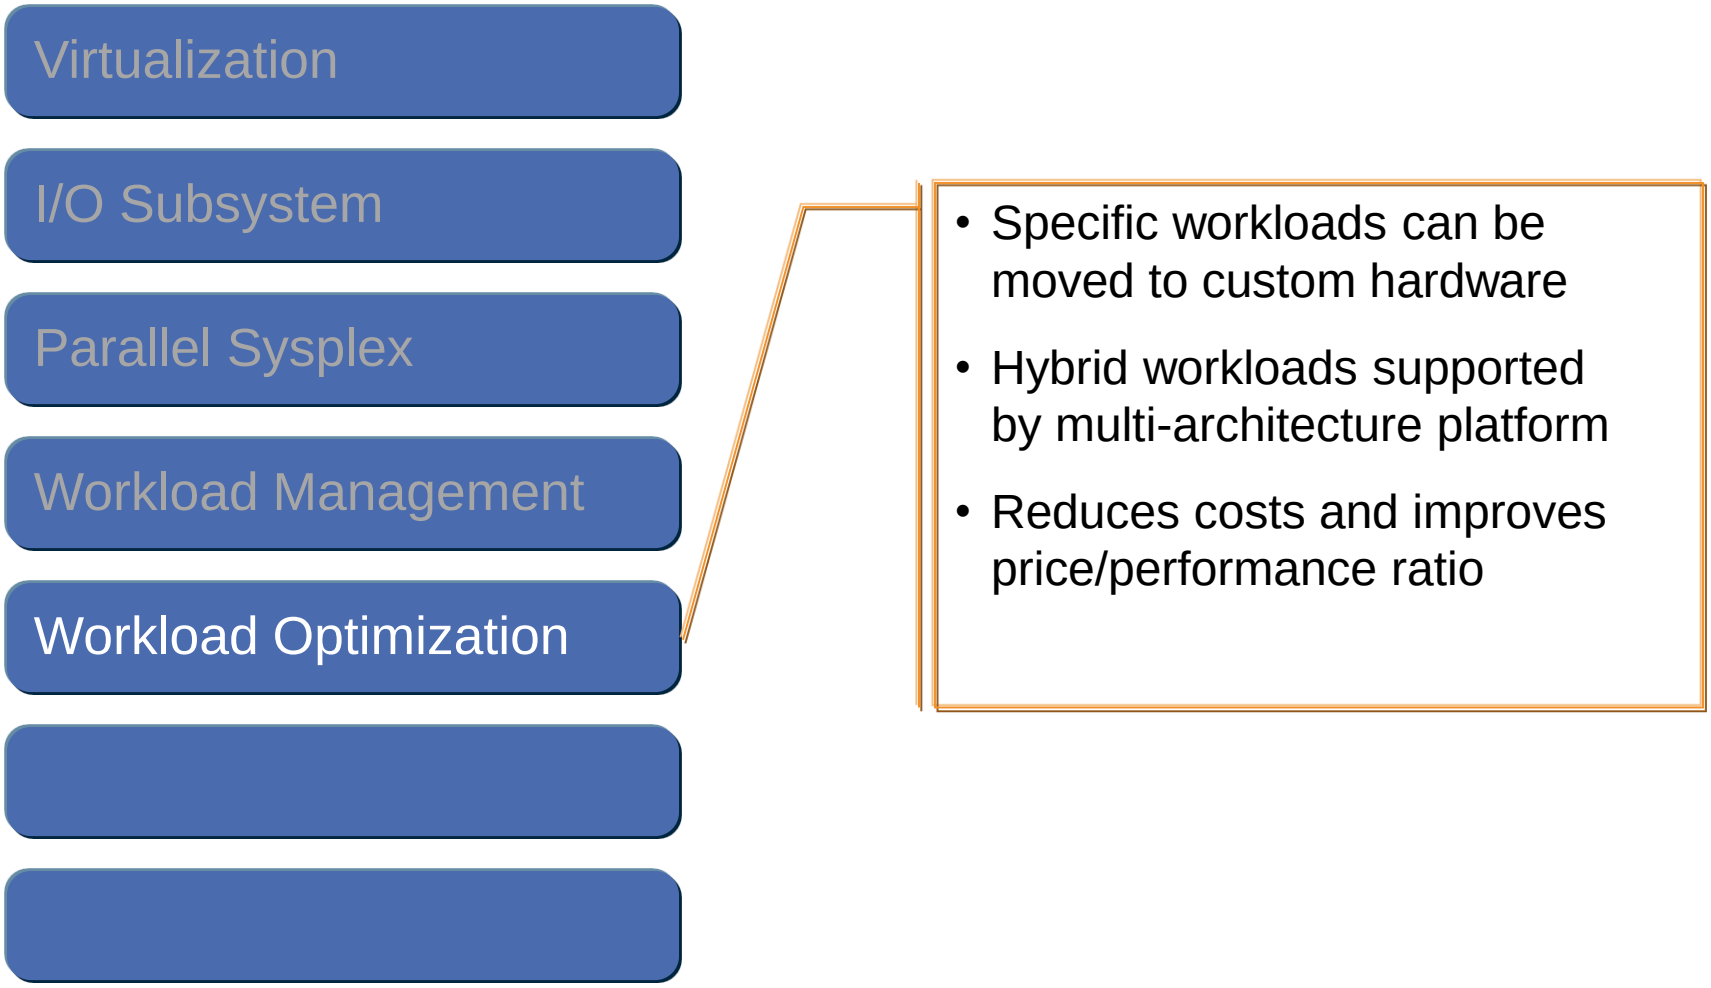
z/VM on zEC12
32 IFLs

$5.77M (3 yr. TCA)

58% *lower cost!*

Consolidation ratios derived from IBM internal studies.. zEC12 numbers derived from measurements on z196. Results may vary based on customer workload profiles/characteristics. Prices will vary by country.

Only zEnterprise offers numerous options for optimizing workloads to reduce costs



Workload optimizations are achieved via special I/O cards

zEnterprise Data Compression (zEDC) introduced in 2013

- Compatible with current coprocessor-based compression
- Specifically designed for large amounts of bulk data
- Cost effective – reduces CPU overhead, and storage overhead
- Optimizes cross-platform exchanges
  - Compatible with zlib compression – an industry standard widely used across all platforms

Up to **4x** data compression

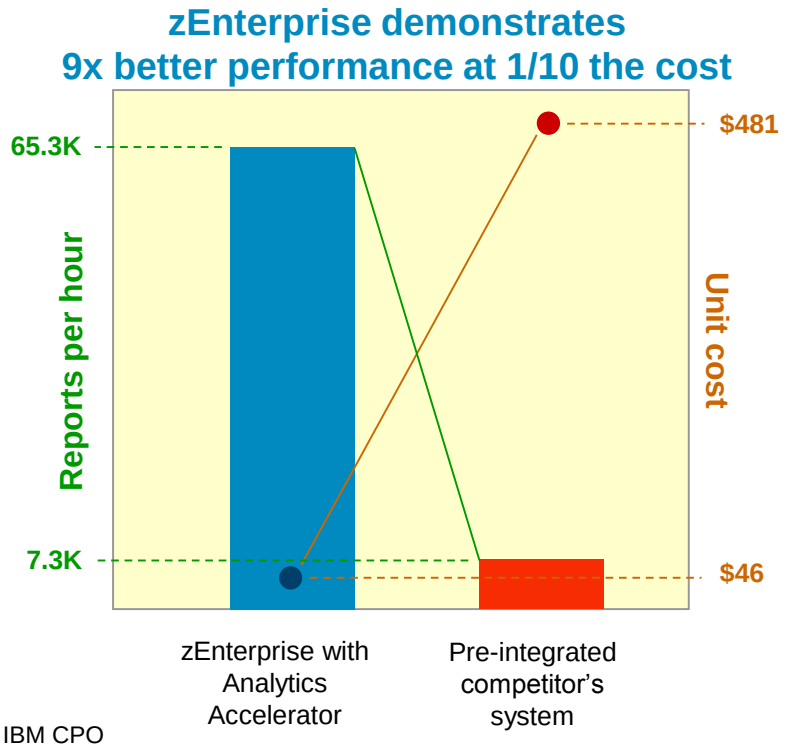
Up to **118x** reduction in CPU

Up to **24x** throughput improvement with zlib

Source: IBM

IBM DB2 Analytics Accelerator speeds up deep analytics queries

- A workload-optimized, blade-based appliance that runs queries in seconds versus hours
- Integrated with DB2 for z/OS, and transparent to applications
- Drives down the costs of data warehousing and business analytics



Source: IBM CPO

zEnterprise extends to support hybrid computing

zEnterprise BladeCenter Extension (zBX) and Unified Resource Manager (URM)

- Industry's first multi-architecture platform
  - zBX includes Power, System x and accelerator blades
- URM extends System z governance extended to zBX blades
  - Provides resource and workload management across mainframe and blades
- Supports application integration with Microsoft Windows, Linux and AIX
- Greater opportunities for consolidation and simplification
- Consistent business controls across applications and platforms

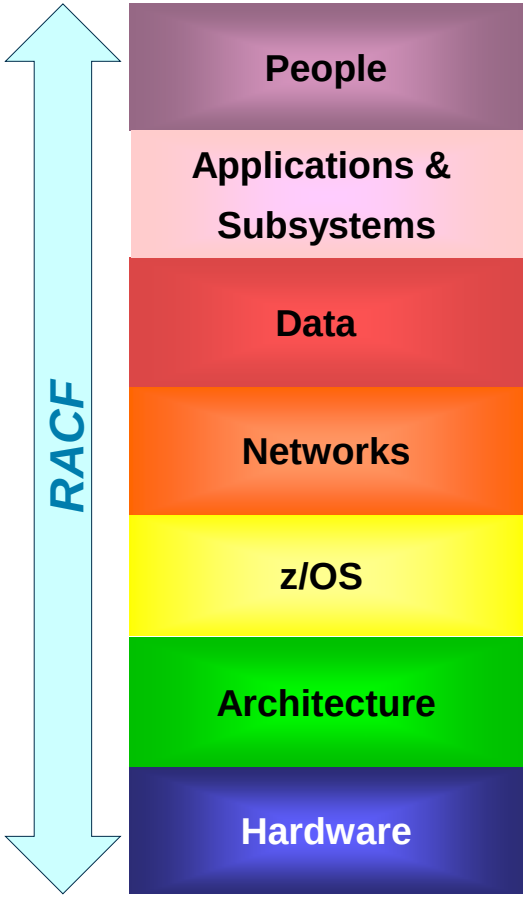
zEnterprise BladeCenter Extension

zEnterprise – the *most* secure commercially available platform

- Virtualization
- I/O Subsystem
- Parallel Sysplex
- Workload Management
- Workload Optimization
- Security
-

- Highest commercially available EAL ratings
- Multiple encryption options
- Provides full function Public Key certificate authority
- APIs extend encryption services across the enterprise
- State of the art security monitoring

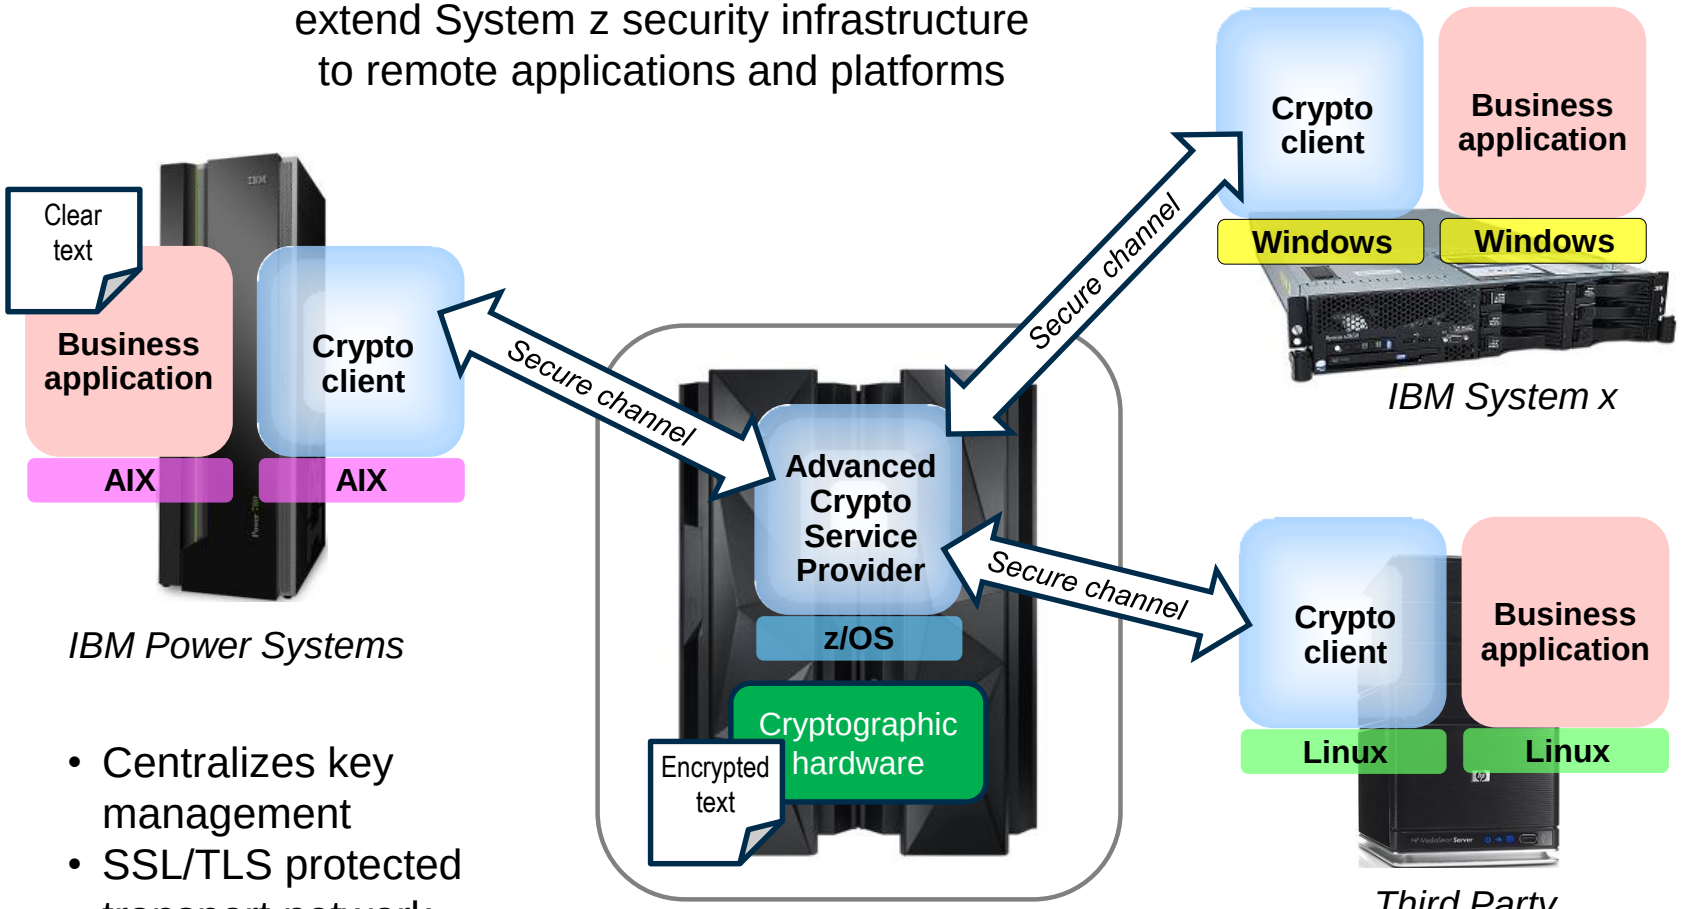
Remote Access Control Facility (RACF) provides security throughout the entire zEnterprise stack



- Tools, reporting, auditing
- Access control to all classes of resources
- Integrated into the operating system
- Provides Enterprise Identity Management
- Supports cryptographic services
- Supports digital certificates

System z is the *hub* of security for the data center

IBM's Advanced Cryptographic Services extend System z security infrastructure to remote applications and platforms



- Centralizes key management
- SSL/TLS protected transport network

Virtualized System z security is superior to other platforms and augmentation costs less

Security Natively Covered by Platform

Security Level Description	IBM System z	x86	Competative UNIX
Normal corporate	100.00%	18.16%	30.26%
Credit card processing involved	99.00%	11.04%	18.28%
Banking	94.00%	5.26%	10.22%
Healthcare	100.00%	3.24%	8.51%
Research	92.50%	2.86%	4.16%
Defense	85.54%	0.26%	1.86%

Major security deficiencies on distributed platforms

Distributed platforms require ***considerable additional expense***

On System z most security requirements are standard

Incremental Cost to Achieve Required Security

Security Level Description	IBM System z	x86	Competative UNIX
Normal corporate	0.00%	32.54%	12.37%
Credit card processing involved	2.32%	46.27%	29.53%
Banking	2.07%	51.31%	26.58%
Healthcare	0.00%	67.26%	35.89%
Research	4.28%	91.26%	64.28%
Defense	11.36%	125.41%	102.26%

Little additional augmentation required on System z

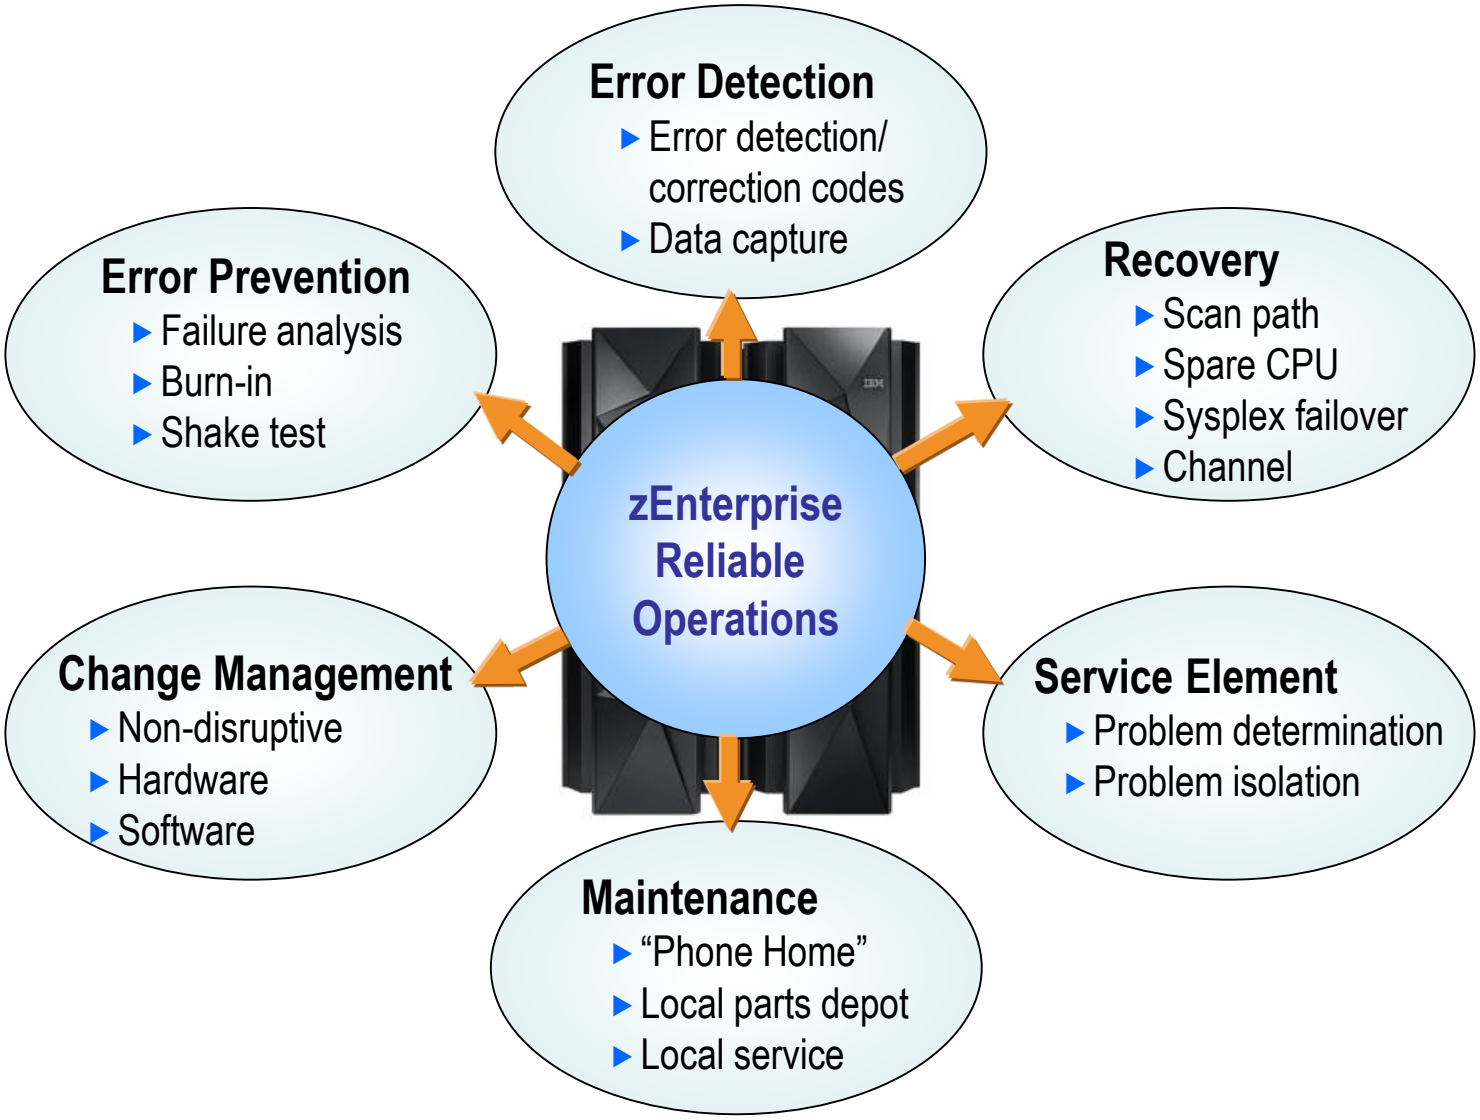
Source: "Tracked, Hacked and Attacked?"

zEnterprise's reliability, availability and serviceability are legendary

- Virtualization
- I/O Subsystem
- Parallel Sysplex
- Workload Management
- Workload Optimization
- Security
- **Reliability**

- Comprehensive, multi-layered strategy for reliability and serviceability
- Supports large number of concurrent operations during maintenance
- "Five 9s" availability
- Lowest costs

System z has always had a comprehensive, multi-layered strategy for reliability and serviceability

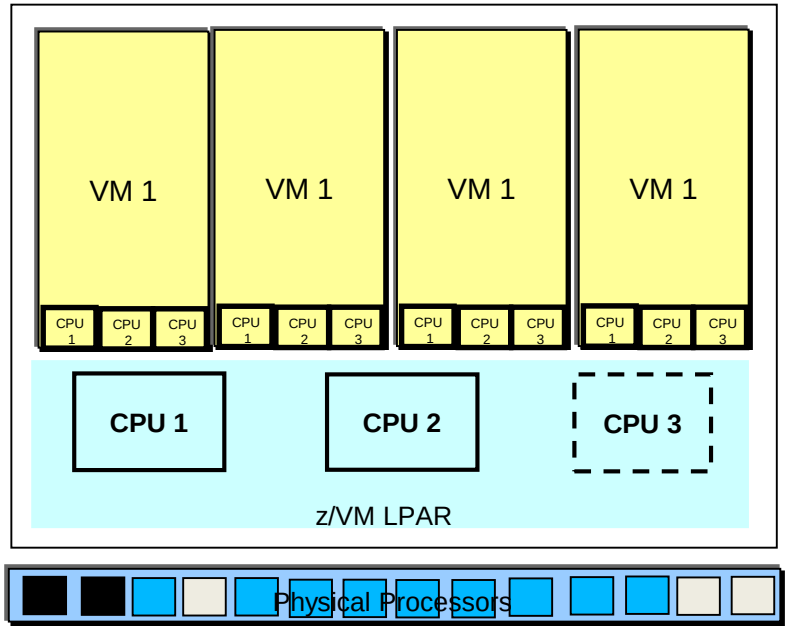


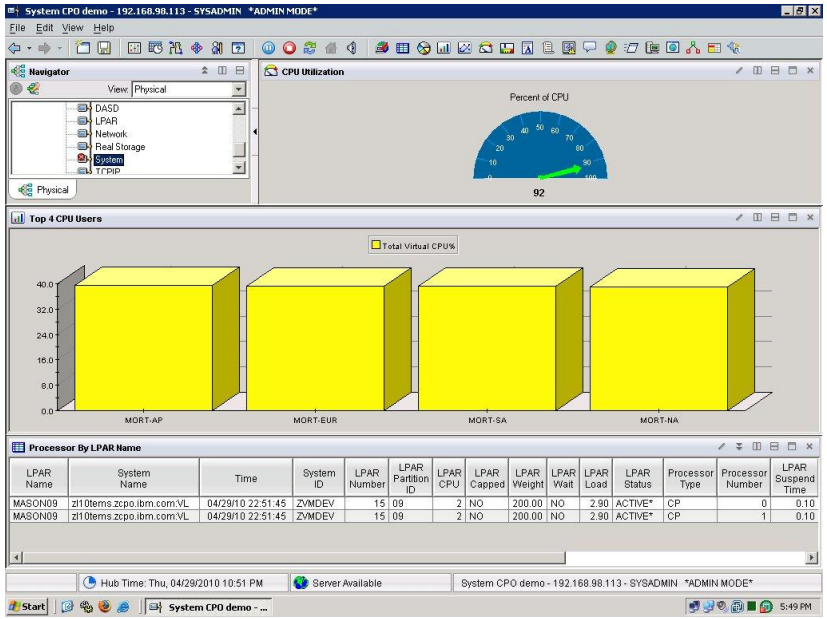
zEnterprise supports concurrent operations during maintenance

Capability	zEC12	x86
ECC on Memory Control Circuitry	Transparent While Running	Can recognize/repair soft errors while running; limited ability with hard errors
Oscillator Failure	Transparent While Running	Must bring server down to replace
Core Sparing	Transparent While Running	Must bring server down to replace
Microcode Driver Updates	While Running	Some OS-level drivers can update while running, not firmware drivers; reboot often required
Book Additions, Replacement	While Running	Must bring server down
Memory Replacement	While Running	Must bring server down
Memory Bus Adaptor Replacement	While Running	Must bring server down
I/O Upgrades	While Running	Must bring server down to replace (limited ability to replace I/O in some servers)
Concurrent Driver Maintenance	While Running	Limited – some drivers replaceable while running
Redundant Service Element	2 per System	“Support processors” can act as poor man’s SE, but no redundancy

Single book systems may not support concurrent memory upgrades

DEMO: Dynamically add processing capacity to z/VM LPAR to handle increased workload… *without disruption*





Tivoli Enterprise Portal

- Guest VMs run without disruption
- Dynamically add logical processors to z/VM LPAR
- Dynamically add processors shared among LPARs

Today's mainframe – 50 years of *continuous* innovation…

- Virtualization
- I/O Subsystem
- Parallel Sysplex
- Workload Management
- Workload Optimization
- Security
- Reliability

IBM zEnterprise EC12

Now let's look at several new opportunities for zEnterprise workloads…
