Winning Business in Aerospace !

Product Lifecycle Management by IBM solutions for Aeronautic Suppliers

The future in Aerospace

Aerospace companies are changing the way they do business. There is increased focus on commonality of tools and processes used within the supply chain.

A core component of this new model is CATIA V5, but decisions on supply chain partners are also being taken based on the way the tools are used to execute work packages for future aircraft programs.

To help in this change, IBM and its partners have put together affordable CATIA V5 packages with Airbus to suit the needs of their different types of suppliers.

By joining other companies in becoming early adopters you will not only be prepared for this change, but also will not suffer from implementation of a new tool at the same time as being considered for new work packages.

WE CAN HELP YOU

Benefits of PLM Solutions:

In addition to CATIA V5, IBM PLM solutions can help you manage your product development processes, intellectual capital (to help you secure your key differentiation), and also help you proliferate your product data across your enterprise, internally and externally

An example of the benefits of PLM solutions was documented by the analyst AMR earlier this year:

PLM Practices	
Challenge	Result with PLM
Engineering change	90% faster
Material sourcing	2%-5% materials savings
RFQ response	60% faster
CTO/ETO order errors	90% lower
Documentation	80% cost reductions
R&D waste	2% of total R&D spend

You can return this reply card to be sent more details OR you can contact us directly by telephone on: xxxxxx

- ☐ Please send me details of the Airbus configurations
- ☐ Please call me to arrange a consultation
To discuss my business and how I could benefit from PLM
- ☐ Please invite me to a seminar
Where I also have the opportunity to meet other companies in my industry
