Chapter 1 Introduction	1
1.1 Objective	1
1.2 Document Structure	1
1.3 Intended Audience	1
1.4 Prerequisites	2
•	
Chapter 2 Introduction to Reporting	
2.1 Objective	
2.2 What is Data Warehousing	
2.3 Data Warehousing	
2.4 BIRT Reporting Tool	
2.5 Changed Data Capture	4
Chapter 3 System Overview	5
3.1 DB2 Environment	
3.2 Oracle Environment	
3.2 Oracle Environment	J
Chapter 4 Runtime Architecture and Development Process	7
4.1 Introduction	
4.2 Architecture Overview	7
4.2.1 Runtime Architecture	7
4.2.2 Development Process And Modelling	9
4.3 Directory Structure & Artifacts	
4.3.1 bin	10
4.3.2 build	10
4.3.3 components/BIBuildTools	11
4.3.4 components/BIBuildTools/source/curam/util/reporting/internal	11
4.3.5 components/core	11
4.3.6 components/core/data_manager	
4.3.7 components/core/data_manager/demodata	
4.3.8 components/core/ddl	
4.3.9 components/core/etl/db2	
4.3.10 components/core/etl/oracle	
4.3.11 components/core/run	
4.3.12 components/core/source/curam	
4.3.13 components/custom	
4.3.14 logs	12

Chapter 5 The Reporting Environment Explained	4.3.15 project/properties	12
5.1 Overview       13         5.2 Initial Setup       13         5.3 ETL explained       13         5.4 Metadata explained       14         5.5 The Build Script       15         5.5.1 The Build Script explained       15         5.5.2 Using the Build script       16         5.5.3 Running the build script       17         5.6 Change Data Capture       18         5.7 Sequence of running ETLs       19         5.8 Performance Tuning and Optimization       20         5.9 Summary       20         Chapter 6 Installation and Configuration       21         6.1 Overview       21         6.2 Ant setup       21         6.3 Java 2 Platform, Standard Edition (J2SE) installation       22         6.4.1 Common       22         6.4.2 DB2       23         6.4.3 Oracle       23         6.5 Install the BIA Reporting Module       23         6.6 Setup BIApplication. Properties and BIBootstrap. properties files       24         6.7 Executing BIRT Reports against Demo-Data       24         6.8 DB2 Environment       25         6.8.1 Install DB2 Database       25         6.8.2 Create DB2 target schema's       26         6.8.4 Create Objects in Databa	Chanter 5 The Reporting Environment Explained	13
5.2 Initial Setup       13         5.3 ETL explained       13         5.4 Metadata explained       14         5.5 The Build Script       15         5.5.1 The Build Script explained       15         5.5.2 Using the Build script       16         5.5.3 Running the build script       17         5.6 Change Data Capture       18         5.7 Sequence of running ETLs       19         5.8 Performance Tuning and Optimization       20         5.9 Summary       20         Chapter 6 Installation and Configuration       21         6.1 Overview       21         6.2 Ant setup       21         6.3 Java 2 Platform, Standard Edition (J2SE) installation       22         6.4 Other Environment Variables       22         6.4.1 Common       22         6.4.2 DB2       23         6.5 Install the BIA Reporting Module       23         6.5 Install the BIA Reporting Module       23         6.5 Install BIA Daplication, Properties and BIBootstrap, properties files       24         6.7 Executing BIRT Reports against Demo-Data       24         6.8 DB2 Environment       25         6.8.2 Create DB2 target schema's       26         6.8.2 Create DB2 targets sto Application Database       <		
5.3 ETL explained       13         5.4 Metadata explained       14         5.5 The Build Script       15         5.5.1 The Build Script explained       15         5.5.2 Using the Build script       16         5.5.3 Running the build script       17         5.6 Change Data Capture       18         5.7 Sequence of running ETLs       19         5.8 Performance Tuning and Optimization       20         5.9 Summary       20         Chapter 6 Installation and Configuration       21         6.1 Overview       21         6.2 Ant setup       21         6.3 Java 2 Platform, Standard Edition (J2SE) installation       22         6.4.1 Common       22         6.4.2 DB2       23         6.4.3 Oracle       23         6.5 Install the BIA Reporting Module       23         6.6 Setup BIApplication. Properties and BIBootstrap. properties files       24         6.7 Executing BIRT Reports against Demo-Data       24         6.8 DB2 Environment       25         6.8.1 Install DB2 Database       25         6.8.2 Create DB2 target schema's       26         6.8.2 Create DB2 target schema's       26         6.8.3 Setting up Access to Application Database       28		
5.4 Metadata explained       14         5.5 The Build Script       15         5.5.1 The Build Script explained       15         5.5.2 Using the Build script       16         5.5.3 Running the build script       17         5.6 Change Data Capture       18         5.7 Sequence of running ETLs       19         5.8 Performance Tuning and Optimization       20         5.9 Summary       20         Chapter 6 Installation and Configuration       21         6.1 Overview       21         6.2 Ant setup       21         6.3 Java 2 Platform, Standard Edition (J2SE) installation       22         6.4 Other Environment Variables       22         6.4.1 Common       22         6.4.2 DB2       23         6.4.3 Oracle       23         6.5 Install the BIA Reporting Module       23         6.6 Setup BIApplication.Properties and BIBootstrap.properties files       24         6.7 Executing BIRT Reports against Demo-Data       24         6.8 DB2 Environment       25         6.8.1 Install DB2 Database       25         6.8.2 Create DB2 target schema's       26         6.8.3 Setting up Access to Application Database       25         6.8.4 Create Objects in Databases using Build Environ	<u>*</u>	
5.5 The Build Script       15         5.5.1 The Build Script explained       15         5.5.2 Using the Build script       16         5.5.3 Running the build script       17         5.6 Change Data Capture       18         5.7 Sequence of running ETLs       19         5.8 Performance Tuning and Optimization       20         5.9 Summary       20         Chapter 6 Installation and Configuration       21         6.1 Overview       21         6.2 Ant setup       21         6.3 Java 2 Platform, Standard Edition (J2SE) installation       22         6.4 Other Environment Variables       22         6.4.1 Common       22         6.4.2 DB2       23         6.4.3 Oracle       23         6.5 Install the BIA Reporting Module       23         6.6 Setup BIApplication.Properties and BIBootstrap.properties files       24         6.7 Executing BIRT Reports against Demo-Data       24         6.8 DB2 Environment       25         6.8.1 Install DB2 Database       25         6.8.2 Create DB2 target schema's       26         6.8.3 Setting up Access to Application Database       28         6.8.4 Create Objects in Databases using Build Environment       28         6.8.5 Install Info

Chapter 7 Customizations and Upgrades	0.2.0 <b>Doubling Data</b>	10
emptor, emissions and epsilons	Chapter 7 Customizations and Upgrades	51

7.1 Introduction	
7.2 Customizations	
7.2.1 Customizing Data Models and ETL Designs	52
7.2.2 Customizing DDLs	
7.2.3 Customizing ETL Meta Data	52
7.2.4 Customizing the Build Script	53
7.2.5 Customizing the Java Transformation Code	
7.2.6 Customizing the Static Data Files	
7.3 Upgrade Process	
7.3.1 Upgrade Strategy	
7.4 Conclusion	
Chapter 8 Troubleshooting	
8.1 Introduction	
8.2 Problem: Build fail errors when running the build script	
8.2.1 Problem	
8.2.2 Solution	
8.3 Problem: 'appbuild configtest' is failing	
8.3.1 Problem	58
8.3.2 Solution	58
8.3.3 Problem	58
8.3.4 Solution	59
8.3.5 Problem	59
8.3.6 Solution	59
8.3.7 Problem	59
8.3.8 Solution	59
8.3.9 Problem	59
8.3.10 Solution	60
8.4 Problem: Errors with permissions	60
8.4.1 Problem	60
8.4.2 Solution	60
8.5 Problem: The lastwritten field in source table is not populated	60
8.5.1 Problem	60
8.5.2 Solution	60
8.6 Problem: Error deploying the locators in Oracle because of Oracle version	60
8.6.1 Problem	
8.6.2 Solution	61
8.7 Problem : Unwanted OWB Locations	61
8.7.1 Problem	61
8.7.2 Solution	61
8.7.3 Necessary locations	
8.8 Problem: Error when running 'appbuild transform.aggcasemonth'	
8.8.1 Problem	
8.8.2 Solution	62
8.9 Problem: Cognos does not start	
8.9.1 Problem	
8.9.2 Solution	
8.10 Problem: Errors while importing the ETL's	
8.10.1 Problem	63

8.10.2 Solution	. 63
8.10.3 Problem	. 63
8.10.4 Problem	. 63
8.10.5 Solution	. 63
8.10.6 Solution	. 63
8.11 Problem: Unable to log into Control Centre	. 63
8.11.1 Problem	. 63
8.11.2 Solution	
8.12 Problem: No Data in Tables after running owb.environment.tests.run	. 64
8.12.1 Problem	
8.12.2 Solution	-
8.13 Problem: Error reimporting due to Matching Conflicts	. 64
8.13.1 Problem	. 64
8.13.2 Solution	
8.14 Problem: Incorrect language code set

# Chapter 1

## Introduction

## 1.1 Objective

This document provides developers with an overview of the Cúram Business Intelligence and Analytics<sup>TM</sup> (BIA) Reporting development process. This includes the architecture, design, development and deployment of BIA Reporting.

### 1.2 Document Structure

Chapter 2 & 3, *Introduction and Overview*, begins this guide with an overview of BIA Reporting. The artifacts that are provided with BIA Reporting are also explained.

Chapter 4 & 5, *Runtime Architecture and Reporting Environment* provide an overview of the architecture and the various components that make up BIA Reporting. They also outline the development process.

Chapter 6 *Installation and Configuration*, describes how to create and run BIA Reporting for both Oracle® Warehouse Builder and DB2® InfoSphere Warehouse Edition. This covers installation, populating the databases, and running the reports. By following the instructions in this chapter you will have a working system installed.

Chapter 7, *Customizations and Upgrades*, covers customizations and describes how to change or extend BIA Reporting using practical examples. This chapter includes a section on how to customize your implementation in a manner that facilitates the take on of future upgrades.

Chapter 8, *Troubleshooting*, details some common pitfalls and problems that may be encountered during installation or deployment together with the solution.

### 1.3 Intended Audience

This guide is intended for developers who are working with BIA Reporting. It provides details on how to work within the BIA Reporting framework.

# 1.4 Prerequisites

A working knowledge of the database platform being used (Oracle or DB2) and ETL tool is required. The reader should also have an understanding of Data Warehousing concepts and techniques.

# Chapter 2

# Introduction to Reporting

## 2.1 Objective

This document provides developers with a definition of warehousing and how it is implemented.

## 2.2 What is Data Warehousing

Data warehousing is the process of collecting data which is then organized in such a way that it can easily analyzed, extracted, reported on, and otherwise be used for the purposes of further understanding the data. This ability to understand any data can give organizations the power to make very useful management decisions.

This process consists of extracting data from one or more source Databases. This information is then transformed or cleaned up to remove all anomalities and brought into a central repository, a Data Warehouse. We then take the information from the data warehouse into Data Mart(s) which are specialized versions of the data warehouse which have been designed to suit the needs of the customer/target audience. It is then possible to view this data using a reporting tool such as Business Objects, Cognos BI in the form of graphs or charts etc. The Stages of the Data warehouse are:

- Extracted into Source System
- 2. Transferred into **Staging** where it is transformed
- 3. Loaded into **Central Warehouse** where it is stored
- 4. Delivered into **Datamart** where it is queried

# 2.3 Data Warehousing

The Reporting schemas are comprised of: Staging, Central and Datamart schemas. Source database or the operational database from which we want to extract our data from.

- 1. Staging. The Staging ETL's are run, they pull any information from Source through to Staging
- 2. Central. Once staging is populated with data the Central ETL's are run. These ETL's pull data into the Central Data Warehouse changing data where necessary and applying any business logic required..
- 3. Datamarts. This is the final stage of the Reporting repository, data is transformed into dimensional format, and de-normalised to ensure ease of query, and to ensure cube builders/report builders find the data easer to model.

## 2.4 BIRT Reporting Tool

An open source reporting tool called Business Information and Reporting Tools (BIRT) is used by the source database. BIRT has been used to develop Dashboards and Reports, which display data that is stored in the Application and Data Warehouse Tables. Please see the BIRT Developer Guide for more information.

# 2.5 Changed Data Capture

When the Staging ETL processes are run, they rely on a lastwritten timestamp column on all source tables, this ensures that only changed data is extracted. It is important to understand that the reporting module requires that each table that it extracts data from must have a column of type timestamp and have a name of lastwritten, and that any application must update this column whenever a row is created or modified in the source database.

# Chapter 3

# System Overview

#### 3.1 DB2 Environment

This product contains components created using DB2 elements and is designed for use with IBM products, licenses for which may be obtained as necessary from IBM.

The installation and configuration section installs the environment shown below. Typically the BIA Reporting Module and IWE are installed on a standalone machine in a development environment. The application and associated operational database are installed on a separate machine called e.g. SourceTest. Connections are configured between the operational database and the data warehouse databases:

A JDBC connection used by the BIA Reporting Module build environment

This environment typically represents the production environment in any project in that the data warehouse is located on separated machine(s) to the production machine(s).

Note that the Staging and Central tables are co-located in the same database called CuramDW. It is a requirement that the staging and central schemas are co-located in one DB2 database so that the Central ETL processes can be promoted and executed correctly.

The IWE Design Studio is the interface that provides a visual representation of the Data Warehouse. Use the Design Studio to import source objects such as tables and views, design ETL processes such as mappings, and ultimately design the target warehouse.

See the section "Customizations and Upgrades" for a description on how to make changes to Reporting and how to take on upgrades to Reporting.

### 3.2 Oracle Environment

This product contains components created using Oracle Warehouse Builder elements and is designed for use with Oracle products, licenses for which may be obtained as necessary from Oracle.

Oracle Warehouse Builder is comprised of a set of graphical user interfaces to assist you in implementing complex data system designs. Your designs are saved as metadata in a centralized repository.

The centralized repository, known as the Warehouse Builder repository, is hosted on an Oracle Database. The Design Center is the interface that provides a visual representation of the Warehouse Builder repository. Use the Design Center to import source objects such as tables and views, design ETL processes such as mappings, and ultimately design the target warehouse.

A mapping is an object in which you define the flow of data from sources to targets. Based on a mapping design, Warehouse Builder generates the code required to implement the ETL logic. Warehouse Builder can generate PL/SQL, SQL\*Loader, or ABAP code for mappings.

After you complete the design of a mapping, for example, and prompt Warehouse Builder to generate the code, the next step is to deploy the mapping. Deployment is the process of copying the relevant metadata and code you generated in the Design Center to a target schema. The target schema is generically defined as the database which will execute the ETL logic you designed in the Design Center. Specifically, in a traditional data warehousing implementation, the data warehouse is the target schema and the two terms are interchangeable.

# Chapter 4

# Runtime Architecture and Development Process

#### 4.1 Introduction

This chapter provides an overview of the architecture and various components that make up BIA Reporting. Each of the artifacts provided with BIA Reporting are explained.

The BIA Reporting solution is a framework for providing specific reports. As a framework it can be customized to include new reporting requirements as they arise. The framework consists of the following deliverables:

- A set of *data models* both Relational and Dimensional. These models are optimized to support reporting needs.
- Extract Transform and Load (ETL) process definitions. A set of process definitions that define how the data is moved and transformed from the On-Line Transaction Processing (OLTP) data source to the BIA Reporting data sources. These are provided for both Oracle and DB2 platforms. The tools used to perform the ETL processes are Oracle Warehouse Builder (OWB) and IBM InfoSphere Warehouse Edition (IWE).

### 4.2 Architecture Overview

#### 4.2.1 Runtime Architecture

The runtime architecture for BIA reporting defines how the data flows from the transactional data source to the Reporting data sources and on to populate the reports. The data is moved from the Souce databes to the Staging database. From here it is moved to the Central Data Warehouse (CDW), and finally is pushed out to the Data Marts. Once the Data Marts are populated the reports are run.

#### **Data Flow**

The data is moved through the Reporting solution in a number of distinct steps.

- Step 1. Extract to Staging Database. The first step is the extract of the data of interest from the source database. The data is filtered on the LASTWRITTEN column in the source tables. Once the data of interest, e.g. all new entries in a particular table, is identified it is moved to the Staging area. The Staging area is a data storage area containing data from various data sources, it is essentially a copy of a subset of the source tables. This data movement is the first run of the ETL, and the data can be cleansed at this point to ensure there is no 'dirty' data that could lead to inaccurate reports.
- Step 2. Staging to CDW. After the required data is in the Staging area it is ready to be moved to the CDW. The CDW is the 'core' of the Reporting solution: it contains all the archived data stored in a normalized data structure. The physical location of this database is usually on the same database as the Staging database. The CDW is optimized for the efficient storage of large amounts of data. It does not prejudge how the data stored will be queried, it just stores the data that is required for analysis. It achieves this by serving all the current reporting needs and also attempting to capture the underlying business processes. Staging area data is not in the form that is required for reporting and has some gaps in it. Therefore when the data is moved from Staging to CDW any 'business logic' required is run on the data to fill in those gaps. This ensures it arrives in the CDW in a state that is useful for analysis.
- Step 3. Load Data Marts. Finally the data is moved from the CDW to the Data Marts, this is done by running another series of ETL processes. Data marts are de-normalized dimensional structures (Star schema). They are logical groupings of data that service a particular group of reports. ETL programs extract a subset of historical data from the CDW. This subset of data, a Data Mart, contains data that is tailored to and optimized for a specific reporting or analysis task.

An overview of the data flow between the main data sources is as follows.

- 1. Source Databases to Staging Area
  - Data is Cleansed
- 2. Staging Area to Central Data Warehouse
  - Business Logic applied from external business logic
- 3. Central Data Warehouse to Datamarts
  - Transformed to Dimensional

As is evident, there can be multiple data sources, only one Staging area, one CDW, and multiple Data Marts.

## 4.2.2 Development Process And Modelling

The development architecture outlines how to extend and maintain the BIA Reporting solution. The design process starts with a report or analysis requirement and works back creating or adding to data models, once that is done the ETL processes are designed. The ETL processes specify how the data is moved through the system from OLTP to end report.

#### Data Models

The starting point is a reporting requirement. This requirement is formalized by drawing a logical user model. A user model captures the end user's model or view of the data required. User models help to determine the structure of the data marts. Drawing the user model involves picking out the measures or facts from the reporting requirement and the dimensions that the measure is sliced by. The user model should also identify the level of granularity required. The granularity is very important, as it determines what and how much data is captured.

#### **Modeling the Data Marts**

In order to model the Data Mart, one must logically grouping the user models. One related group of user models will form the starting point for modeling a single Data Mart. Data Marts are defined as dimensional Star Schemas. The Data Marts contain the measures and the dimensions that are of interest. A measure is usually a numerical 'fact', e.g. 'sales', and dimensions are a way of narrowing the view of this fact, e.g. 'sales for product x in the month of June'. It should be possible to trace each item on a user model to a column in the Data Mart tables. The Data Mart must also provide the granularity specified in the user models. The datamarts are de-normalized and this makes querying them easier.

Models in the Data Mart conceptual model are engineered as star schema structure where one fact table references any number of dimension tables.

#### **Modeling the CDW**

The next step is to design the CDW. The CDW is the main data storage area. This supports the data needs of the various Data Marts and also captures the underlying business processes.

The CDW model is engineered a normalized Entity-Relationship structure. It contains the lowest level of granularity that may be of interest and is a model of the business processes from a reporting viewpoint.

The following model is part of the CDW conceptual model, which is further discussed in the 'Directory Structure & Artifacts' section.

#### **Modeling the Staging Database**

The final data model is the Staging area. This is where the data of interest from the source OLTP data source is stored. It is derived by mapping the CDW to the source system. It contains a copy of every table of interest from

the source system.

### ETL Process Design

The ETL defines what data is taken from one database, how it is manipulated, and where it is stored. The aim is to have all data required for reports available in the Data Marts. Any required data which is not already in the Data Mart needs to be added to the Data Mart and may also need to be added to the CDW if not already there. When this happens data models are updated and the ETL processes are extended. The idea is to work back through the Reporting data sources until the required data is found. This change process is described further in the chapter 'Customizations and Upgrades'.

#### Java Code

The BIA Reporting solution provides both Java® transformation code and Java Connectivity code. The Java transformation code is used when the type of transformation required is not supported by the ETL tool. Java connectivity code is used to establish connections to different databases.

A framework exists for the java code and this framework contains a BIA Reporting connectivity library and BIA Reporting transformations used in any ETL processes. The directories containing the java code are described in the section 'Directory Structure & Artifacts'.

This java code is extendable by developers of BIA Reporting. When a developer needs to create a custom transformation for an ETL (e.g. to apply some business logic to change data from the Staging to CDW) then a new transformation can be created. The transformation can then be called from within the ETL.

## 4.3 Directory Structure & Artifacts

In this section each of the artifacts and the directory structure provided with BIA Reporting is explained.

#### 4.3.1 bin

The *bin* folder contains those files that are generated automatically from the data definition language (DDL) metadata during a build process, with the files for each script being held in its own appropriately named directory mirroring the *core/ddl* folder.

#### 4.3.2 build

The *build* folder contains those files that are generated automatically from the java code during a build process, with each file being held in its own appropriately named directory mirroring the source folder. It will also contain the data\_manager .csv static data files.

## 4.3.3 components/BIBuildTools

This directory contains the code for the BIA Reporting Build Environment. These include the Apache Ant files that are used by all reporting components. These build files should not be changed by the client as to allow new versions to be delivered in future releases.

## 4.3.4 components/

## BIBuildTools/source/curam/util/reporting/internal

The *source/curam/util/reporting/internal* directory contains Java code necessary for the internal workings of the transformations in the ETLs for both Oracle and DB2. This code includes a connectivity library.

## 4.3.5 components/core

The *components/core* directory contains artifacts for the implementation of BIA Reporting. These artifacts include the build.xml file which loads DDLs and ETLs into the required database.

## 4.3.6 components/core/data\_manager

The *components/core/data\_manager* folder contains data manager files to populate the static tables during the implementation of BIA Reporting. These files are populated into the database by running the required ETL which populates the static data from these files into the tables.

## 4.3.7 components/core/data\_manager/demodata

The *components/core/data\_manager/demodata* folder contains sample demonstration data that is used to populate the datamarts database for the purpose of demonstration of the reports to users.

## 4.3.8 components/core/ddl

The *components/core/ddl* folder contains the data definition language (DDL) scripts for the staging, central, and datamarts databases for both Oracle and DB2 used during the implementation of BIA Reporting.

## 4.3.9 components/core/etI/db2

The *components/core/etl/db2* folder contains the DB2 version of the Data Warehouse ETL's and metadata, which was created by IBM's ETL tool InfoSphere Warehouse Edition.

## 4.3.10 components/core/etl/oracle

The *components/core/etl/oracle* folder contains the extract, transform, and load (ETL) metadata for the staging, central, and datamarts databases used during the implementation of BIA Reporting. Like the DDLs the ETL metadata in the Oracle folder can only be read by Oracles ETL tool (Oracle Warehouse Builder).

## 4.3.11 components/core/run

The *source* /run directory contains batch files for Oracle which are used during the build process to run ETLs. These are intended for development and testing use only and we do not recommend that there are used in a production environment.

## 4.3.12 components/core/source/curam

The *components/core/source/curam* directory contains the Java source code for the BIA Reporting ETL Transformations.

## 4.3.13 components/custom

The c *omponents/custom* folder contains a directory structure but no files. This directory is used for the customization of artifacts. The directory structure consists of core, reports, and source folders and any artifacts that need to be customized are copied to this folder. This process is described further in the *Customizations and Upgrades* chapter.

## 4.3.14 logs

The *logs* directory is the default directory to which log files are written.

## 4.3.15 project/properties

The *project/properties* directory contains the property files - BIBootstrap.properties and BIapplication.properties - for both the Data Warehousing databases and the operational source database. These files must be amended before implementing BIA Reporting to reflect the connection information for the Data Warehousing databases and the source database. Please refer to **Appendix A**, **Appendix B** and **Appendix N** for further details.

# Chapter 5

# The Reporting Environment Explained

### 5.1 Overview

This chapter describes the environment, setup and execution of runtime process for BIA Reporting. An assumption is made that the developer knows how to install and use the server and warehouse toolsets for the database platform they are running Reporting on. What is outlined in this chapter is how to use these tools (once installed and configured) to get Reporting up and running. It is hoped that the developer also gets a clear understanding of why some of the design choices have been made in the BIA Reporting solution. This chapter is best read along with the following chapter on Customizations and Upgrades .

## 5.2 Initial Setup

This section briefly describes the steps required to install and setup the reporting solution. An assumption is made that the developer knows how to setup the tools for the database platform they want to run BIA Reporting on.

Please see the supported prerequisites in the Release Notes to see which **database platform versions** are supported by BIA Reporting.

To setup the database and ETL tools for Oracle and DB2 please refer to vendor documentation and Chapter 6 which details the following:

- Ant
- Enterprise Database Server (either Oracle or DB2)
- Warehouse development environment setup and initialization
- J2SE installation

## 5.3 ETL explained

Before explaining how the reporting solution works it is important to define an ETL and explain its function in BIA Reporting. ETL is short for E xtract, T ransform and L oad: three functions that are combined to pull data from a source and place it in a destination database:

- **Extract**: the process of reading data from a source.
- **Transform**: the process of converting the extracted data from its previous form into the form it needs to be in so that it can be placed into another database. Transformation occurs by using business rules or lookup tables or by combining the data with other data.
- **Load**: the process of writing the data into the target database.

BIA Reporting uses ETLs to move and transform data from the On-Line Transaction Processing (OLTP) data source to the BIA Reporting data sources. As explained in the Overview the data is moved from Source database to the Staging data storage, on to the Central Data Warehouse (CDW), and then is pushed out to the Data Marts.

For the population of each of these tables in each database we will need a separate ETL. The following example will help explain why we need these ETLs:

A number of the Participant reports require Person information where the status is 'Active' between two dates. To obtain this information from the Person table in the source database and populate the datamarts the following ETLs are needed:

- An ETL that will take all the data from the source *PERSON* table and populate the Staging database *S\_PERSON* table
- An ETL that will take the required data from the staging *S\_PERSON* table and populate the *DW\_PERSONHISTORY* table in the CDW. Some transformations will need to be performed during the population in the CDW as we need to keep a complete history of the Person so we know what their status is at a particular point in time.
- An ETL that will take the required data from the Central *DW\_PERSONHISTORY* table and populate the *DM\_FACTPERSONHISTORY* fact table and some dimension tables (e.g. gender ETL to populate the gender dimension) in the Datamarts database. This datamart contains data that is tailored to and optimized for running reports against.

From the above example we can see that we will need a minimum of four separate ETLs to 'push' the necessary person data from source tables to a dimensional solution that the reports can run against.

# 5.4 Metadata explained

Metadata is data that describes data and other structures, such as database

objects, business rules, and processes. Each of the ETLs provided as part of the reporting solution is metadata; the database schemas are also metadata.

The metadata provided by BIA Reporting is stored on the hard disk in the folder structure described in Chapter 2. This metadata needs to be imported into the database and ETL tool. This is done by using the *build script* which is detailed in the next section.

Before detailing how to import the metadata using the build script, it is important to understand how the ETL metadata is broken into separate files and what these files are used for. This folder and file structure must be adhered to during the customization of the reporting solution also.

Within the ETL folder in the  $Reporting \setminus Components \setminus Core \setminus ETL$  folder there are two separate folders: one for Oracle and one for DB2. The following files are contained in each of these folders:

- database metadata files which contain metadata for the ETL tool such as database table schema and database sequence information. These files are named after the database they contain the metadata for e.g. central.mdl (Oracle) or curamdw.xml (DB2).
- **ETL metadata files** which contains the ETL metadata for the ETL tool such as mappings and function calls. In Oracle, there is one separate file for each ETL. In DB2 there are 2. These ETL files are named after the destination table they are loading into and include the letters *ETL* at the end of the name as the build script will only load files with the name *ETL* in it e.g. DW\_PERSONHISTORY\_ETL.xxxxxxx.

The reasons why the ETL metadata files are separated and not stored in one metadata file is for **concurrency**. As the ETLs can be imported or exported to or from the ETL tool to disk multiple developers can work on separate ETLs at the same time.

As already explained all BIA Reporting metadata is in the *Reporting*\Components\Core\ETL folder. With the use of the build script the metadata can be loaded into the database and ETL tool. However if the developer needs to customize this metadata the developers must copy the metadata to the *Reporting*\Components\Custom folder and make the changes here. The reasons for this are explained in the next chapter Customizations and Upgrades.

## 5.5 The Build Script

The next step is to load this metadata from disk into the database and ETL tool. This is done with the use of the build script. Once the metadata has been loaded the ETLs can be run from the ETL tool to populate the reporting databases with data.

#### 5.5.1 The Build Script explained

The build script is used to drive the Reporting environment. Its main functions are to build the database schemas for Reporting and to import the ETL metadata into the ETL tools. It functions in the same manner for both supported database platforms.

In addition to importing the database schema and ETL metadata the build script validates the metadata once it is imported. Error messages detailing the problem are displayed if the build script does not successfully validate. The build script can also be used to deploy and run ETLs to populate the tables.

It is quicker to use the build script than manually importing each of the ETLs into the warehouse tool. This is because the build script can import all ETLs using one command. Also, because the database and warehouse tool connection information is stored in a properties file the developer does not need to repeatedly import meta data files.

When customizing ETLs in the *custom* folder the build script will ensure that the customized ETLs and database schemas are being loaded and not the core metadata. Also, as the build script validates the metadata it will ensure that all objects (schema and ETLs) are consistent. It does this by attempting to validate and displaying messages if there are errors. An example of inconsistency includes a developer who changes a column name in a table in the database schema but does not change the corresponding ETL metadata. When the build script attempts to validate these objects a validation error will occur.

## 5.5.2 Using the Build script

Before using the build script it is important to set up the connection information for the databases and ETL tools. This is set up in the BIBootstrap.properties and BIapplications.properties files which are in the *Reporting\project\properties* folder (note: both of these files should be setup during the installation process but they should be checked before using the build script). When running the build script the connection information is obtained from the BIBootstrap.properties file.

A sample properties file is provided with the Reporting solution. To change the connection information please refer to  $Appendix\ A$ . Security details for the BIBootstrap.properties file is provided in  $Appendix\ N$ 

Now that the databases, ETL tools, and 2 property files have been created and configured the developer can use the build script to populate the metadata.

The build script is used by calling **build.bat** in the *Reporting\components* folder. Executing build commands in the components folder will build all platform and all component artifacts. If you want to build all installed components then you must first set the component order property in the BIapplication.properties file.

The component.order property must be set listing the installed components,

for example if you have a Cúram Child Services<sup>TM</sup> (CCS) component installed you must set this property accordingly component.order=core,childservices

#### Some examples:

To build all Cúram Enterprise Framework<sup>TM</sup> (CEF) and CCS artifacts the build commands must be executed from the components directory. For example if you needed to rebuild all tables, then run build database.all from the components directory.

However if you require to only build the CCS artifacts then you can run the build commands from the components\childservices directory. For example, if you only wanted to drop and re-create the CCS tables, then you would run the command build database.all from the components\childservices folder. To get a list to the build commands enter **buildhelp**.

After running this command the developer is presented with a list of commands with their description. These commands can be run by typing 'build x' where x is one of the commands that are listed and described in **Appendix B**.

## 5.5.3 Running the build script

Before importing any of the metadata it is important to check that the database, ETL tool, and 2 property files have been setup correctly. Running the '**build configtest'** command checks that the environment is working correctly.

To build all the metadata (e.g. classes, schema metadata, ETL metadata) the developer can run the 'build all' command. This command can be used to initially populate all metadata and compile all code for BIA Reporting.

Individual components within the build script can be isolated and run alone. A hierarchy exists when using the build script for building database schema and importing ETL metadata. An example of this is using the build script to import ETL metadata for the Staging database. Three options are available to the developer:

- 'build all' command . This will build all metadata including the database schemas and the ETL metadata for all the databases. Also, in Oracle any metadata that had been imported previously is replaced (including modified metadata) in OWB.
- 'build owb.import.all' command . This Oracle command will build all ETL metadata but will not build the database schemas. Any ETL metadata that had been imported previously is replaced (including metadata in the ETL tool which has been modified). There is no DB2 equivalent command as the metadata does not need to be imported into IWE.
- 'build owb.import.staging' command . This Oracle command will build the Staging ETL metadata only. No other metadata will be re-

placed. There is no DB2 equivalent command as the metadata does not need to be imported into IWE.

The developer has the option to replace all metadata or replace isolated components. This is helpful during the customization process as the developer may not wish to replace amended ETLs in the ETL tool or amended schema in the database.

After the build runs for any command the results need to be checked. Messages will be displayed during the build run and a final message will indicate if the build ran successfully or failed ('BUILD SUCCESSFUL' or 'BUILD FAILED'). Even if the build runs successfully it is important to scroll through the output checking for errors. Error and validation messages are also written to the *Reporting*\logs folder.

## 5.6 Change Data Capture

Data needs to be extracted periodically from the source system(s) and transformed to the data warehouse. This process is commonly referred to as refreshing the data warehouse. The most efficient refresh method is to extract and transform only the data that has changed since the last extraction. Change Data Capture identifies and processes only the data that has changed in each of the tables in a database and makes the changed data available to the Data Warehouse. BIA Reporting has been designed with the intention that the refresh will take place on a nightly basis. However, the implementation is flexible and it is possible to run the refresh at a different frequency.

BIA Reporting's 'Change Data Capture' techniques include using a control table which stores a last written date for each table that is being populated. When an ETL runs, the last written field for that table is also updated. The next time the ETL runs, it first reads from this control table and then extracts the data that has been updated since the previous ETL run.

It is important to note that for change data capture to work in BIA Reporting all the last written fields must be populated in the source tables that the reporting solution extract data from.

There are three control tables provided with BIA Reporting. Each of the control tables contain a list of all the tables that are populated in that database:

• Staging ETL Control table: This table is created in the Staging database and is used to extract data from tables in the source database to tables in the Staging database using the last written field to extract only the data that has changed since the last extraction. This table includes a truncate flag which, when set to 'Y', will truncate the destination table in the Staging database before running the ETL. When set to 'N' the table will not be truncated before the ETL runs. The default is 'Y' as there is no need to build up a history of changes in the Staging database. 'N' is used for a reference table, CODETABLEITEM, as some ETLs use this table to retrieve descriptions of codes.

- **CDW ETL Control table**: This table is in the CDW and is used to extract data from tables in the Staging database, using the last written field to extract only the data that has changed since the last extraction.
- **Datamart ETL Control table**: This table is in the Datamart and is used to extract data from tables in the CDW, using the last written field to extract only the data that has changed since the last extraction.

As already stated, a row in the ETL Control table is updated before and after every ETL run for the table which is being updated. This works by the ETLs calling a pre-mapping transformation to read the previous last written date and setting the extract time. After the ETL has run, a post-mapping transformation is called which updates the last written date to the current date. This functionality is not supported by the ETL tool. These transformations are custom BIA Reporting transformations written in java called from the ETL tool.

After the ETL Control table has been initially populated with data (see next section) the last written date is reset to a start date to ensure that the ETLs extract all data updated after this date. The developer can manually set the last written date or use the resetetl.XXX build command (where x is staging, central, or datamarts) which resets the last written date for all tables in that database to the 1st of January, 1934.

## 5.7 Sequence of running ETLs

The BIA Reporting databases can be populated by executing the ETLs. The databases must be populated in the following order:

- 1. Staging database
- 2. Central database (CDW)
- 3. Datamarts

Within each database the ETLs may need to be run in a particular order. The sequence of running ETLs is described below. The reasons why some ETLs need to be run in a database before others are:

- Control tables: the ETL Control tables in the databases must be populated before the other ETLs are run. This is because each ETL identifies and processes only the data that has been added or updated for each of the tables in a database. The ETL identifies this data through the last written date in the ETL Control tables.
- Dependencies in the CDW: foreign key dependencies exist on some of the tables in the CDW as this database is normalized. This means that some ETLs cannot be run until other ETLs are complete e.g DW\_CASESTATUSHISTORY\_ETL cannot be run until the DW\_CASE\_ETL has completed successfully as the prior ETL needs to retrieve the DWCASEID from the latter.

• **Datamart Dimensions and Facts**: dependencies in the datamarts mean that fact tables cannot be populated until all the dimensions that the fact table reference are populated.

The build script should be used to run ETLs in Oracle or DB2. The run commands allows a user to run control and operational ETLs in the Staging, CDW, or Datamarts. **Appendix B** details the build run targets, the sequencing of the ETLs in the Staging, CDW, and Datamarts and how to amend any run batch files.

## 5.8 Performance Tuning and Optimization

There are many ways to enhance the performance in the reporting environment and they are dependent on the database and environment that the reporting solution runs in. The following list some methods which can be used to optimize BIA Reporting:

- **Database Indexing**: Each of the database vendors include different indexing algorithms that can be used to increase the speed with which queries are serviced. BIA Reporting provides indexing but the optimal indexing strategy is dependent on the environment.
- **Database Partitioning**: Partitioning involves the task of breaking a single database table into sections which are stored in multiple files. The strategy used may increase performance.
- Materialized Views: A materialized view is a database object that contains the results of a query. As discussed in the section 'Running Reports' materialized views can increase the performance when running reports.

## 5.9 Summary

This chapter details the setup and running of BIA Reporting. The reader should have acquired a clear understanding of the design choices and the flexibility of the reporting framework provided. This chapter included:

- details on setting up and running the BIA Reporting solution.
- a section on ETLs and how they are used in BIA Reporting.
- a section on the build script and how it is used in BIA Reporting.
- the change data capture method used in BIA Reporting.
- a section on the sequencing needed when running ETLs.
- a section on further possible optimization techniques.

# Chapter 6

# Installation and Configuration

### 6.1 Overview

This chapter outlines the installation and configuration of the BIA Reporting Module and associated third party products.

An assumption is made that the developer knows how to use the setup tools for their database platform.

## 6.2 Ant setup

Apache Ant is a Java-based tool with XML-based configuration files. BIA Reporting uses this open-source software to deploy the metadata into the databases and ETL tools from files on disk.

To install Ant choose a directory and copy the distribution file there. This directory will be known as ANT\_HOME. The Apache Ant distribution files can be found on the core installation disks or downloaded from *ant.apache.org*. Version 1.8.2 should be installed.

Once Ant has been installed some modifications need to be made:

- set the System Environment variable **ANT\_HOME** to the location you have just unzipped Ant to.
- add the entry %ANT\_HOME%\bin; to the start of your **PATH** environment variable.
- create an environment variable **ANT\_OPTS** and set this variable to "-Xmx512m" (do not include the quotes).
- Ensure the following are included in the components\BIBuildtools\lib-ext directory
  - ant.jar

#### ant-contrib-0.6.jar

The Ant-Contrib project is a collection of user supplied tasks (like and <if>task) and a development playground for experimental tasks like a compilation task for different compilers. The Apache Ant distribution files can be found on the core installation disks or downloaded from ant-contrib.sourceforge.net. Ant-contrib-0.6 is the version to be installed.

## 6.3 Java 2 Platform, Standard Edition (J2SE) installation

J2SE is a java-based, runtime platform that is used during the running of the reporting solution. J2SE should have been automatically installed and set up as part of the database installation for Oracle or DB2.

This section describes which version of Java is shipped with the supported third party tooling:

- DB2 9.1 and 9.5 both come with Java JDK 1.5
- Oracle 10.2 and Oracle 11g come with Java JDK 1.5

The BIA Reporting Build Environment requires a Java JDK 1.6 version that is compatible with the RDBMS vendor software (each version RDBMS has a JDK embedded in the installed footprint).

You will need to download and install a Java 1.6 JDK. You will then need to point the JAVA\_HOME System Environment Variable at it, e.g. C:\Program Files\Java\jdk1.6.0

## 6.4 Other Environment Variables

This Section outlines the other Environment Variables that need to be set.

Please note that you will only be able to set the Environment Variables *AFTER* you have installed the Reporting components in the following sections, as you will not know the directory paths beforehand.

#### 6.4.1 Common

This Section outlines the other System Environment Variables that need to be set for both Oracle and DB2:

- ANT\_HOME, ANT\_OPTS, PATH see Section ' Ant setup ' above
- **JAVA\_HOME** see Section ' *Java 2 Platform, Standard Edition (J2SE) installation* ' above
- **REPORTING\_DIR** this points to the Reporting directory that is installed in Section ' *Install the BIA Reporting Module* ' below, e.g.

#### C:\Reporting

- **PATH** the setting of this variable depends on the type of installation:
  - If you have DB2 on the machine then add %JAVA\_HOME%\bin to the beginning of the Variable Value
  - If you have Oracle on the machine then add %JAVA\_HOME%\bin to the beginning of the Variable Value
  - If the reporting build commands are running on a machine that only has OWB installed i.e. no Oracle instance, then ensure that %ORACLE\_HOME%/bin is added to the path, but ensure the %JAVA\_HOME%\bin is still at the beginning of the Variable Value.

#### 6.4.2 DB2

This Section outlines the other System Environment Variables that need to be set for DB2:

- **DB2DIR** This is set to the DB2 directory, e.g. C:\Program Files\IBM\SQLLIB
- JAVA\_HOME\_RDBMS This is set to DB2 Java folder, e.g. DB2DIR \java\jdk

#### 6.4.3 Oracle

This Section outlines the other System Environment Variables that need to be set for Oracle:

- ORACLE\_HOME this is set to the Oracle directory, e.g. C:\oracle\product\11.2.0\db\_1. Note: If the reporting build commands are running on a machine that only has OWB installed i.e. no Oracle instance then set the ORACLE\_HOME to the parent directory of OWB\_HOME. This is to enable the build scripts to find the loadjava.bat and javac.exe files. (ORACLE\_HOME dependencies:loadjava.bat & idk).
- **OWB\_HOME** this is set to the OWB directory, e.g. OR-ACLE\_HOME\owb. Ensure that when this environment variable is set that the path %OWB\_HOME%\bin\win32 is correct. (OWB\_HOME dependencies: OMBPLUS, loadjava.bat & jdk).
- **JAVA\_HOME\_RDBMS** This is set to the Oracle Java folder, e.g. %ORACLE\_HOME%\jdk

## 6.5 Install the BIA Reporting Module

The BIA Reporting Module can be installed by either installing the full development environment or simply copying the reporting directory in its entirety from a BIA development installation

After installing the BIA Reporting Module the BIA Reporting directories and files should be located at "...\Reporting".

# 6.6 Setup BIApplication. Properties and BIBootstrap. properties files

The BIApplication.properties and BIBootstrap.properties files need to be configured with the database connection details.

The passwords for Oracle, DB2, WLS and WAS need to be encrypted in the BIBootstrap.properties as follows:

- Open a command prompt from Reporting\components
- Run the following 'appbuild encrypt.password -Dpassword=' where is the assigned password to be encrypted
- Enter the full ecrytped password returned, for example: qqnscP4c4+s== as the password in BIBootstrap.properties

Refer to **Appendix A, B & N** for samples and further information on the BIBootstrap.properties and BIApplication.properties files

# 6.7 Executing BIRT Reports against Demo-Data

Demo data has been created for most of the Facts and Dimensions in the Datamart. This means that it can be used to test if the BIRT Reports are correctly displaying data without having to set up and load the Data Warehouse first.

You need to build the datamart demo data schema, populate it with our demo data, and then point the Reports at it before they can be executed.

Installation of a vendor database, i.e. DB2 or Oracle, is required before starting below steps.(Refer Sec - 6.8 for DB2 and Sec - 6.9 for Oracle Installations.)

The following steps describe how to setup our data-mart and demo-data.

- 1. Ensure the Demo-Data schema has been created on your database
- 2. Ensure the Demo-Data schema name matches the name specified in the BIBootstrap.properties file. Also ensure the connection details are specified correctly in the file.
- 3. Run the command init at..\Reporting\components in dos prompt (Refer Appendix C).

4. Run the command build database.datamarts.demodata at..\Reporting\components in dos prompt(Refer Appendix C).

The following steps describe how to execute a report:

1. To execute BIRT reports against demo data you need to configure your data source to point to the datamart demo data schema. See the BIRT Developer Guide for the steps for creating a data source.

#### 6.8 DB2 Environment

This section details the installation and configuration of BIA Reporting Module and associated third party products for DB2.

It will guide you through installing these components on the same machine:

- Application Database
- BIA Reporting Datawarehouse Database
- IWE Design Studio
- IBM® WebSphere® Application Server if all of the other components listed here are going on the same machine then it is recommended that WebSphere be installed on a separate machine
- Cognos

If required, each of the above components can be installed on different machines.

It is also important to note that the Staging and Central table schemas should reside in the same database. For the purpose of this document, the Staging and Central tables are stored in the CuramDW database. Failure to have the Staging and Central tables co-located in the same database will result in errors when attempting to promote the Central ETL processes to production.

An assumption is made that the developer is familiar with the tools for the DB2 database platform.

#### 6.8.1 Install DB2 Database

Follow these steps to install a DB2 9.5 database with the minimum requirements for Reporting:

(Please note the below steps may appear in a slightly different order depending on whether DB2 has been installed before.)

- Select setup.exe file from the DB2 9.5 folder
- Select 'Install a Product' from the Welcome Page
- Click 'Install New' under DB2 Enterprise Server Edition

- Accept the License terms and conditions
- Select the default 'Typical' installation type
- Select the default 3rd option and file path 'Install DB2 Enterprise Server Edition on this computer and save my settings in a response file'
- Select the default Directory for the installation
- Select the default 'DB2 copy name'
- Select the default 'Create the default DB2 instance'
- Select the default 'Single partition instance'
- Select the default 'DB2 instance'
- Enter the user information below:
  - Domain: None (default)
  - UserName: db2admin
  - Password: db2admin
  - Confirmation: db2admin
  - Select the check box below to use these userid and password for other services also. If not it will prompt every time
- Select default (Unchecked) for the Tool Catalogue
- Untick the box 'Set up your DB2 server to send notifications
- Select the default 'Enable operating system security' checked this will enable the O/S to restrict the access to DB2 folders
- Review the settings and click 'Finish'
- Setup is complete
- Skip the Visual studio installations
- Click 'Finish'
- DB2 9.5 installation is now complete

## 6.8.2 Create DB2 target schema's

Follow these steps to create the Databases required for Reporting:

- Open the DB2 Control Center by clicking on Start All Programs IBM DB2 - DB2COPY1 - General Administration Tools - Control Center
- Right click on All Databases select Create Database Standard
- Enter the name CuramDW for the Database this Database will store the

Staging and Central Tables

- Select the default Path
- Select the default Storage
- Select the default Country/Region
- Select the Code Set value as 'UTF-8'
- Review the Summary and click 'Finish'
- CuramDW is now created
- Follow these steps again to create these required Databases:
  - DATAMART: this will store the Datamart Facts and Dimensions
  - DWCTRLDB: this is the Control Database

Please note you will need to create a User Temporary Table Space with a Page Size of 8 KB in DB2 Control Centre for the CuramDW and DATAMART databases, otherwise you will get errors when running the ETL's. This can be done in DB2 Control Center using a Wizard , or by running these SQL statements.

#### **Run in DB2 Control Center Command Editor:**

CONNECT TO CuramDW USER DB2ADMIN USING db2admin:

CREATE BUFFERPOOL DWBUFFERPOOL IMMEDIATE SIZE 250 PAGESIZE 8 K ;

CONNECT RESET;

CONNECT TO CuramDW USER DB2ADMIN USING db2admin;

CREATE USER TEMPORARY TABLESPACE DWTABLESAPCE PAGESIZE 8 K MANAGED BY AUTOMATIC STORAGE EXTENTSIZE 16 OVERHEAD 10.5 PREFETCHSIZE 16 TRANSFERRATE 0.14 BUFFERPOOL DWBUFFERPOOL;

CONNECT RESET:

CONNECT TO DATAMART USER DB2ADMIN USING db2admin;

CREATE BUFFERPOOL DWBUFFERPOOL IMMEDIATE SIZE 250 PAGESIZE 8 K ;

CONNECT RESET:

CONNECT TO DATAMART USER DB2ADMIN USING db2admin;

CREATE USER TEMPORARY TABLESPACE DWTABLESAPCE PAGESIZE 8 K MANAGED BY AUTOMATIC STORAGE EXTENTSIZE 16 OVERHEAD 10.5 PREFETCHSIZE 16 TRANSFERRATE 0.14 BUFFERPOOL DWBUFFERPOOL;

CONNECT RESET;

## 6.8.3 Setting up Access to Application Database

The Staging ETL's needs access to the Application Database so that they can extract data from the source tables. There are a number of different options to setup this access which include:

- Installing the Application Database on a different machine to the Data Warehouse and then Catalogue it in the DB2 Control Center on the Data Warehosue machine
- Create a database called DATABASE (following the steps in Section ' *Create DB2 target schema's* ' above) on the same machine as the Data Warehouse and populate it by Restoring a Backup taken from the Application Database

Please note you will need to create a User Temporary Table Space in DB2 Control Centre for the CuramDW and DATAMART databases otherwise you will get errors when running the ETL's.

## 6.8.4 Create Objects in Databases using Build Environment

All the required Databases should now be set up. Next you need to create the objects in the Databases. The best way to do this is to use the Build Environment. Please follow these steps:

- Start a DOS command shell
- Navigate to Reporting\components directory run init.bat
- Navigate to ..\Reporting\components\core
- Run build configtest. This task checks to see that it can connect to the various databases configured. On success, the ANT task will display "BUILD SUCCESSFUL"
- Run **build database.all**. This will create the Java JAR files, DDL, etc. On success, the ANT task will display "BUILD SUCCESSFUL". This command also runs the grant.all.Refer Appendix B
- If "BUILD FAILED" is displayed then the log files (located in ...\Reporting\logs) should be examined for any errors.
- Run build staticdata. This task copies the Static Data files over to Reporting\bin\data\_manager so that they can be picked up when running ETL's

## 6.8.5 Install InfoSphere Warehouse Edition

These steps outline how to install InfoSphere Warehouse Edition.

**Pre-Install Steps** 

Copy and unzip the following zip files:

- IBM DB2 Warehouse Enterprise Edition V9.5, Activation, Multiplatforms, - C165WML.zip This zip contains the license related files. This path has to be set while installing the Server and Client
- IBM Infosphere Warehouse Server V9.5.1 For Microsoft® Windows on 32 bit Multilingual C1N44ML.zip. This contains the Websphere Application Server and data server
- Infosphere Warehouse Client V9.5.1 Multiplatform Multilingual C1N49ML.zip. This contains the IWE Design Studio Components

Please note that if you only intend to use the Websphere console, then you will not need to install the IWE Design Studio Client, which is the third bullet above

WebSphere Application Server Install Steps

Follow these steps to install the Websphere Application Server and its Administration Console:

- Select the launchpad.exe file in Server folder that you created when unzipping C1N44ML.zip above
- Select Install the application server Install the product
- Click the link Launch the installation wizard
- Enter the path to the Activation folder that you created when unzipping C165WML.zip above, e.g. C:\ Install Activation\profile
- You will see the Welcome page for Server Installation
- Accept the Licensing terms
- Select the path
- You should have already installed a DB2 9.5 Database so select 'Work with an existing DB2 copy'
- Select the features you require
- Review the summary and click 'Finish'

WebSphere Client Install Steps

Follow these steps to install the Websphere Client (Design Studio):

- Select the launchpad.exe file in the folder that you created when unzipping C1N49ML.zip above
- Select Install the product
- Click the link Launch the installation wizard

- Enter the path to the Activation folder that you created when unzipping C165WML.zip above, e.g. C:\ Install Activation\profile
- You will see the Welcome page for the Installation
- Accept the Licensing terms
- Select the path
- Select the features you require
- Select the default Service Port Number
- Review the Summary and click 'Finish'

#### Check if Install is Successful

If the installation is successful then:

- The Finish message will not contain any errors
- Design Studio will open without any errors

### 6.8.6 Create an IWE Design Studio Project for Reporting

Follow these steps to create a Project in Design Studio and point it to the BIA Reporting Data Warehouse:

- Open Design Studio by selecting Start All Programs IBM InfoSphere Warehouse V9.5 - DB2COPY1 - Design Studio
- Click File New Project and select Data Warehousing Project and click Next
- Enter the name of the Project, i.e. 'IWE\_Reporting'
- Change the Location to be the folder 'InfoSphere\_Reporting' which was created when you installed BIA in Chapter ' *Runtime Architecture and Development Process* ' above. The folder will have a path like this .. \Reporting\components\core\etl\db2\InfoSphere\_Reporting. You will need **Write** access to this folder.
- You should now be able to open the Data Flows, Sub-Processes etc. of the BIA Reporting Data Warehouse
- In the Database Explorer Panel click on the Import Connection Icon
- Navigate to Reporting\components\core\etl\db2\InfoSphere\_Reporting\database-connection
- Import and configure the settings of each of the 4 connections in turn:
  - CuramDB.xml this is a connection to the Application database

#### called DATABASE

- CuramDW.xml this is a connection to the Staging and Central database called CuramDW
- DATAMART.xml this is a connection to the Datamart database called DATAMART
- DWCTRLDB.xml this is a connection to the Control Database called DWCTRLDB
- Test the connection to each of the database by opening them the user-name/password for each is db2admin/db2admin

Follow these Steps to set the Path Variable to the Data Files:

- Right Click on Variables and select Manage Variables and click Next
- Select the FLATFILES\_PATH Variable Group and the PATH\_V Variable and click Edit
- Browse to the Reporting\bin\data\_manager folder that was created when installing the BIA Reporting Module in Section 4 above
- Click OK and click Finish

## 6.8.7 WebSphere Application Server Post-Installation Configuration

Software developed using IBM InfoSphere Warehouse Design Studio (IWE) must be deployed to a WebSphere Application Server for scheduling, execution and monitoring. These steps outline how to configure the WebSphere Admin Console.

#### General Environment Setup Steps

Please check the following:

- Ensure all environment variable are set up correctly see section ' *Environment Variables* ' above
- Ensure application.properties file is setup for DB2, see Appendix A
- Ensure the environment.jdbc.jars paths are set up correctly in the application.properties file. The paths should point to both of the specified JAR files Please note that the double back slashes are required to fix a bug. This bug will be removed in the next release.
  - environment.jdbc.jars=C:\\Program
    Files\\IBM\\dwe\\SQLLIB\\java\\db2jcc.jar;C:\\Program
    Files\\IBM\\dwe\\SQLLIB\\java\\db2jcc\_license\_cisuz.jar

- From Reporting\components directory run init.bat
- From Reporting\components\core directory run **build configtest** , this should run successfully
- From Reporting\components\core directory run **build database.all**, this should run successfully
- From Reporting\components\core directory run **build staticdata**, to copy the Static Data files over to Reporting\bin\data\_manager so that they can be picked up when running ETL's

### Run InfoSphere Warehouse Configuration Tool

The InfoSphere Warehouse Configuration Tool must be run to create the scheduling and IWE control tables before the WebSphere Application Server Administration Console can be used. Follow the below steps to run the Configuration Tool:

- Open the Configuration Tool by clicking Start All Programs IBM InfoSphere Warehouse V9.5 DB2COPY1-> InfoSphere Warehouse Configuration Tool
- Click Next on the Welcome screen
- Leave the default of Create new or overwrite existing configuration and click Next
- Leave the default of Continue using existing user registery and click Next
- Select the Application InfoSphere Warehouse Administration Console and click Next
- Click Ok on the message 'Websphere Application Server will be restarted during configuration'
- Enter the default userid/password db2admin/db2admin, confirm the password and click Next
- Click Ok on the message 'Please make sure that the DB2 server is started...'
- Leave default database name as DWECTRL, enter db2admin as the userid and password, confirm the password and click Next
- Click Yes/Ok on the following screens
- Leave default database name, enter db2admin as the userid and password, confirm the password and click Next (this screen is to create the scheduling database)
- Click Yes/Ok on the following screens
- Add Groups for Administrator, Manager and Operator. Ensure you se-

lect a domain group that your network login identity exists within

- Click Next on the e-mail configuration screen without entering any data
- Click Finish

Configure WebSphere Application Server Admin Console Users and Groups

Follow the below steps to configure the WebSphere Application Server Admin Console Users and Groups:

- Login to the WebSphere Application Server administration console using the default userid/password which are db2admin/db2admin
- Select the Users and Groups section on the left hand navigation bar
- Select Administrative user roles
- Add a new user and give them all roles, the user should be your network login identity
- Select the administrative roles section and add the same domain group you selected in the InfoSphere Warehouse Configuration Tool above

Follow the below steps to verify your configuration:

- Logout and log back in using your network user identity
- Select the Welcome option from the navigation bar on the left hand side
- Select InfoSphere Warehouse and if your configuration is valid the welcome page should be displayed

Configure WebSphere Application Server Admin Console Security

Please check the following:

- Login to the WebSphere Application Server administration console using your network user identity
- Expand the Security option on the navigation bar
- Select the option Secure administration, applications, and infrastructure
- Ensure the following options are checked:
  - Enable administrative security
  - Use domain-qualified user names
  - Enable application security
  - Warn if applications are granted custom permissions

- Ensure Current realm definition is set to Local operating system
- Ensure Available realm definitions is set to Local operating system
- Click the Set as current button to ensure your network login identity is as the default administrator (you should be logged in using your network login identity)
- Click Apply
- Navigate to the InfoSphere warehouse section in the navigation bar on the left hand side of the page and verify you have access to the InfoSphere features
- You may have to logout of the WebSphere Application Server console, stop and start the WebSphere Application Server server and login in again

Configure WebSphere Application Server Admin Console Data Sources

Data Sources need to be created in the WebSphere Application Server Admin Console so that the ETL's can be run.

Follow these steps to create the **Application Data Source** (DATABASE):

- In WebSphere Application Server Admin Console navigate to InfoSphere Warehouse Common Resources Manage Data Sources and select Create
- Enter 'curamapplication' in the display name
- Uncheck 'managed by WebSphere' and click Next
- Enter the JNDI name as 'jdbc/curam/curamapp'. Ensure the JNDI name is correct the name is structured in three parts, it is formatted as 'prefix/curam/name', e.g. jdbc/curam/Curamdw. The prefix must always be 'jdbc'
- Enter the Database Name as 'database'
- Enter the Database Alias as 'database'
- Enter your Server Name
- The Port Number should default in, if not then please enter it
- Enter the userid/password as db2admin/db2admin
- Leave Access as Public
- Test the Connection
- Click Finish

Follow these steps to create the Staging and Central Data Source

#### (CuramDW):

- In WebSphere Application Server Admin Console navigate to InfoSphere Warehouse Common Resources Manage Data Sources and select Create
- Enter 'Curamdw' in the display name
- Uncheck 'managed by WebSphere' and click Next
- Enter the JNDI name as 'jdbc/curam/curamdw'
- Enter the Database Name as 'curamdw'
- Enter the Database Alias as 'curamdw'
- Enter your Server Name
- The Port Number should default in, if not then please enter it
- Enter the userid/password as db2admin/db2admin
- Leave Access as Public
- Test the Connection
- Click Finish

#### Follow these steps to create the **Datamart Data Source** (DATAMART):

- In WebSphere Application Server Admin Console navigate to InfoSphere Warehouse Common Resources Manage Data Sources and select Create
- Enter 'curamdatanart' in the display name
- Uncheck 'managed by WebSphere' and click Next
- Enter the JNDI name as 'jdbc/curam/datamart'
- Enter the Database Name as 'datamart'
- Enter the Database Alias as 'datamart'
- Enter your Server Name
- The Port Number should default in, if not then please enter it
- Enter the userid/password as db2admin/db2admin
- Leave Access as Public
- Test the Connection
- · Click Finish

#### If required, follow these steps to **delete a data source**:

• In WebSphere Application Server Admin Console navigate to In-

fosphere Warehouse - Resources - Manage Data Source

- Select the data source and click remove
- Navigate to Resources -JDBC Data sources and remove the data source from this location

## 6.8.8 Deploy the BIA Reporting Data Warehouse (CEF Deployment.zip) to WebSphere Application Server

This section outlines how the BIA Reporting Data Warehouse is deployed to WebSphere Application Server.

**Application Profile** 

An **Application Profile** contains configuration information about a deployable Data Warehouse Application.

An Application Profile allows you to test or execute a Data Warehouse Application by specifying different resources like machine resources, database connections, and variables.

A single Data Warehouse Application can have one or more Application Profiles. An Application Profile is identified by a name which must be unique within a Data Warehouse Project. The Application Profile is identified by the file extension .apxmi and can be viewed in IWE Design Studio in the **Warehouse Application Profiles** folder of your Data Warehouse Project. It is stored in the folder Reporting\components\core \etl\db2\InfoSphere\_Reporting\app-profiles.

Generate CEF Deployment.zip File

In IWE Design Studio, a Data Warehouse Application is prepared for deployment using the **Data Warehouse Application Deployment Preparation Wizard**. This Wizard generates a zip file which is then deployed to WebSphere Application Server.

Follow these steps to generate the zip file:

- Navigate to Data Project Explorer Warehouse Application Profiles -CEF Deployment
- Right Click on CEF Deployment Application Deployment Preparation
   and select Package Generation
- Browse to the location where you want to put the zip file, e.g Reporting/components/core/etl/db2/InfoSphere\_Reporting/app-profiles/
- Click Finish it may take a few minutes to generate the zip file called **CEF Deployment.zip**

It is this CEF Deployment.zip file that needs to be deployed to the Web-

Sphere Application Server.

Deploying the CEF Deployment.zip to the WebSphere Application Server

Follow these steps to deploy the CEF Deployment.zip to the WebSphere Application Server:

- In WebSphere Application Server Admin Console navigate to InfoSphere Warehouse SQL Warehousing Warehouse applications Deploy Warehouse Application
- Select 'Location of Zip File on Application Server' and click Browse
- Navigate to Reporting\components\core\etl\db2\InfoSphere\_Reporting\app-profiles and select the file CEF Deployment.zip and click Ok
- Click Next
- Review Summary screen and click Next
- Set c:\ as the location of the Application Home Directory, Log Directory and Working Directory.
- Set Execute Deployment Units to Yes and click Next
- Set the DATAMART Runtime JNDI Name to jdbc/curam/datamart
- Set the CURAMDB Runtime JNDI Name to jdbc/curam/curamapp
- Set the CURAMDW Runtime JNDI Name to jdbc/curam/curamdw and click Next
- Click Next on System Resources
- In Variables check that the correct file path is displayed for the \${FLATFILES\_PATH/PATH\_V}. It should point to ..\\Reporting\bin\data\_manager
- You need to copy the Static Data files over to Reporting\bin\data\_manager so that they can be picked up when running ETL's, so if you have not already done so open a command prompt at ..\Reporting\components\core and run build staticdata.
- Click Finish

The zip should now be successfully imported and displayed on the Manage Data Warehouse Application screen.

## 6.8.9 Executing the BIA Reporting ETL's in WebSphere Application Server Admin Console

This section shows how to execute the BIA Reporting ETL's via the Web-

Sphere Application Server Admin Console. Please note that they can also be executed via the IWE Design Studio.

- In WebSphere Application Server Admin Console navigate to InfoSphere Warehouse SQL Warehousing Processes
- Select Run Processes to execute them now
- Select the Tick box next to the Process you would like to run and click Start
- Leave the Process Instance Name blank and click Next
- Leave Specify Variable Values selected and click Finish
- The Control Flow Process is now running
- Its progress can be monitored in InfoSphere Warehouse SQL Warehousing Processes Monitor Process Instances

## 6.8.10 Delivering Changes to the WebSphere Application Server

When making changes to the existing Control Flows or adding new Control Flows you will need to regenerate the CEF Deployment.zip file and then deploy it to the Websphere Server. The sections below outline how to do this.

Regenerate CEF Deployment.zip file

Follow these steps to Regenerate CEF Deployment.zip file in IWE Design Studio:

- In IWE Design Studio navigate to IWE\_Reporting Warehouse Application Profiles and right click on CEF Deployment
- Select Application Deployment Preparation Code Generation
- Click Next and then select Regenerate Code
- Click Next and specify the zip file directory
- Click Finish to generate the zip file

The zip file should now be successfully generated and is now ready to be redeployed to WebSphere Application Server.

Deploy the Regenerated CEF Deployment.zip file to WebSphere Application Server

Follow these steps to redeploy the CEF Deployment.zip file in WebSphere Application Server Admin Console:

• In WebSphere Application Server Admin Consolenavigate to SQL

Warehousing - Warehouse applications - Manage Warehouse applications

- Tick the Select box next to the Application and click Deploy Changes
- Select 'Location of Zip File on Application Server' and click Browse
- Navigate to the location of the zip file e.g. C:\Reporting\components\core\etl\db2\InfoSphere\_Reporting\app-profil es and select the zip file and click next. This may take a couple of minutes.
- Review Summary screen and click Next
- Set the DATAMART Runtime JNDI Name to jdbc/curam/datamart
- Set the CURAMDB Runtime JNDI Name to jdbc/curam/curamapp
- Set the CURAMDW Runtime JNDI Name to jdbc/curam/curamdw and click Next
- Click Next on System Resources
- In Variables check that the correct file path is displayed for the \${FLATFILES\_PATH/PATH\_V}, e.g. C:\Reporting\components\core\data\_manager
- Click Finish
- You will be taken back to the Manage Warehouse applications screen and a Success message should be displayed at the top
- Tick the Select box next to the Application and click Enable

The zip file should now be successfully redeployed and is ready to be executed.

#### 6.9 Oracle Environment

This section describes the steps required to install and setup the reporting solution for Oracle. An assumption is made that the developer is familiar with the tools for the Oracle database platform.

There are two possible configuration options when setting up Reporting for Oracle:

- 1. The Reporting component, OWB client and Oracle server (hosting the Repository owner and Reporting schema's) reside on one machine.
- 2. The Reporting component and OWB client reside on one machine, and the Oracle server (hosting the Repository owner and Reporting schema's) reside on a remote machine.

When setting up a Reporting sand box environment **Option 1** is recommended as it is a more straight forward and simple configuration. However, if

you are constrained by your local configuration and must use an existing Oracle server then **Option 2** is possible.

**Note:** Regardless of which option is chosen the Staging and Central schemas must exist on the same Oracle instance. We also recommend that the Datamart schema is put on the same instance.

#### 6.9.1 Install Oracle Database and Oracle Warehouse Builder

Installation of the Oracle Database follows that of a typical installation accepting all the defaults.OWB will automatically be installed along with the Database. Please ensure that the install user has administration rights to the install machine.

If installing across two machines, and installing Oracle 11g, it is recommended to install Oracle 11g onto the Server machine first. This will automatically install the Oracle Database and OWB.

Then install the Oracle Client onto the Client machine.

## 6.9.2 Blapplication.properties, BlBootstrap.properties and Environment Variable Setup

Once the Oracle database and OWB have been successfully installed the below setup steps must be completed.

The **BIApplication.properties** and **BIBootstrap.properties** files need to be created in ..\Reporting\project\properties. These files will contain the database connection details and other variables. Please refer to **Appendix N** for security details

BIApplication.propertiessampleora and BIBootstrap.propertiessampleora have been provided for guidance. They can be found in ..\Reporting\project\properties. These files can be copied and renamed as BIApplication.properties and BIBootstrap.properties as a start point. They must be kept in the same folder. Please refer to **Appendix A and B** for more information when setting the properties and following the below steps.

The BIapplication.properties, BIBootstrap.properties and Environment Variables setup depends on which type of configuration option you have chosen, i.e. OWB Client present on Oracle server or no OWB client on Oracle server. However there are a number of common steps which are outlined first.

Note: For each of the Reporting build tasks the equivalent manual steps that could be used are outlined; these may be useful if any of the build targets do not run successfully due to environment configuration issues.

#### Common Setup Steps

Please complete these steps, which are common to both types of configuration. Refer to Appendix B for full list of variables specified below:

1. In the BIapplication.properties file ensure the environ-

ment.owbconfig.remotedatamanagerdir variable is set correctly.

If the Data Manager folder is on the local machine then leave it blank or it will cause an error.

If the staging, central and datamart schema's are being created on a remote server then the Data Manager folder and contents will need to be copied to this server after the build staticdata command has been run, refer to Section 'Create OWB Repository and target schema's', Step 14. You then need to set the environment.owbconfig.remotedatamanagerdir variable to the path of the Data Manager folder on the remote server, using the java convention for path separators (\\\),e.g. Reporting\\bin\\data\_manager\\. Please ensure that the trailing \\ is added or it will cause an error.

- 2. In the BIapplication.properties file ensure the environment.owb.oracleinstalled variable is correctly set. E.g. environment.owb.oracleinstalled=true. Only set this to false if there is no Oracle database on the server where OWB has been installed. Otherwise set this to true.
- 3. If setting up a Development Environment, please ensure that the 2 BIapplication.properties autogrant variables are set to true. Please see Appendix G for more information, and also for information on setting up the privileges on non-development environments.
- 4. If setting up a Development Environment, please ensure that the variable environment.databases.curam.updatenulls.autorun is set to true. Please see Appendix H for further information on last-written columns and setting up privileges on non-development environments.
- 5. Ensure that the following are included in the components\BIBuildTools\lib-ext directory:

ant.jar

ant-contrib-0.6.jar

6. Ensure the following environment variables exist, are correctly set and it is very important that they are spelt correctly:

REPORTING\_DIR - should be set to the location of the Reporting directory, e.g. C:\IBM\Curam\development\Reporting

ANT\_HOME - e.g. C:\apache-ant-1.8.2 or C:\ant182

OWB\_HOME - e.g. C:\oracle\product\11.2.0\db\_1\owb for Oracle 11gR2. Ensure that when this environment variable is set that the path %OWB\_HOME%\bin\win32 is correct. (OWB\_HOME dependencies: OMBPLUS, loadjava.bat & jdk).

JAVA\_HOME - ensure this is set to the jdk of the java location. e.g. C:\jdk1.6.0. This MUST be java 1.6 or higher.

JAVA HOME RDBMS - should be set to %ORACLE HOME%\jdk.

CURAMSDEJ - should be set to C:\IBM\Curam\development\CuramSDEJ

OWB client installed on the Oracle server

If Oracle and OWB are installed on the same machine then:

- 1. Set ORACLE\_HOME Environment Variable E.g.:
  - D:\app\product\11.2.0\dbhome\_1 for Oracle 11gR2

#### OWB client is not installed on the Oracle server

If the Oracle Server and OWB Client are not on a single machine please read the Oracle Warehouse Builder Installation and Administration Guide to ensure a valid Oracle/OWB configuration exists.

When the reporting build commands are running on a machine that only has the OWB Client installed i.e. no Oracle instance, then:

- 1. Set ORACLE\_HOME to the parent directory of OWB\_HOME. This is to enable the build scripts to find the loadjava.bat and javac.exe files. (ORACLE\_HOME dependencies: loadjava.bat & jdk).
- 2. PATH ensure %ORACLE\_HOME%/bin is at the beginning of the Path Environment Variable, with %JAVA\_HOME%\bin next.
- 3. In the BIapplication.Properties file set the environment.jdbc.jar to the path of the jdbc driver that contains the driver defined in the driver properties =
  - (Path in OWB machine)\ojdbc5.jar for Oracle 11gR2

E.g.

C:\\oracle\\product\\11.2.0\\db\_1\\jdbc\\lib\\ojdbc5.jar

#### Bootstrap your environment

All of the remaining properties contained in the files BIapplication.properties and BIBootstrap.properties need to be configured. Please see **Appendices A and B** for information about each property and **Appendix N** for security details.

Once the properties have been fully set, please follow these steps to test your setup:

- 1. Start a command prompt and navigate to...\Reporting
- 2. Navigate to...\Reporting\components

#### 3. Run the 'init' command

This compiles the source files. If this fails verify that the contents of the BIapplication.properties file are correct and refer to the troubleshooting section.

### 6.9.3 Create OWB Repository and target schema's

This section outlines the steps for creating the Reporting schema's i.e. Repository Owner and the target schema's for Staging, Central and Datamarts that need to be created.

- 1. In order to change the language used in localized property names which is defaulted to English, then please modify the **Component.locale.order.installedLanguage** variable in BIApplication.properties and also modify the language code in the 3 intialdata.sql files (Please refer to Appendix L on Globalisation for full details)
- 2. Update all Properties in BIBootstrap.properties, which can be found at ..\Reporting\project\properties. Ensure schema names match the project naming standards. Each user name is a schema:

staging.db.username=CuramST

central.db.username=CuramDW

centraldm.db.username=CuramDM

3. Additional username's for Oracle 11gR2:

design.db.username=CuramBI

runtime.db.username=CuramBI

design.db.workspacename=CuramBI

The variables design.db.username and runtime.db.username need to be the same name. Please ensure that they match. These have been named to keep in accordance with other usernames but we highly recommend that you standardise the names to your own preference.

4. In the BIBootstrap.properties file please ensure that all the xxx.db.name properties are set to be the Oracle Net Service Name, e.g.

staging.db.name=orcl

The Oracle Net Service Name is found in the tnsnames.ora file (%ORACLE\_HOME%\NETWORK\ADMIN) and the Net Service Name is in bold:

ORCL = (DESCRIPTION =(ADDRESS = (PROTOCOL = TCP)(HOST = server name)(PORT = 1521))(CONNECT\_DATA =(SERVER = DEDICATED) (SERVICE\_NAME = **ORCL**)))

5. In the case that Database User OWBSYS is locked, the Database User OWBSYS can be unlocked using either SQL Developer or by entering

the following commands in a command prompt opened in ...\Reporting\components\:

- 'sqlplus'
- 'sys as sysdba'
- password (will not appear, just click click enter once complete)
- 'alter user owbsys identified by password account unlock'
- 6. Prior to creating the Workspace, Workspace owner and Reporting BI schemas, if the users local naming conventions are different to the standard naming conventions which are pre-set in \Reporting\components\project\properties\BIBootstrap.properties then manually update the username and/or workspace names in the BIBootstrap.properties file. Please refer to Appendix M for more advanced updates/additions which can be made to the Reporting BI schemas other than the names.
- 7. Start a command prompt and navigate to.. \Reporting\components. Run the 'build database.create.bischemas' command to create the 3 Reporting BI Schemas. This will create the Staging, Central and Datamart Schemas on the Database and connects to the Database using the User Name and Password specified in the file ..\Reporting\components\BIBuildTools\scripts\rep\_oraschemas.properti es. They are defaulted to SYS as SYSDBA and p. Please set them as required before running the command.
- 8. Open the Warehouse Repository Assistant which can be found here: Start All Programs Oracle\_Home Warehouse Builder Administration Repository Assistant

#### **Oracle Version 11gR2**

- **Step 1: Database Information** Enter the Host Name, Port Number and Oracle Service Name, which can all be found in your tnsnames.ora
- **Step 2: Operation** Select Manage Warehouse Builder Workspace' option and click next
- **Step 3: Workspace Operations** Select 'Create a new Warehouse Builder workspace' option and click next
- **Step 4: New or Existing User** Select 'Create a workspace with a new user as workspace owner' option and click next
- **Step 5: DBA Information** Enter username (e.g. sys) and password and click next
- **Step 6: Workspace Owner -** Enter workspace owner's username, e.g. CuramBI, password and workspace name, e.g. CuramBI (Workspace details should match the workspace details in BIBootstrap.properties file) and click next

**Step 7:** In the OWBSYS information window, enter the OWBSYS username and password (This will not appear in subsequent runs of the Repository Assistant)

**Step 8:** In the Select Languages window, accept the defaults and click Next (This will not appear in subsequent runs of the Repository Assitant)

Step 9: Select Workspace Users - Just click next here.

**Step 10: Summary -** Review the Summary and click finish to build the Workspace and register the Target Schemas.

- 9. If setting up a Development Environment, please ensure that the 2 BIapplication.properties autogrant variables are set as follows:
  - a. Environment.databses.curam.privaleges.autogrant should be set to true if the Curam source data is from a database that resides on the same database instance as the staging database. Otherwise it should be set to false.
  - b. Environment.databases.bi.privilages.autogrant should be set to

Please see Appendix G for more information, and also for information on setting up the privileges on non-development environments.

- 10. From your local environment, add \product\11.2.0\dbhome\_1\jdbc\lib\ojdbc5.jar file to Reporting\components\BIBuildTools\drivers directory
- 11. Open a command prompt and navigate to ...\Reporting\components. Run 'build configtest'. This will test if everything is installed correctly.
- 12. Run 'build owb.environment.tests.import' this imports the Locations, meta data and 6 ETL's to test if they run correctly.
- 13. Log into the OWB Design Center and expand the Reporting Project in the Project Explorer / Projects Navigator panel.
- 14. For Oracle 11gR2: In the Locations Navigator window, double click on the DEFAULT\_CONTROL\_CENTER panel in Control Centers folder. Click on Data locations and ensure all the following locations:
  - DEFAULT\_AGENT
  - SOURCE\_LOCATION
  - STAGING\_LOCATION
  - STATIC\_DATA\_LOCATION
  - DATAMARTS\_LOCATION
  - CDW\_LOCATION

are in the 'Selected Locations' with both Source and Target box's ticked for all except STATIC\_DATA\_LOCATION which should have just the Source box ticked.

- 15. Open the Control Center in Tools-Control Centre Manager, to check that all 5 of the Locations are listed.
- 16. Log out of OWB and click Yes to Save the changes.
- 17. Open Oracle Application Development SQL Developer. On first use, you'll be asked to chose connection for java.exe. This should be located in the java bin folder. e.g.: C:\Program Files\Java\jdk1.5.0\_06\bin. Right click on Connections, choose new connection and fill in the following details for Source, Staging, Central and Datamarts:
  - Connection Name
  - Username
  - Password
  - Hostname
  - Port
  - Service name
- 18. Open a command prompt and navigate to ..\Reporting\components. Run 'build owb.environment.tests.run'.

This builds the database for each schema, and deploys 2 ETL's from each schema and tests the environment has been correctly configured. When this step executes successfully check the following tables and ensure they are populated with data:

- S ETLCONTROL
- DW\_ETLCONTROL
- DM ETLCONTROL

If there is data in the source database then the following tables should also be populated:

- DM\_DIMCASETYPES
- S\_CODETABLEITEM
- DW\_CASETYPE

This confirms that the environment has been correctly configured. This step may between 5 and 20 minutes to execute.

Please note that the previous command executed an 'build staticdata'. This copies/merge's the static data files and the control files to the

...\Reporting\bin\data\_manager directory. Note: IF the OWB client is not installed on the Oracle server then this static data will need to be manually copied to the Oracle server and ensure the Static Data File path points to that location.

It also executed an 'build grant.all' command. This grant.all command grants permissions to the staging, central and datamart schema's in order for the ETL's to run successfully. In order for this grant.all to execute successfully the source, staging and central users must have the correct grant authority. Please see Appendix G for more information, and also for information on setting up the privileges on non-development environments.

It also executed an 'build database.source.updatenulls' command. This command updates the last written column values in the Application Tables if they are null. This ensures that all of the records are extracted from the Source Tables into the Warehouse. If the last written columns are null then the records will not get loaded as they will not pass the join to the Control Table in each ETL.

- 19. If the above tables have data in them then your Data Warehouse is set up correctly!
- 20. Please follow the Steps in the next Sections to Import the Meta Data into OWB, Deploy the ETL's and Run them.

### 6.9.4 Importing the Meta Data

The source code is imported into OWB using the build commands below.

1. Open a command prompt and navigate to ...\Reporting\components. Run "build owb.import.all". It may take up to an hour for these commands to complete.

Please note that this command in turn runs each of these commands:

- "build owb.import.common"
- "build owb.import.source"
- "build owb.import.staging"
- "build owb.import.central"
- "build owb.import.datamarts"

## 6.9.5 Deploying the Meta Data

The source code is deployed from OWB to the Database using the build commands below.

1. Open a command prompt and navigate to ...\Reporting\components.

Run "build owb.deploy.all". It may take up to an hour for these commands to complete.

Please note that this command in turn runs each of these commands:

- "build owb.deploy.runtimesetup"
- "build owb.deploy.staging"
- "build owb.deploy.central"
- "build owb.deploy.datamarts"
- 2. It is necessary to verify via the control centre that these commands ran successfully.
- 3. Open the OWB Design Centre, go to the tools menu and click Control Centre manager. Note it is necessary to expand the Reporting project otherwise this option will be greyed out. The right-hand pane displays the deployment details with the deployment status. Ensure that the green tick is present for all the ETL's that have been deployed.
  - Please ignore the Drop Errors these occur because OWB tries to drop the ETL's before deploying them and they do not exist on the database yet.
- 4. In order to check that the deploy commands have executed successfully carry out the following for each schema.
- 5. Expand the mapping sections for the Staging schema; right click on the S\_ETLCONTROL\_ETL and start. If this executes successfully the S\_ETLCONTROL table will be populated.

Please see the Troubleshooting Section for issues on the deploy command.

## 6.9.6 Loading Data

It should be noted that the execution scripts shipped for the Oracle environment are present to help developers and testers executing ETL processes. These are not intended for production environments.

- 1. Open a command prompt and navigate to ...\Reporting\components. Run "build run.staging.all". Check that the staging tables have data. Specifically the S\_ETLCONTROL table should have date/time stamps.
- 2. Open a command prompt and navigate to ...\Reporting\components. Run "build run.central.all". Check that the central tables have data. Specifically the DW\_ETLCONTROL table should have date/time stamps.
- 3. Open a command prompt and navigate to ...\Reporting\components. Run "build run.datamarts.all". Check that the datamart tables have data. Specifically the DM\_ETLCONTROL table should have date time

stamps.

4. Open a command prompt and navigate to ...\Reporting\components\Core. Run "build run.datamarts.operational. aggregates". Note that the purpose of this command is to run the aggregate ETL's on a monthly basis. As a result this command will only execute on the last day of a month.

This command executes the following ETL's:

- DM\_AGGCASEMONTH\_ETL
- DM AGGCASEDAY ETL
- DM\_AGGFUNDS\_ETL
- DM\_AGGPAYMENTS\_ETL

Before running them, please set the environment.datamart.aggmonth.start/end dates to the required dates in the application.properties file, otherwise the ETL's will run for every month from 1934 till now (Default date set in Application.properties file).

5. The command "build run.all" aggregates the commands in point 1 to 3(above). Use this command on a regular basis (e.g. nightly).

**Note**: If the ETL processes were not deployed successfully they cannot execute correctly. Please note that any messages from the build targets stating "deployed successfully" may be misleading. OWB does not report errors in deployment when deploying from the command line, use the control center to verify all ETL processes are successfully deployed.

Appendix C "Build Script Commands" contains an overview of the build commands available with regards to executing ETL processes. The command "run.all" runs all ETL processes, please note that ETL processes are divided into 2 groups:

- 1. **Control ETL Proceses:** These are ETL processes that do not need to be executed with each batch run, and possibly should not be executed with each batch run (depending on your requirements). The control ETL process populate control tables which only need to be polulated once, and thereafter the tables only need to be populated when new ETL processes are added to the system, other control ETL process only update table which contain data that changes infrequently
- 2. **Opertaional ETL processes:** These are the ETL process that must be executed for each batch run as the extract from the transactional tables within the Curam database schema.

If your primary requirement is to verify operational data extracts, we recommend that the following jobs be executed as part of your batch run:

• run.staging.operational

## Cúram Business Intelligence Reporting Developer Guide

- run.central.operational
- run.datamarts.operational

## Chapter 7

## **Customizations and Upgrades**

#### 7.1 Introduction

Customers who take on BIA Reporting will customize the system in some way. As it is extremely important that customizations continue to work when an upgrade is applied, guidelines are provided in the manner in which customizations should be made. The upgrade approach takes these guidelines into account and does not overwrite functionality which has been properly customized.

This chapter details how to make changes to Reporting and how to take on upgrades to Reporting. The customization and upgrade process is described with the use of examples. The upgrading process clarifies why BIA Reporting is customized in the recommend fashion, so it helps to read the customization and upgrade sections together.

### 7.2 Customizations

There are two primary reasons why customers will have a requirement to customize the Reporting Module. The first is that customers may want to include fields and entities in Reporting that are not included in the 'out of the box' functionality and the second is that they may have already extended the Core Data Model and they want to include the additional data in Reporting:

- Include additional core data in BIA Reporting. The source Data Model consists of hundreds of entities. Only a subset of these entities and a subset of the fields within these entities are extracted to the Data Warehouse. In the event that a Customer requires additional data in the Warehouse they will have to customize some of the reporting artifacts to include the data in the Warehouse.
- Include additional extended data in BIA Reporting . Customers may extend the core data model to cater for additional information that they

need to capture. The data in the extensions will not be automatically propagated through to the warehouse and customers will have to customize many of the Reporting artifacts to include the data in the Warehouse.

The folder structure provided with BIA Reporting consists of both a **core** folder and a **custom** folder. When a customer site wants to modify metadata such as an ETL or DDL they should copy the core file, place it in the custom folder and make modifications in this custom folder. Build scripts will then give precedence to the contents of the custom folder.

The core folder should never contain artifacts modified by the customer. This is necessary for future upgrades (see separate section below on *Upgrades*) of BIA Reporting.

The following steps give the modifiable artifacts delivered with Reporting together with the customization guidelines. Example scenarios in **Appendix** C detail typical customizations that customers will be faced with. The three examples provided detail the user report change required, the methodology used for determining the required changes, and finally a listing of the changes required.

#### 7.2.1 Customizing Data Models and ETL Designs

The Data Models are a pictorial representation of each of the databases. As a customer makes modifications to the physical database they should also make changes to the data model so that they are kept in sync with the physical database.

The ETL process flows are pictorial representations of the activities within an ETL process. As a customer makes modifications to the physical ETL processes they should also make changes to the process flows so that they are kept in sync with the actual ETL process.

The data models and ETL designs are delivered as part of the documentation center. Please refer to the Documentation Center guide for customization guidelines.

## 7.2.2 Customizing DDLs

One set of DDLs are delivered per database and each consists of the code necessary to setup the tables, indexes, views, constraints and sequences. The DDLs are modifiable. When customizing the customer will make modifications in the folder named <code>custom\core\ddl</code>. The build script will give precedence to the contents of the custom folder over the core folder.

## 7.2.3 Customizing ETL Meta Data

The ETL meta data is data about the ETL process. The ETL meta data is modifiable. When a customer needs to make an alteration to an ETL they do this by altering the ETL in the ETL tool and saving the ETL to the *cus*-

tom\core\etl folder. All modified ETLs are saved to the custom\core\etl folder instead of the core\etl folder. The build script will give precedence to the contents of the custom folder. When exporting from the ETL tool to the custom\core\etl folder the customer will separate each ETL into a separate file instead of exporting to one, single file. The purpose of this is to allow concurrent development and to make it easier to import/export individual ETLs to the ETL tool.

### 7.2.4 Customizing the Build Script

The Build scripts are delivered as Ant scripts and are in xml format. A customer can extend the build scripts to add in their own functionality e.g. the customer may wish to copy files to a backup folder after creating the schemas.

If a customer wants to amend or create additional tasks we recommend the following process:

- 1. the customer creates a new ant file, e.g. components\core\mybuild.xml file
- 2. the customer adds any new tasks into mybuild.xml
- 3. call the new build commands through the build.bat by importing the new build file, e.g. by editing component\core\build.xml adding the line <import file="mybuild.xml"/>
- 4. or by creating a new batch file to execute the new build commands, e.g. copy our component\core\build.bat to mybuild.bat and ensure <mybuild.xml> is referenced

## 7.2.5 Customizing the Java Transformation Code

Java transformation code is written when the type of transformation required is not supported by the ETL tools. The java transformation code is configurable but not modifiable from the *core* directory. When configuring existing transformation code the customer will make changes in the folder named *custom\source*. Customers may add their own transformation logic in this folder also and this code will be then referenced from an ETL. The build script will give precedence to the contents of the custom folder.

## 7.2.6 Customizing the Static Data Files

Static data files are used to populate entities such as the time dimension in the datamarts. These are delivered to the customer as comma separated files - .csv format. Any modifications will be made in the folder *custom\core\data\_manager* and not in the *core* folder. For example, the customer may need to change the months in the fiscal calendar for the time dimension or change the fund data to match existing products. The build scripts will give precedence to the custom folder.

## 7.3 Upgrade Process

This section describes the process when a customer upgrades to a newer version of BIA Reporting. This process is described with some examples. This section should be read in conjunction with the customization section as upgrades will be easier if the customization process is followed.

As described in the customization section no modifications by customers to BIA Reporting are made to the core artifacts; instead any modifications are made in the *custom* folder by copying the original artifact to this folder. This means that when artifacts in the core folder are replaced with the newer upgraded metadata no customized artifacts are replaced. The build script will always give precedence to the contents of the custom folder.

When the original BIA Reporting artifacts in the core folder have been replaced with the upgraded artifacts, the customer must then begin the process of upgrading the customized artifacts. The first step is to isolate an upgrade strategy for each artefact; once complete the customer can make the necessary changes to artifacts that need to be updated. This is described in the upgrade strategy section.

### 7.3.1 Upgrade Strategy

When the customer upgrades the Reporting Solution the first step is to review the **Reporting Upgrade Documentation** to review the upgrade and get a list of all artifacts that have changed. Once the customer has a complete list of the changed artifacts a review of each artefact is needed to decide if a change is required. Once the review is complete any required changes are made. The following scenarios illustrate the different strategies which can be taken during an upgrade:

Scenario 1: No upgrade for the artefact

In this scenario the artefact in the core folder has not been changed to a newer version by the upgrade. If the customer uses a modified version of this artefact in the custom folder or the original version in the core folder the results are the same: there is no change required.

Scenario 2: Artefact has been upgraded; customer wants to use the upgraded artefact and is currently using the core artefact

In this scenario the artefact in the core folder has been replaced with the upgraded artefact and the customer wants to use this artefact. The customer is currently using the core artefact i.e. no changes have been made to the artefact by the customer. No modifications need to be made to the artefact as the customer will now use the upgraded artefact in the core folder.

An example of this is a change to the DW\_ADDRESS\_ETL meta data. There has been an upgrade to this ETL to include a new destination field.

Since the customer has not modified this ETL before the upgrade and wants to use the upgraded version then the customer can import this upgraded ETL into the ETL tool and use this instead of the pre-upgrade version.

Scenario 3: Artefact has been upgraded; customer does not want to use the upgraded artefact and is currently using the core artefact

In this scenario the artefact in the core folder has been replaced with the upgraded artefact and the customer does not want to use this artefact. The customer is currently using the core artefact i.e. no changes have been made to the artefact by the customer. The customer must keep the pre-upgraded version in the custom folder as this is now different from the core solution. The build script will always take the artefact in the custom folder before the core folder.

An example of this is a change to the DW\_ADDRESS\_ETL meta data. There has been an upgrade to this ETL to include a new destination field. Since the customer wants to use the original pre-upgraded version without the new destination field they must keep the pre-upgraded version of the DW\_ADDRESS\_ETL meta data in the <code>custom\core\etl</code> folder. They can do this by exporting the ETL from the ETL tool to this folder.

Scenario 4: Artefact has been upgraded; customer wants to take on the upgrade and is currently using a custom artefact

In this scenario the artefact in the core folder has been replaced with the upgraded artefact and the customer wants to take on these upgrade changes. However, the customer has already made changes to the artefact which is in the custom folder. The customer must manually make the upgraded changes to the customized artefact. To do this the customer must check for differences in the new upgraded artefact (a comparison utility may be helpful to compare certain artifacts) and adopt these upgrade changes into the customized artefact.

An example of this is a change to the DW\_ADDRESS\_ETL meta data. There has been an upgrade to this ETL to include a new destination field. However the customer has already modified the meta data by deleting an existing column which they do not need. To adopt the upgrade the customer must check for the differences with the new upgraded artefact to find the new destination column. The customer can then modify their customized ETL in the custom folder to add this destination field. The build script will always take this meta data in the custom folder before the core folder.

Scenario 5: Artefact has been upgraded; customer does not want to take on the upgrade and is currently using a custom artefact

In this scenario the artefact in the core folder has been replaced with the upgraded artefact but the customer does not want to take on these upgrade

changes. The customer has already made changes to the artefact which is in the custom folder. No modifications need to be made as the build script will use the custom artefact and ignore the upgraded artefact in the core folder.

An example of this is a change to the DW\_ADDRESS\_ETL meta data. There has been an upgrade to this ETL to include a new destination field. However the customer has already modified the meta data by deleting an existing column which they do not need. Because the customer does not want to adopt the upgrade no modifications need to be made and the build script will still use the ETL in the custom folder and ignore the upgraded ETL in the core folder.

### 7.4 Conclusion

Customers who take on BIA Reporting will always customize the system in some way and will also need to take on upgrades to BIA Reporting. Guidelines are provided on the manner in which customizations and upgrades should be made and these were discussed in this chapter. The chapter contained the following:

- an overview of the BIA Reporting customization process.
- a listing of all the modifiable artifacts in BIA Reporting and an explanation on how each type of artifact should be customized.
- an overview of the Upgrade process.
- the upgrade strategy chosen for each type of upgrade scenario encountered.

## Chapter 8

## Troubleshooting

#### 8.1 Introduction

This chapter details possible troubleshooting tips and fixes that the user may find helpful.

# 8.2 Problem: Build fail errors when running the build script

#### 8.2.1 Problem

When using the build script to create a database schema or import metadata into the ETL tool the error 'BUILD FAILED' occurs with a description.

The build script may have failed for a number of reasons such as the applications.properties\BIbootstrap.properties files not set up correctly or the database environment variables are not set up correctly.

#### 8.2.2 Solution

The user needs to isolate the error and fix the problem. Check the error messages from the build script output to isolate the problem.

Running a 'appbuild configtest' in the command prompt from the directory that the build script resides will test to check if the reporting environment is setup correctly. The results of running this command are displayed including a message indicating if the environment has been setup correctly (BUILD SUCCESSFUL) or not (BUILD FAILED). The exact error message for failing is also displayed. Should a command not run successfully, then prior to the 'BUILD FAILED' message, an error message report would specify where the issue needs to be fixed. An example of one of these error

## 8.3 Problem: 'appbuild configtest' is failing

First and foremost if the appluild configtest fails for any reason verify that the contents of the application.properties file is correct.

#### 8.3.1 Problem

'appbuild configtest' is failing with this error:

• C:\Curam\development\Reporting\components\core>appbuild configtest Unable to locate tools.jar. Expected to find it in C:\ProgramFiles\Java\jre1.5.0\_09\lib\tools.jarBuildfile: C:\Curam\development\Reporting\components\core\build.xml

BUILD FAILED

C:\Curam\development\Reporting\components\core\build.xml:12: task-def class curam.util.reporting.internal.tasks.AntReadBuildFileName cannot be found

#### 8.3.2 Solution

- Verify that the contents of the application.properties file is correct and copy a tools.jar file into the C:\ProgramFiles\Java\jre1.5.0\_09\lib location
- Ensure JAVA\_HOME is set to the jdk of Java 1.5 or higher

#### 8.3.3 Problem

'appbuild configtest' is failing with the below error:

Info(s), you should fix the following:
 Info, is not a file:REPORTING\_DIR=REPORTING\_DIR
 Info, is not a file:REPORTING\_ENV=REPORTING\_ENV
 Info, is not a file:COGNOS\_HOME=COGNOS\_HOME

Info, is not a file:ANT\_HOME=ANT\_HOME
Info, is not a file:ORACLE\_HOME=ORACLE\_HOME
Info, is not a file:OWB\_HOME=OWB\_HOME

#### 8.3.4 Solution

• Ensure JAVA\_HOME is set to the jdk of Java 1.5 or higher.

#### 8.3.5 Problem

'appbuild configtest' is failing with this error:

• [echo] info:Compiling class using RDBMS compiler, using \${java.path}\javac.exe

#### 8.3.6 Solution

• Ensure JAVA\_HOME points to a JDK home and not a JRE home.

#### 8.3.7 Problem

'appbuild configtest' is failing with this error:

BUILD FAILED

C:\Curam\development\Reporting\devenvironment\scripts\oraclebuild.x ml:328: The following error occurred while executing this line:

#### 8.3.8 Solution

• Ensure the OWB\_HOME var is set correctly, e.g. ...\oracle\owb\owb

#### 8.3.9 Problem

'appbuild configtest' is failing with this error:

• jar: [echo]

info: Compiling class using RDBMS compiler, using \${java.path}\javac.exe [javac] Compiling 87 source files to %REPORTING DIR%\devenvironment\build\rdbms

#### 8.3.10 Solution

• Ensure the application.properties file exists and is correctly configured. Specifically the database type property.

### 8.4 Problem: Errors with permissions

#### 8.4.1 Problem

In the OWB Control Center an ETL fails to deploy and gives this error message:

ORA-06550: line 222, column 11: PL/SQL: ORA-00942: table or view does not exist

#### 8.4.2 Solution

Running this command may resolve the problem - 'appbuild grant.all'.

This command grants permissions from staging, central, and datamarts to public. It should only be used in a Development Environment.

# 8.5 Problem: The lastwritten field in source table is not populated

#### 8.5.1 Problem

When attempting to extract data from a source table to the Staging database using an ETL no data is being extracted. The problem is that the last written field in the source database is not being populated.

#### 8.5.2 Solution

All source tables being used in BIAReporting need the last written field to be populated. The developers of the source system must ensure that this is a mandatory field and always updated.

The last written field in the source table needs to be populated, the date in the control table will need to be reset and the ETL run again.

## 8.6 Problem: Error deploying the locators in Oracle because of Oracle version

#### 8.6.1 Problem

When attempting to run the *owb.deploy.runtimesetup* or the *owb.deploy.all* with Oracle an error occurs saying that there is a version difference between the database and the locators in the warehouse.

#### 8.6.2 Solution

The user needs to change the database version in the locators in Oracle Warehouse Builder (OWB). In the Reporting project in OWB the user needs to select the *database/oracle/locations* folder and open the properties of each location and change the version. If the version looks to be correct then change to an older version and commit and then change back and commit again.

### 8.7 Problem: Unwanted OWB Locations

#### 8.7.1 Problem

The names of the location objects in OWB are related to the schema names in the application.properties file. Every client applies their own naming conventions when creating the schemas for staging, central and datamarts. It is therefore necessary to perform some clean up operations on the OWB location objects created.

#### 8.7.2 Solution

- 1. Open the OWB Design Centre and log in as the Runtime Owner.
- 2. In the Connection Explorer, in the right hand panel, expand the Databases and Oracle options. It may be necessary to delete the following locations: Any duplicate locations prefixed with "curstaging".
- 3. Please do not delete the following:
  - OWB locations which are prefixed with "OWB" or "REPOSIT-ORY"

### 8.7.3 Necessary locations

The locations which should remain are

Locations

- Databases
  - Oracle
    - CDW LOCATION
    - DATAMARTS\_LOCATION
    - OWB\_REPOSITORY\_LOCATION
    - SOURCE\_LOCATION
    - STAGING\_LOCATION
  - DB2

Please note that the locations will be registered correctly when the command md.deploy.runtimesetup is run in Section Websphere Application Server Post-Installation Configuration'

# 8.8 Problem: Error when running 'appbuild transform.aggcasemonth'

#### 8.8.1 Problem

If the transform.aggcasemonth build task fails run the 'appbuild configtest' task to ensure the project properties are correct. If the appbuild configtest fails with the below error:

• Error, ant property <environment.jdbc.jars> can't find file C:\oracle10\product\10.2.0\db\_1\jdbc\lib\classes12.zip

#### 8.8.2 Solution

Then navigate to the application.properties file (...\Reporting\project\properties) and ensure the environment.jdbc.jars is correctly set to the Oracle home directory. (Can vary slightly from different machines)

- environment.jdbc.jars=C:\\oracle\\product\\10.2.0\\db\_1\\jdbc\\lib\\classes12.zip
- Re run 'appbuild configtest', this should now run successfully and then run 'appbuild transform.aggcasemonth' which should also successfully complete.

## 8.9 Problem: Cognos does not start

#### 8.9.1 Problem

Errors thrown in Cognos Configuration preventing Cognos from starting.

#### 8.9.2 Solution

Congos requires a Sun JRE which must be 1.5. Ensure the JAVA\_HOME points to the Cognos JRE or a compatible JRE.

## 8.10 Problem: Errors while importing the ETL's

#### 8.10.1 Problem

Errors thrown when importing the ETL's from the command line.

#### 8.10.2 Solution

If there are issues importing the ETL's, check the owbimport.tcl script located here (%REPORTING\_DIR%\bin\etl) and verify the OMBCONNECT string on the first line is correct.

#### 8.10.3 Problem

Cannot create connection to control centre

#### 8.10.4 Problem

OWBSYS is locked (This relates to any user)

#### 8.10.5 Solution

In SQL developer: Sys>Other Users>OWBSYS -right click and choose edit user. Un-check 'Account is locked. Click Apply and close

#### 8.10.6 Solution

Oracle>Warehosebuilder>Administration>Start Control Centre

## 8.11 Problem: Unable to log into Control Centre

#### 8.11.1 Problem

The following error is thrown when trying to log into the control centre: RTC-5260: Failed to connect to runtime platform, Please check you have

provided the correct Host, user, password and service name

#### 8.11.2 Solution

Navigate to All Programs->Warehouse Builder->Admin and click on Start control centre service. Go back and log into control centre again.

## 8.12 Problem: No Data in Tables after running owb.environment.tests.run

#### 8.12.1 Problem

There is no data in the Tables after running owb.environment.tests.run. There may be a number of reasons for this issue, but if this error message is in the screen output then please see the below solution:

• run.etl.execute:

[exec] ERROR:

[exec] ORA-01017: invalid username/password; logon denied

#### 8.12.2 Solution

appbuild owb.environment.tests.run tries to connect to the database using runtime.db.username.

The variables design.db.username and runtime.db.username in ..\Reporting\project\properties\BIBootstrap.properties need to match.

Please ensure that they match and that they are correct.

## 8.13 Problem: Error reimporting due to Matching Conflicts

#### 8.13.1 Problem

A number of oracle files are failing to reimport due to matching conflicts when reimporting data (using the command 'build owb.import.all' when reporting folder hasn't been deleted) into OWB.

#### 8.13.2 Solution

In order to permanently fix this bug, clients must install patch 10195667 which can be found by logging into https://support.oracle.com/CSP/ui/flash.html. The instructions in the

Readme.txt file provided with this patch are complicated so a more clearer version is provided in Appendix K: Installing Patches

#### 8.14 Problem: Incorrect language code set

#### 8.14.1 Problem

If the workspace is created with the incorrect language code, then the language cannot be changed. Instead, the owbsys user must be dropped and recreated.

#### 8.14.2 Solution

Remove OWB workspace users and owners using the Repository Assistant (follow all the steps in Appendix F).

Open an SQLPLUS command prompt, i.e. open a command prompt and run "sqlplus". Login as owbsys and then run the following:

- To clean out the OWBSYS schema, run the script in the clean\_owbsys.sql file located in the \$ORACLE\_HOME/owb/unifiedRepos directory. This will drop the OWBSYS user and all roles associated with it.
- To recreate the OWBSYS schema and seed all the required objects, run
  the script located in the cat\_owb.sql file. This may lock the OWBSYS
  account, in which case it must be unlocked using either SQL developer,
  or by running the following in SQPLUS: 'alter user owbsys identified by
  password account unlock' where password is the assigned password to
  OWBSYS
- Reset the OWBSYS schema by running the script located in the reset\_owbcc\_home.sql file. This may ask for the full path to \$ORACLE\_HOME to be entered.

#### 8.15 Problem: Import Process running slowly

#### 8.15.1 Problem

The OWB import process has become slow over time and is taking longer than expected

#### 8.15.2 Solution

To optimise your OWB repository:

1. Open the OWB Design centre

#### 2. Execute the "Optimise Repository" option from the Tools menu

The following Oracle publication provides further tips describing which features OWB provides to optimize a repository automatically: https://blogs.oracle.com/warehousebuilder/entry/introducing\_optimize\_reposit ory

## Glossary

Aggregation

Information stored in a data mart in a summarized form. Aggregations are used to save storage space and to improve the performance of the data mart.

Change Data Capture

In database replication, changed data capture occurs when only the data that has changed since the previous replication is copied.

**Data Cleansing** 

The process of removing errors and inconsistencies from data being imported into a data warehouse.

Data Mart

A database, or collection of databases, designed for reporting and to help users make strategic decisions about their business. A data warehouse combines databases across an entire enterprise; data marts are usually smaller and focus on a particular subject or department.

Data Warehouse

A database created from operational extracts that adhere to a single, consistent, enterprise data model to ensure consistency of decision-support data across the corporation.

Data Modeling

A method used to define and analyze data requirements needed to support the business functions of an enterprise. These data requirements are recorded as a conceptual data model with associated data definitions. Data modeling defines the relationships between data elements and structures.

Dimension

A dimension is a structural attribute of a data mart that is a list of members, all of which are of a similar type in the user's perception of the data. For example, all months, quarters, years, etc., make up a time dimension.

ETL

Short for Extract, Transform, Load. ETL refers to the process of getting data out of one

data store (Extract), modifying it (Transform), and inserting it into a different data store (Load).

Fact Table

In a star schema, the central table which contains the individual facts being stored in the database. There are two types of fields stored in a fact table:

- 1. The fields storing the foreign keys which connect each particular fact to the appropriate value in each dimension.
- 2. The fields storing the individual facts (or measures) such as number.

Foreign Key

A foreign key is the primary key of one data structure that is placed into a related data structure to represent a relationship among those structures. Foreign keys resolve relationships, and support navigation among data structures.

Granularity

The level of detail of the data stored in a data warehouse.

Measure

A numeric value stored in a fact table.

Metadata

Data that describes the data in the warehouse. This includes the database schemas, ETLs, and any other information that is needed to support and manage the operation of the data warehouse.

Normalization

The process of organizing data in accordance with the rules of a relational database. The central data warehouse is normalized while the data marts, with its emphasis on efficient retrieval of data, is de-normalized (see *star schema*).

**OLAP** 

On-Line Analytical Processing. Processing that supports the analysis of business trends and projections.

**OLTP** 

On-Line Transactional Processing. OLTP describes the requirements for a system that is used in an operational environment.

Primary Key

#### Cúram Business Intelligence Reporting Developer Guide

A column or combination of columns whose values uniquely identify a row or record in the table. The primary key(s) will have a unique value for each record or row in the table.

Star Schema

A star schema is a set of tables comprised of a single, central fact table surrounded by denormalized dimensions. Each dimension is represented in a single table. Star schema implement dimensional data structures with denormalized dimensions.

**XML** 

eXtensible Markup Language. A method of sharing data between disparate data systems, without needing a direct connection between them.

## Appendix A

### Configuring the BIBootstrap.properties file.

Before using the build script it is important to set up the connection information for the databases and ETL tools. This is set up in the **BIBootstrap.properties** file which needs to be created in the *Reporting\project\properties* folder. When running the build script the connection information is obtained from this properties file.

A sample file, called BIBootstrap.propertiessamplexxx, has been provided for guidance. It can be found in the ..\Reporting\project\properties folder. This file can be copied and renamed as BIBootstrap.properties as a start point. It must be kept in the same folder.

The following lists the main components in the properties file:

- **Database Type** Set this for Oracle (db.type=ORA) or DB2 (db.type=DB2)
- **DB2 Source Type** Only set for DB2. The type must be set to UDB if using DB2 Universal Database (db2.source.type=UDB)
- Connection information for the target databases (Source, Staging, Central, Datamarts). The server, database name, username, SID, port number (if applicable) and password must be set. We will use the target database (staging, central, or datamarts) set up in the previous section as the username. Note: For DB2 Central and Staging should be set up on the same database.
- Connection information for the Demo Data database (curamdmdemo). The server, database name, SID, username, port number (if applicable) and password must be set. The Demo Data schema is set up by running the appropriate Build Environment command.
- **Design time repository connection information.** The server, port (if applicable), database name, username and password and service name (if applicable) should be set. For Oracle we will use the design time repository user previously set up as the username. For DB2 we will use

the control database automatically set up as part of the install as the username.

- Run time repository connection information (Oracle Only). The server, port (if applicable), database name, username and password and service name (if applicable) should be set. For Oracle we will use the runtime repository owner previously set up as the username. For DB2 we will use the control database automatically set up as part of the install as the username.
- Password passwords for Oracle, DB2, WLS and WAS need to be encrypted in the BIBootstrap.properties as follows:
  - Open a command prompt from Reporting\components
  - Run **appbuild encrypt.password -Dpassword=** where is the assigned password to be encrypted
  - Enter the full ecrytped password returned, for example: qqn-scP4c4+s== as the password in BIBootstrap.properties

### A.1 Sample BIBootstrap property file for DB2

#Note: These database usernames are samples. We highly reccomend that you use you standardize the names to your own convention

The passwords below have been encrypted. Please refer to section 'Setup BIApplication.Properties and BIBootstrap.properties files' for further information

# DB2 connections properties for the Application Database

environment.databases.curam.privilages.autogrant=false environment.databases.bi.privilages.autogrant=true environment.databases.curam.updatenulls.autorun=false

## Appendix B

### Configuring the BIApplication properties file.

Before using the build script it is important to set the variables for the Build Environment and ETL tools. They are set in the **BIApplication.properties** file which needs to be created in the *Reporting\project\properties* folder.

A sample file, called BIApplication.propertiessamplexxx, has been provided for guidance. It can be found in the ..\Reporting\project\properties folder. This file can be copied and renamed as BIApplication.properties as a start point. It must be kept in the same folder.

The following lists the main components in the properties file:

- Component Order Warning Level this is set to Error which means that if the Build Environment gets an Error it will stop processing the last command. If it is changed to Warning then it will carry on processing after getting an error.
- Component Order If you are just using the CEF Framework then please delete childservices and cgis, leaving core, e.g. component.order=core. If you are using the Child Services Module then set component.order=core, childservices If you are using any of the other Solution Modules CGIS then please refer to the Application Properties section of their Reporting Deverloper Guides.
- Component.locale.order.installedLanguage This is the language code for choosing the correct localisations and translations, see Appendix L
- Environment IExplorer URL This is the path to Microsoft® Internet Explorer.
- **Environment Variables** This lists the Environment Variable that are used by the Build Environment.
- Environment ResetETL Date This is used by the Build Environment Targets resetetl.staging, resetetl.central and resetetl.datamarts. It resets all of the Last ETL Dates in each schema Control Table. It should only

be used in a Development Environment and not in Production.

- Environment ResetETL Dateformat this specifies the date format that environment.resetetl.date expects
- **Aggmonth** these 3 properties are used by the Build Environment Target transform.aggmonth, they specify the Start Date, End Date and Date Format to be used to load the DM\_AGGCASEMONTH fact
- **Environment.jdbc.drivers** This is the Oracle driver that BIA Reporting uses, i.e. oracle.jdbc.driver.OracleDriver.
- Environment.jdbc.jars Change the path to point to the specified JAR files, e.g. environment.jdbc.jars=C:\\Oracle\\product\\11.2.0\\db\_1\\jdbc\\lib\\ojdbc5.jar Please note that the double back slashes are required to fix a bug. This bug will be removed in the next release.
- **Environment.owb.oracleinstalled** Only set this to false if there is no Oracle database on the server where OWB has been installed. Otherwise set this to true.
- **Environment.owbconfig.validate.failonwarnings** This will check the oracle ETL's for successful validation. This will fail even if the ETL's validates with warnings.
- **Environment.owbconfig.remotedatamanagerdir** If the Data Manager folder is on the local machine then leave it blank or it will cause an error.

If the staging, central and datamart schemas are being created on a remote server then the Data Manager folder and contents will need to be copied to this server after the build staticdata command has been run, refer to Section 6.8.3, Step 12. You then need to set the variable to the path of the Data Manager folder on the remote server, using the java convention for path separators (\\),e.g. Reporting\\bin\\data\_manager\\. Please ensure that the trailing \\ is added or it will cause an error.

- **Environment.owbconfig.version** Set this to the version of Oracle you are using.
- **Environment.owbconfig.version.sourceDB** Set this to the version of Oracle you are using as the source database, e.g. 11.2.
- **Environment.owbconfig.exectemplate** Set this to be sqlplus\_exec\_template.sql.
- Environment.databases.curam.privilages.autogrant This grants select on all Source Tables to the Staging Schema. See Appendix G. This should be set to false.
- Environment.databases.bi.privilages.autogrant This grants select on all Staging Tables to the Central Schema. See Appendix G. This should be set to false.

• Environment.databases.curam.updatenulls.autorun - This turns on/off the privilege of granting from Souce Applications to Reporting Staging Schemas. See Appendix H. Set this to be false.

## Appendix C

## Build Script Commands.

The following table lists a sample of the build targets and their descriptions when using the build script. The full list of commands can also be seen from the command line by typing **buildhelp**.

### C.1 Common DB2 and Oracle Commands

Build command	Description
<b>Control ETL Processes</b>	
all	Initializes the environment and then compiles all code and builds all the metadata for the database and ETL tool.
compile	Compiles the BIA Reporting classes.
clean	Removes datawarehouse ddl, scripts, classes and jars.
database.all	Builds the staging, central, and datamarts schema objects into the databases specified in the applications.properties file.
database.central	Builds the central data warehouse schema objects into the central database specified in the applications.properties file.
database.central.transforms	Loads central transformations into the central database.
database.datamarts	Builds the datamarts schema objects into the datamarts database specified in the ap- plications.properties file.
database.datamarts.demodata	Loads demo data into the datamart schema if present.
database.datamarts.transforms	Loads datamart transformations into the

Build command	Description
	datamarts database.
database.source.updatenulls	Updates source last written column values in the Application tables if null.
database.staging	Builds the staging schema objects into the staging database specified in the applications.properties file.
database.staging.transforms	loads staging transformations into the staging database.
encrypt.password - Dpassword=	Returns the encrypted version of a password
export.control	Writes the contents of all control tables to a log file
jar	Packages multiple java file into reporting classes.
resetetl.central	Sets the Last ETL Date in the Control Table for the Central ETL's.
resetetl.datamarts	Sets the Last ETL Date in the Control Table for the Datamart ETL's.
resetetl.staging	Sets the Last ETL Date in the Control Table for the Staging ETL's.
staticdata	Copies/merge static data files, merge control files into\\Reporting\bin\data_manager
transform.address	A Developer can use this Build Target to help debug the Post Process in DW_ADDRESS_SP.
transform.aggday	A Developer can use this Build Target to help debug the transform in DM_AGGCASEDAY_SP.
transform.aggmonth	A Developer can use this Build Target to help debug the transform in DM_AGGCASEMONTH_SP.
transform.staticdata	A Developer can use this Build Target to help debug the -1 records that are loaded in DW_STATICDATA_SP
<b>Operational ETL Processes</b>	
clean	Removes datawarehouse ddl, scripts, classes and jars.
configtest	Checks that the reporting environment is set up correctly.

### Cúram Business Intelligence Reporting Developer Guide

Build command	Description
database.all	Builds the staging, central, and datamarts schema objects into the databases specified in the applications.properties file.
owb.import.all	Imports source, staging, central and datamart
owb.deploy.all	Deploys staging, central and datamart ETL's
run.all	Runs all the ETLs

Table C.1

## Appendix D

### Scheduling of ETL Processes

This Appendix outline how the execution of our reporting ETL processes can be scheduled.

For Oracle, the Reporting component comes with the build targets - 'run.xxx' - to execute ETL processes. However, this is provided as a productivity utility to help developers and testers execute ETL processes, we do not recommend that these build targets are used in a production environment.

A production quality scheduling and execution system should be used.

#### D.1 DB2

The ETL's can be executed in the IWE Design Studio and also in the Websphere Application Server Admin Console.

The Websphere Application Server Admin Console can be used to schedule the execution of the Control Flows.

Schedules can be created in the Websphere Application Server Admin Console by navigating to InfoSphere Warehouse - SQL Warehousing - Processes- Run Processes.

#### D.2 Oracle

#### D.2.1 Design time platform

Process flows can be designed using Oracle Warehouse Builder. Designing process flows is described in detail in the OWB User Guide.

#### D.2.2 Runtime time platform

Once you create your process flows you deploy your flows to Oracle Work-

flow or any compliant XPDL work flow engine.

You can also execute and schedule flows using Oracle Enterprise Manager. A quote from "OWB User Guide" states:

With Warehouse Builder, you have two main options for executing process flows: you can execute them from within Warehouse Builder using the Deployment Manager as described earlier, or you can execute them from Oracle Workflow. In addition, you can use Warehouse Builder to integrate with Oracle Enterprise Manager to schedule these process flow executions. For information about Oracle Workflow, see the Oracle Workflow Guide. For information about Oracle Enterprise Manager, see the Oracle Enterprise Manager Administrator's Guide.

## Appendix E

## Create OWB Workspace Owner and Users using Repository Assistant

Follow these steps to create the OWB Workspace Owner and Users using the Repository Assistant:

- Ensure the Database User OWBSYS is unlocked and the Password is set using either SQL Developer or Oracle Enterprise Manager.
- Open the Warehouse Repository Assistant which can be found here: Start - All Programs - Oracle\_Home - Warehouse Builder - Administration - Repository Assistant
  - **Step 1:** Enter the Host Name, Port Number and Oracle Service Name, which can all be found in your tnsnames.ora file.
  - Step 2: Select Manage Warehouse Builder Workspace
  - **Step 3:** Select Create a new Warehouse Builder workspace
  - **Step 4:** Select Create a workspace with a new user as workspace owner
  - **Step 5:** Enter the SYS user name and password
  - **Step 6:** Enter the Workspace Owner's User Name, e.g. ORCL, and Password. Also enter the Workspace Name, e.g. CURAMBI
  - **Step 7:** Enter the OWBSYS user name and password
  - **Step 8:** Accept the defaults or else change the Tablespaces
  - **Step 9:** Accept the default or else change the Language
  - **Step 10:** Create 5 new schemas CuramST, CuramDW, CuramDM, CuramDMO and CuramBIROLE. These will be created as Schemas on your database so please name them as Project Standards require.
  - Review the Summary and click finish to build the Repository and create the Target Schemas on the Database.
- By running database.create.bischemas the CuramBIRole is dropped, re-

created and granted each of the required access rights in areas such as drop, recreate & debug. CuramST, CuramDW, CuramDM & CuramDMO are also dropped, but on recreation they are simply granted access to CuramBIRole, giving each of them the same level of access.

• The **grant.all** command, which gets called by database.all, grants table/ view permissions to the 5 schemas (see **Appendix G**)

## Appendix F

# Remove OWB Workspace Owner and Users using the Repository Assistant

Before removing any owb workspace owners or users verify that these are no longer required. The OWB workspace contains the source code for your warehouse project; it is strongly recommended that a backup of the repository is taken before deletion.

Deletion of the OWB schema's through the standard Oracle tools like SQLPLUS does not achieve the same result as the following steps. When removing an OWB workspace or target schema complete the following steps.

Follow these steps to drop the **OWB Workspace Users** using the Repository Assistant:

- Open the Warehouse Repository Assistant which can be found here: Start - All Programs - Oracle\_Home - Warehouse Builder - Administration - Repository Assistant
  - **Step 1:** Enter the Host Name, Port Number and Oracle Service Name, which can all be found in your tnsnames.ora file.
  - **Step 2:** Select Manage Warehouse Builder workspace users
  - **Step 3:** Enter the Workspace Owner's User Name, e.g. CuramBI and Password.
  - **Step 4:** Select the Workspace Name
  - **Step 5:** Unregister Warehouse Builder workspace users
  - **Step 6:** Select all users, e.g. CuramST, CuramDW, CuramDM, CuramDMO and CuramBIROLE
  - Review the Summary and click finish to unregister the Warehouse Builder workspace users.
- If required, manually drop the CuramST, CuramDW, CuramDM, CuramDMO and CuramBIROLE schemas from the database using Or-

acle Enterprise Manager or SQL Developer.

Follow these steps to drop the **OWB Workspace Owner** using the Repository Assistant:

- Open the Warehouse Repository Assistant which can be found here: Start - All Programs - Oracle\_Home - Warehouse Builder - Administration - Repository Assistant
  - **Step 1:** Enter the Host Name, Port Number and Oracle Service Name, which can all be found in your tnsnames.ora file.
  - Step 2: Select Manage Warehouse Builder Workspace
  - **Step 3:** Select Drop an existing Warehouse Builder workspace
  - **Step 4:** Enter the Workspace Owner's User Name, e.g. CuramBI, and Password.
  - **Step 5:** Select the Workspace Name

Review the Summary and click finish to drop the OWB Workspace Owner.

• If required, manually drop the OWB Workspace Owner schema from the database using Oracle Enterprise Manager or SQL Developer.

## Appendix G

### **Granting Database Privileges**

The Reporting Build Environment provides a quick and easy way to grant the required privileges that the Data Warehouse needs. However, it should only be used in a Development Environment, when the source data is from a database that resides on a different database instance to the staging database, and not in an environment where there are stricter security priorities, like a Production Environment.

The BIapplication.properties file contains these variables which, when set to True, automatically grant the required privileges:

- **environment.databases.curam.privilages.autogrant** grants select on all Source Source Tables to the Staging Schema
- environment.databases.bi.privilages.autogrant grants select on all Staging Tables to the Central Schema, and on all Central Tables to the Datamart Schema

The **grant.all** command, which gets called by database.all, grants the permissions from tables/views in Source, Staging, Central to the Staging, Central, Datamart databases respectively:

- Source tables/views granted to Staging
- Staging tables/views granted to Central
- Central tables/views granted to Datamart

each and everyone of which need to be specified in the relevalant grant file for all components:

- curam\_grant
- s\_grant
- dw grant
- dm\_grant

which are located in the Reporting\Components\<Specific Component>\Run\Oracle folder for each individual component

In order for the grant.all command to execute successfully please ensure that the Source, Staging and Central users have the correct grant authority.

In a **Development Environment**, if the source data is coming from an external database different to the staging database, please ensure that:

- The environment.databases.curam.privileges.autogrant is set to false
- The environment.databases.bi.privilages.autogrant is set to true

If the source data is from the same database as that of the staging database, ensure both are set to true.

In a **Production Environment**, please ensure that the 2 autogrant variables are set to false, which is the default. Relevant production environment to meet personal security requirements will then need to be set up.

## Appendix H

### Capturing Changed Data

The source database is provided with default data, however from the perspective for the BIA Reporting module, some of the columns of interest are set to a null value.

BIA Reporting only extracts data from tables where a column named "LASTWRITTEN" has a non-null value. If these columns are not updated to a non-null value, then the warehouse cannot be populated with data correctly.

In order to allow the Reporting Schemas to be populated with data as quickly as possible, we provide a mechanism to update these last written columns to a non-null value. However, it should only be used in a Development Environment, and not in an environment where there are stricter security priorities, like a Production Environment.

It is possible to turn on/turn off the command to update the last written columns by setting:

• environment.databases.curam.updatenulls.autorun - This turns on/off the privilege of granting from Source Applications to Reporting Staging Schemas by setting to true/false respectively

You can update the last written columns manually by executing the target "database.source.updatenulls". Alternately, this command is also called automatically when building the database via the "database.all" command.

## Appendix I

### How to Add an Oracle ETL

#### Please follow these steps to add an ETL:

- Log into OWB Design Center
- Import any new required Tables into OWB
- Create a New Mapping under the appropriate Reporting\Databases\Oracle\Schema Name folder
- Add the Source and Target Tables
- Add the appropriate Control Table and join it to the Source Table to extract the updated records
- Add any other required Joins or Transformations
- Map the Source Columns over to the Target Columns
- Set the Load Properties on the Target Table and its Columns
- Add the Pre and Post Mapping Transformations to update the Control Table
- Validate and Deploy the ETL
- Add a record into the ETLCONTROL Table for the ETL. This can be done manually, as a once off, or by adding a new entry into the appropriate ETLCONTROL csv file and building the database
- Run the ETL to test via the OWB Control Center
- Add an entry into the appropriate run .bat file, which can be found in ..\Reporting\components\core\run\oracle. Any new ETL's should be added to a run .bat file in the custom folder, e.g. ..\Reporting\components\core\custom\run\oracle. This will ensure the new ETL gets run when the ETL's are executed through the build environment

 The ETL and updated Table metadata can be exported from OWB as .mdo files and stored on a file system

## Appendix J

### **Known Issues**

This appendix contains a list of all known issues and suggested work-arounds:

#### J.1 Build Environment

The build command "build owb.deploy.xxx" uses the OWB TCL toolkit called OMBPLUS to deploy all ETL process in the repository. Ombplus does not return an error if a mapping does not deploy successfully, you must review the deployment results using the OWB Control center to verify that mappings deployed successfully.

### J.2 Importing in OWB

Oracle Warehouse Builder ETL Loading Properties are incorrect after a meta data import. See the Oracle Note 754763 for the description of the issue and fix. Oracle recommends migrating to Oracle 11gR2 to resolve the issue. We have not seen the issue on 11gR2, but we cannot guarantee that it will not reoccur.

## Appendix K

### **Installing Patches**

### K.1 Installing Patches

This appendix gives a less complicated set of steps for installing patches than those provided in the Oracle README.txt file provided with each patch. Only the installtion steps are given so please refer to to the readme.txt file, provided with the patch for:

- 1. The list of files provided with the patch
- 2. The list of bugs fixed by the patch
- 3. The software required for the patch to work

### K.2 Instructions for applying a once off patch

The instructions for applying a one off patch are as follows:

- 1. Once the patch is downloaded, extract the contents to a directory, for example E:\stage\12345678 where 12345678 is the no. of the patch
- 2. Add an environment variable OPatch with value %ORACLE\_HOME%\OPatch to the system advanced properties
- 3. Add %ORACLE\_HOME%\OPatch; to the Path variable
- 4. Stop the runtime service by doing the following:
  - Run a command prompt from folder %OWB\_HOME%\rtp\sql
  - Login to sqlplus, i.e run "sqlus"
  - Logon as "sys as sysdba" OR "owbsys" and enter password
  - Execute "@stop\_service.sql"

- 5. Go to Oracle>WarehouseBuilder>Administration>Stop Control Centre Service, log on to the control centre and choose Stop.
- 6. Ensure all Orale programs are closed.
- 7. Run the Opatch Utility in a command prompt from the folder in which it was saved in Step 1:
  - Execute "opatch apply"

The patch will ask to rollback any other conflicting patches, when asked enter in 'y' to proceed.

If you encounter any errors - enter in 'y' to proceed and continue the installation, i.e. duplicate files exist or file cannot be found

- 8. Restart the runtime service by following all the steps in step 4 except the final one which will be
  - Execute "@start\_service.sql"
- 9. The patch should now be fully applied. If any problems are experienced after installing the patch, it can be removed by following steps 4-8 above, only in step 7 run the following in command prompt:
  - Execute "opatch rollback -id 12345678" where 12345678 is the no. of the patch
- 10. Pleas refer to the README.txt files for a more detailed version

## Appendix L

### Globalisation

BIA Reports are defaulted in English but are also now supported in multiple languages. For languages other than English, in order to build the database in the language specific to your BIA Reporting module then set the **Component.locale.order.installedLanguage** variable in Reporting\project\properties\BIApplication.properties to the the relevant language code, prior to building your database. The language codes are:

- en English
- es Spanish
- **pt\_BR** Portuguese (Brazil)
- fr- French
- ko Korean
- it- Italian
- **zh\_CN** Chinese (PRC)
- **zh\_TW** -Chinese (Taiwan)

The 3 localized property files also need to be manually updated. Located in Reporting\components\BIBuildtools\data\_manager\initialdata, for each of the following sql files:

- st intialdata.sql
- dw\_intialdata.sql
- dm\_intialdata.sql

change the language code (BI\_PROP\_VALUE) for the insert statements which contain a BIPROP\_NAME = 'BI.BILOCALE'.

For example, when switching to Korean, change the code in the st\_intialdata.sql file from

INSERT INTO ST\_PROPERTIES (BIPROPERTYID, BICATEGORY, BIPROP\_NAME,BIPROP\_VALUE,BIPROP\_TYPE,DEFAULTVALUE,LOCALE,LASTWRITTEN) VALUES (stpropertiesseq.nextval, 'CONFIG','BI.BILOCALE', 'en', 'STRING',NULL,",getDateTime());

to

INSERT INTO DW\_PROPERTIES (BIPROPERTYID, BICATEGORY, BIPROP\_NAME,BIPROP\_VALUE,BIPROP\_TYPE,DEFAULTVALUE,LOCALE,LASTWRITTEN) VALUES (dwpropertiesseq.nextval, 'CONFIG','BI.BILOCALE', 'ko', 'STRING',NULL,",getDateTime());

and make similar changes to dw\_initialdata.sql and dm\_intialdata.sql

## Appendix M

### Initial Oracle Schemas

The ealier section on 'Create OWB Repository and target schema's provides instructions on how to create the inital oracle roles and schemas with the option of renaming them.

The full list of these schemas is primarily set in the file Reporting\build\scripts\initaloracleschemas.sql with recommended access granted between them and the Repositorys. In order to make further changes other than the naming conventions, i.e. add extra schemas or alter the preset access granted to these schemas then we recommend the following:

- Copy the initoracleschemas.sql file to another location.
- Make the relevant changes/additions required to this new initoracleschemas.sql file
- Open a command prompt from Reporting\components
- Run the command 'database.create.bischemas' using the -D option to point to the updated copy of the initoracleschemas.sql file.
  - E.g. >database.create.bischemas -Dschema.createscript=[fullpath of updated file]\initoracleschemas.sql
  - to run the new script.
- Modifications to naming conventions need only be applied in the BIBootstrap.properties file

## Appendix N

### Security

BIA ETL programs require credentials to authenticate to a database and read/write data. The credentials for this connection are supplied in a configuration file (BIBootstrap.properties).

When an ETL program is ready to be used in production and/or when database builds are being prepared, the person who configures it will provide a BIBootstrap.properties file containing the batch programs production credentials. Since this is sensitive information, the production copy of this file (or the folder it is contained in) should be access-controlled to your satisfaction, e.g. so that the file can be accessed only by administrators and the batch program itself.

#### **Recommendation:**

For best practices, we advise you ro review your production copies of the following files, to ensure that they are access-controlled in line with your security policies:

• Reporting/project/properties/BIBootstrap.properties

You may also have automated packaging and/or deployment tasks for your application. If this automation is used to package or deploy production releases, you should consider the configuration files that support those automated processes.

BIA Reporting also has a sample create schema creation script (initoracleschemas.sql and rep\_oraschemas.properties), this is only intended for use within development environments as a quick-start mechanism to getting a Reporting sandbox created and running. If these files are used for any other purposes other than within development environments then you must ensure the these files are access controlled and secure.

Please ensure any default values are replaced with secure values in line with your local security policies. We advise that you create your own secure copy of any scripts that create the BI schemas.

#### Cúram Business Intelligence Reporting Developer Guide

We also highly recceommend the use of encrypted passwords in the BIBootstrap.properties file. Please refer the password section in  $\bf Apppendix \ A$ 

## Appendix O

### Upgrading to Oracle 11gR2

With this release, Oracle 11g R2 is now the base supported version. Oracle introduced meta-data format changes with OWB version 11g R2 which require all ETL processes to be upgraded to 11g R2 format. All OOTB, OWB artefacts have been upgraded, there is no further action required for OOTB content. All custom OWB 10g ETL development artefacts needs to be upgraded to Oracle 11g R2 format. If this is not done, then OWB will upgrade the OWB content on the fly, each and every time when importing. This will result in longer build times.

#### **How to Upgrade:**

Importing OWB content into OWB upgrades the ETL process, writing a new upgraded file to disk (the new file will have a postfix appended to its name). For example "test.mdo" when imported will be upgraded with a new upgraded file written to disk by OWB, the file name will be "test\_11\_2.mdo".

#### **Items of Note:**

1. If your OWB content is subject to source control, please note that the original file is the file that is source controlled. As such you will be required to overwrite the original file with the upgraded file, ensuring that the Original file name is maintained. If you have many custom artefacts, it can be time consuming to manually rename all upgraded ETL artefacts back to their original name. 2. Please also ensure that the upgraded file is removed from the directory structure otherwise it may be imported by the build process, thus resulting in longer build times.

For points 1 & 2; there is support within the build environment to automate the copying and removing of upgraded files. Please see the build command "buildowb.upgrade.11gR2.collectfiles

#### **Notices**
