

CICS Tools Hands-On Workshop

Understanding Resource Relationships with CICS Interdependency Analyzer V2.2

Assigned Userid: CICSTxx

<u>CICS Interdependency Analyzer V2.2 – Workshop</u> Session Objectives

This workshop serves as a hands-on introduction to CICS Interdependency Analyzer (IA) Explorer. The intent is to introduce you to queries you can perform from a PC and to familiarize you with navigation techniques within the IA Explorer. Some of the basic features of CICS IA have already been performed as follows:

- 1. Running the CINT transaction to setup and collect dependency data
- 2. Running a test suite of transactions for data collection and queries
- 3. Running the batch load job to copy the VSAM collection files to DB2 Tables
- 4. Running the Threadsafe reporter job
- 5. Configuring the IA Explorer preferences with the connection information

By the end of this lab, you will be able to navigate the explorer and demonstrate how CICS IA can help understand the relationships within your CICS applications. It is comprised of a several hands-on exercises designed to familiarize you with the product so that you can:

- 1. Navigate the CICS IA Explorer interface
- 2. Understand Threadsafe analysis
- 3. Review a Threadsafe batch report

Ten exercises are included to accomplish these objectives:

Exercise 1 - Initial System Definition and Basic Navigation

- Exercise 2 Finding Resources
- Exercise 4 Inquire on resources by region
- Exercise 5 Inquire on resources by program
- Exercise 5 Inquire on resources by transaction (optional exercise)
- Exercise 6 Using the sample queries
- *Exercise* 7 Using the sample queries for Migration (optional exercise)
- Exercise 8 Creating you own queries
- Exercise 9 Comparing Query Results
- Exercise 10 Review of Batch Threadsafe Report

There are optional exercises that cover additional features of CICS IA. With limited class time, you may not have time to cover these topics during the CICS Tools Work Shop. However, if you complete the other exercises early you can work on the optional exercises independently.

It is expected that the user of this document as a nominal amount of experience with PC and is familiar with terms for navigation.

For detailed information regarding CICS Interdependency Analyzer, please reference the CICS Interdependency Analyzer User's Guide. This document can be found on the WEB at: <u>http://www.elink.ibmlink.ibm.com/publications/servlet/pbi.wss?CTY=US&FNC=SRX&PBL=S</u>C34-6799

Exercise 1 - Initial System Definition and Basic Navigation

The IA Explorer is an Eclipse based RFP that uses bits of Eclipse bundled into it, and you do not need to install Eclipse separately. It requires approximately 60 meg of storage on your PC.

Normally, the first time you go into the explorer you would be presented with the configuration window which allows you to select the Preferences window by clicking on the green arrow to configure your connections.

Otherwise you will need to open the connections window. Click on **Window->Preferences**. Then select **Connections** on the left hand side.

In this window you would specify the address of the zOS system where your IA DB2 database resides, the TCP/IP Port Number, the Database Name (which is actually the DB2 Location ID from the DB2 startup job), your User ID, Password and IA DB2 Schema. You can leave the schema blank if you only have one database.

Die Preferences	
type filter text	Connections $(\Rightarrow \uparrow \Rightarrow \uparrow$
Connections General ⊕ Help WebSphere Studio Asset Analy	DB2 Location Server Address: Zserveros.dfw.ibm.com (DOMAIN) TCP/IP Port Number: 450
	Database Name: EOSDB203 (Location)
	Authentication User ID: TESTUSER
	Password: ••••••• Save password Saved passwords are stored on your computer in a file that is difficult, but not impossible, for an intruder to read.
	DB2 Settings Schema (Qualifier): CICSTSS Leave blank to default to first available
	Test Connection
<	Restore Defaults Apply
0	OK Cancel

You will need to type in your assigned User ID and password.

Since this step has already been configured for this lab exercise, you will be presented with the default perspective screen. A perspective contains a number of views where you can move views, resize them, drag and drop or maximize and minimize.

Views contain a list of all Regions, Transactions and Programs from data collected in CICS during runtime with IA collection for affinities or dependencies. For this exercise you will be looking at dependency data and data collected with batch scanners of the load libraries.

Initial Perspective view

CICS Interdependency Analyzer			_ 0 ×

Now you can try some basic navigation to get an understanding of the Explorer. At the end of **Exercise 1, you will reset back to the default view**. So have fun and play around with the views and do not worry about resetting. Actions on your part are included in check boxes.

Assume click is a left mouse click unless right is specified.

Menubar is on the top left with File as the first menu item.

- □ Click and hold on a vertical bar separating views until you see the move arrow ← →.
 Drag to the desired location. This is standard windows resizing as you would see in other PC applications.
- Click on **Window->Show Properties View**. You will see a new view at bottom center for Properties. Program data in this view comes from a scan of the load module.

Note: -> in the instructions indicates multiple actions after clicking on a selection, then hold down the mouse and move down to the desired sub-selection.

After changing your views, and you wish to go back to the **default**, in the menu bar that runs across the top of the perspective click on **Window->Reset Perspective**.

Exercise 2 - Finding Resources

In this section you will use the **Find Resources** bar to answer questions on the data collected in this environment. You will also use resource and region prefixes to narrow down the amount of data retrieved.

Is there any DB2 resource data collected?

□ Under the menubar on the top left and to the right of **Find Resource**, click on the **pull down button** \lor and then select **Table**. The bar will change to **Find Table**.

CICS Interdependency Analy	zer		_ P 🛛

View			
E Chatamant			

Click on the green arrow to the right which indicates **Run Search**. The **Resources** window should now contain one collapsed entry for 1 Table resource.

Click on the + to expand the resource tree to find out what tables are used.

What regions, programs and transactions use table, TABLE ()?

Note: Empty brackets () will appear in the Table Name when CICS IA cannot resolve the Table Name from the SYSIBM Table. This could be because the table is dynamic.

☐ Right click and highlight **Used by Programs**. Regions used are listed. There are 2 regions listed CICSACB6 and CICSACB7.

Select the **Used by program** option for the CICSACB6 region. This will populate a **Used by Program** window. In this you will see a 'bottom' up tree of the programs that use this table.

Programs Transactions		ed By 🛛	⇔ □ □		
in Region CAMA100C CAMA10C CAMA200C CAMA200C		ms using Table() in Region	:t .ed by		

How do you search for more specific resources?

- Click on the **Regions** button under the menubar and under Find Table from the previous step. You will see 3 regions with one of them named **IYCYZC44**.
- You will now look for all resources with a prefix of CA in region IYCYZC44. Under the menubar, use the pull down button ▼ to select Resources, enter CA in the ID box and IYCYZC44 in the region box. Select the green Run Search arrow. The Resources window should now have 45 resources in it. Click the + to expand these resources to see what their names are.

Only resources in region IYCYZC44 and starting with CA are displayed.

When the Resources window displays the results of a new search, you can quickly recall the results of previous searches by using the back \leftarrow and forward \leftarrow arrows. The criteria used for the search results shown are displayed at the top of the view under the menubar.

Exercise 3 - Inquire on resources by region

There is an alternative way of finding resources within the Explorer. In this task you will query for resources by using the **Region** window.

- □ Select the **Regions** window and limit your query to regions with a prefix of **CICS** by typing **CICS** in the box under the **Regions** tab, hit enter. You should now see 2 regions in the **Regions** view.
- □ Now show all resources used by region CICSACB6. Right click on CICSACB6 >Show Resources. You should now see 56 resources in the Resource view. They will be displayed in a 'collapsed' tree.
- □ Note there are 2 **File Resources** used by this region. Expand + the resource tree to see **FILEA**. Right click **FILEA->Used By Programs->CICSACB6**. The programs using **FILEA** will be listed in the **Used By** view at the bottom of the perspective.

□ Now look at **Resource Type (Program)**. There are 19 programs used in region **CICSACB6**. Expand + to see the **program names**.

Give CICS Interdependency Analyzer		_ 7 🔀
File Edit Search Window Help Find Resource with ID in Region 	9 # 1	
Queries Regions	□ Resources ↓⇒ ↓ <td< th=""><th></th></td<>	
CICSACB6		3y Resource

☐ To list these 19 programs in the **Programs** view, right click on region **CICSACB6**->**Programs Used**. The programs for region **CICSACB6** are now listed in the **Programs** view on the bottom left.

You can try the same with Transactions Used.

CICSACB	Show Resources Show Files Show Maps Show Temporary Storage Show Transient Data	
Programs	Programs used	Used By 🖾
*	Transactions used	(19)
CBKCMND CBKCSETF CBKC	T 	

Exercise 4 - Inquire on resources by program

In this exercise you will learn how to find resources that are used by programs.

□ With your program view listing all programs used in region CICSACB6, you can limit the list of programs for investigation with a prefix in the program bar. Replace the '*' in the **Program** view with **E**. You should see 4 programs.

What resources are used by program EHDRIVER in region CICSACB6?

Right click on program EHDRIVER->Uses Resources->CICSACB6.
You should see 9 resources in the Uses view on the top right and the bottom right hand
corner the flow for program EHDRIVER .

□ Now put an '*' back in the selection filter under **Programs**. Repeat the previous step for program **DRIVERP**. This program has a more extensive list of **Resources Used**.

□ Notice the execution tree in the bottom right view. Expand File in the Uses view and click on FILEA to select it. The execution tree changes to Programs using FILEA. You can move up and down the tree using the down arrow ↓ and up arrow ↓ buttons to view where the FILEA resource is used. Each time you click on the arrow it takes you to the next or previous use of FILEA, and highlights the resource selected for the tree. In this case, it is all the same program (WORKP) from multiple transactions.

☐ You can also check to see all the Transactions using FILEA in all regions. Right click on **FILEA** in the **Uses** view on the top right. Select **Used By Transactions->All Regions.**

The center bottom **Used By** view is populated with all accesses and the type of access.

le Edit Search Window Help

Exercise 5 - Inquire on resources by transaction (optional)

This section explores resource usage by transaction. It is similar to the previous section but starts with transactions rather than programs.

- Click on the **Transactions** view instead of Programs. This lists all transactions in all regions. The filter bars should be blank.
- Change the filter to transactions starting with VA. This limits the list down to 3.

What resources are used by transaction VA20 in region IYCYZC44?

- ☐ Right click on transaction VA20 and select Uses resources then select region IYCYZC44. You should now see in the Uses view has 22 resources used. You will also see in the bottom right hand corner the flow for transaction VA20.
- ☐ You can now look at the resources used by transaction **VA20** as you did in the previous exercise for programs. Experiment and select some of the other resources such as Map or TD queues.

Exercise 6 - Using the sample queries

In this exercise you will use Threadsafe queries to get you familiar with IA query capabilities.

- Click on the **Queries** window, expand the **CICS** entry and then expand the Threadsafe entry.
- Double click on **All Programs that issue a CWA ADDRESS**.
- □ Expand the EHDRIVERP, ADDRESS and CWA entries. Right click on CWA select Used by Transactions->All Regions. The Used by view will populate with all the transactions that issue the ADDRESS command.

You should now see the results on this query in the center view.

Double click on **CICS commands by TCB mode and program** in the queries view.

☐ Scroll down to the **WORKP** program and expand it. Then expand **Task Control Block**. Notice that there are 2 executions on the **QR TCB** for the **non-threadsafe TQ commands** and 2 executions on the **L8 TCB** for the threadsafe **DEQ/ENQ** commands.

e Edit Search Window Help		
Find Resource 🔻 with ID in Region	0 : 🗈	
Queries 🕀 Regions 👔 🖓 🗖	🖹 Resources 🛛 🗇 🎲 🕶 🗖	3+• Uses → 🗘 🗘 🖓
Migration Specific Specific Specific Specific Second and programs that issue an ADDRESS CWA Second and programs that issue an EXTRACT EXIT Sulf programs which may have threadsafe data integrity i Second and program Second and program	CICS commands by TCB mode and program (420)	Resources used By Resource

Exercise 7 - Using the sample queries for Migration (optional exercise)

This optional exercise will show help you understand changes when migrating from CICS TS 3.1 to CICS TS 3.2.

Expand Migration, and TS 3.1 to CICS TS 3.2.
This gives you a list of resources with APIs or SPIs have changed. The results of these
queries are the programs that contain these APIs or SPIs, and also a report on the
resource name and the APIs or SPIs themselves.

- Select the **FILE APIs new XRBA option** resource. Double click to run the query. It will now populate the **Resources** window and answer the following questions:
 - Which programs use FILE APIs?
 - Which SPIs are used within these programs?
 - What is the FILE name used by the WRITE command?

Exercise 8 – Creating your own Queries

In this exercise you will use an existing query to create 2 new queries. These queries will be used in exercise 9 to show the difference between the same program in threadsafe and non-threadsafe mode. You will use the Queries window to view a list of queries and folders. Folders can contain other folders and are a way of organizing and grouping queries. Queries are a definition of resources to be searched for and you define them using the Query Editor.

Click on the **Queries** view under Find Resources.

Expand the **CICS** folder and the **Threadsafe** folder.

□ Resize the **Queries** view so you can read the Query definitions. Click and hold on the vertical bar until you see the **move arrow** $\leftarrow \rightarrow$. Drag to the desired location.

Copy and Modify the query

□ Right click on the query **CICS commands by TCB mode and program->**Copy.

Selecting **Copy** copies the definition of the query to the clipboard, which you can paste into either the same folder or a different folder in the Query window. If you paste the clipboard contents into a text editor, you see the raw SQL strings that are run against the DB2 tables. This feature is useful for users who have their own way of executing SQL and collecting results.

☐ Right click on the **Threadsafe folder->Paste**. You should see a new query that says **Copy of CICS commands by TCB mode and program**.

□ Right click on the new query Copy of CICS commands by TCB mode and program and rename it to CICSACB6 CICS commands by TCB mode and program.

□ Right click on CICSACB6 CICS commands by TCB mode and program->Edit query.

🗟 Edit CICS Query		
Edit Query "CICSACB6 CICS comm Add, remove or change criteria for which re		
Name: CICSACB6 CICS commands by TCB	mode and program	

Background on the Query Editor

You can read this section for a detailed understanding of the Query Editor, or skip this section and go to the next check box on page 17 which will step you through the process.

The Query Editor is very flexible and allows you to create queries to show exactly what you want to see:

- Use a query to search for resources based on their criteria against a set of expressions.
- Create, delete, edit, execute, and view queries in the Query window menu.
- Name the query keeping to the naming guidelines using valid query and folder names.
- The Resources View displays the results of running a query.

You can specify two main criteria in a query: the parts of an interaction you want to see and the interactions you want to include.

The parts of an interaction to see

When you have selected the type of resource you want to query, you then choose the information you want to be shown in the tree structure of the resources view when the query has run.

To add a resource to the tree, use the green plus \ddagger button above the tree structure. To remove a resource, use the red cross \lessapprox button while the resource is selected. You can move up and down the tree using the down arrow \oiint and up arrow buttons.

Interactions to include

To further refine the query for the resources you have chosen, use the Filter results panel. You can create multiple expression filters and each resource is provided with a set of filter possibilities. To add filters use the green plus 4 button above the table of all expressions. To remove a filter, use the red cross the while the expression is selected.

Exercise 8 – Creating your own Queries (continued)

Add an interaction that you wish to see

Click on the **pull down button** ▼ to the right of the green plus [↓] button above the tree structure. Select **Region Applid** to add this resource to the tree.

○ Notice that **Region Applid** was added to the bottom of the tree and we would like it at the top. Click on **Region Applid** to highlight it, then move it up the tree using the **up arrow** ¹→ button. Click on the **up arrow** ¹→ button until **Region Applid** is at the **top**.

Add a couple of interactions you wish to use.

- As you just did previously in the Show view, click on the **pull down button** ▼ to the right of the green plus ↓ button in the Filter results view. Again select **Region Applid**.
- A new view will appear to the right. Type **CICSACB6** in the view under **Region Applid.** When you type in the filter qualifier, it is automatically added to the **Filter results** view.

🗟 Edit CICS Query			×
Edit Query "CICSACB6 CICS comm Add, remove or change criteria for which re			
Name: CICSACB6 CICS commands by TCB Show	Filter results	Region Applid is O is not CICSACB6	
😑 🗁 Resource Type			

Now repeat the previous 2 steps, but select **Program** expression instead of Region Applid.

Under **Program**, you need to add your choices for the expression filter. Type in **EHDRIVER**, and on the next line **EWHWORKP**.

Bedit CICS Query		
Edit Query "CICSACB6 CICS co Add, remove or change criteria for wh	mmands by TCB mode and program" ich resources to include or exclude	Bost

(>	
0		OK Cancel

Click the **OK** button to save your updated query.

Clone CICSACB6 commands by TCB mode and program for CICSACB7

□ Right click on the query CICSACB6 CICS commands by TCB mode and program, click on Copy.

□ Right click on the **Threadsafe** folder and click on **Paste**. You should see a new query that says **Copy of CICS commands by TCB mode and program**.

- □ Right click on the new query Copy of CICSACB6 CICS commands by TCB mode and program and rename it to CICSACB7 CICS commands by TCB mode and program.
- □ Right click on CICSACB7 CICS commands by TCB mode and program and click on Edit query.

Click on **Region Applid CICSACB6** in the Filters view.

- A new view will appear to the right. Change CICSACB6 in the view under Region Applid to CICSACB7.
- Click the **OK** button to save your updated query.

Exercise 9 – Comparing Query Results

In this exercise you will use the 2 new queries you created in Exercise 8 view the difference in running in threadsafe versus non-threadsafe for the same programs. CICSACB6 ran non-threadsafe and CICSACB7 ran threadsafe. ENQ/DEQ commands were wrapped around the Address CWA to run threadsafe in programs running in CICSACB7.

At this point you should have the queries view displayed with the Threadsafe Query list the various queries for threadsafe.

Double-click on the CICSACB6 CICS commands by TCB mode and program to run the query. The results with populate in the view. Expand CICSACB6. Notice the 2 programs you added to the query in Exercise 8. Expand both programs.

Program EWHWORKP has 1 command on the QR and EHDRIVER has 5 commands on the QR and 1 on the L8.

□ Now look at the same query for CICSACB7 by double-clicking on the CICSACB7 CICS commands by TCB mode and program. Expand both of the programs again.

In comparison to CICSACB6 you see program EWHWORKP has 2 commands running on the QR, 3 on the L8 and program EHDRIVER has 5 commands running on the QR.

Recall your previous search from **search history for CICSACB6** by using the back arrow.

Expand the results down to the command level and expand the **Address command** to see that it is an **Address CWA**.

Use the forward \Rightarrow arrow to move though the **query history stack** to get back to the **query for CICSACB7**.

Expand the results down to the command level and expand the **Address command** to see **Address CWA** and the **ENQ/DEQ**.

CICSACB7 shows the added ENQ/DEQ running on the L8 TCB since it is defined as threadsafe and EWHWORKP issues a DB2 select which puts the work over on the L8 TCB.

☐ At this point you may want to take a detailed look at program EHDRIVER since it is the initiating program. In the Programs view, right click on program EHDRIVER->all resources for CICSACB7. Note that the ENQ/DEQ shows in this view. Click on ADDR under the ENQNAME, the EWHWORKP program pops up in the by resources view. The tree view below titled Programs using ADDR shows EHDRIVER did an XCTL to EWHWORKP.

In this final step you will let the system do a compare for you.

Compare the results from your query history by clicking on the **Compare** toolbar button from the **Resources** view to open the **Compare search results** window.

dia Compare search results	×
Combine search results together	
Select results from search history to create combined re	sult
Show resources in	and not in
CICSACB6 CICS commands by TCB mode ar	CICSACB6 CICS commands by TCB mode ar
0	OK Cancel

☐ In the window to the left click on the **check box** for **CICSACB7 CICS commands**.....to **show resources in** that query, and the window to the right, click on **check box** for **CICSACB6 CICS commands**....to show resources that **are not in** the CICSACB6 query.

Click **OK** to run the compare.

Expand **CICSACB7** in the resources window to see the commands.

With the change for ENQ/DEQ and running in threadsafe mode you see the resource topology has changed. Note EWHWORKP shows 3 commands running on the L8.

You just used the Compare function for predefined queries. You can also use it to compare work across regions. For example, you could click on the Regions Tab next to queries, select all files for a region, then select another region and select all files for that region. Run a compare and get results as follows:

CICS Interdependency Analyzer File Edit Search Window Help			_ @ 🔀
Find Resource with ID in Region	 O :: □ Resources > ⇒ ♥ • □ □ 	3 He Uses	→
(3) CICSACB6 CICSACB7 IYCYZC44	Comparison of search results (1 In: {File for CICSACB6,} Not in: {File for CICSACB7,}) Resources used	By Resource

In this example you see that there is 1 file used in region 7 that is not used in 6.

This concludes the exercises for the CICS IA Explorer. Hopefully, you have discovered how easy it is to use the Explorer and how it can help you understand your resource relationships in CICS.

Exercise 10 – Review of Batch Threadsafe Report

This final exercise is a review of the Batch Threadsafe report. Excerpts from the Batch Threadsafe report follow. The first section is from the report for the transaction flow defined as Quasirent. The second is the same programs with the ENQ/DEQ added and the programs defined as threadsafe.

Take a few minutes to review the difference in the number of threadsafe commands and the workflow change with commands that moved from EHDRIVER to EWHWORKP.

Section 1 – Commands with programs defined as Quasirent

CICS INTERDEPEND	**************************************	.0		*****				**************************************

This concludes the report for the Quasirent execution of the workflow.

Section 2 – Commands with programs defined as Threadsafe

The following report is for the threadsafe execution of the workflow with the ENQ/DEQ added.
