Chapter 1. Foreword

Introduction

The purpose of this manual is to guide the administrator through the installation of the VisualAge Pacbase:

- Server components
- Client components,
- Communication environment.

Once the installation is completed, it is recommended to run the set of tests provided on the installation media.

You will also find in this manual a description of the operations to be performed for the installation of correction versions.

A number of Administration actions must be carried out online in the Administrator workbench in order to make operational a VisualAge Pacbase installation or re-installation. These actions are documented in the 'AD workbench User's Guide', chapter 'Prior Administration Actions'.

The procedures that migrate the Pacbase data to Rational Programming Patterns are documented in the "Migration" entry of the Rational Programming Patterns Knowledge Center.

VisualAge Pacbase Architecture

VisualAge Pacbase is used for the design, development and maintenance of graphical (GUI), textual (TUI) or web eBusiness applications, run in on-line or batch mode.

VisualAge Pacbase consists of:

- A server environment (TUI),
- A client environment (GUI).

These two environments communicate through an encapsulated middleware provided by IBM.

NOTE: The textual mode remains available for some functionalities.

You will find a detailed description of Server Components in chapter 'The Components' in this manual.

The Server environment

It consists of the following components:

- System elements: programs, files (online help included), and parameters.
- VA Pac Administration Database that contains user parameters and other parameters.
- one or more VA Pac Development Databases.

The Client environment

The client environment includes five separately installable components:

- Administrator & Developer workbench (also separately installable).
Developer workbench includes the following modules (each running independently):

- Batch,
- Dialog,
- eBusiness (includes three eBusiness Tools and Services Modeler),
- Services Modeler.

Each of these modules can be executed independently.

- eBusiness Tools:
 - Proxy Generator,
 - Location Editor,
 - Services Test Facility,
 - VisualAge Pacbase Connector,
 - VisualAge Pacbase Web Connection (Dialog Web Revamping Generator),
 - Web application models (WAM).
- VisualAge Pacbase WorkStation (Pacdesign, Pacbench)
- Web application models (WAM)
- Middleware

The communication functions enable the Server and Client environments to communicate via the main communication protocols on the market.

Contents of Supply

The contents of the supply vary according to the terms of your order:

- Installation guide,
- Program Directory (for SMP/E)
- Server installation CD-ROM,
- Client installation CD-ROM,

- Documentation CD-ROM.

Bibliography

- A number of administration actions must be carried out online in Administrator workbench in order to make a VisualAge Pacbase installation or re-installation operational. These actions are documented in the 'AD workbench User's Guide', chapter 'Prior Administration Actions'.
- The procedures, used by the Administrator for the Management of Databases and versions, and utilities provided, are documented in the Administrator's procedures Guide.
- For IBM sites, the installation of a Security System, to control user codes, passwords and access authorizations, is documented in the 'Installation of Server Components' chapter, 'Additional Installations' subchapter, and also in the Online Help of Administrator workbench.

Chapter 2. Prerequisites

Prerequisites for the Server Environment

Hardware and Software

Processor: z/OS 1.12.0 or next.

Installation media: CD-ROM drive.

Monitor: CICS Transaction Server 3.2 or next.

COBOL: COBOL Enterprise 3.4.

Disk Space

The total amount of space needed for the files depends on the size of applications managed by the system.

The following table indicates approximately the disk space necessary (in millions of bytes) to install the servers:

Disk space for the installation	Total	VSAM	Non VSAM
Total installation	300	210	90
Total System	240	175	65
Total user files for installation tests	60	35	25

Prerequisites for the Client Environment

Hardware

The hardware characteristics necessary to install VisualAge Pacbase client components are the following:

- Processor: Intel Pentium III 450 Mhz minimum or compatible processor.
- Monitor: graphic monitor (800x600) VGA or higher resolution (XGA or SVGA).
- CD-ROM drive.
- Card: adapted to the site network.
- Memory (RAM): 512 Mb (1 Gb advised).

Disk Space

Required disk space:

- 100 Mb for Administrator & Developer workbench

- 30 Mb for eBusiness Tools
- 85 Mb for the "IBM SDK for Java 2"
- 25 Mb for the Middleware
- 6 Mb for WAM
- 30 Mb for the VisualAge Pacbase WorkStation (with a Methodology included)

If "IBM SDK for Java 2" is not installed on your workstation, its installation is automatically started.

For an operational installation of AD workbench for example, the minimum disk space required is 215 Mb (100 Mb for AD workbench, 85 Mb for the "IBM SDK for Java 2" and 30 Mb for the Middleware).

Software

The VisualAge Pacbase client components require that a 32 bytes-Windows be installed on your workstation.

See also chapter 'Installation of Client Components', subchapter 'Things to Know Before Installing'.

Communications

To enable the communication between the workstation components and the servers in a MVS/CICS environment, the communication protocol must be: CPI-C and TCP-IP Socket.

Chapter 3. Installation of the Server Components

Parameterization

SMP/E context

VA Pacbase, DSMS and Pactables use common batch and online load modules.

These load-modules are supplied in the HBVP350 root FMID.

The components specific to VA Pacbase are supplied in the JBVP351 dependent FMID.

The components specific to DSMS are supplied in the JBVP352 dependent FMID.

The components specific to Pactables are supplied in the JBVP353 dependent FMID.

To install a dependent FMID, the HBVP350 root FMID must be simultaneously or previously installed.

If the HBVP350 root FMID is already installed, only the dependent JBVP35x FMID must be installed.

On the installation CD-ROM, the HBVP350 root FMID and the JBVP35x dependent FMID are systematically provided.

The RECEIVE, APPLY and ACCEPT JCLs, that are supplied, are to be used for a simultaneous installation of the two FMIDs. They must be adapted if the HBVP350 root FMID is already installed.

Preparation

The preparation to the installation process consists of three stages:

- Receiving the product with the SMP/E (System Modification Program/Extended) utility in dedicated PDSs.
This stage must be performed by the system staff who are accustomed to installing IBM products with SMP/E.
- Allocating a PDS file where all the installation and operation JCLs will be saved.
- Executing the installation JCL from the PDS members created during the first stage.

Remark in case of a previous SMP/E installation

The following SMP/E stage implies that the SMP/E context is empty for the product: either the product has never been installed with SMP/E, or the files related to SMP/E have been reinitialized for the previous version, or you want to create a new SMP/E environment for this version.

Otherwise, if you want to re-use the SMP/E files of the previous version, you can execute, before stage 1, the SMP/E utility described in the Appendix at the end of this manual.

Stage 1

Follow these steps to install the product from the installation CD-ROM:

1 - Download to Z/OS the sample JCLs provided on the CD-ROM.

On the CD-ROM, a file contains the sample JCLs: a JCL for the allocation of the compressed RELFILEs and SMPMCS files, as well as the SMP/E configuration and installation JCLs.

1.1 - Allocate first the receiving file on Z/OS, either by parameterizing the JCL presented here below, or by directly creating it with all the required characteristics (tsouid represents the TSO user code):

```
//ALL0C1 EXEC PGM=IEFBR14
/*
//FTPALLO DD DSN=tsouid.JBVP351.SAMPLE.JCL.BIN,
//           DISP=(NEW,CATLG,DELETE),
//           DSORG=PS,RECFM=FB,LRECL=80,BLKSIZE=6160,
//           SPACE=(TRK,(2,1)),UNIT=SYSALLDA
//           VOL=SER=&TVOL1
```

1.2 - Download the binary-formatted files provided on the CD-ROM to the Z/OS file already created.

To do so, perform an FTP transfer as follows:

1.2.1 - Copy the FTP sample command 'ftpini_model.scr' provided on the CD-ROM to a work directory of your workstation and name it 'ftpini.scr' ; then follow the instructions (contained in this file) concerning the parameters,

1.2.2 - Execute the FTP command -s:ftpini.scr from the work directory.

2 - Decompress the sample JCLs with the TSO command RECEIVE INDA('tsouid.JBVP351.SAMPLE.JCL.BIN').

This creates the tsouid.JBVP351.TMPJCLINST file with the following members:

- BVPALLOC
- BVPPACC
- BVPPAPP
- BVPPREC
- BVPXMIT
- BVP1DCSI
- BVP2ICSI
- BVP3ALLO
- BVP4DEFZ
- BVP5DDEF
- BVP6DDEF
- BVP7ALLO
- BVP8PDD
- BVP9PAL

3 - Download the compressed RELFILEs and the SMPMCS from the CD-ROM.

3.1 - Parameterize and submit the BVPALLOC JCL contained in tsouid.JBVP351.TMPJCLINST in order to allocate, on Z/OS, the files required for the download operations.

To do so, follow the instructions included in the JCL.

3.2 - Download the binary-formatted files provided on the CD-ROM to the Z/OS files.

To do so, perform an FTP transfer as follows:

3.2.1 - Copy the FTP sample command 'ftpput_model.scr' provided on the CD-ROM to a work directory of your workstation and name it 'ftpput.scr' ; then follow the instructions (contained in this file) concerning the parameters.

3.2.2 - Execute the FTP command -s:ftpput.scr from the work directory.

4 - Decompress the RELFILEs files on Z/OS.

To do so, parameterize and submit the BVPXMIT JCL contained in tsouid.JBVP351.TMPJCLINST

5 - You can then install the product with SMP/E using the JCLs contained in tsouid.JBVP351.TMPJCLINST.

If you install in a new environment, you will have to create the SMP/E environment and install the HBVP350 and JBVP351 FMIDs with the JCLs supplied.

This stage then consists of the following steps:

- Setting up the SMP/E environment and the 'Target zone' and 'Distribution zone' files of the HBVP350 root FMID:
 - Defining the SMP/E cluster libraries (BVP1DCSI)
 - Initializing the SMP/E libraries (BVP2ICSI)
 - Allocating the SMP/E work files (BVP3ALLO)
 - Assigning the FMID (BVP4DEFZ)
 - Creating the DDDEF entries for technical files (BVP5DDEF)
 - Defining the 'Target zone' and 'Distribution zone' files (BVP6DDEF)
 - Allocating the 'Target zone' and 'Distribution zone' files (BVP7ALLO)
- Implementing the 'Target zone' and 'Distribution zone' files of the JBVP351 dependent FMID:
 - Defining the 'Target zone' and 'Distribution zone' files (BVP8PDD)
 - Allocating the 'Target zone' and 'Distribution zone' files (BVP9PAL)
- Installing the components of the HBVP350 and JBVP351 FMIDs:
 - Execution of RECEIVE (BVPPREC)
 - Execution of APPLY (BVPPAPP)
 - Execution of ACCEPT (BVPPACC)

If you install in an environment where the HBVP350 FMID and a JBVP35x FMID are already installed, you just have to install the JBVP351 dependent FMID of VA Pacbase.

Then execute steps 3 and 4 once the necessary JCLs are downloaded as described in step 1 and modify the RECEIVE, APPLY and ACCEPT JCLs to remove the HBVP350 FMID from the impacted lines.

At the end of this first stage, all the components required for the installation are located in the following PDSs ; 'hlq' indicates the common prefix of the elements supplied (High-Level Qualifier):

- hlq.SBVPINST: all the 80-long files:
 - The error messages file (BVPAE)
 - The initial installation JCL (BVPPINIT)

- A file which contains the installation and operation JCLs and procedures (BVPPTTAL)
- The SMP/E sample JCLs.
- The BVPAMIAM file which contains the parameters of the MIAM procedure.
- hlq.SBVPPF2: PC and PE initialization files
- hlq.SBVPMBR8: batch load-modules (the BVPDS600 and BVPDS610 load-modules for the interface between VA Pacbase and DSMS 2.5 are provided in standard; if DSMS is to be used, you must adapt the DEXP procedure to use these new load-modules in place of PDS600 and PDS610, no longer compatible since VA Pacbase 3.0) ; moreover you must add the AN and AR files from VA Pac version Y04C onwards.
- hlq.SBVPMT8: online load-modules
- hlq.SBVPPF5: SA SG SN SP SR SS skeletons
- hlq.SBVPPF6: SC skeleton
- hlq.SBVPPF7: SF skeleton
- hlq.SBVPPF8: Administration Model and Development Model update files
- hlq.SBVPSRC: source files with a length of 80
- hlq.SBVPDIC: Dictionary complementary files

Stage 2

This stage is optional but recommended. It consists in allocating a PDS file with the following characteristics:

- Lrecl=80
- Size: around 100 tracks of a 3390 disk, 30 pads directory.

Stage 3

Stage 3 consists in copying the 'hlq.SBVPINST(BVPPINIT)' JCL to the PDS mentioned in stage 2, modifying its parameters to match the constraints of the site and executing it to obtain the complete installation and operation JCL.

The BVPPINIT JCL executes the BVPMMJCL program loaded into the hlq.SBVPMBR8 PDS.

It must be completed as follows:

- Fill in '&hlq' with the value of the 'hlq' parameter used in the SMP/E first stage.
- In the ' //SYSUT2 DD DSN=' field, enter the name of the file into which the complete JCL is to be loaded.

This file can be either a PDS member initially created to receive all the JCLs, or a sequential file selected by the user.

- Enter the parameters (see details in the next chapter).

The BVPMMJCL program execution must be saved: it can be used for a further re-installation.

Warning

The TEST and ADMIN users are automatically provided with their passwords in the Administration Database and are used in the provided JCLs.

The site administrator will have to delete these users after the product installation tests.

Execution JCL

```
//VAPACBAS JOB (---),'JCL INSTALLATION',CLASS=D,MSGCLASS=A

JCL Installation

The BVPMMJCL module reads the skeleton JCL file and produces an appropriate JCL, with commands which enable you to:

- Select portions of the skeleton JCL, which are called 'JCL modules',
- Parameterize the skeleton in order to obtain a JCL which requires a minimum of modifications to be operational,
- Add lines before and/or after the JCL modules to separate each one.

This step can be executed as many times as necessary to generate an appropriate JCL.

USER INPUT

Command	Parameters	Comments
==PRM	PPPP=pppp (1)	Parameter
==SELM	JCL1 JCL2	Selected JCL modules
==BEGMOD		Insertion of lines at the beginning of module
....1		Lines to be added before each module
....n		
==ENDMOD		Insertion of lines at the end of module
....1		Lines to be added after each module
....n		

(1) PPPP = parameter name, pppp = parameter value

Notes

- Lines ==PRM

You can add a comment but it must be preceded by a dot and it should not exceed column 72.

The default values are only examples. You must therefore enter values adapted to your site.

- Lines ==SELM

These lines can be used to select modules.

Since the standard installation provides all the modules, this line is not used.

- Lines ==BEGMOD

./ ADD NAME=\$ZMODUL

As a result, a line is inserted before each JCL module, in the form:

./ ADD NAME=<JCL-module>

RESULT: the complete JCL

The file obtained in SYSUT2 contains all the installation and operation JCLs. This file must be open with an editor to launch the installation process.

Two operations must be performed on the complete JCL:

1. Overall modifications (if necessary)

Adaptations can be performed on all the JCLs.

The VSAM catalogs appear as comments in the JCL obtained after the installation:

- In the DELETE/DEFINE*/
- In the JCL STEPCATs
- In the declarations of the procedures' parameters

When these parameters are not required on the site, the resulting JCL can remain as it is.

When these parameters are required on the site, the relevant lines should be changed into command lines. To do so, you must:

- Transform all '/*:' into '//' ,
- And then replace '/*:' and '*/' with blanks.

Caution: SMS

- In the installation jobs which include the 'GenerationDataGroup' allocation, you must delete the lines DD //GDGMOD from the definition IDCAMS.
- If the UNIT and VOL parameters cannot be used on the site, you can delete them in the whole JCL via an exclude command (EXCLUDE command in TSO/EDIT).

It is usually recommended to perform any other overall modifications on the JCLs before splitting these JCLs.

Caution: LSR

JCLs are standardly provided with the LSR option for the optimization of the batch access to VSAM files.

If the LSR option is not implemented on the site, you must replace the following lines in the procedures:

```
//xxLSR DD DSN=&INDxx..file,DISP=SHR  
//PACxx DD SUBSYS=(&LSR,'DDNAME=xxLSR','BUFND=10','BUFNI=10'
```

with a line:

```
//PACxx DD DSN=&INDxx..file,DISP=SHR.
```

2. JCL splitting

Before each module of a standard complete JCL, there is a ./ ADD NAME=<JCL-module> line, where <JCL-module> is the code of the ==MOD line found (see the following table of JCL modules).

This allows the complete JCL to be split into as many members as JCL modules in a PDS. The complete JCL file is to be used as SYSIN in the PDS update utility: IEBUPDTE.

Note: Because of this default option, all './' characters found in JCL modules containing IEBUPDTE were replaced with ':/'.

Once the JCL is split, the replacement must be performed the other way round before executing jobs which contain IEBUPDTE.

REPORT

BVPMMJCL produces a list for each JCL module created, with the parameters taken into account and according to the variants requested.

Note:

Since the parameters of the skeleton JCL are formatted as \$xxxx, if BVPMMJCL encounters, upon execution, a \$ character which does not correspond to a defined parameter, it sends error messages such as: 'Unknown symbolic parameter' or 'Invalid position or length' or 'Syntax error in symbolic parameter'.

These messages do not stop the execution and should be ignored: they apply to '\$' characters present in the flow processed by BVPMMJCL but which are NOT parameters.

List of JCLs

Table of installation JCLs

Member	Contents	Procedure
	System and Administration Database installation	
D00CSD	CICS update: components	
D01ALLOC	Allocation of parameters PDSs	
D02CPAR	Loading of common parameters	
D03DEFIN	VSAM common file definition	
D03GDG	Definition of GDG for parameter backup

JCL Parameters

Syntax

====PRM PPPP=pppp .Comments

- Parameter values which contain special characters must be entered with simple quotes.
- Comments on ===PRM lines must not exceed the column 72
They must be preceded by a dot ('.').

Note: When the default or '<>' values are filled in, the parameter must be set.

Table of parameters

Parameter	Meaning	Default
	JOB lines:	
PRFJ	Jobname prefix (maximum: 5 characters)	BVPJ
CCPT	Job accounting code	<>
CLASSJ	Job execution class	1
MSGCL	JCL output class	A
INDSV	VA Pac VSAM system (maximum: 24 characters)	'EXP.BVP3V'
INDSVE	Endevor VSAM system (maximum: 24 characters)	'EXP.BVP3VE'
INDSN	VA Pac Non-VSAM system (SAM,PDS) (maximum: 24 characters)	'EXP.BVP3N'
INDSNE	Endevor Non-VSAM system (SAM,PDS) (maximum: 24 characters)	'EXP.BVP3NE'
INDUV	VSAM user (maximum: 24 characters)	'UTI.BVP3V'
INDUN	Non VSAM user (SAM) (Maximum: 24 characters)	'UTI.BVP3N'
BASE	Development Database code (it is automatically loaded in the development transaction code field)	BASE
OUT	SYSOUT print class	H
UWK	UNIT of work files used	SYSDA
UNITSN	UNIT of non-VSAM system files	SYSDA
UNITUN	UNIT of NON VSAM user files	SYSDA
VOLSN	VOL=SER of NON-VSAM files	

Parameter	Meaning	Default
VOLSV	VOL=SER of VSAM system files (6)	
VOLUN	VOL=SER of NON-VSAM user file	
VOLUV	VOL=SER of VSAM user files (6)	
VCAT	VSAM catalog of the Development Database (user files)	
SCAT	VSAM system catalog (System files)	
LSK	Skeleton language (1)	A
DSCB	DSNAME of DSCB model file used for files at generation	'BVP.DSCB'
BIBP	DSNAME of the procedure library	'SYS1.PROCLIB'
HLQ	Common prefix of elements delivered with SMP/E (maximum 30 characters)	'HLQ'
BIBT	DSNAME of sort library (SORTLIB)	'SYS1.SORTLIB'
BCOB	DSNAME of COBOL routine library	'SYS1.SCEERUN'
	Update of CICS CDS	
LDLIB	Endevor load-lib (authorized Lib.)	'NDVR.LOADLIB'
CONLIB	Endevor CONLIB	'NDVR.CONLIB'
MSGLIB	Endevor MSGLIB	'NDVR.MSGLIB'
MSGSX	Endevor messages Suffix	'50'
MSGSXH	Endevor messages Suffix, in hexa.	'F5F0'
CSDL	DFHCSDUP STEPLIB DSN	'CICS410.SDFHLOAD'
DFHCSD	CSD name for update	'BVP.DFHCS'
DFHEXC	EXCI modules PDS (4) (5)	'BVP.DFHEXC'
	CSD input group	
GROUE	EXCI (4)	BVPGR
GROUP	Programs	BVPGR
GROUF	Files	BVPGR
GROUT	Transactions	BVPGR
LIST	List containing CICS groups	<>
	Pactables	
TABTDF	Table description file DSN	TD300
	DSMS module (2)	
DSMS	Development Database-element file name (2)	NULLFILE
	EXCI (4)	

Parameter	Meaning	Default
EXCN	EXCI connection (4)	BVPC
EXSS	EXCI session (4)	BVPS
EXPF	Prefix of EXCI virtual terminal (4)	EX
	Transactions	
CSOC	SOCKET transaction code (3)	DBSS
CPIC	CPIC transaction code (3)	DBST

(1) A = English, F = French

(2) These files DSNs should be replaced with those installed on site only if the Tables or DSMS modules are installed or if you want to change the default name.

(3) These transaction codes are related to the use of Administrator and Developer workbench. One of them is used to access the communication monitor for a TCP-IP Sockets protocol, the other is used to access the communication monitor for a CPI-C protocol. This code must be indicated in the installation parameters of the client environment.

(4) These parameters must be replaced with those installed on site if the SCM module is used.

(5) If SCM is used, the asterisk (which indicates a comment) must be removed from the line which contains the DFHEXC parameter, in the STEPLIB of the PAC step, in the GPRC, GPRP, GPRT and GPRU procedures.

(6) Required parameter, even under SMS.

Sepators of JCL Modules

Lines before and after JCL modules

```
==BEGMOD
....1    )
.....   ) Lines to be inserted before each JCL module
....n    )
==ENDMOD
....1    )
.....   ) Lines to be inserted after each JCL module
....n    )
```

Lines may be inserted as input to BVPMMJCL if the default option is not appropriate (see the installation default values presented above).

The purpose of these lines is to split the JCL file created by the BVPMMCL utility into as many members as JCL modules.

This utility adds1 ton lines in front of each JCL module and1 ton lines to the end of each JCL module.

System Installation

CICS CSD Update

System components

D00CSD module: '\$prfj.D0' job

BVP: SMP/E root, prefix of the Administration Database, batch and on-line load-modules and procedures files.

Files	Comments
BVPAE	Error messages - on-line documentation
BVPGU	User codes / keywords
BVPGN	Administration Database, index file
BVPGR	Administration Database, data file
BVPGJ	Administration Database, transaction file
BVPGY	Administration Database, bulk data
BVPGK	Work file
BVPLB	Job follow-up file
BVPPA	PAF work file
BVPQJ	SCM work file
BVPTR	A&D workbench work file
BVPWS	A&D workbench working file

Programs

BVPQnnn, BVPPnnn, BVRnnn, BVPSnnn and a few specific programs prefixed with BVP.

Note: The 'Dynamic Backout' option (JNLSYNCWrite and RECOVery) is required for GN, GR, GJ, and GY files.

Addition of programs under CICS

It is required to add, in 'DFHRPL', the DD line of the VA Pac online programs library.

For more details on the declaration of programs, refer to the 'Efficiency enhancement' subchapter in the Appendix of this manual.

Uppercase and lowercase management

The VA Pacbase manages the input character as follows:

- All the codes entered in lowercase are automatically transformed into uppercase,
- All entity names, as well as texts, remain in lowercase. Implicit keywords drawn from entity names are changed into uppercase words.

In order to inhibit the lowercase to uppercase switch, the letter 'X' should be entered in the ACTION CODE field.

This case management is provided by the BVPUTC program.

To work in uppercase letters only, you just have to replace the BVPUTC program with the BVPUTCX program.

Execution JCL

```

Loading of Procedures

It is recommended that all operation procedures be cataloged in one procedures library:

- Either in a reserved PROCLIB: in this case, execute the allocation job first, and then the loading job.
 - Or in an existing PROCLIB: in this case, execute the loading job straight away.

D05IPROC module: '\$prfj.D5I' job

Allocation of a reserved library (optional)

D05PROC module: '\$prfj.D5P' job

Loading of procedures

This job includes an IEBUPDTE step, which creates one member for each procedure.

Caution:

Replace all :/ with ./ before submitting the job.

Each member is coded 'BVPNNNN', where NNNN is the standard name of the procedure.

Procedures are detailed in the 'Administrator's Procedures' manual or in the 'Developer's Procedures' manual, except for the Database retrieval procedures, which are described in this manual.

Loading of Error messages and online help

D07AE0 module: '\$prfj.D7' job

This JCL defines, and then loads the AE error messages file.

It must be executed every time a version is re-installed.

To take one or more languages into account, you must add as many parameter lines which contain the two-characters language code in position 3.

To take all the available languages into account, you must enter a parameter line which contains '**' in position 3.

The AE file must be closed in on-line mode.

Step	Program	Comments
INPUT	BVPTU001	Recognition of the language parameter

Step	Program	Comments
DELDEF	IDCAMS	DELETE DEFINE of AE
PTUCAE	BVPTUCAE	Loading of AE

Execution JCL

```
//$PRFJ.D7 JOB ($CCPT),'PAC D07AE0',CLASS=$CLASSJ,
// MSGCLASS=$MSGCL

Installation of the Administration Database

Users File Initialization

D08INGU module: '\$prfj.D8' job

This JCL should be submitted upon the first installation only.

It defines and then loads the GU file with the 'TEST' and 'ADMIN' user codes. These user codes will be used to activate the keys and to execute the test JCLs.

Note:

For a re-installation on a version higher than or equal to 3.0, if you want to restore the Administration Database of the previous version, you will first have to retrieve the GU file which corresponds to the PE backup.

Step	Program	Comments
STEP1	IDCAMS	DELETE DEFINE of GU
STEP2	PTUIGU	creation of data

Execution JCL

```

Loading of the Administration Database

D08RSAD module: '\$prfj.D8B' job

This JCL must be submitted upon the first installation only.

It runs the RSAD procedure in order to restore the Administration Database with the backup file created in the previous '\$prfj.D8A' job.

Note

If you have a Database of a previous version, consult the chapter dedicated to the retrieval of user parameters.

Caution

To use VisualAge Pacbase, you need an access key. At the end of this step, an evaluation key is installed, but this key only allows the execution of some procedures, in particular the installation procedures.

This access key must be updated via Administrator workbench, to allow an unrestricted access to VA Pacbase.

Execution JCL

```

//$PRFJ.D8B JOB ($CCPT),'PAC D08RSAD',CLASS=$CLASSJ,
// MSGCLASS=$MSGCL
// JCLLIB ORDER=($BIBP)
//*****                                                 *
//** VISUALAGE PACBASE                               *
//**                                                 * 
//**           INSTALLATION - D08RSAD               *
//**                                                 * 

```

```

/** CREATION OF THE TEST DATABASE ADMINISTRATOR      *
/** INDICATE THE LANGUAGE CODE OF THE SITE ON Y LINE COL 10-11      *

//**           - INITIALIZATION OF SYSTEM FILE QJ -
//**                                         *
//**           EXECUTE THIS JOB ONLY FOR FIRST INSTALLATION >= V300  *
//**                                         *
//*****                                         *****
//INQJ     EXEC BVPINQJ

```

Loading of the Administration Model

D08XMET module: '\$prfj.8X' job

This JCL must be submitted upon the first installation and upon each re-installation.

It is used to run the VING procedure and to install the administration model.

Execution JCL

```

//$PRFJ.8X  JOB ($CCPT),'PAC D08XMET',CLASS=$CLASSJ,
// MSGCLASS=$MSGCL
// JCLLIB ORDER=($BIBP)
//*****                                         *****
//** VISUALAGE PACBASE                         *

```

```

/*
/*      - ADMINISTRATION DATABASE -
/*
    MODEL INSTALLATION
/*
    INDICATE THE FILE NECESSARY FOR ROAD PROCEDURE
//*****
//VING EXEC BVPVING,FDIC='$HLQ..SBVPPF8(BVPMETAD)',
//          USER=ADMIN
*ADMIN   ADMIN   ***      VINSI
/*
//VINS.PAC7MR DD DSN=ROADFILE

```

Access Key Input

This step is performed with Administrator workbench and consists in executing the following operations:

- Entering the access key,
- Defining generation targets,
- Activating the key.

These operations are presented in the 'AD workbench User's Guide', 'Prior administration actions' chapter. They are detailed in the Online Help of Administrator workbench.

Backup of the Administration Database

Performing this step is recommended since it prevents you from having to enter the key again in case of a problem.

List of components with their dates of creation

D99INSL module: '\$prfj.D99' job

This job prints the following lists:

- A list of batch and on-line programs, with their generation characteristics,
- A list of permanent system files AE ,SA, SC, SG, SR, SS, SN, SP and SF with the date of their creation.

In case of system operation problem, these lists should be printed in order to communicate to the VisualAge Pacbase Support all the installation references.

This job also executes the INSL procedure.

Meaning of return code:

Return code	label
6	Load-module not found in the library
A	Not standard

Execution JCL

```
//$PRFJ.D99 JOB ($CCPT),'PAC D99INSL',CLASS=$CLASSJ,  
// MSGCLASS=$MSGCL  
// JCLLIB ORDER=($BIBP)  
//*****  
//** VISUALAGE PACBASE *  
//** *  
//**           INSTALLATION - D99INSL *  
//** THE FOLLOWING JOB PROVIDES THE LIST OF PROGRAMS *  
//** AND SYSTEM FILES INSTALLED ON THE SITE. *  
//*****  
//INSL EXEC BVPINSL  
/*
```

Additional Installations

CICS Complements for Sockets

To use sockets (specific to CICS), you must install a CICS listener which does not standardly include an authentication system. The security system performs the control via the BVPCICSE security user-exit provided by SMP/E in the hlq.SBVPMTR8 PDS.

The BVPCICSE user-exit must be declared in the CSD with the 'EXECKEY(CICS)' clause (see the D00CSD installation JCL) in the following way:

In CICS, enter the 'EZAC AL' command:

```
EZAC,ALTER  
ENTER ONE OF THE FOLLOWING  
CICS      ==>          Enter Yes!No  
LISTENER ==> Y          Enter Yes!No
```

Select the listener and enter:

```
EZAC,ALTER,LISTENER  
ENTER ALL FIELDS  
APPLID      ==> A6ECCSXP    APPLID of CICS System  
NAME        ==> CSKL       TRANSACTION NAME OF LISTENER
```

The following screen is then displayed. You must indicate the code of the user-exit:

```
EZAC,ALTER,LISTENER  
OVERTYPE TO ENTER  
APPLID      ==> A6ECCSXP    APPLID of CICS System  
TRANID      ==> CSKL       Transaction Name of Listener  
PORT        ==> 09957     Port Number of Listener
```

IMMEDIATE	====> YES	Immediate Startup Yes!No
BACKLOG	====> 040	Backlog Value for Listener
NUMSOCK	====> 100	Number of Sockets in Listener
MINMSGL	====> 004	Minimum Message Length
ACCTIME	====> 030	Timeout Value for ACCEPT
GIVTIME	====> 010	Timeout Value for GIVESOCKE
REATIME	====> 300	Timeout Value for READ
FASTRD	====> YES	Read Immediately Yes!No
TRANTRN	====> YES	Translate TRNID Yes!No
TRANUSR	====> YES	Translate User Data Yes!No
SECEXIT	====> BVPCICSE	Name of Security Exit
WLM groups	====> CICSSEXP	====>

Utility to purge work files

The JCLPURGE JCL is provided in standard.

Its purpose is to purge the WS workstation work file (its size is 150 cylinders, to allow voluminous requests), the PA PAF work file, and the LB job execution report file.

It is recommended to execute this JCL daily or to insert it in the CICS startup to prevent a possible problem in online mode.

SQL sources for access to DB2 catalog

With the B.....GN... choice, the system generates the SQL and calls the SQL update module: BVPRS12.

The BVPRS12 SQL update load-module is automatically provided by SMP/E in the hlq.SBVPSRC PDS. It just allows the online use but does not perform updates.

To benefit from the update functions, you must download the BVPRS12 source from the VisualAge Pacbase Support: <http://www.ibm.com/software/awdtools/vapacbase/support.htm>. You must adapt it and install it as any standard DB2 program:

- Pre-processor preparation, resulting in a COBOL source and a DBRM (same name as the COBOL source).
- Compilation and link-edit of the COBOL source, resulting in an executable program (BVPRS12).

The plan is built with the DBRM, using the TSO DB2I application (this being the BIND operation).

The CICS RCT table is updated with the development Database transaction code and the code of the plan previously built.

Special authorizations

The TSO userid used for the BIND must allow for the consultation of the following catalog tables:

- SYSIBM.SYSDATABASE
- SYSIBM.SYSTABLESPACE
- SYSIBM.SYSTABLES
- SYSIBM.SYSCOLUMNS

Notes:

- Updates are performed via SQL dynamic statements.
- DB2 tables or views which are accessed or updated are not qualified, i.e. the user's CICS Userid will implicitly qualify the DB2 object's name.

CICS Complements for EXCI

This step is to be executed only on the sites which use SCM.

You will have to check that the EXCI interface for the communication with the CICS system is operational.

If this is not the case, you will have to make sure that the CICS is started with the ISC=YES option and you will have to define a "SESSION/CONNECTION" set by executing the EC00CSD JCL as follows:

Execution JCL

```
//$PRFJ.E0 JOB ('$CCPT'),'SYSTEM DFHCEXCI',CLASS=$CLASSJ,  
//      MSGCLASS=$MSGCL  
//*****  
//** VISUALAGE PACBASE *  
//** *  
//**           INSTALLATION - CICSCSD *  
//**             EXCI: CSD BATCH UPDATE SYSTEM *  
//*****  
//DFHCSDUP EXEC PGM=DFHCSDUP  
//STEPLIB  DD DSN=$CSDL,DISP=SHR  
//SYSPRINT DD SYSOUT=$OUT  
//DFHCSD   DD DSN=$DFHCSD,DISP=SHR  
//SYSIN    DD *  
*****

*****
ADD GROUP($GROUE) LIST($LIST)

```

Security Systems Interface

Introduction

Security systems provide a mechanism for data access control. They perform user identification and verification, and they control resource access authorizations.

The Security System Interface is designed to ensure the communication of these controls between the security system installed on site and VA Pac.

In order to ensure a standardized control for all security systems, VA Pac is not directly interfaced with the security system, but with SAF (System Authorization Facility), via the RACROUTE macro-instructions for RACF or the TSS macro-instructions for TOPSECRET.

To enable the communication between the security system and VA Pac, two types of operations are required: the first ones must be performed in the Administrator workbench module, and the others in the security system.

- From the Administrator workbench module

You must change the access key, define the type of security system used (RACF or TOPSECRET) and the class in which VA Pac logical resources are defined.

For more information, consult the Administrator & Developer workbench User's Guide , Chapter "Prior Administration Actions ", and the online help of Administrator workbench, on the "Access Key" and "Security" browsers.

- From the security system

You must perform the following operations:

- create a RACF or TOPSECRET resource class in accordance with the security system chosen.

To allow the security system to work properly, all the VA Pac logical resources are associated with a RACF or TOPSECRET class.

The VA Pac logical resources correspond to all the possible access authorizations for each library.

- create resources in RACF or TOPSECRET.

This operation consists in defining, in the RACF or TOPSECRET tables, the access authorizations to the VA Pac libraries if you want a complete control of resources from RACF or TOPSECRET.

- specify the user access authorizations to the resources either by using commands, or by installing sub-programs.

Implementation for RACF

- Operating mode of the RACF interface in online mode:

- In 'dumb' terminal mode, the following processing is performed:

Retrieval of the CICS login user code via an 'EXEC CICS ASSIGN' and display of this user code on the VisualAge Pacbase login screen.

If the user can connect with a user code other than that used for the CICS login, the User and Password fields become input fields. The existence of the 'User/Password' is checked in RACF tables as soon as the user code entered differs from that of the CICS login.

For a login via the workbench, the existence of the 'User/password' is checked in RACF tables.

Possible error messages:

9127 Unknown user (unknown to RACF)

9128 Wrong password

9129 Revoked user

9126 Security system: connection problem (any other error on the 'User/password' check)

- Operating mode of the RACF interface in batch mode:

The following processing is performed:

1) Retrieval of the TSO system login user code, and checking, in the Administration Database, that this code is authorized to submit the procedure.

Possible error if the user is not authorized:

8296 User not authorized for this procedure

2) For each '*' line:

- If the user code is entered (different from blank), the BVPSECUR batch RACF sub-program (declared in the system via a SVC service) checks the validity of the 'User/password' in this '*' line.

Possible errors:

9127 Unknown user (unknown to RACF)

9128 Wrong password

9129 Revoked user

9126 Security system: connection problem (any other error on the 'User/password' check)

- If the user code on the '*' line is set to 'blank', the user code of the TSO login is retrieved, and there is no RACF check on the 'User/password'.
- 3) For the procedures where a library code is specified on the '*' line (GPRT, EXTR, UPDT ...), the user/resource VA Pac authorizations on the library are checked.

Possible error if the user is not authorized:

2546 Unauthorized access to this library

There are always two control levels:

- the VA Pac user is the user of the system (RACF)
- the resources (Library-Authorization level) are managed in RACF.

Creation of resources

Resources are created with the 'RDEFINE' procedure.

Definition of resources

- Definition of the resource class

The resource class is defined via the ICHERCDE and ICHRFRTB macros:

```
cccc ICHERCDE CLASS=cccc, ID=128, MAXLNTH=4, FIRST=ALPHANUM,  
OTHER=ANY, POSIT=25, OPER=NO
```

```
cccc ICHRFRTB CLASS=cccc,ACTION=RACF
```

with cccc as the code of the RACF resource class dedicated to VA Pac.

- Definition of the access authorizations to the resources

These authorizations must be assigned using PERMIT as follows:

```
PERMIT 4$P CLASS(cccc) ID(user) ACCESS(ALTER) for VA Pac  
Administrators
```

PERMIT nLLL CLASS(cccc) ID(user) ACCESS(ALTER), n varies from 0 to 3 and corresponds to the VA Pac authorization level on the LLL library.

Online mode requests

In online mode, a command allows to execute a RACF request to determine the user access authorizations to the resources ('EXEC QUERY SECURITY' in the BVPRAF control sub-program).

Batch requests

Contrary to the online mode, there is no command you could use to execute a RACF request: therefore, you must execute the RACF request via an assembler sub-program.

This BVPSECUR sub-program is provided by SMP/E in the hlq.SBVPMBR8 PDS.

Moreover, you must install an SVC in the LPA library.

To do so, you must:

1. Declare the SVC with the appropriate routine number.

Example for number 232: in SYS1.PARMLIB(IEASVC00), add the line
SVCPARM 232,REPLACE,TYPE(3),EPNAME(IGC0023B) where IGC0023B is
the name of the SVC load module.

2. Link the BVPSECUR object module to create the name of the load
module.
3. Add this load module name in the SVC load system library.
4. ZAP the BVPSECB VA Pac module with the chosen SVC routine number.
5. After the LPA library update, you must execute an IPL CLPA to take the
modifications into account.

The E10RACF sample JCL, that is supplied with the installation JCLs,
performs steps 2 and 3, and the E11RACF JCL executes step 4.

Then, you must check whether the user is authorized to run the procedure.
In case of a multi-user procedure (UPDT for instance), each identification
line triggers the control of the user's authorization on the library.

Implementation for TOPSECRET

The sources of the sub-programs (assembler) which allow the access to the
TOPSECRET tables are supplied by SMP/E in the hlq.SBVPSRC PDS and
must be compiled.

COMPILEATION OF THE ACCESS SUB-PROGRAMS

For the compilation of BVPTSS and BVPTSSC, the "OPMAT" TSS library must
be specified in the SYSLIB line of the Assembler compilation program.

BVPTSSC is a CICS program. It must be translated before being compiled and
link-edited.

BVPTSSC and the TSSCAI program (Computer Associates) must be declared
in the CICS CDS. They must be loaded in one of the DFHRPL's load-module
library .

CREATION OF RESOURCES

TSS ADD(dept-name) cccc(nlib) cccc(nlib) ...

dept-name = department name

n = authorization level

lib = Library code

cccc = Resource class

EXAMPLE

Let a Database, with two Libraries BI1 and BI2. The resource class will be, for access authorizations to Libraries:

4BI1 3BI1 2BI1 1BI1 0BI1 4BI2 3BI2 2BI2 1BI2 0BI2

Note: there is no difference between the global authorization and the database authorization, for this latter does not exist in the Security System Interface.

The resources corresponding to the general access authorization must be defined with a special Library code \$\$\$:

4\$\$\$ 3\$\$\$ 2\$\$\$ 1\$\$\$ 0\$\$\$

Since '*' is the generic character for the security system, the Inter-Library '***' mode must be coded as 'FFF' (or '###' depending on the keyboard used).

There is another special library code \$P, which is used to declare an administrator.

DEFINITION OF RESOURCES

- Definition of the resource class

SS ADD (RDT) RESCLASS(cccc) RESCODE(xx)

cccc = code of the resource class which corresponds to VA Pac

xx = hexadecimal code indicating the type of resource

- Definition of access authorizations

TSS PERMIT(user-code) cccc(nlib)

TSS PERMIT(user-code) cccc(nlib)

VA Pacbase/Endeavor TSO interface

Warning

The system preparation, installation and operation use some standard functions of the operating system and of VSAM. The user is entirely responsible for any adaptation which modifies the parameters entered upon installation (described in chapter 3).

In particular, all modifications on JCLs and executable modules' names etc., must be performed with caution. This kind of modifications often causes abnormal conditions which are sometimes difficult to detect.

In case of an incident during the execution of an installation phase, the phase must be started again from the beginning without any JCL modification of the specific JOBS.

Allocation of processors to the PROCESSOR GROUP

Reminder: The VA Pacbase Endevor system is constituted of two types of elements:

- 'VA Pac' type: All VA Pac entities (compilable or not) are stored in Endevor Types called 'VA Pac' types. Several 'VA Pac' types can be created.
- 'INFOPAC' type: Each VA Pac type element is associated with an 'INFOPAC' type, which is in its turn associated with this 'VA Pac' type. The 'INFOPAC' type is transparent to the user. It cannot be modified, except on some specified processors.

Three PROCESSOR GROUPs must be defined for the VA Pacbase Endevor system.

Two of these PROCESSOR GROUPs are allocated to each 'VA Pac' type and one is allocated to each 'INFOPAC' type.

These PROCESSOR GROUPs must be defined in the following way:

- Non-compilable VA Pac entities ('VA Pac' type)
 - PROCESSOR GROUP: (user-defined name)
 - GENERATE PROCESSOR: (5)
 - DELETE PROCESSOR: (2)
 - MOVE PROCESSOR: (3)
- Compilable VA Pac entities ('VA Pac' type)
 - PROCESSOR GROUP: (user-defined name)
 - GENERATE PROCESSOR: (1)
 - DELETE PROCESSOR: (2)
 - MOVE PROCESSOR: (3)
- Compilable or non-compilable VA Pac entities ('INFOPAC' type)
 - PROCESSOR GROUP: (user-defined name)
 - GENERATE PROCESSOR: (4)
 - DELETE PROCESSOR: *NOPROC*
 - MOVE PROCESSOR: *NOPROC*

Where:

(1): 'PRCSGENP' member of the 'BVPSY' parameters PDS.

This processor compiles and link-edits the generated VA Pac entity, and creates its FOOTPRINT.

Note: This JCL must be adapted to the site standards before it is installed in the Endevor system; in particular the LOADTEST parameter must correspond to the user load-modules library.

(2): 'PRCSDEL' member of the 'BVPSY' parameters PDS.

This processor executes the DELETE action on the INFOPAC type associated with the VA Pac type (See the 'TYND' batch procedure). It also communicates to EXIT3 the VA Pac data of the element to be deleted. This data is contained in its homonym, but whose type is INFOPAC. EXIT3 then relates this data to the data of the Endevor context and prepares the VA Pac Database update transactions.

(3): 'PRCSMOVP' member of the 'BVPSY' parameters PDS.

This processor executes the MOVE action on the INFOPAC type associated with the VA Pac type: it transfers it from STAGE 1 to STAGE 2 (See 'TYND' batch procedure). It also communicates to EXIT3 the VA Pac data of the element to be transferred. This data is contained in its homonym, but whose type is INFOPAC. EXIT3 then relates this data to the data of the Endevor context and prepares VA Pac Database update transactions.

(4): 'PRCSGENI' member of the 'BVPSY' parameters PDS.

This processor executes the ADD action on the INFOPAC type associated with the VA Pac type. IT also modifies the compiled load module FOOTPRINT (when the entity is compilable) in order to allocate the FOOTPRINT of the current INFOPAC to it. It finally communicates to EXIT3 the VA Pac data of the element to be transferred. This data is contained in its homonym, but whose type is INFOPAC. EXIT3 then relates this data to the data of the Endevor context and prepares VA Pac Database update transactions.

Note: The LOADTEST parameter must correspond to the user load-modules library.

(5): 'PRCSGEPP' member of the 'BVPSY' parameters PDS.

This 'GENERATE' type processor is only used for the 'TRANSFER' action of a non-compilable VA Pac element. It generates and executes the 'TRANSFER' action of the 'INFOPAC' element.

Important: All these processors can be used without modification. They can also be customized to meet site's requirements. Proceed with

caution and carefully follow the recommendations given in this manual (see Chapter 'Description of the Interface Elements', Subchapter 'Interface Processors' of the 'Endevor Reference Manual').

Installation of the system

Execute the six following JCLs:

- Zap on EXIT2 'C1UEXT02'.
- Loading of the system parameters' PDS.
- Initial preparation of files.
- Loading of EXITS in an authorized library
- Loading of TSO / VA Pacbase Endevor messages into the site ENDEVOR library.
- Retrieval from the 2.5 version (before executing this JOB, read carefully the "Retrieval" chapter in the "VA Pacbase Endevor TSO Reference Manual").

EXIT2 ZAP 'C1UEXT02'

D11ZXIT module: '\$prfj.ZXIT' job

This job contains the following steps:

Step	Program	Comments
STEP01	IMASPZAP	EXIT2 ZAP. It concerns the member name of the VA Pacbase Endevor messages 'ISPMLIB' library. It must be executed only if the value chosen for the \$MSGSXH parameter is other than 50.

Execution JCL

```
//$PRFJ.XIT JOB ($CCPT),'ZAP EXIT USER',CLASS=$CLASSJ,
// MSGCLASS=$MSGCL
//*****
//**          --- ZAP 'C1UEXT02' EXIT USER ---
//*****                                 *
//*****                                 *
//*
//*-----*
//*           I M P O R T A N T      *
//*-----*
//* IT IS NOT NECESSARY TO EXECUTE THIS JOB      *
//* IF THE SUFFIX OF THE PACBASE USER MESSAGES   *
//* MEMBER OF ENDEVOR 'ISPMLIB' LIBRARY CONTAINS  *
//* THE VALUE '50' (CHECK 'MSGSX' PARAMETER).    *
//* IF THE SUFFIX IS MODIFIED, THIS STEP MUST BE   *
//* EXECUTED. IN ORDER TO DO SO, THE 'MSGSHX'     *

Loading of the system parameters' PDS

D12SY module: '\$prfj.SY' job

This job contains an IEBUPDTE of the following members:

- Input dedicated to SORT utilities
- Definitions (DELETE/DEFINE), verifications (VERIFY) and REPRO of VSAM files
- BLBVPQU member which contains the building command of the 'QU' backup index of the 'UQ' VA Pac update file.
- 'ISPLOGON' member which contains the 3 VSAM files used by the VA Pacbase Endevor system. They must be defined in the TSO procedure of the user LOGON.
- 'ISPF' member which contains the allocation of the Exits trace file. Since its contents are specific to each user, it must be copied in the ISPF connection procedure.
- 'CIUU\$msgsx' member (see the meaning of '\$MSGSX' parameter in the table of parameters). It contains the TSO messages of the VA Pacbase Endevor system and is copied in the Endevor 'ISPMLIB' library.
- 'PRCSGENI' member: JCL of the 'GENERATE' type processor for 'INFOPAC'-type ELEMENTS (1)
- 'PRCSGENP' member: JCL of the 'GENERATE' type processor for 'VA Pac'-type ELEMENTS with compilation (1)
- 'PRCSGEPP' member: JCL of the 'GENERATE' type processor for 'VA Pac'-type ELEMENTS without compilation, related to the 'TRANSFER' action (1).
- 'PRCSDELP' member: JCL of the 'DELETE' type processor for 'VA Pac'-type ELEMENTS (see PHASE 1)
- 'PRCSMOVP' member: JCL of the 'MOVE' type processor for 'VA Pac'-type ELEMENTS (1)

(1) 'see Allocation of processors to the PROCESSOR GROUP'

Execution JCL

LINK-EDIT of EXITS in an authorized library

D14EXIT module: '\$prfj.EXIT job'

The VA Pacbase Endevor system is constituted of 2 EXITS (EXIT2 and EXIT3) which must be linked with 'EPC1UEXT' Endevor DRIVER.

The '\$PRFJ.EXT' JOB includes the 2 following steps (which must be adapted to the sites) :

Step	Program	Comments
ET010	IEWL	EXIT2 link
ET020	IEWL	EXIT3 link

Note: After this job, the user must define EXITS in Endevor by adding them via the C1UEXIT macro structure lines of the 'BC1JXITS' Endevor JCL.

Execution JCL

```
//$/PRFJ.EXT JOB ($CCPT),'EXIT2-EXIT3',CLASS=$CLASSJ,
// MSGCLASS=$MSGCL
//*****
//*
//*          LINK-EDIT EXITS IN AN AUTHORIZED LINKLIST LIBRARY
//*
//*          -----
//*
//* IMPORTANT: YOU MUST DEFINE EXIT PROGRAMS TO ENDEVOR BY ADDING
```

```

//*          THEM TO THE `C1UEXIT MACRO IN THE ENDEVOR JCL      *
//*          'BC1JXITS'.                                         *
//*                                                               *
//*****                                                       *****

Retrievals from the 2.5 version (JJND RPTY RP25)

D162530 module: '\$prfj.2530' job

This job is to be executed only for the sites which upgrade from the 2.5 version of the VA Pacbase / Endevor interface. See before "Retrieval of VisualAge Pacbase 2.5" chapter in this manual.

The job includes the following steps:

Step	Procedure	Comments
ET010	BVPJND	Retrieval of archived journal
ET020	BVPRPTY	Retrieval of 2.5 Types VSAM file into the Administration Database
ET030	BVPTYND	Loading of Types VSAM file of the installed version from data contained in the Administration Database supplied in the previous step
ET040	BVPRP25	Retrieval of the Elements managed by Endevor and contained in VA Pacbase as User Entities of the .NDENV and .NDVLM Meta Entities, into User Entities of the new model.

Execution JCL

```

```

Installation of the Development Database

Before being installed, a Development Database must be declared in the Administration Database.

If the code entered does not correspond to the provided database (BVAP) or to a database predefined in the Administration Database, then this reference is updated by UPGP in the Administration Database.

The complete declaration of a new database is done via Administrator workbench. For more information, refer to the 'Installation of Client Components' chapter and also to the 'AD workbench User's Guide'.

NOTE: The BVAP test Database, provided at installation, is already declared in the Administration Database.

The following operations must be executed every time a new Development Database is created.

CICS CSD Update

Development Database components

I00CSD module: '\$prfj.I0' job

bbbb=BASE, code of the Development Database, transaction code and prefixes of the Development Database file codes selected by the user.

Files:

- bbbbAN: index file,
- bbbbAR: data file,
- bbbbAJ: transaction journal,
- bbbbAY: bulk data

Transaction: bbbb executes the current operations in the Database (read-only, update).

Notes

The option allowing the "Dynamic Backout" (JNLSYNCWrite and RECOVery) is required for AN, AR, AJ, AY files.

The number of Strings, Indexbuffers and Databuffers allows the product to run correctly in most installations.

However, for sites containing large volumes of data and a large number of users, these parameters must be adapted.

For more details, refer to the 'Efficiency enhancement' subchapter in the Appendix of this manual.

```

Loading of the Test Database

I04REST module: '\$prfj.I4' job

This job executes the REST procedure, using as input the backup file previously loaded on the disk in STEP4 of the '\$prfj.I3I' job.

To install the test Database provided on the CD-ROM, run the JCL as is, without any modification.

To install a Database different from the one you are provided with, see the 'Administrator's Procedures' manual. You will find details on the REST procedure.

In this case, the Database to be restored must have been declared in the Administration Database.

If the version of your Database is previous to 3.5, see in the 'Database Retrieval' chapter, the sub-chapter dedicated to the retrieval of user parameters.

Execution JCL

```

//$PRFJ.I4  JOB ($CCPT),'PAC I04REST',CLASS=$CLASSJ,
// MSGCLASS=$MSGCL
// JCLLIB ORDER=($BIBP)
//*****                                                 *
//** VISUALAGE PACBASE                               *
//**                                                 *
//**           INSTALLATION - I04REST                 *
//**           CREATION OF THE DEVELOPMENT TEST DATABASE*
//**           INDICATE THE LANGUAGE CODE OF DATABASE ON Y LINE COL 10-11  *
//*****                                                 *

```

```
//TESTREST EXEC BVPREST
*ADMIN    ADMIN
Y        20EN
//
```

Loading of the Development Model

I05META module: '\$prfj.I5' job

This JCL must be submitted when the Development Database is installed for the first time and then each time it is reinstalled.

It runs the VINS procedure and installs the Development Model.

Execution JCL

```
//$PRFJ.I5 JOB ($CCPT), 'PAC I05META',CLASS=$CLASSJ,
// MSGCLASS=$MSGCL
// JCLLIB ORDER=($BIBP)
//*****
//** VISUALAGE PACBASE
//*
//**      - DEVELOPMENT DATABASE -
//**      MODEL INSTALLATION
//**      INDICATE THE FILE NECESSARY FOR REOR PROCEDURE
//*****
//VINS EXEC BVPVINS,FDIC='$HLQ..SBVPPF8(BVPMETBA)',
//       USER=ADMIN, BASE=$BASE
*ADMIN   ADMIN ***      VINS
/*
//**VINS.PAC7MR DD DSN=REORFILE
```

Complement - Pac/Impact

I20GDG module: '\$prfj.I20' job

This job creates the files which are necessary to the impact analysis module.

Caution

If SMS is installed on the site, delete the DD //GDGMOD lines from the steps GDGBJ and GDGBB before submitting the job.

Step	Program	Comments
INIFO1	BVPRMSYS	
INIFO2	IDCAMS	allocation of GDG for FO file
INIFO3	IEBGENER	initialization of FO file from scratch
INIFR1	BVPRMSYS	
INIFR2	IDCAMS	allocation of GDG for FR file
INIFR3	IEBGENER	initialization from scratch of FR file

Step	Program	Comments
INIFQ1	BVPRMSYS	
INIFQ2	IDCAMS	allocation of GDG for FQ file
INIFQ3	IEBGENER	initialization from scratch of FQ file
INIFH1	BVPRMSYS	
INIFH2	IDCAMS	allocation of GDG for FH file
INIFH3	IEBGENER	initialization from scratch of FH file

These files are described in the 'Components' chapter, 'Development Database' subchapter, 'Pac/Impact' section.

Execution JCL

```

CICS Complement-Modification of transaction Output

When exiting the VA Pac 'bbbb' transaction, the system sends a CICS RETURN through the BVPR005 program called by XCTL ('bbbb' is the Database code valorized upon installation).

You may replace this program with another program, in order to return the control to a general user menu or to any other operation.

You can download the BVPR005 source from the VisualAge Pacbase Support site: <http://www.ibm.com/software/awdtools/vapacbase/support.html>

Chapter 4. Installation/Reinstallation of Client Components

Things to Know Before Installing

- To install the VisualAge Pacbase Client components on a Windows workstation, you must have an Administrator profile.
- VA Pac Client components are installed via InstallShield for Windows Installer (ISWI).
If Windows Installer is not installed on the workstation, it will be installed automatically.
- You also need Microsoft Windows Script, version 5.1 or higher. You can download it from the following URL:
<http://www.microsoft.com/downloads>
- Both the Administrator & Developer workbench and the eBusiness Tools components require, for their online help, that a standard internet browser be used (Mozilla Firefox or Internet Explorer is advised).
- The installation of a Client component does not require the prior installation on the server of the VA Pac Database(s) to which it will connect. However, the code of each VA Pac Database you must indicate when you install some Client components will have to be strictly reused when these Databases are installed at the server level.

A number of administration actions must be carried out online in the Administrator workbench in order to make operational a VisualAge Pacbase installation or re-installation. These actions are documented in the 'AD workbench User's Guide', chapter 'Prior Administration Actions'.

Root Directory

By default, the root directory of all the VisualAge Pacbase Client components is:

C:\Program Files\IBM\VisualAge_Pacbase_35

If you are connected to Developer workbench and need a simultaneous connection to the Pacbench module of VisualAge Pacbase WorkStation, it is absolutely necessary to install the two components in the same root directory.

The directories located under this root can be modified only once, at the beginning, i.e. when the first component is installed.

NOTE: Do not use blank characters in directory names.

The other components will necessarily be installed under this root directory (whether it has been modified or not).

However, for the installation of a later version of a component, the new root name is your choice, knowing that it must be different than the current installation root (the installation script controls that).

By 'version' one must understand the version identified by the first digits, e.g. '3.5'. Versions identified by 'Vnn' actually are sub-versions.

For more information, see Subchapter 'Component Updating, Modification, or Removing'.

Installation Startup

Insert the installation CD-Rom.

The execution of setup.exe launches the graphical interface of Wizard InstallShield which will guide you through the installation.

The first panel displays the text of the Java runtime license. You agree with the terms of the license ; the next panel then asks for your identification (Name and Organization).

NOTE: All the VisualAge Pacbase Client components are installed in a shared use mode on the workstation.

Then the list of the VisualAge Pacbase Client components is displayed.

Choose the Client component you want to install.

The continuation of the installation is described in the sub-chapters dedicated to each component.

Fundamentals of VA Pac Client-Server Communication

This section presents the principles of the communication between the Client components and the VisualAge Pacbase server.

The following pages contain important information essential to the choice of the communication protocol and the parameterization of the associated middleware.

This information will also be useful for future installations (other Client components or new versions of already installed components).

AVAILABLE COMMUNICATION TYPES

- If the VisualAge Pacbase server runs on Windows or UNIX, the VAP Socket protocol must be used.
- If it runs on MVS/CICS, you can either use the MVS CICS Socket, MVS CICS CPI-C, or MQ-CICS Bridge protocol, depending on which protocol is in use at the server level (see 'Installation of Server Components' chapter).
For more information on this configuration, see subchapter 'Additional Information', section 'How to configure the MVS CICS CPI-C protocol'.
- If the server runs on MVS/IMS, you can use the IMS Connect or the MQ-IMS Bridge protocol, depending on the protocol in use at the server level (see 'Installation of Server Components' chapter).

MIDDLEWARE

The middleware must always be installed on each developer work station. This installation starts automatically during the first installation under a given root of one of the following Client components: Administrator and Developer workbench, VisualAge Pacbase Workstation, and eBusiness Tools.

The middleware installed on each developer work station ensures direct communication between the Client component(s) and the Server.

However you can also choose a communication via a gateway.

This gateway performs a centralized and optimized management of server access.

In this context, you must also install the middleware on an intermediate server by selecting the Middleware item in the list of Client components (see corresponding subchapter).

Client components then communicate via a gateway (the VisualAge Pacbase Gateway) which runs on this intermediate server.

COMMUNICATION FILES

For the Administrator & Developer workbench and the VisualAge Pacbase WorkStation, the parameterization of the communication is made in two files: the bases.ini and vaplocat.ini. files.

The vaplocat.ini file is also used by the eBusiness Tools component.

These files are automatically created and are located in a directory named 'common'.

A reinstallation does not affect the bases.ini and vaplocat.ini files. A base_new.ini file is created only as a reference. It contains the most recent version of this file.

IMPORTANT: To add/delete VisualAge Pacbase Databases, or modify parameters related to the communication, you will have to modify these files.

For details on how data is structured within both files, see the end of this chapter (Updating communication parameters).

THE VAPLOCAT.INI FILE

- When communication is direct, the vaplocat.ini file used is located on each Developer workstation.
- When communication is via a gateway, the vaplocat.ini file used is located on the intermediate server.

In both cases this file is located in the 'common' sub-directory of the installation root directory.

The location(s) is(are) described in this file.

A location :

- identifies the protocol used to access the VisualAge Pacbase server,
- gives the physical addresses of the server for this protocol,
- defines the communication parameters required for the operation of this protocol.

THE BASES.INI FILE

The bases.ini file is found on each Developer workstation, in the 'common' sub-directory of the installation root directory.

This file contains the list of accessible VisualAge Pacbase Databases. Each Database is associated with a location.

Several Databases can be associated with the same location. The locations are defined in the other file, the vaplocat.ini file.

Administrator & Developer workbench

If IBM SDK for Java 2 is not installed on your workstation, it will be automatically installed. For this installation, as for that of the Administrator & Developer workbench, the root being used depends on the current installation context. For complete details, refer to this chapter's first page.

The installation script then asks you to choose to install Administrator workbench or Developer workbench or both:

- Administrator workbench
- Developer workbench

Developer workbench includes the following modules, each running independently:

- Batch module,
- eBusiness module, also including three of the eBusiness Tools:
 - Proxy Generator,
 - Location Editor,
 - Services Test Facility.
- Services Modeler module (all of its functionalities being included in the eBusiness module).

Whether you install Administrator or Developer workbench or both, the CFM utility (Configuration File Manager) is always installed. CFM allows you to inhibit the display of selected browsers unused by your site's teams and/or to enable the display of browsers specific to Meta Entities defined on site.

Consult the VisualAge Support team for more information.

In the next panel, you indicate the communication mode (direct communication or gateway).

NOTE: IMPORTANT information on communication issues are given at the beginning of this chapter.

This panel does not appear if you have already installed Administrator & Developer workbench or the VA Pac WorkStation under the same root.

- If you choose the direct communication option, the middleware installation script will automatically start once the installation of the workbench is finished. It will ask you to specify a number of communication parameters. For complete details on this part of the installation, refer to the Middleware subchapter.
- If you choose the gateway option, enter first the IP address of the gateway here. The installation of the middleware on the Developer workstation - also necessary in this context - will then start automatically after the installation of the workbench.

Next, in this same initial context, enter the (first) Database which the Administrator and Developer workbench will access.

To do this, a window enables you to enter:

1. The name of a VA Pac Database, already installed at the server level or not. The names entered here will be displayed in the connection smartguide, thus showing users which Databases they can connect to. The name given to each Database should therefore be clear enough to be easily identified in the list of Databases proposed by the connection smartguide.

2. The Database logical code.

Maximum length: 4 characters.

If the Database is not installed at the server level yet, please keep this code in mind: it will have to be used again upon this installation. The codes entered here will also be displayed in the connection smartguide.

NOTE: The Database specifically dedicated to the site administration is automatically created. Its logical code is the '****' reserved code.

3. The location name

Maximum length: 20 characters.

Default: Location-1

More than one Database may be associated with one location.

4. Finally, specify the user authentication mode at connection. Refer to the Database Administrator to ensure authentication measures at the server level are imposed at the workbench level.

You select the mode via two check boxes.

VisualAge Pacbase signon:

The user will have to enter his/her code and password to connect to the VA Pac Database.

Middleware signon:

The user will have to enter his/her code and password to connect to the host system (in the two fields displayed under 'Middleware references' in the connection smartguide).

If only the Middleware signon box is checked, VA Pac authentication is performed by the security system.

If both boxes are checked, the user will have to enter his/her code and password to connect to the host system and to the Database.

In this way, you have defined the access to a first VA Pac Database. The installation script then allows you to define communication and connection to as many other Databases as necessary.

The actual installation can then start ; press the [Install] button.

NOTE: This installation is followed by the installation of the eBusiness tools (if not already installed under the same root) and -- in the initial context defined above -- of the Middleware.

START-UP FILES

The start-up files are :

- wb_admin.bat
- wb_global.bat
- wb_batch.bat
- wb_dialog.bat
- wb_eBusiness.bat
- wb_services.bat
- wb_extensibility.bat
- wb_cfm.bat

These files are to be found under the root directory of the Administrator & Developer workbench ('adworkbench').

START MENU / PROGRAMS CHOICE

Once the installation is complete, the Windows desktop includes the VisualAge Pacbase 3.5 Components section in the Start Menu/Programs choice, with the following sub-sections:

Administrator-Developer workbench

Administration
Batch
Dialog
eBusiness
Services Modeler
Extensibility
cfm
Global

Open Jade and Tidy / Publishing facility

Since version 3.5 V05, the Publishing facility has used the XSL technology by default. So the OpenJade and Tidy tools are no longer needed.

However if you prefer to use the DSSSL publishing, you must install these products.

For the versions earlier than 3.5 V05, you must install OpenJade and Tidy to publish documents.

To obtain these tools, refer to the installation instructions on the VA Pac support internet page: <http://www.ibm.com/software/awdtools/vapacbase/download.html> .

eBusiness Tools

The eBusiness Tools are:

- Proxy Generator
- Location Editor
- Services Test Facility
- VisualAge Pacbase Web Connection (Dialog Web Revamping Generator)
- Web Application Models (WAM)

This installation allows the eBusiness Tools to be used independently of Developer workbench, without a connection to the VisualAge Pacbase server. eBusiness tools (save WAM) are installed as VisualAge for Java features and tools.

If IBM SDK for Java 2 is not installed on your workstation, it will be installed automatically. . For this installation, as for that of the eBusiness Tools, the root being used depends on the current installation context. For complete details, refer to this chapter's first page.

To start the installation, click on the [INSTALL] button.

The following lines are irrelevant as far as WAM is concerned.

The Middleware component is automatically installed after the installation of the eBusiness Tools if it does not already exist under the root of the current installation. You will then have to specify some communication parameters.

For information on this part of the installation, see the Middleware subchapter.

The middleware installed in this context allows communication between the server and the generated proxies. Communication parameters will have to be set by the developer with the Location Editor tool included in this installation.

Also, the eBusiness Tools component can run via a gateway. In this case you will also have to install the Middleware component and configure the communication parameters, on the intermediate server which hosts the VisualAge Pacbase gateway.

NOTE: IMPORTANT information on communication issues is given at the beginning of this chapter.

START-UP FILES

The start-up files are :

- For the Proxy Generator:

vapGen.exe

- For the Location Editor:

vapLocationEditor.exe

- For the Services Test Facility:

vapServicesTestFacility.exe

- For VisualAge Pacbase Web Connection:

PacWebgen.exe

These files are to be found in the following sub-directory:

eBusinessTools\bin

- Unlike the other eBusiness Tools, WAM is installed in its own directory named Wam. This directory contains a zipped file and a readme file. Read this file and follow the instructions included therein.

START MENU / PROGRAMS CHOICE

Once the installation is over, the Windows desktop includes the VisualAge Pacbase 3.5 Components section in its Start Menu/Programs choice, with the following sub-sections:

eBusinessTools	Location Editor
	Proxy Generator
	Services test Facility
	Dialog Web Revamping Generator

VisualAge Pacbase WorkStation

WARNING: The WorkStation runs on a 16 or 32 bits environment. Check that the WorkStation is installed in an environment compatible with such applications.

The root used for this installation depends on this installation context. For complete details, refer to this chapter's first page.

The first panel invites you to select the language option of the VisualAge Pacbase WorkStation interface. The default language option is English.

In the following panel, you select the methodology to be implemented by the WorkStation.

NOTE: If you wish to install another methodology, you will have to repeat this installation process one more time.

If displayed, the 'Local Install' option must be selected.

NOTE: The 'sub-features' option is identical to the 'feature' option.

In the next panel, select the elements to install:

- One or both of the following modules:
 - Pacdesign,
 - Pacbench.
- The connection mode:
 - The connected mode where a connection to the VisualAge Pacbase Repository is systematically performed.
 - The open connection option where the user has to choose between the connected or the local mode.

In the next panel, you indicate the communication mode (direct communication or communication via a gateway).

NOTE: Important information on communication issues is given at the beginning of this chapter.

This panel is not displayed if you have already installed Administrator & Developer workbench or the VA Pac WorkStation under the same root.

- If you choose the direct communication option, the middleware installation script will automatically start once the installation of the workstation is finished. It will require the configuration of communication parameters.
For information on this part the installation, see the subchapter Middleware.
- If you choose the gateway option, enter the IP address of the gateway here. The installation of the middleware on the Developer workstation - also necessary in this context - will then start automatically after the installation of the WorkStation.

Next, in this same initial context, indicate the first Database which the VisualAge Pacbase WorkStation will access.

To do this, a panel enables you to enter:

1. The name of a Database, already installed at the server level or not.

The names entered here will be displayed in the connection smartguide, thus showing users which Databases they can connect to.

The name given to each Database should therefore be clear enough to be easily identified in the list of Databases proposed by the connection smartguide.

NOTE: If you use a customized file for the parameters, enter, after the Database name, the name of this file, framed by the '<' and '>' signs.

Complete details on these parameters are given at the end of this subchapter.

2. The Database logical code.

Maximum length: 4 characters.

If the Database is not installed yet at the server level, please keep this code in mind: it will have to be used again upon this installation. The codes entered here will also be displayed in the connection smartguide.

The Database specifically dedicated to the site administration is automatically created. Its logical code is the '****' reserved code.

NOTE: A logical code must be unique for a given location (see next item 3.)

3. The location name

Maximum length: 20 characters.

Default: Location-1

More than one Database may be associated with one location.

4. Finally, specify the user authentication mode upon connection. Refer to the Database Administrator to make sure that the authentication mode applied at the server level is also applied at the WorkStation level.

You select the mode via two check boxes:

'Pacbase is secured':

indicates that the user will have to enter his/her code and password to connect to the VisualAge Pacbase Database.

'Middleware is secured':

indicates that the user will have to enter his/her code and password in the Middleware identification box to connect to the host system. If only the Middleware box is selected, VA Pac authentication is performed by the security system.

If you check both boxes, the user will have to enter his/her code and password to connect to the host system and to the Database.

In this way, you have defined the access to a first VA Pac Database. The installation script then allows you to define communication and connection to as many other Databases as necessary.

The actual installation can then start ; press the [Install] button.

NOTE: This installation -- in the particular context defined below -- is automatically followed by the middleware installation.

START-UP FILE

The start-up file is :

pexec.exe

This file is to be found in the VisualAge Pacbase WorkStation root directory (SPAC\nnnl where 'nnn' identifies the WorkStation's version and 'l' its installed language).

START MENU / PROGRAMS CHOICE

Once the installation is completed, your Windows desktop includes the VisualAge Pacbase 3.5 Components section in its Menu Start/Programs choice, with the following sub-sections:

```
WorkStation
    WorkStation 3.5
    WorkStation 3.5 News
    <methodology> News
```

INSTALLATION PARAMETERS FILE

A number of the installation parameters of the VA Pac WorkStation are located in the Pacbase.dat file.

The WorkStation installation procedure automatically creates this file in the \SPAC\NNNL directory where 'NNN' indicates the version and 'L' the language code of the version installed.

The Pacbase.dat file, which necessarily conforms to the most recent installation, is therefore used by default when the WorkStation is started up.

However you can create one or more parameter files. This can be useful if more than one methodology is installed on a workstation, which is rather rare. It will then be easier to change the methodology when reconnecting.

The choice of file name is open but must conform to DOS file standard. The .dat extension is recommended.

These DOS files should resemble the Pacbase.dat file and should be stored in the same directory as this file.

When the VA Pac WorkStation is reinstalled, the *.dat files you created will not be deleted.

DESCRIPTION OF THE PARAMETERS FILE

Each of the lines in this file has the following structure:

- a three-digit identifier in positions 1 to 3
- the parameter label, whose position is unfixed
- the parameter value, between square brackets ([and]), whose position is also unfixed

The following is an example of a PACBASE.DAT file:

001 Station Version	[350F]
002 Server	[PACBASE]
003 Communication Manager	[MWCOM]
004 Communication Parameters	[MWCOM]
005 System	[WINDOWS]
006 Method	[MER]
007 EXE disk	[C]
008 EXE disk(default)	[C]
009 System Data Disk	[C]
010 User Data Disk	[C]
011 Connection execution mode	[E]

The Pacbase.dat file should not be destroyed.

The possible values for the Methodology parameter are:

Parameter value	Methodology name
MER	MERISE
DON	YSM
ADM	SSADM (in English only)
OMT	OMT
IFW	FAA

WARNING: The parameters 001 to 005 and 011 cannot be modified.

WARNING ON VAPLOCAT.INI FILE

The Vaplocat.ini file indicates the locations of the Databases and the communication parameters. If you modify this file while using the WorkStation, you must reboot your computer to take the modification into account.

For more details on this file, read the information developed in subchapters 'Things to Know Before Installing' and 'Editing communication Parameters'.

Web Application Models (WAM)

The root used for an installation depends on the context of that installation. For more information, see the first page of this chapter.

To start the WAM installation, press the [Install] button.

WAM is installed in its own directory named Wam. This directory contains a zipped file and a readme file. Read this file and follow the instructions included therein.

Middleware

The specific installation of the Middleware component on a dedicated machine (intermediate server) is necessary only when a communication via a gateway is used.

In fact, the Middleware component is automatically installed, immediately after the first installation (under a given root) of one of the other Client components.

The root used for an installation depends on the context of that installation. For more information, see the first page of this chapter.

To use the Administrator and Developer workbench or the VA Pac WorkStation, the location parameters of your VisualAge Pacbase Databases must always be specified.

NOTE: IMPORTANT information related to the communication is given in the beginning of this chapter.

- If communication is provided via the VisualAge Pacbase Gateway, installation of the Middleware on this intermediate server requires the definition of the location necessary for the first VA Pac Database.

NOTE: In the New location field, enter a name for each location.

WARNING: If there is more than one location to define, either for the same Database or to manage more than one Database, you must define these extra locations directly in the `vaplocat.ini` file.

For more information on updating this file, see subchapter 'Complementary Information', section 'Updating Communication Parameters'.

- If communication is direct, the locations are automatically displayed, as they have been predefined in the first phase of the Administrator & Developer workbench or the VA Pac WorkStation installation.

Next, whatever the Client component concerned, you have to specify a certain number of different parameters, depending on the protocol used.

LIST OF PARAMETERS

- VAP SOCKET
 - IP address: IP address and port used by the VA Pac server.
Do not enter left-aligned '0', source of error with some configurations.
- MVS CICS SOCKET
 - IP address: IP address and port used by the VA Pac server.
Do not enter left aligned '0', source of error with some configurations.
 - Transaction code: Code of the CICS transaction of the VA Pac Communication Monitor.
 - Code Page: Value identifying the coding of characters used by the VA Pac server.
1140 (US EBCDIC) or 1146 (UK EBCDIC)
- MVS CICS CPI-C
 - Destination-id entry: BVPSCPI (default value).
If you modify this value, it must be the same as the value entered in the Symbolic destination name, a parameter included in the configuration of this communication protocol.
 - Code page: Value identifying the coding of characters used by the VA Pac server.
1140 (US EBCDIC) or 1146 (UK EBCDIC)
- MQ-CICS Bridge and MQ-IMS Bridge
 - LocCcsid: Character-set code of the machine in local (819 by default), used for the conversion of messages by MQSeries during the read and write of Queues.
Maximum: 9 characters.
 - Queue Manager name: Name of the local Queue Manager of the client part.

If there is an intermediate MQSeries Server on NT, this parameter must identify the intermediate NT Queue Manager and not the Queue Manager.

Maximum: 4 characters.

- Request Queue name:

Maximum: 48 characters.

- Reply Queue name:

Maximum: 48 characters.

- Transaction code:

Maximum of 4 characters for CICS.

Maximum of 8 characters for IMS.

- MVS IMS Connect

- IP address: IP address and port used by the VA Pacbase server.
- Transaction code: IMS transaction code of the VA Pacbase Communications Monitor.
- Code page: Value identifying the coding of characters used by the VA Pacbase server.
1140 (US EBCDIC) or 1146 (UK EBCDIC)
- Data Store:
Name of the link to IMS defined in IMS Connect (IMS Data Store ID).
- RACF group: Name of the RACF group for IMS Connect.

You can now start the installation; press the [Install] button.

Additional Information

How to Configure the MVS CICS CPI-C Protocol

The following text gives you details on the configuration specific to the use of VisualAge Pacbase Client components.

The minimum prerequisites are:

- IBM Personal Communications 4.2
- Microsoft SNA Server 3.0A

The Service Pack 2 must be installed for APPC corrections.

The protocol (CPI-C/APPC LU6.2) must be configured as follows:

- In the "Define CPI-C Side Information" window, type BVPSCPI in the "Symbolic destination name" field.

This code identifies the monitor which sets up the connection between the Client components and the VisualAge Pacbase server programs which use APPC.

NOTE: It is possible to type a value other than BVPSCPI, provided the Symbolic destination name value is the same as the MONITOR parameter value in the vaplocat.ini file.

Example of a location in vaplocat.ini:

```
<MVS-DB2-CPIC>
COMM_TYPE=CPIC
MONITOR=BVPSCPI
MESSAGE_LENGTH=31744
IXO_TIMEOUT=30
HOST_ENCODING=1140 (US EBCDIC) or 1146 (UK EBCDIC)
```

- In the "TP name" field, type the CICS transaction code which is associated with the BVPSCPI communication monitor.

Editing Communication Parameters

The bases.ini File

You will need to update the bases.ini file to add or delete a Database, or to modify communication parameters.

By default this file's access path is:

C:\Program Files\IBM\VisualAge_Pacbase_35\Common\

This file's format meets the standards of Windows .ini files.

Each section in the bases.ini file defines a configuration allowing access to one VisualAge Pacbase Database. Each section's name must be framed by brackets [Section Name].

The name of each section will be presented to the user in the connection smartguide. In the displayed list of VA Pac Databases, the user picks the Database he/she wants to connect to. This is why section names need be very explicit. All the more so since you can manage several communication options for one VA Pac Database. To do so, define as many configurations/sections as needed for one Database, clearly differentiated from one another by their name.

NOTE: With the VA Pac WorkStation, you may use a customized parameters file. To do so, enter -- after the VA Pac Database name -- this file's name framed by the '<' and '>' signs. Complete details on these parameters are given above, at the end of the 'VisualAge Pacbase WorkStation' subchapter.

DESCRIPTION OF A SECTION'S CONTENTS

The parameters in each section are listed below. There is one parameter per line:

- baseCode = code of the VisualAge Pacbase Database (required)
Maximum length: 4 characters

NOTE: Concerning the VA Pac WorkStation, this code must be unique in the bases.ini file for a given Location.
- signOn = indicator for the control of the user signon. This indicator is required and takes one of the three following values:
 - VAPac: indicates that the user will have to give his/her code and password only when he/she connects to the VisualAge Pacbase Database.
 - Middleware: indicates that the user will have to give his/her code and password only when he/she connects to the host. The connection to the VA Pac Database will be controlled by RACF (or equivalent).
 - VAPac Middleware: indicates that the user will have to give his/her code and password when he/she connects to the host and to the Database (default option).
- communicationAdapter = indicates the communication mode in use.
 - DIRECT: local middleware
 - GATEWAY: remote middleware (via the VisualAge Pacbase gateway)

The following parameters vary according to the chosen option.

- connectionCleaningInterval = period of time (in millisecond) between two startups of connections cleaning procedures.

Parameter needed for the VisualAge Pacbase Workstation only.
Default value for Windows NT/2000/XP = 60000.
For Windows 95/98, this parameter must be set to -1, and cannot be modified, to avoid problems of multi-threading, not supported by these platforms.

PARAMETERS FOR DIRECT ADAPTER (LOCAL MIDDLEWARE)

- locationsFile = indicates the path and name of the file which contains the locations definitions.
Default: ..\common\vaplocat.ini

- CAUTION:** The default value of this parameter should not be modified.
- location = location name for the Database
Maximum length: 20 characters.

Default: Location-1

More than one Database can point to the same location.

REMINDER: A location identifies the communication protocol used to access the VisualAge Pacbase server and the physical address of this server for this protocol.

- traceFile = path and name of the file which will receive the trace of the middleware execution.
By default this file is automatically created (with timestamp) in the VapTrace sub-directory.
- traceLevel = trace level of the middleware execution. Its possible values are:
 - 0 : no trace
 - 1 : trace with errors (default)
 - 2 : standard trace, not detailed
 - 3 : trace for information
 - 4 and + : trace for debugging
- codePageFile = path and name of the file which contains the conversion table of the code pages.

Default: ..\middleware\CharConv.txt

PARAMETERS FOR GATEWAY ADAPTER (REMOTE MIDDLEWARE)

- host = name or IP address of the host where the VisualAge Pacbase gateway is installed.
Do not enter left aligned '0', source of error with some configurations.
Default: 127.0.0.1 for a local host
- port = value of the IP port where the gateway receives the client requests.
Default: 5647
- location = location name for the Database
Maximum length: 20 characters.
Default : Location-1
More than one Database can point to the same location.
REMINDER: A location identifies the communication protocol used to access the VisualAge Pacbase server and the physical address of this server for this protocol.
- The traceFile and traceLevel parameters can be used to start the GATEWAY. For more details, refer to the Middleware User's Guide.

NOTE: All the parameters which may be present in the bases.ini file are not explained here. In fact, a number of these parameters allow finer middleware settings, particularly used by proxies (generated by the

eBusiness Tools). These parameters are used separately from the bases.ini file and are documented in the Proxy Programming Interface manual.

The vaplocat.ini File

You will have to update the vaplocat.ini file to add or delete a Database, or possibly modify other parameters described below.

By default, the path to this file is:

C:\Program Files\IBM\VisualAge_Pacbase_35\Common\

To add a VisualAge Pacbase Database, create a line on which you enter the location name between '<' and '>'.

The maximum length of this name is 20 characters.

According to the protocol selected, you will have to choose different parameters (one per line):

- VAP SOCKET

```
<LocationName>
COMM_TYPE=SOCKET
MONITOR=BVPSCPI
MESSAGE_LENGTH=31744
IXO_TIMEOUT=30
IXO_ADDRESS=127.0.0.1 3676
```
- MVS CICS SOCKET

```
<LocationName>
COMM_TYPE=TCPMVS
MONITOR=BVPSSOC
MESSAGE_LENGTH=31744
IXO_TIMEOUT=30
HOST_ENCODING=1140 (US) or 1146 (UK)
IXO_ADDRESS=127.0.0.1 3676
IXO_TRANSID=V303
```
- MVS CICS CPI-C

```
<LocationName>
COMM_TYPE=CPIC
MONITOR=BVPSCPI
MESSAGE_LENGTH=31744
IXO_TIMEOUT=30
HOST_ENCODING=1140 (US) or 1146 (UK)
```
- MQ-CICS Bridge

```
<LocationName>
MESSAGE_LENGTH=31744
MONITOR=BVPSCPI
COMM_TYPE=MQCICS
IXO_LOCALCCSID=819
```

- ```

IXO_QUEUEMANAGER=EECC
IXO_REQUESTQUEUE=VAP.CICS_BRIDGE.VAPCS.REQUESTER
IXO_REPLYQUEUE=VAP.CICS_BRIDGE.VAPCS.REPLY
IXO_DYNAMICREPLYQUEUE=VAP.CICS_BRIDGE.VAPCS.DYNAMICREPLY
IXO_TRANSID=WK51
IXO_REQUESTEXPIRY=120
IXO_TIMEOUT=35
IXO_HEADERVERSION=1

```
- IMS Connect
 

```

<LocationName>
COMM_TYPE=TCPIMS
MONITOR=XXXXXXXX
MESSAGE_LENGTH=31744
IXO_TIMEOUT=30
HOST_ENCODING=1140 (US) or 1146 (UK)
IXO_ADDRESS=127.0.0.1 3676
IXO_TRANSID=WK35
IXO_DATASTORE=IMSC
IXO_RACFGROUP=FR42

```
  - MQ-IMS Bridge
 

```

<LocationName>
MESSAGE_LENGTH=31744
MONITOR=XXX
COMM_TYPE=MQIMS
IXO_LOCALCCSID=819
IXO_QUEUEMANAGER=EECC
IXO_REQUESTQUEUE=VAP.IMS_BRIDGE.VAPCS.REQUESTER
IXO_REPLYQUEUE=VAP.IMS_BRIDGE.VAPCS.REPLY
IXO_DYNAMICREPLYQUEUE=VAP.IMS_BRIDGE.VAPCS.DYNAMICREPLY
IXO_TRANSID=WK51
IXO_REQUESTEXPIRY=120
IXO_TIMEOUT=35
IXO_HEADERVERSION=1

```

## DETAILS ON THE PARAMETERS

The following list is organized according to the alphabetical order of the parameters.

- COMM\_TYPE:

This parameter identifies the communication protocol in use.

The possible values are:

- SOCKET: VA Pac Server under Windows or UNIX, with the use of TCP/IP.
- TCPMVS: VA Pac Server under MVS/CICS with the use of a TCP/IP listener.
- CPIC: VA Pac Server under MVS/CICS, with the use of the CPI-C protocol.

- MQCICS: VA Pac Server under MVS/CICS, with the use of the MQ-CICS-BRIDGE protocol.
- MQMCICS: Same as MQCICS and if the middleware is installed on the same machine as MQSeries Server and you want to use a direct link with MQSeries.
- TCPIMS: VA Pac Server under MVS/IMS, with the use of the IMS Connect protocol.
- MQIMS: VA Pac Server under MVS/IMS, with the use of the MQ-IMS-BRIDGE protocol.
- MQMIMS: Same as MQIMS and if the middleware is installed on the same machine as MQSeries Server and you want to use a direct link with MQSeries.
- IXO\_ADDRESS: IP address and port used by the VA Pac Server.  
Do not enter left-aligned '0', source of error with some configurations.  
The port number must correspond to the one indicated at the host machine configuration for OS390 CICS and IMS/VS.  
The same for Windows or UNIX, but for these platforms, a number specifically identifies a VA Pac Database. For more details, refer to the 'Installation of Server Environment' chapter, 'Repository Installation' subchapter, 'Development Databases' section, in the respective Installation Guides.
- IXO\_DATASTORE: Name of link to IMS defined in IMS Connect (IMS DataStore ID).
- IXO\_DYNAMICREPLYQUEUE  
MQ-CICS Bridge and MQ-IMS Bridge.  
When this parameter is set, the reply Queue is dynamically created by MQSeries to pass the response messages (consult the MQSeries documentation to use this type of Queue). This parameter must contain the dynamic name of the Queue (Dynamic Queue name) and the IXO\_REPLYQUEUE parameter must contain the 'Queue Model' name (48 characters maximum).
- IXO\_HEADERVERSION: Version of the MQCIH structure (for MQ-CICS Bridge) or of the MQIIH structure (for MQ-IMS Bridge).  
1 (default) or 2, depending on the Bridge interface in use (1 character maximum).
- IXO\_LOCALCCSID: code of the character set of the machine locally  
MQ-CICS Bridge and MQ-IMS Bridge.  
This code (819 by default), used for the conversion of messages by MQSeries during the read and write of Queues.  
(9 characters maximum).
- IXO\_QUEUEMANAGER: Local Queue Manager name of the client part.

MQ-CICS Bridge and MQ-IMS Bridge.

(4 characters maximum).

If there is an intermediate MQSeries Server on NT, this parameter identifies the intermediate NT Queue Manager and not the Queue Manager.

- IXO\_RACFGROUP: Name of RACF group for IMS Connect.

- IXO\_REPLYQUEUE: Name of reply messages Queue.

MQ-CICS Bridge and MQ-IMS Bridge.

(48 characters maximum).

- IXO\_REQUESTEXPIRY: Expiration delay of the request message, in seconds.

MQ-CICS Bridge and MQ-IMS Bridge.

(9 characters maximum).

- IXO\_REQUESTQUEUE: Name of request messages Queue.

MQ-CICS Bridge and MQ-IMS Bridge.

(48 characters maximum).

- IXO\_TIMEOUT: Maximum time required for a workstation to receive an answer from the server before indicating any communication error.

This parameter is indicated in seconds. Its default value is 30.

- IXO\_TRANSID: Transaction code.

(4 characters maximum for CICS and 8 characters maximum for IMS).

This IMS transaction will have to be declared on IMS by a GEN INPUT IMS as follows:

```
APPLCTN PSB=BVPSSOC
TRANSACT CODE=WK35,SEGSIZE=32000,MODE=SNGL,SEGNO=00050,
 PRTY=(07,10,00002),PROCLIM=(00005,00015),EDIT=ULC,
 MSGTYPE=(MULTSEG,RESPONSE,$CLS)
```

- HOST\_ENCODING: Identifies the encoding of the characters used by the VisualAge Pacbase server.

1140 (US EBCDIC) or 1146 (UK EBCDIC)

Not used with MQ-CICS Bridge and MQ-IMS Bridge.

- MESSAGE\_LENGTH The value of this parameter MUST be 31744.

- MONITOR: Communication monitor code for VisualAge Pacbase, which is BVPSCPI, or BVPSSOC for MVS CICS SOCKET.

Not used with IMS Connect and MQ-IMS Bridge.

**NOTE:** For MVS CICS CPI-C, you can however enter a value other than BVPSCPI, bearing in mind that the value of the MONITOR parameter must be in all cases the same as the one set in the Symbolic destination name, a parameter included in the communication protocol configuration.

All the parameters of the vaplocat.ini file are not explained here. In fact, certain parameters allow finer middleware settings, particularly used by proxies (generated by eBusiness Tools). In this context, these parameters are edited with the Location Editor tool and are therefore documented in its online help. You can also consult the documentation of these parameters in the Middleware use's Guide.

---

## **Component Updating, Modification, or Removing**

The VA Pac Client Components Installation CD-Rom also allows you to:

- 'Update' a component which is already installed.
- 'Modify' i.e. add a new sub-component to a component which is already installed.

This option is available only with:

- Administrator & Developer workbench:

To add one of both workbenches as the other is already installed,

- VisualAge Pacbase WorkStation:

To add a Methodology.

- 'Remove' a component which is already installed.

You can also use the Windows service 'Add/Remove' Programs in the Configuration Panel.

---

## Chapter 5. Tests

---

### List of Utilities

The summary table below lists the management utilities of the Administration and Development Databases.

| JCL     | Description                                           |
|---------|-------------------------------------------------------|
| JCLRAD  | Archiving of the Administration Database journal      |
| JCLSVAD | Saving of the Administration Database                 |
| JCLROAD | Reorganization of the Administration Database         |
| JCLRSAD | Restoration of the Administration Database            |
| JCLPAGX | Extraction of Administration Database                 |
| JCLUPGP | Update in PAF batch format of Administration Database |
| JCLARCH | Storage of the Development Database journal           |
| JCLSAVE | Saving of the Development Database                    |
| JCLMLIB | Library management                                    |
| JCLREOR | Reorganization of the Development Database            |
| JCLREST | Restoration of the Development Database               |
| JCLUPDT | Batch update of the Development Database              |
| JCLGPRT | Generation print                                      |
| JCLEXLI | Library extraction                                    |
| JCLEXPJ | Journal extraction                                    |
| JCLEXTR | Entities extraction                                   |
| JCLUXSR | sub-networks extraction                               |

---

### Installation Tests

The VA Pac Installation tests include the following operations:

- Generation-print, online and batch update tests,
- Administration procedures tests,
- Development procedures tests,
- Extraction utility tests.

## **Generation-Print, Online and Batch Update Tests**

These tests consist of the following steps:

- Online use tests:
  - Opening the test Database files in on-line mode.
  - Testing screen branching.
  - Executing some updates.
- Batch updating tests:
  - Executing the 'JCLUPDT' JCL (UPDT procedure).
  - The Database files must be closed to on-line use.
- Test on generation and print of programs:
  - Executing the 'JCLGPRT' JCL (GPRT procedure).

## **Administration Database Procedures Tests**

You must first consult and perform a number of updates with the Administrator workbench.

You can then carry out the procedure tests, knowing that the Administration Database files must be closed to on-line access.

These tests include the following steps, to be executed in this order:

- Archiving of the journal created during the use tests: execute the 'JCLARAD' JCL, which outputs a PK(1) file.
- Backup of the Administration Database: execute the 'JCLSVAD' JCL, which outputs a PE(1) file; as the evaluation key does not allow to execute this procedure, you must enter the access key previously provided.
- Reorganization of the sequential backup, PE(1), of the Administration Database: execute the 'JCLROAD' JCL, which outputs a PE(2) file.
- Restoration of the Administration Database using the PK(1) archived transaction file and the PE(2) Database backup file: execute the 'JCLRSAD' JCL.
- Extraction of Administration Database data: execute the 'JCLPAGX' JCL and save the GY file of extracted data.
- PAF update of the Administration Database: execute the 'JCLUPGP' JCL with the extracted file (result of the 'JCLPAGX' JCL execution).

## **Development Database Procedures Tests**

You must first consult and perform a number of updates with the Developer workbench.

You can then carry out the procedure tests, knowing that the Development Database files must be closed to on-line access.

These tests include the following steps, to be executed in the following order:

- Archiving of the journal created during the use tests: execute the 'JCLARCH' JCL, which outputs a PJ(1) file.
- Direct backup of the Development Database: execute the 'JCLSAVE' JCL, which outputs a PC(1) file; as the evaluation key does not allow to execute this procedure, you must enter the access key previously provided.
- Library manager: add/delete a library in the Development Database: execute the 'JCLMLIB' JCL, which outputs a PC(2) file.
- Reorganization of the sequential backup, PC(2), of the Development Database: execute the 'JCLREOR' JCL, which outputs a PC(3) file.
- Restoration of the Development Database using the PJ(1) archived transaction file and the PC(3) Database backup file: execute the 'JCLREST' JCL.

The Development Database files must be closed to on-line use while these tests are being performed.

It is advised to briefly test on-line operations again, after restoring and re-opening the Development Database files to make sure that the application runs properly.

## **Extraction-Utility Tests**

The purpose of these tests is to execute the Database extraction procedures.

These tests include the following steps, to be executed in the following order:

- Extraction of a library as transactions: execute the 'JCLEXLI' JCL.
- Extraction of entities from a library: execute the 'JCLEXTR' JCL.
- Extraction of selected transactions and/or lists of transactions from the archived journal (PJ): execute the 'JCLEXPJ' JCL.
- Extraction of sub-network: execute the 'JCLUXSR' JCL.

To run these tests, the development files can be open in on-line mode.

Each of these jobs can be followed by an UPDT or UPDP procedure to check the validity of these extracted transactions.

---

## Chapter 6. Server Re-installation

A reinstallation of the system environment of the VisualAge Pacbase server is necessary in the case of corrections or enhancements on the version installed.

To install this version, download it from the CD-ROM to the dedicated PDS by using SMP/E and execute the provided JCLs if necessary.

This version is identified by a number and includes:

- An installation CD-ROM,
- The "Program Directory for VA Pacbase" specific to SMP/E,
- The list of corrected anomalies,
- Instructions -- possibly included -- to complete this chapter.

Generally, only system files and program libraries are impacted by this version.

In any case, load-modules are updated by SMP/E. They are copied in hlq.SBVPMBR8 and hlq.SBVPMTR8 PDS.

### Remark in case of a previous SMP/E installation

The SMP/E reinstallation implies that the SMP/E context is empty for the product: either the product has never been installed with SMP/E, or the files related to SMP/E have been reinitialized for the previous version, or you want to create a new SMP/E environment for this reinstallation.

Otherwise, if you want to re-use the SMP/E files of the previous version, you can execute, before step 1, the SMP/E utility described in the Appendix at the end of this manual.

Two cases are possible:

### Case 1: Standard re-installation

This operation consists in executing the jobs contained in the following JCL modules:

1. D04MBR : job \$prfj.D4B renaming of batch user-exits load modules,
2. D06SKEL: loading of skeleton files,
3. D07AE0 : loading of error messages,

4. D08XMET: installation of the Administration Model, (see the description in the appendix at the end of the manual).
5. I05META: installation of the Development Model extension. This job must be run for each re-installed base (see the description in the appendix at the end of the manual).

#### Notes

If the execution report of the D08XMET JCL indicates that a re-organization is requested, you will have to run the following JCLs:

1. JCLSVAD: backup of the Administration Database,
2. JCLROAD: re-organization of the Administration Database,
3. JCLARAD: archiving of the Administration Database journal,
4. JCLRSAD: restoration of the Administration Database.

If the execution report of the I05META JCL indicates that a re-organization is requested, you will have to run the following JCLs:

1. JCLSAVE: backup of the Development Database,
2. JCLREOR: re-organization of the Development Database,
3. JCLARCH: archiving the Development Database journal,
4. JCLREST: restoration of the Development Database.

#### Case 2: Non-standard re-installation

It consists in executing specific operations detailed in the instructions included in the shipment.

Here are some general rules you must follow before executing the jobs previously described in the standard re-installation.

- If a JCL, a procedure or a SYSIN has been modified, you must rerun the hlq.SBVPINST(BVPPINIT) JCL and split the result file to re-install the JCLs as described in the chapter 3, 'Parameterization' subchapter.
- If a system or an Administration Database SYSIN has been modified, you must execute the D02CPAR JCL.
- If there is a new skeleton or system file, you must modify the D03DEFIN JCL and keep the DELETE/DEFINE of the new files only, then execute this JCL. And if needed, execute the D03INI JCL on the concerned files to re-initialize them.
- If there is a new procedure, you must run the D05PROC JCL.
- If there is a new SYSIN of the Development Database, execute the I02SY JCL.

Note:

The split of the BVPPINIT JCL result file, as well as the D02CPAR, D05PROC and I02SY JCLs respectively override all the JCLs, the system and Administration Database SYSINs, the procedures, and the Development Database SYSINs.

It is recommended to previously save the customized elements.

---

# **Chapter 7. Retrieval - Exchanges between 2.n & 3.n Databases**

---

## **Retrieval of VisualAge Pacbase 2.0 and 2.5**

### **Foreword**

The installation of the release can be complemented by the execution of utilities procedures.

These procedures are dedicated to prepare the retrieval in the new release.

There are two types of procedures:

#### Procedures to be executed on the 2.5 Database.

See the manual related to the 2.5 utilities used to retrieve a 2.5 version.

These procedures are :

- UTAG : AG file purge,
- UTEG : PIA stamp,
- UTSD : association of keyword to a data structure type.

#### Procedures to be executed on the new Database.

See the 'Appendix' at the end of this manual for a detailed documentation.

These procedures are :

- UTU1 : extraction of 'UNS' lines,
- UTU2 : update of 'UNS' lines.

### **Operations to be Performed**

The installation of this version requires, in the one hand, the retrieval of the AG (generation-print commands file), AE AP (user parameters files) and AB AC (PEI files) files in the new Administration Database, and on the other hand, the retrieval of the old Development Database.

#### Sequence of operations

It consists of seven steps:

1) Backup of all the old files required. You must execute the following procedures in the old version.

- SAVE: backup of the Development Database (PC),
- PARM: backup of the user parameters (PE),
- SVAG: backup of the generation-print commands (PG),
- SVPE: backup of the PEI environment (PP),
- ARCH: backup of the journal (PF).

## 2) Installation of the Administration Database

To install the Administration Database, execute the installation process up to the D07AE0 JCL.

This step creates the GN, GR, GY, GJ and GU files.

You must execute the following JCLs:

- Creation of the Administration Database,
  - D08INGU: creation and initialization of GU user codes file,
  - D08INIAD: creation and initialization of the Database backup file (PE file), and journal backup file (PK file),
  - D08RSAD: initialization of the Administration Database with installation data,
  - D08TINQJ: initialization of the QJ archive file
  - D08XMET: installation of the Administration Model (see the Appendix, at the end of the manual),
- Implementation of the access key from Administrator workbench by executing the following operations:
  - Input of access key,
  - targets definition,
  - key activation.
- Re-organization of the Administration Database if it is mentioned in the execution report of the preceding job (D08XMET).
  - JCLSVAD: backup of the Administration Database,
  - JCLROAD: re-organization of the Administration Database,
  - JCLARAD: initialization of the Administration Database journal file,
  - JCLRSAD: restoration of the Administration Database,
- Retrieval of the old Database data,
  - RPE250: retrieval of user parameters from the PE file which was generated during step 1,
  - RMP250: retrieval of 2.n user passwords (optional),

- JCLSVAD: backup of the Administration Database.

### 3) Retrieval of a Development Database.

To perform this step, the installation process of the Development Database(s) must be run up to the I03INI JCL.

It consists in executing the following JCLs:

- RPC250: retrieval of the old Development Database from the backup of the old Database which was created during step 1, and re-organization of the new Database.
- JCLARCH: archiving of the Development Database,
- I04REST: restoration of the new Development Database from the backup obtained previously; do not forget to specify the Development Database code in the user input of the procedure,
- I05META: installation of the new Database Development Model (see the description in the appendix at the end of this manual and create the MR file to take its transactions into account in the re-organization),

The execution of the following procedures, even if it is not requested in the I05META report, is advised for a better optimization.

- JCLSAVE: backup of the new Development Database,
- JCLREOR: re-organization of new Development Database,
- JCLREST: restoration of the Development Database from the backup file resulting from the preceding re-organization procedure.

Steps 4, 5, 6 and 7 are optional.

### 4) Retrieval of generation-print commands.

It involves executing the following JCLs:

- RPG200: retrieval of a 2.0 PG file,
- RPG250: retrieval of a 2.5 PG file.

### 5) Retrieval of PJ journal

It involves executing the following JCL:

- RPJ250: retrieval of PJ file data.

### 6) Retrieval of PEI files.

It involves executing the following JCLs:

- RPP250: retrieval of PP file,

- RPEI25: PEI retrieval.
- 7) Retrieval of Pac/Transfer parameters (UV).

It involves executing the following JCL:

- RUV250: retrieval of UV file data.

## **Retrieval of User Parameters (PE25)**

### **PE25 - Introduction**

#### Principle

This procedure (PE25) retrieves the PE file resulting from the user parameters backup executed by the PARM procedure, to update the Administration Database.

#### Execution conditions

The Administration Database files must be closed to on-line use.

#### Printed output

This procedure prints a report which indicates the errors encountered.

#### Result

This procedure integrates the 2.0 or 2.5 user parameters into the Administration Database.

#### Notes

If the Database to be retrieved is under RACF control, you cannot connect via the ADMIN code provided upon installation ; you must use an Administrator code of this Database.

The retrieval reinitializes the license assignments.

### **PE25 - Input / Processing / Results**

A '\*' line in which you indicate a user code and password.

An 'A' line (optional) in which you indicate the Administrator's code and name. This line is necessary only if a security system (RACF) is used.

The 'A' line has the following structure:

| <b>Position</b> | <b>Length</b> | <b>Value</b> | <b>Meaning</b>       |
|-----------------|---------------|--------------|----------------------|
| 2               | 1             | 'A'          | Line code            |
| 3               | 8             | bbbbbbbb     | Administrator's code |
| 11              | 36            |              | Administrator's name |

A 'B' line by Database. You indicate in this line the characteristics of the Development Databases that will be managed in the new Administration Database. You must specify:

- the Database code: it is the logical code, which will be indicated upon the Database restoration.
- the Database name
- the transaction code: it is used to connect to the Database in character mode. The \$BASE installation parameter is also used to code the file names.

If the Database code or name is not specified, an error message is sent and the procedure cannot be run.

The 'B' line has the following structure:

| <b>Position</b> | <b>Length</b> | <b>Value</b> | <b>Meaning</b>        |
|-----------------|---------------|--------------|-----------------------|
| 2               | 1             | 'B'          | Line code             |
| 3               | 4             | bbbb         | Logical Database name |
| 7               | 36            |              | Database name         |
| 43              | 4             | cccc         | Transaction code      |

A 'C' line (optional) in which you indicate the code of the Database linked to the Optional Command Lines Set. If the command is common to all the Databases, do not enter this line and the Database code is '\*\*\*\*'.

The 'C' line has the following structure:

| <b>Position</b> | <b>Length</b> | <b>Value</b> | <b>Meaning</b> |
|-----------------|---------------|--------------|----------------|
| 2               | 1             | 'C'          | Line code      |
| 3               | 4             | bbbb         | Database code  |

### **PE25 - Description of Steps**

Input recognition: PTU001

Processing of user parameters (PE): PTU920

| <b>Code</b> | <b>Physical name</b> | <b>Type</b> | <b>Label</b>                                |
|-------------|----------------------|-------------|---------------------------------------------|
| PAC7EN      | &OLDPE               | Input       | User parameters, old version                |
| PAC7AE      | &INDSV..BVPAGE       | Input       | Error messages                              |
| PAC7MB      | &&PE25MB             | Input       | User input                                  |

## **Retrieval of the Development Database (PC25)**

### **PC25 - Introduction**

#### Principle

This procedure (PC25) retrieves the PC file output by the backup of the old Development Database into a PC file with the new format.

#### Execution conditions

None.

#### Printed output

This procedure prints a report which indicates the number of Manuals changed into Volumes, the code of the new Development Database and the number of records output by the PC file.

#### Result

The result of this procedure is a sequential image of the Development Database with the new format. This new PC file must be used as input to the next step: the re-organization step (required).

### **PC25 - Notes on Data Retrieval**

#### Splitting up of the comment description (-G)

The comment description is split up into several descriptions.

- Comments

They include the comments and the COBOL alias (-GC).

Caution

In the 2.0 or 2.5 release, if the type of documentation line was not adapted to the entity type (ex: a generation line in a Data Element), it will become a comment.

- Generation lines

They include the G, P, V and Z line types (-GG).

- Generation parameters

They include the O line type (-GO).

- Error messages management

They include the C, D, F, S, T, U line types (-GE).

- Call of entities via Relations

They include the R line type (-CR).

- Specificity of the Input Aid entity

The type on the input aid description determines the type value on the definition, i.e. 'C' for comments, 'G' for generation parameters or 'O' for generation options. The input aid calls are accessible through -GC, -GG or -GO.

#### **WARNING:**

If there are several type values on the same description in the 2.0 or 2.5 release, an error message is displayed, and the error must be corrected manually.

There again, if the input aid call is wrongly 'Generated' or 'dialogue option', it will become a comment.

**Important:** If in the 2.n release, a line with a type which is not a comment is overridden by a comment line, because of the -G splitting, this override is not transferred to the actual release, it must be done manually in the new Database.

#### Data structures table type

Data Structure with a table type (G, T, M, N) and a Logical View type (V) do not change. All other types (files...) become the Z type. The Report entity is no longer supported by the Data Structure, thus the J type no longer exists.

#### Transformation of U type manuals

Manuals are replaced with volumes, their codes are completed with 'EIBM'.

#### Extension data: User entities, Input Aids, Report Layouts

There are no more continuation records for these entities. There is only one index for each main record and one index for each continuation record. This

Long data is created to concatenate the information included in the previous records. This data can be 1,000 characters long. It is split up into several records. Now a single index is created and it points to the first of these records.

### **PC25 - Input / Processing / Results**

A \* line with the code of the new Development Database.

This line is optional if the Database code indicated in the 2.5 release can be kept. This Database code must have been defined in the Administration Database.

If you do not specify any Database code, an error message is sent and the procedure cannot be run.

This line must be structured in this way:

| Position | Length | Value | Meaning              |
|----------|--------|-------|----------------------|
| 2        | 1      | '*'   | Line code            |
| 3        | 4      | bbbb  | Code of new Database |

### **PC25 - Description of Steps**

Input recognition: PTU001

General processes: PTU911

## Generation-Print Commands Retrieval (PG20)

### PG20 - Introduction

#### Principle

The PG20 procedure retrieves the 2.0 release PG file, sequential image of the generation-print commands, in the format of the new release.

It updates the Development Database with the generation-print commands and the Administration Database with the JCL command lines (displayed on the GP screen with the C4 option in the 2.0 release).

#### Execution conditions

The files of the Administration and Development Databases must be closed to on-line use.

#### Printed output

This procedure outputs a report which contains the errors encountered.

#### Note

The insertion of update transactions is possible only in libraries or sessions already defined in the Database, otherwise they are rejected.

The PG file may contain commands associated with a specific library or session which can be purged later.

The update of a generation-print command associated with an entity is not possible if the entity is not defined.

Example: for the GCP PROGRA command, the PROGRA program must be defined in the Database.

User codes present in the PG file and not present in the Administration Database are automatically created for users who have JCLs.

### **PG20 - Input / Processing / Results**

A \* line with the user code, password and the code of the Development Database for which the JCL command lines were previously updated in the Administration Database.

If you do not specify the user code or the Database code, an error message is sent and the procedure cannot be run.

The line structure is as follows:

| Position | Length | Value    | Meaning   |
|----------|--------|----------|-----------|
| 2        | 1      | '*'      | Line code |
| 3        | 8      | uuuuuuuu | User code |
| 11       | 8      | pppppppp | Password  |

| Position | Length | Value | Meaning       |
|----------|--------|-------|---------------|
| 22       | 4      | cccc  | Database code |

## PG20 - Description of Steps

Input recognition: PTU001

Generation-print commands formatting: PTU908

| Code   | Physical name | Type   | Label                                               |
|--------|---------------|--------|-----------------------------------------------------|
| PAC7IN | &OLDPG        | Input  | Generation-print commands, old release              |
| PAC7OU | &&PG          | Output | Re-formatted generation-print commands (length=150) |

Generation-print commands processing: PTU921

| Code   | Physical name | Type   | Label                                               |
|--------|---------------|--------|-----------------------------------------------------|
| PAC7PG | &&PG          | Input  | Generation-print commands, old release              |
| PAC7AE | &INDSV..BVPAE | Input  | Error labels                                        |
| PAC7MB | &&PG20MB      | Input  | User Entities                                       |
| PAC7GY | &&PACGY       | Output | Generation-print commands transactions (length=310) |
| PAC7GZ | &&PACGZ       | Output | JCL lines transactions (length = 310)               |

## **Generation-Print Commands Retrieval (PG25)**

### **PG25 - Introduction**

#### Principle

The PG25 procedure retrieves the 2.5 PG file, which is the sequential image of the generation-print commands, into the new format.

It updates the Development Database with the generation-print commands and the Administration Database with the JCL command lines (displayed on the GP screen with the C4 option in the 2.5 release).

#### Execution conditions

The files of the Administration and Development Databases must be closed to on-line use.

## Printed output

This procedure prints a report on the errors encountered.

## Note

The insertion of update transactions is possible only in libraries or sessions already defined in the Database, otherwise they are rejected.

The PG file may contain commands associated with a specific library or session which can be purged later.

The update of a generation-print command associated with an entity is not possible if the entity is not defined. Example: for the GCP PROGRA command, the PROGRA program must be defined in the Database.

Any user who has JCL lines for online generation (GP screen, displayed in C4 option) is automatically created in the Administration Database.

## **PG25 - Input / Processing / Results**

A \* line with the user code, password and the code of the Development Database for which the JCL command lines were previously updated in the Administration Database.

If you do not specify the user code or the Database code, an error message is sent and the procedure cannot be run.

The line structure is as follows:

| Position | Length | Value    | Meaning       |
|----------|--------|----------|---------------|
| 2        | 1      | '*'      | Line code     |
| 3        | 8      | uuuuuuuu | User code     |
| 11       | 8      | pppppppp | Password      |
| 22       | 4      | cccc     | Database code |

## **PG25 - Description of Steps**

Input recognition: PTU001

Generation-print commands processing: PTU921

| Code   | Physical name | Type  | Label                                  |
|--------|---------------|-------|----------------------------------------|
| PAC7PG | &OLDPG        | Input | Generation-print commands, old release |

| <b>Code</b> | <b>Physical name</b> | <b>Type</b> | <b>Label</b>                                        |

## **Retrieval of PJ Transactions (PJ25)**

### **PJ25 - Introduction**

#### Principle

This procedure (PJ25) is used to change the PJ file, which is the journal file (transactions sequential file), into a new archive file in the new version format.

#### Execution conditions

None.

#### Printed output

This procedure generates a transaction file which indicates the number of transactions retrieved in their initial 2.n format the number of transactions converted in the new version format and the number of written transactions.

**WARNING:** The number of written transactions can be much higher than the number of read transactions. More than one transaction of the new version can be created from an old 2.n transaction, in particular for the meta entities and user entities.

Some Input Guide call transactions might be incomplete if their content is distributed on more than one transaction and if only one of these transactions is displayed in the journal. A message is displayed in this case.

#### Result

This procedure generates a PJ journal file in the new release format.

#### Comments

This conversion process of the journal is optional. It should be executed if required by the batch procedures (Use of Pac/Transfer).

This retrieval procedure must be used only for a conversion from a 2.0 or 2.5 version into the new version.

To retrieve some transactions, it is sometimes necessary to search for information in the new version Database. But the corresponding data may no longer exist in the new Database (example: session or library deleted). In such a case, the old transaction is retrieved with its 2.n format.

## PJ25 - Description of Steps

Processing of PJ transactions sequential file: PTU918

| Code   | Physical name    | Type   | Label                                       |

```

## **Retrieval of PP file (PP25)**

### **PP25 - Introduction**

#### Principle

This procedure retrieves the 2.0 or 2.5 PP file, which is the sequential image of the Production Environment Interface, and updates the Development Database of the installed version.

#### Execution conditions

The Development Database files must be closed in the on-line mode.

#### Printed output

This procedure outputs a report which indicates the error encountered.

#### Result

The procedure generates a transaction file which contains the existing production environments, the list of the generated entities, the default environments (-GO of the Library), the list of production sessions in the new format, and updates the Development Database of the installed version.

#### Note

Any update transactions in a session or library which is not already defined in the Database will be rejected.

The PP file may contain environments with library codes or sessions to be created or purged later in the 2.0 or 2.5 Database.

When creating environments in the oldest Session (0001 or the Library initialization Session), a default Application is automatically created in the same context.

### **PP25 - Input / Processing / Results**

A '\*' line with a user code and a password.

If the user code is not indicated, an error message is displayed and the procedure cannot be run.

The structure of the line is presented as follows:

| Position | Length | Value    | Meaning                                               |
|----------|--------|----------|-------------------------------------------------------|
| 2        | 1      | '*'      | Line code                                             |
| 3        | 8      | uuuuuuuu | User code                                             |
| 11       | 8      | PPPPPPPP | Password                                              |
| 19       | 3      | '***'    | Option to update the environments<br>in inter-library |
|          |        |          |                                                       |

## PEI Retrieval (RPP2)

### RPP2 - Introduction

#### Principle

This procedure retrieves the old PEI environment from a 2.0 or 2.5 version and updates the Development Database of the version installed.

It takes into account the transactions of environments for which entities are generated.

#### Execution condition

The Development Database files must be closed to on-line use.

#### Result

The result is a Development Database which integrates the migrated environments.

#### Notes

Any update transaction in a Library or a Session which does not exist in the new Database will be rejected.

The prior existence of the target environment is required.

### RPP2 - Input / Processing / Results

A '\*' line with a user code and password, as well as the source environments and the target environment.

If the '\*' line is missing or incorrect, an error message is sent and the procedure cannot be run.

The structure of the line is as follows:

| <b>Pos.</b> | <b>Length</b> | <b>Value</b> | <b>Meaning</b>                                          |
|-------------|---------------|--------------|---------------------------------------------------------|
| 2           | 1             | '*'          | Line code                                               |
| 3           | 8             | uuuuuuuu     | User code                                               |
| 11          | 8             | pppppppp     | Password                                                |
| 19          | 10            | 1234567890   | One-character codes of the environments to be retrieved |
| 29          | 2             | EE           | Code of the target environment                          |

### RPP2 - Description of Steps

Input recognition: PTU001

PEI retrieval. Step 1: PTU950

| <b>Code</b> | <b>Physical name</b> | <b>Type</b> | <b>Label</b>                         |
|-------------|----------------------|-------------|--------------------------------------|
| PAC7PP      | &OLDPP               | Input       | Backup of PEI file (old version)     |
| PAC7MB      | &&RPP2MB             | Input       | User input                           |
| PAC7GY      | &&PP                 | Output      | Intermediate transactions for PTU955 |

PEI retrieval. Step 2: PTU955

| <b>Code</b> | <b>Physical name</b> | <b>Type</b> | <b>Label</b>                                           |
|-------------|----------------------|-------------|--------------------------------------------------------|
| PAC7GY      | &&PP                 | Output      | Intermediate transactions output by PTU950             |
| PAC7GY      | &&PACGY              | Output      | Transactions from production environments (length=310) |
| SORTWK01    |                      | Sort        |                                                        |
| SORTWK02    |                      | Sort        |                                                        |
| SORTWK03    |                      | Sort        |                                                        |

## **Retrieval of passwords (UTMP)**

### **UTMP - Introduction**

#### Principle

The purpose of this procedure is to retrieve the 2.n user passwords, using as input the PE file produced by the backup of users parameters (PARM procedure), and to integrate them into the Administration Database users file.

Passwords are refreshed according to the option specified on the '\*' line.

#### Execution conditions

The users file of the Administration Database must be closed to online use.

#### Printed report

In case of a wrong creation, the procedure prints an error message in display format.

#### Result

The procedure integrates 2.0 or 2.5 user passwords into the Administration Database.

### **UTMP - Description of Steps**

#### 2.N passwords retrieval: PTURMP

| Code   | Physical name | Type  | Label                         |
|--------|---------------|-------|-------------------------------|
| PAC7MB | &&UTMPMB      | Input | User input                    |
| PAC7CE | &OLDPE        | Input | Old version user parameters   |
| PACGGU | &INDSV..BVPGU | Input | Administration Database users |

### **UTMP - Execution JCL**

```

## **Retrieval of Pac/Transfer Parameters (UV25)**

### **UV25 - Introduction**

#### Principle

The UV25 procedure retrieves the UV PacTransfer parameters file, 2.0 or 2.5 release, in the new format.

It updates the Administration Database.

#### Execution conditions

The Administration Database files must be closed to on-line use.

#### Printed output

This procedure prints a report on the errors encountered.

### UV25 - Input / Processing / Results

A '\*' line with a user code, a password and the code of the Development Database concerned by the transfers.

If you do not specify the user code or the Database code, an error message is sent and the procedure cannot be run.

The line structure must be as follows:

| Position | Length | Value    | Meaning       |
|----------|--------|----------|---------------|
| 2        | 1      | '*'      | Line code     |
| 3        | 8      | uuuuuuuu | User code     |
| 11       | 8      | pppppppp | Password      |
| 22       | 4      | cccc     | Database code |

### UV25 - Description of Steps

Input recognition: PTU001

Processing of transfer parameters: PTU922

| Code   | Physical name | Type   | Label                                        |
|--------|---------------|--------|----------------------------------------------|
| PAC7UV | &OLDUV        | Input  | Transfer parameters, old release             |
| PAC7AE | &INDSV..BVPAE | Input  | Error messages                               |
| PAC7MB | &&UV25MB      | Input  | User input                                   |
| PAC7GY | &&PACGY       | Output | Transfer parameter transactions (length=310) |
| PAC7ET |               | Report | Report in case of error                      |

## **MB Transactions exchanges between 2.n & 3.n (MB25)**

### **MB25 - Introduction**

#### Principle

This procedure retrieves the 2.0 or 2.5 UPDT format transactions in the new release.

#### Limits

The User Entities, User Entity Occurrences, Relations, U-type Volumes are not processed.

The P.I.A. calls are processed as comments.

The P.I.A. types change between the 2.n and 3.n versions: to allow the exchange of transactions between these 2 versions, execute, in the 2.n version, the UTFG procedure which assigns the types in the 3.n version.

#### Execution conditions

None.

#### Printed output

This procedure prints a report of the errors encountered.

#### Result

This procedure generates a transaction file for the new version UPDT procedure and a revoked transactions file.

### **MB25 - Description of Steps**

#### MB file retrieval: PTU926

| Code   | Physical name    | Type   | Label                                |
|--------|------------------|--------|--------------------------------------|
| PAC7AE | &INDSV..BVPAE    | Input  | Error messages                       |
| PAC7AR | &INDUV..&BASE.AR | Input  | Development Database data            |

## **GY Transactions exchanges between 2.n & 3.n (GY25)**

### **GY25 - Introduction**

#### Principle

This procedure retrieves the 2.0 or 2.5 UPDP format transactions into the new release.

#### Limits

The User Entities, Relations, U-type Manuals are not processed.

The P.I.A. calls are processed as comments.

The P.I.A. types change between the 2.n and 3.n versions: to allow the transactions exchange between these versions, execute in 2.n the UTFG procedure which assigns the 3.n types.

#### Execution conditions

None.

#### Printed output

This procedure prints a report of the errors encountered.

#### Result

This procedure generates a transaction file for the UPDP procedure of the new release and a revoked transactions file.

### **GY25 - Description of Steps**

#### GY file retrieval: PTU927

## **MB Transactions exchanges between 3.n & 2.n (MB30)**

### **MB30 - Introduction**

#### Principle

This procedure retrieves the UPDT format transactions of the new release to the 2.0 or 2.5 release.

#### Limits

The User Entities, Meta entities, Relations, Descriptions, Keywords, associated Documentation and Relation calls are not processed.

#### Execution conditions

None.

#### Printed output

This procedure prints a report of the errors encountered.

#### Result

This procedure generates a transaction file for the 2.0 or 2.5 UPDT procedure and a revoked transactions file.

## MB30 - Description of Steps

MB file retrieval: PTU928

| Code   | Physical name    | Type   | Label                              |

## **GY Transactions exchanges between 3.n & 2.n (GY30)**

### **GY30 - Introduction**

#### Principle

This procedure retrieves the UPDP format transactions of the new release into the 2.0 or 2.5 release.

#### Limits

The Meta entities, Relations, Descriptions, Keywords, associated Documentation and Relation calls are not processed.

But, User entities are retrieved as 2.n User entity occurrences. The user will have to create the corresponding 2.n user entity.

#### Execution conditions

None.

### Printed output

This procedure prints a report of the errors encountered.

### Result

This procedure generates a transaction file for the 2.0 or 2.5 UPDP procedure and a revoked transactions file.

## **GY30 - Description of Steps**

### GY file retrieval: PTU929

| Code   | Physical name    | Type   | Label                               |

## Retrieval of VisualAge Pacbase 3.0

### Operations to be Performed

The 3.5 version can be installed in the same environment as the 3.0 version.  
This case is considered as a re-installation.

Before, it is recommended to save the Development and Administration Databases (SAVE, ARCH, SVAD, ARAD) in the 3.0 version.

- If this version is installed in the same environment as the 3.0, refer to the 'Re-installation of Server' chapter in this manual.  
After the Administration Model update (VING execution), connect to the Administrator workbench to enter the new access key.
- If this version is installed in a new environment, after the execution of all the steps of the server part installation, the Databases must be restored following the steps:
  - RSAD : restoration of the Administration Database,
  - VING : update of the Administration Model,
  - Connection via the Administration workbench to enter and activate the new access key to the system,
  - REST : restoration of each Development Database,
  - VINS : update of the Development Model for each Development Database.
- In any case, the reorganization of Databases is required (ARCH, SAVE, REOR, REST).

---

# **Chapter 8. Components**

---

## **Server Environment Components**

### **Introduction**

One of the purposes of the product is to manage permanent data in either batch or on-line mode, by using two types of resources:

- Libraries in which the programs which make up the system, and the parameters required to run the system, are stored:
  - One On-Line Program library,
  - One Batch Program library,
  - One library for the common parameters and the Administration Database,
  - One parameter library for each Development Database,
  - One library for the batch procedures' JCLs.
- Permanent files, containing the data handled by the programs defined previously. These files can be classified into two categories:
  - System files, which are not linked to a particular Development Database and remain relatively unchanged,
  - Evolving files which are associated to a Development Database and whose volumes vary according to the updates performed.

### **Security Systems Interface Extension**

Sub-programs are used as interface between VA Pac and the site's security system.

For RACF, the sub-program coded BVPSECRA must be installed in an authorized library by copying the module found in the batch load-modules library (SBVPMBR8) under the name BVPSECUR.

| <b>Program</b> | <b>Security system</b> |
|----------------|------------------------|
| BVPSECRA       | RACF                   |
| BVPTSS         | TOPSECRET Batch        |
| BVPTSSC        | TOPSECRET CICS         |

For more information on the operation of this extension, refer to chapter 'Installation of Server Environment', Subchapter 'Other Installations', 'Security Systems Interface'.

## On-Line Documentation

Besides the libraries described in the preceding subchapters, the VA PAC system includes the AE file which contains the error messages and on-line documentation.

| Characteristics | Value                                     |
|-----------------|-------------------------------------------|
| Size            | approximately 50,000 records per language |
| Organization    | VSAM-KSDS                                 |
| Recsize         | 80                                        |
| CI Size         | 4,096 (data) 1,024 (index)                |
| Key             | 12 (position 0)                           |
| Use             | batch and TP                              |
| Dsname          | &INDSV..BVPAE                             |

## Generation Skeletons

The product also includes the following files:

- A generation skeleton file (SA file) used by the Batch generator function for COBOL API.

| Characteristics | Value                      |
|-----------------|----------------------------|
| Size            | Approx. 69 records         |
| Organization    | VSAM-KSDS                  |
| Recsize         | 4,605                      |
| CI Size         | 5,120 (data) 1,536 (index) |
| Key             | 5 (position 0)             |
| Utilization     | Batch only                 |
| Dsname          | &INDSV..BVPSA              |

- A generation skeleton file (SC file) used by the Batch generator function.

| Characteristics | Value                      |
|-----------------|----------------------------|
| Size            | Approximately 45 records   |
| Organization    | VSAM-KSDS                  |
| Recsize         | 3,204                      |
| CI Size         | 3,584 (data) 1,024 (index) |
| Key             | 4 (position 0)             |
| Dsname          | &INDSV..BVPSC              |

- A generation skeleton file (SG file) used by the On-Line Systems Development and Database generator functions.

| Characteristics | Value                      |
|-----------------|----------------------------|
| Size            | Approx. 450 records        |
| Organization    | VSAM-KSDS                  |
| Recsize         | 4,605                      |
| CI Size         | 5,120 (data) 1,536 (index) |
| Key             | 5 (position 0)             |
| Utilization     | Batch only                 |
| Dsname          | &INDSV..BVPSG              |

- A generation skeleton file (SN file) used by the eBusiness generator function.

| Characteristics | Value                      |
|-----------------|----------------------------|
| Size            | Approx. 350 records        |
| Organization    | VSAM-KSDS                  |
| Recsize         | 4,605                      |
| CI Size         | 5,120 (data) 1,536 (index) |
| Key             | 5 (position 0)             |
| Utilization     | Batch only                 |
| Dsname          | &INDSV..BVPSN              |

- A generation skeleton file (SR file), used by the Reverse generator function.

| Characteristics | Value                    |
|-----------------|--------------------------|
| Size            | Approx. 25 records       |
| Organization    | VSAM-KSDS                |
| Recsize         | 4,605                    |
| CI Size         | 5,120 (data) 512 (index) |
| Key             | 5 (position 0)           |
| Utilization     | Batch only               |
| Dsname          | &INDSV..BVPSR            |

- A generation skeleton file (SP file) used by the PAF function for the generation of extractors.

| <b>Characteristics</b> | <b>Value</b>             |
|------------------------|--------------------------|
| Size                   | Approx. 5 records        |
| Organization           | VSAM-KSDS                |
| Reclsize               | 4,605                    |
| CI Size                | 5,120 (data) 512 (index) |
| Key                    | 5 (position 0)           |
| Utilization            | Batch only               |
| Dsname                 | &INDSV..BVPSP            |

- A skeleton file (SF file) used by the PAF function for the generation of extractors.

| <b>Characteristics</b> | <b>Value</b>          |
|------------------------|-----------------------|
| Size                   | Approx. 3,000 records |
| Organization           | Sequential            |
| Lrecl                  | 119                   |
| Utilization            | Batch only            |
| Dsname                 | &INDSN..BVPSF         |

- A generation skeleton file (SS file), used by the eBusiness generator function.

| <b>Characteristics</b> | <b>Value</b>               |
|------------------------|----------------------------|
| Size                   | Approx. 600 records        |
| Organization           | VSAM-KSDS                  |
| Reclsize               | 4,605                      |
| CI Size                | 5,120 (data) 1,536 (index) |
| Key                    | 5 (position 0)             |
| Utilization            | Batch only                 |
| Dsname                 | &INDSV..BVPSS              |

## Parameters

### System Parameters Library

The VA Pac system parameters library contains all the system utility programs parameters used in the batch procedures for the installation and operation of the Administration and Development Databases, and in the user standard PAF procedures.

| Characteristics | Value                             |
|-----------------|-----------------------------------|
| Size            | Approx. 20 blocks of 6,080 bytes  |
| Organization    | PDS                               |
| DCB             | Recfm=FB, Lrecl=80, Blksize=6,080 |
| Dsname          | &INDSN..BVPSY                     |

The information on names and disks (catalog) is initialized according to the parameters entered upon installation.

### Caution

This information should not be modified except in particular cases.

| Member  | Contents or format    | Special indication |
|---------|-----------------------|--------------------|

- (1) The size depends on the number of PAF requests sent when using the file in on-line mode.
- (2) must be used if DSMS is to be installed.
- (3) Size depending on the number of requests sent by the deep extractor.
- (4) Size depending on the PAF requests sent in the batch mode when using the file.
- (5) Size depending on the GPRT executions. This file contains the execution reports.
- (6) Size depending on the workstation requests. This work file must contain all the A&D workbench requests for each user.

## **Batch Procedure JCL Libraries**

The procedures must be loaded in a special library called PROCLIB.

This library can be an existing library or one specially created for the purpose.

In some cases, its characteristics must be the following ones:

| Characteristics | Value                             |
|-----------------|-----------------------------------|
| Size            | Approx.150 blocks of 6,080 bytes  |
| Organization    | PDS                               |
| DCB             | Recfm=FB, Lrecl=80, Blksize=6,080 |
| Dsname          | user defined.                     |

## **Administration Database**

### **Administration Database Files**

- Data file, GR.

| Characteristics | Value                        |
|-----------------|------------------------------|
| Organization    | VSAM-RRDS                    |
| Recsize         | 144                          |
| CI size         | 4,096                        |
| Utilization     | Batch and on-line            |
| Dsname          | &INDSV..BVPGR                |
| Size            | 27 records per C.I. of 4,096 |

- Extension data file, GY.

| Characteristics | Value                       |
|-----------------|-----------------------------|
| Organization    | VSAM-RRDS                   |
| Recsize         | 1,018                       |
| CI size         | 4,096                       |
| Utilization     | Batch and on-line           |
| Dsname          | &INDSV..BVPGY               |
| Size            | 4 records per C.I. of 4,096 |

- Index file, GN.

| Characteristics | Value                        |
|-----------------|------------------------------|
| Organization    | VSAM-KSDS                    |
| Reccsize        | 59                           |
| CI size         | 4,096 (for index and data)   |
| Key             | 49 (position 0)              |
| Utilization     | Batch and TP                 |
| Dsname          | &INDSV..BVPGN                |
| Size            | 62 records per C.I. of 4,096 |

- Journal file, GJ.

| Characteristics | Value                        |
|-----------------|------------------------------|
| Organization    | VSAM-RRDS                    |
| Reccsize        | 170                          |
| CI size         | 4,096                        |
| Utilization     | Batch and TP                 |
| Dsname          | &INDSV..BVPGJ                |
| Size            | 23 records per C.I. of 4,096 |

- User file, GU.

| Characteristics | Value                        |
|-----------------|------------------------------|
| Organization    | VSAM-KSDS                    |
| Reccsize        | 80                           |
| CI size         | 4,096                        |
| Utilization     | Batch and on-line            |
| Dsname          | &INDSV..BVPGU                |
| Size            | 50 records per C.I. of 4,096 |

This file is sensitive and its backup must be executed in a secure environment of the installation site.

- Journal file of SCM Tools Interface, QJ

| Characteristics | Value     |
|-----------------|-----------|
| Organization    | VSAM-KSDS |
| Reccsize        | 1,105     |
| CI size         | 1,105     |

| Characteristics | Value                       |
|-----------------|-----------------------------|
| Utilization     | Batch and on-line           |
| Dsname          | &INDSV..BVPQJ               |
| Size            | 4 records per C.I. of 4,096 |

## Administration Database Backup

The Administration Database backup consists of two sequential generation files.

- Database backup (PE).

This is a backup file of the Administration Database components: index (GN), Data (GR) and extension (GY) in a sequential format.

| Characteristics | Value                                 |
|-----------------|---------------------------------------|
| Organization    | Sequential, generation                |
| Dsname          | &INDSN..BVPPE(n)                      |
| DCB             | Recfm=VB, Lrecl=1,023, Blksize=27,998 |
| Utilization     | batch                                 |
| Size            | 144 bytes per data item               |
|                 | 1,023 bytes per extension data item   |
|                 | 59 bytes per index                    |

- Journal backup (PK).

The purpose of this file is to store all the update transactions that have affected the Administration Database since its installation and that have passed through the transactions file (GJ).

When the size of this file becomes incompatible with operation requirements, the ARAD procedure enables you to split it into several files, among which only the most recent one is used on a regular basis.

| Characteristics | Value                              |
|-----------------|------------------------------------|
| Organization    | Sequential, generation             |
| Dsname          | &INDSN..BVPPK(n)                   |
| DCB             | Recfm=FB, Lrecl=170, Blksize=6,800 |
| Utilization     | batch                              |

- Backup of SCM module QJ journal

The backup of QJ is the JQ file.

The purpose of this file is to archive the valid transactions already processed by different updates and stored in the QJ journal file.

| Characteristics | Value                                |
|-----------------|--------------------------------------|
| Organization    | Sequential, generation               |
| DSNAME          | &INDSN..BVPJQ(n)                     |
| DCB             | Recfm=FB, Lrecl=1,119, Blksize=1,119 |
| Utilization     | batch                                |

## Development Database

### Development Database Files

These files contain all the data related to development of applications.

- The Data file (AR).

| Characteristics | Value                        |
|-----------------|------------------------------|
| Organization    | VSAM-RRDS                    |
| Reccsize        | 144                          |
| CI size         | 4,096                        |
| Utilization     | Batch and TP                 |
| Dsname          | &INDUV..&BASE.AR             |
| Size            | 27 records per C.I. of 4,096 |

- The extension data file (AY).

| Characteristics | Value                       |
|-----------------|-----------------------------|
| Organization    | VSAM-RRDS                   |
| Reccsize        | 1,018                       |
| CI size         | 4,096                       |
| Utilization     | Batch and On-line           |
| Dsname          | &INDUV..&BASE.AY            |
| Size            | 4 records per C.I. of 4,096 |

- The index file (AN).

| Characteristics | Value     |
|-----------------|-----------|
| Organization    | VSAM-KSDS |

| Characteristics | Value                        |
|-----------------|------------------------------|
| Recsize         | 59                           |
| CI size         | 4,096 (for index and data)   |
| Key             | 49 (position 0)              |
| Utilization     | Batch and On-line            |
| Dsname          | &INDUV..&BASE.AN             |
| Size            | 62 records per C.I. of 4,096 |

- The journal file (AJ).

All the transactions performed on the Database in batch or on-line mode are saved for two reasons:

- To allow Database restoration if the system standard securities were to fail.
- This information may be used for statistical purposes.

These transactions are usually stored in the transactions backup file (PJ). The transactions file is used temporarily, between the moment transactions are processed by the system and the moment they are saved on their final storage medium by the ARCH procedure.

| Characteristics | Value                        |
|-----------------|------------------------------|
| Organization    | VSAM-RRDS                    |
| Recsize         | 170                          |
| CI size         | 4,096                        |
| Utilization     | Batch and on-line            |
| Dsname          | &INDUV..&BASE.AJ             |
| Size            | 23 records per C.I. of 4,096 |

### Development Database Parameters Library

| Characteristics | Value                             |
|-----------------|-----------------------------------|
| Size            | Approx. 10 blocks of 6,080        |
| Organization    | PDS                               |
| DCB             | Recfm=FB, Lrecl=80, Blksize=6,080 |
| Dsname          | &INDUN..&BASE.SY                  |

This library contains the SYSINs of the IDCAMS utility implemented in the batch procedures used for the operations of a Development Database.

The information related to file names and disks (catalog), is initialized according to the initial installation parameters.

- DELETE/DEFINES of the Database files:

Their names have the DFxxnnff format (xx=ROOT, nn=FILE, and ff=suffix of the relevant file.)

Important note: In these members, the VA Pac Database Administrator can modify the size of the files that make up the Database, according to the evolution of this Database.

- LISTCAT of VSAM file AJ (Development Database Journal):

Its name has the LIxxnnAJ format.

### **Development Database Backup Files**

According to the 'Dispatch' option taken into account upon restoration, the Database backup is either made of two sequential generation files (PC and PJ) or of four sequential generation files (PC, PD, PY and PJ).

- Database or Data backup (PC).

This is a sequential backup file of the Development Database components (Data (AR), Index (AN), and extension (AY) if 'Dispatch' option) or of Data only (AR).

| Characteristics | Value                                 |
|-----------------|---------------------------------------|
| Organization    | Sequential, generation                |
| Dsname          | &INDUN..&BASE.PC(n)                   |
| DCB             | Recfm=VB, Lrecl=1,023, Blksize=27,998 |
| Utilization     | Batch                                 |
| Size            | 144 bytes per data item               |
|                 | 1,018 per extension data item         |
|                 | 59 bytes per index                    |

- The backup of the Development Database index (PD) if 'Dispatch' option.

| Characteristics | Value                                 |
|-----------------|---------------------------------------|
| Organization    | Sequential, generation                |
| Dsname          | &INDUN..&BASE.PD(n)                   |
| DCB             | Recfm=VB, Lrecl=1,023, Blksize=27,998 |
| Utilization     | Batch                                 |

| Characteristics | Value              |
|-----------------|--------------------|
| Size            | 59 bytes per index |

- The backup of the Development Database bulk data (PY) if 'Dispatch' option.

| Characteristics | Value                                 |
|-----------------|---------------------------------------|
| Organization    | Sequential, generation                |
| Dsname          | &INDUN..&BASE.PY(n)                   |
| DCB             | Recfm=VB, Lrecl=1,023, Blksize=27,998 |
| Utilization     | Batch                                 |
| Size            | 1,018 bytes per index                 |

- Journal backup (PJ)

The purpose of this file is to store all the update transactions performed in the Development Database since its installation, and that have passed through the transactions file (AJ).

When the size of this file becomes incompatible with operation requirements, the ARCH procedure enables you to split it into several files, among which only the most recent one is used on a regular basis.

| Characteristics | Value                               |
|-----------------|-------------------------------------|
| Organization    | Sequential, generation              |
| Dsname          | &INDUN..&BASE.PJ(n)                 |
| DCB             | Recfm=FB, Lrecl=170, Blksize=27,880 |
| Utilization     | batch                               |

## Modules - Specific Files

### Pac/Impact:

- File of already-impacted criteria (FQ).

| Characteristics | Value                                                                |
|-----------------|----------------------------------------------------------------------|
| Organization    | Sequential with generation                                           |
| DCB             | Recfm=FB, Lrecl=100, Blksize=21,600                                  |
| Dsname          | &INDUN..&USER..&BASE.FQ(n)                                           |
| Utilization     | Memorize the impact search criteria that have already been processed |

- Search criteria or entry points file (FH).

| Characteristics | Value                                                       |
|-----------------|-------------------------------------------------------------|
| Organization    | Sequential with generation                                  |
| DCB             | Recl=160, Blksize=24,000                                    |
| Dsname          | &INDUN..&USER..&BASE.FH(n)                                  |
| Utilization     | Memorize impact search criteria for the next IANA execution |

- Reduced file of criteria for purge (FR).

| Characteristics | Value                                              |
|-----------------|----------------------------------------------------|
| Organization    | Sequential with generation                         |
| DCB             | Recl=72, Blksize=21,600                            |
| Dsname          | &INDUN..&USER..&BASE.FR(n)                         |
| Utilization     | Purge the impact search criteria in a text editor. |

- Impact result file (FO).

| Characteristics | Value                                            |
|-----------------|--------------------------------------------------|
| Organization    | Sequential with generation                       |
| DCB             | Recl=260, Blksize=26,000                         |
| Dsname          | &INDUN..&USER..&BASE.FO(n)                       |
| Utilization     | Memorize all the results of the impact analysis. |

- File of entities to be analyzed (FP).

| Characteristics | Value                                                              |
|-----------------|--------------------------------------------------------------------|
| Organization    | VSAM-KSDS                                                          |
| Recsize         | 33                                                                 |
| CI size         | 4,096                                                              |
| key             | 33 (position 0)                                                    |
| Dsname          | &INDUV..&USER..&BASE.FP                                            |
| Utilization     | Restrict the impact analysis to the entities specified in the file |

## DSMS:

When the DSMS function (refer to the 'DSMS' manual) is available on site, a DSMS file is accessed for each Development Database, in batch and on-line modes.

This file contains the list of the entities concerned by each change. The change number is entered by the user on the Database sign-on screen.

- The DSMS file of the Development Database elements (DC)

| Characteristics | Value                                           |
|-----------------|-------------------------------------------------|
| Organization    | VSAM-KSDS                                       |
| Recsize         | mini 50, maxi 168                               |
| CI size         | 4,096                                           |
| Key             | 31 (position 2)                                 |
| Utilization     | Accessed by batch and on-line updates           |
| Ddname batch    | PAC7DC (Proc. UPDT, REST, RESY)                 |
| Ddname CICS     | ddy0DC (dd=ROOTD, y=ROOT2 of DSMS installation) |

This file is allocated and initialized at the time of the installation of the DSMS Function.

The definition supplied when installing VA Pac must be used if the DSMS has not been installed on the site yet.

#### PAF:

- PAF work file (PA) for PAF-TP and PUF-TP.

All the user on-line programs which access Databases with the same root need an indexed work file to use the PAF and PUF functions.

| Characteristics | Value                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------|
| Organization    | VSAM-KSDS                                                                                     |
| Recsize         | average: 200, maxi: 539                                                                       |
| CI size         | 4,096                                                                                         |
| Key             | 37 (position 2)                                                                               |
| Utilization     | Updated by the BVPTPST and/or BVPTPWS sub-programs, which are called by On-line user programs |
| Dsname          | &INDSV..BVPPA                                                                                 |
| Ddname          | BVPPA                                                                                         |

- Work file for PAF in batch mode

All the user batch programs need an indexed work file to use the PAF function. This file is allocated for the job duration and is destroyed at the end of the job.

| Characteristics | Value                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------|
| Organization    | VSAM-KSDS                                                                                                                  |
| Recsize         | average: 170, maxi: 1,031                                                                                                  |
| CI size         | 4,096                                                                                                                      |
| Key             | 12 (position 0)                                                                                                            |
| Utilization     | Updated by the BVPBBT98 sub- program which is called by BVPBBTST/BVPBBTWS (PAF sub- programs called by the user programs). |
| Dsname          | &INDUV..SYSPAF.&USER                                                                                                       |

#### PAF extension

Extraction master path file (GS), containing the user's extractors and macro-commands.

| Characteristics | Value             |
|-----------------|-------------------|
| Organization    | VSAM-KSDS         |
| Recsize         | 230               |
| CI size         | 4,096             |
| Key             | 49 (position 0)   |
| Utilization     | Batch and On-line |
| Dsname          | &INDUV..BVPGS     |

#### **Complementary Libraries and Files**

Complementary Dictionary files are automatically downloaded via SMP/E in the hlq.SBVPDIC PDS.

#### PQC function

The BVPQCRA and BVPQCRF members contain the standard quality rules.

- Specific members of Pacbench Quality Control function

| Member  | Contents of format         | Comments       |
|---------|----------------------------|----------------|
| BVPQCRA | Sequential file in English | Standard rules |

| <b>Member</b> | <b>Contents of format</b> | <b>Comments</b> |
|---------------|---------------------------|-----------------|
| BVPQCRF       | Sequential file in French | Standard rules  |

MIAM procedure.

The parameters file for the MIAM procedure is automatically supplied by SMP/E in the hlq.SBVPINST PDS.

| <b>Member</b> | <b>Content or format</b> | <b>Remarks</b>                             |
|---------------|--------------------------|--------------------------------------------|
| BVPAMIAM      | Sequential file          | Standard parameters for the procedure MIAM |

---

# Chapter 9. Appendix

---

## Installation of the Administration Database Model

### VING - Introduction

The VING procedure performs the batch update of the Administration Database using transactions provided by IBM. Another file may sometimes be used. For example when the Pacdesign/Pacbench methodology changes.

#### Execution conditions

The Database must be closed to on-line processing.

#### Abnormal execution

Refer to the Administrator's Procedures manual, sub-chapter 'Abnormal Ending'.

When an abend occurs during the execution of the BVPACI30 or BVPACI40 program, the Database is no longer consistent.

Once the problem has been solved, the Database must be reloaded with a retrieval of archived transactions and the VING procedure must be executed again.

### VING - Input / Processing / Results

This procedure requires two types of user input:

- A line which contains the User ID as well as the operation to perform,
- The transactions which enable the creation of IBM Meta Entities and the retrieval of client User Entities with the 'extension' format: the user should never modify the content of these transactions.

The structure of the line is the following:

| Position | Length | Value    | Meaning      |
|----------|--------|----------|--------------|
| 2        | 1      | '*'      | Line code    |
| 3        | 8      | uuuuuuuu | User code    |
| 11       | 8      | pppppppp | Password     |
| 19       | 3      | '***'    | Library code |
| 29       | 4      | 'VINS'   |              |

| Position | Length | Value | Meaning                           |
|----------|--------|-------|-----------------------------------|
| 33       | 1      | T     | Installation of IBM Meta Entities |

### Printed output

The procedure outputs:

- a report listing the executed programs,
- the list of requests with the errors detected if any,
- a report of the updates performed by the installation.

### Result

Once the update is performed, the network is ready for either on line or batch use.

### Note

The extracted transactions to be used by the ROAD procedure are to be written in a file. To do so, take the following line into account (this line is a comment otherwise):

```
'///*VINS.PAC7MR DD DSN=ROADFILE'.
```

## **VING - Description of Steps**

Input recognition: PTU001

Initialization of the KSDS work file: IDCAMS

Check of VSAM files: IDCAMS

### Update of the Administration Database: VING

| Code   | Physical name | Type   | Label                             |
|--------|---------------|--------|-----------------------------------|

## Installation of the Development Database Model

### VINS - Introduction

The VINS procedure performs the batch update of the Development Database using transactions provided by IBM. Another file may sometimes be used (for example when the Pacdesign/Pacbench methodology changes).

Entities are created in inter-Library mode and in the 0001Z session. They can thus be accessed from any Library of the Development Database and from any session.

#### Execution conditions

The Database must be closed to on-line processing.

#### Abnormal execution

Refer to the 'Administrator's Procedures' manual, sub-chapter 'Abnormal Ending'.

When an abend occurs during the execution of the BVPACI30 or BVPACI40 programs, the Database is no longer consistent.

Once the problem has been solved, the Database must be reloaded with a retrieval of archived transactions and the VINS procedure must be executed again.

### VINS - Input / Processing / Results

This procedure requires two types of user input:

- a line which contains the User ID as well as the operation to perform,
- the transactions which enable the creation of IBM Meta Entities and the retrieval of client User Entities with the 'extension' format: the user should never modify the content of these transactions.

The structure of the line is the following:

| Position | Length | Value    | Meaning                           |
|----------|--------|----------|-----------------------------------|
| 2        | 1      | '*       | Line code                         |
| 3        | 8      | uuuuuuuu | User code                         |
| 11       | 8      | pppppppp | Password                          |
| 19       | 3      | '***'    | Library code                      |
| 29       | 4      | 'VINS'   |                                   |
| 33       | 1      | 'T'      | Installation of IBM Meta Entities |

| Position | Length | Value | Meaning                                                |
|----------|--------|-------|--------------------------------------------------------|
|          |        | 'R'   | Retrieval of User Entities with the 'extension' format |
|          |        | ''    | 'T + 'R'                                               |

### Printed output

The procedure prints

- a report listing the executed programs,
- the list of requests with the errors detected if any,
- a report of the updates performed by the installation,
- a report of the updates performed by the retrieval,

### Result

Once the update is performed, the Development Database is ready for either on-line or batch use.

For the retrieval of User Entities with an extension format, a sequential file of purge transactions can be generated (if 'R' in column 33 in the user input). You then have to reorganize the Database with this file as input. The reorganization of the Database with the PC file, saved after the retrieval, is also required if the client user entities of the .PPTEX and .QPAQC meta entities exist in more than one session.

### Note

Extracted transactions to be used as input to the REOR procedure must be copied in a file by taking the following - otherwise comment - line into account:

```
'///*VINS.PAC7MR DD DSN=REORFILE'.
```

## **VINS - Description of Steps**

Input recognition: PTU001

Initialization of the KSDS work file: IDCAMS

Check of VSAM files: IDCAMS

### Update of the Development Database : VINS

## Retrieval utilities

### UTU1 UTU2 - Adaptation of 'UNS' operators

#### UTU1 - Extraction of 'P' lines with 'UNS'

##### Principle

This tool is used to extract the programs' 'P' lines which contain the 'UNS' operator and do not contain anything in the 'Level-Condition type' field. The user will have to check the output file and delete, in this file, all the lines he/she wants to keep as they are. For the other lines, the 'Level-Condition type' field will have to be forced to '99BL' before the execution of the UTU2 procedure.

##### Execution conditions

Enter the name of the result file of the lines to be checked in the startup JCL:  
NOMUT='... '

##### Result

A 'NOMUT' file which contains UNS 'P' lines to be checked.

## **UTU1 - Input / Processing / Results**

No user input.

## **UTU1 - Description of Steps**

Extracting 'P' lines with 'UNS' operator: UTIUN1

| <b>Code</b> | <b>Physical name</b> | <b>Type</b> | <b>Label</b>                                 |
|-------------|----------------------|-------------|----------------------------------------------|
| PAC7PC      | &INDUN..&BASE.PC(0)  | Input       | Sequential image of the Development Database |
| UTUTO       | &NOMUT               | Output      | 'P' lines with 'UNS' to be updated           |

## **UTU1 - Execution JCL**

```

/*
//*- -----
//* VISUALAGE PACBASE
//*
//*- -----
//* EXTRACTION OF LINES "P"
//* WITH OPERATOR "UNS"
//* WITHOUT LEVEL-CONDITION TYPE
//*- -----
//*

//SYSPRINT DD SYSOUT=&OUT
//SYSOUT DD SYSOUT=&OUT
//SYSUDUMP DD SYSOUT=&OUT

```

## **UTU2 - Update of 'P' lines with 'UNS'**

### Principle

This tool is used to update the transactions extracted with the UTU1 procedure.

For all the lines in the input file, the 'Level- Condition type' area is forced to '99BL'.

### Execution conditions

Specify the result file name of the UTU1 procedure in the startup JCL:  
NOMUT='... '

### Result

A new sequential image of the Development Database.

## **UTU2 - Input / Processing / Results**

No user input.

## **UTU2 - Description of Steps**

### Extracting 'P' lines with 'UNS' operator: UTIUN2

| Code   | Physical name        | Type   | Label                                            |
|--------|----------------------|--------|--------------------------------------------------|
| PAC7PC | &INDUN..&BASE.PC(0)  | Input  | Sequential image of the Development Database     |
| UTUTI  | &NOMUT               | Input  | 'P' lines with 'UNS' to be updated               |
| PAC7CP | &INDUN..&BASE.PC(+1) | Output | New sequential image of the Development Database |

## **UTU2 - Execution JCL**

```

```

## **UTM1 UTM2 - Conversion of 'old' Meta Entities**

### Principle

This procedure is a utility whose purpose is to convert the 'old' meta entities into 'formatted' meta entities.

The PC25 procedure retrieves the 2.n user entities into 3.n 'old'-type meta entities. These meta entities cannot be modified.

Once converted, the 'formatted' meta entities can be modified and enriched.

You will have to operate manually during this conversion, which consists of several steps.

### Migration process

#### Step 1: Analysis of the Database relations (UTM1)

In the 3.n version, a relation is associated with one entity type and not with several types as in the 2.n version.

Any 'old'-type relation must be converted into as many relations as the number of entities they are associated with.

This first step consists in searching, in the VA Pacbase Database, the calls to 'old' relations in the description lines of the meta entities and in all the entities.

The list of calls is printed in the output file.

In this file, the '&&' characters separate the printed information from the information in transaction format.

You will have to specify the new relation code.

The old code can be kept if the relation is associated with one entity type only.

Example of transformation:

```
RELAT1 P 220 P PGMXCR CR VAO 2243 && ...
```

modified as:

```
RELATE P 220 P PGMXCR CR VAO 2243 && ...
```

The RELATE relation will then be dedicated to the 'P'-type entity (Program), whereas RELAT1 was dedicated to several entity types.

Note: Only the Relation name, located before the && characters, is to be modified. The continuation of the line must remain as is.

If the same relation code is linked to UEs, but in libraries which belong to different branches, you must rename the relation for each new library.

#### Step 2: Conversion of meta entities, relations and impacted entities and update (UTM2)

- Prior to this conversion, all the relations of the PAC7ME file are checked to ensure that they all point to only one entity type. If they do not, you are requested, via a display, to make them point to only one type and to re-run the UTM2 procedure. The procedure is then stopped.

When the ME file is consistent, the 'old'-type meta entities are converted into 'formatted' meta entities.

- The relations you have selected are modified or created.

If the relation already exists in the Database, it can be kept if it is defined in a convenient context for the calling entity, if it is 'constrained' and if the associated entity type is the same as the chosen type.

If the relation is 'old', it will be changed into 'constrained' and the chosen entity type will be associated with it.

If the existing relation is not suitable, an error message is printed and you will have to choose a new relation code.

All the relations are created in the library and the 'H' session which is the closest to their use.

- Relations calls are updated in the concerned entities (description lines of meta entities and others).
- If errors are detected (return code 8), you will have to modify the input file PAC7ME and start again the UTM2 procedure before the update. Caution, the &UTM2MV permanent file must first be deleted or renamed.

### Update

The update is performed by the BVPACA15 program.

A backup of the Database is recommended before the update.

Only transactions where an error is detected are printed. There may be many rejects because these entities created in the 2.n version are much more controlled in the 3.n version. Manual interventions in the Database are then required.

The transactions are not journalized.

The &UTM2MV transaction file is declared as a permanent file to enable the user to view all the transactions impacted by the update.

### Step 3: Inventory of fixtures

It is recommended to re-execute the first step to make sure that the Database no longer contains calls to 'old'-type relations.

Otherwise, you will have to operate again and re-execute the next steps.

### Step 4: Reorganization

When the conversion is acceptable, you must reorganize the Database.

#### Execution conditions

None during step 1 (UTM1).

For step 2 (update), the AR, AN, AJ and AY files must be closed to online use (except for platforms which allow a Batch/Online concurrency).

#### Printed output

At the end of step 1, a report is printed. It contains the list of the calls to 'old'-type relations.

At the end of step 2 before the update, error messages are printed in display format.

At the end of the update, a report lists the errors encountered.

#### Result

Once the reorganization is performed, the result is a Database free from 'old'-type meta entities and calls to 'old'-type relations.

## UTM1 - Description of Steps

## SMP/E : Delete a prior version

### Introduction

This utility (not provided) is used to delete a VA Pacbase, DSMS or Pactables version in SMP/E.

The PDS of the 'Target zones' (hlq.SBVPxxx) and 'Distribution zones' (hlq.ABVPxxx) files are purged from the components of the previous version and are available for the new installation.

#### Implementation:

- Define an MCS (see below), replacing JBVPxxx with the FMID of the version to be deleted.
- Create and execute the JCL presented below, after valorizing its parameters. This JCL calls the MCS defined just before.

### Examples

MCS TO BE DEFINED :

```

++FUNCTION(DELFUNC)
DESCRIPTION(VISUALAGE PACBASE - CICS)
/* (C) COPYRIGHT IBM CORP 1983, 2007 */.
++VER(Z038)
DELETE(JBVPXXX) .
```

JCL TO BE EXECUTED :

```
$$$$$DDEF JOB ($$$$$$),'DDEF',CLASS=$,MSGCLASS=$
/*-----
/* PERFORM SMP/E DELETING SYSMOD
/*
/* BEFORE USING THIS JOB STEP, YOU WILL HAVE TO MAKE THE
/* FOLLOWING MODIFICATIONS.
/*
/* - CHANGE THE JOB CARD TO MEET THE INSTALLATION REQUIREMENT
/* - CHANGE &SMPE BY THE NAME OF SMPE HLQ ON YOUR SYSTEM
/* - CHANGE &TGT BY THE NAME YOU CHOOSE FOR TARGET ZONE
/* - CHANGE &DLIB BY THE NAME YOU CHOOSE FOR DISTRIBUTION ZONE
/* - CHANGE &USER BY THE PREFIX YOU CHOOSE FOR MCS
/* - CHANGE JBVPXXX BY THE FMID YOU WANT TO DELETE
/*-----
```

```

//COPT EXEC PGM=GIMSMP,COND=(4000,LT),REGION=0M
//SMPCSI DD DSN=&SMPE.GLOBAL.CSI,DISP=OLD
//SMPPTFIN DD DSN=&USER.SMPMCS,DISP=SHR
//SMPCONTL DD DUMMY
//SYSPRINT DD SYSOUT=*
//SMPCNTL DD *
 SET BDY(GLOBAL) /* SET TO GLOBAL ZONE. */.
 RECEIVE S(DELFUNC) /* RECEIVE THE FUNCTION. */.
 SET BDY(&TGT) /* SET TO APPLICABLE TARGET. */.
 APPLY S(DELFUNC) /* APPLY TO DELETE OLD FCT. */.
 SET BDY(&DLIB) /* SET TO APPLICABLE DLIB. */.
 ACCEPT S(DELFUNC) /* ACCEPT TO DELETE OLD */.
 SET BDY(&TGT) /* SET TO APPLICABLE TARGET. */.
 UCLIN.
 DEL SYSMOD(DELFUNC) /* DELETE SYSMOD ENTRIES FOR */.
 DEL SYSMOD(JBVPXXX) /* DUMMY AND OLD FUNCTION. */.
ENDUCL.
 SET BDY(&DLIB) /* SET TO APPLICABLE DLIB. */.
 UCLIN.
 DEL SYSMOD(DELFUNC) /* DELETE SYSMOD ENTRIES FOR */.
 DEL SYSMOD(JBVPXXX) /* DUMMY AND OLD FUNCTION. */.
ENDUCL.
 SET BDY(GLOBAL) /* SET TO GLOBAL ZONE. */.
 REJECT HOLDDATA NOFMID /* REJECT SYSMODS, HOLDDATA */.
 DELETEFMID /* FOR THE DELETED FUNCTIONS.*/
 (DELFUNC JBVPXXX) /* DELETE THE FMIDS FROM THE */
 /* GLOBALZONE ENTRY. */.

```

## **Efficiency enhancement**

The performance of the VisualAge Pacbase system may be improved in batch or on-line mode in several ways, depending on the environment and on the size of the managed VA Pac Databases.

This chapter provides information necessary for efficiency enhancement.

The file, program and JCL installation default options may be modified according to the suggestions described below. It is also possible to enhance efficiency by modifying the system environment, which is not described in this chapter since it depends on the specifications of each site.

Moreover, it is recommended not to modify too many chosen default options, so that the VA Pac Database Manager can retrieve these modifications easily when reinstalling the system.

### **Installation of the Database files**

Where possible, the AN, AR and AY files should be copied onto separate volumes.

For large VA Pac Databases (more than one million data items), it may also be appropriate to allocate the files onto several volumes.

Since the AN file is used in its entirety by the system, it is possible to carry out a multi-volume installation simply by modifying the file's DEFINE in the DFbaseAN member of the VA Pac Database parameter PDS.

## **Resources required under CICS**

In order to improve the VA Pac system efficiency under CICS, two objectives should be pursued:

- reduce program loading time,
- make VSAM buffer management more efficient.

### Program management

The first solution is fairly easy to implement: it requires a frequency survey on program runs. As a result, the programs that are most often used are said to be resident in the CICS partition (RESIDENT(YES) in CSD).

For example, here are the programs most commonly used by the system:

- BVPRADM : Administration Database access subprogram,
- BVPFCHK : read/write of PUF communication area,
- BVPF000 : distributor for PUF folder,
- BVPFCTL : authorizations control,
- BVPFANM : VA Pacbase choice,
- BVPSERR : errors server,
- BVPSSFF0 : meta entities folder,
- BVPR980 : 3270 messages formatting,
- BVPSEFIN : meta entities folder initialization,
- BVPR000 : COMM.3270,PUF-TP,V.LOG server.

### Buffer management

Three parameters associated with the files must be entered in CSD: STRINGS, DATABUFFERS, and INDEXBUFFERS.

- STRINGS:

It specifies the number of strings or requests which can be executed in parallel by VSAM on the same file: usually, a string is used during an input/output on disk.

Certain commands, however, do not follow this rule:

READ UPDATE and STARTBR or RESETBR reserve a string up to the REWRITE or UNLOCK and ENDBR commands, respectively.

- **DATABUFFERS:**

It specifies the number of DATA buffers to be allocated by VSAM upon the file opening. A minimum of two buffers is required: one for the reading of the 'control interval DATA', and one for the 'split' of the 'control interval'.

Default: DATABUFFERS = STRINGS + 1

- **INDEXBUFFERS:**

It specifies the number of INDEX buffers to be allocated by VSAM upon the file opening. The minimum number of buffers per request is one.

It is preferable, however, to increase this number because for a file with three INDEX levels, three EXCP's are required to point to the searched CI DATA for each on-line request.

It is recommended to allocate:

- at least: one buffer per index level, plus one buffer per string (STRING value).
- no more than: one buffer per CI of INDEX SET, plus one buffer per string.

### Conclusion

A sufficient number of buffers should be provided for, according to the number of strings.

However, too many buffers may lead to an excessive pagination, and therefore EXCP's.
