

# WebSphere Application Server Liberty

*Version 8 Release 5*

---

# Contents

## Chapter 1. Liberty overview . . . . . 1

Liberty: zero-migration architecture. . . . .	2
Java EE 7 in Liberty . . . . .	4
Liberty:Architecture . . . . .	6
Java EE 7 programming model support . . . . .	9
Java EE 6 programming model support . . . . .	13
Supported Java EE 6 and 7 feature combinations	16
Java EE 7 behavior changes . . . . .	17
Enterprise OSGi programming model support. . . . .	18
Liberty externals support. . . . .	19
Liberty:Server configuration . . . . .	21
Activation Specification (activationSpec). . . . .	22
Microsoft Active Directory LDAP Filters	
(activatedLdapFilterProperties) . . . . .	23
Administered Object (adminObject) . . . . .	24
Administrator Role (administrator-role) . . . . .	24
API Discovery (apiDiscovery) . . . . .	24
Application (application) . . . . .	25
Application Manager (applicationManager). . . . .	37
Application Monitoring (applicationMonitor) . . . . .	38
z/OS Connect SMF Audit Interceptor	
(auditInterceptor) . . . . .	39
Authentication Cache (authCache). . . . .	39
Authentication Data (authData). . . . .	39
Authentication Filter (authFilter) . . . . .	40
Authentication (authentication) . . . . .	42
Feature Authorization Role Mapping	
(authorization-roles) . . . . .	42
z/OS Connect Authorization Interceptor	
(authorizationInterceptor). . . . .	43
Basic User Registry (basicRegistry) . . . . .	44
Batch JMS Dispatcher (batchJmsDispatcher) . . . . .	45
Batch JMS Events (batchJmsEvents) . . . . .	62
Batch JMS Executor (batchJmsExecutor) . . . . .	74
Batch Job Logging (batchJobLogging) . . . . .	103
Batch Persistence (batchPersistence) . . . . .	103
BELL (bell) . . . . .	155
OSGi Applications Bundle Repository	
(bundleRepository) . . . . .	157
Contexts And Dependency Injection (CDI) V1.2	
(cdi12). . . . .	158
CDI Container (cdiContainer) . . . . .	158
Channel Framework (channelfw) . . . . .	158
Classloading (classloading) . . . . .	159
Cloudant Builder (cloudant) . . . . .	159
Cloudant Database (cloudantDatabase) . . . . .	165
Cluster Member (clusterMember). . . . .	171
WebSphere Cluster Manager	
(clusterPluginConfig) . . . . .	171
Certificate Authority Signed Certificate	
(collectiveCertificate) . . . . .	171
Collective Controller (collectiveController). . . . .	172
Collective Member (collectiveMember) . . . . .	173
WebSphere Collective Repository MBean	
(collectiveRepository). . . . .	174
Configuration Management (config) . . . . .	174

Connection Factory (connectionFactory) . . . . .	176
Connection Manager (connectionManager) . . . . .	180
Thread Context Propagation (contextService) . . . . .	182
Cross-Origin Resource Sharing (cors) . . . . .	186
CouchDB (couchdb) . . . . .	187
Custom LDAP Filters	
(customLdapFilterProperties) . . . . .	190
Data Source (dataSource) . . . . .	191
Database Store (databaseStore) . . . . .	240
DeployManager (deployManager) . . . . .	291
Deploy Rule (deployRule) . . . . .	291
DeployVariable (deployVariable) . . . . .	292
Distributed Map (distributedMap) . . . . .	292
SIP Domain Resolver (domainResolver) . . . . .	296
IBM Lotus Domino LDAP Filters	
(domino50LdapFilterProperties) . . . . .	297
Dynamic Routing (dynamicRouting). . . . .	298
Novell eDirectory LDAP Filters	
(edirectoryLdapFilterProperties) . . . . .	301
EJB Application (ejbApplication) . . . . .	301
EJB Container (ejbContainer) . . . . .	308
Enterprise Application (enterpriseApplication) . . . . .	322
Event Logging (eventLogging). . . . .	335
Executor Management (executor) . . . . .	336
Feature Manager (featureManager) . . . . .	339
User Registry Federation (federatedRepository) . . . . .	339
z/OS Connect File System Logger Interceptor	
(fileSystemloggerInterceptor) . . . . .	349
Fileset (fileset) . . . . .	350
Health Policy (healthPolicy) . . . . .	351
Host Access (hostAccess) . . . . .	354
Host Authentication Information (hostAuthInfo) . . . . .	355
Host Singleton (hostSingleton). . . . .	357
HTTP Access Logging (httpAccessLogging) . . . . .	357
HTTP Dispatcher (httpDispatcher) . . . . .	358
HTTP Transport Encoding (httpEncoding) . . . . .	358
HTTP Endpoint (httpEndpoint) . . . . .	361
HTTP Options (httpOptions) . . . . .	366
HTTP Proxy Redirect (httpProxyRedirect) . . . . .	367
HTTP Session (httpSession). . . . .	368
HTTP Session Database (httpSessionDatabase) . . . . .	373
HTTP Whiteboard (httpWhiteboard). . . . .	379
IBM Tivoli Directory Server LDAP Filters	
(idsLdapFilterProperties) . . . . .	380
IIOP Endpoint (iiopEndpoint) . . . . .	380
IIOP Server Policies (iiopServerPolicies) . . . . .	382
Include (include) . . . . .	382
Installable (installable) . . . . .	383
Sun Java System Directory Server LDAP Filters	
(iplanetLdapFilterProperties) . . . . .	383
JAAS Login Context Entry	
(jaasLoginContextEntry) . . . . .	384
JAAS Login Module (jaasLoginModule) . . . . .	384
Java 2 Security (javaPermission) . . . . .	387
JDBC Driver (jdbcDriver) . . . . .	388
JMS Activation Specification (jmsActivationSpec) . . . . .	390

JMS Connection Factory (jmsConnectionFactory)	403	SAML Web SSO 2.0 Authentication (samlWebSso20)	682
JMS Destination (jmsDestination)	415	Scaling Definitions (scalingDefinitions)	692
JMS Queue (jmsQueue)	415	Scaling Member (scalingMember)	698
JMS Queue Connection Factory (jmsQueueConnectionFactory)	419	IBM SecureWay Directory Server LDAP Filters (securewayLdapFilterProperties)	699
JMS Topic (jmsTopic)	429	Server Commands MBean (serverCommands)	699
JMS Topic Connection Factory (jmsTopicConnectionFactory)	433	SIP Application Router (sipApplicationRouter)	700
JNDI Entry (jndiEntry)	445	SIP Container (sipContainer)	700
JNDI Object Factory (jndiObjectFactory)	445	SIP Endpoint (sipEndpoint)	702
JNDI Reference Entry (jndiReferenceEntry)	447	SIP Stack (sipStack)	704
JNDI URL Entry (jndiURLEntry)	449	Spnego Authentication (spnego)	710
JPA Container (jpa)	450	SSL Repertoire (ssl)	713
JSP Engine (jspEngine)	451	SSL Default Repertoire (sslDefault)	715
Keystore (keyStore)	452	SSL Options (sslOptions)	715
LDAP User Registry (ldapRegistry)	454	Stack Group (stackGroup)	716
Shared Library (library)	466	Stack Manager (stackManager)	718
WebSphere Optimized Local Adapters (WOLA) Connect (localAdaptersConnectService)	468	Sync-to-OS-thread (syncToOSThread)	719
Logging (logging)	472	TCP Options (tcpOptions)	719
Logstash Collector (logstashCollector)	474	Timed Operation (timedOperation)	721
LTPA Token (ltpa)	475	Transaction Manager (transaction)	722
Mail Session Object (mailSession)	475	Trust Association Interceptor (trustAssociation)	775
Managed Executor (managedExecutorService)	476	User Information (userInfo)	777
Managed Scheduled Executor (managedScheduledExecutorService)	480	Variable Declaration (variable)	778
Managed Thread Factory (managedThreadFactory)	485	Virtual Host (virtualHost)	778
Messaging Engine (messagingEngine)	490	WAS JMS Endpoint (wasJmsEndpoint)	782
Default Mime Types (mimeTypes)	496	WAS JMS Outbound (wasJmsOutbound)	784
Mongo (mongo)	496	Web Container Application Security (webAppSecurity)	786
MongoDB DB (mongoDB)	501	Web Application (webApplication)	790
Monitor (monitor)	507	Web Container (webContainer)	797
RRS Native Transaction Manager (nativeTransactionManager)	508	WLM Classification (wlmClassification)	802
Netscape Directory Server LDAP Filters (netscapeLdapFilterProperties)	508	WebSphere MQ Messaging (wmqJmsClient)	803
OAuth Role Map (oauth-roles)	509	WS-AtomicTransaction (wsAtomicTransaction)	804
OAuth Provider Definition (oauthProvider)	511	WS-Security Client (wsSecurityClient)	805
OpenId Authentication (openId)	570	WS-Security Provider (wsSecurityProvider)	806
OpenID Connect Client (openidConnectClient)	574	WAS WebSocket Outbound (wsocOutbound)	810
OpenID Connect Server Provider (openidConnectProvider)	580	z/OS Connect Data Transformer (zosConnectDataXform)	813
Object Request Broker (ORB) (orb)	644	z/OS Connect Interceptors (zosConnectInterceptors)	814
OSGi Application (osgiApplication)	650	z/OS Connect Manager (zosConnectManager)	814
OSGi Applications (osgiApplications)	653	z/OS Connect Endpoint (zosConnectService)	817
OSGi Library (osgiLibrary)	653	z/OS Connect REST Client (zosConnectServiceRestClient)	821
Package (package)	655	z/OS Connect Rest Client Basic Authentication (zosConnectServiceRestClientBasicAuth)	823
Persistent Scheduled Executor (persistentExecutor)	655	WOLA (zosLocalAdapters)	823
Web Server Plugin (pluginConfiguration)	661	z/OS Logging (zosLogging)	824
Quick Start Security (quickStartSecurity)	669	WLM Native Enclave Manager (zosWorkloadManager)	824
Remote File Access (remoteFileAccess)	669	Liberty: Feature management	824
Request Timing (requestTiming)	670	Liberty features	826
Resource Adapter (resourceAdapter)	670	Liberty Kernel	964
Real-Time Communications (rtcomm)	676	Liberty: Liberty Repository	965
SAF Authorization (safAuthorization)	680	Liberty profile: Product extension	967
SAF Credentials (safCredentials)	681	Liberty: Security	971
SAF User Registry (safRegistry)	682	Liberty:Quick overview of security	975
SAF Role Mapper (safRoleMapper)	682	Liberty:Authentication	976
		Liberty: Authorization	999

Security on the Liberty application client container . . . . .	1001
Liberty: Java 2 Security . . . . .	1002
Liberty:Security public APIs . . . . .	1004
Configuration differences between the traditional and Liberty: security . . . . .	1008
Liberty:The limits to protection through password encryption . . . . .	1009
Liberty:JMS messaging . . . . .	1010
Liberty JMS messaging providers . . . . .	1010
JMS messaging (wasJmsClient-2.0) behavior changes . . . . .	1014
Java Persistence API (JPA). . . . .	1015
Java Persistence API (JPA) feature overview	1016
Java Persistence API 2.1 behavior changes . . . . .	1017
Liberty profile: Process types on z/OS . . . . .	1019
IBM z/OS Connect overview . . . . .	1020
Liberty:Binary logging . . . . .	1023
BinaryLog command options . . . . .	1027
Configuring binary logging in Liberty . . . . .	1031
Liberty: Session Initiation Protocol (SIP) . . . . .	1033
Session Initiation Protocol (SIP) applications on Liberty . . . . .	1033
Session Initiation Protocol (SIP) container on Liberty . . . . .	1035
SIP industry standards compliance on Liberty	1035
Liberty: Real-Time Communications . . . . .	1038
Configuring Liberty Real-Time Communications . . . . .	1039
Using the rtcomm-1.0 WebRTC JavaScript client and services . . . . .	1042
Configuring a Rtcomm Gateway . . . . .	1042
Configuring Security for the rtcomm-1.0 Feature . . . . .	1044
Configuring the Media Server Control Feature	1046
Multimedia . . . . .	1046
Video: Comparing collectives and cells . . . . .	1047
Video: Configure session cache management with Liberty and WebSphere eXtreme Scale . . . . .	1049
Video: Configuring a Liberty auto-scalable cluster for JVM elasticity . . . . .	1055
Video: Configuring an auto-scalable cluster for Liberty elasticity . . . . .	1059
Video: DevOps with WebSphere Liberty Server	1069
Video: Enabling IHS for Liberty Dynamic Routing . . . . .	1074
Video: Getting started with the Server Configuration Tool for WebSphere Liberty . . . . .	1078
Video: Google OpenID Connect for applications on WebSphere Liberty . . . . .	1079
Video: Health management for Liberty collectives . . . . .	1084
Video: Installing Liberty from a ZIP file . . . . .	1086
Video: Introduction to creating a collective	1088
Video: Java EE 7 in Liberty . . . . .	1092
Video: OpenID Connect on Liberty . . . . .	1098
Video: Setting up Admin Center . . . . .	1104
Video: Thoughts on Liberty: Interview with Alasdair Nottingham . . . . .	1106
Video: Touring Admin Center . . . . .	1107

Video: Using the IBM WebSphere Liberty Repository to enhance Liberty environments . . . . .	1108
Video: Why Liberty? Performance that scales	1110
Video: Why Liberty? Fast application development . . . . .	1113
Video: Why Liberty? Rapid deployment and powerful administration . . . . .	1114
Notices . . . . .	1116
Privacy Policy Considerations . . . . .	1119

## Chapter 2. End-to-end paths for Liberty . . . . . 1121

Enabling JMS messaging for Liberty . . . . .	1121
Enabling JMS messaging for a single Liberty server . . . . .	1122
Enabling JMS messaging between two Liberty servers . . . . .	1124
Enabling secure JMS messaging for Liberty	1126
Enabling interoperability between Liberty and WebSphere Application Server traditional . . . . .	1130
Configuring connection pooling for JMS connections . . . . .	1132
Securing JMS communications in Liberty by using SSL . . . . .	1133
Setting up the server-management environment for Liberty by using collectives . . . . .	1134
Configuring a Liberty collective . . . . .	1136
Registering host computers with a Liberty collective . . . . .	1142
Overriding Liberty server host information	1144
Setting the JAVA_HOME variable for Liberty collective members . . . . .	1147
Configuring Liberty collective replica sets . . . . .	1148
Setting up Liberty server clusters . . . . .	1153

## Chapter 3. Migrating applications to Liberty . . . . . 1157

Migrating data access applications to Liberty . . . . .	1157
Configuration differences between the traditional and Liberty: dataSource and jdbcDriver elements . . . . .	1157
Configuration differences between the traditional and Liberty: connectionManager element . . . . .	1158
Migrating a DB2 data source to Liberty . . . . .	1159
Migrating a Derby embedded data source to Liberty . . . . .	1161

## Chapter 4. Installing Liberty . . . . . 1163

Installing and uninstalling Liberty using Installation Manager . . . . .	1164
Installing and uninstalling Liberty on distributed operating systems . . . . .	1165
Installing and uninstalling Liberty on IBM i operating systems . . . . .	1292
Installing Liberty on z/OS . . . . .	1343
Installing and uninstalling Liberty using downloaded files and archives . . . . .	1371
Installing Liberty developer tools and (optionally) Liberty . . . . .	1374

Installing Liberty by extracting a Java archive file . . . . .	1374
Installing Liberty by extracting a ZIP archive file . . . . .	1381
Upgrading Liberty installations . . . . .	1386
Applying an interim fix to a Liberty archive installation . . . . .	1388
Configuring the Liberty server to start as a job in the QWAS85 subsystem on IBM i . . . . .	1390
Uninstalling Liberty application-serving environment from IBM i operating systems . . . . .	1390
Installing Liberty Repository assets . . . . .	1391
Installing assets using the installUtility command . . . . .	1393
Installing assets using the featureManager command . . . . .	1403
Installing assets using Installation Manager . . . . .	1411
Installing assets by using developer tools . . . . .	1413
Verifying the integrity of Liberty installation . . . . .	1414
Liberty:productInfo command . . . . .	1415
Docker support in Liberty . . . . .	1416
Accessing a remote Liberty server in a Docker container by using developer tools . . . . .	1417
Liberty and Chef . . . . .	1418
Installing the OpenShift Cartridge for Liberty . . . . .	1418
Installing the IBM WebSphere Application Server Liberty Buildpack into a Cloud Foundry Environment . . . . .	1420
Structure a Liberty repository for personal binary files . . . . .	1421
<b>Chapter 5. Setting up Liberty . . . . .</b>	<b>1423</b>
Creating a Liberty server manually . . . . .	1423
Creating a Liberty server by using developer tools . . . . .	1424
Creating a remote Liberty server by using developer tools . . . . .	1427
Creating a workbench Liberty server in a Docker container by using developer tools . . . . .	1430
Liberty:Directory locations and properties . . . . .	1434
Specifying Liberty bootstrap properties . . . . .	1437
Setting the default host name of a Liberty server . . . . .	1439
Liberty: Default port numbers . . . . .	1440
Using virtual hosts . . . . .	1441
Isolating two applications from each other . . . . .	1441
Isolating applications based on the requested host or port . . . . .	1442
Restricting access based on originating endpoint . . . . .	1442
Virtual hosts . . . . .	1443
Preparing and running an application client . . . . .	1445
Creating a Liberty application client manually . . . . .	1446
Creating a Liberty application client with multiple client modules . . . . .	1447
Setting up the server-management environment for Liberty by using collectives . . . . .	1448
Liberty: Collective architecture . . . . .	1450
Liberty: Collective security . . . . .	1453
Configuring a Liberty collective . . . . .	1454
Overriding Liberty server host information . . . . .	1461
Starting and stopping a Liberty collective member . . . . .	1463

Registering host computers with a Liberty collective . . . . .	1464
Configuring Liberty collective replica sets . . . . .	1467
Generating collective controller SSL keys . . . . .	1475
Setting administrative metadata for Liberty resources . . . . .	1476
Updating a Liberty collective . . . . .	1480
Setting up Liberty server clusters . . . . .	1485
Setting the JAVA_HOME variable for Liberty collective members . . . . .	1490
Setting up RXA for Liberty collective operations . . . . .	1491
Setting up dynamic routing for Liberty collectives . . . . .	1493
Setting up auto scaling for Liberty collectives . . . . .	1503
Entering maintenance mode for Liberty collectives . . . . .	1516
Configuring health management for Liberty Liberty collective troubleshooting . . . . .	1519
Setting up a Liberty server to use Bluemix services . . . . .	1529
bluemixUtility command . . . . .	1529
Configuring Liberty for Bluemix Cloudant services . . . . .	1533
Configuring Liberty for Bluemix Watson services . . . . .	1535
Setting up a Liberty Server for use with z/OS Connect . . . . .	1536
Setting up z/OS Connect . . . . .	1536
Defining z/OS Connect services . . . . .	1537
Setting up the z/OS Connect REST client service . . . . .	1541
Defining z/OS Connect interceptors . . . . .	1542
Setting up the z/OS Connect file system logger interceptor . . . . .	1544
Defining z/OS Connect message payload transformations . . . . .	1545
Auditing and tracking with z/OS Connect . . . . .	1548
z/OS Connect high availability . . . . .	1550
Configuring security for z/OS Connect . . . . .	1550
Platform-as-a-service environment considerations for setting up Liberty . . . . .	1553
<b>Chapter 6. Administering Liberty . . . . .</b>	<b>1555</b>
XML escape characters . . . . .	1555
Administering Liberty by using developer tools . . . . .	1556
Editing the Liberty configuration by using developer tools . . . . .	1556
Specifying the Liberty configuration with dropins files by using developer tools . . . . .	1557
Starting and stopping a server by using developer tools . . . . .	1558
Switching a Liberty Docker server between run and debug mode by using developer tools . . . . .	1558
Defining a utility project as a shared library . . . . .	1559
Exploring the runtime environment by using developer tools . . . . .	1561
Displaying the server configuration in a merged view . . . . .	1562
Viewing the schema documentation for the server configuration . . . . .	1563

Generating a Liberty server dump using developer tools . . . . .	1563
Packaging a Liberty server by using developer tools . . . . .	1563
Adding a data source by using developer tools	1564
Administering Liberty manually. . . . .	1564
Customizing the Liberty environment . . . . .	1565
Administering Liberty from the command line	1567
Adding and removing Liberty features . . . . .	1587
Using include elements, variables, and Ref tags in configuration files . . . . .	1588
Controlling dynamic updates. . . . .	1594
Configuring class loaders and libraries for Java EE applications . . . . .	1596
Configuring libraries for OSGi applications	1600
Configuring JPA for Liberty . . . . .	1601
Configuring a web server plug-in for Liberty	1604
Configuring session persistence for Liberty	1610
Configuring and deploying a basic JCA ResourceAdapter . . . . .	1612
Configuring ManagedExecutorService instances	1633
Configuring thread context service instances	1635
Configuring managed scheduled executors	1637
Configuring managed thread factories. . . . .	1639
Connecting to Liberty by using JMX . . . . .	1641
Establishing a JMX MBean Liberty server connection . . . . .	1658
Liberty: File transfer. . . . .	1660
Transferring files in a Liberty collective . . . . .	1660
Configuring binary logging in Liberty. . . . .	1667
Administering the transaction service on Liberty . . . . .	1668
Administering data access resources on Liberty	1672
Administering web applications on Liberty	1712
Administering Contexts and Dependency Injection applications on Liberty. . . . .	1725
Administering Session Initiation Protocol (SIP) on Liberty . . . . .	1728
Administering JavaMail on Liberty. . . . .	1730
Administering Liberty on z/OS . . . . .	1731
Administering Liberty using Admin Center . . . . .	1741
Setting up Admin Center . . . . .	1742
Logging in to Admin Center . . . . .	1745
Customizing the Toolbox . . . . .	1746
Editing server configuration files in Admin Center . . . . .	1748
Exploring and managing resources with Admin Center . . . . .	1749
Deploying resources with Admin Center . . . . .	1761
Monitoring background tasks . . . . .	1764
Configuration updates . . . . .	1766
Liberty and Chef . . . . .	1767
Liberty:Including configuration information from external xml files in the server.xml file . . . . .	1767
Liberty:Configuration element merging rules . . . . .	1768

## Chapter 7. Extending Liberty . . . . 1771

Developing a Liberty feature for Liberty . . . . .	1771
Developing a Liberty feature manually . . . . .	1771
Creating a Liberty feature by using developer tools . . . . .	1782

Developing an OSGi bundle with simple activation . . . . .	1788
Composing advanced features by using OSGi Declarative Services . . . . .	1793
Advanced Configuration . . . . .	1798
Providing an application endpoint . . . . .	1808
Liberty SPI utilities . . . . .	1808
Including protected features . . . . .	1816
Locating OSGi applications . . . . .	1818
Developing with the JNDI default namespace in a Liberty feature . . . . .	1819
Developing a custom TAI as a Liberty feature	1820
Dynamic content management . . . . .	1821
Packaging and installing Liberty features. . . . .	1822
Provide product information for your feature extension . . . . .	1823
Embedding Liberty in your applications . . . . .	1824
Creating Liberty servers from custom configurations. . . . .	1826
Disabling z/OS operator console command handling in the Liberty server . . . . .	1826

## Chapter 8. Securing Liberty and its applications . . . . . 1829

Getting started with security in Liberty . . . . .	1829
Liberty:Quick overview of security . . . . .	1831
Setting up BasicRegistry and role mapping on Liberty . . . . .	1832
Securing communications in Liberty . . . . .	1833
Enabling SSL communication in Liberty . . . . .	1834
Creating SSL certificates for your Liberty using the Utilities menu . . . . .	1844
Creating SSL certificates from the command line . . . . .	1844
Configuring your web application and server for client certificate authentication . . . . .	1847
Setting up Liberty to run in SP800-131a . . . . .	1848
Configuring an httpEndpoint to use an SSL configuration other than the default . . . . .	1850
Authenticating users in Liberty . . . . .	1850
Configuring a user registry for Liberty . . . . .	1851
Configuring the authentication cache in Liberty	1867
Configuring a JAAS custom login module for Liberty . . . . .	1868
Configuring a Java Authentication SPI for Containers (JASPIC) User Feature . . . . .	1871
Configuring LTPA in Liberty . . . . .	1872
OpenID . . . . .	1873
OpenID Connect . . . . .	1875
Configuring an OpenID Relying Party in Liberty . . . . .	1878
Configuring SPNEGO authentication in Liberty	1879
Customizing SSO configuration using LTPA cookies in Liberty . . . . .	1887
Configuring RunAs authentication in Liberty	1888
Configuring TAI in Liberty . . . . .	1889
Configuring a custom form login page . . . . .	1891
Configuring SAML Web Browser SSO in Liberty . . . . .	1893
Using OpenID Connect. . . . .	1897
Authentication Filters . . . . .	1937

Authorizing access to resources in Liberty . . . . .	1939
Configuring authorization for applications in Liberty . . . . .	1939
Enabling z/OS authorized services in Liberty for z/OS . . . . .	1942
Configuring distributed identity filters in z/OS security . . . . .	1948
Securing optimized local adapters on Liberty for z/OS . . . . .	1949
Configuring security authorization for Liberty servers on IBM i . . . . .	1952
OAuth . . . . .	1953
Configuring Common Secure Interoperability version 2 (CSIv2) in Liberty . . . . .	1973
Configuring inbound CSIv2 in Liberty . . . . .	1974
Configuring outbound CSIv2 in Liberty . . . . .	1979
Configuring security for the Liberty application client container and its applications . . . . .	1984
Enabling SSL communication for the Liberty application client container . . . . .	1984
Configuring a JAAS programmatic login on the Liberty application client container . . . . .	1986
Configuring a JAAS custom login module for the Liberty application client container . . . . .	1988

## **Index . . . . . 2355**

---

## Chapter 1. Liberty overview

Liberty is a highly composable, fast to start, dynamic application server runtime environment.

You can install the server as described in “Installing and uninstalling Liberty using downloaded files and archives” on page 1371.

Because Liberty does not include a Java™ runtime environment (JRE), you must install a compliant Java implementation (JRE or SDK) beforehand. For more information about supported Java environments, and where to get them, see “Minimum supported Java levels” on page 2333.

This server supports two models of application deployment:

- Deploy an application by dropping it into the `dropins` directory.
- Deploy an application by adding it to the server configuration file.

Liberty supports a subset of the following parts of the full WebSphere® Application Server programming model:

- Web applications
- OSGi applications
- **8.5.5.0** Enterprise JavaBeans (EJB) applications

Associated services such as transactions and security are available to these application types.

Features are the units of functionality by which you control the pieces of the runtime environment that are loaded into a particular server. For a list of the main Liberty features, see “Liberty features” on page 826.

**8.5.5.0** You can also create your own features, as described in Chapter 7, “Extending Liberty,” on page 1771.

**8.5.5.2** You can work with the runtime environment directly, or use the WebSphere Application Server Developer Tools for Eclipse. Further, you can use Admin Center to administer Liberty servers and applications and other resources from a web browser. See Chapter 6, “Administering Liberty,” on page 1555.

On distributed platforms, Liberty provides both a development and an operational environment. On Mac OS, it provides a development environment.

**z/OS** On z/OS® systems, Liberty provides an operations environment. You can work natively with this environment by using the MVS™ console. For application development, consider using the Eclipse-based developer tools on a separate distributed system, or on Mac OS.

You can organize Liberty servers into collectives to support clustering, administration, and other operations that act on multiple Liberty servers at a time in order to efficiently and accurately deliver application services to your organization. See “Liberty: Collective architecture” on page 1450 for more information.

---

## Liberty: zero-migration architecture

With the Liberty zero-migration architecture, you can move to the latest version of Liberty with minimal impact to your current applications and configurations.

Zero-migration architecture means that you can use existing, unmodified configuration and application files with an updated version of the Liberty runtime environment without unwanted or unexpected change in behavior. With the following two aspects of architecture, you almost never need to make changes:

### Full compatibility between product versions

You can update Liberty without migrating your configuration files.

### Pluggable features

Your existing APIs and behaviors are supported in new product versions, and new APIs and behaviors are added in new features.

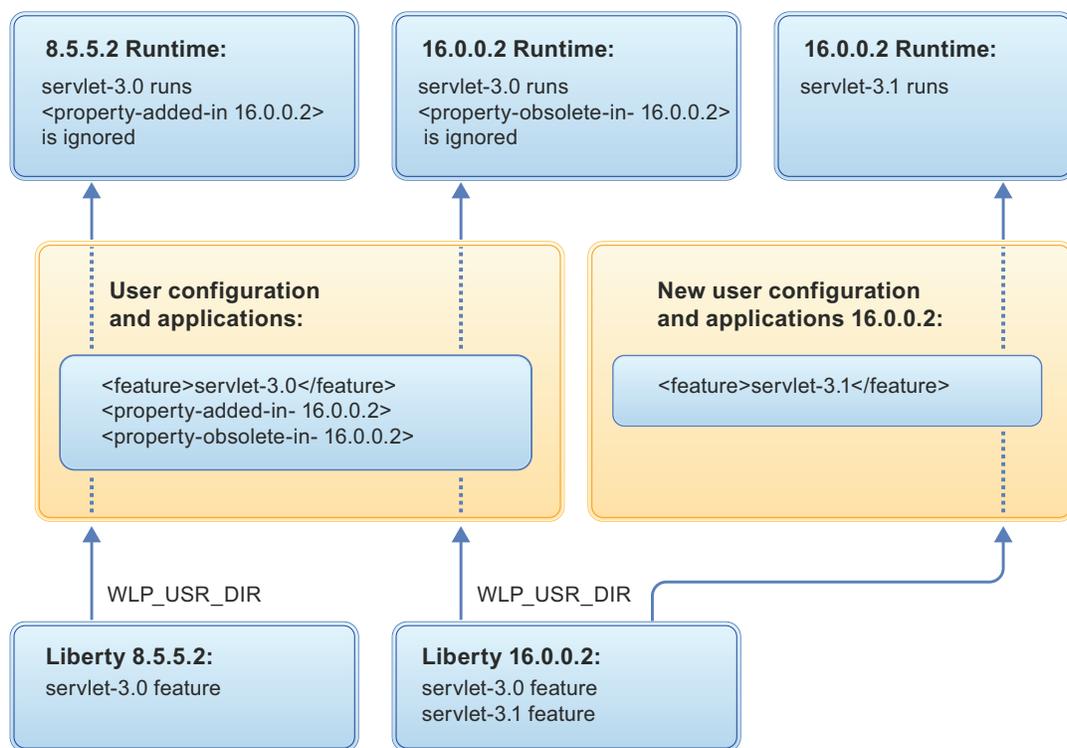

## User configuration files

The Liberty runtime environment never modifies user configuration files, which are fully compatible between versions. You can use a single version of your configuration files across multiple versions. Files that you created for a previous version of Liberty can be used with a later version. Files that you create for later versions can be used with previous versions. As a result, if all configured features are installed, you can use a single set of files across multiple versions without modifications. Any configuration settings that do not apply to a particular version of the Liberty runtime environment are ignored.

## User applications

The Liberty runtime environment uses pluggable features to support multiple versions of an API. For example, both the Servlet 3.0 and 3.1 specifications are supported. Changes in API behavior only happen in new feature versions, so you can choose the appropriate feature version for your application. These versioned features continue to be supported across Liberty updates. If you continue to use the same feature version, you never need to migrate your application.

For example, if your application uses Servlet 3.0, the Liberty server that runs the application must have the `servlet-3.0` feature. You can update Liberty and continue to use the `servlet-3.0` feature indefinitely, regardless of how many other Servlet specification levels are supported. You need to migrate your applications only if you choose to use the `servlet-3.1` feature instead.

If you use third-party APIs, be aware that they can be changed or removed when you update Liberty. Third-party APIs are exposed to applications through Liberty features. Compatibility with an earlier version of these APIs is not controlled by Liberty and is not guaranteed. Some APIs that are available to applications are not provided by Liberty features and do not benefit from this design, so you might need to modify your application code. For example, you might need to update the Java APIs that are provided by the underlying Java SDK. Occasionally, you might need to update the version of the Java SDK. Rather than manually gathering information and migrating your applications, scan your applications for any required changes by using the Migration Toolkit for Application Binaries and the WebSphere Application Server Migration Toolkit. To download the toolkit and get more information, see the *Migration on WASdev*.

## Using new features

If you want to use a new feature, consider the following questions:

### How does a new feature affect existing applications?

A new version of a feature that you are already using might impact your existing applications. For example, if you currently use Servlet 3.0 and you want to use Servlet 3.1, your existing servlet applications might need to be changed to work correctly with Servlet 3.1. Modify your application to work with the new feature version or keep your applications in a server that is configured with the original feature version, such as Servlet 3.0, and create a server configuration with the new version for new applications.

### Is the new feature compatible with existing features?

The product supports mixing some features across different versions of Java EE, but it is simpler to stay within one version of the Java EE specification, if possible. Some features interact closely with other features when they are both configured into the same server, and are sensitive to their versions. For example, many of the Java EE features are closely associated with the features for Contexts and Dependency Injection (CDI) and only work with a specific version of that feature. If you add a feature into your configuration, you might need to change the versions of other features that you are already using. For more information, see *Supported Java EE 6 and 7 feature combinations*.

## Does the new feature require other configuration changes

Some features require specific versions of prerequisite software, most commonly the Java SDK. Java EE 7 features, for example, require Java version 7 as a minimum. Therefore, adding a Java EE 7 feature to your server configuration might require you to move up to Java SDK 7 or later.

## Exceptions to zero-migration

In some rare instances, the zero-migration concept is not followed. In the following scenarios, you might need to modify your application or configuration:

### Security fixes

If a security-related fix is required, but cannot be done safely while preserving existing behavior, then you might need to modify your application or configuration.

### Third-party API requirements

The product does not control APIs from the third-party class loader configuration. As a result, updates to third-party components have no guarantee of compatibility with an earlier version.

### Removal of support

Liberty continues support for parts of the product that affect user data, but it is occasionally necessary to withdraw a feature or supported software product. Usually, users receive removal notifications at least two years in advance. However, notifications are not as practical when other software suppliers remove support for their product earlier than Liberty does. Be aware of the third-party products that you are using with your Liberty installation and of their lifecycle dates. For information about items that are eligible for future removal, see *Removal notices*.

### Undocumented configuration properties

The Liberty code base is common with the WebSphere Application Server full profile code base. Therefore, some configuration properties in the Liberty code base might not be documented, but when specified might affect the behavior of Liberty. As these configuration properties do not apply to Liberty, they are not supported for Liberty. They were not tested for Liberty and might not work reliably in Liberty now or in the future. As these properties are not documented as a product external, they can be removed at any time.

---

## Java EE 7 in Liberty

8.5.5.6

Liberty now supports the full Java Platform, Enterprise Edition (Java EE) 7. Before Version 8.5.5.6, Liberty only supported the Java EE 6 Web Profile. But, now Liberty supports the Java EE 7 full platform. This is a significant improvement and better aligns with the Java EE 6 full platform support available in WebSphere Application Server traditional.

 **Watch:** The Java EE 7 in Liberty video shows what specifications are in Java EE 7 and briefly describes how to enable your Liberty server for Java EE 7 features. [Transcript]

### Benefits of Java EE 7

- Easier delivery of HTML5 dynamic scalable applications for desktops, tablets, and smartphones through Java EE 7 Web Profile

Java EE 6 introduced Web Profile to assist developers of dynamic web applications, providing technologies such as Enterprise JavaBeans (EJB) Lite, Java Persistence API (JPA), and Java Transaction API (JTA).

Java EE 7 Web Profile adds support for HTML5. Two new technologies, WebSocket and JSON, speed up data exchanges and simplify data parsing for portable applications. Updates to existing technologies, JAX-RS 2.0, Java Server Faces (JSF) 2.2, and Servlet 3.1 enhance your ability to develop dynamic HTML5 applications. For example, JAX-RS 2.0 provides asynchronous response processing through scalable, high performance RESTful Services.

- Increased developer productivity  
A simplified application architecture reduces the amount of boilerplate code needed for business logic, such as in JMS 2.0 and the JAX-RS 2.0 client API. A more robust POJO development model enables broader use of annotations, such as in JAX-RS 2.0 Interceptors and Filters and in CDI. Bean Validation 1.1 offers method-level validation.
- Improved support for enterprise demands  
Java EE continues to support enterprise demands with Java EE Connector Architecture (JCA), Java Transaction API (JTA), and Java Message Service (JMS). Java EE 7 introduces the ability to write batch applications in Java that use a standard API and are portable across multiple runtimes. Batch Applications enables better use of computing resources by shifting processing times to when resources are typically idle. Concurrency Utilities enables developers to write scalable applications that integrate with the Java EE runtime in a secure, reliable manner.
- Deprecation of older technologies  
Older technologies are optional: Application Deployment (JSR-88); JAXR, for interfacing with UDDI registries (JSR-93); JAX-RPC, for XML-based RPC (JSR-101); and EJB 2.x Container Managed Persistence, which Java Persistence API (JSR-338) replaces.

## Java EE 7 full platform and Web Profile

The Java EE 7 specification defines the full platform Enterprise Edition. The Web Profile is a properly defined subset of the full platform.

### Web Profile

The Web Profile defines a reasonably complete stack that targets "modern" web applications. This stack is a subset of the full platform standard APIs, capable of addressing the needs of most web applications.

### Full platform

The full platform defines the full complement of the Java EE programming model. Besides the Web Profile features, the full platform has specifications for advanced business capabilities that an enterprise needs, such as for connectivity, security, enterprise beans, messaging, and application clients.

You need to consider these definitions when you install Liberty and its available features. Installation options provide the Liberty runtime (kernel) as well as features that support the full platform or Web Profile. You can choose to install the Liberty kernel with just the Web Profile features or install individual Java EE features to your existing Liberty kernel installation.

You also need to consider the definitions when you deploy applications to a Liberty server. For example, if your Liberty installation supports Web Profile features but your application needs a server that supports enterprise connectivity APIs, you must add full platform features to your Liberty installation or deploy the application to a Liberty installation that has full platform features.

To quickly add support for Java EE to your Liberty server, use either the `webProfile-7.0` or `javaee-7.0` convenience features in the feature manager of your server configuration; for example:

```
<featureManager>
  <feature>javaee-7.0</feature>
</featureManager>
```

A third convenience feature, `javaeeClient-7.0`, is also available to quickly configure an application client component:

```
<featureManager>
  <feature>javaeeClient-7.0</feature>
</featureManager>
```

## Installing a Liberty kernel with Java EE 7 features

The quickest way to install a Liberty runtime with Java EE 7 features is to download a compressed (ZIP) file from the WASdev community download page and extract it into an empty directory. See “Installing Liberty by extracting a ZIP archive file” on page 1381.

You also can install a Liberty runtime with Java EE 7 features by using a developer tool such as WebSphere Application Server Developer Tools for Eclipse. See “Installing Liberty Repository assets” on page 1391.

You can add Java EE 7 features to an existing installation by running the **featureManager** or **installUtility** command. See “Installing Liberty Repository assets” on page 1391.

If you used Installation Manager to install a version of Liberty older than 8.5.5.6, you can use Installation Manager to apply interim fixes that upgrade the installation to Liberty 8.5.5.6 and then install Java EE 7 features. See “Installing and uninstalling Liberty using Installation Manager” on page 1164 and “Installing assets using Installation Manager” on page 1411.

## Liberty:Architecture

Liberty is a highly composable and dynamic runtime environment. OSGi services are used to manage component lifecycles, and the injection of dependencies and configuration. The server process comprises a single JVM, the Liberty kernel, and any number of optional features. The feature code and most of the kernel code runs as OSGi bundles within an OSGi framework. Features provide the programming models and services that are required by applications.

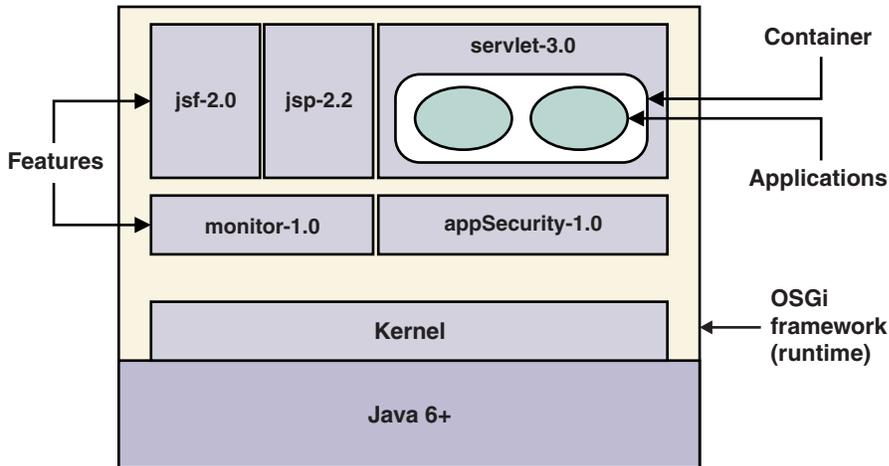

Figure 1. Liberty architecture

The kernel launcher bootstraps the system and starts the OSGi framework. The configuration is parsed, and then the configured features are loaded by the feature manager. The kernel extensively uses OSGi services to provide a highly dynamic runtime environment. The OSGi Configuration Admin service manages system configuration, and an OSGi Declarative Services component manages the lifecycle of system services. The file monitor service detects application and configuration file changes, and the logging service writes messages and debug information to the local file system.

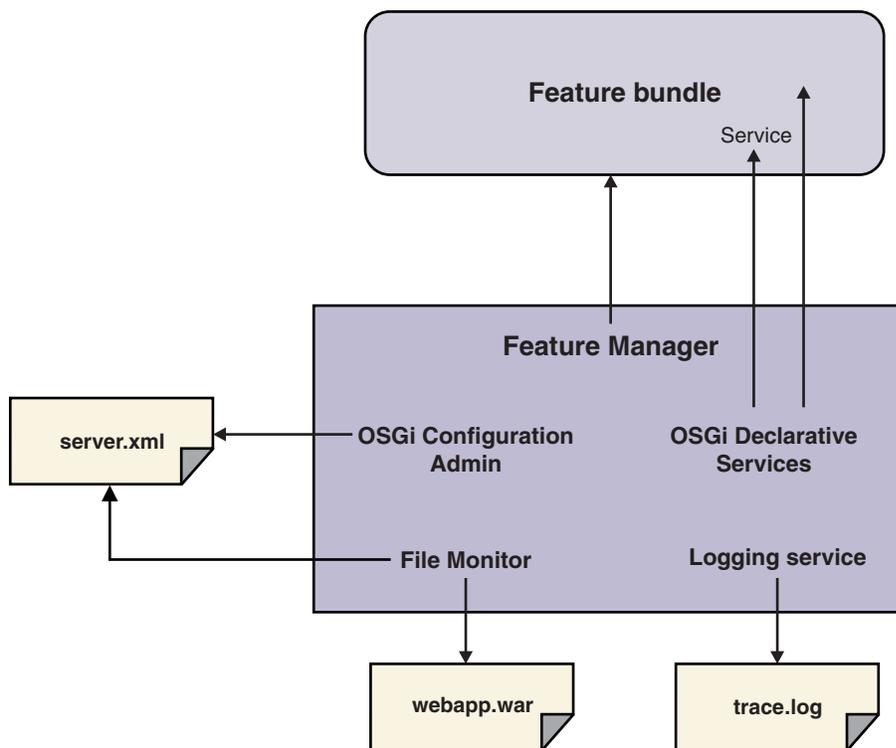

Figure 2. Liberty kernel

Features are specified in the system configuration files that are the `server.xml` file and any other included files. The server configuration files populate the OSGi Configuration Admin service, which injects the feature configuration into the feature manager service. The feature manager maps each feature name to a

list of bundles that provide the feature. The bundles are installed into the OSGi framework and started. The feature manager responds to configuration changes by dynamically adding and removing features while the server is running.

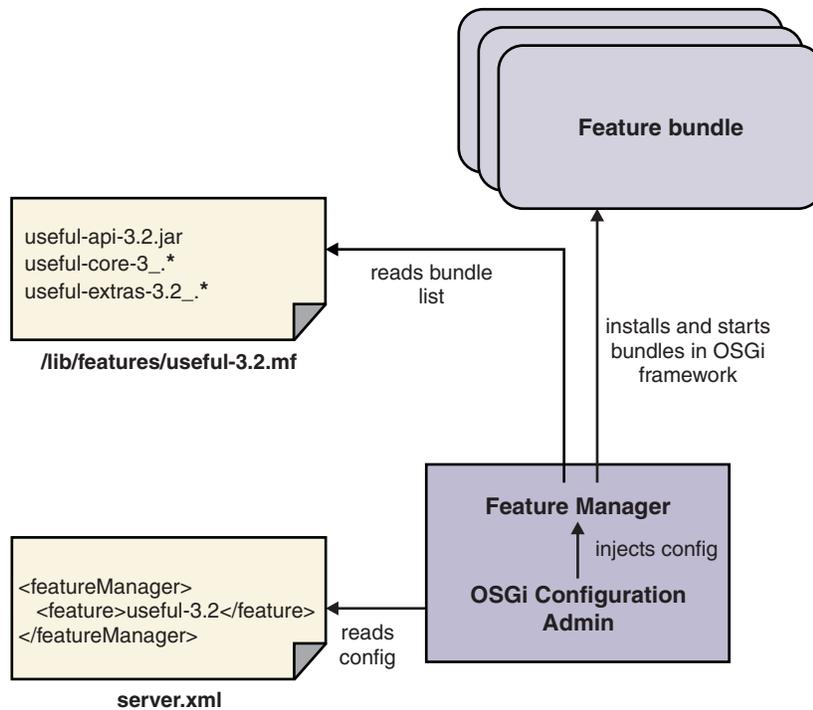

Figure 3. Feature management

Runtime services provide configuration default settings so that the configuration you need to specify is kept to a minimum. You specify the features you need, along with any additions or overrides to the system default settings, in a `server.xml` file. You might choose to structure your configuration into a number of separate files that are linked to the parent `server.xml` file by using an “include” syntax. At server startup, or when the user configuration files are changed, the kernel configuration management parses your configuration and applies it over the system default settings. The set of configuration properties that belongs to each service is injected into the service each time the configuration is updated.

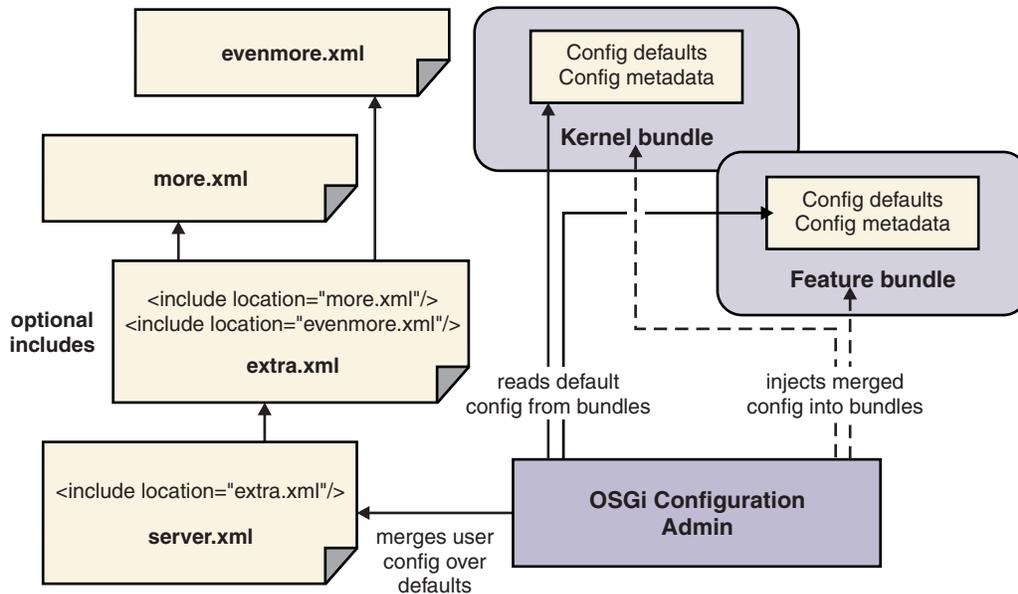

Figure 4. Configuration management

The OSGi Declarative Services component is used so that function can be decomposed into discrete services, which are activated only when needed. This behavior helps the runtime environment to be “late and lazy”, keeping the footprint small and the startup fast. Declared services are added to the OSGi service registry, and dependencies between services can be resolved without loading implementation classes. Service activation can be delayed until a service is used: when the service reference is resolved. Configuration for each service is injected as the service is activated, and is reinjected if the configuration is later modified.

## Java EE 7 programming model support

Liberty complies with Java Platform, Enterprise Edition (Java EE) 7. The Java EE 7 table and links show the extent to which each of the major server profiles supports the full WebSphere Application Server programming model.

### Java EE 7 technologies

Table 1. Java EE 7 support by profile.

A list of Java EE technologies, subdivided into sections for web services, web applications, enterprise applications, management and security, and Java EE-related specifications in Java SE. For each technology there is a specification reference, any related Liberty feature, and an indication of whether the technology is supported by the full profile, the Liberty profile, and Liberty Core.

Technology	Specification reference	Liberty feature	Full profile	Liberty profile	Liberty Core
Java Platform, Enterprise Edition 7 (Java EE 7)	JSR 342	javaee-7.0 javaeeClient-7.0		8.5.5.6

## Programming model extensions

For a list of WebSphere programming model extensions, see "WebSphere extensions" in the WebSphere Application Server: Overview and quick start topic.

## Supported Java EE 6 and 7 feature combinations

8.5.5.6

Some combinations of Java EE 7 and Java EE 6 Liberty features in a server configuration are compatible. However, many combinations are not compatible and cause an error when the server starts.

The error message resembles:

CWWKF0033E: The singleton features com.ibm.websphere.appserver.javaeeCompatible-6.0 and com.ibm.websphere.appserver.javaeeCompat

The following table marks compatible feature combinations with a checkmark (△). Ensure that your server configuration does not contain incompatible features.

*Table 3. Supported combinations of Java EE 7 and Java EE 6 Liberty features.* Java EE 7 features are listed vertically. Java EE 6 features are listed horizontally. A checkmark (△) indicates that the combination of Java EE 7 and 6 features is supported and a server configuration can contain both features. An empty cell (no △) indicates that the combination of Java EE 7 and 6 features is not supported.

Java EE 7 features	Java EE 6 features														
	beanValidation-1.0	cdi-1.0	ejbLite-3.1	jaxb-2.2	jaxrs-1.1	jaxws-2.2	jca-1.6	jdbc-4.0	jms-1.1	jpa-2.0	jsf-2.0	jsp-2.2	managed-Beans-1.0	mdb-3.1	servlet-3.0
batch-1.0				△		△		△		△			△		
beanValidation-1.1				△		△		△		△			△		
cdi-1.2				△		△		△		△			△		
concurrent-1.0	△	△	△	△	△	△	△	△	△	△	△	△	△	△	△
el-3.0	△	△	△	△	△	△	△	△	△	△	△	△	△	△	△
ejb-3.2				△		△				△			△		
ejbLite-3.2				△		△		△		△			△		
javaMail-1.5	△	△	△	△	△	△	△	△	△	△	△	△	△	△	△
jacc-1.5	△	△	△	△	△	△	△	△	△	△	△	△	△	△	△
jaspic1.1	△	△	△	△	△	△	△	△	△	△	△	△	△	△	△
jaxrs-2.0				△		△		△		△			△		
jca-1.7				△		△		△		△			△		
jdbc-4.1	△	△	△	△	△	△	△	△	△	△	△	△	△	△	△
jms-2.0				△		△		△		△			△		
jpa-2.1				△		△				△			△		
jsf-2.2				△				△		△			△		
jsonp-1.0	△	△	△	△	△	△	△	△	△	△	△	△	△	△	△
jsp-2.3	△	△	△	△	△	△	△	△	△	△	△	△	△	△	△
mdb-3.2				△		△		△		△			△		
servlet-3.1	△	△	△	△	△	△	△	△	△	△	△	△	△	△	△
websocket-1.0	△	△	△	△	△	△	△	△	△	△	△	△	△	△	△
websocket-1.1	△	△	△	△	△	△	△	△	△	△	△	△	△	△	△

The table shows that the `servlet-3.0` feature of Java EE 6 is incompatible with the `websocket-1.1` feature of Java EE 7. Thus, a server configuration with the following features causes an error:

```
<featureManager>
  <feature>servlet-3.0</feature>
  <feature>websocket-1.1</feature>
</featureManager>
```

To resolve the error, use `servlet-3.1` instead of `servlet-3.0` in the server configuration. The `servlet-3.1` feature is compatible with the `websocket-1.1` feature.

For more information on compatibility, or toleration, of features, see [Tolerating features](#).

## Java EE 7 behavior changes

If you previously incorporated Java Platform, Enterprise Edition (Java EE) 6 features in your Liberty environment, you might encounter behavior changes when you move to a Java EE 7 feature.

You can choose between the Java EE 6 and Java EE 7 feature implementations for each server instance, with consideration for behavior changes. If the required behavior is contained in the Java EE 7 feature only, you must use the Java EE 7 feature. If an existing application would be adversely impacted by behavior changes in the Java EE 7 feature, using the Java EE 6 feature preserves the existing behavior for

that application. You must ensure that the Java EE implementation that you choose is compatible with other Java EE features in your server; for more information, see “Supported Java EE 6 and 7 feature combinations” on page 16.

*Table 4. Features that have Java EE 6 and 7 implementations*

Technology	Java EE 6 feature	Java EE 7 feature	Behavior changes
Bean Validation	beanValidation-1.0	beanValidation-1.1	No behavior changes.
Contexts and Dependency Injection for Java (CDI)	cdi-1.0	cdi-1.2	See “Contexts and Dependency Injection 1.2 behavior changes” on page 1726.
Enterprise JavaBeans (EJB)	ejbLite-3.1	ejbLite-3.2	No behavior changes.
Expression Language (EL)	Included as part of jsp-2.2	el-3.0	See “Expression Language 3.0 feature functions” on page 1722.
Java API for RESTful Web Services (JAX-RS)	jaxrs-1.1	jaxrs-2.0	See “JAX-RS 2.0 behavior changes” on page 2167.
Java EE Connector Architecture (JCA)	jca-1.6	jca-1.7	No behavior changes.
Java Database Connectivity (JDBC)	jdbc-4.0	jdbc-4.1	No behavior changes.
Java Message Service (JMS)	jms-1.1	jms-2.0	No behavior changes.
	wasJmsClient-1.1	wasJmsClient-2.0	See “JMS messaging (wasJmsClient-2.0) behavior changes” on page 1014.
	wmqJmsClient-1.1	wmqJmsClient-2.0	See SupportMQExtensions property.
Java Persistence API (JPA)	jpa-2.0	jpa-2.1	See “Java Persistence API 2.1 behavior changes” on page 1017.
Java Servlet	servlet-3.0	servlet-3.1	See “Servlet 3.1 behavior changes” on page 1714.
Java Transaction API (JTA)	transaction-1.1 (protected feature)	transaction-1.2 (protected feature)	No behavior changes.
JavaServer Faces (JSF)	jsf-2.0	jsf-2.2	See “Configuring Liberty for JavaServer Faces 2.2” on page 1722.
JavaServer Pages (JSP)	jsp-2.2	jsp-2.3	No behavior changes.
Message Driven Beans (MDB)	mdb-3.1	mdb-3.2	No behavior changes.

## Enterprise OSGi programming model support

The Enterprise OSGi table and links show the extent to which each of the major server profiles supports the full WebSphere Application Server programming model.

## Enterprise OSGi technologies

Table 5. Enterprise OSGi support by profile.

A list of enterprise OSGi technologies, subdivided into sections for blueprint, web, and other enterprise technologies. For each technology there is a specification reference, and an indication of whether the technology is supported by the full profile, by the Liberty profile, and by Liberty Core.

Technology	Specification reference	Full profile	Liberty profile	Liberty Core
<b>Blueprint-related technologies</b>				
Blueprint Container	R4.2 Enterprise Chapter 121	△	△	△
Blueprint Transactions		△	△	△
Blueprint Managed JPA		△	△	△
Blueprint Security		△		
Blueprint Resource References		△

Remote Bundle Repositories		△	△	△
SIP		△(SIP annotations are not supported.)		
Local OSGi application integration			8.5.5.5 △	8.5.5.5 △

**Note:** 8.5.5.7 WebSockets is currently only supported on Liberty.

## Liberty externals support

External functions and resources of Liberty can be used directly, and can be relied on to be in the next release. Internal or incidental aspects of Liberty might change when you apply service, or upgrade to a future release.

### What can I use directly in Liberty and rely on being in the next release?

The following resources can be used directly and will continue to be available in the next release:

- The application programming interfaces (APIs) and system programming interfaces (SPIs) defined by the content of the JAR files in the `${wlp.install.dir}/dev` directories.
  - The application class loader has visibility to the API that is provided by the features in your server configuration. Product extension features have visibility to all API and SPI that is provided by the features in your server configuration.
  - Compile your code against the JAR files in the `${wlp.install.dir}/dev` directories. The JAR files in the `${wlp.install.dir}/dev` directories are provided only for compilation of applications and features, they are not supported for runtime use. Do not use these JAR files in applications, libraries, or tests.
- The server configuration, including features with *public* or *protected* visibility. Public features and configuration elements can be specified in the `server.xml` file and included files; protected features can be included in your own features.
- Commands, scripts and archives in the `${wlp.install.dir}/bin` directory and subdirectories.
- Client utilities in the `${wlp.install.dir}/clients` directory and subdirectories.

## What should I avoid dependencies on?

Do not build dependencies on incidental aspects of the product, or you might be impacted when you apply service or upgrade to future releases. Examples of product internals that you should avoid relying on include, but are not restricted to, the following scenarios:

- The names of product binary jars, for example those in the `${wlp.install.dir}/dev` directory. Compile your code against these JAR files by using the tools or the `javac -extdirs` option.

8.5.5.4

If you are using Apache Ant to compile your code, use wildcards to avoid dependencies on the specific JAR version; for example:

```
<fileset dir="${wlp.install.dir}/dev/api/spec" includes="com.ibm.ws.javaee.servlet.3.0_*.jar"/>
```

Alternatively, you can use the `featureManager classpath` command to generate a classpath for a specific set of features. See “Overriding classes from the Java SDK” on page 2334.

- Direct use of the product binaries in the `${wlp.install.dir}/lib` directory. The only JAR files that can be directly invoked are in the `${wlp.install.dir}/bin/tools` directory.
- Messages that are output by the server at run time. The text and inserts of messages are subject to change in service and version upgrades. As far as practically possible, the product will be consistent in the message IDs that are output at particular points of operation, but this cannot be guaranteed because underlying implementations might change.
- The layout of the product installation, other than the `${wlp.install.dir}/bin` and `${wlp.install.dir}/dev` directories.
- Examples and template files in the `${wlp.install.dir}/templates` directory. These files might be modified when you apply services to your installation.
- Private or third party Java packages that are not explicitly exposed as APIs. These are not visible to the application class loader at run time.
- Do not use the `console.log` file for the automated processing of server output. Instead, use the `messages.log` file for accessing and processing the messages, which provides more detailed information, in a format that is easier to process.

## What might be modified by applying service or an upgrade?

The contents of the following directories and their subdirectories might be modified when service or upgrade is applied. Do not make your own modifications to files in these locations, or they might be overwritten by product maintenance or upgrade:

- `${wlp.install.dir}/bin`
- `${wlp.install.dir}/clients`
- `${wlp.install.dir}/dev`

- `${wlp.install.dir}/java`
- `${wlp.install.dir}/lib`
- `${wlp.install.dir}/templates`

No modifications are made to the contents of the following directories. These are your files, and applying service or upgrade will not modify them:

- `${wlp.install.dir}/etc` (where you might have added a `server.env` or `jvm.options` file).
- `${wlp.install.dir}/usr` (the default location for user configuration and applications).
- Any non-default directory that you designate through the `WLP_USER_DIR` environment variable.

**IBM i** There is an exception to the policy that no modifications are made to the contents of `${wlp.install.dir}/etc`. The file `${wlp.install.dir}/etc/default.env` is created when you install Liberty on IBM® iSeries Platforms using the Installation Manager. This file is also created or replaced by the `iAdmin POSTINSTALL` command during archive and Job Manager installations. The `iAdmin` command is in the `${wlp.install.dir}/lib/native/os400/bin` directory. See “Liberty: iAdmin command” on page 1572.

Third-party APIs might change over time without consideration to backward compatibility. These are Java packages that are considered part of the implementation of features developed in open source communities and delivered as part of Liberty. Third-party APIs are not visible to applications by default; Java EE applications with a classloader configuration that explicitly allows third-party access will have visibility to those packages on the application class loader, and OSGi applications must explicitly import the packages. Consider the impact of incompatible changes before deciding to use third-party APIs.

---

## Liberty:Server configuration

Liberty is configured by exception. The runtime environment operates from a set of built-in configuration default settings, and you only need to specify configuration that overrides those default settings. You do this by editing either the `server.xml` file or another XML file that is included in `server.xml` at run time.

The configuration has the following characteristics:

- Described in XML files.
- Human-readable, and editable in a text editor.
- Small, easy to back up, and easy to copy to another system.
- Shareable across an application development team.
- Composable, so that features can easily add their own configuration to the system.
- Extensibly-typed, so you don't have to modify the current configuration to work with later versions of the runtime environment.
- Dynamically responsive to updates.
- Forgiving, so that missing values are assumed and unrecognized properties are ignored.

Features are the units of functionality by which you control the pieces of the runtime environment that are loaded into a particular server. They are the primary mechanism that makes the server composable. The list of features that you specify in the server configuration provides a functional server. See “Liberty features” on page 826.

When you first install and start the server, a feature manager and a default server configuration are available:

- By default, a server contains the `jsp-2.2` feature, to support servlet and JSP applications. You can use the feature manager to add the features that you need.

- Server configuration is by exception. When you specify the features that you need, the default configuration of those features provides a rich environment that is designed to cover most common requirements, therefore you only need to specify changes from the default configuration.

For a full list of the elements that you can configure to complement or modify the configuration provided by Liberty features, see “Liberty features” on page 826.

You can also use a `bootstrap.properties` file to specify properties that are needed before the main configuration is processed, and to define variables that are used in the main configuration.

For a complete list of configuration files, see Directory locations and properties.

## 8.5.5.0

### Service author perspective: Runtime management of configuration

The Liberty configuration service parses the primary `server.xml` file and any files it includes.

#### 8.5.5.5

The Liberty configuration service also parses the configuration files in the `configDropins` directory.

The Liberty configuration service parses the files, merges the contents over the default configuration values provided by the installed bundles, then feeds the resulting property sets into the OSGi Configuration Admin Service (CA). CA injects each set of properties into the service that owns the set, if it is registered with CA.

The ordering of these steps is flexible. Services can register with CA before or after the initial property sets are established. Properties can be updated in CA after the initial injection, at which time the updated properties are injected into the owning service. It is therefore important that the services can receive, and respond appropriately to, updates to their configuration at any time that the service is active. Specifically, if a service delays its activation until its configuration is available, it must still be able to activate.

To enable a service to receive configuration data, there are a number of steps involved. See “Enabling a service to receive configuration data” on page 1796.

#### z/OS

### Encoding on z/OS

The WLP JVMs are configured to run with a default file encoding of ISO8859-1 (ISO Latin-1). The configuration files that are created by Liberty are tagged in the z/OS file system as text files with an ISO8859-1 encoding. If the z/OS UNIX System Services (USS) automatic code page conversion feature is active, you can use standard editors and text utilities to view and manage configuration files.

For the encoding of log files on z/OS(r) systems, see “Liberty:Logging and Trace” on page 2313.

For more information about USS automatic code page conversion, see Statements and parameters for BPXPRMxx.

### Activation Specification (activationSpec)

Defines an activation specification configuration.

- `authData`

Attribute name	Data type	Default value	Description
authDataRef	A reference to top level authData element (string).		Default authentication data for an activation specification.
id	string		A unique configuration ID.
maxEndpoints	int Minimum: 0	500	The maximum number of endpoints to dispatch to.

### authData

Default authentication data for an activation specification.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

## Microsoft Active Directory LDAP Filters (activedLdapFilterProperties)

Specifies the list of default Microsoft Active Directory LDAP filters.

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)(objectcategory=group))	An LDAP filter clause for searching the user registry for groups.
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	memberOf:member	An LDAP filter that identifies user to group memberships.
id	string		A unique configuration ID.
userFilter	string	(&(sAMAccountName=%v)(objectcategory=user))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	user:sAMAccountName	An LDAP filter that maps the name of a user to an LDAP entry.

## Administered Object (adminObject)

Defines an administered object configuration.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
jndiName	string		JNDI name for a resource.

## Administrator Role (administrator-role)

A collection of users and/or groups assigned the server administrator role.

- group
- user

### group

Group assigned a role.

false

string

### user

User assigned a role.

false

string

## API Discovery (apiDiscovery)

Configuration for the API Discovery feature to document your REST APIs.

- webModuleDoc

Attribute name	Data type	Default value	Description
apiName	string		The name of the aggregated API.
id	string		A unique configuration ID.
maxSubscriptions	int Minimum: 0 Maximum: 100	20	Specifies the maximum number of concurrent REST API clients that are listening for updates.

### webModuleDoc

Configuration for each web module that provides API documentation to be exposed.

false

Attribute name	Data type	Default value	Description
contextRoot	string		The context root of the web module for which you are providing documentation.

Attribute name	Data type	Default value	Description
docURL	string		The URL of the documentation of this web module. The URL can be relative to the context root by starting with a forward slash (/) or absolute by starting with http or https.
enabled	boolean	true	A boolean that controls the processing of documentation for this web module.
id	string		A unique configuration ID.

## Application (application)

Defines the properties of an application.

- application-bnd
  - security-role
    - group
    - run-as
    - special-subject
    - user
- classloader
  - commonLibrary
    - file
    - fileset
    - folder
  - privateLibrary
    - file
    - fileset
    - folder
- resourceAdapter
  - contextService
    - baseContext
      - baseContext
      - classloaderContext
      - jeeMetadataContext
      - securityContext
      - syncToOSThreadContext
      - zosWLMContext
    - classloaderContext
    - jeeMetadataContext
    - securityContext
    - syncToOSThreadContext
    - zosWLMContext
  - customize

Attribute name	Data type	Default value	Description
autoStart	boolean	true	Indicates whether or not the server automatically starts the application.
context-root	string		Context root of an application.
id	string		A unique configuration ID.
location	A file, directory or url.		Location of an application expressed as an absolute path or a path relative to the server-level apps directory.
name	string		Name of an application.
suppressUncoveredHttpMethodWarning	boolean	false	Option to suppress uncovered HTTP method warning message during application deployment.
type	string		Type of application archive.

#### **application-bnd**

Binds general deployment information included in the application to specific resources.

false

Attribute name	Data type	Default value	Description
version	string		Version of the application bindings specification.

#### **application-bnd > security-role**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		Name of a security role.

#### **application-bnd > security-role > group**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		Group access ID
id	string		A unique configuration ID.
name	string		Name of a group possessing a security role.

#### **application-bnd > security-role > run-as**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
password	Reversably encoded password (string)		Password of a user required to access a bean from another bean. The value can be stored in clear text or encoded form. To encode the password, use the securityUtility tool with the encode option.
userid	string		ID of a user required to access a bean from another bean.

**application-bnd > security-role > special-subject**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
type	<ul style="list-style-type: none"> <li>• EVERYONE</li> <li>• ALL_AUTHENTICATED_USERS</li> </ul>		One of the following special subject types: ALL_AUTHENTICATED_USERS, EVERYONE.  <b>EVERYONE</b> Everyone  <b>ALL_AUTHENTICATED_USERS</b> All authenticated users

**application-bnd > security-role > user**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		A user access ID in the general form user:realmName/userUniqueId. A value will be generated if one is not specified.
id	string		A unique configuration ID.
name	string		Name of a user possessing a security role.

**classloader**

Defines the settings for an application classloader.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
classProviderRef	List of references to top level resourceAdapter elements (comma-separated string).		List of class provider references. When searching for classes or resources, this class loader will delegate to the specified class providers after searching its own class path.
commonLibraryRef	List of references to top level library elements (comma-separated string).		List of library references. Library class instances are shared with other classloaders.
delegation	<ul style="list-style-type: none"> <li>parentFirst</li> <li>parentLast</li> </ul>	parentFirst	<p>Controls whether parent classloader is used before or after this classloader. If parent first is selected then delegate to immediate parent before searching the classpath. If parent last is selected then search the classpath before delegating to the immediate parent.</p> <p><b>parentFirst</b> Parent first</p> <p><b>parentLast</b> Parent last</p>
privateLibraryRef	List of references to top level library elements (comma-separated string).		List of library references. Library class instances are unique to this classloader, independent of class instances from other classloaders.

### **classloader > commonLibrary**

List of library references. Library class instances are shared with other classloaders.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators

Attribute name	Data type	Default value	Description
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
id	string		A unique configuration ID.
name	string		Name of shared library for administrators

**classloader > commonLibrary > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**classloader > commonLibrary > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**classloader > commonLibrary > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**classloader > privateLibrary**

List of library references. Library class instances are unique to this classloader, independent of class instances from other classloaders.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
id	string		A unique configuration ID.
name	string		Name of shared library for administrators

**classloader > privateLibrary > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**classloader > privateLibrary > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**classloader > privateLibrary > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

### resourceAdapter

Specifies configuration for a resource adapter that is embedded in an application.

false

Attribute name	Data type	Default value	Description
alias	string	\${id}	Overrides the default identifier for the resource adapter. The identifier is used in the name of the resource adapter's configuration properties element, which in turn is used in determining the name of configuration properties elements for any resources provided by the resource adapter. The resource adapter's configuration properties element name has the format, <code>properties.&lt;APP_NAME&gt;.&lt;ALIAS&gt;</code> , where <code>&lt;APP_NAME&gt;</code> is the name of the application and <code>&lt;ALIAS&gt;</code> is the configured alias. If unspecified, the alias defaults to the module name of the resource adapter.
autoStart	boolean		Configures whether a resource adapter starts automatically upon deployment of the resource adapter or lazily upon injection or lookup of a resource.
contextServiceRef	A reference to top level contextService element (string).		Configures how context is captured and propagated to threads.
id	string		Identifies the name of the embedded resource adapter module to which this configuration applies.

### resourceAdapter > contextService

Configures how context is captured and propagated to threads.

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
jndiName	string		JNDI name
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**resourceAdapter > contextService > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
id	string		A unique configuration ID.
jndiName	string		JNDI name

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**resourceAdapter > contextService > baseContext > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

com.ibm.ws.context.service-factory

**resourceAdapter > contextService > baseContext > classloaderContext**

Classloader context propagation configuration.

false

**resourceAdapter > contextService > baseContext > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**resourceAdapter > contextService > baseContext > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**resourceAdapter > contextService > baseContext > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**resourceAdapter > contextService > baseContext > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"><li>• Propagate</li><li>• PropagateOrNew</li><li>• New</li></ul>	Propagate	Indicates how the WLM context should be handled for non-Daemon work. <b>Propagate</b> Use the same WLM Context (if one exists). <b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists. <b>New</b> Always create a new WLM context.

**resourceAdapter > contextService > classloaderContext**

Classloader context propagation configuration.

false

**resourceAdapter > contextService > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**resourceAdapter > contextService > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**resourceAdapter > contextService > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**resourceAdapter > contextService > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"> <li>• Propagate</li> <li>• PropagateOrNew</li> <li>• New</li> </ul>	Propagate	<p>Indicates how the WLM context should be handled for non-Daemon work.</p> <p><b>Propagate</b> Use the same WLM Context (if one exists).</p> <p><b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists.</p> <p><b>New</b> Always create a new WLM context.</p>

**resourceAdapter > customize**

Customizes the configuration properties element for the activation specification, administered object, or connection factory with the specified interface and/or implementation class.

false

Attribute name	Data type	Default value	Description
implementation	string		Fully qualified implementation class name for which the configuration properties element should be customized.
interface	string		Fully qualified interface class name for which the configuration properties element should be customized.

Attribute name	Data type	Default value	Description
suffix	string		Overrides the default suffix for the configuration properties element. For example, "CustomConnectionFactory" in properties.rarModule1.CustomConnectionFa The suffix is useful to disambiguate when multiple types of connection factories, administered objects, or endpoint activations are provided by a resource adapter. If a configuration properties element customization omits the suffix or leaves it blank, no suffix is used.

## Application Manager (applicationManager)

Properties that control the behavior of the application manager

Attribute name	Data type	Default value	Description
autoExpand	boolean	false	Enables automatic extraction of WAR files and EAR files
startTimeout	A period of time with second precision	30s	Specifies how long the server waits for an application to start before it considers it slow. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
stopTimeout	A period of time with second precision	30s	Specifies how long the server waits for an application to stop before it considers it slow. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

## Application Monitoring (applicationMonitor)

Defines how the server responds to application additions, updates, and deletions.

Attribute name	Data type	Default value	Description
dropins	Path to a directory	dropins	Location of the application drop-in directory expressed as an absolute path or a path relative to the server directory.
dropinsEnabled	boolean	true	Monitor the drop-in directory for application additions, updates, and deletions.
pollingRate	A period of time with millisecond precision	500ms	Rate at which the server checks for application additions, updates, and deletions. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
updateTrigger	<ul style="list-style-type: none"> <li>• mbean</li> <li>• polled</li> <li>• disabled</li> </ul>	polled	<p>Application update method or trigger.</p> <p><b>mbean</b> Server will only update applications when prompted by an MBean called by an external program such as an integrated development environment or a management application.</p> <p><b>polled</b> Server will scan for application changes at the polling interval and update any applications that have detectable changes.</p> <p><b>disabled</b> Disables all update monitoring. Application changes will not be applied while the server is running.</p>

## z/OS Connect SMF Audit Interceptor (auditInterceptor)

Defines z/OS Connect's audit interceptor to allow request data to be logged using System Management Facility (SMF) 120 subtype 11 records on z/OS.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
sequence	int Minimum: 0 Maximum: 2147483647	0	The sequence in which this interceptor should be processed with respect to other configured interceptors implementing z/OS Connect's com.ibm.wsspi.zos.connect.Interceptor Service Provider Interface (SPI).

## Authentication Cache (authCache)

Controls the operation of the authentication cache.

Attribute name	Data type	Default value	Description
allowBasicAuthLookup	boolean	true	Allow lookup by user ID and hashed password.
initialSize	int Minimum: 1	50	Initial number of entries supported by the authentication cache.
maxSize	int Minimum: 1	25000	Maximum number of entries supported by the authentication cache.
timeout	A period of time with millisecond precision	600s	Amount of time after which an entry in the cache will be removed. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

## Authentication Data (authData)

Authentication alias for a connection to an Enterprise Information System (EIS) or database.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

## Authentication Filter (authFilter)

Specifies a selection rule that represents conditions that are matched against the HTTP request headers to determine whether or not the HTTP request is selected for the authentication.

- host
- remoteAddress
- requestUrl
- userAgent
- webApp

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

### host

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
name	string		Specifies the name.

### remoteAddress

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
ip	string		Specifies the IP address.

Attribute name	Data type	Default value	Description
matchType	<ul style="list-style-type: none"> <li>lessThan</li> <li>equals</li> <li>greaterThan</li> <li>contains</li> <li>notContain</li> </ul>	contains	Specifies the match type. <b>lessThan</b> Less than <b>equals</b> Equals <b>greaterThan</b> Greater than <b>contains</b> Contains <b>notContain</b> Not contain

### requestUrl

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>equals</li> <li>contains</li> <li>notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
urlPattern	string		Specifies the URL pattern.

### userAgent

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
agent	string		Specifies the user agent
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>equals</li> <li>contains</li> <li>notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain

### webApp

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
name	string		Specifies the name.

## Authentication (authentication)

Controls the built-in authentication service configuration.

Attribute name	Data type	Default value	Description
allowHashtableLoginWithIdOnly	boolean	false	Allow an application to login with just an identity in the hashtable properties. Use this option only when you have applications that require this and have other means to validate the identity.
cacheEnabled	boolean	true	Enables the authentication cache.

## Feature Authorization Role Mapping (authorization-roles)

A collection of role names and mappings of the roles to users, groups, or special subjects

- security-role
  - group
  - special-subject
  - user

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

### security-role

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		Role name.

### security-role > group

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		A group access ID in the general form group:realmName/groupUniqueId. A value will be generated if one is not specified.
id	string		A unique configuration ID.
name	string		Name of a group that has the security role.

#### security-role > special-subject

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
type	<ul style="list-style-type: none"> <li>• EVERYONE</li> <li>• ALL_AUTHENTICATED_USERS</li> </ul>		<p>One of the following special subject types: ALL_AUTHENTICATED_USERS, EVERYONE.</p> <p><b>EVERYONE</b> All users for every request, even if the request was not authenticated.</p> <p><b>ALL_AUTHENTICATED_USERS</b> All authenticated users.</p>

#### security-role > user

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		A user access ID in the general form user:realmName/userUniqueId. A value will be generated if one is not specified.
id	string		A unique configuration ID.
name	string		Name of a user who has the security role.

## z/OS Connect Authorization Interceptor (authorizationInterceptor)

Defines a z/OS Connect authorization interceptor.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
sequence	int Minimum: 0 Maximum: 2147483647	0	The sequence in which this interceptor should be processed with respect to other configured interceptors implementing z/OS Connect's com.ibm.wsspi.zos.connect.Interceptor Service Provider Interface (SPI).

## Basic User Registry (basicRegistry)

A simple XML-based user registry.

- group
  - member
- user

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
ignoreCaseForAuthentication	boolean	false	Allow case-insensitive user name authentication.
realm	string	BasicRegistry	The realm name represents the user registry.

### group

A group in a Basic User Registry.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		Name of a group in a Basic User Registry.

### group > member

A member of a Basic User Registry group.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		Name of a user in a Basic User Registry group.

### user

A user in a Basic User Registry.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
name	string		Name of a user in a Basic User Registry.
password	One way hashable, or reversably encoded password (string)		Password of a user in a Basic User Registry. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.

## Batch JMS Dispatcher (batchJmsDispatcher)

Configures the Batch JMS dispatcher.

- connectionFactory
  - connectionManager
  - containerAuthData
  - properties.wasJms
  - properties.wmqJms
  - recoveryAuthData
- queue
  - properties.wasJms
  - properties.wmqJms

Attribute name	Data type	Default value	Description
connectionFactoryRef	A reference to top level jmsConnectionFactory element (string).	batchConnectionFactory	The identifier of the JMS connection factory that the Batch dispatcher should use to obtain JMS connections.
id	string		A unique configuration ID.
queueRef	A reference to top level jmsQueue element (string).	batchJobSubmissionQueue	The identifier of the JMS queue that the Batch JMS dispatcher uses to send JMS messages.

### connectionFactory

The identifier of the JMS connection factory that the Batch dispatcher should use to obtain JMS connections.

false

Attribute name	Data type	Default value	Description
connectionManagerRef	A reference to top level connectionManager element (string).		Connection manager for a connection factory.

Attribute name	Data type	Default value	Description
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.
jndiName	string		JNDI name for a resource.
recoveryAuthDataRef	A reference to top level authData element (string).		Authentication data for transaction recovery.

**connectionFactory > connectionManager**

Connection manager for a connection factory.

false

Attribute name	Data type	Default value	Description
agedTimeout	A period of time with second precision	-1	Amount of time before a physical connection can be discarded by pool maintenance. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
connectionTimeout	A period of time with second precision	30s	Amount of time after which a connection request times out. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxConnectionsPerThread	int Minimum: 0		Limits the number of open connections on each thread.

Attribute name	Data type	Default value	Description
maxIdleTime	A period of time with second precision	30m	Amount of time after which an unused or idle connection can be discarded during pool maintenance, if doing so does not reduce the pool below the minimum size. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxPoolSize	int Minimum: 0	50	Maximum number of physical connections for a pool. A value of 0 means unlimited.
minPoolSize	int Minimum: 0		Minimum number of physical connections to maintain in the pool. The pool is not pre-populated. Aged timeout can override the minimum.
numConnectionsPerThreadLocal	int Minimum: 0		Caches the specified number of connections for each thread.

Attribute name	Data type	Default value	Description
purgePolicy	<ul style="list-style-type: none"> <li>• ValidateAllConnections</li> <li>• FailingConnectionOnly</li> <li>• EntirePool</li> </ul>	EntirePool	<p>Specifies which connections to destroy when a stale connection is detected in a pool.</p> <p><b>ValidateAllConnections</b> When a stale connection is detected, connections are tested and those found to be bad are closed.</p> <p><b>FailingConnectionOnly</b> When a stale connection is detected, only the connection which was found to be bad is closed.</p> <p><b>EntirePool</b> When a stale connection is detected, all connections in the pool are marked stale, and when no longer in use, are closed.</p>
reapTime	A period of time with second precision	3m	Amount of time between runs of the pool maintenance thread. A value of -1 disables pool maintenance. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

**connectionFactory > containerAuthData**

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

#### connectionFactory > properties.wasJms

A JMS connection factory is used to create connections to the associated JMS provider of JMS destinations, for both point-to-point and publish/subscribe messaging.

false

Attribute name	Data type	Default value	Description
busName	string	defaultBus	The name of a bus when connecting to the service integration bus in a full profile server.
clientID	string	clientID	The JMS client identifier needed for durable(and for shared non-durable) topic subscriptions on all connections. This identifier is required if the application is doing durable(and for shared non-durable) publish/subscribe messaging.
durableSubscriptionHome	string	defaultME	Durable subscription home defines ME name to which connection needs to be established.
nonPersistentMapping	<ul style="list-style-type: none"> <li>• BestEffortNonPersistent</li> <li>• ReliableNonPersistent</li> <li>• ExpressNonPersistent</li> </ul>	ExpressNonPersistent	<p>The reliability applied to Non-persistent JMS messages sent using this connection factory.</p> <p><b>BestEffortNonPersistent</b> BestEffortNonPersistent</p> <p><b>ReliableNonPersistent</b> ReliableNonPersistent</p> <p><b>ExpressNonPersistent</b> ExpressNonPersistent</p>
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.

Attribute name	Data type	Default value	Description
persistentMapping	<ul style="list-style-type: none"> <li>AssuredPersistent</li> <li>ReliablePersistent</li> </ul>	ReliablePersistent	<p>The reliability applied to persistent JMS messages sent using this connection factory.</p> <p><b>AssuredPersistent</b> AssuredPersistent</p> <p><b>ReliablePersistent</b> ReliablePersistent</p>
readAhead	<ul style="list-style-type: none"> <li>AlwaysOff</li> <li>Default</li> <li>AlwaysOn</li> </ul>	Default	<p>Read ahead is an optimization that preemptively assigns messages to consumers. This processes the consumer requests faster.</p> <p><b>AlwaysOff</b> AlwaysOff</p> <p><b>Default</b> Default</p> <p><b>AlwaysOn</b> AlwaysOn</p>
remoteServerAddress	string		<p>The remote server address that has triplets separated by a comma, with the syntax hostName:portNumber:chainName, used to connect to a bootstrap server. For example, Merlin:7276:BootstrapBasicMessaging. If hostName is not specified, the default is localhost. If portNumber is not specified, the default is 7276. If chainName is not specified, the default is BootstrapBasicMessaging. Refer to the information center for more information.</p>
shareDurableSubscription	string		Controls whether or not durable subscription can be shared across connections.
targetTransportChain	string		Transport chains specify the communication protocols that can be used to communicate with the service integration bus in a full profiles server.
temporaryQueueNamePrefix	string	temp	The prefix of up to twelve characters used for the temporary queues created by applications that use this queue connection factory.

Attribute name	Data type	Default value	Description
temporaryTopicNamePrefix	string	temp	The prefix of up to twelve characters used for the temporary topics created by applications that use this topic connection factory.
userName	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**connectionFactory > properties.wmqJms**  
 WebSphere MQ JMS connection factory  
 false

Attribute name	Data type	Default value	Description
CCSID	int Minimum: 1	819	The coded character set identifier for a connection.
applicationName	string		The name by which an application is registered with the queue manager.
arbitraryProperties	string		Ability to specify properties not defined elsewhere
brokerCCSubQueue	string		The name of the queue from which a connection consumer receives nondurable subscription messages
brokerControlQueue	string		The name of the broker control queue
brokerPubQueue	string		The name of the queue where published messages are sent (the stream queue).
brokerQueueManager	string		The name of the queue manager on which the broker is running
brokerSubQueue	string		The name of the queue from which a nondurable message consumer receives messages
brokerVersion	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		The version of the broker being used  2      2 1      1
ccdtURL	string		A URL that identifies the name and location of the file containing the client channel definition table (CCDT) and specifies how the file can be accessed.

Attribute name	Data type	Default value	Description
channel	string		The name of the MQI channel to use.
cleanupInterval	A period of time with millisecond precision		The interval, in milliseconds, between background runs of the publish/subscribe cleanup utility. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
cleanupLevel	<ul style="list-style-type: none"> <li>• SAFE</li> <li>• FORCE</li> <li>• NONDUR</li> <li>• NONE</li> <li>• STRONG</li> </ul>	SAFE	<p>The cleanup level for a broker-based subscription store.</p> <p><b>SAFE</b> SAFE</p> <p><b>FORCE</b> FORCE</p> <p><b>NONDUR</b> NONDUR</p> <p><b>NONE</b> NONE</p> <p><b>STRONG</b> STRONG</p>
clientId	string		The client identifier for a connection
cloneSupport	<ul style="list-style-type: none"> <li>• ENABLED</li> <li>• DISABLED</li> </ul>	DISABLED	<p>Whether two or more instances of the same durable topic subscriber can run simultaneously.</p> <p><b>ENABLED</b> ENABLED</p> <p><b>DISABLED</b> DISABLED</p>
connectionNameList	string		A list of TCP/IP connection names (hostname(port))used for communications. ConnectionNameList supersedes the hostname and port properties.
failIfQuiesce	boolean	true	Whether calls to certain methods fail if the queue manager is in a quiescing state.

Attribute name	Data type	Default value	Description
headerCompression	<ul style="list-style-type: none"> <li>• SYSTEM</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing header data on a connection</p> <p><b>SYSTEM</b> SYSTEM</p> <p><b>NONE</b> NONE</p>
hostName	string		<p>The host name or IP address of the system on which the queue manager resides. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.</p>
localAddress	string		<p>For a connection to a queue manager, this property specifies either or both of the following, (1) The local network interface to be used, (2) The local port, or range of local ports, to be used</p>
messageCompression	<ul style="list-style-type: none"> <li>• RLE</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing message data on a connection.</p> <p><b>RLE</b> RLE</p> <p><b>NONE</b> NONE</p>
messageSelection	<ul style="list-style-type: none"> <li>• CLIENT</li> <li>• BROKER</li> </ul>	CLIENT	<p>Determines whether message selection is done by WebSphere MQ classes for JMS or by the broker.</p> <p><b>CLIENT</b> CLIENT</p> <p><b>BROKER</b> BROKER</p>
password	Reversably encoded password (string)		<p>The default password to use when creating a connection to the queue manager. (It is recommended to use a container managed authentication alias instead of configuring this property)</p>

Attribute name	Data type	Default value	Description						
pollingInterval	A period of time with millisecond precision		If each message listener within a session has no suitable message on its queue, this value is the maximum interval, in milliseconds, that elapses before each message listener tries again to get a message from its queue. If it frequently happens that no suitable message is available for any of the message listeners in a session, consider increasing the value of this property. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.						
port	int Minimum: 1	1414	The port on which the queue manager listens. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.						
providerVersion	<ul style="list-style-type: none"> <li>• 7</li> <li>• 6</li> <li>• unspecified</li> </ul>	unspecified	<p>The version, release, modification level and fix pack of the queue manager to which the application intends to connect.</p> <table style="width: 100%; border: none;"> <tr> <td style="width: 50%; text-align: center;">7</td> <td style="width: 50%; text-align: center;">7</td> </tr> <tr> <td style="text-align: center;">6</td> <td style="text-align: center;">6</td> </tr> <tr> <td style="text-align: center;"><b>unspecified</b></td> <td style="text-align: center;">unspecified</td> </tr> </table>	7	7	6	6	<b>unspecified</b>	unspecified
7	7								
6	6								
<b>unspecified</b>	unspecified								
pubAckInterval	int Minimum: 0	25	The number of messages published by a publisher before WebSphere MQ classes for JMS requests an acknowledgment from the broker						
queueManager	string		The name of the queue manager to connect to						
receiveExit	string		Identifies a channel receive exit program, or a sequence of receive exit programs to be run in succession						

Attribute name	Data type	Default value	Description
receiveExitInit	string		The user data that is passed to channel receive exit programs when they are called
rescanInterval	A period of time with millisecond precision	5s	When a message consumer in the point-to-point domain uses a message selector to select which messages it wants to receive, WebSphere MQ classes for JMS searches the WebSphere MQ queue for suitable messages in the sequence determined by the <code>MsgDeliverySequence</code> attribute of the queue. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
securityExit	string		Identifies a channel security exit program
securityExitInit	string		The user data that is passed to a channel security exit program when it is called
sendCheckCount	int Minimum: 0		The number of send calls to allow between checking for asynchronous put errors, within a single non-transacted JMS session.
sendExit	string		Identifies a channel send exit program, or a sequence of send exit programs to be run in succession.
sendExitInit	string		The user data that is passed to channel send exit programs when they are called.
shareConvAllowed	boolean	true	Whether a client connection can share its socket with other top-level JMS connections from the same process to the same queue manager, if the channel definitions match
sparseSubscriptions	boolean	false	Controls the message retrieval policy of a <code>TopicSubscriber</code> object.

Attribute name	Data type	Default value	Description
sslCertStores	string		The Lightweight Directory Access Protocol (LDAP) servers that hold certificate revocation lists (CRLs) for use on an SSL connection.
sslCipherSuite	string		The CipherSuite to use for an SSL connection.
sslFipsRequired	boolean		Whether an SSL connection must use a CipherSuite that is supported by the IBM Java JSSE FIPS provider (IBMJSSEFIPS).
sslPeerName	string		For an SSL connection, a template that is used to check the distinguished name in the digital certificate provided by the queue manager.
sslResetCount	int Minimum: 0 Maximum: 999999999	0	The total number of bytes sent and received by an SSL connection before the secret keys used by SSL are renegotiated.
statusRefreshInterval	A period of time with millisecond precision	1m	The interval, in milliseconds, between refreshes of the long running transaction that detects when a subscriber loses its connection to the queue manager. This property is relevant only if subscription store has the value QUEUE. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
subscriptionStore	<ul style="list-style-type: none"> <li>• MIGRATE</li> <li>• BROKER</li> <li>• QUEUE</li> </ul>	BROKER	<p>Determines where WebSphere MQ classes for JMS stores persistent data about active subscriptions.</p> <p><b>MIGRATE</b> MIGRATE</p> <p><b>BROKER</b> BROKER</p> <p><b>QUEUE</b> QUEUE</p>

Attribute name	Data type	Default value	Description
targetClientMatching	boolean	true	Whether a reply message, sent to the queue identified by the JMSReplyTo header field of an incoming message, has an MQRFH2 header only if the incoming message has an MQRFH2 header.
tempQPrefix	string		The prefix that is used to form the name of a WebSphere MQ dynamic queue.
tempTopicPrefix	string		When creating temporary topics, JMS generates a topic string of the form TEMP/TEMPTOPICPREFIX/unique_id, or if this property is left with the default value, just TEMP/unique_id. Specifying a non-empty TEMPTOPICPREFIX allows specific model queues to be defined for creating the managed queues for subscribers to temporary topics created under this connection.
temporaryModel	string		The name of the model queue from which JMS temporary queues are created. SYSTEM.JMS.TEMPQ.MODEL can be used by the JMS Layer to create queues which accept persistent messages, as the default value cannot. SYSTEM.DEFAULT.MODEL.QUEUE can be opened only once. SYSTEM.JMS.TEMPQ.MODEL can be opened more than once. SYSTEM.DEFAULT.MODEL.QUEUE is deprecated.
transportType	<ul style="list-style-type: none"> <li>• CLIENT</li> <li>• BINDINGS</li> </ul>	CLIENT	Whether a connection to a queue manager uses client mode or bindings mode.  <b>CLIENT</b> CLIENT  <b>BINDINGS</b> BINDINGS

Attribute name	Data type	Default value	Description
userName	string		The default user name to use when creating a connection to a queue manager. (It is recommended to use a container managed authentication alias instead of configuring this property)
wildcardFormat	<ul style="list-style-type: none"> <li>• CHAR</li> <li>• TOPIC</li> </ul>	TOPIC	Which version of wildcard syntax is to be used.  <b>CHAR</b> CHAR <b>TOPIC</b> TOPIC

**connectionFactory > recoveryAuthData**

Authentication data for transaction recovery.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

**queue**

The identifier of the JMS queue that the Batch JMS dispatcher uses to send JMS messages.

false

Attribute name	Data type	Default value	Description
jndiName	string		JNDI name for a resource.

**queue > properties.wasJms**

The name of the queue that this JMS queue is assigned to.

false

Attribute name	Data type	Default value	Description
deliveryMode	<ul style="list-style-type: none"> <li>• NonPersistent</li> <li>• Application</li> <li>• Persistent</li> </ul>	Application	<p>The delivery mode for messages sent to this destination. This controls the persistence of messages on this destination.</p> <p><b>NonPersistent</b> NonPersistent</p> <p><b>Application</b> Application</p> <p><b>Persistent</b> Persistent</p>
priority	int  Minimum: 0  Maximum: 9		<p>The relative priority for messages sent to this destination, in the range 0 to 9, with 0 as the lowest priority and 9 as the highest priority.</p>
queueName	string	Default.Queue	The name of the associated Queue
readAhead	<ul style="list-style-type: none"> <li>• AlwaysOff</li> <li>• AsConnection</li> <li>• AlwaysOn</li> </ul>	AsConnection	<p>Read ahead is an optimization that preemptively assigns messages to consumers. This processes the consumer requests faster.</p> <p><b>AlwaysOff</b> AlwaysOff</p> <p><b>AsConnection</b> AsConnection</p> <p><b>AlwaysOn</b> AlwaysOn</p>
timeToLive	A period of time with second precision	0s	<p>The default time in milliseconds from its dispatch time that the system must keep the messages live in the destination. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.</p>

```
queue > properties.wmqJms
WebSphere MQ JMS Queue
false
```

Attribute name	Data type	Default value	Description
CCSID	int Minimum: 1	1208	The coded character set ID to be used for a connection or destination
arbitraryProperties	string		Ability to specify properties not defined elsewhere
baseQueueManagerName	string		Queue Manager name that has this queue defined on it
baseQueueName	string		Name of the Queue on the Queue Manager
encoding	string	NATIVE	How numeric data in the body of a message is represented when the message is sent to this destination. The property specifies the representation of binary integers, packed decimal integers, and floating point numbers.
expiry	string	APP	The period after which messages at a destination expire
failIfQuiesce	boolean	true	Whether calls to certain methods fail if the queue manager is in a quiescing state
persistence	<ul style="list-style-type: none"> <li>• APP</li> <li>• QDEF</li> <li>• HIGH</li> <li>• NON</li> <li>• PERS</li> </ul>	APP	The persistence of messages sent to a destination <b>APP</b> APP <b>QDEF</b> QDEF <b>HIGH</b> HIGH <b>NON</b> NON <b>PERS</b> PERS
priority	<ul style="list-style-type: none"> <li>• 3</li> <li>• 2</li> <li>• 1</li> <li>• APP</li> <li>• 0</li> <li>• 7</li> <li>• 6</li> <li>• 5</li> <li>• QDEF</li> <li>• 4</li> <li>• 9</li> <li>• 8</li> </ul>	APP	The priority for messages sent to a destination <b>3</b> 3 <b>2</b> 2 <b>1</b> 1 <b>APP</b> APP <b>0</b> 0 <b>7</b> 7 <b>6</b> 6 <b>5</b> 5 <b>QDEF</b> QDEF <b>4</b> 4 <b>9</b> 9 <b>8</b> 8

Attribute name	Data type	Default value	Description
putAsyncAllowed	<ul style="list-style-type: none"> <li>ENABLED</li> <li>DESTINATION</li> <li>DISABLED</li> </ul>	DESTINATION	<p>Whether message producers are allowed to use asynchronous puts to send messages to this destination</p> <p><b>ENABLED</b> ENABLED</p> <p><b>DESTINATION</b> DESTINATION</p> <p><b>DISABLED</b> DISABLED</p>
readAheadAllowed	<ul style="list-style-type: none"> <li>ENABLED</li> <li>DESTINATION</li> <li>DISABLED</li> </ul>	DESTINATION	<p>Whether the MDB is allowed to use read ahead to get nonpersistent messages from the destination into an internal buffer before receiving them</p> <p><b>ENABLED</b> ENABLED</p> <p><b>DESTINATION</b> DESTINATION</p> <p><b>DISABLED</b> DISABLED</p>
readAheadClosePolicy	<ul style="list-style-type: none"> <li>CURRENT</li> <li>ALL</li> </ul>	ALL	<p>What happens to messages in the internal read ahead buffer when the MDB is stopped by the administrator.</p> <p><b>CURRENT</b> CURRENT</p> <p><b>ALL</b> ALL</p>
receiveCCSID	<p>int</p> <p>Minimum: 0</p>		<p>Destination property that sets the target Coded character set identifier for queue manager message conversion. The value is ignored unless receive conversion is set to WMQ_RECEIVE_CONVERSION_QMG</p>
receiveConversion	<ul style="list-style-type: none"> <li>QMGR</li> <li>CLIENT_MSG</li> </ul>	CLIENT_MSG	<p>Destination property that determines if data conversion is going to be performed by the queue manager.</p> <p><b>QMGR</b> QMGR</p> <p><b>CLIENT_MSG</b> CLIENT_MSG</p>

Attribute name	Data type	Default value	Description
targetClient	<ul style="list-style-type: none"> <li>• JMS</li> <li>• MQ</li> </ul>	JMS	Whether the WebSphere MQ RFH2 format is used to exchange information with target applications  <b>JMS</b> JMS <b>MQ</b> MQ

## Batch JMS Events (batchJmsEvents)

Configure the Batch JMS events.

- connectionFactory
  - connectionManager
  - containerAuthData
  - properties.wasJms
  - properties.wmqJms
  - recoveryAuthData

Attribute name	Data type	Default value	Description
connectionFactoryRef	A reference to top level jmsConnectionFactory element (string).	batchConnectionFactory	The identifier of the JMS connection factory.
id	string		A unique configuration ID.

### connectionFactory

The identifier of the JMS connection factory.

false

Attribute name	Data type	Default value	Description
connectionManagerRef	A reference to top level connectionManager element (string).		Connection manager for a connection factory.
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.
jndiName	string		JNDI name for a resource.
recoveryAuthDataRef	A reference to top level authData element (string).		Authentication data for transaction recovery.

### connectionFactory > connectionManager

Connection manager for a connection factory.

false

Attribute name	Data type	Default value	Description
agedTimeout	A period of time with second precision	-1	Amount of time before a physical connection can be discarded by pool maintenance. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
connectionTimeout	A period of time with second precision	30s	Amount of time after which a connection request times out. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxConnectionsPerThread	int Minimum: 0		Limits the number of open connections on each thread.
maxIdleTime	A period of time with second precision	30m	Amount of time after which an unused or idle connection can be discarded during pool maintenance, if doing so does not reduce the pool below the minimum size. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxPoolSize	int Minimum: 0	50	Maximum number of physical connections for a pool. A value of 0 means unlimited.

Attribute name	Data type	Default value	Description
minPoolSize	int Minimum: 0		Minimum number of physical connections to maintain in the pool. The pool is not pre-populated. Aged timeout can override the minimum.
numConnectionsPerThreadLocal	int Minimum: 0		Caches the specified number of connections for each thread.
purgePolicy	<ul style="list-style-type: none"> <li>• ValidateAllConnections</li> <li>• FailingConnectionOnly</li> <li>• EntirePool</li> </ul>	EntirePool	<p>Specifies which connections to destroy when a stale connection is detected in a pool.</p> <p><b>ValidateAllConnections</b> When a stale connection is detected, connections are tested and those found to be bad are closed.</p> <p><b>FailingConnectionOnly</b> When a stale connection is detected, only the connection which was found to be bad is closed.</p> <p><b>EntirePool</b> When a stale connection is detected, all connections in the pool are marked stale, and when no longer in use, are closed.</p>
reapTime	A period of time with second precision	3m	Amount of time between runs of the pool maintenance thread. A value of -1 disables pool maintenance. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

**connectionFactory > containerAuthData**

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

**connectionFactory > properties.wasJms**

A JMS connection factory is used to create connections to the associated JMS provider of JMS destinations, for both point-to-point and publish/subscribe messaging.

false

Attribute name	Data type	Default value	Description
busName	string	defaultBus	The name of a bus when connecting to the service integration bus in a full profile server.
clientID	string	clientID	The JMS client identifier needed for durable(and for shared non-durable) topic subscriptions on all connections. This identifier is required if the application is doing durable(and for shared non-durable) publish/subscribe messaging.
durableSubscriptionHome	string	defaultME	Durable subscription home defines ME name to which connection needs to be established.
nonPersistentMapping	<ul style="list-style-type: none"> <li>• BestEffortNonPersistent</li> <li>• ReliableNonPersistent</li> <li>• ExpressNonPersistent</li> </ul>	ExpressNonPersistent	The reliability applied to Non-persistent JMS messages sent using this connection factory.  <b>BestEffortNonPersistent</b> BestEffortNonPersistent  <b>ReliableNonPersistent</b> ReliableNonPersistent  <b>ExpressNonPersistent</b> ExpressNonPersistent

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
persistentMapping	<ul style="list-style-type: none"> <li>AssuredPersistent</li> <li>ReliablePersistent</li> </ul>	ReliablePersistent	<p>The reliability applied to persistent JMS messages sent using this connection factory.</p> <p><b>AssuredPersistent</b> AssuredPersistent</p> <p><b>ReliablePersistent</b> ReliablePersistent</p>
readAhead	<ul style="list-style-type: none"> <li>AlwaysOff</li> <li>Default</li> <li>AlwaysOn</li> </ul>	Default	<p>Read ahead is an optimization that preemptively assigns messages to consumers. This processes the consumer requests faster.</p> <p><b>AlwaysOff</b> AlwaysOff</p> <p><b>Default</b> Default</p> <p><b>AlwaysOn</b> AlwaysOn</p>
remoteServerAddress	string		<p>The remote server address that has triplets separated by a comma, with the syntax hostName:portNumber:chainName, used to connect to a bootstrap server. For example, Merlin:7276:BootstrapBasicMessaging. If hostName is not specified, the default is localhost. If portNumber is not specified, the default is 7276. If chainName is not specified, the default is BootstrapBasicMessaging. Refer to the information center for more information.</p>
shareDurableSubscription	string		Controls whether or not durable subscription can be shared across connections.
targetTransportChain	string		Transport chains specify the communication protocols that can be used to communicate with the service integration bus in a full profiles server.

Attribute name	Data type	Default value	Description
temporaryQueueNamePrefix	string	temp	The prefix of up to twelve characters used for the temporary queues created by applications that use this queue connection factory.
temporaryTopicNamePrefix	string	temp	The prefix of up to twelve characters used for the temporary topics created by applications that use this topic connection factory.
userName	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**connectionFactory > properties.wmqJms**  
 WebSphere MQ JMS connection factory  
 false

Attribute name	Data type	Default value	Description
CCSID	int Minimum: 1	819	The coded character set identifier for a connection.
applicationName	string		The name by which an application is registered with the queue manager.
arbitraryProperties	string		Ability to specify properties not defined elsewhere
brokerCCSubQueue	string		The name of the queue from which a connection consumer receives nondurable subscription messages
brokerControlQueue	string		The name of the broker control queue
brokerPubQueue	string		The name of the queue where published messages are sent (the stream queue).
brokerQueueManager	string		The name of the queue manager on which the broker is running
brokerSubQueue	string		The name of the queue from which a nondurable message consumer receives messages
brokerVersion	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		The version of the broker being used  2        2 1        1

Attribute name	Data type	Default value	Description
ccdtURL	string		A URL that identifies the name and location of the file containing the client channel definition table (CCDT) and specifies how the file can be accessed.
channel	string		The name of the MQI channel to use.
cleanupInterval	A period of time with millisecond precision		The interval, in milliseconds, between background runs of the publish/subscribe cleanup utility. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
cleanupLevel	<ul style="list-style-type: none"> <li>• SAFE</li> <li>• FORCE</li> <li>• NONDUR</li> <li>• NONE</li> <li>• STRONG</li> </ul>	SAFE	<p>The cleanup level for a broker-based subscription store.</p> <p><b>SAFE</b> SAFE</p> <p><b>FORCE</b> FORCE</p> <p><b>NONDUR</b> NONDUR</p> <p><b>NONE</b> NONE</p> <p><b>STRONG</b> STRONG</p>
clientId	string		The client identifier for a connection
cloneSupport	<ul style="list-style-type: none"> <li>• ENABLED</li> <li>• DISABLED</li> </ul>	DISABLED	<p>Whether two or more instances of the same durable topic subscriber can run simultaneously.</p> <p><b>ENABLED</b> ENABLED</p> <p><b>DISABLED</b> DISABLED</p>
connectionNameList	string		A list of TCP/IP connection names (hostname(port)) used for communications. ConnectionNameList supersedes the hostname and port properties.

Attribute name	Data type	Default value	Description
failIfQuiesce	boolean	true	Whether calls to certain methods fail if the queue manager is in a quiescing state.
headerCompression	<ul style="list-style-type: none"> <li>• SYSTEM</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing header data on a connection</p> <p><b>SYSTEM</b> SYSTEM</p> <p><b>NONE</b> NONE</p>
hostName	string		The host name or IP address of the system on which the queue manager resides. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.
localAddress	string		For a connection to a queue manager, this property specifies either or both of the following, (1) The local network interface to be used, (2) The local port, or range of local ports, to be used
messageCompression	<ul style="list-style-type: none"> <li>• RLE</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing message data on a connection.</p> <p><b>RLE</b> RLE</p> <p><b>NONE</b> NONE</p>
messageSelection	<ul style="list-style-type: none"> <li>• CLIENT</li> <li>• BROKER</li> </ul>	CLIENT	<p>Determines whether message selection is done by WebSphere MQ classes for JMS or by the broker.</p> <p><b>CLIENT</b> CLIENT</p> <p><b>BROKER</b> BROKER</p>
password	Reversably encoded password (string)		The default password to use when creating a connection to the queue manager. (It is recommended to use a container managed authentication alias instead of configuring this property)

Attribute name	Data type	Default value	Description				
pollingInterval	A period of time with millisecond precision		If each message listener within a session has no suitable message on its queue, this value is the maximum interval, in milliseconds, that elapses before each message listener tries again to get a message from its queue. If it frequently happens that no suitable message is available for any of the message listeners in a session, consider increasing the value of this property. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.				
port	int Minimum: 1	1414	The port on which the queue manager listens. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.				
providerVersion	<ul style="list-style-type: none"> <li>• 7</li> <li>• 6</li> <li>• unspecified</li> </ul>	unspecified	<p>The version, release, modification level and fix pack of the queue manager to which the application intends to connect.</p> <table style="margin-left: 20px;"> <tr> <td style="padding-right: 20px;">7</td> <td>7</td> </tr> <tr> <td>6</td> <td>6</td> </tr> </table> <p><b>unspecified</b> unspecified</p>	7	7	6	6
7	7						
6	6						
pubAckInterval	int Minimum: 0	25	The number of messages published by a publisher before WebSphere MQ classes for JMS requests an acknowledgment from the broker				
queueManager	string		The name of the queue manager to connect to				
receiveExit	string		Identifies a channel receive exit program, or a sequence of receive exit programs to be run in succession				

Attribute name	Data type	Default value	Description
receiveExitInit	string		The user data that is passed to channel receive exit programs when they are called
rescanInterval	A period of time with millisecond precision	5s	When a message consumer in the point-to-point domain uses a message selector to select which messages it wants to receive, WebSphere MQ classes for JMS searches the WebSphere MQ queue for suitable messages in the sequence determined by the <code>MsgDeliverySequence</code> attribute of the queue. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
securityExit	string		Identifies a channel security exit program
securityExitInit	string		The user data that is passed to a channel security exit program when it is called
sendCheckCount	int Minimum: 0		The number of send calls to allow between checking for asynchronous put errors, within a single non-transacted JMS session.
sendExit	string		Identifies a channel send exit program, or a sequence of send exit programs to be run in succession.
sendExitInit	string		The user data that is passed to channel send exit programs when they are called.
shareConvAllowed	boolean	true	Whether a client connection can share its socket with other top-level JMS connections from the same process to the same queue manager, if the channel definitions match
sparseSubscriptions	boolean	false	Controls the message retrieval policy of a <code>TopicSubscriber</code> object.

Attribute name	Data type	Default value	Description
sslCertStores	string		The Lightweight Directory Access Protocol (LDAP) servers that hold certificate revocation lists (CRLs) for use on an SSL connection.
sslCipherSuite	string		The CipherSuite to use for an SSL connection.
sslFipsRequired	boolean		Whether an SSL connection must use a CipherSuite that is supported by the IBM Java JSSE FIPS provider (IBMJSSEFIPS).
sslPeerName	string		For an SSL connection, a template that is used to check the distinguished name in the digital certificate provided by the queue manager.
sslResetCount	int Minimum: 0 Maximum: 999999999	0	The total number of bytes sent and received by an SSL connection before the secret keys used by SSL are renegotiated.
statusRefreshInterval	A period of time with millisecond precision	1m	The interval, in milliseconds, between refreshes of the long running transaction that detects when a subscriber loses its connection to the queue manager. This property is relevant only if subscription store has the value QUEUE. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
subscriptionStore	<ul style="list-style-type: none"> <li>• MIGRATE</li> <li>• BROKER</li> <li>• QUEUE</li> </ul>	BROKER	<p>Determines where WebSphere MQ classes for JMS stores persistent data about active subscriptions.</p> <p><b>MIGRATE</b> MIGRATE</p> <p><b>BROKER</b> BROKER</p> <p><b>QUEUE</b> QUEUE</p>

Attribute name	Data type	Default value	Description
targetClientMatching	boolean	true	Whether a reply message, sent to the queue identified by the JMSReplyTo header field of an incoming message, has an MQRFH2 header only if the incoming message has an MQRFH2 header.
tempQPrefix	string		The prefix that is used to form the name of a WebSphere MQ dynamic queue.
tempTopicPrefix	string		When creating temporary topics, JMS generates a topic string of the form TEMP/TEMPTOPICPREFIX/unique_id, or if this property is left with the default value, just TEMP/unique_id. Specifying a non-empty TEMPTOPICPREFIX allows specific model queues to be defined for creating the managed queues for subscribers to temporary topics created under this connection.
temporaryModel	string		The name of the model queue from which JMS temporary queues are created. SYSTEM.JMS.TEMPQ.MODEL can be used by the JMS Layer to create queues which accept persistent messages, as the default value cannot. SYSTEM.DEFAULT.MODEL.QUEUE can be opened only once. SYSTEM.JMS.TEMPQ.MODEL can be opened more than once. SYSTEM.DEFAULT.MODEL.QUEUE is deprecated.
transportType	<ul style="list-style-type: none"> <li>• CLIENT</li> <li>• BINDINGS</li> </ul>	CLIENT	Whether a connection to a queue manager uses client mode or bindings mode.  <b>CLIENT</b> CLIENT  <b>BINDINGS</b> BINDINGS

Attribute name	Data type	Default value	Description
userName	string		The default user name to use when creating a connection to a queue manager. (It is recommended to use a container managed authentication alias instead of configuring this property)
wildcardFormat	<ul style="list-style-type: none"> <li>• CHAR</li> <li>• TOPIC</li> </ul>	TOPIC	Which version of wildcard syntax is to be used.  <b>CHAR</b> CHAR <b>TOPIC</b> TOPIC

**connectionFactory > recoveryAuthData**

Authentication data for transaction recovery.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

## Batch JMS Executor (batchJmsExecutor)

Configures the Batch JMS executor.

- activationSpec
  - authData
  - properties.wasJms
  - properties.wmqJms
- queue
  - properties.wasJms
  - properties.wmqJms
- replyConnectionFactory
  - connectionManager
  - containerAuthData
  - properties.wasJms
  - properties.wmqJms
  - recoveryAuthData

Attribute name	Data type	Default value	Description
activationSpecRef	A reference to top level jmsActivationSpec element (string).	batchActivationSpec	The identifier of the JMS activation specification that the Batch executor uses to create JMS listeners.
id	string		A unique configuration ID.
queueRef	A reference to top level jmsQueue element (string).	batchJobSubmissionQueue	The identifier of the JMS queue that the Batch activation specification uses to listen for batch JMS messages.
replyConnectionFactoryRef	A reference to top level jmsConnectionFactory element (string).	batchConnectionFactory	The identifier of the JMS connection factory that the Batch executor should use to obtain JMS connections.

### activationSpec

The identifier of the JMS activation specification that the Batch executor uses to create JMS listeners.

false

Attribute name	Data type	Default value	Description
authDataRef	A reference to top level authData element (string).		Default authentication data for an activation specification.
maxEndpoints	int Minimum: 0	500	The maximum number of endpoints to dispatch to.

### activationSpec > authData

Default authentication data for an activation specification.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

### activationSpec > properties.wasJms

A JMS activation specification is associated with one or more message-driven beans and provides the configuration necessary for them to receive messages.

false

Attribute name	Data type	Default value	Description
acknowledgeMode	<ul style="list-style-type: none"> <li>Dups-ok-acknowledge</li> <li>Auto-acknowledge</li> </ul>	Auto-acknowledge	<p>The acknowledge mode indicates how a message received by a message-driven bean should be acknowledged.</p> <p><b>Dups-ok-acknowledge</b> Dups-ok-acknowledge</p> <p><b>Auto-acknowledge</b> Auto-acknowledge</p>
busName	string	defaultBus	The name of a bus when connecting to the service integration bus in a full profile server.
clientId	string		The JMS client identifier needed for durable(and for shared non-durable) topic subscriptions on all connections. This identifier is required if the application is doing durable(and for shared non-durable) publish/subscribe messaging.
connectionFactoryLookup	string		This property can be used to specify the lookup name of an administratively-defined <code>javax.jms.ConnectionFactory</code> , <code>javax.jms.QueueConnectionFactory</code> or <code>javax.jms.TopicConnectionFactory</code> object that is used to connect to the JMS provider from which the endpoint (message-driven bean) can receive messages.
destination	string		Reference to a JMS destination
destinationLookup	string		This property can be used to specify the lookup name of the administratively-defined <code>javax.jms.Queue</code> or <code>javax.jms.Topic</code> objects that define the JMS queue or topic from which the endpoint (message-driven bean) can receive messages.
destinationRef	A reference to top level adminObject element (string).		Reference to a JMS destination

Attribute name	Data type	Default value	Description
destinationType	<ul style="list-style-type: none"> <li>javax.jms.Topic</li> <li>javax.jms.Queue</li> </ul>	javax.jms.Queue	<p>The type of the destination, which is javax.jms.Queue or javax.jms.Topic.</p> <p><b>javax.jms.Topic</b> javax.jms.Topic</p> <p><b>javax.jms.Queue</b> javax.jms.Queue</p>
maxBatchSize	int Minimum: 1 Maximum: 2147483647		The maximum number of messages received from the messaging engine in a single batch.
maxConcurrency	int Minimum: 1 Maximum: 2147483647	5	The maximum number of endpoints to which the messages are delivered concurrently. The increase in the number can improve the performance, but it also increases the number of threads that are in use at the specified time. If the message order must be retained for all the failed deliveries, set the maximum concurrent endpoints value to 1.
messageSelector	string		The JMS message selector used to determine which messages the message-driven bean receives. The value is a string that is used to select a subset of the available messages.
readAhead	<ul style="list-style-type: none"> <li>AlwaysOff</li> <li>Default</li> <li>AlwaysOn</li> </ul>	Default	<p>Read ahead is an optimization that preemptively assigns messages to consumers. This processes the consumer requests faster.</p> <p><b>AlwaysOff</b> AlwaysOff</p> <p><b>Default</b> Default</p> <p><b>AlwaysOn</b> AlwaysOn</p>

Attribute name	Data type	Default value	Description
remoteServerAddress	string		The remote server address that has triplets separated by a comma, with the syntax <code>hostName:portNumber:chainName</code> , used to connect to a bootstrap server. For example, <code>Merlin:7276:BootstrapBasicMessaging</code> . If <code>hostName</code> is not specified, the default is <code>localhost</code> . If <code>portNumber</code> is not specified, the default is <code>7276</code> . If <code>chainName</code> is not specified, the default is <code>BootstrapBasicMessaging</code> . Refer to the information center for more information.
retryInterval	A period of time with second precision	30s	The delay (in seconds) between attempts to connect to a messaging engine, both for the initial connection, and any subsequent attempts to establish a better connection. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as <code>30s</code> . You can include multiple values in a single entry. For example, <code>1m30s</code> is equivalent to 90 seconds.
shareDurableSubscription	string		Controls whether or not durable subscription can be shared across connections.
subscriptionDurability	<ul style="list-style-type: none"> <li>• DurableShared</li> <li>• Durable</li> <li>• NonDurable</li> <li>• NonDurableShared</li> </ul>	NonDurable	Type of MS topic subscription. The value can be any of following values: Durable DurableShared NonDurable NonDurableShared <b>DurableShared</b> DurableShared <b>Durable</b> Durable <b>NonDurable</b> NonDurable <b>NonDurableShared</b> NonDurableShared

Attribute name	Data type	Default value	Description
subscriptionName	string		The subscription name needed for durable(and for shared non-durable). Required field when using a durable(and for shared non-durable) topic subscription.This subscription name must be unique within a given client identifier.
targetTransportChain	<ul style="list-style-type: none"> <li>InboundSecureMessaging</li> <li>InboundBasicMessaging</li> </ul>	InboundBasicMessaging	<p>Transport chains specify the communication protocols that can be used to communicate with the service integration bus in a full profiles server.</p> <p><b>InboundSecureMessaging</b> InboundSecureMessaging</p> <p><b>InboundBasicMessaging</b> InboundBasicMessaging</p>

**activationSpec > properties.wmqJms**  
 WebSphere MQ JMS activation specification  
 false

Attribute name	Data type	Default value	Description
CCSID	int Minimum: 1	819	The coded character set identifier for a connection.
applicationName	string		The name by which an application is registered with the queue manager.
brokerCCDurSubQueue	string		The name of the queue from which non-durable subscription messages are retrieved for a ConnectionConsumer
brokerCCSubQueue	string		The name of the queue from which a connection consumer receives nondurable subscription messages
brokerControlQueue	string		The name of the broker control queue
brokerPubQueue	string		The name of the queue where published messages are sent (the stream queue)
brokerQueueManager	string		The name of the queue manager on which the broker is running

Attribute name	Data type	Default value	Description
brokerSubQueue	string		The name of the queue from which a nondurable message consumer receives messages
brokerVersion	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>The version of the broker being used</p> <p><b>2</b>      2</p> <p><b>1</b>      1</p>
ccdtURL	string		A URL that identifies the name and location of the file containing the client channel definition table (CCDT) and specifies how the file can be accessed.
channel	string	SYSTEM.DEF.SVRCONN	The name of the MQI channel to use.
cleanupInterval	A period of time with millisecond precision		The interval, in milliseconds, between background runs of the publish/subscribe cleanup utility. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
cleanupLevel	<ul style="list-style-type: none"> <li>• SAFE</li> <li>• FORCE</li> <li>• NONDUR</li> <li>• NONE</li> <li>• STRONG</li> </ul>	SAFE	<p>The cleanup level for a broker-based subscription store.</p> <p><b>SAFE</b>    SAFE</p> <p><b>FORCE</b>            FORCE</p> <p><b>NONDUR</b>            NONDUR</p> <p><b>NONE</b>    NONE</p> <p><b>STRONG</b>            STRONG</p>
clientId	string		The client identifier for a connection

Attribute name	Data type	Default value	Description
cloneSupport	<ul style="list-style-type: none"> <li>ENABLED</li> <li>DISABLED</li> </ul>	DISABLED	<p>Whether two or more instances of the same durable topic subscriber can run simultaneously</p> <p><b>ENABLED</b> ENABLED</p> <p><b>DISABLED</b> DISABLED</p>
connectionNameList	string		<p>A list of TCP/IP connection names (hostname(port)) used for communications. ConnectionNameList supersedes the hostname and port properties.</p>
destinationRef	A reference to top level adminObject element (string).		Destination
destinationType	<ul style="list-style-type: none"> <li>javax.jms.Topic</li> <li>javax.jms.Queue</li> </ul>	javax.jms.Queue	<p>The type of destination - javax.jms.Queue or javax.jms.Topic</p> <p><b>javax.jms.Topic</b> javax.jms.Topic</p> <p><b>javax.jms.Queue</b> javax.jms.Queue</p>
failIfQuiesce	boolean	true	Whether calls to certain methods fail if the queue manager is in a quiescing state.
headerCompression	<ul style="list-style-type: none"> <li>SYSTEM</li> <li>NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing header data on a connection</p> <p><b>SYSTEM</b> SYSTEM</p> <p><b>NONE</b> NONE</p>
hostName	string	localhost	The host name or IP address of the system on which the queue manager resides. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.

Attribute name	Data type	Default value	Description
localAddress	string		For a connection to a queue manager, this property specifies either or both of the following, (1) The local network interface to be used, (2) The local port, or range of local ports, to be used
maxMessages	int Minimum: 0	1	The maximum number of messages that can be assigned to a server session at one time. If the activation spec is delivering messages to an MDB in an XA transaction, a value of 1 is used regardless of the setting of this property.
maxPoolDepth	int Minimum: 0	10	The maxPoolDepth property on the activation specification defines the number of available MDB (Message Driven Bean) instances. Decreasing the value of this property decreases the number of messages that can be delivered concurrently.
messageBatchSize	int Minimum: 0		Maximum number of messages to process in one batch.
messageCompression	<ul style="list-style-type: none"> <li>• RLE</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing message data on a connection</p> <p><b>RLE</b>    RLE <b>NONE</b>   NONE</p>
messageRetention	boolean		Whether the connection consumer keeps unwanted messages on the input queue
messageSelection	<ul style="list-style-type: none"> <li>• CLIENT</li> <li>• BROKER</li> </ul>	CLIENT	<p>Determines whether message selection is done by WebSphere MQ classes for JMS or by the broker.</p> <p><b>CLIENT</b>           CLIENT <b>BROKER</b>           BROKER</p>

Attribute name	Data type	Default value	Description
messageSelector	string		Determines whether message selection is done by WebSphere MQ classes for JMS or by the broker. Message selection by the broker is not supported when brokerVersion has the value 1
pollingInterval	A period of time with millisecond precision	5s	If each message listener within a session has no suitable message on its queue, this value is the maximum interval, in milliseconds, that elapses before each message listener tries again to get a message from its queue. If it frequently happens that no suitable message is available for any of the message listeners in a session, consider increasing the value of this property. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
poolTimeout	A period of time with millisecond precision	5m	The time, in milliseconds, that an unused server session is held open in the server session pool before being closed due to inactivity. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
port	int Minimum: 1	1414	The port on which the queue manager listens. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.

Attribute name	Data type	Default value	Description
providerVersion	<ul style="list-style-type: none"> <li>7</li> <li>6</li> <li>unspecified</li> </ul>	unspecified	<p>The version, release, modification level and fix pack of the queue manager to which the application intends to connect.</p> <p>7      7</p> <p>6      6</p> <p><b>unspecified</b> unspecified</p>
queueManager	string		The name of the queue manager to connect to
receiveCCSID	int Minimum: 0	0	Destination property that sets the target Coded character set identifier for queue manager message conversion. The value is ignored unless receive conversion is set to WMQ_RECEIVE_CONVERSION_QMG
receiveConversion	<ul style="list-style-type: none"> <li>QMGR</li> <li>CLIENT_MSG</li> </ul>	CLIENT_MSG	Destination property that determines if data conversion is going to be performed by the queue manager. <p><b>QMGR</b> QMGR</p> <p><b>CLIENT_MSG</b> CLIENT_MSG</p>
receiveExit	string		Identifies a channel receive exit program, or a sequence of receive exit programs to be run in succession
receiveExitInit	string		The user data that is passed to channel receive exit programs when they are called

Attribute name	Data type	Default value	Description
rescanInterval	A period of time with millisecond precision	5s	When a message consumer in the point-to-point domain uses a message selector to select which messages it wants to receive, WebSphere MQ classes for JMS searches the WebSphere MQ queue for suitable messages in the sequence determined by the <code>MsgDeliverySequence</code> attribute of the queue. When WebSphere MQ classes for JMS finds a suitable message and delivers it to the consumer, WebSphere MQ classes for JMS resumes the search for the next suitable message from its current position in the queue. WebSphere MQ classes for JMS continues to search the queue in this way until it reaches the end of the queue, or until the interval of time in milliseconds, as determined by the value of this property, has expired. In each case, WebSphere MQ classes for JMS returns to the beginning of the queue to continue its search, and a new time interval commences. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
securityExit	string		Identifies a channel security exit program
securityExitInit	string		The user data that is passed to a channel security exit program when it is called
sendExit	string		Identifies a channel send exit program, or a sequence of send exit programs to be run in succession

Attribute name	Data type	Default value	Description
sendExitInit	string		The user data that is passed to channel send exit programs when they are called
shareConvAllowed	boolean	true	Whether a client connection can share its socket with other top-level JMS connections from the same process to the same queue manager, if the channel definitions match
sparseSubscriptions	boolean	false	Controls the message retrieval policy of a TopicSubscriber object
sslCertStores	string		The Lightweight Directory Access Protocol (LDAP) servers that hold certificate revocation lists (CRLs) for use on an SSL connection
sslCipherSuite	string		The CipherSuite to use for an SSL connection
sslFipsRequired	boolean		Whether an SSL connection must use a CipherSuite that is supported by the IBM Java JSSE FIPS provider (IBMJSSEFIPS).
sslPeerName	string		For an SSL connection, a template that is used to check the distinguished name in the digital certificate provided by the queue manager
sslResetCount	int Minimum: 0 Maximum: 999999999	0	The total number of bytes sent and received by an SSL connection before the secret keys used by SSL are renegotiated
startTimeout	A period of time with millisecond precision	10s	Configures the time duration (in milliseconds) within which the execution must start. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
statusRefreshInterval	A period of time with millisecond precision	1m	The interval, in milliseconds, between refreshes of the long running transaction that detects when a subscriber loses its connection to the queue manager. This property is relevant only if subscription store has the value QUEUE. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
subscriptionDurability	<ul style="list-style-type: none"> <li>Durable</li> <li>NonDurable</li> </ul>		<p>Whether a durable or nondurable subscription is used to deliver messages to an MDB subscribing to the topic</p> <p><b>Durable</b> Durable</p> <p><b>NonDurable</b> NonDurable</p>
subscriptionName	string		The name of the durable subscription
subscriptionStore	<ul style="list-style-type: none"> <li>MIGRATE</li> <li>BROKER</li> <li>QUEUE</li> </ul>	BROKER	<p>Determines where WebSphere MQ classes for JMS stores persistent data about active subscriptions</p> <p><b>MIGRATE</b> MIGRATE</p> <p><b>BROKER</b> BROKER</p> <p><b>QUEUE</b> QUEUE</p>
transportType	<ul style="list-style-type: none"> <li>CLIENT</li> <li>BINDINGS</li> </ul>	CLIENT	<p>Whether a connection to a queue manager uses client mode or bindings mode.</p> <p><b>CLIENT</b> CLIENT</p> <p><b>BINDINGS</b> BINDINGS</p>
wildcardFormat	<ul style="list-style-type: none"> <li>CHAR</li> <li>TOPIC</li> </ul>	TOPIC	<p>Which version of wildcard syntax is to be used.</p> <p><b>CHAR</b> CHAR</p> <p><b>TOPIC</b> TOPIC</p>

## queue

The identifier of the JMS queue that the Batch activation specification uses to listen for batch JMS messages.

false

Attribute name	Data type	Default value	Description
jndiName	string		JNDI name for a resource.

## queue > properties.wasJms

The name of the queue that this JMS queue is assigned to.

false

Attribute name	Data type	Default value	Description
deliveryMode	<ul style="list-style-type: none"><li>NonPersistent</li><li>Application</li><li>Persistent</li></ul>	Application	The delivery mode for messages sent to this destination. This controls the persistence of messages on this destination.  <b>NonPersistent</b> NonPersistent  <b>Application</b> Application  <b>Persistent</b> Persistent
priority	int  Minimum: 0  Maximum: 9		The relative priority for messages sent to this destination, in the range 0 to 9, with 0 as the lowest priority and 9 as the highest priority.
queueName	string	Default.Queue	The name of the associated Queue
readAhead	<ul style="list-style-type: none"><li>AlwaysOff</li><li>AsConnection</li><li>AlwaysOn</li></ul>	AsConnection	Read ahead is an optimization that preemptively assigns messages to consumers. This processes the consumer requests faster.  <b>AlwaysOff</b> AlwaysOff  <b>AsConnection</b> AsConnection  <b>AlwaysOn</b> AlwaysOn

Attribute name	Data type	Default value	Description
timeToLive	A period of time with second precision	0s	The default time in milliseconds from its dispatch time that the system must keep the messages live in the destination. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

```

queue > properties.wmqJms
WebSphere MQ JMS Queue
false

```

Attribute name	Data type	Default value	Description
CCSID	int Minimum: 1	1208	The coded character set ID to be used for a connection or destination
arbitraryProperties	string		Ability to specify properties not defined elsewhere
baseQueueManagerName	string		Queue Manager name that has this queue defined on it
baseQueueName	string		Name of the Queue on the Queue Manager
encoding	string	NATIVE	How numeric data in the body of a message is represented when the message is sent to this destination. The property specifies the representation of binary integers, packed decimal integers, and floating point numbers.
expiry	string	APP	The period after which messages at a destination expire
failIfQuiesce	boolean	true	Whether calls to certain methods fail if the queue manager is in a quiescing state

Attribute name	Data type	Default value	Description
persistence	<ul style="list-style-type: none"> <li>• APP</li> <li>• QDEF</li> <li>• HIGH</li> <li>• NON</li> <li>• PERS</li> </ul>	APP	<p>The persistence of messages sent to a destination</p> <p><b>APP</b> APP  <b>QDEF</b> QDEF  <b>HIGH</b> HIGH  <b>NON</b> NON  <b>PERS</b> PERS</p>
priority	<ul style="list-style-type: none"> <li>• 3</li> <li>• 2</li> <li>• 1</li> <li>• APP</li> <li>• 0</li> <li>• 7</li> <li>• 6</li> <li>• 5</li> <li>• QDEF</li> <li>• 4</li> <li>• 9</li> <li>• 8</li> </ul>	APP	<p>The priority for messages sent to a destination</p> <p><b>3</b> 3  <b>2</b> 2  <b>1</b> 1  <b>APP</b> APP  <b>0</b> 0  <b>7</b> 7  <b>6</b> 6  <b>5</b> 5  <b>QDEF</b> QDEF  <b>4</b> 4  <b>9</b> 9  <b>8</b> 8</p>
putAsyncAllowed	<ul style="list-style-type: none"> <li>• ENABLED</li> <li>• DESTINATION</li> <li>• DISABLED</li> </ul>	DESTINATION	<p>Whether message producers are allowed to use asynchronous puts to send messages to this destination</p> <p><b>ENABLED</b>  ENABLED  <b>DESTINATION</b>  DESTINATION  <b>DISABLED</b>  DISABLED</p>
readAheadAllowed	<ul style="list-style-type: none"> <li>• ENABLED</li> <li>• DESTINATION</li> <li>• DISABLED</li> </ul>	DESTINATION	<p>Whether the MDB is allowed to use read ahead to get nonpersistent messages from the destination into an internal buffer before receiving them</p> <p><b>ENABLED</b>  ENABLED  <b>DESTINATION</b>  DESTINATION  <b>DISABLED</b>  DISABLED</p>

Attribute name	Data type	Default value	Description
readAheadClosePolicy	<ul style="list-style-type: none"> <li>CURRENT</li> <li>ALL</li> </ul>	ALL	What happens to messages in the internal read ahead buffer when the MDB is stopped by the administrator. <b>CURRENT</b> CURRENT <b>ALL</b> ALL
receiveCCSID	int Minimum: 0		Destination property that sets the target Coded character set identifier for queue manager message conversion. The value is ignored unless receive conversion is set to WMQ_RECEIVE_CONVERSION_QMGR
receiveConversion	<ul style="list-style-type: none"> <li>QMGR</li> <li>CLIENT_MSG</li> </ul>	CLIENT_MSG	Destination property that determines if data conversion is going to be performed by the queue manager. <b>QMGR</b> QMGR <b>CLIENT_MSG</b> CLIENT_MSG
targetClient	<ul style="list-style-type: none"> <li>JMS</li> <li>MQ</li> </ul>	JMS	Whether the WebSphere MQ RFH2 format is used to exchange information with target applications <b>JMS</b> JMS <b>MQ</b> MQ

### replyConnectionFactory

The identifier of the JMS connection factory that the Batch executor should user to obtain JMS connections.

false

Attribute name	Data type	Default value	Description
connectionManagerRef	A reference to top level connectionManager element (string).		Connection manager for a connection factory.
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.
jndiName	string		JNDI name for a resource.
recoveryAuthDataRef	A reference to top level authData element (string).		Authentication data for transaction recovery.

**replyConnectionFactory > connectionManager**  
 Connection manager for a connection factory.  
 false

Attribute name	Data type	Default value	Description
agedTimeout	A period of time with second precision	-1	Amount of time before a physical connection can be discarded by pool maintenance. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
connectionTimeout	A period of time with second precision	30s	Amount of time after which a connection request times out. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxConnectionsPerThread	int Minimum: 0		Limits the number of open connections on each thread.
maxIdleTime	A period of time with second precision	30m	Amount of time after which an unused or idle connection can be discarded during pool maintenance, if doing so does not reduce the pool below the minimum size. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
maxPoolSize	int Minimum: 0	50	Maximum number of physical connections for a pool. A value of 0 means unlimited.
minPoolSize	int Minimum: 0		Minimum number of physical connections to maintain in the pool. The pool is not pre-populated. Aged timeout can override the minimum.
numConnectionsPerThreadLocal	int Minimum: 0		Caches the specified number of connections for each thread.
purgePolicy	<ul style="list-style-type: none"> <li>• ValidateAllConnections</li> <li>• FailingConnectionOnly</li> <li>• EntirePool</li> </ul>	EntirePool	<p>Specifies which connections to destroy when a stale connection is detected in a pool.</p> <p><b>ValidateAllConnections</b> When a stale connection is detected, connections are tested and those found to be bad are closed.</p> <p><b>FailingConnectionOnly</b> When a stale connection is detected, only the connection which was found to be bad is closed.</p> <p><b>EntirePool</b> When a stale connection is detected, all connections in the pool are marked stale, and when no longer in use, are closed.</p>
reapTime	A period of time with second precision	3m	Amount of time between runs of the pool maintenance thread. A value of -1 disables pool maintenance. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

**replyConnectionFactory > containerAuthData**

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

**replyConnectionFactory > properties.wasJms**

A JMS connection factory is used to create connections to the associated JMS provider of JMS destinations, for both point-to-point and publish/subscribe messaging.

false

Attribute name	Data type	Default value	Description
busName	string	defaultBus	The name of a bus when connecting to the service integration bus in a full profile server.
clientID	string	clientID	The JMS client identifier needed for durable(and for shared non-durable) topic subscriptions on all connections. This identifier is required if the application is doing durable(and for shared non-durable) publish/subscribe messaging.
durableSubscriptionHome	string	defaultME	Durable subscription home defines ME name to which connection needs to be established.
nonPersistentMapping	<ul style="list-style-type: none"> <li>• BestEffortNonPersistent</li> <li>• ReliableNonPersistent</li> <li>• ExpressNonPersistent</li> </ul>	ExpressNonPersistent	<p>The reliability applied to Non-persistent JMS messages sent using this connection factory.</p> <p><b>BestEffortNonPersistent</b> BestEffortNonPersistent</p> <p><b>ReliableNonPersistent</b> ReliableNonPersistent</p> <p><b>ExpressNonPersistent</b> ExpressNonPersistent</p>

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
persistentMapping	<ul style="list-style-type: none"> <li>AssuredPersistent</li> <li>ReliablePersistent</li> </ul>	ReliablePersistent	<p>The reliability applied to persistent JMS messages sent using this connection factory.</p> <p><b>AssuredPersistent</b> AssuredPersistent</p> <p><b>ReliablePersistent</b> ReliablePersistent</p>
readAhead	<ul style="list-style-type: none"> <li>AlwaysOff</li> <li>Default</li> <li>AlwaysOn</li> </ul>	Default	<p>Read ahead is an optimization that preemptively assigns messages to consumers. This processes the consumer requests faster.</p> <p><b>AlwaysOff</b> AlwaysOff</p> <p><b>Default</b> Default</p> <p><b>AlwaysOn</b> AlwaysOn</p>
remoteServerAddress	string		<p>The remote server address that has triplets separated by a comma, with the syntax hostName:portNumber:chainName, used to connect to a bootstrap server. For example, Merlin:7276:BootstrapBasicMessaging. If hostName is not specified, the default is localhost. If portNumber is not specified, the default is 7276. If chainName is not specified, the default is BootstrapBasicMessaging. Refer to the information center for more information.</p>
shareDurableSubscription	string		Controls whether or not durable subscription can be shared across connections.
targetTransportChain	string		Transport chains specify the communication protocols that can be used to communicate with the service integration bus in a full profiles server.

Attribute name	Data type	Default value	Description
temporaryQueueNamePrefix	string	temp	The prefix of up to twelve characters used for the temporary queues created by applications that use this queue connection factory.
temporaryTopicNamePrefix	string	temp	The prefix of up to twelve characters used for the temporary topics created by applications that use this topic connection factory.
userName	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**replyConnectionFactory > properties.wmqJms**

WebSphere MQ JMS connection factory

false

Attribute name	Data type	Default value	Description
CCSID	int Minimum: 1	819	The coded character set identifier for a connection.
applicationName	string		The name by which an application is registered with the queue manager.
arbitraryProperties	string		Ability to specify properties not defined elsewhere
brokerCCSubQueue	string		The name of the queue from which a connection consumer receives nondurable subscription messages
brokerControlQueue	string		The name of the broker control queue
brokerPubQueue	string		The name of the queue where published messages are sent (the stream queue).
brokerQueueManager	string		The name of the queue manager on which the broker is running
brokerSubQueue	string		The name of the queue from which a nondurable message consumer receives messages
brokerVersion	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		The version of the broker being used  <b>2</b> 2 <b>1</b> 1

Attribute name	Data type	Default value	Description
ccdtURL	string		A URL that identifies the name and location of the file containing the client channel definition table (CCDT) and specifies how the file can be accessed.
channel	string		The name of the MQI channel to use.
cleanupInterval	A period of time with millisecond precision		The interval, in milliseconds, between background runs of the publish/subscribe cleanup utility. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
cleanupLevel	<ul style="list-style-type: none"> <li>• SAFE</li> <li>• FORCE</li> <li>• NONDUR</li> <li>• NONE</li> <li>• STRONG</li> </ul>	SAFE	<p>The cleanup level for a broker-based subscription store.</p> <p><b>SAFE</b> SAFE</p> <p><b>FORCE</b> FORCE</p> <p><b>NONDUR</b> NONDUR</p> <p><b>NONE</b> NONE</p> <p><b>STRONG</b> STRONG</p>
clientId	string		The client identifier for a connection
cloneSupport	<ul style="list-style-type: none"> <li>• ENABLED</li> <li>• DISABLED</li> </ul>	DISABLED	<p>Whether two or more instances of the same durable topic subscriber can run simultaneously.</p> <p><b>ENABLED</b> ENABLED</p> <p><b>DISABLED</b> DISABLED</p>
connectionNameList	string		A list of TCP/IP connection names (hostname(port)) used for communications. ConnectionNameList supersedes the hostname and port properties.

Attribute name	Data type	Default value	Description
failIfQuiesce	boolean	true	Whether calls to certain methods fail if the queue manager is in a quiescing state.
headerCompression	<ul style="list-style-type: none"> <li>• SYSTEM</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing header data on a connection</p> <p><b>SYSTEM</b> SYSTEM</p> <p><b>NONE</b> NONE</p>
hostName	string		The host name or IP address of the system on which the queue manager resides. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.
localAddress	string		For a connection to a queue manager, this property specifies either or both of the following, (1) The local network interface to be used, (2) The local port, or range of local ports, to be used
messageCompression	<ul style="list-style-type: none"> <li>• RLE</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing message data on a connection.</p> <p><b>RLE</b> RLE</p> <p><b>NONE</b> NONE</p>
messageSelection	<ul style="list-style-type: none"> <li>• CLIENT</li> <li>• BROKER</li> </ul>	CLIENT	<p>Determines whether message selection is done by WebSphere MQ classes for JMS or by the broker.</p> <p><b>CLIENT</b> CLIENT</p> <p><b>BROKER</b> BROKER</p>
password	Reversably encoded password (string)		The default password to use when creating a connection to the queue manager. (It is recommended to use a container managed authentication alias instead of configuring this property)

Attribute name	Data type	Default value	Description				
pollingInterval	A period of time with millisecond precision		If each message listener within a session has no suitable message on its queue, this value is the maximum interval, in milliseconds, that elapses before each message listener tries again to get a message from its queue. If it frequently happens that no suitable message is available for any of the message listeners in a session, consider increasing the value of this property. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.				
port	int Minimum: 1	1414	The port on which the queue manager listens. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.				
providerVersion	<ul style="list-style-type: none"> <li>• 7</li> <li>• 6</li> <li>• unspecified</li> </ul>	unspecified	<p>The version, release, modification level and fix pack of the queue manager to which the application intends to connect.</p> <table style="width: 100%; border: none;"> <tr> <td style="width: 50px;">7</td> <td>7</td> </tr> <tr> <td>6</td> <td>6</td> </tr> </table> <p><b>unspecified</b> unspecified</p>	7	7	6	6
7	7						
6	6						
pubAckInterval	int Minimum: 0	25	The number of messages published by a publisher before WebSphere MQ classes for JMS requests an acknowledgment from the broker				
queueManager	string		The name of the queue manager to connect to				
receiveExit	string		Identifies a channel receive exit program, or a sequence of receive exit programs to be run in succession				

Attribute name	Data type	Default value	Description
receiveExitInit	string		The user data that is passed to channel receive exit programs when they are called
rescanInterval	A period of time with millisecond precision	5s	When a message consumer in the point-to-point domain uses a message selector to select which messages it wants to receive, WebSphere MQ classes for JMS searches the WebSphere MQ queue for suitable messages in the sequence determined by the <code>MsgDeliverySequence</code> attribute of the queue. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
securityExit	string		Identifies a channel security exit program
securityExitInit	string		The user data that is passed to a channel security exit program when it is called
sendCheckCount	int Minimum: 0		The number of send calls to allow between checking for asynchronous put errors, within a single non-transacted JMS session.
sendExit	string		Identifies a channel send exit program, or a sequence of send exit programs to be run in succession.
sendExitInit	string		The user data that is passed to channel send exit programs when they are called.
shareConvAllowed	boolean	true	Whether a client connection can share its socket with other top-level JMS connections from the same process to the same queue manager, if the channel definitions match
sparseSubscriptions	boolean	false	Controls the message retrieval policy of a <code>TopicSubscriber</code> object.

Attribute name	Data type	Default value	Description
sslCertStores	string		The Lightweight Directory Access Protocol (LDAP) servers that hold certificate revocation lists (CRLs) for use on an SSL connection.
sslCipherSuite	string		The CipherSuite to use for an SSL connection.
sslFipsRequired	boolean		Whether an SSL connection must use a CipherSuite that is supported by the IBM Java JSSE FIPS provider (IBMJSSEFIPS).
sslPeerName	string		For an SSL connection, a template that is used to check the distinguished name in the digital certificate provided by the queue manager.
sslResetCount	int Minimum: 0 Maximum: 999999999	0	The total number of bytes sent and received by an SSL connection before the secret keys used by SSL are renegotiated.
statusRefreshInterval	A period of time with millisecond precision	1m	The interval, in milliseconds, between refreshes of the long running transaction that detects when a subscriber loses its connection to the queue manager. This property is relevant only if subscription store has the value QUEUE. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
subscriptionStore	<ul style="list-style-type: none"> <li>• MIGRATE</li> <li>• BROKER</li> <li>• QUEUE</li> </ul>	BROKER	<p>Determines where WebSphere MQ classes for JMS stores persistent data about active subscriptions.</p> <p><b>MIGRATE</b> MIGRATE</p> <p><b>BROKER</b> BROKER</p> <p><b>QUEUE</b> QUEUE</p>

Attribute name	Data type	Default value	Description
targetClientMatching	boolean	true	Whether a reply message, sent to the queue identified by the JMSReplyTo header field of an incoming message, has an MQRFH2 header only if the incoming message has an MQRFH2 header.
tempQPrefix	string		The prefix that is used to form the name of a WebSphere MQ dynamic queue.
tempTopicPrefix	string		When creating temporary topics, JMS generates a topic string of the form TEMP/TEMPTOPICPREFIX/unique_id, or if this property is left with the default value, just TEMP/unique_id. Specifying a non-empty TEMPTOPICPREFIX allows specific model queues to be defined for creating the managed queues for subscribers to temporary topics created under this connection.
temporaryModel	string		The name of the model queue from which JMS temporary queues are created. SYSTEM.JMS.TEMPQ.MODEL can be used by the JMS Layer to create queues which accept persistent messages, as the default value cannot. SYSTEM.DEFAULT.MODEL.QUEUE can be opened only once. SYSTEM.JMS.TEMPQ.MODEL can be opened more than once. SYSTEM.DEFAULT.MODEL.QUEUE is deprecated.
transportType	<ul style="list-style-type: none"> <li>• CLIENT</li> <li>• BINDINGS</li> </ul>	CLIENT	Whether a connection to a queue manager uses client mode or bindings mode.  <b>CLIENT</b> CLIENT  <b>BINDINGS</b> BINDINGS

Attribute name	Data type	Default value	Description
userName	string		The default user name to use when creating a connection to a queue manager. (It is recommended to use a container managed authentication alias instead of configuring this property)
wildcardFormat	<ul style="list-style-type: none"> <li>• CHAR</li> <li>• TOPIC</li> </ul>	TOPIC	Which version of wildcard syntax is to be used.  <b>CHAR</b> CHAR <b>TOPIC</b> TOPIC

**replyConnectionFactory > recoveryAuthData**  
 Authentication data for transaction recovery.  
 false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

## Batch Job Logging (batchJobLogging)

Configures Batch job logging.

Attribute name	Data type	Default value	Description
enabled	boolean	true	Enables or disables batch job logging.
maxRecords	int Minimum: 0 Maximum: 2147483647	1000	The maximum number of log records per job log file before rolling over to the next file.

## Batch Persistence (batchPersistence)

Configures the Batch persistence store.

- jobStore

Attribute name	Data type	Default value	Description
jobStoreRef	A reference to top level databaseStore element (string).	defaultDatabaseStore	Persistent store for batch data.

### **jobStore**

Persistent store for batch data.

false

Attribute name	Data type	Default value	Description
authDataRef	A reference to top level authData element (string).		Authentication data for task scheduling, queries, and execution.
createTables	boolean	true	When set to true, database tables are created.
dataSourceRef	A reference to top level dataSource element (string).	DefaultDataSource	Data source that connects to the persistent store.

Attribute name	Data type	Default value	Description
keyGenerationStrategy	<ul style="list-style-type: none"> <li>• TABLE</li> <li>• SEQUENCE</li> <li>• IDENTITY</li> <li>• AUTO</li> </ul>	AUTO	<p>The preferred strategy for generating unique primary keys. If the selected strategy is not supported for the database, a different strategy might be used.</p> <p><b>TABLE</b> Use a database table to generate unique primary keys.</p> <p><b>SEQUENCE</b> Use a database sequence to generate unique primary keys.</p> <p><b>IDENTITY</b> Use a database identity column to generate unique primary keys.</p> <p><b>AUTO</b> Automatically select the strategy to generate unique primary keys.</p>
schema	string		Schema name with read and write access to the database tables.
tablePrefix	string	WLP	Name prefix for tables, sequences, and other database artifacts.

#### **jobStore > authData**

Authentication data for task scheduling, queries, and execution.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

#### **jobStore > dataSource**

Data source that connects to the persistent store.

false

Attribute name	Data type	Default value	Description
beginTranForResultSetScrolling	boolean	true	Attempt transaction enlistment when result set scrolling interfaces are used.
beginTranForVendorAPIs	boolean	true	Attempt transaction enlistment when vendor interfaces are used.
commitOrRollbackOnCleanup	<ul style="list-style-type: none"> <li>• commit</li> <li>• rollback</li> </ul>		<p>Determines how to clean up connections that might be in a database unit of work (AutoCommit=false) when the connection is closed or returned to the pool.</p> <p><b>commit</b> Clean up the connection by committing.</p> <p><b>rollback</b> Clean up the connection by rolling back.</p>
connectionManagerRef	A reference to top level connectionManager element (string).		Connection manager for a data source.
connectionSharing	<ul style="list-style-type: none"> <li>• MatchOriginalRequest</li> <li>• MatchCurrentState</li> </ul>	MatchOriginalRequest	<p>Specifies how connections are matched for sharing.</p> <p><b>MatchOriginalRequest</b> When sharing connections, match based on the original connection request.</p> <p><b>MatchCurrentState</b> When sharing connections, match based on the current state of the connection.</p>
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

Attribute name	Data type	Default value	Description
enableConnectionCasting	boolean	false	Indicates that connections obtained from the data source should be castable to interface classes that the JDBC vendor connection implementation implements. Enabling this option incurs additional overhead on each getConnection operation. If vendor JDBC interfaces are needed less frequently, it might be more efficient to leave this option disabled and use Connection.unwrap(interface) only where it is needed.
isolationLevel	<ul style="list-style-type: none"> <li>• TRANSACTION_REPEATABLE_READ</li> <li>• TRANSACTION_READ_COMMITTED</li> <li>• TRANSACTION_SERIALIZABLE</li> <li>• TRANSACTION_READ_UNCOMMITTED</li> <li>• TRANSACTION_SNAPSHOT</li> </ul>		<p>Default transaction isolation level.</p> <p><b>TRANSACTION_REPEATABLE_READ</b> Dirty reads and non-repeatable reads are prevented; phantom reads can occur.</p> <p><b>TRANSACTION_READ_COMMITTED</b> Dirty reads are prevented; non-repeatable reads and phantom reads can occur.</p> <p><b>TRANSACTION_SERIALIZABLE</b> Dirty reads, non-repeatable reads and phantom reads are prevented.</p> <p><b>TRANSACTION_READ_UNCOMMITTED</b> Dirty reads, non-repeatable reads and phantom reads can occur.</p> <p><b>TRANSACTION_SNAPSHOT</b> Snapshot isolation for Microsoft SQL Server JDBC Driver and DataDirect Connect for JDBC driver.</p>

Attribute name	Data type	Default value	Description
jaasLoginContextEntryRef	A reference to top level jaasLoginContextEntry element (string).		JAAS login context entry for authentication.
jdbcDriverRef	A reference to top level jdbcDriver element (string).		JDBC driver for a data source.
jndiName	string		JNDI name for a data source.
queryTimeout	A period of time with second precision		Default query timeout for SQL statements. In a JTA transaction, syncQueryTimeoutWithTransactionTimeout can override this default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
recoveryAuthDataRef	A reference to top level authData element (string).		Authentication data for transaction recovery.
statementCacheSize	int Minimum: 0	10	Maximum number of cached statements per connection.
supplementalJDBCTrace	boolean		Supplements the JDBC driver trace that is logged when JDBC driver trace is enabled in bootstrap.properties. JDBC driver trace specifications include: com.ibm.ws.database.logwriter, com.ibm.ws.db2.logwriter, com.ibm.ws.derby.logwriter, com.ibm.ws.informix.logwriter, com.ibm.ws.oracle.logwriter, com.ibm.ws.sqlserver.logwriter, com.ibm.ws.sybase.logwriter
syncQueryTimeoutWithTransactionTimeout	boolean	false	Use the time remaining (if any) in a JTA transaction as the default query timeout for SQL statements.
transactional	boolean	true	Enable participation in transactions that are managed by the application server.

Attribute name	Data type	Default value	Description
type	<ul style="list-style-type: none"> <li>javax.sql.DataSource</li> <li>javax.sql.XADataSource</li> <li>javax.sql.ConnectionPoolDataSource</li> </ul>		Type of data source. <b>javax.sql.DataSource</b> javax.sql.DataSource <b>javax.sql.XADataSource</b> javax.sql.XADataSource <b>javax.sql.ConnectionPoolDataSource</b> javax.sql.ConnectionPoolDataSource

**jobStore > dataSource > connectionManager**

Connection manager for a data source.

false

Attribute name	Data type	Default value	Description
agedTimeout	A period of time with second precision	-1	Amount of time before a physical connection can be discarded by pool maintenance. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
connectionTimeout	A period of time with second precision	30s	Amount of time after which a connection request times out. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxConnectionsPerThread	int Minimum: 0		Limits the number of open connections on each thread.

Attribute name	Data type	Default value	Description
maxIdleTime	A period of time with second precision	30m	Amount of time after which an unused or idle connection can be discarded during pool maintenance, if doing so does not reduce the pool below the minimum size. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxPoolSize	int Minimum: 0	50	Maximum number of physical connections for a pool. A value of 0 means unlimited.
minPoolSize	int Minimum: 0		Minimum number of physical connections to maintain in the pool. The pool is not pre-populated. Aged timeout can override the minimum.
numConnectionsPerThreadLocal	int Minimum: 0		Caches the specified number of connections for each thread.

Attribute name	Data type	Default value	Description
purgePolicy	<ul style="list-style-type: none"> <li>• ValidateAllConnections</li> <li>• FailingConnectionOnly</li> <li>• EntirePool</li> </ul>	EntirePool	<p>Specifies which connections to destroy when a stale connection is detected in a pool.</p> <p><b>ValidateAllConnections</b> When a stale connection is detected, connections are tested and those found to be bad are closed.</p> <p><b>FailingConnectionOnly</b> When a stale connection is detected, only the connection which was found to be bad is closed.</p> <p><b>EntirePool</b> When a stale connection is detected, all connections in the pool are marked stale, and when no longer in use, are closed.</p>
reapTime	A period of time with second precision	3m	Amount of time between runs of the pool maintenance thread. A value of -1 disables pool maintenance. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

**jobStore > dataSource > containerAuthData**

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

**jobStore > dataSource > jaasLoginContextEntry**

JAAS login context entry for authentication.

false

Attribute name	Data type	Default value	Description
loginModuleRef	List of references to top level jaasLoginModule elements (comma-separated string).	hashtable,userNameAndPassword,certificate,trustID	Word certificate trustID of a JAAS login module.
name	string		Name of a JAAS configuration entry.

**jobStore > dataSource > jdbcDriver**

JDBC driver for a data source.

false

Attribute name	Data type	Default value	Description
javax.sql.ConnectionPoolDataSource	string		JDBC driver implementation of javax.sql.ConnectionPoolDataSource.
javax.sql.DataSource	string		JDBC driver implementation of javax.sql.DataSource.
javax.sql.XADataSource	string		JDBC driver implementation of javax.sql.XADataSource.
libraryRef	A reference to top level library element (string).		Identifies JDBC driver JARs and native files.

**jobStore > dataSource > jdbcDriver > library**

Identifies JDBC driver JARs and native files.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

**jobStore > dataSource > jdbcDriver > library > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**jobStore > dataSource > jdbcDriver > library > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**jobStore > dataSource > jdbcDriver > library > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**jobStore > dataSource > properties**

List of JDBC vendor properties for the data source. For example, databaseName="dbname" serverName="localhost" portNumber="50000".

false

Attribute name	Data type	Default value	Description
URL	string		URL for connecting to the database.
databaseName	string		JDBC driver property: databaseName.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
serverName	string		Server where the database is running.

Attribute name	Data type	Default value	Description
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**jobStore > dataSource > properties.datadirect.sqlserver**

Data source properties for the DataDirect Connect for JDBC driver for Microsoft SQL Server.

false

Attribute name	Data type	Default value	Description
JDBCBehavior	<ul style="list-style-type: none"> <li>• 1</li> <li>• 0</li> </ul>	0	JDBC driver property: JDBCBehavior. Values are: 0 (JDBC 4.0) or 1 (JDBC 3.0).  <b>1</b> JDBC 3.0 <b>0</b> JDBC 4.0
XATransactionGroup	string		JDBC driver property: XATransactionGroup.
XMLDescribeType	<ul style="list-style-type: none"> <li>• longvarbinary</li> <li>• longvarchar</li> </ul>		JDBC driver property: XMLDescribeType.  <b>longvarbinary</b> longvarbinary <b>longvarchar</b> longvarchar
accountingInfo	string		JDBC driver property: accountingInfo.
alternateServers	string		JDBC driver property: alternateServers.
alwaysReportTriggerResults	boolean		JDBC driver property: alwaysReportTriggerResults.
applicationName	string		JDBC driver property: applicationName.
authenticationMethod	<ul style="list-style-type: none"> <li>• ntlm</li> <li>• userIdPassword</li> <li>• kerberos</li> <li>• auto</li> </ul>		JDBC driver property: authenticationMethod.  <b>ntlm</b> ntlm <b>userIdPassword</b> userIdPassword <b>kerberos</b> kerberos <b>auto</b> auto
bulkLoadBatchSize	long		JDBC driver property: bulkLoadBatchSize.
bulkLoadOptions	long		JDBC driver property: bulkLoadOptions.
clientHostName	string		JDBC driver property: clientHostName.
clientUser	string		JDBC driver property: clientUser.

Attribute name	Data type	Default value	Description
codePageOverride	string		JDBC driver property: codePageOverride.
connectionRetryCount	int		JDBC driver property: connectionRetryCount.
connectionRetryDelay	A period of time with second precision		JDBC driver property: connectionRetryDelay. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
convertNull	int		JDBC driver property: convertNull.
databaseName	string		JDBC driver property: databaseName.
dateTimeInputParameterType	<ul style="list-style-type: none"> <li>• dateTime</li> <li>• dateTimeOffset</li> <li>• auto</li> </ul>		JDBC driver property: dateTimeInputParameterType.  <b>dateTime</b> dateTime <b>dateTimeOffset</b> dateTimeOffset <b>auto</b> auto
dateTimeOutputParameterType	<ul style="list-style-type: none"> <li>• dateTime</li> <li>• dateTimeOffset</li> <li>• auto</li> </ul>		JDBC driver property: dateTimeOutputParameterType.  <b>dateTime</b> dateTime <b>dateTimeOffset</b> dateTimeOffset <b>auto</b> auto
describeInputParameters	<ul style="list-style-type: none"> <li>• describeIfString</li> <li>• noDescribe</li> <li>• describeIfDateTime</li> <li>• describeAll</li> </ul>		JDBC driver property: describeInputParameters.  <b>describeIfString</b> describeIfString <b>noDescribe</b> noDescribe <b>describeIfDateTime</b> describeIfDateTime <b>describeAll</b> describeAll

Attribute name	Data type	Default value	Description
describeOutputParameters	<ul style="list-style-type: none"> <li>describeIfString</li> <li>noDescribe</li> <li>describeIfDateTime</li> <li>describeAll</li> </ul>		JDBC driver property: describeOutputParameters. <b>describeIfString</b> describeIfString <b>noDescribe</b> noDescribe <b>describeIfDateTime</b> describeIfDateTime <b>describeAll</b> describeAll
enableBulkLoad	boolean		JDBC driver property: enableBulkLoad.
enableCancelTimeout	boolean		JDBC driver property: enableCancelTimeout.
encryptionMethod	<ul style="list-style-type: none"> <li>loginSSL</li> <li>requestSSL</li> <li>SSL</li> <li>noEncryption</li> </ul>		JDBC driver property: encryptionMethod. <b>loginSSL</b> loginSSL <b>requestSSL</b> requestSSL <b>SSL</b> SSL <b>noEncryption</b> noEncryption
failoverGranularity	<ul style="list-style-type: none"> <li>disableIntegrityCheck</li> <li>atomicWithRepositioning</li> <li>nonAtomic</li> <li>atomic</li> </ul>		JDBC driver property: failoverGranularity. <b>disableIntegrityCheck</b> disableIntegrityCheck <b>atomicWithRepositioning</b> atomicWithRepositioning <b>nonAtomic</b> nonAtomic <b>atomic</b> atomic
failoverMode	<ul style="list-style-type: none"> <li>connect</li> <li>select</li> <li>extended</li> </ul>		JDBC driver property: failoverMode. <b>connect</b> connect <b>select</b> select <b>extended</b> extended
failoverPreconnect	boolean		JDBC driver property: failoverPreconnect.
hostNameInCertificate	string		JDBC driver property: hostNameInCertificate.
initializationString	string		JDBC driver property: initializationString.
insensitiveResultSetBufferSize	int		JDBC driver property: insensitiveResultSetBufferSize.

Attribute name	Data type	Default value	Description
javaDoubleToString	boolean		JDBC driver property: javaDoubleToString.
loadBalancing	boolean		JDBC driver property: loadBalancing.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
longDataCacheSize	int Minimum: -1		JDBC driver property: longDataCacheSize.
netAddress	string		JDBC driver property: netAddress.
packetSize	int Minimum: -1 Maximum: 128		JDBC driver property: packetSize.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
queryTimeout	A period of time with second precision		JDBC driver property: queryTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
resultsetMetaDataOptions	int		JDBC driver property: resultSetMetaDataOptions.
selectMethod	<ul style="list-style-type: none"> <li>• direct</li> <li>• cursor</li> </ul>		JDBC driver property: selectMethod.  <b>direct</b> direct <b>cursor</b> cursor
serverName	string	localhost	Server where the database is running.
snapshotSerializable	boolean		JDBC driver property: snapshotSerializable.

Attribute name	Data type	Default value	Description
spyAttributes	string		JDBC driver property: spyAttributes.
stringInputParameterType	<ul style="list-style-type: none"> <li>varchar</li> <li>nvarchar</li> </ul>	varchar	JDBC driver property: stringInputParameterType. <b>varchar</b> varchar <b>nvarchar</b> nvarchar
stringOutputParameterType	<ul style="list-style-type: none"> <li>varchar</li> <li>nvarchar</li> </ul>	varchar	JDBC driver property: stringOutputParameterType. <b>varchar</b> varchar <b>nvarchar</b> nvarchar
suppressConnectionWarnings	boolean		JDBC driver property: suppressConnectionWarnings.
transactionMode	<ul style="list-style-type: none"> <li>explicit</li> <li>implicit</li> </ul>		JDBC driver property: transactionMode. <b>explicit</b> explicit <b>implicit</b> implicit
truncateFractionalSeconds	boolean		JDBC driver property: truncateFractionalSeconds.
trustStore	string		JDBC driver property: trustStore.
trustStorePassword	Reversably encoded password (string)		JDBC driver property: trustStorePassword.
useServerSideUpdatableCursors	boolean		JDBC driver property: useServerSideUpdatableCursors.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
validateServerCertificate	boolean		JDBC driver property: validateServerCertificate.

### jobStore > dataSource > properties.db2.i.native

Data source properties for the IBM DB2 for i Native JDBC driver.

false

Attribute name	Data type	Default value	Description
access	<ul style="list-style-type: none"> <li>read only</li> <li>all</li> <li>read call</li> </ul>	all	JDBC driver property: access. <b>read only</b> read only <b>all</b> all <b>read call</b> read call

Attribute name	Data type	Default value	Description
autoCommit	boolean	true	JDBC driver property: autoCommit.
batchStyle	<ul style="list-style-type: none"> <li>• 2.1</li> <li>• 2.0</li> </ul>	2.0	JDBC driver property: batchStyle. <b>2.1</b> 2.1 <b>2.0</b> 2.0
behaviorOverride	int		JDBC driver property: behaviorOverride.
blockSize	<ul style="list-style-type: none"> <li>• 512</li> <li>• 128</li> <li>• 0</li> <li>• 32</li> <li>• 64</li> <li>• 16</li> <li>• 8</li> <li>• 256</li> </ul>	32	JDBC driver property: blockSize. <b>512</b> 512 <b>128</b> 128 <b>0</b> 0 <b>32</b> 32 <b>64</b> 64 <b>16</b> 16 <b>8</b> 8 <b>256</b> 256
cursorHold	boolean	false	JDBC driver property: cursorHold.
cursorSensitivity	<ul style="list-style-type: none"> <li>• asensitive</li> <li>• sensitive</li> </ul>	asensitive	JDBC driver property: cursorSensitivity. Values are: 0 (TYPE_SCROLL_SENSITIVE_STATIC), 1 (TYPE_SCROLL_SENSITIVE_DYNAMIC), 2 (TYPE_SCROLL_ASENSITIVE). <b>asensitive</b> asensitive <b>sensitive</b> sensitive
dataTruncation	string	true	JDBC driver property: dataTruncation.
databaseName	string	*LOCAL	JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
dateFormat	<ul style="list-style-type: none"> <li>• dmy</li> <li>• iso</li> <li>• eur</li> <li>• ymd</li> <li>• julian</li> <li>• jis</li> <li>• usa</li> <li>• mdy</li> </ul>		JDBC driver property: dateFormat. <b>dmy</b> dmy <b>iso</b> iso <b>eur</b> eur <b>ymd</b> ymd <b>julian</b> julian <b>jis</b> jis <b>usa</b> usa <b>mdy</b> mdy
dateSeparator	<ul style="list-style-type: none"> <li>• \,</li> <li>• b</li> <li>• .</li> <li>• /</li> <li>• -</li> </ul>		JDBC driver property: dateSeparator. <b>\,</b> The comma character (,). <b>b</b> The character b <b>.</b> The period character (.). <b>/</b> The forward slash character (/). <b>-</b> The dash character (-).
decimalSeparator	<ul style="list-style-type: none"> <li>• \,</li> <li>• .</li> </ul>		JDBC driver property: decimalSeparator. <b>\,</b> The comma character (,). <b>.</b> The period character (.).
directMap	boolean	true	JDBC driver property: directMap.
doEscapeProcessing	boolean	true	JDBC driver property: doEscapeProcessing.
fullErrors	boolean		JDBC driver property: fullErrors.
libraries	string		JDBC driver property: libraries.
lobThreshold	int Maximum: 500000	0	JDBC driver property: lobThreshold.

Attribute name	Data type	Default value	Description
lockTimeout	A period of time with second precision	0	JDBC driver property: lockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maximumPrecision	<ul style="list-style-type: none"> <li>• 31</li> <li>• 63</li> </ul>	31	JDBC driver property: maximumPrecision.  <b>31</b> 31 <b>63</b> 63
maximumScale	int Minimum: 0 Maximum: 63	31	JDBC driver property: maximumScale.
minimumDivideScale	int Minimum: 0 Maximum: 9	0	JDBC driver property: minimumDivideScale.
networkProtocol	int		JDBC driver property: networkProtocol.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
prefetch	boolean	true	JDBC driver property: prefetch.
queryOptimizeGoal	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>	2	JDBC driver property: queryOptimizeGoal. Values are: 1 (*FIRSTIO) or 2 (*ALLIO).  <b>2</b> *ALLIO <b>1</b> *FIRSTIO

Attribute name	Data type	Default value	Description
reuseObjects	boolean	true	JDBC driver property: reuseObjects.
serverName	string		Server where the database is running.
serverTraceCategories	int	0	JDBC driver property: serverTraceCategories.
systemNaming	boolean	false	JDBC driver property: systemNaming.
timeFormat	<ul style="list-style-type: none"> <li>• iso</li> <li>• eur</li> <li>• jis</li> <li>• usa</li> <li>• hms</li> </ul>		JDBC driver property: timeFormat.  <b>iso</b> iso <b>eur</b> eur <b>jis</b> jis <b>usa</b> usa <b>hms</b> hms
timeSeparator	<ul style="list-style-type: none"> <li>• \,</li> <li>• b</li> <li>• :</li> <li>• .</li> </ul>		JDBC driver property: timeSeparator.  \,    The comma character (,). <b>b</b> The character b :    The colon character (:). .    The period character (.).
trace	boolean		JDBC driver property: trace.
transactionTimeout	A period of time with second precision	0	JDBC driver property: transactionTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
translateBinary	boolean	false	JDBC driver property: translateBinary.
translateHex	<ul style="list-style-type: none"> <li>• binary</li> <li>• character</li> </ul>	character	JDBC driver property: translateHex.  <b>binary</b> binary <b>character</b> character
useBlockInsert	boolean	false	JDBC driver property: useBlockInsert.

Attribute name	Data type	Default value	Description
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**jobStore > dataSource > properties.db2.i.toolbox**

Data source properties for the IBM DB2 for i Toolbox JDBC driver.

false

Attribute name	Data type	Default value	Description
access	<ul style="list-style-type: none"> <li>• read only</li> <li>• all</li> <li>• read call</li> </ul>	all	JDBC driver property: access.  <b>read only</b> read only  <b>all</b> all  <b>read call</b> read call
behaviorOverride	int		JDBC driver property: behaviorOverride.
bidiImplicitReordering	boolean	true	JDBC driver property: bidiImplicitReordering.
bidiNumericOrdering	boolean	false	JDBC driver property: bidiNumericOrdering.
bidiStringType	int		JDBC driver property: bidiStringType.
bigDecimal	boolean	true	JDBC driver property: bigDecimal.
blockCriteria	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> <li>• 0</li> </ul>	2	JDBC driver property: blockCriteria. Values are: 0 (no record blocking), 1 (block if FOR FETCH ONLY is specified), 2 (block if FOR UPDATE is specified).  <b>2</b> 2  <b>1</b> 1  <b>0</b> 0

Attribute name	Data type	Default value	Description
blockSize	<ul style="list-style-type: none"> <li>• 512</li> <li>• 128</li> <li>• 0</li> <li>• 32</li> <li>• 64</li> <li>• 16</li> <li>• 8</li> <li>• 256</li> </ul>	32	JDBC driver property: blockSize. <b>512</b> 512 <b>128</b> 128 <b>0</b> 0 <b>32</b> 32 <b>64</b> 64 <b>16</b> 16 <b>8</b> 8 <b>256</b> 256
cursorHold	boolean	false	JDBC driver property: cursorHold.
cursorSensitivity	<ul style="list-style-type: none"> <li>• asensitive</li> <li>• sensitive</li> <li>• insensitive</li> </ul>	asensitive	JDBC driver property: cursorSensitivity. Values are: 0 (TYPE_SCROLL_SENSITIVE_STATIC), 1 (TYPE_SCROLL_SENSITIVE_DYNAMIC), 2 (TYPE_SCROLL_ASENSITIVE). <b>asensitive</b> asensitive <b>sensitive</b> sensitive <b>insensitive</b> insensitive
dataCompression	boolean	true	JDBC driver property: dataCompression.
dataTruncation	boolean	true	JDBC driver property: dataTruncation.
databaseName	string		JDBC driver property: databaseName.
dateFormat	<ul style="list-style-type: none"> <li>• dmy</li> <li>• iso</li> <li>• eur</li> <li>• ymd</li> <li>• julian</li> <li>• jis</li> <li>• usa</li> <li>• mdy</li> </ul>		JDBC driver property: dateFormat. <b>dmy</b> dmy <b>iso</b> iso <b>eur</b> eur <b>ymd</b> ymd <b>julian</b> julian <b>jis</b> jis <b>usa</b> usa <b>mdy</b> mdy

Attribute name	Data type	Default value	Description
dateSeparator	<ul style="list-style-type: none"> <li>•</li> <li>• \,</li> <li>• .</li> <li>• /</li> <li>• -</li> </ul>		JDBC driver property: dateSeparator. The space character ( ). \, The comma character (,). . The period character (.). / The forward slash character (/). - The dash character (-).
decimalSeparator	<ul style="list-style-type: none"> <li>• \,</li> <li>• .</li> </ul>		JDBC driver property: decimalSeparator. \, The comma character (,). . The period character (.).
driver	<ul style="list-style-type: none"> <li>• toolbox</li> <li>• native</li> </ul>	toolbox	JDBC driver property: driver. <b>toolbox</b> toolbox <b>native</b> native
errors	<ul style="list-style-type: none"> <li>• full</li> <li>• basic</li> </ul>	basic	JDBC driver property: errors. <b>full</b> full <b>basic</b> basic
extendedDynamic	boolean	false	JDBC driver property: extendedDynamic.
extendedMetaData	boolean	false	JDBC driver property: extendedMetaData.
fullOpen	boolean	false	JDBC driver property: fullOpen.
holdInputLocators	boolean	true	JDBC driver property: holdInputLocators.
holdStatements	boolean	false	JDBC driver property: holdStatements.
isolationLevelSwitchingSupport	boolean	false	JDBC driver property: isolationLevelSwitchingSupport.
keepAlive	boolean		JDBC driver property: keepAlive.
lazyClose	boolean	false	JDBC driver property: lazyClose.
libraries	string		JDBC driver property: libraries.

Attribute name	Data type	Default value	Description
lobThreshold	int Minimum: 0 Maximum: 16777216	0	JDBC driver property: lobThreshold.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maximumPrecision	<ul style="list-style-type: none"> <li>• 31</li> <li>• 63</li> </ul>	31	JDBC driver property: maximumPrecision.  <b>31</b> 31 <b>63</b> 64
maximumScale	int Minimum: 0 Maximum: 63	31	JDBC driver property: maximumScale.
metaDataSource	int Minimum: 0 Maximum: 1	1	JDBC driver property: metaDataSource.
minimumDivideScale	int Minimum: 0 Maximum: 9	0	JDBC driver property: minimumDivideScale.
naming	<ul style="list-style-type: none"> <li>• system</li> <li>• sql</li> </ul>	sql	JDBC driver property: naming.  <b>system</b> system <b>sql</b> sql
package	string		JDBC driver property: package.
packageAdd	boolean	true	JDBC driver property: packageAdd.
packageCCSID	<ul style="list-style-type: none"> <li>• 13488</li> <li>• 1200</li> </ul>	13488	JDBC driver property: packageCCSID. Values are: 1200 (UCS-2) or 13488 (UTF-16).  <b>13488</b> 13488 (UTF-16) <b>1200</b> 1200 (UCS-2)
packageCache	boolean	false	JDBC driver property: packageCache.

Attribute name	Data type	Default value	Description
packageCriteria	<ul style="list-style-type: none"> <li>default</li> <li>select</li> </ul>	default	JDBC driver property: packageCriteria. <b>default</b> default <b>select</b> select
packageError	<ul style="list-style-type: none"> <li>exception</li> <li>none</li> <li>warning</li> </ul>	warning	JDBC driver property: packageError. <b>exception</b> exception <b>none</b> none <b>warning</b> warning
packageLibrary	string	QGPL	JDBC driver property: packageLibrary.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
prefetch	boolean	true	JDBC driver property: prefetch.
prompt	boolean	false	JDBC driver property: prompt.
proxyServer	string		JDBC driver property: proxyServer.
qaqqiniLibrary	string		JDBC driver property: qaqqiniLibrary.
queryOptimizeGoal	int Minimum: 0 Maximum: 2	0	JDBC driver property: queryOptimizeGoal. Values are: 1 (*FIRSTIO) or 2 (*ALLIO).
receiveBufferSize	int Minimum: 1		JDBC driver property: receiveBufferSize.
remarks	<ul style="list-style-type: none"> <li>system</li> <li>sql</li> </ul>	system	JDBC driver property: remarks. <b>system</b> system <b>sql</b> sql
rollbackCursorHold	boolean	false	JDBC driver property: rollbackCursorHold.
savePasswordWhenSerialized	boolean	false	JDBC driver property: savePasswordWhenSerialized.
secondaryUrl	string		JDBC driver property: secondaryUrl.
secure	boolean	false	JDBC driver property: secure.
sendBufferSize	int Minimum: 1		JDBC driver property: sendBufferSize.

Attribute name	Data type	Default value	Description
serverName	string		Server where the database is running.
serverTraceCategories	int	0	JDBC driver property: serverTraceCategories.
soLinger	A period of time with second precision		JDBC driver property: soLinger. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
soTimeout	A period of time with millisecond precision		JDBC driver property: soTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
sort	<ul style="list-style-type: none"> <li>• hex</li> <li>• table</li> <li>• language</li> </ul>	hex	JDBC driver property: sort. <b>hex</b> hex <b>table</b> table <b>language</b> language
sortLanguage	string		JDBC driver property: sortLanguage.
sortTable	string		JDBC driver property: sortTable.
sortWeight	<ul style="list-style-type: none"> <li>• unqiue</li> <li>• shared</li> </ul>		JDBC driver property: sortWeight. <b>unqiue</b> unique <b>shared</b> shared
tcpNoDelay	boolean		JDBC driver property: tcpNoDelay.
threadUsed	boolean	true	JDBC driver property: threadUsed.

Attribute name	Data type	Default value	Description
timeFormat	<ul style="list-style-type: none"> <li>• iso</li> <li>• eur</li> <li>• jis</li> <li>• usa</li> <li>• hms</li> </ul>		JDBC driver property: timeFormat. <b>iso</b> iso <b>eur</b> eur <b>jis</b> jis <b>usa</b> usa <b>hms</b> hms
timeSeparator	<ul style="list-style-type: none"> <li>•</li> <li>• \,</li> <li>• :</li> <li>• .</li> </ul>		JDBC driver property: timeSeparator.  The space character ( ). \, The comma character (,). : The colon character (:). . The period character (.).
toolboxTrace	<ul style="list-style-type: none"> <li>• diagnostic</li> <li>• information</li> <li>• conversion</li> <li>• error</li> <li>• thread</li> <li>• proxy</li> <li>• none</li> <li>• datastream</li> <li>• pcml</li> <li>• all</li> <li>• jdbc</li> <li>• warning</li> </ul>		JDBC driver property: toolboxTrace. <b>diagnostic</b> diagnostic <b>information</b> information <b>conversion</b> conversion <b>error</b> error <b>thread</b> thread <b>proxy</b> proxy <b>none</b> none <b>datastream</b> datastream <b>pcml</b> pcml <b>all</b> all <b>jdbc</b> jdbc <b>warning</b> warning
trace	boolean		JDBC driver property: trace.
translateBinary	boolean	false	JDBC driver property: translateBinary.
translateBoolean	boolean	true	JDBC driver property: translateBoolean.

Attribute name	Data type	Default value	Description
translateHex	<ul style="list-style-type: none"> <li>binary</li> <li>character</li> </ul>	character	JDBC driver property: translateHex.  <b>binary</b> binary <b>character</b> character
trueAutoCommit	boolean	false	JDBC driver property: trueAutoCommit.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
xaLooselyCoupledSupport	int  Minimum: 0  Maximum: 1	0	JDBC driver property: xaLooselyCoupledSupport.

### jobStore > dataSource > properties.db2.jcc

Data source properties for the IBM Data Server Driver for JDBC and SQLJ for DB2.

false

Attribute name	Data type	Default value	Description
activateDatabase	int		JDBC driver property: activateDatabase.
alternateGroupDatabaseName	string		JDBC driver property: alternateGroupDatabaseName.
alternateGroupPortNumber	string		JDBC driver property: alternateGroupPortNumber.
alternateGroupServerName	string		JDBC driver property: alternateGroupServerName.
blockingReadConnectionTimeout	A period of time with second precision		JDBC driver property: blockingReadConnectionTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
clientAccountingInformation	string		JDBC driver property: clientAccountingInformation.
clientApplicationInformation	string		JDBC driver property: clientApplicationInformation.
clientRerouteAlternatePortNumber	string		JDBC driver property: clientRerouteAlternatePortNumber.
clientRerouteAlternateServerName	string		JDBC driver property: clientRerouteAlternateServerName.

Attribute name	Data type	Default value	Description
clientUser	string		JDBC driver property: clientUser.
clientWorkstation	string		JDBC driver property: clientWorkstation.
connectionCloseWithInFlightTransaction	Transaction • 1		JDBC driver property: connectionCloseWithInFlightTransaction. 2 CONNECTION_CLOSE_WITH_ROLLBACK 1 CONNECTION_CLOSE_WITH_EXCEPTION
currentAlternateGroupEntry	int		JDBC driver property: currentAlternateGroupEntry.
currentFunctionPath	string		JDBC driver property: currentFunctionPath.
currentLocaleLcCtype	string		JDBC driver property: currentLocaleLcCtype.
currentLockTimeout	A period of time with second precision		JDBC driver property: currentLockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
currentPackagePath	string		JDBC driver property: currentPackagePath.
currentPackageSet	string		JDBC driver property: currentPackageSet.
currentSQLID	string		JDBC driver property: currentSQLID.
currentSchema	string		JDBC driver property: currentSchema.
cursorSensitivity	• 2 • 1 • 0		JDBC driver property: cursorSensitivity. Values are: 0 (TYPE_SCROLL_SENSITIVE_STATIC), 1 (TYPE_SCROLL_SENSITIVE_DYNAMIC), 2 (TYPE_SCROLL_ASENSITIVE). 2 TYPE_SCROLL_ASENSITIVE 1 TYPE_SCROLL_SENSITIVE_DYNAMIC 0 TYPE_SCROLL_SENSITIVE_STATIC
databaseName	string		JDBC driver property: databaseName.
deferPrepares	boolean	true	JDBC driver property: deferPrepares.

Attribute name	Data type	Default value	Description
driverType	<ul style="list-style-type: none"> <li>2</li> <li>4</li> </ul>	4	JDBC driver property: driverType. 2 Type 2 JDBC driver. 4 Type 4 JDBC driver.
enableAlternateGroupSeamlessACR	boolean		JDBC driver property: enableAlternateGroupSeamlessACR.
enableClientAffinitiesList	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableClientAffinitiesList. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
enableExtendedDescribe	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableExtendedDescribe. 2 NO 1 YES
enableExtendedIndicators	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableExtendedIndicators. 2 NO 1 YES
enableNamedParameterMarkers	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableNamedParameterMarkers. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
enableSeamlessFailover	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableSeamlessFailover. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
enableSysplexWLB	boolean		JDBC driver property: enableSysplexWLB.
fetchSize	int		JDBC driver property: fetchSize.
fullyMaterializeInputStreams	boolean		JDBC driver property: fullyMaterializeInputStreams.
fullyMaterializeInputStreamsOnBatchExecution	<ul style="list-style-type: none"> <li>1</li> </ul>		JDBC driver property: fullyMaterializeInputStreamsOnBatchExecution. 2 NO 1 YES
fullyMaterializeLobData	boolean		JDBC driver property: fullyMaterializeLobData.

Attribute name	Data type	Default value	Description
implicitRollbackOption	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> <li>• 0</li> </ul>		<p>JDBC driver property: implicitRollbackOption.</p> <p>2 IMPLICIT_ROLLBACK_OPTION_CLOSE</p> <p>1 IMPLICIT_ROLLBACK_OPTION_NO</p> <p>0 IMPLICIT_ROLLBACK_OPTION_NO</p>
interruptProcessingMode	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> <li>• 0</li> </ul>		<p>JDBC driver property: interruptProcessingMode.</p> <p>2 INTERRUPT_PROCESSING_MODE_C</p> <p>1 INTERRUPT_PROCESSING_MODE_S</p> <p>0 INTERRUPT_PROCESSING_MODE_D</p>
keepAliveTimeOut	A period of time with second precision		<p>JDBC driver property: keepAliveTimeOut. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.</p>
keepDynamic	int		JDBC driver property: keepDynamic.
kerberosServerPrincipal	string		JDBC driver property: kerberosServerPrincipal.
loginTimeout	A period of time with second precision		<p>JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.</p>
maxConnCachedParamBufferSize	int		JDBC driver property: maxConnCachedParamBufferSize.
maxRetriesForClientReroute	int		JDBC driver property: maxRetriesForClientReroute.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	50000	Port on which to obtain database connections.
profileName	string		JDBC driver property: profileName.

Attribute name	Data type	Default value	Description
queryCloseImplicit	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: queryCloseImplicit. Values are: 1 (QUERY_CLOSE_IMPLICIT_YES) or 2 (QUERY_CLOSE_IMPLICIT_NO).</p> <p>2        QUERY_CLOSE_IMPLICIT_NO 1        QUERY_CLOSE_IMPLICIT_YES</p>
queryDataSize	<p>int</p> <p>Minimum: 4096</p> <p>Maximum: 65535</p>		JDBC driver property: queryDataSize.
queryTimeoutInterruptProcessingMode	<p>int</p> <ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: queryTimeoutInterruptProcessingMode.</p> <p>2        INTERRUPT_PROCESSING_MODE 1        INTERRUPT_PROCESSING_MODE</p>
readOnly	boolean		JDBC driver property: readOnly.
recordTemporalHistory	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: recordTemporalHistory.</p> <p>2        NO 1        YES</p>
resultSetHoldability	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldability. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2        CLOSE_CURSORS_AT_COMMIT 1        HOLD_CURSORS_OVER_COMMIT</p>
resultSetHoldabilityForCatalogQueries	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldabilityForCatalogQueries. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2        CLOSE_CURSORS_AT_COMMIT 1        HOLD_CURSORS_OVER_COMMIT</p>
retrieveMessagesFromServerOnGetMessage	boolean	true	JDBC driver property: retrieveMessagesFromServerOnGetMessage.

Attribute name	Data type	Default value	Description
retryIntervalForClientReroute	A period of time with second precision		JDBC driver property: retryIntervalForClientReroute. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
securityMechanism	<ul style="list-style-type: none"> <li>• 3</li> <li>• 7</li> <li>• 4</li> <li>• 18</li> <li>• 15</li> <li>• 9</li> <li>• 16</li> <li>• 13</li> <li>• 11</li> <li>• 12</li> </ul>		<p>JDBC driver property: securityMechanism. Values are:</p> <ul style="list-style-type: none"> <li>3 (CLEAR_TEXT_PASSWORD_SECURITY),</li> <li>4 (USER_ONLY_SECURITY),</li> <li>7 (ENCRYPTED_PASSWORD_SECURITY),</li> <li>9 (ENCRYPTED_USER_AND_PASSWORD_SECURITY),</li> <li>11 (KERBEROS_SECURITY),</li> <li>12 (ENCRYPTED_USER_AND_DATA_SECURITY),</li> <li>13 (ENCRYPTED_USER_PASSWORD_AND_DATA_SECURITY),</li> <li>15 (PLUGIN_SECURITY),</li> <li>16 (ENCRYPTED_USER_ONLY_SECURITY),</li> <li>18 (TLS_CLIENT_CERTIFICATE_SECURITY).</li> </ul> <p>3 CLEAR_TEXT_PASSWORD_SECURITY  7 ENCRYPTED_PASSWORD_SECURITY  4 USER_ONLY_SECURITY  18 TLS_CLIENT_CERTIFICATE_SECURITY  15 PLUGIN_SECURITY  9 ENCRYPTED_USER_AND_PASSWORD_SECURITY  16 ENCRYPTED_USER_ONLY_SECURITY  13 ENCRYPTED_USER_PASSWORD_AND_DATA_SECURITY  11 KERBEROS_SECURITY  12 ENCRYPTED_USER_AND_DATA_SECURITY</p>
sendDataAsIs	boolean		JDBC driver property: sendDataAsIs.
serverName	string	localhost	Server where the database is running.
sessionTimeZone	string		JDBC driver property: sessionTimeZone.
sqljCloseStmtsWithOpenResultSet	boolean		JDBC driver property: sqljCloseStmtsWithOpenResultSet.

Attribute name	Data type	Default value	Description
sqljEnableClassLoaderSpecificProfiles	boolean		JDBC driver property: sqljEnableClassLoaderSpecificProfiles.
sslConnection	boolean		JDBC driver property: sslConnection.
streamBufferSize	int		JDBC driver property: streamBufferSize.
stripTrailingZerosForDecimalNumbers	Numbers <ul style="list-style-type: none"> <li>• 1</li> </ul>		JDBC driver property: stripTrailingZerosForDecimalNumbers. 2 NO 1 YES
sysSchema	string		JDBC driver property: sysSchema.
timerLevelForQueryTimeOut	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> <li>• -1</li> </ul>		JDBC driver property: timerLevelForQueryTimeOut. 2 QUERYTIMEOUT_CONNECTION 1 QUERYTIMEOUT_STATEMENT_L -1 QUERYTIMEOUT_DISABLED
traceDirectory	string		JDBC driver property: traceDirectory.
traceFile	string		JDBC driver property: traceFile.
traceFileAppend	boolean		JDBC driver property: traceFileAppend.
traceFileCount	int		JDBC driver property: traceFileCount.
traceFileSize	int		JDBC driver property: traceFileSize.
traceLevel	int	0	Bitwise combination of the following constant values: TRACE_NONE=0, TRACE_CONNECTION_CALLS=1, TRACE_STATEMENT_CALLS=2, TRACE_RESULT_SET_CALLS=4, TRACE_DRIVER_CONFIGURATION=16, TRACE_CONNECTS=32, TRACE_DRDA_FLOWS=64, TRACE_RESULT_SET_META_DATA=128, TRACE_PARAMETER_META_DATA=256, TRACE_DIAGNOSTICS=512, TRACE_SQLJ=1024, TRACE_META_CALLS=8192, TRACE_DATASOURCE_CALLS=16384, TRACE_LARGE_OBJECT_CALLS=32768, TRACE_SYSTEM_MONITOR=131072, TRACE_TRACEPOINTS=262144, TRACE_ALL=-1.
traceOption	<ul style="list-style-type: none"> <li>• 1</li> <li>• 0</li> </ul>		JDBC driver property: traceOption 1 1 0 0

Attribute name	Data type	Default value	Description
translateForBitData	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: translateForBitData. 2 SERVER_ENCODING_REPRESENTATION 1 HEX_REPRESENTATION
updateCountForBatch	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: updateCountForBatch. 2 TOTAL_UPDATE_COUNT 1 NO_UPDATE_COUNT
useCachedCursor	boolean		JDBC driver property: useCachedCursor.
useIdentityValLocalForAutoGeneratedKeys	boolean		JDBC driver property: useIdentityValLocalForAutoGeneratedKeys.
useJDBC41DefinitionForGetColumns	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: useJDBC41DefinitionForGetColumns. 2 NO 1 YES
useJDBC4ColumnNameAndLabelSemantics	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: useJDBC4ColumnNameAndLabelSemantics. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
useTransactionRedirect	boolean		JDBC driver property: useTransactionRedirect.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
xaNetworkOptimization	boolean		JDBC driver property: xaNetworkOptimization.

**jobStore > dataSource > properties.derby.client**

Data source properties for Derby Network Client JDBC driver.

false

Attribute name	Data type	Default value	Description
connectionAttributes	string		JDBC driver property: connectionAttributes.

Attribute name	Data type	Default value	Description
createDatabase	<ul style="list-style-type: none"> <li>false</li> <li>create</li> </ul>		<p>JDBC driver property: createDatabase.</p> <p><b>false</b> Do not automatically create the database.</p> <p><b>create</b> When the first connection is established, automatically create the database if it doesn't exist.</p>
databaseName	string		JDBC driver property: databaseName.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1527	Port on which to obtain database connections.
retrieveMessageText	boolean	true	JDBC driver property: retrieveMessageText.
securityMechanism	<ul style="list-style-type: none"> <li>3</li> <li>7</li> <li>4</li> <li>9</li> <li>8</li> </ul>	3	<p>JDBC driver property: securityMechanism. user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

### jobStore > dataSource > properties.informix

Data source properties for the Informix JDBC driver.

false

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
ifxCLIENT_LOCALE	string		JDBC driver property: ifxCLIENT_LOCALE.
ifxCPMAgeLimit	A period of time with second precision		JDBC driver property: ifxCPMAgeLimit. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxCPMInitPoolSize	int		JDBC driver property: ifxCPMInitPoolSize.
ifxCPMMaxConnections	int		JDBC driver property: ifxCPMMaxConnections.
ifxCPMMaxPoolSize	int		JDBC driver property: ifxCPMMaxPoolSize.
ifxCPMMinAgeLimit	A period of time with second precision		JDBC driver property: ifxCPMMinAgeLimit. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxCPMMinPoolSize	int		JDBC driver property: ifxCPMMinPoolSize.
ifxCPMServiceInterval	A period of time with millisecond precision		JDBC driver property: ifxCPMServiceInterval. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
ifxDBANSIWARN	boolean		JDBC driver property: ifxDBANSIWARN.
ifxDBCENTURY	string		JDBC driver property: ifxDBCENTURY.
ifxDBDATE	string		JDBC driver property: ifxDBDATE.
ifxDBSPACETEMP	string		JDBC driver property: ifxDBSPACETEMP.

Attribute name	Data type	Default value	Description
ifxDBTEMP	string		JDBC driver property: ifxDBTEMP.
ifxDBTIME	string		JDBC driver property: ifxDBTIME.
ifxDBUPSPACE	string		JDBC driver property: ifxDBUPSPACE.
ifxDB_LOCALE	string		JDBC driver property: ifxDB_LOCALE.
ifxDELIMIDENT	boolean		JDBC driver property: ifxDELIMIDENT.
ifxENABLE_TYPE_CACHE	boolean		JDBC driver property: ifxENABLE_TYPE_CACHE.
ifxFET_BUF_SIZE	int		JDBC driver property: ifxFET_BUF_SIZE.
ifxGL_DATE	string		JDBC driver property: ifxGL_DATE.
ifxGL_DATETIME	string		JDBC driver property: ifxGL_DATETIME.
ifxIFXHOST	string	localhost	JDBC driver property: ifxIFXHOST.
ifxIFX_AUTOFREE	boolean		JDBC driver property: ifxIFX_AUTOFREE.
ifxIFX_DIRECTIVES	string		JDBC driver property: ifxIFX_DIRECTIVES.
ifxIFX_LOCK_MODE_WAIT	A period of time with second precision	2s	JDBC driver property: ifxIFX_LOCK_MODE_WAIT. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxIFX_SOC_TIMEOUT	A period of time with millisecond precision		JDBC driver property: ifxIFX_SOC_TIMEOUT. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
ifxIFX_USEPUT	boolean		JDBC driver property: ifxIFX_USEPUT.

Attribute name	Data type	Default value	Description
ifxIFX_USE_STRENC	boolean		JDBC driver property: ifxIFX_USE_STRENC.
ifxIFX_XASPEC	string	y	JDBC driver property: ifxIFX_XASPEC.
ifxINFORMIXCONRETRY	int		JDBC driver property: ifxINFORMIXCONRETRY.
ifxINFORMIXCONTIME	A period of time with second precision		JDBC driver property: ifxINFORMIXCONTIME. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxINFORMIXOPCACHE	string		JDBC driver property: ifxINFORMIXOPCACHE.
ifxINFORMIXSTACKSIZE	int		JDBC driver property: ifxINFORMIXSTACKSIZE.
ifxJDBCTEMP	string		JDBC driver property: ifxJDBCTEMP.
ifxLDAP_IFXBASE	string		JDBC driver property: ifxLDAP_IFXBASE.
ifxLDAP_PASSWD	string		JDBC driver property: ifxLDAP_PASSWD.
ifxLDAP_URL	string		JDBC driver property: ifxLDAP_URL.
ifxLDAP_USER	string		JDBC driver property: ifxLDAP_USER.
ifxLOBCACHE	int		JDBC driver property: ifxLOBCACHE.
ifxNEWCODESET	string		JDBC driver property: ifxNEWCODESET.
ifxNEWLOCALE	string		JDBC driver property: ifxNEWLOCALE.
ifxNODEFDAC	string		JDBC driver property: ifxNODEFDAC.
ifxOPTCOMPIND	string		JDBC driver property: ifxOPTCOMPIND.
ifxOPTOFC	string		JDBC driver property: ifxOPTOFC.
ifxOPT_GOAL	string		JDBC driver property: ifxOPT_GOAL.
ifxPATH	string		JDBC driver property: ifxPATH.
ifxPDQPRIORITY	string		JDBC driver property: ifxPDQPRIORITY.

Attribute name	Data type	Default value	Description
ifxPLCONFIG	string		JDBC driver property: ifxPLCONFIG.
ifxPLOAD_LO_PATH	string		JDBC driver property: ifxPLOAD_LO_PATH.
ifxPROTOCOLTRACE	int		JDBC driver property: ifxPROTOCOLTRACE.
ifxPROTOCOLTRACEFILE	string		JDBC driver property: ifxPROTOCOLTRACEFILE.
ifxPROXY	string		JDBC driver property: ifxPROXY.
ifxPSORT_DBTEMP	string		JDBC driver property: ifxPSORT_DBTEMP.
ifxPSORT_NPROCS	boolean		JDBC driver property: ifxPSORT_NPROCS.
ifxSECURITY	string		JDBC driver property: ifxSECURITY.
ifxSQLH_FILE	string		JDBC driver property: ifxSQLH_FILE.
ifxSQLH_LOC	string		JDBC driver property: ifxSQLH_LOC.
ifxSQLH_TYPE	string		JDBC driver property: ifxSQLH_TYPE.
ifxSSLCONNECTION	string		JDBC driver property: ifxSSLCONNECTION.
ifxSTMT_CACHE	string		JDBC driver property: ifxSTMT_CACHE.
ifxTRACE	int		JDBC driver property: ifxTRACE.
ifxTRACEFILE	string		JDBC driver property: ifxTRACEFILE.
ifxTRUSTED_CONTEXT	string		JDBC driver property: ifxTRUSTED_CONTEXT.
ifxUSEV5SERVER	boolean		JDBC driver property: ifxUSEV5SERVER.
ifxUSE_DTENV	boolean		JDBC driver property: ifxUSE_DTENV.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1526	Port on which to obtain database connections.
roleName	string		JDBC driver property: roleName.
serverName	string		Server where the database is running.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**jobStore > dataSource > properties.informix.jcc**

Data source properties for the IBM Data Server Driver for JDBC and SQLJ for Informix.

false

Attribute name	Data type	Default value	Description
DBANSIWARN	boolean		JDBC driver property: DBANSIWARN.
DBDATE	string		JDBC driver property: DBDATE.
DBPATH	string		JDBC driver property: DBPATH.
DBSPACETEMP	string		JDBC driver property: DBSPACETEMP.
DBTEMP	string		JDBC driver property: DBTEMP.
DBUPSPACE	string		JDBC driver property: DBUPSPACE.
DELIMIDENT	boolean		JDBC driver property: DELIMIDENT.
IFX_DIRECTIVES	<ul style="list-style-type: none"> <li>• ON</li> <li>• OFF</li> </ul>		JDBC driver property: IFX_DIRECTIVES. <b>ON</b> ON <b>OFF</b> OFF
IFX_EXTDIRECTIVES	<ul style="list-style-type: none"> <li>• ON</li> <li>• OFF</li> </ul>		JDBC driver property: IFX_EXTDIRECTIVES. <b>ON</b> ON <b>OFF</b> OFF
IFX_UPDDESC	string		JDBC driver property: IFX_UPDDESC.

Attribute name	Data type	Default value	Description
IFX_XASTDCOMPLIANCE_XAEND	<ul style="list-style-type: none"> <li>0</li> </ul>		JDBC driver property: IFX_XASTDCOMPLIANCE_XAEND. <b>1</b> 1 <b>0</b> 0
INFORMIXOPCACHE	string		JDBC driver property: INFORMIXOPCACHE.
INFORMIXSTACKSIZE	string		JDBC driver property: INFORMIXSTACKSIZE.
NODEFDAC	<ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul>		JDBC driver property: NODEFDAC. <b>yes</b> yes <b>no</b> no
OPTCOMPIND	<ul style="list-style-type: none"> <li>2</li> <li>1</li> <li>0</li> </ul>		JDBC driver property: OPTCOMPIND. <b>2</b> 2 <b>1</b> 1 <b>0</b> 0
OPTOFC	<ul style="list-style-type: none"> <li>1</li> <li>0</li> </ul>		JDBC driver property: OPTOFC. <b>1</b> 1 <b>0</b> 0
PDQPRIORITY	<ul style="list-style-type: none"> <li>HIGH</li> <li>LOW</li> <li>OFF</li> </ul>		JDBC driver property: PDQPRIORITY. <b>HIGH</b> HIGH <b>LOW</b> LOW <b>OFF</b> OFF
PSORT_DBTEMP	string		JDBC driver property: PSORT_DBTEMP.
PSORT_NPROCS	string Maximum: 10		JDBC driver property: PSORT_NPROCS.
STMT_CACHE	<ul style="list-style-type: none"> <li>1</li> <li>0</li> </ul>		JDBC driver property: STMT_CACHE. <b>1</b> 1 <b>0</b> 0
currentLockTimeout	A period of time with second precision	2s	JDBC driver property: currentLockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
deferPrepares	boolean		JDBC driver property: deferPrepares.
driverType	int	4	JDBC driver property: driverType.
enableNamedParameterMarkers	int		JDBC driver property: enableNamedParameterMarkers. Values are: 1 (YES) or 2 (NO).
enableSeamlessFailover	int		JDBC driver property: enableSeamlessFailover. Values are: 1 (YES) or 2 (NO).
enableSysplexWLB	boolean		JDBC driver property: enableSysplexWLB.
fetchSize	int		JDBC driver property: fetchSize.
fullyMaterializeLobData	boolean		JDBC driver property: fullyMaterializeLobData.
keepDynamic	int		JDBC driver property: keepDynamic.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1526	Port on which to obtain database connections.
progressiveStreaming	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		JDBC driver property: progressiveStreaming. Values are: 1 (YES) or 2 (NO).  2      NO 1      YES
queryDataSize	int  Minimum: 4096  Maximum: 10485760		JDBC driver property: queryDataSize.

Attribute name	Data type	Default value	Description
resultSetHoldability	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldability. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2 CLOSE_CURSORS_AT_COMMIT 1 HOLD_CURSORS_OVER_COMMIT</p>
resultSetHoldabilityForCatalogQueries	<ul style="list-style-type: none"> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldabilityForCatalogQueries. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2 CLOSE_CURSORS_AT_COMMIT 1 HOLD_CURSORS_OVER_COMMIT</p>
retrieveMessagesFromServerOnGetMessage	boolean	true	<p>JDBC driver property: retrieveMessagesFromServerOnGetMessage.</p>
securityMechanism	<ul style="list-style-type: none"> <li>• 3</li> <li>• 7</li> <li>• 4</li> <li>• 9</li> </ul>		<p>JDBC driver property: securityMechanism. Values are: 3 (CLEAR_TEXT_PASSWORD_SECURITY), 4 (USER_ONLY_SECURITY), 7 (ENCRYPTED_PASSWORD_SECURITY), 9 (ENCRYPTED_USER_AND_PASSWORD_SECURITY).</p> <p>3 CLEAR_TEXT_PASSWORD_SECURITY 7 ENCRYPTED_PASSWORD_SECURITY 4 USER_ONLY_SECURITY 9 ENCRYPTED_USER_AND_PASSWORD_SECURITY</p>
serverName	string	localhost	Server where the database is running.
traceDirectory	string		JDBC driver property: traceDirectory.
traceFile	string		JDBC driver property: traceFile.
traceFileAppend	boolean		JDBC driver property: traceFileAppend.

Attribute name	Data type	Default value	Description
traceLevel	int		Bitwise combination of the following constant values: TRACE_NONE=0, TRACE_CONNECTION_CALLS=1, TRACE_STATEMENT_CALLS=2, TRACE_RESULT_SET_CALLS=4, TRACE_DRIVER_CONFIGURATION=16, TRACE_CONNECTS=32, TRACE_DRDA_FLOWS=64, TRACE_RESULT_SET_META_DATA=128, TRACE_PARAMETER_META_DATA=256, TRACE_DIAGNOSTICS=512, TRACE_SQLJ=1024, TRACE_META_CALLS=8192, TRACE_DATASOURCE_CALLS=16384, TRACE_LARGE_OBJECT_CALLS=32768, TRACE_SYSTEM_MONITOR=131072, TRACE_TRACEPOINTS=262144, TRACE_ALL=-1.
useJDBC4ColumnNameAndLabelSemantics	boolean		JDBC driver property: useJDBC4ColumnNameAndLabelSemantics. Values are: 1 (YES) or 2 (NO).
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**jobStore > dataSource > properties.microsoft.sqlserver**  
Data source properties for Microsoft SQL Server JDBC Driver.

false

Attribute name	Data type	Default value	Description
URL	string		URL for connecting to the database. Example: jdbc:sqlserver://localhost:1433;databaseName=myDB.
applicationIntent	<ul style="list-style-type: none"> <li>ReadOnly</li> <li>ReadWrite</li> </ul>		JDBC driver property: applicationIntent. <b>ReadOnly</b> ReadOnly <b>ReadWrite</b> ReadWrite
applicationName	string		JDBC driver property: applicationName.
authenticationScheme	<ul style="list-style-type: none"> <li>NativeAuthentication</li> <li>JavaKerberos</li> </ul>		JDBC driver property: authenticationScheme. <b>NativeAuthentication</b> NativeAuthentication <b>JavaKerberos</b> JavaKerberos

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
encrypt	boolean		JDBC driver property: encrypt.
failoverPartner	string		JDBC driver property: failoverPartner.
hostNameInCertificate	string		JDBC driver property: hostNameInCertificate.
instanceName	string		JDBC driver property: instanceName.
integratedSecurity	boolean		JDBC driver property: integratedSecurity.
lastUpdateCount	boolean		JDBC driver property: lastUpdateCount.
lockTimeout	A period of time with millisecond precision		JDBC driver property: lockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
multiSubnetFailover	boolean		JDBC driver property: multiSubnetFailover.
packetSize	int Minimum: 512 Maximum: 32767		JDBC driver property: packetSize.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.

Attribute name	Data type	Default value	Description
responseBuffering	<ul style="list-style-type: none"> <li>full</li> <li>adaptive</li> </ul>		JDBC driver property: responseBuffering. <b>full</b> full <b>adaptive</b> adaptive
selectMethod	<ul style="list-style-type: none"> <li>direct</li> <li>cursor</li> </ul>		JDBC driver property: selectMethod. <b>direct</b> direct <b>cursor</b> cursor
sendStringParametersAsUnicode	boolean	false	JDBC driver property: sendStringParametersAsUnicode.
sendTimeAsDatetime	boolean		JDBC driver property: sendTimeAsDatetime.
serverName	string	localhost	Server where the database is running.
trustServerCertificate	boolean		JDBC driver property: trustServerCertificate.
trustStore	string		JDBC driver property: trustStore.
trustStorePassword	Reversably encoded password (string)		JDBC driver property: trustStorePassword.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
workstationID	string		JDBC driver property: workstationID.
xopenStates	boolean		JDBC driver property: xopenStates.

**jobStore > dataSource > properties.oracle**

Data source properties for Oracle JDBC driver.

false

Attribute name	Data type	Default value	Description
ONSConfiguration	string		JDBC driver property: ONSConfiguration.
TNSEntryName	string		JDBC driver property: TNSEntryName.
URL	string		URL for connecting to the database. Examples: jdbc:oracle:thin:@//localhost:1521/sample or jdbc:oracle:oci:@//localhost:1521/sample.
connectionProperties	string		JDBC driver property: connectionProperties.

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
driverType	<ul style="list-style-type: none"> <li>oci</li> <li>thin</li> </ul>	thin	JDBC driver property: driverType.  <b>oci</b> oci <b>thin</b> thin
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
networkProtocol	string		JDBC driver property: networkProtocol.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1521	Port on which to obtain database connections.
serverName	string	localhost	Server where the database is running.
serviceName	string		JDBC driver property: serviceName.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**jobStore > dataSource > properties.sybase**

Data source properties for Sybase JDBC driver.

false

Attribute name	Data type	Default value	Description
SERVER_INITIATED_TRANSACTIONS	<ul style="list-style-type: none"> <li>false</li> <li>true</li> </ul>	false	JDBC driver property: SERVER_INITIATED_TRANSACTIONS.  <b>false</b> false <b>true</b> true
connectionProperties	string	SELECT_OPENS_CURSOR=true	JDBC driver property: connectionProperties.
databaseName	string		JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
networkProtocol	<ul style="list-style-type: none"> <li>• SSL</li> <li>• socket</li> </ul>		JDBC driver property: networkProtocol.  <b>SSL</b> SSL <b>socket</b> socket
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	5000	Port on which to obtain database connections.
resourceManagerName	string		JDBC driver property: resourceManagerName.
serverName	string	localhost	Server where the database is running.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
version	int		JDBC driver property: version.

**jobStore > dataSource > recoveryAuthData**

Authentication data for transaction recovery.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

## BELL (bell)

This feature enables the configuration of Basic Extensions using Liberty Libraries (BELL). A BELL enables the server runtime to be extended using shared libraries.

- library
  - file
  - fileset
  - folder
- service

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
libraryRef	A reference to top level library element (string).		The library to use for the BELL.

### library

The library to use for the BELL.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

### library > file

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

### library > fileset

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

### library > folder

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

### service

The name of the service that the system will look up in the /META-INF/services folder. If not specified, the system discovers all services located in the META-INF/services folder.

false

string

## OSGi Applications Bundle Repository (bundleRepository)

An internal bundle repository, in which you can store the bundles for your OSGi applications.

- fileset

Attribute name	Data type	Default value	Description
filesetRef	List of references to top level fileset elements (comma-separated string).		Space separated list of fileset references
id	string		A unique configuration ID.
location	A file, directory or url.		Location of the remote repository expressed as an absolute URL or one relative to the server home directory.

### fileset

Space separated list of fileset references

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

## Contexts And Dependency Injection (CDI) V1.2 (cdi12)

Defines the behavior of the Contexts and Dependency Injection (CDI) v1.2.

Attribute name	Data type	Default value	Description
enableImplicitBeanArchives	boolean	true	The implicit bean archives are scanned for any bean discoveries.

## CDI Container (cdiContainer)

Defines behavior for the Contexts and Dependency Injection (CDI) container.

## Channel Framework (channelfw)

Defines channel and chain management settings.

Attribute name	Data type	Default value	Description
chainQuiesceTimeout	A period of time with millisecond precision	30s	Default amount of time to wait while quiescing chains. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
chainStartRetryAttempts	int Minimum: 0	60	Number of retry attempts to make per chain.

Attribute name	Data type	Default value	Description
chainStartRetryInterval	A period of time with millisecond precision	5s	Time interval between start retries. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
warningWaitTime	A period of time with millisecond precision	10s	Amount of time to wait before notifying of a missing factory configuration. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

## Classloading (classloading)

Global classloading

Attribute name	Data type	Default value	Description
useJarUrls	boolean	false	Whether to use jar: or wsjar: URLs for referencing files in archives

## Cloudant Builder (cloudant)

Configuration for a Cloudant Builder. A Cloudant Builder creates Cloudant Client instances, which can connect to a Cloudant Database.

- containerAuthData
- library
  - file
  - fileset
  - folder
- ssl

Attribute name	Data type	Default value	Description
account	string		Account name used to connect to a Cloudant database.

Attribute name	Data type	Default value	Description
connectTimeout	A period of time with millisecond precision	5m	The timeout to establish a connection. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.
disableSSLAuthentication	boolean	false	Disables host name verification and certificate chain validation.
id	string		A unique configuration ID.
jndiName	string		JNDI name.
libraryRef	A reference to top level library element (string).		Specifies a library that contains the Cloudant Client library and its dependencies.
maxConnections	int Minimum: 0	6	The maximum number of concurrent connections that a Cloudant Client can make to the host.
password	Reversably encoded password (string)		Password corresponding to your Cloudant user ID.
proxyPassword	Reversably encoded password (string)		Password corresponding to the user name for a proxy server to use when connecting to a Cloudant server.
proxyUrl	string		The URL of a proxy server to use when connecting to a Cloudant server.
proxyUser	string		User name for a proxy server to use when connecting to a Cloudant server.

Attribute name	Data type	Default value	Description
readTimeout	A period of time with millisecond precision	30s	Timeout value to wait for a response from an established client connection. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
sslRef	A reference to top level ssl element (string).		Specifies the SSL configuration that is needed to establish a secure connection.
url	string		URL for the Cloudant server, which includes the host and port.
username	string		The Cloudant user ID used to log in and access your databases.

#### containerAuthData

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

#### library

Specifies a library that contains the Cloudant Client library and its dependencies.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

### library > file

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

### library > fileset

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

### library > folder

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

### ssl

Specifies the SSL configuration that is needed to establish a secure connection.

false

Attribute name	Data type	Default value	Description
clientAuthentication	boolean	false	Specifies whether client authentication is enabled. If set to true then client authentication is required and the client must provide a certificate for the server trusts.
clientAuthenticationSupported	boolean	false	Specifies whether a client authentication is supported. If set to true then the client authentication support means the server will check trust from a client if the client presents a certificate.

Attribute name	Data type	Default value	Description
clientKeyAlias	string		Specifies the alias of the certificate in the keystore that is used as the key to send to a server that has client authentication enabled. This attribute is only needed if the keystore has more than one key entry.
enabledCiphers	string		Specifies a custom list of ciphers. Separate each cipher in the list with a space. The supported cipher will depend on the underlying JRE used. Please check the JRE for valid ciphers.
keyStoreRef	A reference to top level keyStore element (string).		A keystore containing key entries for the SSL repertoire. This attribute is required.
securityLevel	<ul style="list-style-type: none"> <li>• MEDIUM</li> <li>• CUSTOM</li> <li>• HIGH</li> <li>• LOW</li> </ul>	HIGH	<p>Specifies the cipher suite group used by the SSL handshake. HIGH are 3DES and 128 bit and higher ciphers, MEDIUM are DES and 40 bit ciphers, LOW are ciphers without encryption. If the enabledCiphers attribute is used the securityLevel list is ignored.</p> <p><b>MEDIUM</b> %repertoire.MEDIUM</p> <p><b>CUSTOM</b> %repertoire.CUSTOM</p> <p><b>HIGH</b> Cipher suites 3DES and 128 bit and higher</p> <p><b>LOW</b> %repertoire.LOW</p>
serverKeyAlias	string		Specifies the alias of the certificate in the keystore used as the server's key. This attribute is only needed if the keystore has more then one key entry.

Attribute name	Data type	Default value	Description
sslProtocol	string		The SSL handshake protocol. Protocol values can be found in the documentation for the underlying JRE's Java Secure Socket Extension (JSSE) provider. When using the IBM JRE the default value is SSL_TLS and when using the Oracle JRE the default value is SSL.
trustStoreRef	A reference to top level keyStore element (string).	\${keyStoreRef}	A keystore containing trusted certificate entries used by the SSL repertoire for signing verification. This attribute is optional. If unspecified, the same keystore is used for both key and trusted certificate entries.

## Cloudant Database (cloudantDatabase)

Configuration for a Cloudant Database.

- cloudant
  - containerAuthData
  - library
    - file
    - fileset
    - folder
  - ssl

Attribute name	Data type	Default value	Description
cloudantRef	A reference to top level cloudant element (string).		Specifies the builder for the Cloudant Client that will be used when connecting to this database.
create	boolean	true	Indicates that the Cloudant Client should create the database if it does not already exist.
databaseName	string		Name of the database.
id	string		A unique configuration ID.
jndiName	string		JNDI name.

### cloudant

Specifies the builder for the Cloudant Client that will be used when connecting to this database.

false

Attribute name	Data type	Default value	Description
account	string		Account name used to connect to a Cloudbant database.
connectTimeout	A period of time with millisecond precision	5m	The timeout to establish a connection. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.
disableSSLAuthentication	boolean	false	Disables host name verification and certificate chain validation.
jndiName	string		JNDI name.
libraryRef	A reference to top level library element (string).		Specifies a library that contains the Cloudbant Client library and its dependencies.
maxConnections	int Minimum: 0	6	The maximum number of concurrent connections that a Cloudbant Client can make to the host.
password	Reversably encoded password (string)		Password corresponding to your Cloudbant user ID.
proxyPassword	Reversably encoded password (string)		Password corresponding to the user name for a proxy server to use when connecting to a Cloudbant server.
proxyUrl	string		The URL of a proxy server to use when connecting to a Cloudbant server.
proxyUser	string		User name for a proxy server to use when connecting to a Cloudbant server.

Attribute name	Data type	Default value	Description
readTimeout	A period of time with millisecond precision	30s	Timeout value to wait for a response from an established client connection. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
sslRef	A reference to top level ssl element (string).		Specifies the SSL configuration that is needed to establish a secure connection.
url	string		URL for the Cloudant server, which includes the host and port.
username	string		The Cloudant user ID used to log in and access your databases.

#### **cloudant > containerAuthData**

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

#### **cloudant > library**

Specifies a library that contains the Cloudant Client library and its dependencies.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

**cloudant > library > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**cloudant > library > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**cloudant > library > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**cloudant > ssl**

Specifies the SSL configuration that is needed to establish a secure connection.

false

Attribute name	Data type	Default value	Description
clientAuthentication	boolean	false	Specifies whether client authentication is enabled. If set to true then client authentication is required and the client must provide a certificate for the server trusts.
clientAuthenticationSupported	boolean	false	Specifies whether a client authentication is supported. If set to true then the client authentication support means the server will check trust from a client if the client presents a certificate.

Attribute name	Data type	Default value	Description
clientKeyAlias	string		Specifies the alias of the certificate in the keystore that is used as the key to send to a server that has client authentication enabled. This attribute is only needed if the keystore has more than one key entry.
enabledCiphers	string		Specifies a custom list of ciphers. Separate each cipher in the list with a space. The supported cipher will depend on the underlying JRE used. Please check the JRE for valid ciphers.
keyStoreRef	A reference to top level keyStore element (string).		A keystore containing key entries for the SSL repertoire. This attribute is required.
securityLevel	<ul style="list-style-type: none"> <li>• MEDIUM</li> <li>• CUSTOM</li> <li>• HIGH</li> <li>• LOW</li> </ul>	HIGH	<p>Specifies the cipher suite group used by the SSL handshake. HIGH are 3DES and 128 bit and higher ciphers, MEDIUM are DES and 40 bit ciphers, LOW are ciphers without encryption. If the enabledCiphers attribute is used the securityLevel list is ignored.</p> <p><b>MEDIUM</b> %repertoire.MEDIUM</p> <p><b>CUSTOM</b> %repertoire.CUSTOM</p> <p><b>HIGH</b> Cipher suites 3DES and 128 bit and higher</p> <p><b>LOW</b> %repertoire.LOW</p>
serverKeyAlias	string		Specifies the alias of the certificate in the keystore used as the server's key. This attribute is only needed if the keystore has more then one key entry.

Attribute name	Data type	Default value	Description
sslProtocol	string		The SSL handshake protocol. Protocol values can be found in the documentation for the underlying JRE's Java Secure Socket Extension (JSSE) provider. When using the IBM JRE the default value is SSL_TLS and when using the Oracle JRE the default value is SSL.
trustStoreRef	A reference to top level keyStore element (string).	\${keyStoreRef}	A keystore containing trusted certificate entries used by the SSL repertoire for signing verification. This attribute is optional. If unspecified, the same keystore is used for both key and trusted certificate entries.

## Cluster Member (clusterMember)

Static cluster member configuration.

Attribute name	Data type	Default value	Description
name	string	defaultCluster	The name of the static cluster this server belongs to.

## WebSphere Cluster Manager (clusterPluginConfig)

The Cluster Manager MBean configuration.

Attribute name	Data type	Default value	Description
outputDir	string	\${server.output.dir}/pluginConfig	The output directory of the merged plugin-cfg.xml files.

## Certificate Authority Signed Certificate (collectiveCertificate)

Certificate authority signed certificate for collective.

Attribute name	Data type	Default value	Description
rdn	string	DC=com.ibm.ws.collective	Configure expected RDN attribute for incoming collective certificate.

## Collective Controller (collectiveController)

### Collective controller replica configuration

Attribute name	Data type	Default value	Description
isInitialReplicaSet	boolean	true	A boolean value that specifies whether a collective controller replica is joining an existing replica set or defining a new one. By default, the initial replica set contains only the first collective controller replica. Specify a value of true in each replica in the initial replica set. Specify a value of false in each replica subsequently added to the initial replica set. If the replicaSet value is changed after it was initially defined, specify a value of false.
password	Reversably encoded password (string)		The password of the controller user
replicaHost	string	localhost	The host name or IP address associated with this collective controller's replication port.
replicaPort	int Minimum: 1 Maximum: 65535	10010	The port number assigned for this collective controller's replication port.
replicaSet	string	\${replicaHost}:\${replicaPort}	A space delimited list of collective controller replica endpoints. The set of endpoints is used by this replica to establish contact with other replicas in the set. The list does not need to contain all replicas, but must contain at least one replica from the initial replica set. An endpoint is defined as a host:port pair, for example localhost:10010
repositoryDir	string	\${server.output.dir}/resources/collective/repository	The path on the local file system within which the replica's repository contents should be stored. The directory should have the necessary permissions to enable the process to read, write, and create files.
user	string		The user ID of the controller

## Collective Member (collectiveMember)

The collective member configuration requires at least one collective controller address (identified by controllerHost and controllerPort). The collective controller can have multiple available addresses. Add one or more failoverController elements to identify the additional controllers. When multiple controllers are available, the member connects to one of the controllers. If the connection to the controller ends unexpectedly, the member connects to another controller in the remaining set of controllers.

- failoverController

Attribute name	Data type	Default value	Description
controllerHost	string		The host name for the collective controller instance.
controllerPort	int		The port for the JMX/REST connector, typically the HTTPS port.
controllerReadTimeout	A period of time with millisecond precision	300s	The read timeout for member connection to the collective controller. A longer read timeout may be necessary in large or geographically dispersed topologies. Minimum value is 2 minutes. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
heartBeatInterval	A period of time with millisecond precision	60s	Periodic time interval at which the collective member will contact the collective controller to indicate liveness. Minimum value is 1 second. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

### failoverController

An additional collective controller address which is available for the collective member to use.

false

Attribute name	Data type	Default value	Description
host	string		The host name for the collective controller instance.
id	string		A unique configuration ID.
port	int		The port for the JMX/REST connector, typically the HTTPS port.

## WebSphere Collective Repository MBean (collectiveRepository)

The Collective Repository MBean configuration.

Attribute name	Data type	Default value	Description
maxMemberConnections	int	2147483647	The maximum number of members permitted to connect to the repository.

## Configuration Management (config)

Defines how the server processes configuration information.

Attribute name	Data type	Default value	Description
monitorInterval	A period of time with millisecond precision	500ms	Rate at which the server checks for configuration updates. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Action to take after a incurring a configuration error.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

Attribute name	Data type	Default value	Description
updateTrigger	<ul style="list-style-type: none"> <li>mbean</li> <li>polled</li> <li>disabled</li> </ul>	polled	<p>Configuration update method or trigger.</p> <p><b>mbean</b> Server will only update the configuration when prompted by the FileNotificationMbean. The FileNotificationMbean is typically called by an external program such as an integrated development environment or a management application.</p> <p><b>polled</b> Server will scan for changes at the polling interval on all the configuration files and update the runtime configuration with the changes detected.</p> <p><b>disabled</b> Disables all update monitoring. Configuration changes will not be applied while the server is running.</p>

## Connection Factory (connectionFactory)

Defines a connection factory configuration.

- connectionManager
- containerAuthData
- recoveryAuthData

Attribute name	Data type	Default value	Description
connectionManagerRef	A reference to top level connectionManager element (string).		Connection manager for a connection factory.

Attribute name	Data type	Default value	Description
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.
id	string		A unique configuration ID.
jndiName	string		JNDI name for a resource.
recoveryAuthDataRef	A reference to top level authData element (string).		Authentication data for transaction recovery.

### connectionManager

Connection manager for a connection factory.

false

Attribute name	Data type	Default value	Description
agedTimeout	A period of time with second precision	-1	Amount of time before a physical connection can be discarded by pool maintenance. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
connectionTimeout	A period of time with second precision	30s	Amount of time after which a connection request times out. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxConnectionsPerThread	int Minimum: 0		Limits the number of open connections on each thread.

Attribute name	Data type	Default value	Description
maxIdleTime	A period of time with second precision	30m	Amount of time after which an unused or idle connection can be discarded during pool maintenance, if doing so does not reduce the pool below the minimum size. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxPoolSize	int Minimum: 0	50	Maximum number of physical connections for a pool. A value of 0 means unlimited.
minPoolSize	int Minimum: 0		Minimum number of physical connections to maintain in the pool. The pool is not pre-populated. Aged timeout can override the minimum.
numConnectionsPerThreadLocal	int Minimum: 0		Caches the specified number of connections for each thread.

Attribute name	Data type	Default value	Description
purgePolicy	<ul style="list-style-type: none"> <li>• ValidateAllConnections</li> <li>• FailingConnectionOnly</li> <li>• EntirePool</li> </ul>	EntirePool	<p>Specifies which connections to destroy when a stale connection is detected in a pool.</p> <p><b>ValidateAllConnections</b> When a stale connection is detected, connections are tested and those found to be bad are closed.</p> <p><b>FailingConnectionOnly</b> When a stale connection is detected, only the connection which was found to be bad is closed.</p> <p><b>EntirePool</b> When a stale connection is detected, all connections in the pool are marked stale, and when no longer in use, are closed.</p>
reapTime	A period of time with second precision	3m	Amount of time between runs of the pool maintenance thread. A value of -1 disables pool maintenance. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

#### containerAuthData

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

### recoveryAuthData

Authentication data for transaction recovery.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

## Connection Manager (connectionManager)

Connection Manager configuration

Attribute name	Data type	Default value	Description
agedTimeout	A period of time with second precision	-1	Amount of time before a physical connection can be discarded by pool maintenance. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
connectionTimeout	A period of time with second precision	30s	Amount of time after which a connection request times out. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
id	string		A unique configuration ID.
maxConnectionsPerThread	int Minimum: 0		Limits the number of open connections on each thread.
maxIdleTime	A period of time with second precision	30m	Amount of time after which an unused or idle connection can be discarded during pool maintenance, if doing so does not reduce the pool below the minimum size. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxPoolSize	int Minimum: 0	50	Maximum number of physical connections for a pool. A value of 0 means unlimited.
minPoolSize	int Minimum: 0		Minimum number of physical connections to maintain in the pool. The pool is not pre-populated. Aged timeout can override the minimum.
numConnectionsPerThreadLocal	int Minimum: 0		Caches the specified number of connections for each thread.

Attribute name	Data type	Default value	Description
purgePolicy	<ul style="list-style-type: none"> <li>• ValidateAllConnections</li> <li>• FailingConnectionOnly</li> <li>• EntirePool</li> </ul>	EntirePool	<p>Specifies which connections to destroy when a stale connection is detected in a pool.</p> <p><b>ValidateAllConnections</b> When a stale connection is detected, connections are tested and those found to be bad are closed.</p> <p><b>FailingConnectionOnly</b> When a stale connection is detected, only the connection which was found to be bad is closed.</p> <p><b>EntirePool</b> When a stale connection is detected, all connections in the pool are marked stale, and when no longer in use, are closed.</p>
reapTime	A period of time with second precision	3m	Amount of time between runs of the pool maintenance thread. A value of -1 disables pool maintenance. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

## Thread Context Propagation (contextService)

Configures how context is propagated to threads

- baseContext
  - baseContext
  - classloaderContext
  - jeeMetadataContext
  - securityContext
  - syncToOSThreadContext
  - zosWLMContext

- classloaderContext
- jeeMetadataContext
- securityContext
- syncToOSThreadContext
- zosWLMContext

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
id	string		A unique configuration ID.
jndiName	string		JNDI name
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

### baseContext

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
id	string		A unique configuration ID.
jndiName	string		JNDI name
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**baseContext > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

com.ibm.ws.context.service-factory

**baseContext > classloaderContext**

Classloader context propagation configuration.

false

**baseContext > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**baseContext > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**baseContext > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**baseContext > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"><li>• Propagate</li><li>• PropagateOrNew</li><li>• New</li></ul>	Propagate	Indicates how the WLM context should be handled for non-Daemon work.  <b>Propagate</b> Use the same WLM Context (if one exists).  <b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists.  <b>New</b> Always create a new WLM context.

**classloaderContext**

Classloader context propagation configuration.

false

**jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

### syncToOSThreadContext

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

### zosWLMContext

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"><li>• Propagate</li><li>• PropagateOrNew</li><li>• New</li></ul>	Propagate	Indicates how the WLM context should be handled for non-Daemon work. <b>Propagate</b> Use the same WLM Context (if one exists). <b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists. <b>New</b> Always create a new WLM context.

## Cross-Origin Resource Sharing (cors)

Refers to a cross-domain security procedure for JavaScript-based clients.

Attribute name	Data type	Default value	Description
allowCredentials	boolean		A boolean that indicates if the user credentials can be included in the request.
allowedHeaders	string		A comma-separated list of HTTP headers allowed to be used by the origin domain when making requests to the configured domain.

Attribute name	Data type	Default value	Description
allowedMethods	string		A comma-separated list of HTTP methods allowed to be used by the origin domain when making requests to the configured domain.
allowedOrigins	string	null	A comma-separated list of origins allowed to access the configured domain.
domain	string		The domain name represents the URL being setup with these CORS settings.
exposeHeaders	string		A comma-separated list of HTTP headers that are safe to expose to the calling API.
id	string		A unique configuration ID.
maxAge	long		A long that indicates how many seconds a response to a preflight request can be cached in the browser.

## CouchDB (couchdb)

Configuration for a CouchDB Connector.

- library
  - file
  - fileset
  - folder

Attribute name	Data type	Default value	Description
caching	boolean	true	Allows loading documents from http client's cache if it exists and the revision has not changed since last access.
cleanupIdleConnections	boolean	true	Closes connections automatically when they are considered idle.
connectionTimeout	A period of time with millisecond precision	30s	The timeout to establish a connection. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
enableSSL	boolean	false	Enables SSL when connecting to CouchDB.
host	string		Host name for the CouchDB server.
id	string		A unique configuration ID.
jndiName	string		JNDI name for a CouchDB instance.
libraryRef	A reference to top level library element (string).		Specifies a library that contains the CouchDB Client library and its dependencies.
maxCacheEntries	int Minimum: 0	1000	The maximum number of cache entries for the http client.
maxConnections	int	20	The maximum number of concurrent connections to the host.
maxObjectSizeBytes	int Minimum: 0	8192	Sets the maximum size for a stored document.
password	Reversably encoded password (string)		Password corresponding to your Couchdb User ID.
port	int	5984	Port number for the CouchDB server.
relaxedSSLSettings	boolean	false	Enables relaxed SSL settings which allows the trust manager to accept any host and certificate.
socketTimeout	A period of time with millisecond precision	1m	The duration to wait for a response. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
url	string		URL for the CouchDB server, which includes the host and port.
useExpectContinue	boolean	true	Use Expect Continue header in request when making requests to CouchDB.
username	string		The CouchDB User ID used to log-in and access your DBs.

## library

Specifies a library that contains the CouchDB Client library and its dependencies.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

### library > file

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

### library > fileset

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

### library > folder

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

## Custom LDAP Filters (customLdapFilterProperties)

Specifies the list of default Custom LDAP filters.

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)(!(objectclass=groupOfNames)(!(objectclass=groupOfUniqueNames)(objectclass=groupOfUniqueNames)))	An LDAP filter clause for groups.
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	ibm-allGroups:member;ibm-allGroups:uniqueMember;groupOfNames:member;groupOfUniqueNames:member	An LDAP filter that maps group memberships.
id	string		A unique configuration ID.
userFilter	string	(&(uid=%v)(objectclass=ePerson))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	*:uid	An LDAP filter that maps the name of a user to an LDAP entry.

## Data Source (dataSource)

Defines a data source configuration.

- recoveryAuthData

Attribute name	Data type	Default value	Description
beginTranForResultSetScrolling	boolean	true	Attempt transaction enlistment when result set scrolling interfaces are used.
beginTranForVendorAPIs	boolean	true	Attempt transaction enlistment when vendor interfaces are used.
commitOrRollbackOnCleanup	<ul style="list-style-type: none"> <li>• commit</li> <li>• rollback</li> </ul>		<p>Determines how to clean up connections that might be in a database unit of work (AutoCommit=false) when the connection is closed or returned to the pool.</p> <p><b>commit</b> Clean up the connection by committing.</p> <p><b>rollback</b> Clean up the connection by rolling back.</p>

Attribute name	Data type	Default value	Description
connectionManagerRef	A reference to top level connectionManager element (string).		Connection manager for a data source.
connectionSharing	<ul style="list-style-type: none"> <li>MatchOriginalRequest</li> <li>MatchCurrentState</li> </ul>	MatchOriginalRequest	<p>Specifies how connections are matched for sharing.</p> <p><b>MatchOriginalRequest</b> When sharing connections, match based on the original connection request.</p> <p><b>MatchCurrentState</b> When sharing connections, match based on the current state of the connection.</p>
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.
enableConnectionCasting	boolean	false	Indicates that connections obtained from the data source should be castable to interface classes that the JDBC vendor connection implementation implements. Enabling this option incurs additional overhead on each getConnection operation. If vendor JDBC interfaces are needed less frequently, it might be more efficient to leave this option disabled and use Connection.unwrap(interface) only where it is needed.
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
isolationLevel	<ul style="list-style-type: none"> <li>• TRANSACTION_REPEATABLE_READ</li> <li>• TRANSACTION_READ_COMMITTED</li> <li>• TRANSACTION_SERIALIZABLE</li> <li>• TRANSACTION_READ_UNCOMMITTED</li> <li>• TRANSACTION_SNAPSHOT</li> </ul>		<p>Default transaction isolation level.</p> <p><b>TRANSACTION_REPEATABLE_READ</b> Dirty reads and non-repeatable reads are prevented; phantom reads can occur.</p> <p><b>TRANSACTION_READ_COMMITTED</b> Dirty reads are prevented; non-repeatable reads and phantom reads can occur.</p> <p><b>TRANSACTION_SERIALIZABLE</b> Dirty reads, non-repeatable reads and phantom reads are prevented.</p> <p><b>TRANSACTION_READ_UNCOMMITTED</b> Dirty reads, non-repeatable reads and phantom reads can occur.</p> <p><b>TRANSACTION_SNAPSHOT</b> Snapshot isolation for Microsoft SQL Server JDBC Driver and DataDirect Connect for JDBC driver.</p>
jaasLoginContextEntryRef	A reference to top level jaasLoginContextEntry element (string).		JAAS login context entry for authentication.
jdbcDriverRef	A reference to top level jdbcDriver element (string).		JDBC driver for a data source.
jndiName	string		JNDI name for a data source.

Attribute name	Data type	Default value	Description
queryTimeout	A period of time with second precision		Default query timeout for SQL statements. In a JTA transaction, syncQueryTimeoutWithTransactionTimeout can override this default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
recoveryAuthDataRef	A reference to top level authData element (string).		Authentication data for transaction recovery.
statementCacheSize	int Minimum: 0	10	Maximum number of cached statements per connection.
supplementalJDBCTrace	boolean		Supplements the JDBC driver trace that is logged when JDBC driver trace is enabled in bootstrap.properties. JDBC driver trace specifications include: com.ibm.ws.database.logwriter, com.ibm.ws.db2.logwriter, com.ibm.ws.derby.logwriter, com.ibm.ws.informix.logwriter, com.ibm.ws.oracle.logwriter, com.ibm.ws.sqlserver.logwriter, com.ibm.ws.sybase.logwriter
syncQueryTimeoutWithTransactionTimeout	boolean	false	Use the time remaining (if any) in a JTA transaction as the default query timeout for SQL statements.
transactional	boolean	true	Enable participation in transactions that are managed by the application server.
type	<ul style="list-style-type: none"> <li>javax.sql.DataSource</li> <li>javax.sql.XADataSource</li> <li>javax.sql.ConnectionPoolDataSource</li> </ul>		Type of data source. <b>javax.sql.DataSource</b> javax.sql.DataSource <b>javax.sql.XADataSource</b> javax.sql.XADataSource <b>javax.sql.ConnectionPoolDataSource</b> javax.sql.ConnectionPoolDataSource

### connectionManager

Connection manager for a data source.

false

Attribute name	Data type	Default value	Description
agedTimeout	A period of time with second precision	-1	Amount of time before a physical connection can be discarded by pool maintenance. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
connectionTimeout	A period of time with second precision	30s	Amount of time after which a connection request times out. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxConnectionsPerThread	int Minimum: 0		Limits the number of open connections on each thread.
maxIdleTime	A period of time with second precision	30m	Amount of time after which an unused or idle connection can be discarded during pool maintenance, if doing so does not reduce the pool below the minimum size. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxPoolSize	int Minimum: 0	50	Maximum number of physical connections for a pool. A value of 0 means unlimited.

Attribute name	Data type	Default value	Description
minPoolSize	int Minimum: 0		Minimum number of physical connections to maintain in the pool. The pool is not pre-populated. Aged timeout can override the minimum.
numConnectionsPerThreadLocal	int Minimum: 0		Caches the specified number of connections for each thread.
purgePolicy	<ul style="list-style-type: none"> <li>• ValidateAllConnections</li> <li>• FailingConnectionOnly</li> <li>• EntirePool</li> </ul>	EntirePool	<p>Specifies which connections to destroy when a stale connection is detected in a pool.</p> <p><b>ValidateAllConnections</b> When a stale connection is detected, connections are tested and those found to be bad are closed.</p> <p><b>FailingConnectionOnly</b> When a stale connection is detected, only the connection which was found to be bad is closed.</p> <p><b>EntirePool</b> When a stale connection is detected, all connections in the pool are marked stale, and when no longer in use, are closed.</p>
reapTime	A period of time with second precision	3m	Amount of time between runs of the pool maintenance thread. A value of -1 disables pool maintenance. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

**containerAuthData**

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

### jaasLoginContextEntry

JAAS login context entry for authentication.

false

Attribute name	Data type	Default value	Description
loginModuleRef	List of references to top level jaasLoginModule elements (comma-separated string).	hashtable,userNameAndPassword,certificate,clientId	Word, certificate, clientId of a JAAS login module.
name	string		Name of a JAAS configuration entry.

### jdbcDriver

JDBC driver for a data source.

false

Attribute name	Data type	Default value	Description
javax.sql.ConnectionPoolDataSource	string		JDBC driver implementation of javax.sql.ConnectionPoolDataSource.
javax.sql.DataSource	string		JDBC driver implementation of javax.sql.DataSource.
javax.sql.XADataSource	string		JDBC driver implementation of javax.sql.XADataSource.
libraryRef	A reference to top level library element (string).		Identifies JDBC driver JARs and native files.

### jdbcDriver > library

Identifies JDBC driver JARs and native files.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

**jdbcDriver > library > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**jdbcDriver > library > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**jdbcDriver > library > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**properties**

List of JDBC vendor properties for the data source. For example, `databaseName="dbname"`  
`serverName="localhost"` `portNumber="50000"`.

false

Attribute name	Data type	Default value	Description
URL	string		URL for connecting to the database.
databaseName	string		JDBC driver property: databaseName.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
serverName	string		Server where the database is running.

Attribute name	Data type	Default value	Description
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

### properties.datadirect.sqlserver

Data source properties for the DataDirect Connect for JDBC driver for Microsoft SQL Server.

false

Attribute name	Data type	Default value	Description
JDBCBehavior	<ul style="list-style-type: none"> <li>• 1</li> <li>• 0</li> </ul>	0	JDBC driver property: JDBCBehavior. Values are: 0 (JDBC 4.0) or 1 (JDBC 3.0).  <b>1</b> JDBC 3.0 <b>0</b> JDBC 4.0
XATransactionGroup	string		JDBC driver property: XATransactionGroup.
XMLDescribeType	<ul style="list-style-type: none"> <li>• longvarbinary</li> <li>• longvarchar</li> </ul>		JDBC driver property: XMLDescribeType.  <b>longvarbinary</b> longvarbinary  <b>longvarchar</b> longvarchar
accountingInfo	string		JDBC driver property: accountingInfo.
alternateServers	string		JDBC driver property: alternateServers.
alwaysReportTriggerResults	boolean		JDBC driver property: alwaysReportTriggerResults.
applicationName	string		JDBC driver property: applicationName.
authenticationMethod	<ul style="list-style-type: none"> <li>• ntlm</li> <li>• userIdPassword</li> <li>• kerberos</li> <li>• auto</li> </ul>		JDBC driver property: authenticationMethod.  <b>ntlm</b> ntlm <b>userIdPassword</b> userIdPassword  <b>kerberos</b> kerberos  <b>auto</b> auto
bulkLoadBatchSize	long		JDBC driver property: bulkLoadBatchSize.
bulkLoadOptions	long		JDBC driver property: bulkLoadOptions.
clientHostName	string		JDBC driver property: clientHostName.
clientUser	string		JDBC driver property: clientUser.

Attribute name	Data type	Default value	Description
codePageOverride	string		JDBC driver property: codePageOverride.
connectionRetryCount	int		JDBC driver property: connectionRetryCount.
connectionRetryDelay	A period of time with second precision		JDBC driver property: connectionRetryDelay. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
convertNull	int		JDBC driver property: convertNull.
databaseName	string		JDBC driver property: databaseName.
dateTimeInputParameterType	<ul style="list-style-type: none"> <li>• dateTime</li> <li>• dateTimeOffset</li> <li>• auto</li> </ul>		JDBC driver property: dateTimeInputParameterType.  <b>dateTime</b> dateTime <b>dateTimeOffset</b> dateTimeOffset <b>auto</b> auto
dateTimeOutputParameterType	<ul style="list-style-type: none"> <li>• dateTime</li> <li>• dateTimeOffset</li> <li>• auto</li> </ul>		JDBC driver property: dateTimeOutputParameterType.  <b>dateTime</b> dateTime <b>dateTimeOffset</b> dateTimeOffset <b>auto</b> auto
describeInputParameters	<ul style="list-style-type: none"> <li>• describeIfString</li> <li>• noDescribe</li> <li>• describeIfDateTime</li> <li>• describeAll</li> </ul>		JDBC driver property: describeInputParameters.  <b>describeIfString</b> describeIfString <b>noDescribe</b> noDescribe <b>describeIfDateTime</b> describeIfDateTime <b>describeAll</b> describeAll

Attribute name	Data type	Default value	Description
describeOutputParameters	<ul style="list-style-type: none"> <li>describeIfString</li> <li>noDescribe</li> <li>describeIfDateTime</li> <li>describeAll</li> </ul>		JDBC driver property: describeOutputParameters. <b>describeIfString</b> describeIfString <b>noDescribe</b> noDescribe <b>describeIfDateTime</b> describeIfDateTime <b>describeAll</b> describeAll
enableBulkLoad	boolean		JDBC driver property: enableBulkLoad.
enableCancelTimeout	boolean		JDBC driver property: enableCancelTimeout.
encryptionMethod	<ul style="list-style-type: none"> <li>loginSSL</li> <li>requestSSL</li> <li>SSL</li> <li>noEncryption</li> </ul>		JDBC driver property: encryptionMethod. <b>loginSSL</b> loginSSL <b>requestSSL</b> requestSSL <b>SSL</b> SSL <b>noEncryption</b> noEncryption
failoverGranularity	<ul style="list-style-type: none"> <li>disableIntegrityCheck</li> <li>atomicWithRepositioning</li> <li>nonAtomic</li> <li>atomic</li> </ul>		JDBC driver property: failoverGranularity. <b>disableIntegrityCheck</b> disableIntegrityCheck <b>atomicWithRepositioning</b> atomicWithRepositioning <b>nonAtomic</b> nonAtomic <b>atomic</b> atomic
failoverMode	<ul style="list-style-type: none"> <li>connect</li> <li>select</li> <li>extended</li> </ul>		JDBC driver property: failoverMode. <b>connect</b> connect <b>select</b> select <b>extended</b> extended
failoverPreconnect	boolean		JDBC driver property: failoverPreconnect.
hostNameInCertificate	string		JDBC driver property: hostNameInCertificate.
initializationString	string		JDBC driver property: initializationString.
insensitiveResultSetBufferSize	int		JDBC driver property: insensitiveResultSetBufferSize.

Attribute name	Data type	Default value	Description
javaDoubleToString	boolean		JDBC driver property: javaDoubleToString.
loadBalancing	boolean		JDBC driver property: loadBalancing.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
longDataCacheSize	int Minimum: -1		JDBC driver property: longDataCacheSize.
netAddress	string		JDBC driver property: netAddress.
packetSize	int Minimum: -1 Maximum: 128		JDBC driver property: packetSize.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
queryTimeout	A period of time with second precision		JDBC driver property: queryTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
resultsetMetaDataOptions	int		JDBC driver property: resultSetMetaDataOptions.
selectMethod	<ul style="list-style-type: none"> <li>• direct</li> <li>• cursor</li> </ul>		JDBC driver property: selectMethod.  <b>direct</b> direct <b>cursor</b> cursor
serverName	string	localhost	Server where the database is running.
snapshotSerializable	boolean		JDBC driver property: snapshotSerializable.

Attribute name	Data type	Default value	Description
spyAttributes	string		JDBC driver property: spyAttributes.
stringInputParameterType	<ul style="list-style-type: none"> <li>varchar</li> <li>nvarchar</li> </ul>	varchar	JDBC driver property: stringInputParameterType. <b>varchar</b> varchar <b>nvarchar</b> nvarchar
stringOutputParameterType	<ul style="list-style-type: none"> <li>varchar</li> <li>nvarchar</li> </ul>	varchar	JDBC driver property: stringOutputParameterType. <b>varchar</b> varchar <b>nvarchar</b> nvarchar
suppressConnectionWarnings	boolean		JDBC driver property: suppressConnectionWarnings.
transactionMode	<ul style="list-style-type: none"> <li>explicit</li> <li>implicit</li> </ul>		JDBC driver property: transactionMode. <b>explicit</b> explicit <b>implicit</b> implicit
truncateFractionalSeconds	boolean		JDBC driver property: truncateFractionalSeconds.
trustStore	string		JDBC driver property: trustStore.
trustStorePassword	Reversably encoded password (string)		JDBC driver property: trustStorePassword.
useServerSideUpdatableCursors	boolean		JDBC driver property: useServerSideUpdatableCursors.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
validateServerCertificate	boolean		JDBC driver property: validateServerCertificate.

### properties.db2.i.native

Data source properties for the IBM DB2 for i Native JDBC driver.

false

Attribute name	Data type	Default value	Description
access	<ul style="list-style-type: none"> <li>read only</li> <li>all</li> <li>read call</li> </ul>	all	JDBC driver property: access. <b>read only</b> read only <b>all</b> all <b>read call</b> read call

Attribute name	Data type	Default value	Description
autoCommit	boolean	true	JDBC driver property: autoCommit.
batchStyle	<ul style="list-style-type: none"> <li>• 2.1</li> <li>• 2.0</li> </ul>	2.0	JDBC driver property: batchStyle. <b>2.1</b> 2.1 <b>2.0</b> 2.0
behaviorOverride	int		JDBC driver property: behaviorOverride.
blockSize	<ul style="list-style-type: none"> <li>• 512</li> <li>• 128</li> <li>• 0</li> <li>• 32</li> <li>• 64</li> <li>• 16</li> <li>• 8</li> <li>• 256</li> </ul>	32	JDBC driver property: blockSize. <b>512</b> 512 <b>128</b> 128 <b>0</b> 0 <b>32</b> 32 <b>64</b> 64 <b>16</b> 16 <b>8</b> 8 <b>256</b> 256
cursorHold	boolean	false	JDBC driver property: cursorHold.
cursorSensitivity	<ul style="list-style-type: none"> <li>• asensitive</li> <li>• sensitive</li> </ul>	asensitive	JDBC driver property: cursorSensitivity. Values are: 0 (TYPE_SCROLL_SENSITIVE_STATIC), 1 (TYPE_SCROLL_SENSITIVE_DYNAMIC), 2 (TYPE_SCROLL_ASENSITIVE). <b>asensitive</b> asensitive <b>sensitive</b> sensitive
dataTruncation	string	true	JDBC driver property: dataTruncation.
databaseName	string	*LOCAL	JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
dateFormat	<ul style="list-style-type: none"> <li>• dmy</li> <li>• iso</li> <li>• eur</li> <li>• ymd</li> <li>• julian</li> <li>• jis</li> <li>• usa</li> <li>• mdy</li> </ul>		JDBC driver property: dateFormat. <b>dmy</b> dmy <b>iso</b> iso <b>eur</b> eur <b>ymd</b> ymd <b>julian</b> julian <b>jis</b> jis <b>usa</b> usa <b>mdy</b> mdy
dateSeparator	<ul style="list-style-type: none"> <li>• \,</li> <li>• b</li> <li>• .</li> <li>• /</li> <li>• -</li> </ul>		JDBC driver property: dateSeparator. <b>\,</b> The comma character (,). <b>b</b> The character b <b>.</b> The period character (.). <b>/</b> The forward slash character (/). <b>-</b> The dash character (-).
decimalSeparator	<ul style="list-style-type: none"> <li>• \,</li> <li>• .</li> </ul>		JDBC driver property: decimalSeparator. <b>\,</b> The comma character (,). <b>.</b> The period character (.).
directMap	boolean	true	JDBC driver property: directMap.
doEscapeProcessing	boolean	true	JDBC driver property: doEscapeProcessing.
fullErrors	boolean		JDBC driver property: fullErrors.
libraries	string		JDBC driver property: libraries.
lobThreshold	int Maximum: 500000	0	JDBC driver property: lobThreshold.

Attribute name	Data type	Default value	Description
lockTimeout	A period of time with second precision	0	JDBC driver property: lockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maximumPrecision	<ul style="list-style-type: none"> <li>• 31</li> <li>• 63</li> </ul>	31	JDBC driver property: maximumPrecision.  <b>31</b> 31 <b>63</b> 63
maximumScale	int Minimum: 0 Maximum: 63	31	JDBC driver property: maximumScale.
minimumDivideScale	int Minimum: 0 Maximum: 9	0	JDBC driver property: minimumDivideScale.
networkProtocol	int		JDBC driver property: networkProtocol.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
prefetch	boolean	true	JDBC driver property: prefetch.
queryOptimizeGoal	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>	2	JDBC driver property: queryOptimizeGoal. Values are: 1 (*FIRSTIO) or 2 (*ALLIO).  <b>2</b> *ALLIO <b>1</b> *FIRSTIO

Attribute name	Data type	Default value	Description
reuseObjects	boolean	true	JDBC driver property: reuseObjects.
serverName	string		Server where the database is running.
serverTraceCategories	int	0	JDBC driver property: serverTraceCategories.
systemNaming	boolean	false	JDBC driver property: systemNaming.
timeFormat	<ul style="list-style-type: none"> <li>• iso</li> <li>• eur</li> <li>• jis</li> <li>• usa</li> <li>• hms</li> </ul>		JDBC driver property: timeFormat.  <b>iso</b> iso <b>eur</b> eur <b>jis</b> jis <b>usa</b> usa <b>hms</b> hms
timeSeparator	<ul style="list-style-type: none"> <li>• \,</li> <li>• b</li> <li>• :</li> <li>• .</li> </ul>		JDBC driver property: timeSeparator.  \,    The comma character (,). <b>b</b> The character b :    The colon character (:). .    The period character (.).
trace	boolean		JDBC driver property: trace.
transactionTimeout	A period of time with second precision	0	JDBC driver property: transactionTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
translateBinary	boolean	false	JDBC driver property: translateBinary.
translateHex	<ul style="list-style-type: none"> <li>• binary</li> <li>• character</li> </ul>	character	JDBC driver property: translateHex.  <b>binary</b> binary <b>character</b> character
useBlockInsert	boolean	false	JDBC driver property: useBlockInsert.

Attribute name	Data type	Default value	Description
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

### properties.db2.i.toolbox

Data source properties for the IBM DB2 for i Toolbox JDBC driver.

false

Attribute name	Data type	Default value	Description
access	<ul style="list-style-type: none"> <li>• read only</li> <li>• all</li> <li>• read call</li> </ul>	all	JDBC driver property: access. <b>read only</b> read only <b>all</b> all <b>read call</b> read call
behaviorOverride	int		JDBC driver property: behaviorOverride.
bidImplicitReordering	boolean	true	JDBC driver property: bidImplicitReordering.
bidNumericOrdering	boolean	false	JDBC driver property: bidNumericOrdering.
bidStringType	int		JDBC driver property: bidStringType.
bigDecimal	boolean	true	JDBC driver property: bigDecimal.
blockCriteria	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> <li>• 0</li> </ul>	2	JDBC driver property: blockCriteria. Values are: 0 (no record blocking), 1 (block if FOR FETCH ONLY is specified), 2 (block if FOR UPDATE is specified). <b>2</b> 2 <b>1</b> 1 <b>0</b> 0

Attribute name	Data type	Default value	Description
blockSize	<ul style="list-style-type: none"> <li>• 512</li> <li>• 128</li> <li>• 0</li> <li>• 32</li> <li>• 64</li> <li>• 16</li> <li>• 8</li> <li>• 256</li> </ul>	32	JDBC driver property: blockSize. <b>512</b> 512 <b>128</b> 128 <b>0</b> 0 <b>32</b> 32 <b>64</b> 64 <b>16</b> 16 <b>8</b> 8 <b>256</b> 256
cursorHold	boolean	false	JDBC driver property: cursorHold.
cursorSensitivity	<ul style="list-style-type: none"> <li>• asensitive</li> <li>• sensitive</li> <li>• insensitive</li> </ul>	asensitive	JDBC driver property: cursorSensitivity. extendedMetaData	boolean	false	JDBC driver property: extendedMetaData.
fullOpen	boolean	false	JDBC driver property: fullOpen.
holdInputLocators	boolean	true	JDBC driver property: holdInputLocators.
holdStatements	boolean	false	JDBC driver property: holdStatements.
isolationLevelSwitchingSupport	boolean	false	JDBC driver property: isolationLevelSwitchingSupport.
keepAlive	boolean		JDBC driver property: keepAlive.
lazyClose	boolean	false	JDBC driver property: lazyClose.
libraries	string		JDBC driver property: libraries.

Attribute name	Data type	Default value	Description
lobThreshold	int Minimum: 0 Maximum: 16777216	0	JDBC driver property: lobThreshold.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maximumPrecision	<ul style="list-style-type: none"> <li>• 31</li> <li>• 63</li> </ul>	31	JDBC driver property: maximumPrecision.  <b>31</b> 31 <b>63</b> 64
maximumScale	int Minimum: 0 Maximum: 63	31	JDBC driver property: maximumScale.
metaDataSource	int Minimum: 0 Maximum: 1	1	JDBC driver property: metaDataSource.
minimumDivideScale	int Minimum: 0 Maximum: 9	0	JDBC driver property: minimumDivideScale.
naming	<ul style="list-style-type: none"> <li>• system</li> <li>• sql</li> </ul>	sql	JDBC driver property: naming.  <b>system</b> system <b>sql</b> sql
package	string		JDBC driver property: package.
packageAdd	boolean	true	JDBC driver property: packageAdd.
packageCCSID	<ul style="list-style-type: none"> <li>• 13488</li> <li>• 1200</li> </ul>	13488	JDBC driver property: packageCCSID. Values are: 1200 (UCS-2) or 13488 (UTF-16).  <b>13488</b> 13488 (UTF-16) <b>1200</b> 1200 (UCS-2)
packageCache	boolean	false	JDBC driver property: packageCache.

Attribute name	Data type	Default value	Description
packageCriteria	<ul style="list-style-type: none"> <li>default</li> <li>select</li> </ul>	default	JDBC driver property: packageCriteria. <b>default</b> default <b>select</b> select
packageError	<ul style="list-style-type: none"> <li>exception</li> <li>none</li> <li>warning</li> </ul>	warning	JDBC driver property: packageError. <b>exception</b> exception <b>none</b> none <b>warning</b> warning
packageLibrary	string	QGPL	JDBC driver property: packageLibrary.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
prefetch	boolean	true	JDBC driver property: prefetch.
prompt	boolean	false	JDBC driver property: prompt.
proxyServer	string		JDBC driver property: proxyServer.
qaqqiniLibrary	string		JDBC driver property: qaqqiniLibrary.
queryOptimizeGoal	int Minimum: 0 Maximum: 2	0	JDBC driver property: queryOptimizeGoal. Values are: 1 (*FIRSTIO) or 2 (*ALLIO).
receiveBufferSize	int Minimum: 1		JDBC driver property: receiveBufferSize.
remarks	<ul style="list-style-type: none"> <li>system</li> <li>sql</li> </ul>	system	JDBC driver property: remarks. <b>system</b> system <b>sql</b> sql
rollbackCursorHold	boolean	false	JDBC driver property: rollbackCursorHold.
savePasswordWhenSerialized	boolean	false	JDBC driver property: savePasswordWhenSerialized.
secondaryUrl	string		JDBC driver property: secondaryUrl.
secure	boolean	false	JDBC driver property: secure.
sendBufferSize	int Minimum: 1		JDBC driver property: sendBufferSize.

Attribute name	Data type	Default value	Description
serverName	string		Server where the database is running.
serverTraceCategories	int	0	JDBC driver property: serverTraceCategories.
soLinger	A period of time with second precision		JDBC driver property: soLinger. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
soTimeout	A period of time with millisecond precision		JDBC driver property: soTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
sort	<ul style="list-style-type: none"> <li>• hex</li> <li>• table</li> <li>• language</li> </ul>	hex	JDBC driver property: sort. <b>hex</b> hex <b>table</b> table <b>language</b> language
sortLanguage	string		JDBC driver property: sortLanguage.
sortTable	string		JDBC driver property: sortTable.
sortWeight	<ul style="list-style-type: none"> <li>• unqiue</li> <li>• shared</li> </ul>		JDBC driver property: sortWeight. <b>unqiue</b> unique <b>shared</b> shared
tcpNoDelay	boolean		JDBC driver property: tcpNoDelay.
threadUsed	boolean	true	JDBC driver property: threadUsed.

Attribute name	Data type	Default value	Description
timeFormat	<ul style="list-style-type: none"> <li>• iso</li> <li>• eur</li> <li>• jis</li> <li>• usa</li> <li>• hms</li> </ul>		JDBC driver property: timeFormat. <b>iso</b> iso <b>eur</b> eur <b>jis</b> jis <b>usa</b> usa <b>hms</b> hms

toolboxTrace	<ul style="list-style-type: none"> <li>• diagnostic</li> <li>• information</li> <li>• conversion</li> <li>• error</li> <li>• thread</li> <li>• proxy</li> <li>• none</li> <li>• datastream</li> <li>• pcml</li> <li>• all</li> <li>• jdbc</li> <li>• warning</li> </ul>		JDBC driver property: toolboxTrace. <b>diagnostic</b> diagnostic <b>information</b> information <b>conversion</b> conversion <b>error</b> error <b>thread</b> thread <b>proxy</b> proxy <b>none</b> none <b>datastream</b> datastream <b>pcml</b> pcml <b>all</b> all <b>jdbc</b> jdbc <b>warning</b> warning
trace	boolean		JDBC driver property: trace.
translateBinary	boolean	false	JDBC driver property: translateBinary.
translateBoolean	boolean	true	JDBC driver property: translateBoolean.

Attribute name	Data type	Default value	Description
translateHex	<ul style="list-style-type: none"> <li>binary</li> <li>character</li> </ul>	character	JDBC driver property: translateHex.  <b>binary</b> binary <b>character</b> character
trueAutoCommit	boolean	false	JDBC driver property: trueAutoCommit.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
xaLooselyCoupledSupport	int  Minimum: 0  Maximum: 1	0	JDBC driver property: xaLooselyCoupledSupport.

### properties.db2.jcc

Data source properties for the IBM Data Server Driver for JDBC and SQLJ for DB2.

false

Attribute name	Data type	Default value	Description
activateDatabase	int		JDBC driver property: activateDatabase.
alternateGroupDatabaseName	string		JDBC driver property: alternateGroupDatabaseName.
alternateGroupPortNumber	string		JDBC driver property: alternateGroupPortNumber.
alternateGroupServerName	string		JDBC driver property: alternateGroupServerName.
blockingReadConnectionTimeout	A period of time with second precision		JDBC driver property: blockingReadConnectionTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
clientAccountingInformation	string		JDBC driver property: clientAccountingInformation.
clientApplicationInformation	string		JDBC driver property: clientApplicationInformation.
clientRerouteAlternatePortNumber	string		JDBC driver property: clientRerouteAlternatePortNumber.
clientRerouteAlternateServerName	string		JDBC driver property: clientRerouteAlternateServerName.

Attribute name	Data type	Default value	Description
clientUser	string		JDBC driver property: clientUser.
clientWorkstation	string		JDBC driver property: clientWorkstation.
connectionCloseWithInFlightTransaction	Transaction • 1		JDBC driver property: connectionCloseWithInFlightTransaction. 2 CONNECTION_CLOSE_WITH_ROLLBACK 1 CONNECTION_CLOSE_WITH_EXCEPTION
currentAlternateGroupEntry	int		JDBC driver property: currentAlternateGroupEntry.
currentFunctionPath	string		JDBC driver property: currentFunctionPath.
currentLocaleLcCtype	string		JDBC driver property: currentLocaleLcCtype.
currentLockTimeout	A period of time with second precision		JDBC driver property: currentLockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
currentPackagePath	string		JDBC driver property: currentPackagePath.
currentPackageSet	string		JDBC driver property: currentPackageSet.
currentSQLID	string		JDBC driver property: currentSQLID.
currentSchema	string		JDBC driver property: currentSchema.
cursorSensitivity	• 2 • 1 • 0		JDBC driver property: cursorSensitivity. Values are: 0 (TYPE_SCROLL_SENSITIVE_STATIC), 1 (TYPE_SCROLL_SENSITIVE_DYNAMIC), 2 (TYPE_SCROLL_ASENSITIVE). 2 TYPE_SCROLL_ASENSITIVE 1 TYPE_SCROLL_SENSITIVE_DYNAMIC 0 TYPE_SCROLL_SENSITIVE_STATIC
databaseName	string		JDBC driver property: databaseName.
deferPrepares	boolean	true	JDBC driver property: deferPrepares.

Attribute name	Data type	Default value	Description
driverType	<ul style="list-style-type: none"> <li>2</li> <li>4</li> </ul>	4	JDBC driver property: driverType. 2 Type 2 JDBC driver. 4 Type 4 JDBC driver.
enableAlternateGroupSeamlessACR	boolean		JDBC driver property: enableAlternateGroupSeamlessACR.
enableClientAffinitiesList	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableClientAffinitiesList. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES

user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

### properties.informix

Data source properties for the Informix JDBC driver.

false

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
ifxCLIENT_LOCALE	string		JDBC driver property: ifxCLIENT_LOCALE.
ifxCPMAgeLimit	A period of time with second precision		JDBC driver property: ifxCPMAgeLimit. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxCPMInitPoolSize	int		JDBC driver property: ifxCPMInitPoolSize.
ifxCPMMaxConnections	int		JDBC driver property: ifxCPMMaxConnections.
ifxCPMMaxPoolSize	int		JDBC driver property: ifxCPMMaxPoolSize.
ifxCPMMinAgeLimit	A period of time with second precision		JDBC driver property: ifxCPMMinAgeLimit. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxCPMMinPoolSize	int		JDBC driver property: ifxCPMMinPoolSize.
ifxCPMServiceInterval	A period of time with millisecond precision		JDBC driver property: ifxCPMServiceInterval. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
ifxDBANSIWARN	boolean		JDBC driver property: ifxDBANSIWARN.
ifxDBCENTURY	string		JDBC driver property: ifxDBCENTURY.
ifxDBDATE	string		JDBC driver property: ifxDBDATE.
ifxDBSPACETEMP	string		JDBC driver property: ifxDBSPACETEMP.

Attribute name	Data type	Default value	Description
ifxDBTEMP	string		JDBC driver property: ifxDBTEMP.
ifxDBTIME	string		JDBC driver property: ifxDBTIME.
ifxDBUPSPACE	string		JDBC driver property: ifxDBUPSPACE.
ifxDB_LOCALE	string		JDBC driver property: ifxDB_LOCALE.
ifxDELIMIDENT	boolean		JDBC driver property: ifxDELIMIDENT.
ifxENABLE_TYPE_CACHE	boolean		JDBC driver property: ifxENABLE_TYPE_CACHE.
ifxFET_BUF_SIZE	int		JDBC driver property: ifxFET_BUF_SIZE.
ifxGL_DATE	string		JDBC driver property: ifxGL_DATE.
ifxGL_DATETIME	string		JDBC driver property: ifxGL_DATETIME.
ifxIFXHOST	string	localhost	JDBC driver property: ifxIFXHOST.
ifxIFX_AUTOFREE	boolean		JDBC driver property: ifxIFX_AUTOFREE.
ifxIFX_DIRECTIVES	string		JDBC driver property: ifxIFX_DIRECTIVES.
ifxIFX_LOCK_MODE_WAIT	A period of time with second precision	2s	JDBC driver property: ifxIFX_LOCK_MODE_WAIT. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxIFX_SOC_TIMEOUT	A period of time with millisecond precision		JDBC driver property: ifxIFX_SOC_TIMEOUT. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
ifxIFX_USEPUT	boolean		JDBC driver property: ifxIFX_USEPUT.

Attribute name	Data type	Default value	Description
ifxIFX_USE_STRENC	boolean		JDBC driver property: ifxIFX_USE_STRENC.
ifxIFX_XASPEC	string	y	JDBC driver property: ifxIFX_XASPEC.
ifxINFORMIXCONRETRY	int		JDBC driver property: ifxINFORMIXCONRETRY.
ifxINFORMIXCONTIME	A period of time with second precision		JDBC driver property: ifxINFORMIXCONTIME. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxINFORMIXOPCACHE	string		JDBC driver property: ifxINFORMIXOPCACHE.
ifxINFORMIXSTACKSIZE	int		JDBC driver property: ifxINFORMIXSTACKSIZE.
ifxJDBCTEMP	string		JDBC driver property: ifxJDBCTEMP.
ifxLDAP_IFXBASE	string		JDBC driver property: ifxLDAP_IFXBASE.
ifxLDAP_PASSWD	string		JDBC driver property: ifxLDAP_PASSWD.
ifxLDAP_URL	string		JDBC driver property: ifxLDAP_URL.
ifxLDAP_USER	string		JDBC driver property: ifxLDAP_USER.
ifxLOBCACHE	int		JDBC driver property: ifxLOBCACHE.
ifxNEWCODESET	string		JDBC driver property: ifxNEWCODESET.
ifxNEWLOCALE	string		JDBC driver property: ifxNEWLOCALE.
ifxNODEFDAC	string		JDBC driver property: ifxNODEFDAC.
ifxOPTCOMPIND	string		JDBC driver property: ifxOPTCOMPIND.
ifxOPTOFC	string		JDBC driver property: ifxOPTOFC.
ifxOPT_GOAL	string		JDBC driver property: ifxOPT_GOAL.
ifxPATH	string		JDBC driver property: ifxPATH.
ifxPDQPRIORITY	string		JDBC driver property: ifxPDQPRIORITY.

Attribute name	Data type	Default value	Description
ifxPLCONFIG	string		JDBC driver property: ifxPLCONFIG.
ifxPLOAD_LO_PATH	string		JDBC driver property: ifxPLOAD_LO_PATH.
ifxPROTOCOLTRACE	int		JDBC driver property: ifxPROTOCOLTRACE.
ifxPROTOCOLTRACEFILE	string		JDBC driver property: ifxPROTOCOLTRACEFILE.
ifxPROXY	string		JDBC driver property: ifxPROXY.
ifxPSORT_DBTEMP	string		JDBC driver property: ifxPSORT_DBTEMP.
ifxPSORT_NPROCS	boolean		JDBC driver property: ifxPSORT_NPROCS.
ifxSECURITY	string		JDBC driver property: ifxSECURITY.
ifxSQLH_FILE	string		JDBC driver property: ifxSQLH_FILE.
ifxSQLH_LOC	string		JDBC driver property: ifxSQLH_LOC.
ifxSQLH_TYPE	string		JDBC driver property: ifxSQLH_TYPE.
ifxSSLCONNECTION	string		JDBC driver property: ifxSSLCONNECTION.
ifxSTMT_CACHE	string		JDBC driver property: ifxSTMT_CACHE.
ifxTRACE	int		JDBC driver property: ifxTRACE.
ifxTRACEFILE	string		JDBC driver property: ifxTRACEFILE.
ifxTRUSTED_CONTEXT	string		JDBC driver property: ifxTRUSTED_CONTEXT.
ifxUSEV5SERVER	boolean		JDBC driver property: ifxUSEV5SERVER.
ifxUSE_DTENV	boolean		JDBC driver property: ifxUSE_DTENV.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1526	Port on which to obtain database connections.
roleName	string		JDBC driver property: roleName.
serverName	string		Server where the database is running.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

### properties.informix.jcc

Data source properties for the IBM Data Server Driver for JDBC and SQLJ for Informix.

false

Attribute name	Data type	Default value	Description
DBANSIWARN	boolean		JDBC driver property: DBANSIWARN.
DBDATE	string		JDBC driver property: DBDATE.
DBPATH	string		JDBC driver property: DBPATH.
DBSPACETEMP	string		JDBC driver property: DBSPACETEMP.
DBTEMP	string		JDBC driver property: DBTEMP.
DBUPSPACE	string		JDBC driver property: DBUPSPACE.
DELIMIDENT	boolean		JDBC driver property: DELIMIDENT.
IFX_DIRECTIVES	<ul style="list-style-type: none"> <li>• ON</li> <li>• OFF</li> </ul>		JDBC driver property: IFX_DIRECTIVES. ON ON OFF OFF
IFX_EXTDIRECTIVES	<ul style="list-style-type: none"> <li>• ON</li> <li>• OFF</li> </ul>		JDBC driver property: IFX_EXTDIRECTIVES. ON ON OFF OFF
IFX_UPDDESC	string		JDBC driver property: IFX_UPDDESC.

Attribute name	Data type	Default value	Description
IFX_XASTDCOMPLIANCE_XAEND	<ul style="list-style-type: none"> <li>0</li> </ul>		JDBC driver property: IFX_XASTDCOMPLIANCE_XAEND. <b>1</b> 1 <b>0</b> 0
INFORMIXOPCACHE	string		JDBC driver property: INFORMIXOPCACHE.
INFORMIXSTACKSIZE	string		JDBC driver property: INFORMIXSTACKSIZE.
NODEFDAC	<ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul>		JDBC driver property: NODEFDAC. <b>yes</b> yes <b>no</b> no
OPTCOMPIND	<ul style="list-style-type: none"> <li>2</li> <li>1</li> <li>0</li> </ul>		JDBC driver property: OPTCOMPIND. <b>2</b> 2 <b>1</b> 1 <b>0</b> 0
OPTOFC	<ul style="list-style-type: none"> <li>1</li> <li>0</li> </ul>		JDBC driver property: OPTOFC. <b>1</b> 1 <b>0</b> 0
PDQPRIORITY	<ul style="list-style-type: none"> <li>HIGH</li> <li>LOW</li> <li>OFF</li> </ul>		JDBC driver property: PDQPRIORITY. <b>HIGH</b> HIGH <b>LOW</b> LOW <b>OFF</b> OFF
PSORT_DBTEMP	string		JDBC driver property: PSORT_DBTEMP.
PSORT_NPROCS	string Maximum: 10		JDBC driver property: PSORT_NPROCS.
STMT_CACHE	<ul style="list-style-type: none"> <li>1</li> <li>0</li> </ul>		JDBC driver property: STMT_CACHE. <b>1</b> 1 <b>0</b> 0
currentLockTimeout	A period of time with second precision	2s	JDBC driver property: currentLockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
deferPrepares	boolean		JDBC driver property: deferPrepares.
driverType	int	4	JDBC driver property: driverType.
enableNamedParameterMarkers	int		JDBC driver property: enableNamedParameterMarkers. Values are: 1 (YES) or 2 (NO).
enableSeamlessFailover	int		JDBC driver property: enableSeamlessFailover. Values are: 1 (YES) or 2 (NO).
enableSysplexWLB	boolean		JDBC driver property: enableSysplexWLB.
fetchSize	int		JDBC driver property: fetchSize.
fullyMaterializeLobData	boolean		JDBC driver property: fullyMaterializeLobData.
keepDynamic	int		JDBC driver property: keepDynamic.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1526	Port on which to obtain database connections.
progressiveStreaming	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		JDBC driver property: progressiveStreaming. Values are: 1 (YES) or 2 (NO).  2      NO 1      YES
queryDataSize	int  Minimum: 4096  Maximum: 10485760		JDBC driver property: queryDataSize.

Attribute name	Data type	Default value	Description
resultSetHoldability	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldability. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2 CLOSE_CURSORS_AT_COMMIT 1 HOLD_CURSORS_OVER_COMMIT</p>
resultSetHoldabilityForCatalogQueries	<ul style="list-style-type: none"> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldabilityForCatalogQueries. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2 CLOSE_CURSORS_AT_COMMIT 1 HOLD_CURSORS_OVER_COMMIT</p>
retrieveMessagesFromServerOnGetMessage	boolean	true	JDBC driver property: retrieveMessagesFromServerOnGetMessage.
securityMechanism	<ul style="list-style-type: none"> <li>• 3</li> <li>• 7</li> <li>• 4</li> <li>• 9</li> </ul>		<p>JDBC driver property: securityMechanism. Values are: 3 (CLEAR_TEXT_PASSWORD_SECURITY), 4 (USER_ONLY_SECURITY), 7 (ENCRYPTED_PASSWORD_SECURITY), 9 (ENCRYPTED_USER_AND_PASSWORD_SECURITY).</p> <p>3 CLEAR_TEXT_PASSWORD_SECURITY 7 ENCRYPTED_PASSWORD_SECURITY 4 USER_ONLY_SECURITY 9 ENCRYPTED_USER_AND_PASSWORD_SECURITY</p>
serverName	string	localhost	Server where the database is running.
traceDirectory	string		JDBC driver property: traceDirectory.
traceFile	string		JDBC driver property: traceFile.
traceFileAppend	boolean		JDBC driver property: traceFileAppend.

Attribute name	Data type	Default value	Description
traceLevel	int		Bitwise combination of the following constant values: TRACE_NONE=0, TRACE_CONNECTION_CALLS=1, TRACE_STATEMENT_CALLS=2, TRACE_RESULT_SET_CALLS=4, TRACE_DRIVER_CONFIGURATION=16, TRACE_CONNECTS=32, TRACE_DRDA_FLOWS=64, TRACE_RESULT_SET_META_DATA=128, TRACE_PARAMETER_META_DATA=256, TRACE_DIAGNOSTICS=512, TRACE_SQLJ=1024, TRACE_META_CALLS=8192, TRACE_DATASOURCE_CALLS=16384, TRACE_LARGE_OBJECT_CALLS=32768, TRACE_SYSTEM_MONITOR=131072, TRACE_TRACEPOINTS=262144, TRACE_ALL=-1.
useJDBC4ColumnNameAndLabelSemantics	boolean		JDBC driver property: useJDBC4ColumnNameAndLabelSemantics. Values are: 1 (YES) or 2 (NO).
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

### properties.microsoft.sqlserver

Data source properties for Microsoft SQL Server JDBC Driver.

false

Attribute name	Data type	Default value	Description
URL	string		URL for connecting to the database. Example: jdbc:sqlserver://localhost:1433;databaseName=myDB.
applicationIntent	<ul style="list-style-type: none"> <li>ReadOnly</li> <li>ReadWrite</li> </ul>		JDBC driver property: applicationIntent. <b>ReadOnly</b> ReadOnly <b>ReadWrite</b> ReadWrite
applicationName	string		JDBC driver property: applicationName.
authenticationScheme	<ul style="list-style-type: none"> <li>NativeAuthentication</li> <li>JavaKerberos</li> </ul>		JDBC driver property: authenticationScheme. <b>NativeAuthentication</b> NativeAuthentication <b>JavaKerberos</b> JavaKerberos

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
encrypt	boolean		JDBC driver property: encrypt.
failoverPartner	string		JDBC driver property: failoverPartner.
hostNameInCertificate	string		JDBC driver property: hostNameInCertificate.
instanceName	string		JDBC driver property: instanceName.
integratedSecurity	boolean		JDBC driver property: integratedSecurity.
lastUpdateCount	boolean		JDBC driver property: lastUpdateCount.
lockTimeout	A period of time with millisecond precision		JDBC driver property: lockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
multiSubnetFailover	boolean		JDBC driver property: multiSubnetFailover.
packetSize	int Minimum: 512 Maximum: 32767		JDBC driver property: packetSize.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.

Attribute name	Data type	Default value	Description
responseBuffering	<ul style="list-style-type: none"> <li>full</li> <li>adaptive</li> </ul>		JDBC driver property: responseBuffering. <b>full</b> full <b>adaptive</b> adaptive
selectMethod	<ul style="list-style-type: none"> <li>direct</li> <li>cursor</li> </ul>		JDBC driver property: selectMethod. <b>direct</b> direct <b>cursor</b> cursor
sendStringParametersAsUnicode	boolean	false	JDBC driver property: sendStringParametersAsUnicode.
sendTimeAsDatetime	boolean		JDBC driver property: sendTimeAsDatetime.
serverName	string	localhost	Server where the database is running.
trustServerCertificate	boolean		JDBC driver property: trustServerCertificate.
trustStore	string		JDBC driver property: trustStore.
trustStorePassword	Reversably encoded password (string)		JDBC driver property: trustStorePassword.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
workstationID	string		JDBC driver property: workstationID.
xopenStates	boolean		JDBC driver property: xopenStates.

### properties.oracle

Data source properties for Oracle JDBC driver.

false

Attribute name	Data type	Default value	Description
ONSConfiguration	string		JDBC driver property: ONSConfiguration.
TNSEntryName	string		JDBC driver property: TNSEntryName.
URL	string		URL for connecting to the database. Examples: jdbc:oracle:thin://localhost:1521/sample or jdbc:oracle:oci://localhost:1521/sample.
connectionProperties	string		JDBC driver property: connectionProperties.

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
driverType	<ul style="list-style-type: none"> <li>oci</li> <li>thin</li> </ul>	thin	JDBC driver property: driverType.  <b>oci</b> oci <b>thin</b> thin
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
networkProtocol	string		JDBC driver property: networkProtocol.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1521	Port on which to obtain database connections.
serverName	string	localhost	Server where the database is running.
serviceName	string		JDBC driver property: serviceName.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**properties.sybase**

Data source properties for Sybase JDBC driver.

false

Attribute name	Data type	Default value	Description
SERVER_INITIATED_TRANSACTIONS	<ul style="list-style-type: none"> <li>false</li> <li>true</li> </ul>	false	JDBC driver property: SERVER_INITIATED_TRANSACTIONS.  <b>false</b> false <b>true</b> true
connectionProperties	string	SELECT_OPENS_CURSOR=true	JDBC driver property: connectionProperties.
databaseName	string		JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
networkProtocol	<ul style="list-style-type: none"> <li>• SSL</li> <li>• socket</li> </ul>		JDBC driver property: networkProtocol.  <b>SSL</b> SSL <b>socket</b> socket
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	5000	Port on which to obtain database connections.
resourceManagerName	string		JDBC driver property: resourceManagerName.
serverName	string	localhost	Server where the database is running.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
version	int		JDBC driver property: version.

#### recoveryAuthData

Authentication data for transaction recovery.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

## Database Store (databaseStore)

Specifies a relational database as a persistent store for server features.

- authData
- dataSource
  - connectionManager
  - containerAuthData
  - jaasLoginContextEntry
  - jdbcDriver
    - library
      - file
      - fileset
      - folder
  - properties
  - properties.datadirect.sqlserver
  - properties.db2.i.native
  - properties.db2.i.toolbox
  - properties.db2.jcc
  - properties.derby.client
  - properties.derby.embedded
  - properties.informix
  - properties.informix.jcc
  - properties.microsoft.sqlserver
  - properties.oracle
  - properties.sybase
  - recoveryAuthData

Attribute name	Data type	Default value	Description
authDataRef	A reference to top level authData element (string).		Authentication data for task scheduling, queries, and execution.
createTables	boolean	true	When set to true, database tables are created.
dataSourceRef	A reference to top level dataSource element (string).	DefaultDataSource	Data source that connects to the persistent store.
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
keyGenerationStrategy	<ul style="list-style-type: none"> <li>• TABLE</li> <li>• SEQUENCE</li> <li>• IDENTITY</li> <li>• AUTO</li> </ul>	AUTO	<p>The preferred strategy for generating unique primary keys. If the selected strategy is not supported for the database, a different strategy might be used.</p> <p><b>TABLE</b> Use a database table to generate unique primary keys.</p> <p><b>SEQUENCE</b> Use a database sequence to generate unique primary keys.</p> <p><b>IDENTITY</b> Use a database identity column to generate unique primary keys.</p> <p><b>AUTO</b> Automatically select the strategy to generate unique primary keys.</p>
schema	string		Schema name with read and write access to the database tables.
tablePrefix	string	WLP	Name prefix for tables, sequences, and other database artifacts.

#### authData

Authentication data for task scheduling, queries, and execution.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

#### dataSource

Data source that connects to the persistent store.

false

Attribute name	Data type	Default value	Description
beginTranForResultSetScrolling	boolean	true	Attempt transaction enlistment when result set scrolling interfaces are used.
beginTranForVendorAPIs	boolean	true	Attempt transaction enlistment when vendor interfaces are used.
commitOrRollbackOnCleanup	<ul style="list-style-type: none"> <li>• commit</li> <li>• rollback</li> </ul>		<p>Determines how to clean up connections that might be in a database unit of work (AutoCommit=false) when the connection is closed or returned to the pool.</p> <p><b>commit</b> Clean up the connection by committing.</p> <p><b>rollback</b> Clean up the connection by rolling back.</p>
connectionManagerRef	A reference to top level connectionManager element (string).		Connection manager for a data source.
connectionSharing	<ul style="list-style-type: none"> <li>• MatchOriginalRequest</li> <li>• MatchCurrentState</li> </ul>	MatchOriginalRequest	<p>Specifies how connections are matched for sharing.</p> <p><b>MatchOriginalRequest</b> When sharing connections, match based on the original connection request.</p> <p><b>MatchCurrentState</b> When sharing connections, match based on the current state of the connection.</p>
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

Attribute name	Data type	Default value	Description
enableConnectionCasting	boolean	false	Indicates that connections obtained from the data source should be castable to interface classes that the JDBC vendor connection implementation implements. Enabling this option incurs additional overhead on each getConnection operation. If vendor JDBC interfaces are needed less frequently, it might be more efficient to leave this option disabled and use Connection.unwrap(interface) only where it is needed.
isolationLevel	<ul style="list-style-type: none"> <li>• TRANSACTION_REPEATABLE_READ</li> <li>• TRANSACTION_READ_COMMITTED</li> <li>• TRANSACTION_SERIALIZABLE</li> <li>• TRANSACTION_READ_UNCOMMITTED</li> <li>• TRANSACTION_SNAPSHOT</li> </ul>		<p>Default transaction isolation level.</p> <p><b>TRANSACTION_REPEATABLE_READ</b> Dirty reads and non-repeatable reads are prevented; phantom reads can occur.</p> <p><b>TRANSACTION_READ_COMMITTED</b> Dirty reads are prevented; non-repeatable reads and phantom reads can occur.</p> <p><b>TRANSACTION_SERIALIZABLE</b> Dirty reads, non-repeatable reads and phantom reads are prevented.</p> <p><b>TRANSACTION_READ_UNCOMMITTED</b> Dirty reads, non-repeatable reads and phantom reads can occur.</p> <p><b>TRANSACTION_SNAPSHOT</b> Snapshot isolation for Microsoft SQL Server JDBC Driver and DataDirect Connect for JDBC driver.</p>

Attribute name	Data type	Default value	Description
jaasLoginContextEntryRef	A reference to top level jaasLoginContextEntry element (string).		JAAS login context entry for authentication.
jdbcDriverRef	A reference to top level jdbcDriver element (string).		JDBC driver for a data source.
jndiName	string		JNDI name for a data source.
queryTimeout	A period of time with second precision		Default query timeout for SQL statements. In a JTA transaction, syncQueryTimeoutWithTransactionTimeout can override this default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
recoveryAuthDataRef	A reference to top level authData element (string).		Authentication data for transaction recovery.
statementCacheSize	int Minimum: 0	10	Maximum number of cached statements per connection.
supplementalJDBCTrace	boolean		Supplements the JDBC driver trace that is logged when JDBC driver trace is enabled in bootstrap.properties. JDBC driver trace specifications include: com.ibm.ws.database.logwriter, com.ibm.ws.db2.logwriter, com.ibm.ws.derby.logwriter, com.ibm.ws.informix.logwriter, com.ibm.ws.oracle.logwriter, com.ibm.ws.sqlserver.logwriter, com.ibm.ws.sybase.logwriter
syncQueryTimeoutWithTransactionTimeout	boolean	false	Use the time remaining (if any) in a JTA transaction as the default query timeout for SQL statements.
transactional	boolean	true	Enable participation in transactions that are managed by the application server.

Attribute name	Data type	Default value	Description
type	<ul style="list-style-type: none"> <li>javax.sql.DataSource</li> <li>javax.sql.XADataSource</li> <li>javax.sql.ConnectionPoolDataSource</li> </ul>		Type of data source. <b>javax.sql.DataSource</b> javax.sql.DataSource <b>javax.sql.XADataSource</b> javax.sql.XADataSource <b>javax.sql.ConnectionPoolDataSource</b> javax.sql.ConnectionPoolDataSource

### dataSource > connectionManager

Connection manager for a data source.

false

Attribute name	Data type	Default value	Description
agedTimeout	A period of time with second precision	-1	Amount of time before a physical connection can be discarded by pool maintenance. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
connectionTimeout	A period of time with second precision	30s	Amount of time after which a connection request times out. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxConnectionsPerThread	int Minimum: 0		Limits the number of open connections on each thread.

Attribute name	Data type	Default value	Description
maxIdleTime	A period of time with second precision	30m	Amount of time after which an unused or idle connection can be discarded during pool maintenance, if doing so does not reduce the pool below the minimum size. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxPoolSize	int Minimum: 0	50	Maximum number of physical connections for a pool. A value of 0 means unlimited.
minPoolSize	int Minimum: 0		Minimum number of physical connections to maintain in the pool. The pool is not pre-populated. Aged timeout can override the minimum.
numConnectionsPerThreadLocal	int Minimum: 0		Caches the specified number of connections for each thread.

Attribute name	Data type	Default value	Description
purgePolicy	<ul style="list-style-type: none"> <li>• ValidateAllConnections</li> <li>• FailingConnectionOnly</li> <li>• EntirePool</li> </ul>	EntirePool	<p>Specifies which connections to destroy when a stale connection is detected in a pool.</p> <p><b>ValidateAllConnections</b> When a stale connection is detected, connections are tested and those found to be bad are closed.</p> <p><b>FailingConnectionOnly</b> When a stale connection is detected, only the connection which was found to be bad is closed.</p> <p><b>EntirePool</b> When a stale connection is detected, all connections in the pool are marked stale, and when no longer in use, are closed.</p>
reapTime	A period of time with second precision	3m	Amount of time between runs of the pool maintenance thread. A value of -1 disables pool maintenance. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

**dataSource > containerAuthData**

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

**dataSource > jaasLoginContextEntry**

JAAS login context entry for authentication.

false

Attribute name	Data type	Default value	Description
loginModuleRef	List of references to top level jaasLoginModule elements (comma-separated string).	hashtable,userNameAndPassword,certificateURL	Word certificateURL of a JAAS login module.
name	string		Name of a JAAS configuration entry.

**dataSource > jdbcDriver**

JDBC driver for a data source.

false

Attribute name	Data type	Default value	Description
javax.sql.ConnectionPoolDataSource	string		JDBC driver implementation of javax.sql.ConnectionPoolDataSource.
javax.sql.DataSource	string		JDBC driver implementation of javax.sql.DataSource.
javax.sql.XADataSource	string		JDBC driver implementation of javax.sql.XADataSource.
libraryRef	A reference to top level library element (string).		Identifies JDBC driver JARs and native files.

**dataSource > jdbcDriver > library**

Identifies JDBC driver JARs and native files.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

**dataSource > jdbcDriver > library > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**dataSource > jdbcDriver > library > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**dataSource > jdbcDriver > library > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**dataSource > properties**

List of JDBC vendor properties for the data source. For example, databaseName="dbname" serverName="localhost" portNumber="50000".

false

Attribute name	Data type	Default value	Description
URL	string		URL for connecting to the database.
databaseName	string		JDBC driver property: databaseName.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
serverName	string		Server where the database is running.

Attribute name	Data type	Default value	Description
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**dataSource > properties.datadirect.sqlserver**

Data source properties for the DataDirect Connect for JDBC driver for Microsoft SQL Server.

false

Attribute name	Data type	Default value	Description
JDBCBehavior	<ul style="list-style-type: none"> <li>• 1</li> <li>• 0</li> </ul>	0	JDBC driver property: JDBCBehavior. Values are: 0 (JDBC 4.0) or 1 (JDBC 3.0).  <b>1</b> JDBC 3.0 <b>0</b> JDBC 4.0
XATransactionGroup	string		JDBC driver property: XATransactionGroup.
XMLDescribeType	<ul style="list-style-type: none"> <li>• longvarbinary</li> <li>• longvarchar</li> </ul>		JDBC driver property: XMLDescribeType.  <b>longvarbinary</b> longvarbinary  <b>longvarchar</b> longvarchar
accountingInfo	string		JDBC driver property: accountingInfo.
alternateServers	string		JDBC driver property: alternateServers.
alwaysReportTriggerResults	boolean		JDBC driver property: alwaysReportTriggerResults.
applicationName	string		JDBC driver property: applicationName.
authenticationMethod	<ul style="list-style-type: none"> <li>• ntlm</li> <li>• userIdPassword</li> <li>• kerberos</li> <li>• auto</li> </ul>		JDBC driver property: authenticationMethod.  <b>ntlm</b> ntlm  <b>userIdPassword</b> userIdPassword  <b>kerberos</b> kerberos  <b>auto</b> auto
bulkLoadBatchSize	long		JDBC driver property: bulkLoadBatchSize.
bulkLoadOptions	long		JDBC driver property: bulkLoadOptions.
clientHostName	string		JDBC driver property: clientHostName.
clientUser	string		JDBC driver property: clientUser.

Attribute name	Data type	Default value	Description
codePageOverride	string		JDBC driver property: codePageOverride.
connectionRetryCount	int		JDBC driver property: connectionRetryCount.
connectionRetryDelay	A period of time with second precision		JDBC driver property: connectionRetryDelay. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
convertNull	int		JDBC driver property: convertNull.
databaseName	string		JDBC driver property: databaseName.
dateTimeInputParameterType	<ul style="list-style-type: none"> <li>• dateTime</li> <li>• dateTimeOffset</li> <li>• auto</li> </ul>		JDBC driver property: dateTimeInputParameterType.  <b>dateTime</b> dateTime <b>dateTimeOffset</b> dateTimeOffset <b>auto</b> auto
dateTimeOutputParameterType	<ul style="list-style-type: none"> <li>• dateTime</li> <li>• dateTimeOffset</li> <li>• auto</li> </ul>		JDBC driver property: dateTimeOutputParameterType.  <b>dateTime</b> dateTime <b>dateTimeOffset</b> dateTimeOffset <b>auto</b> auto
describeInputParameters	<ul style="list-style-type: none"> <li>• describeIfString</li> <li>• noDescribe</li> <li>• describeIfDateTime</li> <li>• describeAll</li> </ul>		JDBC driver property: describeInputParameters.  <b>describeIfString</b> describeIfString <b>noDescribe</b> noDescribe <b>describeIfDateTime</b> describeIfDateTime <b>describeAll</b> describeAll

Attribute name	Data type	Default value	Description
describeOutputParameters	<ul style="list-style-type: none"> <li>describeIfString</li> <li>noDescribe</li> <li>describeIfDateTime</li> <li>describeAll</li> </ul>		JDBC driver property: describeOutputParameters. <b>describeIfString</b> describeIfString <b>noDescribe</b> noDescribe <b>describeIfDateTime</b> describeIfDateTime <b>describeAll</b> describeAll
enableBulkLoad	boolean		JDBC driver property: enableBulkLoad.
enableCancelTimeout	boolean		JDBC driver property: enableCancelTimeout.
encryptionMethod	<ul style="list-style-type: none"> <li>loginSSL</li> <li>requestSSL</li> <li>SSL</li> <li>noEncryption</li> </ul>		JDBC driver property: encryptionMethod. <b>loginSSL</b> loginSSL <b>requestSSL</b> requestSSL <b>SSL</b> SSL <b>noEncryption</b> noEncryption
failoverGranularity	<ul style="list-style-type: none"> <li>disableIntegrityCheck</li> <li>atomicWithRepositioning</li> <li>nonAtomic</li> <li>atomic</li> </ul>		JDBC driver property: failoverGranularity. <b>disableIntegrityCheck</b> disableIntegrityCheck <b>atomicWithRepositioning</b> atomicWithRepositioning <b>nonAtomic</b> nonAtomic <b>atomic</b> atomic
failoverMode	<ul style="list-style-type: none"> <li>connect</li> <li>select</li> <li>extended</li> </ul>		JDBC driver property: failoverMode. <b>connect</b> connect <b>select</b> select <b>extended</b> extended
failoverPreconnect	boolean		JDBC driver property: failoverPreconnect.
hostNameInCertificate	string		JDBC driver property: hostNameInCertificate.
initializationString	string		JDBC driver property: initializationString.
insensitiveResultSetBufferSize	int		JDBC driver property: insensitiveResultSetBufferSize.

Attribute name	Data type	Default value	Description
javaDoubleToString	boolean		JDBC driver property: javaDoubleToString.
loadBalancing	boolean		JDBC driver property: loadBalancing.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
longDataCacheSize	int Minimum: -1		JDBC driver property: longDataCacheSize.
netAddress	string		JDBC driver property: netAddress.
packetSize	int Minimum: -1 Maximum: 128		JDBC driver property: packetSize.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
queryTimeout	A period of time with second precision		JDBC driver property: queryTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
resultsetMetaDataOptions	int		JDBC driver property: resultSetMetaDataOptions.
selectMethod	<ul style="list-style-type: none"> <li>• direct</li> <li>• cursor</li> </ul>		JDBC driver property: selectMethod.  <b>direct</b> direct <b>cursor</b> cursor
serverName	string	localhost	Server where the database is running.
snapshotSerializable	boolean		JDBC driver property: snapshotSerializable.

Attribute name	Data type	Default value	Description
spyAttributes	string		JDBC driver property: spyAttributes.
stringInputParameterType	<ul style="list-style-type: none"> <li>varchar</li> <li>nvarchar</li> </ul>	varchar	JDBC driver property: stringInputParameterType. <b>varchar</b> varchar <b>nvarchar</b> nvarchar
stringOutputParameterType	<ul style="list-style-type: none"> <li>varchar</li> <li>nvarchar</li> </ul>	varchar	JDBC driver property: stringOutputParameterType. <b>varchar</b> varchar <b>nvarchar</b> nvarchar
suppressConnectionWarnings	boolean		JDBC driver property: suppressConnectionWarnings.
transactionMode	<ul style="list-style-type: none"> <li>explicit</li> <li>implicit</li> </ul>		JDBC driver property: transactionMode. <b>explicit</b> explicit <b>implicit</b> implicit
truncateFractionalSeconds	boolean		JDBC driver property: truncateFractionalSeconds.
trustStore	string		JDBC driver property: trustStore.
trustStorePassword	Reversably encoded password (string)		JDBC driver property: trustStorePassword.
useServerSideUpdatableCursors	boolean		JDBC driver property: useServerSideUpdatableCursors.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
validateServerCertificate	boolean		JDBC driver property: validateServerCertificate.

#### dataSource > properties.db2.i.native

Data source properties for the IBM DB2 for i Native JDBC driver.

false

Attribute name	Data type	Default value	Description
access	<ul style="list-style-type: none"> <li>read only</li> <li>all</li> <li>read call</li> </ul>	all	JDBC driver property: access. <b>read only</b> read only <b>all</b> all <b>read call</b> read call

Attribute name	Data type	Default value	Description
autoCommit	boolean	true	JDBC driver property: autoCommit.
batchStyle	<ul style="list-style-type: none"> <li>• 2.1</li> <li>• 2.0</li> </ul>	2.0	JDBC driver property: batchStyle. <b>2.1</b> 2.1 <b>2.0</b> 2.0
behaviorOverride	int		JDBC driver property: behaviorOverride.
blockSize	<ul style="list-style-type: none"> <li>• 512</li> <li>• 128</li> <li>• 0</li> <li>• 32</li> <li>• 64</li> <li>• 16</li> <li>• 8</li> <li>• 256</li> </ul>	32	JDBC driver property: blockSize. <b>512</b> 512 <b>128</b> 128 <b>0</b> 0 <b>32</b> 32 <b>64</b> 64 <b>16</b> 16 <b>8</b> 8 <b>256</b> 256
cursorHold	boolean	false	JDBC driver property: cursorHold.
cursorSensitivity	<ul style="list-style-type: none"> <li>• asensitive</li> <li>• sensitive</li> </ul>	asensitive	JDBC driver property: cursorSensitivity. Values are: 0 (TYPE_SCROLL_SENSITIVE_STATIC), 1 (TYPE_SCROLL_SENSITIVE_DYNAMIC), 2 (TYPE_SCROLL_ASENSITIVE). <b>asensitive</b> asensitive <b>sensitive</b> sensitive
dataTruncation	string	true	JDBC driver property: dataTruncation.
databaseName	string	*LOCAL	JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
dateFormat	<ul style="list-style-type: none"> <li>• dmy</li> <li>• iso</li> <li>• eur</li> <li>• ymd</li> <li>• julian</li> <li>• jis</li> <li>• usa</li> <li>• mdy</li> </ul>		JDBC driver property: dateFormat. <b>dmy</b> dmy <b>iso</b> iso <b>eur</b> eur <b>ymd</b> ymd <b>julian</b> julian <b>jis</b> jis <b>usa</b> usa <b>mdy</b> mdy
dateSeparator	<ul style="list-style-type: none"> <li>• \,</li> <li>• b</li> <li>• .</li> <li>• /</li> <li>• -</li> </ul>		JDBC driver property: dateSeparator. <b>\,</b> The comma character (,). <b>b</b> The character b <b>.</b> The period character (.). <b>/</b> The forward slash character (/). <b>-</b> The dash character (-).
decimalSeparator	<ul style="list-style-type: none"> <li>• \,</li> <li>• .</li> </ul>		JDBC driver property: decimalSeparator. <b>\,</b> The comma character (,). <b>.</b> The period character (.).
directMap	boolean	true	JDBC driver property: directMap.
doEscapeProcessing	boolean	true	JDBC driver property: doEscapeProcessing.
fullErrors	boolean		JDBC driver property: fullErrors.
libraries	string		JDBC driver property: libraries.
lobThreshold	int Maximum: 500000	0	JDBC driver property: lobThreshold.

Attribute name	Data type	Default value	Description
lockTimeout	A period of time with second precision	0	JDBC driver property: lockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maximumPrecision	<ul style="list-style-type: none"> <li>• 31</li> <li>• 63</li> </ul>	31	JDBC driver property: maximumPrecision.  <b>31</b> 31 <b>63</b> 63
maximumScale	int Minimum: 0 Maximum: 63	31	JDBC driver property: maximumScale.
minimumDivideScale	int Minimum: 0 Maximum: 9	0	JDBC driver property: minimumDivideScale.
networkProtocol	int		JDBC driver property: networkProtocol.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
prefetch	boolean	true	JDBC driver property: prefetch.
queryOptimizeGoal	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>	2	JDBC driver property: queryOptimizeGoal. Values are: 1 (*FIRSTIO) or 2 (*ALLIO).  <b>2</b> *ALLIO <b>1</b> *FIRSTIO

Attribute name	Data type	Default value	Description
reuseObjects	boolean	true	JDBC driver property: reuseObjects.
serverName	string		Server where the database is running.
serverTraceCategories	int	0	JDBC driver property: serverTraceCategories.
systemNaming	boolean	false	JDBC driver property: systemNaming.
timeFormat	<ul style="list-style-type: none"> <li>• iso</li> <li>• eur</li> <li>• jis</li> <li>• usa</li> <li>• hms</li> </ul>		JDBC driver property: timeFormat.  <b>iso</b> iso <b>eur</b> eur <b>jis</b> jis <b>usa</b> usa <b>hms</b> hms
timeSeparator	<ul style="list-style-type: none"> <li>• \,</li> <li>• b</li> <li>• :</li> <li>• .</li> </ul>		JDBC driver property: timeSeparator.  \,    The comma character (,). <b>b</b> The character b :    The colon character (:). .    The period character (.).
trace	boolean		JDBC driver property: trace.
transactionTimeout	A period of time with second precision	0	JDBC driver property: transactionTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
translateBinary	boolean	false	JDBC driver property: translateBinary.
translateHex	<ul style="list-style-type: none"> <li>• binary</li> <li>• character</li> </ul>	character	JDBC driver property: translateHex.  <b>binary</b> binary <b>character</b> character
useBlockInsert	boolean	false	JDBC driver property: useBlockInsert.

Attribute name	Data type	Default value	Description
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**dataSource > properties.db2.i.toolbox**

Data source properties for the IBM DB2 for i Toolbox JDBC driver.

false

Attribute name	Data type	Default value	Description
access	<ul style="list-style-type: none"> <li>• read only</li> <li>• all</li> <li>• read call</li> </ul>	all	JDBC driver property: access.  <b>read only</b> read only  <b>all</b> all  <b>read call</b> read call
behaviorOverride	int		JDBC driver property: behaviorOverride.
bidiImplicitReordering	boolean	true	JDBC driver property: bidiImplicitReordering.
bidiNumericOrdering	boolean	false	JDBC driver property: bidiNumericOrdering.
bidiStringType	int		JDBC driver property: bidiStringType.
bigDecimal	boolean	true	JDBC driver property: bigDecimal.
blockCriteria	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> <li>• 0</li> </ul>	2	JDBC driver property: blockCriteria. Values are: 0 (no record blocking), 1 (block if FOR FETCH ONLY is specified), 2 (block if FOR UPDATE is specified).  <b>2</b> 2  <b>1</b> 1  <b>0</b> 0

extendedMetaData	boolean	false	JDBC driver property: extendedMetaData.
fullOpen	boolean	false	JDBC driver property: fullOpen.
holdInputLocators	boolean	true	JDBC driver property: holdInputLocators.
holdStatements	boolean	false	JDBC driver property: holdStatements.
isolationLevelSwitchingSupport	boolean	false	JDBC driver property: isolationLevelSwitchingSupport.
keepAlive	boolean		JDBC driver property: keepAlive.
lazyClose	boolean	false	JDBC driver property: lazyClose.
libraries	string		JDBC driver property: libraries.

Attribute name	Data type	Default value	Description
lobThreshold	int Minimum: 0 Maximum: 16777216	0	JDBC driver property: lobThreshold.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maximumPrecision	<ul style="list-style-type: none"> <li>• 31</li> <li>• 63</li> </ul>	31	JDBC driver property: maximumPrecision.  <b>31</b> 31 <b>63</b> 64
maximumScale	int Minimum: 0 Maximum: 63	31	JDBC driver property: maximumScale.
metaDataSource	int Minimum: 0 Maximum: 1	1	JDBC driver property: metaDataSource.
minimumDivideScale	int Minimum: 0 Maximum: 9	0	JDBC driver property: minimumDivideScale.
naming	<ul style="list-style-type: none"> <li>• system</li> <li>• sql</li> </ul>	sql	JDBC driver property: naming.  <b>system</b> system <b>sql</b> sql
package	string		JDBC driver property: package.
packageAdd	boolean	true	JDBC driver property: packageAdd.
packageCCSID	<ul style="list-style-type: none"> <li>• 13488</li> <li>• 1200</li> </ul>	13488	JDBC driver property: packageCCSID. Values are: 1200 (UCS-2) or 13488 (UTF-16).  <b>13488</b> 13488 (UTF-16) <b>1200</b> 1200 (UCS-2)
packageCache	boolean	false	JDBC driver property: packageCache.

Attribute name	Data type	Default value	Description
packageCriteria	<ul style="list-style-type: none"> <li>default</li> <li>select</li> </ul>	default	JDBC driver property: packageCriteria. <b>default</b> default <b>select</b> select
packageError	<ul style="list-style-type: none"> <li>exception</li> <li>none</li> <li>warning</li> </ul>	warning	JDBC driver property: packageError. <b>exception</b> exception <b>none</b> none <b>warning</b> warning
packageLibrary	string	QGPL	JDBC driver property: packageLibrary.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
prefetch	boolean	true	JDBC driver property: prefetch.
prompt	boolean	false	JDBC driver property: prompt.
proxyServer	string		JDBC driver property: proxyServer.
qaqqiniLibrary	string		JDBC driver property: qaqqiniLibrary.
queryOptimizeGoal	int Minimum: 0 Maximum: 2	0	JDBC driver property: queryOptimizeGoal. Values are: 1 (*FIRSTIO) or 2 (*ALLIO).
receiveBufferSize	int Minimum: 1		JDBC driver property: receiveBufferSize.
remarks	<ul style="list-style-type: none"> <li>system</li> <li>sql</li> </ul>	system	JDBC driver property: remarks. <b>system</b> system <b>sql</b> sql
rollbackCursorHold	boolean	false	JDBC driver property: rollbackCursorHold.
savePasswordWhenSerialized	boolean	false	JDBC driver property: savePasswordWhenSerialized.
secondaryUrl	string		JDBC driver property: secondaryUrl.
secure	boolean	false	JDBC driver property: secure.
sendBufferSize	int Minimum: 1		JDBC driver property: sendBufferSize.

Attribute name	Data type	Default value	Description
serverName	string		Server where the database is running.
serverTraceCategories	int	0	JDBC driver property: serverTraceCategories.
soLinger	A period of time with second precision		JDBC driver property: soLinger. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
soTimeout	A period of time with millisecond precision		JDBC driver property: soTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
sort	<ul style="list-style-type: none"> <li>• hex</li> <li>• table</li> <li>• language</li> </ul>	hex	JDBC driver property: sort. <b>hex</b> hex <b>table</b> table <b>language</b> language
sortLanguage	string		JDBC driver property: sortLanguage.
sortTable	string		JDBC driver property: sortTable.
sortWeight	<ul style="list-style-type: none"> <li>• unqiue</li> <li>• shared</li> </ul>		JDBC driver property: sortWeight. <b>unqiue</b> unique <b>shared</b> shared
tcpNoDelay	boolean		JDBC driver property: tcpNoDelay.
threadUsed	boolean	true	JDBC driver property: threadUsed.

Attribute name	Data type	Default value	Description
timeFormat	<ul style="list-style-type: none"> <li>• iso</li> <li>• eur</li> <li>• jis</li> <li>• usa</li> <li>• hms</li> </ul>		JDBC driver property: timeFormat. <b>iso</b> iso <b>eur</b> eur <b>jis</b> jis <b>usa</b> usa <b>hms</b> hms
timeSeparator	<ul style="list-style-type: none"> <li>•</li> <li>• \,</li> <li>• :</li> <li>• .</li> </ul>		JDBC driver property: timeSeparator.  The space character ( ). \, The comma character (,). : The colon character (:). . The period character (.).
toolboxTrace	<ul style="list-style-type: none"> <li>• diagnostic</li> <li>• information</li> <li>• conversion</li> <li>• error</li> <li>• thread</li> <li>• proxy</li> <li>• none</li> <li>• datastream</li> <li>• pcml</li> <li>• all</li> <li>• jdbc</li> <li>• warning</li> </ul>		JDBC driver property: toolboxTrace. <b>diagnostic</b> diagnostic <b>information</b> information <b>conversion</b> conversion <b>error</b> error <b>thread</b> thread <b>proxy</b> proxy <b>none</b> none <b>datastream</b> datastream <b>pcml</b> pcml <b>all</b> all <b>jdbc</b> jdbc <b>warning</b> warning
trace	boolean		JDBC driver property: trace.
translateBinary	boolean	false	JDBC driver property: translateBinary.
translateBoolean	boolean	true	JDBC driver property: translateBoolean.

Attribute name	Data type	Default value	Description
translateHex	<ul style="list-style-type: none"> <li>binary</li> <li>character</li> </ul>	character	JDBC driver property: translateHex.  <b>binary</b> binary <b>character</b> character
trueAutoCommit	boolean	false	JDBC driver property: trueAutoCommit.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
xaLooselyCoupledSupport	int  Minimum: 0  Maximum: 1	0	JDBC driver property: xaLooselyCoupledSupport.

#### dataSource > properties.db2.jcc

Data source properties for the IBM Data Server Driver for JDBC and SQLJ for DB2.

false

Attribute name	Data type	Default value	Description
activateDatabase	int		JDBC driver property: activateDatabase.
alternateGroupDatabaseName	string		JDBC driver property: alternateGroupDatabaseName.
alternateGroupPortNumber	string		JDBC driver property: alternateGroupPortNumber.
alternateGroupServerName	string		JDBC driver property: alternateGroupServerName.
blockingReadConnectionTimeout	A period of time with second precision		JDBC driver property: blockingReadConnectionTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
clientAccountingInformation	string		JDBC driver property: clientAccountingInformation.
clientApplicationInformation	string		JDBC driver property: clientApplicationInformation.
clientRerouteAlternatePortNumber	string		JDBC driver property: clientRerouteAlternatePortNumber.
clientRerouteAlternateServerName	string		JDBC driver property: clientRerouteAlternateServerName.

Attribute name	Data type	Default value	Description
clientUser	string		JDBC driver property: clientUser.
clientWorkstation	string		JDBC driver property: clientWorkstation.
connectionCloseWithInFlightTransaction	Transaction <ul style="list-style-type: none"> <li>• 1</li> </ul>		JDBC driver property: connectionCloseWithInFlightTransaction. 2 CONNECTION_CLOSE_WITH_ROLLBACK 1 CONNECTION_CLOSE_WITH_EXCEPTION
currentAlternateGroupEntry	int		JDBC driver property: currentAlternateGroupEntry.
currentFunctionPath	string		JDBC driver property: currentFunctionPath.
currentLocaleLcCtype	string		JDBC driver property: currentLocaleLcCtype.
currentLockTimeout	A period of time with second precision		JDBC driver property: currentLockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
currentPackagePath	string		JDBC driver property: currentPackagePath.
currentPackageSet	string		JDBC driver property: currentPackageSet.
currentSQLID	string		JDBC driver property: currentSQLID.
currentSchema	string		JDBC driver property: currentSchema.
cursorSensitivity	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> <li>• 0</li> </ul>		JDBC driver property: cursorSensitivity. Values are: 0 (TYPE_SCROLL_SENSITIVE_STATIC), 1 (TYPE_SCROLL_SENSITIVE_DYNAMIC), 2 (TYPE_SCROLL_ASENSITIVE). 2 TYPE_SCROLL_ASENSITIVE 1 TYPE_SCROLL_SENSITIVE_DYNAMIC 0 TYPE_SCROLL_SENSITIVE_STATIC
databaseName	string		JDBC driver property: databaseName.
deferPrepares	boolean	true	JDBC driver property: deferPrepares.

Attribute name	Data type	Default value	Description
driverType	<ul style="list-style-type: none"> <li>2</li> <li>4</li> </ul>	4	JDBC driver property: driverType. 2 Type 2 JDBC driver. 4 Type 4 JDBC driver.
enableAlternateGroupSeamlessACR	boolean		JDBC driver property: enableAlternateGroupSeamlessACR.
enableClientAffinitiesList	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableClientAffinitiesList. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
enableExtendedDescribe	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableExtendedDescribe. 2 NO 1 YES
enableExtendedIndicators	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableExtendedIndicators. 2 NO 1 YES
enableNamedParameterMarkers	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableNamedParameterMarkers. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
enableSeamlessFailover	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableSeamlessFailover. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
enableSysplexWLB	boolean		JDBC driver property: enableSysplexWLB.
fetchSize	int		JDBC driver property: fetchSize.
fullyMaterializeInputStreams	boolean		JDBC driver property: fullyMaterializeInputStreams.
fullyMaterializeInputStreamsOnBatchExecution	<ul style="list-style-type: none"> <li>1</li> </ul>		JDBC driver property: fullyMaterializeInputStreamsOnBatchExecution. 2 NO 1 YES
fullyMaterializeLobData	boolean		JDBC driver property: fullyMaterializeLobData.

Attribute name	Data type	Default value	Description
implicitRollbackOption	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> <li>• 0</li> </ul>		<p>JDBC driver property: implicitRollbackOption.</p> <p><b>2</b> IMPLICIT_ROLLBACK_OPTION_CLOSE</p> <p><b>1</b> IMPLICIT_ROLLBACK_OPTION_NO</p> <p><b>0</b> IMPLICIT_ROLLBACK_OPTION_NO</p>

keepAliveTimeOut	A period of time with second precision		<p>JDBC driver property: keepAliveTimeOut. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.</p>
keepDynamic	int		JDBC driver property: keepDynamic.
kerberosServerPrincipal	string		JDBC driver property: kerberosServerPrincipal.
loginTimeout	A period of time with second precision		<p>JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.</p>
maxConnCachedParamBufferSize	int		JDBC driver property: maxConnCachedParamBufferSize.
maxRetriesForClientReroute	int		JDBC driver property: maxRetriesForClientReroute.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	50000	Port on which to obtain database connections.
profileName	string		JDBC driver property: profileName.

Attribute name	Data type	Default value	Description
queryCloseImplicit	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: queryCloseImplicit. Values are: 1 (QUERY_CLOSE_IMPLICIT_YES) or 2 (QUERY_CLOSE_IMPLICIT_NO).</p> <p>2        QUERY_CLOSE_IMPLICIT_NO 1        QUERY_CLOSE_IMPLICIT_YES</p>
queryDataSize	<p>int</p> <p>Minimum: 4096</p> <p>Maximum: 65535</p>		JDBC driver property: queryDataSize.
queryTimeoutInterruptProcessingMode	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: queryTimeoutInterruptProcessingMode.</p> <p>2        INTERRUPT_PROCESSING_MODAL 1        INTERRUPT_PROCESSING_MODAL</p>
readOnly	boolean		JDBC driver property: readOnly.
recordTemporalHistory	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: recordTemporalHistory.</p> <p>2        NO 1        YES</p>
resultSetHoldability	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldability. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2        CLOSE_CURSORS_AT_COMMIT 1        HOLD_CURSORS_OVER_COMMIT</p>
resultSetHoldabilityForCatalogQueries	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldabilityForCatalogQueries. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2        CLOSE_CURSORS_AT_COMMIT 1        HOLD_CURSORS_OVER_COMMIT</p>
retrieveMessagesFromServerOnGetMessage	boolean	true	JDBC driver property: retrieveMessagesFromServerOnGetMessage.

Attribute name	Data type	Default value	Description
retryIntervalForClientReroute	A period of time with second precision		JDBC driver property: retryIntervalForClientReroute. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
securityMechanism	<ul style="list-style-type: none"> <li>• 3</li> <li>• 7</li> <li>• 4</li> <li>• 18</li> <li>• 15</li> <li>• 9</li> <li>• 16</li> <li>• 13</li> <li>• 11</li> <li>• 12</li> </ul>		<p>JDBC driver property: securityMechanism. Values are:</p> <ul style="list-style-type: none"> <li>3 (CLEAR_TEXT_PASSWORD_SECURITY),</li> <li>4 (USER_ONLY_SECURITY),</li> <li>7 (ENCRYPTED_PASSWORD_SECURITY),</li> <li>9 (ENCRYPTED_USER_AND_PASSWORD_SECURITY),</li> <li>11 (KERBEROS_SECURITY),</li> <li>12 (ENCRYPTED_USER_AND_DATA_SECURITY),</li> <li>13 (ENCRYPTED_USER_PASSWORD_AND_DATA_SECURITY),</li> <li>15 (PLUGIN_SECURITY),</li> <li>16 (ENCRYPTED_USER_ONLY_SECURITY),</li> <li>18 (TLS_CLIENT_CERTIFICATE_SECURITY).</li> </ul> <p>3 CLEAR_TEXT_PASSWORD_SECURITY  7 ENCRYPTED_PASSWORD_SECURITY  4 USER_ONLY_SECURITY  18 TLS_CLIENT_CERTIFICATE_SECURITY  15 PLUGIN_SECURITY  9 ENCRYPTED_USER_AND_PASSWORD_SECURITY  16 ENCRYPTED_USER_ONLY_SECURITY  13 ENCRYPTED_USER_PASSWORD_AND_DATA_SECURITY  11 KERBEROS_SECURITY  12 ENCRYPTED_USER_AND_DATA_SECURITY</p>
sendDataAsIs	boolean		JDBC driver property: sendDataAsIs.
serverName	string	localhost	Server where the database is running.
sessionTimeZone	string		JDBC driver property: sessionTimeZone.
sqljCloseStmtsWithOpenResultSet	boolean		JDBC driver property: sqljCloseStmtsWithOpenResultSet.

Attribute name	Data type	Default value	Description
sqljEnableClassLoaderSpecificProfiles	boolean		JDBC driver property: sqljEnableClassLoaderSpecificProfiles.
sslConnection	boolean		JDBC driver property: sslConnection.
streamBufferSize	int		JDBC driver property: streamBufferSize.
stripTrailingZerosForDecimalNumbers	Numbers <ul style="list-style-type: none"> <li>• 1</li> </ul>		JDBC driver property: stripTrailingZerosForDecimalNumbers. 2 NO 1 YES
sysSchema	string		JDBC driver property: sysSchema.

#### dataSource > properties.informix

Data source properties for the Informix JDBC driver.

false

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
ifxCLIENT_LOCALE	string		JDBC driver property: ifxCLIENT_LOCALE.
ifxCPMAgeLimit	A period of time with second precision		JDBC driver property: ifxCPMAgeLimit. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxCPMInitPoolSize	int		JDBC driver property: ifxCPMInitPoolSize.
ifxCPMMaxConnections	int		JDBC driver property: ifxCPMMaxConnections.
ifxCPMMaxPoolSize	int		JDBC driver property: ifxCPMMaxPoolSize.
ifxCPMMinAgeLimit	A period of time with second precision		JDBC driver property: ifxCPMMinAgeLimit. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxCPMMinPoolSize	int		JDBC driver property: ifxCPMMinPoolSize.
ifxCPMServiceInterval	A period of time with millisecond precision		JDBC driver property: ifxCPMServiceInterval. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
ifxDBANSIWARN	boolean		JDBC driver property: ifxDBANSIWARN.
ifxDBCENTURY	string		JDBC driver property: ifxDBCENTURY.
ifxDBDATE	string		JDBC driver property: ifxDBDATE.
ifxDBSPACETEMP	string		JDBC driver property: ifxDBSPACETEMP.

Attribute name	Data type	Default value	Description
ifxDBTEMP	string		JDBC driver property: ifxDBTEMP.
ifxDBTIME	string		JDBC driver property: ifxDBTIME.
ifxDBUPSPACE	string		JDBC driver property: ifxDBUPSPACE.
ifxDB_LOCALE	string		JDBC driver property: ifxDB_LOCALE.
ifxDELIMIDENT	boolean		JDBC driver property: ifxDELIMIDENT.
ifxENABLE_TYPE_CACHE	boolean		JDBC driver property: ifxENABLE_TYPE_CACHE.
ifxFET_BUF_SIZE	int		JDBC driver property: ifxFET_BUF_SIZE.
ifxGL_DATE	string		JDBC driver property: ifxGL_DATE.
ifxGL_DATETIME	string		JDBC driver property: ifxGL_DATETIME.
ifxIFXHOST	string	localhost	JDBC driver property: ifxIFXHOST.
ifxIFX_AUTOFREE	boolean		JDBC driver property: ifxIFX_AUTOFREE.
ifxIFX_DIRECTIVES	string		JDBC driver property: ifxIFX_DIRECTIVES.
ifxIFX_LOCK_MODE_WAIT	A period of time with second precision	2s	JDBC driver property: ifxIFX_LOCK_MODE_WAIT. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxIFX_SOC_TIMEOUT	A period of time with millisecond precision		JDBC driver property: ifxIFX_SOC_TIMEOUT. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
ifxIFX_USEPUT	boolean		JDBC driver property: ifxIFX_USEPUT.

Attribute name	Data type	Default value	Description
ifxIFX_USE_STRENC	boolean		JDBC driver property: ifxIFX_USE_STRENC.
ifxIFX_XASPEC	string	y	JDBC driver property: ifxIFX_XASPEC.
ifxINFORMIXCONRETRY	int		JDBC driver property: ifxINFORMIXCONRETRY.
ifxINFORMIXCONTIME	A period of time with second precision		JDBC driver property: ifxINFORMIXCONTIME. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxINFORMIXOPCACHE	string		JDBC driver property: ifxINFORMIXOPCACHE.
ifxINFORMIXSTACKSIZE	int		JDBC driver property: ifxINFORMIXSTACKSIZE.
ifxJDBCTEMP	string		JDBC driver property: ifxJDBCTEMP.
ifxLDAP_IFXBASE	string		JDBC driver property: ifxLDAP_IFXBASE.
ifxLDAP_PASSWD	string		JDBC driver property: ifxLDAP_PASSWD.
ifxLDAP_URL	string		JDBC driver property: ifxLDAP_URL.
ifxLDAP_USER	string		JDBC driver property: ifxLDAP_USER.
ifxLOBCACHE	int		JDBC driver property: ifxLOBCACHE.
ifxNEWCODESET	string		JDBC driver property: ifxNEWCODESET.
ifxNEWLOCALE	string		JDBC driver property: ifxNEWLOCALE.
ifxNODEFDAC	string		JDBC driver property: ifxNODEFDAC.
ifxOPTCOMPIND	string		JDBC driver property: ifxOPTCOMPIND.
ifxOPTOFC	string		JDBC driver property: ifxOPTOFC.
ifxOPT_GOAL	string		JDBC driver property: ifxOPT_GOAL.
ifxPATH	string		JDBC driver property: ifxPATH.
ifxPDQPRIORITY	string		JDBC driver property: ifxPDQPRIORITY.

Attribute name	Data type	Default value	Description
ifxPLCONFIG	string		JDBC driver property: ifxPLCONFIG.
ifxPLOAD_LO_PATH	string		JDBC driver property: ifxPLOAD_LO_PATH.
ifxPROTOCOLTRACE	int		JDBC driver property: ifxPROTOCOLTRACE.
ifxPROTOCOLTRACEFILE	string		JDBC driver property: ifxPROTOCOLTRACEFILE.
ifxPROXY	string		JDBC driver property: ifxPROXY.
ifxPSORT_DBTEMP	string		JDBC driver property: ifxPSORT_DBTEMP.
ifxPSORT_NPROCS	boolean		JDBC driver property: ifxPSORT_NPROCS.
ifxSECURITY	string		JDBC driver property: ifxSECURITY.
ifxSQLH_FILE	string		JDBC driver property: ifxSQLH_FILE.
ifxSQLH_LOC	string		JDBC driver property: ifxSQLH_LOC.
ifxSQLH_TYPE	string		JDBC driver property: ifxSQLH_TYPE.
ifxSSLCONNECTION	string		JDBC driver property: ifxSSLCONNECTION.
ifxSTMT_CACHE	string		JDBC driver property: ifxSTMT_CACHE.
ifxTRACE	int		JDBC driver property: ifxTRACE.
ifxTRACEFILE	string		JDBC driver property: ifxTRACEFILE.
ifxTRUSTED_CONTEXT	string		JDBC driver property: ifxTRUSTED_CONTEXT.
ifxUSEV5SERVER	boolean		JDBC driver property: ifxUSEV5SERVER.
ifxUSE_DTENV	boolean		JDBC driver property: ifxUSE_DTENV.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1526	Port on which to obtain database connections.
roleName	string		JDBC driver property: roleName.
serverName	string		Server where the database is running.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**dataSource > properties.informix.jcc**

Data source properties for the IBM Data Server Driver for JDBC and SQLJ for Informix.

false

Attribute name	Data type	Default value	Description
DBANSIWARN	boolean		JDBC driver property: DBANSIWARN.
DBDATE	string		JDBC driver property: DBDATE.
DBPATH	string		JDBC driver property: DBPATH.
DBSPACETEMP	string		JDBC driver property: DBSPACETEMP.
DBTEMP	string		JDBC driver property: DBTEMP.
DBUPSPACE	string		JDBC driver property: DBUPSPACE.
DELIMIDENT	boolean		JDBC driver property: DELIMIDENT.
IFX_DIRECTIVES	<ul style="list-style-type: none"> <li>• ON</li> <li>• OFF</li> </ul>		JDBC driver property: IFX_DIRECTIVES. <b>ON</b> ON <b>OFF</b> OFF
IFX_EXTDIRECTIVES	<ul style="list-style-type: none"> <li>• ON</li> <li>• OFF</li> </ul>		JDBC driver property: IFX_EXTDIRECTIVES. <b>ON</b> ON <b>OFF</b> OFF
IFX_UPDESC	string		JDBC driver property: IFX_UPDESC.

Attribute name	Data type	Default value	Description
IFX_XASTDCOMPLIANCE_XAEND	<ul style="list-style-type: none"> <li>0</li> </ul>		JDBC driver property: IFX_XASTDCOMPLIANCE_XAEND. <b>1</b> 1 <b>0</b> 0
INFORMIXOPCACHE	string		JDBC driver property: INFORMIXOPCACHE.
INFORMIXSTACKSIZE	string		JDBC driver property: INFORMIXSTACKSIZE.
NODEFDAC	<ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul>		JDBC driver property: NODEFDAC. <b>yes</b> yes <b>no</b> no
OPTCOMPIND	<ul style="list-style-type: none"> <li>2</li> <li>1</li> <li>0</li> </ul>		JDBC driver property: OPTCOMPIND. <b>2</b> 2 <b>1</b> 1 <b>0</b> 0
OPTOFC	<ul style="list-style-type: none"> <li>1</li> <li>0</li> </ul>		JDBC driver property: OPTOFC. <b>1</b> 1 <b>0</b> 0
PDQPRIORITY	<ul style="list-style-type: none"> <li>HIGH</li> <li>LOW</li> <li>OFF</li> </ul>		JDBC driver property: PDQPRIORITY. <b>HIGH</b> HIGH <b>LOW</b> LOW <b>OFF</b> OFF
PSORT_DBTEMP	string		JDBC driver property: PSORT_DBTEMP.
PSORT_NPROCS	string Maximum: 10		JDBC driver property: PSORT_NPROCS.
STMT_CACHE	<ul style="list-style-type: none"> <li>1</li> <li>0</li> </ul>		JDBC driver property: STMT_CACHE. <b>1</b> 1 <b>0</b> 0
currentLockTimeout	A period of time with second precision	2s	JDBC driver property: currentLockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
deferPrepares	boolean		JDBC driver property: deferPrepares.
driverType	int	4	JDBC driver property: driverType.
enableNamedParameterMarkers	int		JDBC driver property: enableNamedParameterMarkers. Values are: 1 (YES) or 2 (NO).
enableSeamlessFailover	int		JDBC driver property: enableSeamlessFailover. Values are: 1 (YES) or 2 (NO).
enableSysplexWLB	boolean		JDBC driver property: enableSysplexWLB.
fetchSize	int		JDBC driver property: fetchSize.
fullyMaterializeLobData	boolean		JDBC driver property: fullyMaterializeLobData.
keepDynamic	int		JDBC driver property: keepDynamic.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1526	Port on which to obtain database connections.
progressiveStreaming	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		JDBC driver property: progressiveStreaming. Values are: 1 (YES) or 2 (NO).  2 NO 1 YES
queryDataSize	int Minimum: 4096 Maximum: 10485760		JDBC driver property: queryDataSize.

Attribute name	Data type	Default value	Description
resultSetHoldability	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldability. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2 CLOSE_CURSORS_AT_COMMIT 1 HOLD_CURSORS_OVER_COMMIT</p>
resultSetHoldabilityForCatalogQueries	<ul style="list-style-type: none"> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldabilityForCatalogQueries. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2 CLOSE_CURSORS_AT_COMMIT 1 HOLD_CURSORS_OVER_COMMIT</p>
retrieveMessagesFromServerOnGetMessage	boolean	true	<p>JDBC driver property: retrieveMessagesFromServerOnGetMessage.</p>
securityMechanism	<ul style="list-style-type: none"> <li>• 3</li> <li>• 7</li> <li>• 4</li> <li>• 9</li> </ul>		<p>JDBC driver property: securityMechanism. Values are: 3 (CLEAR_TEXT_PASSWORD_SECURITY), 4 (USER_ONLY_SECURITY), 7 (ENCRYPTED_PASSWORD_SECURITY), 9 (ENCRYPTED_USER_AND_PASSWORD_SECURITY).</p> <p>3 CLEAR_TEXT_PASSWORD_SECURITY 7 ENCRYPTED_PASSWORD_SECURITY 4 USER_ONLY_SECURITY 9 ENCRYPTED_USER_AND_PASSWORD_SECURITY</p>
serverName	string	localhost	Server where the database is running.
traceDirectory	string		JDBC driver property: traceDirectory.
traceFile	string		JDBC driver property: traceFile.
traceFileAppend	boolean		JDBC driver property: traceFileAppend.

Attribute name	Data type	Default value	Description
traceLevel	int		Bitwise combination of the following constant values: TRACE_NONE=0, TRACE_CONNECTION_CALLS=1, TRACE_STATEMENT_CALLS=2, TRACE_RESULT_SET_CALLS=4, TRACE_DRIVER_CONFIGURATION=16, TRACE_CONNECTS=32, TRACE_DRDA_FLOWS=64, TRACE_RESULT_SET_META_DATA=128, TRACE_PARAMETER_META_DATA=256, TRACE_DIAGNOSTICS=512, TRACE_SQLJ=1024, TRACE_META_CALLS=8192, TRACE_DATASOURCE_CALLS=16384, TRACE_LARGE_OBJECT_CALLS=32768, TRACE_SYSTEM_MONITOR=131072, TRACE_TRACEPOINTS=262144, TRACE_ALL=-1.
useJDBC4ColumnNameAndLabelSemantics	int		JDBC driver property: useJDBC4ColumnNameAndLabelSemantics. Values are: 1 (YES) or 2 (NO).
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

#### dataSource > properties.microsoft.sqlserver

Data source properties for Microsoft SQL Server JDBC Driver.

false

Attribute name	Data type	Default value	Description
URL	string		URL for connecting to the database. Example: jdbc:sqlserver://localhost:1433;databaseName=myDB.
applicationIntent	<ul style="list-style-type: none"> <li>ReadOnly</li> <li>ReadWrite</li> </ul>		JDBC driver property: applicationIntent. <b>ReadOnly</b> ReadOnly <b>ReadWrite</b> ReadWrite
applicationName	string		JDBC driver property: applicationName.
authenticationScheme	<ul style="list-style-type: none"> <li>NativeAuthentication</li> <li>JavaKerberos</li> </ul>		JDBC driver property: authenticationScheme. <b>NativeAuthentication</b> NativeAuthentication <b>JavaKerberos</b> JavaKerberos

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
encrypt	boolean		JDBC driver property: encrypt.
failoverPartner	string		JDBC driver property: failoverPartner.
hostNameInCertificate	string		JDBC driver property: hostNameInCertificate.
instanceName	string		JDBC driver property: instanceName.
integratedSecurity	boolean		JDBC driver property: integratedSecurity.
lastUpdateCount	boolean		JDBC driver property: lastUpdateCount.
lockTimeout	A period of time with millisecond precision		JDBC driver property: lockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
multiSubnetFailover	boolean		JDBC driver property: multiSubnetFailover.
packetSize	int Minimum: 512 Maximum: 32767		JDBC driver property: packetSize.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.

Attribute name	Data type	Default value	Description
responseBuffering	<ul style="list-style-type: none"> <li>full</li> <li>adaptive</li> </ul>		JDBC driver property: responseBuffering. <b>full</b> full <b>adaptive</b> adaptive
selectMethod	<ul style="list-style-type: none"> <li>direct</li> <li>cursor</li> </ul>		JDBC driver property: selectMethod. <b>direct</b> direct <b>cursor</b> cursor
sendStringParametersAsUnicode	boolean	false	JDBC driver property: sendStringParametersAsUnicode.
sendTimeAsDatetime	boolean		JDBC driver property: sendTimeAsDatetime.
serverName	string	localhost	Server where the database is running.
trustServerCertificate	boolean		JDBC driver property: trustServerCertificate.
trustStore	string		JDBC driver property: trustStore.
trustStorePassword	Reversably encoded password (string)		JDBC driver property: trustStorePassword.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
workstationID	string		JDBC driver property: workstationID.
xopenStates	boolean		JDBC driver property: xopenStates.

#### dataSource > properties.oracle

Data source properties for Oracle JDBC driver.

false

Attribute name	Data type	Default value	Description
ONSConfiguration	string		JDBC driver property: ONSConfiguration.
TNSEntryName	string		JDBC driver property: TNSEntryName.
URL	string		URL for connecting to the database. Examples: jdbc:oracle:thin://localhost:1521/sample or jdbc:oracle:oci://localhost:1521/sample.
connectionProperties	string		JDBC driver property: connectionProperties.

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
driverType	<ul style="list-style-type: none"> <li>oci</li> <li>thin</li> </ul>	thin	JDBC driver property: driverType.  <b>oci</b> oci <b>thin</b> thin
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
networkProtocol	string		JDBC driver property: networkProtocol.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1521	Port on which to obtain database connections.
serverName	string	localhost	Server where the database is running.
serviceName	string		JDBC driver property: serviceName.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

#### dataSource > properties.sybase

Data source properties for Sybase JDBC driver.

false

Attribute name	Data type	Default value	Description
SERVER_INITIATED_TRANSACTIONS	<ul style="list-style-type: none"> <li>false</li> <li>true</li> </ul>	false	JDBC driver property: SERVER_INITIATED_TRANSACTIONS.  <b>false</b> false <b>true</b> true
connectionProperties	string	SELECT_OPENS_CURSOR=true	JDBC driver property: connectionProperties.
databaseName	string		JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
networkProtocol	<ul style="list-style-type: none"> <li>• SSL</li> <li>• socket</li> </ul>		JDBC driver property: networkProtocol.  <b>SSL</b> SSL <b>socket</b> socket
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	5000	Port on which to obtain database connections.
resourceManagerName	string		JDBC driver property: resourceManagerName.
serverName	string	localhost	Server where the database is running.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
version	int		JDBC driver property: version.

**dataSource > recoveryAuthData**

Authentication data for transaction recovery.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

## DeployManager (deployManager)

DeployManager

Attribute name	Data type	Default value	Description
maxResults	int	100	The maximum number of deploy results to hold in memory. After the maximum is reached, the oldest result is discarded.

## Deploy Rule (deployRule)

The rule used to deploy a member

- inputVariable
- runtimeTpe

Attribute name	Data type	Default value	Description
deploy	string		The command to deploy a member
id	string		A unique configuration ID.
name	string		The name of the deploy rule
restart	string		The command to restart a deployed member
start	string		The command to start a deployed member
stop	string		The command to stop a deployed member
type	string		The type of member to be deployed
undeploy	string		The command to undeploy a member

### inputVariable

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
defaultValue	string		The default value for the input variable
description	string		The description of the input variable
displayName	string		The display name of the input variable
group	string		The group of the input variable
id	string		A unique configuration ID.
name	string		The name of the input variable

Attribute name	Data type	Default value	Description
type	string		The type of the input variable

### runtimeTpe

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
displayName	string		The display name for the runtime
id	string		A unique configuration ID.

## DeployVariable (deployVariable)

The deploy variable configuration element.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
increment	int	0	Increment value for the deployVariable.
name	string		Name for the deployVariable.
value	string		Initial value of the deployVariable.

## Distributed Map (distributedMap)

Distributed map configuration for a local cache.

- cacheGroup
  - member
    - adapterBeanName
- diskCache
- library
  - file
  - fileset
  - folder

Attribute name	Data type	Default value	Description
cacheProviderName	string	default	Specifies the name of an alternate cache provider.
highThreshold	int Minimum: -1 Maximum: 100	-1	Specifies when the memory cache eviction policy starts. The threshold is expressed in terms of the percentage of the memory cache size in megabytes (MB).
id	string		A unique configuration ID.
jndiName	string	\${id}	JNDI name for a cache instance.

Attribute name	Data type	Default value	Description
libraryRef	A reference to top level library element (string).		Specifies a reference to a shared library.
lowThreshold	int Minimum: -1 Maximum: 100	-1	Specifies when the memory cache eviction policy ends. The threshold is expressed in terms of the percentage of the memory cache size in megabytes (MB).
memorySizeInEntries	int Minimum: 0	2000	Specifies a positive integer that defines the maximum number of entries that the cache can hold. Values are usually in the thousands. The minimum value is 100, with no set maximum value. The default value is 2000.
memorySizeInMB	int Minimum: -1	-1	Specifies a value for the maximum memory cache size in megabytes (MB).

#### cacheGroup

Specifies sets of external caches that are controlled by WebSphere(R) Application Server on servers such as IBM(R) WebSphere(R) Edge Server and IBM(R) HTTP Server.

false

Attribute name	Data type	Default value	Description
name	string		Specifies a unique name for the external cache group. The external cache group name must match the ExternalCache property that is defined in the servlet or Java(TM) Server Pages (JSP) cachespec.xml file.

#### cacheGroup > member

Members of an external cache group that are controlled by WebSphere Application Server.

false

Attribute name	Data type	Default value	Description
host	string		Fully qualified host name
port	int Minimum: 0		Port.

#### cacheGroup > member > adapterBeanName

Specifies the name of a class, which is located on the WebSphere Application Server class path, of the adapter between WebSphere Application Server and this external cache.

false

string

## diskCache

Enable disk offload to specify that when the cache is full, cache entries are removed from the cache and saved to disk. The location is a fully-qualified directory location that is used by the disk offload function. The Flush to Disk on Stop option specifies that when the server stops, the contents of the memory cache are moved to disk.

false

Attribute name	Data type	Default value	Description
evictionPolicy	<ul style="list-style-type: none"><li>• RANDOM</li><li>• SIZE</li></ul>	RANDOM	Specifies the eviction algorithm and thresholds that the disk cache uses to evict entries. When the disk size reaches a high threshold limit, the disk cache garbage collector wakes up and evicts randomly-selected (Random) or the largest (Size) entries on the disk until the disk size reaches a low threshold limit. <b>RANDOM</b> Random <b>SIZE</b> Size
flushToDiskOnStopEnabled	boolean	false	Set this value to true to have objects that are cached in memory saved to disk when the server stops. This value is ignored if Enable disk offload is set to false.
highThreshold	int Minimum: 0 Maximum: 100	80	Specifies when the eviction policy starts.
location	Path to a directory		Specifies a directory to use for disk offload.
lowThreshold	int Minimum: 0 Maximum: 100	70	Specifies when the eviction policy ends.
sizeInEntries	int Minimum: 0	100000	Specifies a value for the maximum disk cache size, in number of entries.
sizeInGB	int Minimum: 3	3	Specifies a value for the maximum disk cache size, in gigabytes (GB).

## library

Specifies a reference to a shared library.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

### library > file

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

### library > fileset

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

### library > folder

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

## SIP Domain Resolver (domainResolver)

Configuration for the SIP domain resolver

- dnsServers

Attribute name	Data type	Default value	Description				
addTtl	boolean	false	Add an IBMTTL parameter to the SIP URI.				
dnsAllowedFailures	int	5	The number of allowed DNS lookup failures for the DNS failover mechanism.				
dnsAutoResolve	boolean	false	Resolve domain names automatically.				
dnsEdns	<ul style="list-style-type: none"> <li>• N</li> <li>• Y</li> </ul>	Y	Defines the transport protocol for DNS lookup to resolve RFC 3263 SIP URIs. If set to Y, UDP is used. If set to N, TCP is used. <table border="0" style="margin-left: 20px;"> <tr> <td>N</td> <td>N</td> </tr> <tr> <td>Y</td> <td>Y</td> </tr> </table>	N	N	Y	Y
N	N						
Y	Y						

Attribute name	Data type	Default value	Description
dnsRequestCacheTimeoutMin	A period of time with minute precision	10m	The minimum time in minutes after which cached DNS queries time out. Specify a positive integer followed by a unit of time, which can be hours (h) or minutes (m). For example, specify 30 minutes as 30m. You can include multiple values in a single entry. For example, 1h30m is equivalent to 90 minutes.
dnsSingleQueryTimeoutSec	A period of time with second precision	5s	The number of seconds after which a single query times out for the DNS failover mechanism. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
dnsUdpPayloadSize	short Minimum: 512 Maximum: 32767	1280	The UDP payload size in bytes for the DNS resolver service.
dnsWindowSizeInterval	int	10	The resolver service window size interval for the DNS failover mechanism.
dnsWindowSizeMin	int	600	The minimum window size for the DNS failover mechanism.

### dnsServers

Allows a SIP URI to be resolved through DNS into the IP address, port, and transport protocol. The value is a String that contains exactly one or two address and port tuples, where two tuples are separated by a space.

false

string

## IBM Lotus Domino LDAP Filters (domino50LdapFilterProperties)

Specifies the list of default IBM Lotus Domino LDAP filters.

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)(objectclass=dominoGroup))	An LDAP filter clause for searching the user registry for groups.

Attribute name	Data type	Default value	Description
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	dominoGroup:member	An LDAP filter that identifies user to group memberships.
id	string		A unique configuration ID.
userFilter	string	(&(uid=%v)(objectclass=Person))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	person:uid	An LDAP filter that maps the name of a user to an LDAP entry.

## Dynamic Routing (dynamicRouting)

Defines Dynamic Routing specific configuration options.

- pluginProperty
- routingRules
  - routingRule
    - permitAction
      - loadBalanceEndPoints
        - endPoint
    - redirectAction
    - rejectAction
- traceSpecification

Attribute name	Data type	Default value	Description
connectorClusterName	string		The name of the connector cluster.
maxRetries	int Minimum: -1	-1	The maximum number of retry attempts. Specifying -1 (default) disables the limit.
retryInterval	A period of time with second precision	60s	The retry interval duration. The default value is 60 seconds. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

### pluginProperty

A custom property for the WebSphere plug-in configuration. This property is directly inserted into the generated WebSphere plug-in configuration file.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		The name of the custom property. This name is directly inserted into the generated WebSphere plug-in configuration file.
scope	<ul style="list-style-type: none"> <li>connectorCluster</li> <li>intelligentManagement</li> </ul>	intelligentManagement	<p>The scope of the custom property. This determines which generated WebSphere plug-in configuration file stanza it is nested upon.</p> <p><b>connectorCluster</b> ConnectorCluster</p> <p><b>intelligentManagement</b> IntelligentManagement</p>
value	string		The value of the custom property. This value is directly inserted into the generated WebSphere plug-in configuration file.

### routingRules

Set of routing rules

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
webServers	string	*	Web servers for which the routing rules have to be created.

### routingRules > routingRule

Routing rule as part of the routing rule set

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
matchExpression	string	false	Expression to be matched
order	string		Order

### routingRules > routingRule > permitAction

Permit action

false

Attribute name	Data type	Default value	Description
allowMaintenanceModeServers	boolean	false	Check it to permit requests to maintenance mode servers

**routingRules > routingRule > permitAction > loadBalanceEndpoints**

Destination end points between which the requests have to be load balanced

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

**routingRules > routingRule > permitAction > loadBalanceEndpoints > endPoint**

Target destination for the routing rule

false

Attribute name	Data type	Default value	Description
destination	string	*	Destination
id	string		A unique configuration ID.

**routingRules > routingRule > redirectAction**

Redirect action

false

Attribute name	Data type	Default value	Description
redirectAction.location	string		URL to which the redirect should be done

**routingRules > routingRule > rejectAction**

Reject action

false

Attribute name	Data type	Default value	Description
rejectAction.code	string	404	The status code to be returned on reject

**traceSpecification**

A custom trace specification for the WebSphere plug-in configuration. This property is directly inserted into the generated WebSphere plug-in configuration file.

false

Attribute name	Data type	Default value	Description
condition	string		When a request satisfies this condition, specified trace specification will be enabled for the request. This value should not be left blank for non-default specifications. It is directly inserted into the generated WebSphere plug-in configuration file.
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
name	string		The name of the trace specification property. Trace specifications for the same webserver should have unique names. Only the most specific, latest specification with the same name is inserted into the generated WebSphere plug-in configuration file.
specification	string		The value of the trace specification property. This value is directly inserted into the generated WebSphere plug-in configuration file.
webservers	string	*	Webservers for which the trace specification applies. Comma-separated list of webserver names for which the specification should be inserted into the generated WebSphere plug-in configuration file. Specify "*" (default) for all webservers.

## Novell eDirectory LDAP Filters (edirectoryLdapFilterProperties)

Specifies the list of Novell eDirectory LDAP filters.

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)(objectclass=groupOfNames))	An LDAP filter clause for searching the user registry for groups.
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	groupOfNames:member	An LDAP filter that identifies user to group memberships.
id	string		A unique configuration ID.
userFilter	string	(&(cn=%v)(objectclass=Person))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	person:cn	An LDAP filter that maps the name of a user to an LDAP entry.

## EJB Application (ejbApplication)

Defines the properties of an EJB application.

- application-bnd

- security-role
  - group
  - run-as
  - special-subject
  - user
- classloader
  - commonLibrary
    - file
    - fileset
    - folder
  - privateLibrary
    - file
    - fileset
    - folder

Attribute name	Data type	Default value	Description
autoStart	boolean	true	Indicates whether or not the server automatically starts the application.
context-root	string		Context root of an application.
id	string		A unique configuration ID.
location	A file, directory or url.		Location of an application expressed as an absolute path or a path relative to the server-level apps directory.
name	string		Name of an application.
suppressUncoveredHttpMethodWarning	boolean	false	Option to suppress uncovered HTTP method warning message during application deployment.

### application-bnd

Binds general deployment information included in the application to specific resources.

false

Attribute name	Data type	Default value	Description
version	string		Version of the application bindings specification.

### application-bnd > security-role

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		Name of a security role.

**application-bnd > security-role > group**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		Group access ID
id	string		A unique configuration ID.
name	string		Name of a group possessing a security role.

**application-bnd > security-role > run-as**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
password	Reversably encoded password (string)		Password of a user required to access a bean from another bean. The value can be stored in clear text or encoded form. To encode the password, use the securityUtility tool with the encode option.
userid	string		ID of a user required to access a bean from another bean.

**application-bnd > security-role > special-subject**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
type	<ul style="list-style-type: none"> <li>• EVERYONE</li> <li>• ALL_AUTHENTICATED_USERS</li> </ul>		One of the following special subject types: ALL_AUTHENTICATED_USERS, EVERYONE.  <b>EVERYONE</b> Everyone  <b>ALL_AUTHENTICATED_USERS</b> All authenticated users

**application-bnd > security-role > user**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		A user access ID in the general form user:realmName/userUniqueId. A value will be generated if one is not specified.
id	string		A unique configuration ID.
name	string		Name of a user possessing a security role.

### classloader

Defines the settings for an application classloader.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
classProviderRef	List of references to top level resourceAdapter elements (comma-separated string).		List of class provider references. When searching for classes or resources, this class loader will delegate to the specified class providers after searching its own class path.
commonLibraryRef	List of references to top level library elements (comma-separated string).		List of library references. Library class instances are shared with other classloaders.
delegation	<ul style="list-style-type: none"> <li>parentFirst</li> <li>parentLast</li> </ul>	parentFirst	Controls whether parent classloader is used before or after this classloader. If parent first is selected then delegate to immediate parent before searching the classpath. If parent last is selected then search the classpath before delegating to the immediate parent.  <b>parentFirst</b> Parent first  <b>parentLast</b> Parent last
privateLibraryRef	List of references to top level library elements (comma-separated string).		List of library references. Library class instances are unique to this classloader, independent of class instances from other classloaders.

**classloader > commonLibrary**

List of library references. Library class instances are shared with other classloaders.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
id	string		A unique configuration ID.
name	string		Name of shared library for administrators

**classloader > commonLibrary > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**classloader > commonLibrary > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**classloader > commonLibrary > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**classloader > privateLibrary**

List of library references. Library class instances are unique to this classloader, independent of class instances from other classloaders.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
id	string		A unique configuration ID.
name	string		Name of shared library for administrators

**classloader > privateLibrary > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**classloader > privateLibrary > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**classloader > privateLibrary > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

## EJB Container (ejbContainer)

Defines the behavior of the EJB container.

- asynchronous
  - contextService
    - baseContext
      - baseContext
      - classloaderContext
      - jeeMetadataContext
      - securityContext
      - syncToOSThreadContext
      - zosWLMContext
    - classloaderContext
    - jeeMetadataContext
    - securityContext
    - syncToOSThreadContext
    - zosWLMContext
- timerService
  - persistentExecutor
    - contextService
      - baseContext
        - baseContext
        - classloaderContext
        - jeeMetadataContext
        - securityContext
        - syncToOSThreadContext
        - zosWLMContext
      - classloaderContext
      - jeeMetadataContext
      - securityContext
      - syncToOSThreadContext
      - zosWLMContext

Attribute name	Data type	Default value	Description
cacheCleanupInterval	A period of time with second precision	3s	The interval between passivating unused stateful session bean instances when the size is exceeded. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
cacheSize	int Minimum: 1	2053	The number of stateful session bean instances that should be cached in memory.
poolCleanupInterval	A period of time with second precision	30s	The interval between removing unused bean instances. This setting only applies to stateless session and message-driven beans. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
startEJBsAtAppStart	boolean		Specifies when EJB types will be initialized. If this property is set to true, EJB types will be initialized at the time applications are first started. If this property is set to false, EJB types will be initialized at the time the EJB type is first used by an application. If this property is not set, the behavior is determined on a bean-by-bean basis from the start-at-app-start attribute in the ibm-ejb-jar-ext.xml file. This setting does not apply to either message-driven or startup singleton beans. Message-driven and startup singleton beans will always be initialized at the time applications are started.

**asynchronous**

Defines the behavior of EJB asynchronous methods.

false

Attribute name	Data type	Default value	Description
contextServiceRef	A reference to top level contextService element (string).		The context service used to manage context propagation to asynchronous EJB method threads.
maxUnclaimedRemoteResults	sint Minimum: 1	1000	The maximum number of unclaimed results that the server retains from all remote asynchronous method calls that return a Future object. If the maximum is exceeded, the server purges the result of the method call that completed the longest ago to prevent memory leakage.
unclaimedRemoteResultTimeout	A period of time with second precision	24h	The amount of time that the server retains the result for each remote asynchronous method call that returns a Future object. If an application does not claim the result within the specified period of time, the server purges the result of that method call to prevent memory leakage. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

**asynchronous > contextService**

The context service used to manage context propagation to asynchronous EJB method threads.

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
jndiName	string		JNDI name

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**asynchronous > contextService > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
id	string		A unique configuration ID.
jndiName	string		JNDI name

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**asynchronous > contextService > baseContext > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

com.ibm.ws.context.service-factory

**asynchronous > contextService > baseContext > classloaderContext**

Classloader context propagation configuration.

false

**asynchronous > contextService > baseContext > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**asynchronous > contextService > baseContext > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**asynchronous > contextService > baseContext > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**asynchronous > contextService > baseContext > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"><li>• Propagate</li><li>• PropagateOrNew</li><li>• New</li></ul>	Propagate	Indicates how the WLM context should be handled for non-Daemon work. <b>Propagate</b> Use the same WLM Context (if one exists). <b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists. <b>New</b> Always create a new WLM context.

**asynchronous > contextService > classloaderContext**

Classloader context propagation configuration.

false

**asynchronous > contextService > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**asynchronous > contextService > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**asynchronous > contextService > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**asynchronous > contextService > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"> <li>• Propagate</li> <li>• PropagateOrNew</li> <li>• New</li> </ul>	Propagate	<p>Indicates how the WLM context should be handled for non-Daemon work.</p> <p><b>Propagate</b> Use the same WLM Context (if one exists).</p> <p><b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists.</p> <p><b>New</b> Always create a new WLM context.</p>

**timerService**

Defines the behavior of the EJB timer service.

false

Attribute name	Data type	Default value	Description
lateTimerThreshold	A period of time with minute precision	5m	Number of minutes after the scheduled expiration of a timer that the start of the timer will be considered late. When a timer does start late, a warning message will be logged indicating that the timer has started later than scheduled. The default threshold is 5 minutes and a value of 0 minutes turns off the warning message feature. Specify a positive integer followed by a unit of time, which can be hours (h) or minutes (m). For example, specify 30 minutes as 30m. You can include multiple values in a single entry. For example, 1h30m is equivalent to 90 minutes.
nonPersistentMaxRetries	int Minimum: -1	-1	When a non-persistent timer expires, the timeout callback method is called. This setting controls how many times the EJB container attempts to retry the timer. If the transaction for this callback method fails or is rolled back, the EJB container must retry the timer at least once. The default value is -1, which means the EJB container retries infinitely until the timer is successful. If the value is set to 0, the EJB container does not retry the timer, however, this results in behavior that is not compliant with the EJB specification.

Attribute name	Data type	Default value	Description
nonPersistentRetryInterval	A period of time with second precision	300s	When a non-persistent timer expires, the timeout callback method is called. If the transaction for this callback method fails or is rolled back, the container must retry the timer. The first retry attempt occurs immediately, and subsequent retry attempts are delayed by the number of seconds specified. If the value is set to 0, then all retries occur immediately. If you do not specify a value, the default interval is 300 seconds. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
persistentExecutorRef	A reference to top level persistentExecutor element (string).		Schedules and runs EJB persistent timer tasks.

**timerService > persistentExecutor**

Schedules and runs EJB persistent timer tasks.

false

Attribute name	Data type	Default value	Description
contextServiceRef	A reference to top level contextService element (string).	DefaultContextService	Configures how context is captured and propagated to threads.
enableTaskExecution	boolean	true	Determines whether or not this instance may run tasks.

Attribute name	Data type	Default value	Description
initialPollDelay	A period of time with millisecond precision	0	Duration of time to wait before this instance might poll the persistent store for tasks to run. A value of -1 delays polling until it is started programmatically. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
pollInterval	A period of time with millisecond precision	-1	Interval between polling for tasks to run. A value of -1 disables all polling after the initial poll. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
pollSize	int Minimum: 1		The maximum number of task entries to find when polling the persistent store for tasks to run. If unspecified, there is no limit.
retryInterval	A period of time with millisecond precision	1m	The amount of time that must pass between the second and subsequent consecutive retries of a failed task. The first retry occurs immediately, regardless of the value of this attribute. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
retryLimit	short Minimum: -1 Maximum: 10000	10	Limit of consecutive retries for a task that has failed or rolled back, after which the task is considered permanently failed and does not attempt further retries. A value of -1 allows for unlimited retries.
taskStoreRef	A reference to top level databaseStore element (string).	defaultDatabaseStore	Persistent store for scheduled tasks.

**timerService > persistentExecutor > contextService**

Configures how context is captured and propagated to threads.

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
jndiName	string		JNDI name

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**timerService > persistentExecutor > contextService > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
id	string		A unique configuration ID.
jndiName	string		JNDI name

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**timerService > persistentExecutor > contextService > baseContext > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

com.ibm.ws.context.service-factory

**timerService > persistentExecutor > contextService > baseContext > classloaderContext**

Classloader context propagation configuration.

false

**timerService > persistentExecutor > contextService > baseContext > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**timerService > persistentExecutor > contextService > baseContext > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**timerService > persistentExecutor > contextService > baseContext > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**timerService > persistentExecutor > contextService > baseContext > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"><li>• Propagate</li><li>• PropagateOrNew</li><li>• New</li></ul>	Propagate	Indicates how the WLM context should be handled for non-Daemon work. <b>Propagate</b> Use the same WLM Context (if one exists). <b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists. <b>New</b> Always create a new WLM context.

**timerService > persistentExecutor > contextService > classloaderContext**

Classloader context propagation configuration.

false

**timerService > persistentExecutor > contextService > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**timerService > persistentExecutor > contextService > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**timerService > persistentExecutor > contextService > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**timerService > persistentExecutor > contextService > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"><li>• Propagate</li><li>• PropagateOrNew</li><li>• New</li></ul>	Propagate	Indicates how the WLM context should be handled for non-Daemon work. <b>Propagate</b> Use the same WLM Context (if one exists). <b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists. <b>New</b> Always create a new WLM context.

## Enterprise Application (enterpriseApplication)

Defines the properties of an enterprise application.

- application-bnd
  - security-role
    - group
    - run-as
    - special-subject
    - user
- classloader
  - commonLibrary
  - file
  - fileset
  - folder
  - privateLibrary

- file
- fileset
- folder
- resourceAdapter
  - contextService
    - baseContext
      - baseContext
      - classloaderContext
      - jeeMetadataContext
      - securityContext
      - syncToOSThreadContext
      - zosWLMContext
    - classloaderContext
    - jeeMetadataContext
    - securityContext
    - syncToOSThreadContext
    - zosWLMContext
  - customize

Attribute name	Data type	Default value	Description
autoStart	boolean	true	Indicates whether or not the server automatically starts the application.
defaultClientModule	string		Default client module of an enterprise application.
id	string		A unique configuration ID.
location	A file, directory or url.		Location of an application expressed as an absolute path or a path relative to the server-level apps directory.
name	string		Name of an application.
suppressUncoveredHttpMethodWarning	boolean	false	Option to suppress uncovered HTTP method warning message during application deployment.

### application-bnd

Binds general deployment information included in the application to specific resources.

false

Attribute name	Data type	Default value	Description
version	string		Version of the application bindings specification.

### application-bnd > security-role

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		Name of a security role.

**application-bnd > security-role > group**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		Group access ID
id	string		A unique configuration ID.
name	string		Name of a group possessing a security role.

**application-bnd > security-role > run-as**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
password	Reversably encoded password (string)		Password of a user required to access a bean from another bean. The value can be stored in clear text or encoded form. To encode the password, use the securityUtility tool with the encode option.
userid	string		ID of a user required to access a bean from another bean.

**application-bnd > security-role > special-subject**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
type	<ul style="list-style-type: none"> <li>• EVERYONE</li> <li>• ALL_AUTHENTICATED_USERS</li> </ul>		One of the following special subject types: ALL_AUTHENTICATED_USERS, EVERYONE.  <b>EVERYONE</b> Everyone  <b>ALL_AUTHENTICATED_USERS</b> All authenticated users

**application-bnd > security-role > user**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		A user access ID in the general form user:realmName/userUniqueId. A value will be generated if one is not specified.
id	string		A unique configuration ID.
name	string		Name of a user possessing a security role.

### classloader

Defines the settings for an application classloader.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
classProviderRef	List of references to top level resourceAdapter elements (comma-separated string).		List of class provider references. When searching for classes or resources, this class loader will delegate to the specified class providers after searching its own class path.
commonLibraryRef	List of references to top level library elements (comma-separated string).		List of library references. Library class instances are shared with other classloaders.
delegation	<ul style="list-style-type: none"><li>parentFirst</li><li>parentLast</li></ul>	parentFirst	Controls whether parent classloader is used before or after this classloader. If parent first is selected then delegate to immediate parent before searching the classpath. If parent last is selected then search the classpath before delegating to the immediate parent. <b>parentFirst</b> Parent first <b>parentLast</b> Parent last

Attribute name	Data type	Default value	Description
privateLibraryRef	List of references to top level library elements (comma-separated string).		List of library references. Library class instances are unique to this classloader, independent of class instances from other classloaders.

**classloader > commonLibrary**

List of library references. Library class instances are shared with other classloaders.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
id	string		A unique configuration ID.
name	string		Name of shared library for administrators

**classloader > commonLibrary > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**classloader > commonLibrary > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.

Attribute name	Data type	Default value	Description
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**classloader > commonLibrary > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**classloader > privateLibrary**

List of library references. Library class instances are unique to this classloader, independent of class instances from other classloaders.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
id	string		A unique configuration ID.
name	string		Name of shared library for administrators

**classloader > privateLibrary > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**classloader > privateLibrary > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**classloader > privateLibrary > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**resourceAdapter**

Specifies configuration for a resource adapter that is embedded in an application.

false

Attribute name	Data type	Default value	Description
alias	string	#{id}	Overrides the default identifier for the resource adapter. The identifier is used in the name of the resource adapter's configuration properties element, which in turn is used in determining the name of configuration properties elements for any resources provided by the resource adapter. The resource adapter's configuration properties element name has the format, properties.<APP_NAME>.<ALIAS>, where <APP_NAME> is the name of the application and <ALIAS> is the configured alias. If unspecified, the alias defaults to the module name of the resource adapter.
autoStart	boolean		Configures whether a resource adapter starts automatically upon deployment of the resource adapter or lazily upon injection or lookup of a resource.
contextServiceRef	A reference to top level contextService element (string).		Configures how context is captured and propagated to threads.
id	string		Identifies the name of the embedded resource adapter module to which this configuration applies.

**resourceAdapter > contextService**

Configures how context is captured and propagated to threads.

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
jndiName	string		JNDI name

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**resourceAdapter > contextService > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
id	string		A unique configuration ID.
jndiName	string		JNDI name

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**resourceAdapter > contextService > baseContext > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

com.ibm.ws.context.service-factory

**resourceAdapter > contextService > baseContext > classloaderContext**

Classloader context propagation configuration.

false

**resourceAdapter > contextService > baseContext > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**resourceAdapter > contextService > baseContext > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**resourceAdapter > contextService > baseContext > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**resourceAdapter > contextService > baseContext > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"><li>• Propagate</li><li>• PropagateOrNew</li><li>• New</li></ul>	Propagate	Indicates how the WLM context should be handled for non-Daemon work. <b>Propagate</b> Use the same WLM Context (if one exists). <b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists. <b>New</b> Always create a new WLM context.

**resourceAdapter > contextService > classloaderContext**

Classloader context propagation configuration.

false

**resourceAdapter > contextService > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**resourceAdapter > contextService > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**resourceAdapter > contextService > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**resourceAdapter > contextService > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"> <li>• Propagate</li> <li>• PropagateOrNew</li> <li>• New</li> </ul>	Propagate	<p>Indicates how the WLM context should be handled for non-Daemon work.</p> <p><b>Propagate</b> Use the same WLM Context (if one exists).</p> <p><b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists.</p> <p><b>New</b> Always create a new WLM context.</p>

**resourceAdapter > customize**

Customizes the configuration properties element for the activation specification, administered object, or connection factory with the specified interface and/or implementation class.

false

Attribute name	Data type	Default value	Description
implementation	string		Fully qualified implementation class name for which the configuration properties element should be customized.
interface	string		Fully qualified interface class name for which the configuration properties element should be customized.

Attribute name	Data type	Default value	Description
suffix	string		Overrides the default suffix for the configuration properties element. For example, "CustomConnectionFactory" in properties.rarModule1.CustomConnectionFa The suffix is useful to disambiguate when multiple types of connection factories, administered objects, or endpoint activations are provided by a resource adapter. If a configuration properties element customization omits the suffix or leaves it blank, no suffix is used.

## Event Logging (eventLogging)

Logs a record of events, such as the JDBC requests and servlet requests, and their durations.

Attribute name	Data type	Default value	Description
eventTypes	string	all	A list of comma-separated event types that needs to be logged. Use all, to log all event types.
includeContextInfo	boolean	true	Indicates if the context information details are included in the log output.
logMode	<ul style="list-style-type: none"> <li>• entry</li> <li>• entryExit</li> <li>• exit</li> </ul>	exit	Controls whether the event logging occurs at the entry to events, at the exit from events, or both.  <b>entry</b> log at entry  <b>entryExit</b> log at entry and exit  <b>exit</b> log at exit
minDuration	A period of time with millisecond precision	1s	Exit entries will be logged for events longer than minDuration. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
sampleRate	int Minimum: 1	1	To sample one out of every n requests, set sampleRate to n. To sample all requests, set sampleRate to 1.

## Executor Management (executor)

Defines settings for the Liberty kernel default executor. Note that there is always one and exactly one default executor, for use by the Liberty runtime only and not directly accessible by applications.

Applications that need to configure and utilize executors should instead use Managed Executors.

Attribute name	Data type	Default value	Description
coreThreads	int	-1	Steady-state or core number of threads to associate with the executor. The number of threads associated with the executor will quickly grow to this number. If this value is less than 0, a default value is used. This default value is calculated based on the number of hardware threads on the system.
keepAlive	A period of time with millisecond precision	60s	Amount of time to keep an idle thread in the pool before allowing it to terminate. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
maxThreads	int	-1	Maximum number of threads that can be associated with the executor. If greater than 0, this value must be greater than or equal to the value of coreThreads. If the value of maxThreads is less than or equal to 0, the maximum number of threads is unbounded. Note that the actual number of threads associated with the executor is determined dynamically by the Liberty kernel, so leaving the maximum threads unbounded does not imply that the runtime will actively create large amounts of threads; it simply lets the Liberty kernel decide how many threads to associate with the executor without having a defined upper boundary.
name	string	Default Executor	The name of the Liberty kernel default executor.
rejectedWorkPolicy	<ul style="list-style-type: none"> <li>• CALLER_RUNS</li> <li>• ABORT</li> </ul>	ABORT	<p>Policy to employ when the executor is unable to stage work for execution.</p> <p><b>CALLER_RUNS</b> Execute the work immediately on the caller's thread.</p> <p><b>ABORT</b> Raise an exception.</p>

Attribute name	Data type	Default value	Description
stealPolicy	<ul style="list-style-type: none"> <li>• STRICT</li> <li>• NEVER</li> <li>• LOCAL</li> </ul>	LOCAL	<p>The work-stealing policy to employ. The options for this policy determine how work is queued, and how threads obtain queued work.</p> <p><b>STRICT</b> All threads that generate work own a local work pile. Threads that are associated with the executor take work from other threads when the local work pile is exhausted.</p> <p><b>NEVER</b> A global work queue is used to feed work to threads that are associated with the executor. No stealing will occur.</p> <p><b>LOCAL</b> A global work queue is used for work that is generated by threads that are not associated with the executor. Work generated by threads associated with the executor is placed on a local work pile. This work pile is owned by the generating thread, unless another thread steals it. Threads that are associated with the executor take work associated with other threads if the local work pile is empty and there is no work on the global work queue.</p>

## Feature Manager (featureManager)

Defines how the server loads features.

- feature

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"><li>• IGNORE</li><li>• FAIL</li><li>• WARN</li></ul>	WARN	Action to take after a failure to load a feature.  <b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.  <b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.  <b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.

### feature

Specifies a feature to be used when the server runs.

false

string

## User Registry Federation (federatedRepository)

Configuration for the user registry federation.

- extendedProperty
- primaryRealm
  - defaultParents
  - groupDisplayNameMapping
  - groupSecurityNameMapping
  - participatingBaseEntry
  - uniqueGroupIdMapping
  - uniqueUserIdMapping
  - userDisplayNameMapping
  - userSecurityNameMapping
- realm
  - defaultParents
  - groupDisplayNameMapping
  - groupSecurityNameMapping
  - participatingBaseEntry

- uniqueGroupIdMapping
- uniqueUserIdMapping
- userDisplayNameMapping
- userSecurityNameMapping
- supportedEntityType
  - defaultParent
  - name

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
maxSearchResults	int	4500	Maximum number of entries that can be returned in a search.
pageCacheSize	int	1000	Defines the number of pagination requests that can be stored in the cache. The paging cache size needs to be configured based on the number of pagination requests executed on the system and the hardware system resources available.
pageCacheTimeout	A period of time with millisecond precision	30000ms	Defines the maximum time that an entry, which added to the page cache, is available. When the specified time has elapsed, the entry from the page cache is cleared. This needs to be configured based on the interval between pagination search requests executed on the system and the hardware system resources available. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
searchTimeout	A period of time with millisecond precision	10m	Maximum amount of time, in milliseconds, to process a search. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

### extendedProperty

The extended properties for Person and Group.

false

Attribute name	Data type	Default value	Description
dataType	<ul style="list-style-type: none"> <li>• Double</li> <li>• Long</li> <li>• Date</li> <li>• String</li> <li>• BigDecimal</li> <li>• BigInteger</li> <li>• Boolean</li> <li>• Integer</li> </ul>		<p>Defines the data type of the property extended for Person and Group. The basic Java data types are supported.</p> <p><b>Double</b> Double</p> <p><b>Long</b> Long</p> <p><b>Date</b> Date</p> <p><b>String</b> String</p> <p><b>BigDecimal</b> BigDecimal</p> <p><b>BigInteger</b> BigInteger</p> <p><b>Boolean</b> Boolean</p> <p><b>Integer</b> Integer</p>
defaultValue	string		Defines the default value for the property during write operation, if no default value is set.
entityType	<ul style="list-style-type: none"> <li>• PersonAccount</li> <li>• Group</li> </ul>		<p>The name of the entity being mapped. The name of the entity can be PersonAccount or Group.</p> <p><b>PersonAccount</b> Person</p> <p><b>Group</b> Group</p>
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
multiValued	boolean	false	Defines if the property extended for Person and Group supports multiple values.
name	string		Defines the name of the property extended for Person and Group.

### **primaryRealm**

Primary realm configuration.

false

Attribute name	Data type	Default value	Description
allowOpIfRepoDown	boolean	false	Specifies whether operation is allowed if a repository is down. The default value is false.
delimiter	string	/	Delimiter used to qualify the realm under which the operation should be executed. For example, userid=test1/myrealm where / is the delimiter and myrealm is the realm name.
name	string		Name of the realm.

### **primaryRealm > defaultParents**

The default parent mapping for the realm.

false

Attribute name	Data type	Default value	Description
name	string		The name of the entity being mapped. The name of the entity can be PersonAccount or Group.
parentUniqueName	string		The distinguished name under Base distinguished name (DN) in the repository under which all entities of the configured type will be created.

### **primaryRealm > groupDisplayNameMapping**

The input and output property mappings for group display name in an user registry operation.

false

Attribute name	Data type	Default value	Description
inputProperty	string	cn	The property that maps to the user registry attribute for input. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.
outputProperty	string	cn	The property that maps to the user registry attribute for output. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

**primaryRealm > groupSecurityNameMapping**

The input and output property mappings for group security name in an user registry operation.

false

Attribute name	Data type	Default value	Description
inputProperty	string	cn	The property that maps to the user registry attribute for input. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.
outputProperty	string	cn	The property that maps to the user registry attribute for output. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

**primaryRealm > participatingBaseEntry**

The Base Entry that is part of this realm.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		Name of the base entry.

**primaryRealm > uniqueGroupIdMapping**

The input and output property mappings for unique group id in an user registry operation.

false

Attribute name	Data type	Default value	Description
inputProperty	string	cn	The property that maps to the user registry attribute for input. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.
outputProperty	string	uniqueName	The property that maps to the user registry attribute for output. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

**primaryRealm > uniqueUserIdMapping**

The input and output property mappings for unique user id used in an user registry operation.

false

Attribute name	Data type	Default value	Description
inputProperty	string	uniqueName	The property that maps to the user registry attribute for input. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.
outputProperty	string	uniqueName	The property that maps to the user registry attribute for output. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

**primaryRealm > userDisplayNameMapping**

The input and output property mappings for user display name in an user registry operation.

false

Attribute name	Data type	Default value	Description
inputProperty	string	principalName	The property that maps to the user registry attribute for input. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

Attribute name	Data type	Default value	Description
outputProperty	string	principalName	The property that maps to the user registry attribute for output. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

**primaryRealm > userSecurityNameMapping**

The input and output property mappings for user security name in an user registry operation.

false

Attribute name	Data type	Default value	Description
inputProperty	string	principalName	The property that maps to the user registry attribute for input. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.
outputProperty	string	uniqueName	The property that maps to the user registry attribute for output. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

**realm**

Reference to the realm.

false

Attribute name	Data type	Default value	Description
allowOpIfRepoDown	boolean	false	Specifies whether operation is allowed if a repository is down. The default value is false.
delimiter	string	/	Delimiter used to qualify the realm under which the operation should be executed. For example, userid=test1/myrealm where / is the delimiter and myrealm is the realm name.
id	string		A unique configuration ID.
name	string		Name of the realm.

**realm > defaultParents**

The default parent mapping for the realm.

false

Attribute name	Data type	Default value	Description
name	string		The name of the entity being mapped. The name of the entity can be PersonAccount or Group.
parentUniqueName	string		The distinguished name under Base distinguished name (DN) in the repository under which all entities of the configured type will be created.

**realm > groupDisplayNameMapping**

The input and output property mappings for group display name in an user registry operation.

false

Attribute name	Data type	Default value	Description
inputProperty	string	cn	The property that maps to the user registry attribute for input. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.
outputProperty	string	cn	The property that maps to the user registry attribute for output. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

**realm > groupSecurityNameMapping**

The input and output property mappings for group security name in an user registry operation.

false

Attribute name	Data type	Default value	Description
inputProperty	string	cn	The property that maps to the user registry attribute for input. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

Attribute name	Data type	Default value	Description
outputProperty	string	cn	The property that maps to the user registry attribute for output. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

**realm > participatingBaseEntry**

The Base Entry that is part of this realm.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		Name of the base entry.

**realm > uniqueGroupIdMapping**

The input and output property mappings for unique group id in an user registry operation.

false

Attribute name	Data type	Default value	Description
inputProperty	string	cn	The property that maps to the user registry attribute for input. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.
outputProperty	string	uniqueName	The property that maps to the user registry attribute for output. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

**realm > uniqueUserIdMapping**

The input and output property mappings for unique user id used in an user registry operation.

false

Attribute name	Data type	Default value	Description
inputProperty	string	uniqueName	The property that maps to the user registry attribute for input. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

Attribute name	Data type	Default value	Description
outputProperty	string	uniqueName	The property that maps to the user registry attribute for output. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

**realm > userDisplayNameMapping**

The input and output property mappings for user display name in an user registry operation.

false

Attribute name	Data type	Default value	Description
inputProperty	string	principalName	The property that maps to the user registry attribute for input. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.
outputProperty	string	principalName	The property that maps to the user registry attribute for output. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

**realm > userSecurityNameMapping**

The input and output property mappings for user security name in an user registry operation.

false

Attribute name	Data type	Default value	Description
inputProperty	string	principalName	The property that maps to the user registry attribute for input. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.
outputProperty	string	uniqueName	The property that maps to the user registry attribute for output. The valid values are: uniqueId, uniqueName, externalId, externalName and the attributes of PersonAccount and Group entity types.

**supportedEntityType**

The default parent for an entity type mapping.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

**supportedEntityType > defaultParent**

The distinguished name under Base distinguished name (DN) in the repository under which all entities of the configured type will be created.

false

string

**supportedEntityType > name**

The name of the entity being mapped. The name of the entity can be PersonAccount or Group.

false

string

## z/OS Connect File System Logger Interceptor (fileSystemLoggerInterceptor)

Defines a z/OS Connect File System logger interceptor.

Attribute name	Data type	Default value	Description
bufferSize	int	8192	Buffer size in bytes to be used when the bufferLogging attribute is set to true.
bufferedLogging	boolean	false	Indicates whether entries to the log is buffered before they are written to the log file.
encoding	string	UTF-8	Encoding used when writing to the log file.
id	string		A unique configuration ID.
logName	string		Log file name pattern used for payload logging.
logOption	<ul style="list-style-type: none"> <li>• RESPONSE</li> <li>• REQUEST</li> <li>• ALL</li> </ul>	ALL	<p>Log option that controls what is logged.</p> <p><b>RESPONSE</b> Indicates that only response data is logged.</p> <p><b>REQUEST</b> Indicates that only request data is logged.</p> <p><b>ALL</b> Indicates that both request and response data are logged.</p>

Attribute name	Data type	Default value	Description
logPath	string		File system location in which the file log is created. If the environment variable <code>\${server.output.dir}</code> is configured, its value is used by default.
maxPayloadSize	int	524288	Maximum payload size in characters allowed to be written to the log file.
rollOffLogPolicy	<ul style="list-style-type: none"> <li>• SIZE</li> <li>• DURATION</li> </ul>	SIZE	<p>Indicates that log file should be rolled off based on size or duration.</p> <p><b>SIZE</b> Indicates that the log file should be roll off based on the size of the log.</p> <p><b>DURATION</b> Indicates that the roll off log policy will be based on the elapsed time since the active log file was created.</p>
rollOffLogPolicyDuration	int	1440	Roll off policy duration in minutes.
rollOffLogPolicySize	int	52428800	Roll off policy size in bytes.
sequence	int Minimum: 0 Maximum: 2147483647	0	Sequence in which the interceptor is processed with respect to others.

## Fileset (fileset)

Specifies a set of files starting from a base directory and matching a set of patterns.

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	<code>\${server.config.dir}</code>	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

## Health Policy (healthPolicy)

Defines a condition for a server to be considered healthy and actions to take when the condition is not met.

- action
- cluster
- excessiveMemoryUsage
- excessiveRequestTimeout
- excessiveResponseTime
- host
- memoryLeak
- server

Attribute name	Data type	Default value	Description
enabled	boolean	true	Indicates whether the health policy is enabled.
id	string		A unique configuration ID.

### action

An action to take when the health condition breaches.

false

Attribute name	Data type	Default value	Description
action	<ul style="list-style-type: none"> <li>• generateThreadDump</li> <li>• restartServer</li> <li>• exitMaintenanceMode</li> <li>• enterMaintenanceMode</li> <li>• generateHeapDump</li> </ul>		<p>An action to take when the health condition breaches.</p> <p><b>generateThreadDump</b> Generate a thread dump of the server.</p> <p><b>restartServer</b> Restart the server.</p> <p><b>exitMaintenanceMode</b> Remove the server from maintenance mode</p> <p><b>enterMaintenanceMode</b> Put the server into maintenance mode</p> <p><b>generateHeapDump</b> Generate a heap dump of the server.</p>

#### cluster

Applies the health policy to servers that belong to a cluster.

false

Attribute name	Data type	Default value	Description
clusterName	string		The name of a cluster of servers to be monitored.

#### excessiveMemoryUsage

Detects if a JVM's heap size has grown over a configured percentage of the maximum heap size for a configured period of time.

false

Attribute name	Data type	Default value	Description
heapSizePercentage	int Minimum: 1 Maximum: 99	85	The threshold value for the percentage of the max heap size used by the server.

Attribute name	Data type	Default value	Description
timePeriod	A period of time with millisecond precision	5m	The time period over which the heap size must be over threshold before action is taken. The value can be from 1 millisecond to 1 day. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

#### **excessiveRequestTimeout**

Detects when the request timeout of a server, as measured by a web server that is enabled for Intelligent Management, exceeds the configured threshold value.

false

Attribute name	Data type	Default value	Description
timeoutPercentage	int Minimum: 1 Maximum: 99	85	The threshold value for the percentage of the request timeout by the server.

#### **excessiveResponseTime**

Detects when the average response time of requests to a server, as measured by a web server that is enabled for Intelligent Management, exceeds the configured threshold value.

false

Attribute name	Data type	Default value	Description
responseTime	A period of time with millisecond precision	10s	The average time that requests can take prior to corrective action. The value can be from 1 millisecond to 1 hour. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

#### **host**

Applies the health policy to servers that reside on a host.

false

Attribute name	Data type	Default value	Description
hostName	string		The name of a host whose servers are to be monitored.

**memoryLeak**

Detects if a JVMs heap size after the GC keeps growing.

false

**server**

Applies the health policy to a specific server.

false

Attribute name	Data type	Default value	Description
hostName	string		The host name of the server to be monitored.
serverName	string		The name of the server to be monitored.
wlpUsrDirectory	Path to a directory		The absolute WLP usr directory of the server to be monitored.

## Host Access (hostAccess)

Host Access configuration

Attribute name	Data type	Default value	Description
connTimeout	A period of time with second precision	180s	Amount of time to wait for obtaining a remote connection to remote targets. The default value is 180 seconds. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
enableCustomActions	boolean	false	Indicates whether custom actions are allowed to be executed on collective hosts. The default value is false.

Attribute name	Data type	Default value	Description
operationTimeout	A period of time with second precision	360s	Amount of time to wait for completing an operation on remote targets. The default value is 360 seconds. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
useSftp	boolean	false	Indicates whether to use sftp to transfer file. Te default value is false meaning to use scp to transfer file.

## Host Authentication Information (hostAuthInfo)

Connection details to allow for the collective controller to authenticate to the server's host.

Attribute name	Data type	Default value	Description
rpcHost	string	localhost	The fully qualified host name or IP address. A '*' wildcard will result in host name detection; this is not recommended for multi-homed systems and may result in unexpected behaviour. The host name must be unique within the network and must be the host name on which the remote connection protocol is listening (SSH, or OS specific RPC). This value will inherit from the defaultHostName variable if not set. The host name set here will directly control where the server's information is stored within the collective controller repository.
rpcPort	int	22	The port on which the remote connection protocol is listening (SSH, or OS specific RPC). See product documentation for supported RPC mechanisms.

Attribute name	Data type	Default value	Description
rpcUser	string		The operating system user ID to use to connect to the host.
rpcUserHome	string		The home directory of the user login ID. Only required to be set if sudo is to be used and SSH generation is to be done automatically.
rpcUserPassword	Reversably encoded password (string)		The password for the operating system user. If this property is not set, key-based authentication will be used. Use of key-based authentication is recommended for hosts which support SSH. If this property is set and sshPrivateKeyPath is also set, the key will take precedence.
sshPrivateKeyPassword	Reversably encoded password (string)		The password for the SSH private key.
sshPrivateKeyPath	string		The path to the SSH private key file. If the key pair does not exist, a key pair will be generated automatically. The private key is required for key-based authentication.
sshPublicKeyPath	string		The path to the SSH public key file. If the key pair does not exist, a key pair will be generated automatically. The public key will be placed into the configured userId's authorized_keys file if it is not present. Setting the path to the public key is not required.
sudoUser	string		The sudo user ID. This property should not be set when useSudo=false.
sudoUserPassword	Reversably encoded password (string)		The password for the sudo user. This property should not be set when useSudo=false.

Attribute name	Data type	Default value	Description
useHostCredentials	boolean		If this property is set to true, then the product uses the RPC credentials of the host to invoke commands and ignores other parameters in the 'Host Authentication Information' element.
useSudo	boolean		If this property is set to true, then sudo will be used to invoke commands. The user to sudo as can be controlled by setting sudoUser attribute. If sudoUser is not set, then the user to sudo as will be the configured default sudo user for the host. If this property is not set, and either sudoUser or sudoUserPassword are set, then useSudo is assumed to be true. If this property is set to false, and either sudoUser or sudoUserPassword are set, then a warning will be printed and the sudo options will be ignored.

## Host Singleton (hostSingleton)

Host singleton elector configuration

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string	*	The name of the singleton. A '*' wildcard is the default value and indicates this configuration applies to all singletons in this server.
port	int	0	The port to use for host singleton leader elections. A value of 0 is the default and means that no election will occur. In this case, the singleton in each member will be its own leader.

## HTTP Access Logging (httpAccessLogging)

HTTP access logs contain a record of all inbound HTTP client requests.

Attribute name	Data type	Default value	Description
enabled	boolean	true	Enable access logging.

Attribute name	Data type	Default value	Description
filePath	Path to a file	\${server.output.dir}/logs/http_access.log	Directory path and name of the access log file. Standard variable substitutions, such as \${server.output.dir}, can be used when specifying the directory path.
id	string		A unique configuration ID.
logFormat	string	%h %u %t]W "%r" %s %b	Specifies the log format that is used when logging client access information.
maxFileSize	int Minimum: 0	20	Maximum size of a log file, in megabytes, before being rolled over; a value of 0 means no limit.
maxFiles	int Minimum: 0	2	Maximum number of log files that will be kept, before the oldest file is removed; a value of 0 means no limit.

## HTTP Dispatcher (httpDispatcher)

HTTP Dispatcher configuration.

- trustedHeaderOrigin

Attribute name	Data type	Default value	Description
appOrContextRootMissingMessage	string		Message to return to the client when the application in the requested URI can not be found.
enableWelcomePage	boolean	true	Enables the default Liberty profile welcome page when no application is bound to a context root of "/". The default value is true.

### trustedHeaderOrigin

Private headers are used by the web server plug-in to provide information about the original request. These headers take precedence over the http Host header, and are used to select a virtual host to service a request. The default value is '\*', which will trust incoming private headers from any source. Specify 'none' to disable private headers and rely only on the http Host header, or specify a list of IP addresses to restrict private header processing to specific trusted sources.

false

string

## HTTP Transport Encoding (httpEncoding)

HTTP transport encoding settings

Attribute name	Data type	Default value	Description
converter.Big5	string	Cp950	Big5 Chinese converter

Attribute name	Data type	Default value	Description
converter.EUC-JP	string	Cp33722C	EUC Japanese converter (EUC-JP)
converter.EUC-KR	string	Cp970	EUC Korean converter (EUC-KR)
converter.EUC-TW	string	Cp964	EUC Chinese (Taiwan) converter (EUC-TW)
converter.EUC_KR	string	Cp970	EUC Korean converter (EUC_KR)
converter.GB2312	string	EUC_CN	GB2312 Chinese converter
converter.ISO-2022-KR	string	ISO2022KR	ISO-2022 Korean converter (ISO-2022-KR)
converter.Shift_JIS	string	Cp943C	Shift_JIS Japanese converter
encoding.ar	string	ISO-8859-6	Arabic language encoding (ar)
encoding.be	string	ISO-8859-5	Belarusian language encoding (be)
encoding.bg	string	ISO-8859-5	Bulgarian language encoding (bg)
encoding.bn	string	UTF-8	Bengali language encoding (bn)
encoding.ca	string	ISO-8859-1	Catalan language encoding (ca)
encoding.cs	string	ISO-8859-2	Czech language encoding (cs)
encoding.da	string	ISO-8859-1	Danish language encoding (da)
encoding.de	string	ISO-8859-1	German language encoding (de)
encoding.el	string	ISO-8859-7	Greek language encoding (el)
encoding.en	string	ISO-8859-1	English language encoding (en)
encoding.es	string	ISO-8859-1	Spanish language encoding (es)
encoding.et	string	ISO-8859-4	Estonian language encoding (et)
encoding.eu	string	ISO-8859-1	Basque language encoding (eu)
encoding.fa	string	ISO-8859-6	Persian language encoding (fa)
encoding.fi	string	ISO-8859-1	Finnish language encoding (fi)
encoding.fo	string	ISO-8859-2	Faroese language encoding (fo)
encoding.fr	string	ISO-8859-1	French language encoding (fr)
encoding.he	string	ISO-8859-8	Hebrew language encoding (he)

Attribute name	Data type	Default value	Description
encoding.hi	string	UTF-8	Hindi language encoding (hi)
encoding.hr	string	ISO-8859-2	Croatian language encoding (hr)
encoding.hu	string	ISO-8859-2	Hungarian language encoding (hu)
encoding.hy	string	UTF-8	Armenian language encoding (hy)
encoding.is	string	ISO-8859-1	Icelandic language encoding (is)
encoding.it	string	ISO-8859-1	Italian language encoding (it)
encoding.iw	string	ISO-8859-8	Hebrew language encoding (iw)
encoding.ja	string	Shift_JIS	Japanese language encoding (ja)
encoding.ji	string	ISO-8859-8	Yiddish language encoding (ji)
encoding.ka	string	UTF-8	Georgian language encoding (ka)
encoding.ko	string	EUC-KR	Korean language encoding (ko)
encoding.lt	string	ISO-8859-2	Lithuanian language encoding (lt)
encoding.lv	string	ISO-8859-4	Latvian language encoding (lv)
encoding.mk	string	ISO-8859-5	Macedonian language encoding (mk)
encoding.mr	string	UTF-8	Marathi language encoding (mr)
encoding.ms	string	ISO-8859-6	Malay language encoding (ms)
encoding.mt	string	ISO-8859-3	Maltese language encoding (mt)
encoding.nl	string	ISO-8859-1	Dutch language encoding (nl)
encoding.no	string	ISO-8859-1	Norwegian language encoding (no)
encoding.pl	string	ISO-8859-2	Polish language encoding (pl)
encoding.pt	string	ISO-8859-1	Portuguese language encoding (pt)
encoding.ro	string	ISO-8859-2	Romanian language encoding (ro)
encoding.ru	string	ISO-8859-5	Russian language encoding (ru)
encoding.sa	string	UTF-8	Sanskrit language encoding (sa)

Attribute name	Data type	Default value	Description
encoding.sh	string	ISO-8859-2	Serbo-Croatian language encoding (sh)
encoding.sk	string	ISO-8859-2	Slovak language encoding (sk)
encoding.sl	string	ISO-8859-2	Slovenian language encoding (sl)
encoding.sq	string	ISO-8859-2	Albanian language encoding (sq)
encoding.sr	string	ISO-8859-5	Serbian language encoding (sr)
encoding.sv	string	ISO-8859-1	Swedish language encoding (sv)
encoding.ta	string	UTF-8	Tamil language encoding (ta)
encoding.th	string	windows-874	Thai language encoding (th)
encoding.tr	string	ISO-8859-9	Turkish language encoding (tr)
encoding.uk	string	ISO-8859-5	Ukrainian language encoding (uk)
encoding.vi	string	windows-1258	Vietnamese language encoding (vi)
encoding.yi	string	ISO-8859-8	Yiddish language encoding (yi)
encoding.zh	string	GB2312	Chinese language encoding (zh)
encoding.zh_TW	string	Big5	Chinese language encoding (zh_TW)

## HTTP Endpoint (`httpEndpoint`)

Configuration properties for an HTTP endpoint.

- `accessLogging`
- `httpOptions`
- `sslOptions`
- `tcpOptions`

Attribute name	Data type	Default value	Description
<code>accessLoggingRef</code>	A reference to top level <code>httpAccessLogging</code> element (string).		HTTP access logging configuration for the endpoint.
<code>enabled</code>	boolean	<code>true</code>	Toggle the availability of an endpoint. When true, this endpoint will be activated by the dispatcher to handle HTTP requests.

Attribute name	Data type	Default value	Description
host	string	localhost	IP address, domain name server (DNS) host name with domain name suffix, or just the DNS host name, used by a client to request a resource. Use '*' for all available network interfaces.
httpOptionsRef	A reference to top level httpOptions element (string).	defaultHttpOptions	HTTP protocol options for the endpoint.
httpPort	int Minimum: -1 Maximum: 65535		The port used for client HTTP requests. Use -1 to disable this port.
httpsPort	int Minimum: -1 Maximum: 65535		The port used for client HTTP requests secured with SSL (https). Use -1 to disable this port.
id	string		A unique configuration ID.
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Action to take after a failure to start an endpoint.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>
sslOptionsRef	A reference to top level sslOptions element (string).		SSL protocol options for the endpoint.
tcpOptionsRef	A reference to top level tcpOptions element (string).	defaultTCPOptions	TCP protocol options for the endpoint.

### accessLogging

HTTP access logging configuration for the endpoint.

false

Attribute name	Data type	Default value	Description
enabled	boolean	true	Enable access logging.
filePath	Path to a file	\${server.output.dir}/logs/http_access.log	Directory path and name of the access log file. Standard variable substitutions, such as \${server.output.dir}, can be used when specifying the directory path.
logFormat	string	%h %u %{t}W "%r" %s %b	Specifies the log format that is used when logging client access information.
maxFileSize	int Minimum: 0	20	Maximum size of a log file, in megabytes, before being rolled over; a value of 0 means no limit.
maxFiles	int Minimum: 0	2	Maximum number of log files that will be kept, before the oldest file is removed; a value of 0 means no limit.

### httpOptions

HTTP protocol options for the endpoint.

false

Attribute name	Data type	Default value	Description
keepAliveEnabled	boolean	true	Enables persistent connections (HTTP keepalive). If true, connections are kept alive for reuse by multiple sequential requests and responses. If false, connections are closed after the response is sent.
maxKeepAliveRequests	int Minimum: -1	100	Maximum number of persistent requests that are allowed on a single HTTP connection if persistent connections are enabled. A value of -1 means unlimited.

Attribute name	Data type	Default value	Description
persistTimeout	A period of time with second precision	30s	Amount of time that a socket will be allowed to remain idle between requests. This setting only applies if persistent connections are enabled. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
readTimeout	A period of time with second precision	60s	Amount of time to wait for a read request to complete on a socket after the first read occurs. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
removeServerHeader	boolean	false	Removes server implementation information from HTTP headers and also disables the default Liberty profile welcome page.
writeTimeout	A period of time with second precision	60s	Amount of time to wait on a socket for each portion of the response data to be transmitted. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

### sslOptions

SSL protocol options for the endpoint.

false

Attribute name	Data type	Default value	Description
sessionTimeout	A period of time with second precision	1d	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
sslRef	A reference to top level ssl element (string).		The default SSL configuration repertoire. The default value is defaultSSLSettings.
suppressHandshakeErrors	boolean	false	Disable logging of SSL handshake errors. SSL handshake errors can occur during normal operation, however these messages can be useful when SSL is behaving unexpectedly.

### tcpOptions

TCP protocol options for the endpoint.

false

Attribute name	Data type	Default value	Description
inactivityTimeout	A period of time with millisecond precision	60s	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
soReuseAddr	boolean	true	Enables immediate rebind to a port with no active listener.

## HTTP Options (httpOptions)

HTTP protocol configuration.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
keepAliveEnabled	boolean	true	Enables persistent connections (HTTP keepalive). If true, connections are kept alive for reuse by multiple sequential requests and responses. If false, connections are closed after the response is sent.
maxKeepAliveRequests	int Minimum: -1	100	Maximum number of persistent requests that are allowed on a single HTTP connection if persistent connections are enabled. A value of -1 means unlimited.
persistTimeout	A period of time with second precision	30s	Amount of time that a socket will be allowed to remain idle between requests. This setting only applies if persistent connections are enabled. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
readTimeout	A period of time with second precision	60s	Amount of time to wait for a read request to complete on a socket after the first read occurs. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
removeServerHeader	boolean	false	Removes server implementation information from HTTP headers and also disables the default Liberty profile welcome page.

Attribute name	Data type	Default value	Description
writeTimeout	A period of time with second precision	60s	Amount of time to wait on a socket for each portion of the response data to be transmitted. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

## HTTP Proxy Redirect (httpProxyRedirect)

Configures port redirection. HTTP Proxy Redirect is used when redirecting HTTP requests from a non-secure port (for example, 80) to an SSL-enabled secured port (for example, 443).

Attribute name	Data type	Default value	Description
enabled	boolean	true	This attribute determines whether or not the server should redirect ports that are specified in this configuration element. The default is true.
host	string	*	The host name used for this proxy redirect. The server redirects HTTP requests only if the incoming request specifies a host name that matches this value. The default is * (all hosts).
httpPort	int Minimum: 1 Maximum: 65535		The (non-secure) port to redirect from. Incoming HTTP requests on this port are redirected to the specified HTTPS port.
httpsPort	int Minimum: 1 Maximum: 65535		The (secure) port to redirect to. Incoming HTTP requests that use the HTTP port are redirected to this port.
id	string		A unique configuration ID.

## HTTP Session (httpSession)

Configuration for HTTP session management.

Attribute name	Data type	Default value	Description
allowOverflow	boolean	true	Allows the number of sessions in memory to exceed the value of the Max in-memory session count property.
alwaysEncodeUrl	boolean	false	The Servlet 2.5 specification specifies to not encode the URL on a response.encodeURL call if it is not necessary. To support backward compatibility when URL encoding is enabled, set this property to true to call the encodeURL method. The URL is always encoded, even if the browser supports cookies.
cloneId	string		The clone identifier of the cluster member. Within a cluster, this identifier must be unique to maintain session affinity. When set, this name overwrites the default name generated by the server.

Attribute name	Data type	Default value	Description
cloneSeparator	string	:	The single character used to separate the session identifier from the clone identifier in session cookies. The default value should usually be used. On some Wireless Application Protocol (WAP) devices, a colon (:) is not allowed, so a plus sign (+) should be used instead. Different values should rarely be used. You should understand the clone character requirements of other products running on your system before using this property to change the clone separator character. The fact that any character can be specified as the value for this property does not imply that the character you specify will function correctly. This fact also does not imply that IBM is responsible for fixing any problem that might arise from using an alternative character.
cookieDomain	string		Domain field of a session tracking cookie.
cookieHttpOnly	boolean	true	Specifies that session cookies include the HttpOnly field. Browsers that support the HttpOnly field do not enable cookies to be accessed by client-side scripts. Using the HttpOnly field will help prevent cross-site scripting attacks.
cookieMaxAge	A period of time with second precision	-1	Maximum amount of time that a cookie can reside on the client browser. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
cookieName	string	JSESSIONID	A unique name for a session management cookie.

Attribute name	Data type	Default value	Description
cookiePath	string	/	A cookie is sent to the URL designated in the path.
cookieSecure	boolean	false	Specifies that the session cookies include the secure field.
cookiesEnabled	boolean	true	Specifies that session tracking uses cookies to carry session identifiers.
debugCrossover	boolean	false	Enable this option to perform additional checks to verify that only the session associated with the request is accessed or referenced, and log messages if any discrepancies are detected. Disable this option to skip the additional checks.
forceInvalidationMultiple	int	3	If your requests normally are not bound by a response time limit, specify 0 to indicate that the session manager should wait indefinitely until a request is complete before attempting to invalidate the session. Otherwise, set this property to a positive integer to delay the invalidation of active sessions. Active timed out sessions will not be invalidated by the first invalidation interval pass, but will be invalidated by the interval pass based on this value. For example, a value of 2 would invalidate an active session on the second invalidation interval pass after the session timeout has expired.
idLength	int	23	Length of the session identifier.

Attribute name	Data type	Default value	Description
idReuse	boolean	false	In a multi-JVM environment that is not configured for session persistence, setting this property to "true" enables the session manager to use the same session information for all of a user's requests even if the web applications that are handling these requests are governed by different JVMs. The default value for this property is false. Set this property to true if you want to enable the session manager to use the session identifier sent from a browser to preserve session data across web applications that are running in an environment that is not configured for session persistence.
invalidateOnUnauthorizedSessionRequestException	boolean	false	Set this property to true if, in response to an unauthorized request, you want the session manager to invalidate a session instead of issuing an UnauthorizedSessionRequestException. When a session is invalidated, the requester can create a new session, but does not have access to any of the previously saved session data. This allows a single user to continue processing requests to other applications after a logout while still protecting session data.
invalidationTimeout	A period of time with second precision	30m	Amount of time a session can go unused before it is no longer valid. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
maxInMemorySessionCount	int	1000	Maximum number of sessions to maintain in memory for each web module.
noAdditionalInfo	boolean	false	Forces removal of information that is not needed in session identifiers.
protocolSwitchRewritingEnabled	boolean	false	Adds the session identifier to a URL when the URL requires a switch from HTTP to HTTPS or from HTTPS to HTTP.
reaperPollInterval	A period of time with second precision	-1	The wake-up interval, in seconds, for the process that removes invalid sessions. The minimum value is 30 seconds. If a value less than the minimum is entered, an appropriate value is automatically determined and used. This value overrides the default installation value, which is between 30 and 360 seconds, based off the session timeout value. Because the default session timeout is 30 minutes, the reaper interval is usually between 2 and 3 minutes. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
rewriteId	string	jsessionId	Use this property to change the key used with URL rewriting.
securityIntegrationEnabled	boolean	true	Enables security integration, which causes the session management facility to associate the identity of users with their HTTP sessions.

Attribute name	Data type	Default value	Description
securityUserIgnoreCase	boolean	false	Indicates that the session security identity and the client security identity should be considered a match even if their cases are different. For example, when this property is set to true, the session security identity USER1 matches the client security identities User1 and user1.
sslTrackingEnabled	boolean	false	Specifies that session tracking uses Secure Sockets Layer (SSL) information as a session identifier.
urlRewritingEnabled	boolean	false	Specifies that the session management facility uses rewritten URLs to carry the session identifiers.
useContextRootAsCookiePath	boolean	false	Specifies that the cookie path equals the context root of the web module instead of /

## HTTP Session Database (httpSessionDatabase)

Controls how HTTP sessions are persisted to a database.

Attribute name	Data type	Default value	Description
dataSourceRef	string		The identifier of the data source the session manager should use to persist HTTP session data.

Attribute name	Data type	Default value	Description
db2RowSize	<ul style="list-style-type: none"> <li>• 32KB</li> <li>• 4KB</li> <li>• 8KB</li> <li>• 16KB</li> </ul>	4KB	<p>Table space page size configured for the sessions table, if using a DB2 database. Increasing this value can improve database performance in some environments.</p> <p><b>32KB</b> Use a table space page size of 32 KB. You must additionally create a DB2 buffer pool and table space, and specify 32KB as the page size for both. You must also specify the name of the table space you created.</p> <p><b>4KB</b> Use the default table space page size of 4 KB. You do not need to create a DB2 buffer pool or table space, and you do not need to specify a table space name.</p> <p><b>8KB</b> Use a table space page size of 8 KB. You must additionally create a DB2 buffer pool and table space, and specify 8KB as the page size for both. You must also specify the name of the table space you created.</p> <p><b>16KB</b> Use a table space page size of 16 KB. You must additionally create a DB2 buffer pool and table space, and specify 16KB as the page size for both. You must also specify the name of the table space you created.</p>

Attribute name	Data type	Default value	Description
noAffinitySwitchBack	boolean	false	Set this property to "true" to maintain affinity to the new member even after original one comes back up. When a cluster member fails, its requests routed to a different cluster member, and sessions are activated in that other member. Thus, session affinity is maintained to the new member, and when failed cluster member comes back up, the requests for sessions that were created in the original cluster member are routed back to it. Allowed values are true or false, with the default being false. Set this property to true when you have distributed sessions configured with time-based write. Note that this property has no affect on the behavior when distributed sessions are not enabled.
onlyCheckInCacheDuringPrehook	boolean	false	A value of true indicates that the last access time of a session should only be updated if a request gets the session. A value of false indicates that the last access time of a session should be updated upon every request. Changing this value can improve performance in some environments.

Attribute name	Data type	Default value	Description
optimizeCacheIdIncrements	boolean	true	If the user's browser session is moving back and forth across multiple web applications, you might see extra persistent store activity as the in-memory sessions for a web module are refreshed from the persistent store. As a result, the cache identifiers are continually increasing and the in-memory session attributes are overwritten by those of the persistent copy. Set this property to true if you want to prevent the cache identifiers from continually increasing. A value of true indicates that the session manager should assess whether the in-memory session for a web module is older than the copy in persistent store. If the configuration is a cluster, ensure that the system times of each cluster member are as identical as possible.
scheduleInvalidation	boolean	false	Enable this option to reduce the number of database updates required to keep the HTTP sessions alive. Specify the two hours of a day when there is the least activity in the application server. When this option is disabled, the invalidator process runs every few minutes to remove invalidated HTTP sessions.
scheduleInvalidationFirstHour	int	0	Indicates the first hour during which the invalidated sessions are cleared from the persistent store. Specify this value as an integer between 0 and 23. This value is valid only when schedule invalidation is enabled.

Attribute name	Data type	Default value	Description
scheduleInvalidationSecondHour	int	0	Indicates the second hour during which the invalidated sessions are cleared from the persistent store. Specify this value as an integer between 0 and 23. This value is valid only when schedule invalidation is enabled.
skipIndexCreation	boolean	false	Set this property to "true" to disable index creation on server startup. This custom property should only be used if you want to manually create your own database indices for session persistence. However, it is recommended that you let session manager create database indices. Before enabling this property, make sure that the correct index does exist on your session database.
tableName	string	sessions	The database table name.
tableSpaceName	string		Table space to be used for the sessions table. This value is only required when the DB2 Row Size is greater than 4KB.
useInvalidatedId	boolean	true	Set this property to "true" to reuse the incoming identifier if the session with that identifier was recently invalidated. This is a performance optimization because it prevents checking the persistent store.
useMultiRowSchema	boolean	false	When enabled, each session data attribute is placed in a separate row in the database, allowing larger amounts of data to be stored for each session. This configuration can yield better performance when session attributes are very large and few changes are required to the session attributes. When disabled, all session data attributes are placed in the same row for each session.

Attribute name	Data type	Default value	Description
useOracleBlob	boolean	false	Set this property to "true" to create the database table using the Binary Large Object (BLOB) data type for the medium column. This value increases performance of persistent sessions when Oracle databases are used. Due to an Oracle restriction, BLOB support requires use of the Oracle Call Interface (OCI) database driver for more than 4000 bytes of data. You must also ensure that a new sessions table is created before the server is restarted by dropping your old sessions table or by changing the datasource definition to reference a database that does not contain a sessions table.
usingCustomSchemaName	boolean	false	Set this property to "true" if you are using DB2 for session persistence and the currentSchema property is set in the data source.
writeContents	<ul style="list-style-type: none"> <li>• ALL_SESSION_ATTRIBUTES</li> <li>• ONLY_UPDATED_ATTRIBUTES</li> </ul>	ONLY_UPDATED_ATTRIBUTES	<p>Specifies how much session data should be written to the persistent store. By default, only updated attributes are written, but all attributes can be written instead (regardless of whether or not they changed).</p> <p><b>ALL_SESSION_ATTRIBUTES</b> All attributes are written to the persistent store.</p> <p><b>ONLY_UPDATED_ATTRIBUTES</b> Only updated attributes are written to the persistent store.</p>

Attribute name	Data type	Default value	Description
writeFrequency	<ul style="list-style-type: none"> <li>• TIME_BASED_WRITE</li> <li>•</li> <li>END_OF_SERVLET_SERVICE</li> <li>• MANUAL_UPDATE</li> </ul>	END_OF_SERVLET_SERVICE	<p>Specifies when session data is written to the persistent store. By default, session data is written to the persistent store after the servlet completes execution. Changing this value can improve performance in some environments.</p> <p><b>TIME_BASED_WRITE</b> Session data is written to the persistent store based on the specified write interval value.</p> <p><b>END_OF_SERVLET_SERVICE</b> Session data is written to the persistent store after the servlet completes execution.</p> <p><b>MANUAL_UPDATE</b> A programmatic sync on the IBMSession object is required to write the session data to the persistent store.</p>
writeInterval	A period of time with second precision	2m	Number of seconds that should pass before writing session data to the persistent store. The default is 120 seconds. This value is only used when a time based write frequency is enabled. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

## HTTP Whiteboard (httpWhiteboard)

The HTTP Whiteboard provides a runtime environment for hosting servlets and resources provided by OSGi services.

Attribute name	Data type	Default value	Description
contextPath	string	/osgi/http	The context path to use for the HTTP Whiteboard runtime environment.

## IBM Tivoli Directory Server LDAP Filters (idsLdapFilterProperties)

Specifies the list of default IBM Tivoli Directory Server LDAP filters.

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)( (objectclass=groupOfNames)(objectclass=groupOfUniqueNames)(objectclass=groupOfNames))	An LDAP filter clause for searching the user registry for groups.
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	ibm-allGroups:member;ibm-allGroups:uniqueMember;groupOfNames:cn;groupOfUniqueNames:uniqueMember	An LDAP filter that maps group memberships to LDAP entries.
id	string		A unique configuration ID.
userFilter	string	(&(uid=%v)(objectclass=ePerson))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	*:uid	An LDAP filter that maps the name of a user to an LDAP entry.

## IIOE Endpoint (iiopEndpoint)

IIOE Endpoint configuration

- iiopOptions
- tcpOptions

Attribute name	Data type	Default value	Description
host	string	localhost	IP address, domain name server (DNS) host name with domain name suffix, or just the DNS host name
id	string		A unique configuration ID.
iiopPort	int		Port for the unsecured server socket opened by this IIOE endpoint
tcpOptionsRef	A reference to top level tcpOptions element (string).	defaultTCPOptions	TCP protocol options for the IIOE endpoint

### iiopOptions

Specification of a secured server socket opened by this IIOE endpoint

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
iiopsPort	int		Specify the port to be configured with the SSL options.
sessionTimeout	A period of time with second precision	1d	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
sslRef	A reference to top level ssl element (string).		The default SSL configuration repertoire. The default value is defaultSSLSettings.
suppressHandshakeErrors	boolean	false	Disable logging of SSL handshake errors. SSL handshake errors can occur during normal operation, however these messages can be useful when SSL is behaving unexpectedly.

### tcpOptions

TCP protocol options for the IIOP endpoint

false

Attribute name	Data type	Default value	Description
inactivityTimeout	A period of time with millisecond precision	60s	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
soReuseAddr	boolean	true	Enables immediate rebind to a port with no active listener.

## IIOp Server Policies (iiopServerPolicies)

Configuration for IIOp server policies

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

### Include (include)

Specify a configuration resource to include in the server's configuration.

Attribute name	Data type	Default value	Description
location	A file, directory or url.		Specifies the resource location. This can be a file path or a URI for a remote resource.
onConflict	<ul style="list-style-type: none"><li>• IGNORE</li><li>• REPLACE</li><li>• MERGE</li></ul>	MERGE	<p>Specifies the behavior that is used to merge elements when conflicts are found.</p> <p><b>IGNORE</b> Conflicting elements in the included file will be ignored.</p> <p><b>REPLACE</b> When elements conflict, the element from the included file will replace the conflicting element.</p> <p><b>MERGE</b> Conflicting elements will be merged together.</p>
optional	boolean	false	Allow the included resource to be skipped if it cannot be found.

## Installable (installable)

The installable configuration element

Attribute name	Data type	Default value	Description
expand	string		Specifies whether to expand the installable during deployment. Valid values are yes, no, or auto. Overrides the default behavior determined by the installable file type. A no value disables unzip for installable zip files. The default value is auto, which determines whether to expand or not expand based on the installable file type. For example, auto selects to expand the zip file type.
id	string		A unique configuration ID.
installDir	string		Absolute path to the installable target directory.
name	string	default	The name of the installable archive file, for example, wlp.8555.zip.
sourceDir	string		Absolute path to the installable archive file. The default value is the path: <code>\${WLP_STACK_GROUPS_DIR}/stack_name/installables</code>
type	string		The installable type. Valid values are wlp, jre, or other. This attribute overrides the type prefix of the installable name.

## Sun Java System Directory Server LDAP Filters (iplanetLdapFilterProperties)

Specifies the list of default Sun Java System Directory Server LDAP filters.

Attribute name	Data type	Default value	Description
groupFilter	string	<code>(&amp;(cn=%v)(objectclass=ldapsubentry))</code>	An LDAP filter clause for searching the user registry for groups.
groupIdMap	string	<code>*:cn</code>	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	<code>nsRole:nsRole</code>	An LDAP filter that identifies user to group memberships.
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
userFilter	string	(&(uid=%v)(objectclass=inetOrgPerson))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	inetOrgPerson:uid	An LDAP filter that maps the name of a user to an LDAP entry.

## JAAS Login Context Entry (jaasLoginContextEntry)

The JAAS login context entry configuration.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
loginModuleRef	List of references to top level jaasLoginModule elements (comma-separated string).	hashtable,userNameAndPassword,certificate,lockID	A reference to the ID of a JAAS login module.
name	string		Name of a JAAS configuration entry.

## JAAS Login Module (jaasLoginModule)

A login module in the JAAS configuration.

- library
  - file
  - fileset
  - folder
- options

Attribute name	Data type	Default value	Description
className	string		Fully-qualified package name of the JAAS login module class.

Attribute name	Data type	Default value	Description
controlFlag	<ul style="list-style-type: none"> <li>• SUFFICIENT</li> <li>• REQUISITE</li> <li>• REQUIRED</li> <li>• OPTIONAL</li> </ul>	REQUIRED	<p>The login module's control flag. Valid values are REQUIRED, REQUISITE, SUFFICIENT, and OPTIONAL.</p> <p><b>SUFFICIENT</b> This LoginModule is SUFFICIENT as per the JAAS specification. The LoginModule is not required to succeed. If authentication is successful, no other LoginModules will be called and control is returned to the caller.</p> <p><b>REQUISITE</b> This LoginModule is REQUISITE as per the JAAS specification. The LoginModule is required to succeed. If authentication fails, no other LoginModules will be called and control is returned to the caller.</p> <p><b>REQUIRED</b> This LoginModule is REQUIRED as per the JAAS specification. The LoginModule is required to succeed.</p> <p><b>OPTIONAL</b> This LoginModule is OPTIONAL as per the JAAS specification. The LoginModule is not required to succeed.</p>
id	string		A unique configuration ID.
libraryRef	A reference to top level library element (string).		A reference to the ID of the shared library configuration.

## library

A reference to the ID of the shared library configuration.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

### library > file

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

### library > fileset

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

### library > folder

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

### options

A collection of JAAS Login module options

false

## Java 2 Security (javaPermission)

Configuration of permissions for Java 2 Security.

Attribute name	Data type	Default value	Description
actions	string		The actions that the permission grant allows on the target name. For example, read in the case of a java.io.FilePermission.
className	string		The name of the class implementing the permission being granted. For example, java.io.FilePermission.
codebase	string		The codebase that is being granted the permission.
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
name	string		The target for which the permission applies to. For example, ALL FILES in the case of a java.io.FilePermission.
principalName	string		The principal to whom the permission is being granted.
principalType	string		The class name that would be matched for the given Principal Name.
restriction	boolean	false	Declares whether the permission is being restricted versus granted. If restriction is set to "true" then this permission is denied as opposed to being granted.

## JDBC Driver (jdbcDriver)

Identifies a JDBC driver.

- library
  - file
  - fileset
  - folder

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
javax.sql.ConnectionPoolDataSource	string		JDBC driver implementation of javax.sql.ConnectionPoolDataSource.
javax.sql.DataSource	string		JDBC driver implementation of javax.sql.DataSource.
javax.sql.XADataSource	string		JDBC driver implementation of javax.sql.XADataSource.
libraryRef	A reference to top level library element (string).		Identifies JDBC driver JARs and native files.

### library

Identifies JDBC driver JARs and native files.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

### library > file

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

### library > fileset

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**library > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

## JMS Activation Specification (jmsActivationSpec)

Defines a JMS activation specification configuration.

- authData
- properties.wasJms
- properties.wmqJms

Attribute name	Data type	Default value	Description
authDataRef	A reference to top level authData element (string).		Default authentication data for an activation specification.
id	string		A unique configuration ID.
maxEndpoints	int Minimum: 0	500	The maximum number of endpoints to dispatch to.

**authData**

Default authentication data for an activation specification.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

### properties.wasJms

A JMS activation specification is associated with one or more message-driven beans and provides the configuration necessary for them to receive messages.

false

Attribute name	Data type	Default value	Description
acknowledgeMode	<ul style="list-style-type: none"> <li>• Dups-ok-acknowledge</li> <li>• Auto-acknowledge</li> </ul>	Auto-acknowledge	<p>The acknowledge mode indicates how a message received by a message-driven bean should be acknowledged.</p> <p><b>Dups-ok-acknowledge</b> Dups-ok-acknowledge</p> <p><b>Auto-acknowledge</b> Auto-acknowledge</p>
busName	string	defaultBus	The name of a bus when connecting to the service integration bus in a full profile server.
clientId	string		The JMS client identifier needed for durable(and for shared non-durable) topic subscriptions on all connections. This identifier is required if the application is doing durable(and for shared non-durable) publish/subscribe messaging.

Attribute name	Data type	Default value	Description
connectionFactoryLookup	string		This property can be used to specify the lookup name of an administratively-defined <code>javax.jms.ConnectionFactory</code> , <code>javax.jms.QueueConnectionFactory</code> or <code>javax.jms.TopicConnectionFactory</code> object that is used to connect to the JMS provider from which the endpoint (message-driven bean) can receive messages.
destination	string		Reference to a JMS destination
destinationLookup	string		This property can be used to specify the lookup name of the administratively-defined <code>javax.jms.Queue</code> or <code>javax.jms.Topic</code> objects that define the JMS queue or topic from which the endpoint (message-driven bean) can receive messages.
destinationRef	A reference to top level <code>adminObject</code> element (string).		Reference to a JMS destination
destinationType	<ul style="list-style-type: none"> <li><code>javax.jms.Topic</code></li> <li><code>javax.jms.Queue</code></li> </ul>	<code>javax.jms.Queue</code>	The type of the destination, which is <code>javax.jms.Queue</code> or <code>javax.jms.Topic</code> .  <b>javax.jms.Topic</b> <code>javax.jms.Topic</code>  <b>javax.jms.Queue</b> <code>javax.jms.Queue</code>
maxBatchSize	int Minimum: 1 Maximum: 2147483647		The maximum number of messages received from the messaging engine in a single batch.
maxConcurrency	int Minimum: 1 Maximum: 2147483647	5	The maximum number of endpoints to which the messages are delivered concurrently. The increase in the number can improve the performance, but it also increases the number of threads that are in use at the specified time. If the message order must be retained for all the failed deliveries, set the maximum concurrent endpoints value to 1.

Attribute name	Data type	Default value	Description
messageSelector	string		The JMS message selector used to determine which messages the message-driven bean receives. The value is a string that is used to select a subset of the available messages.
readAhead	<ul style="list-style-type: none"> <li>• AlwaysOff</li> <li>• Default</li> <li>• AlwaysOn</li> </ul>	Default	<p>Read ahead is an optimization that preemptively assigns messages to consumers. This processes the consumer requests faster.</p> <p><b>AlwaysOff</b> AlwaysOff</p> <p><b>Default</b> Default</p> <p><b>AlwaysOn</b> AlwaysOn</p>
remoteServerAddress	string		<p>The remote server address that has triplets separated by a comma, with the syntax hostName:portNumber:chainName, used to connect to a bootstrap server. For example, Merlin:7276:BootstrapBasicMessaging. If hostName is not specified, the default is localhost. If portNumber is not specified, the default is 7276. If chainName is not specified, the default is BootstrapBasicMessaging. Refer to the information center for more information.</p>
retryInterval	A period of time with second precision	30s	The delay (in seconds) between attempts to connect to a messaging engine, both for the initial connection, and any subsequent attempts to establish a better connection. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
shareDurableSubscription	string		Controls whether or not durable subscription can be shared across connections.
subscriptionDurability	<ul style="list-style-type: none"> <li>DurableShared</li> <li>Durable</li> <li>NonDurable</li> <li>NonDurableShared</li> </ul>	NonDurable	<p>Type of MS topic subscription. The value can be any of following values: Durable DurableShared NonDurable NonDurableShared</p> <p><b>DurableShared</b> DurableShared</p> <p><b>Durable</b> Durable</p> <p><b>NonDurable</b> NonDurable</p> <p><b>NonDurableShared</b> NonDurableShared</p>
subscriptionName	string		The subscription name needed for durable(and for shared non-durable). Required field when using a durable(and for shared non-durable) topic subscription.This subscription name must be unique within a given client identifier.
targetTransportChain	<ul style="list-style-type: none"> <li>InboundSecureMessaging</li> <li>InboundBasicMessaging</li> </ul>	InboundBasicMessaging	<p>Transport chains specify the communication protocols that can be used to communicate with the service integration bus in a full profiles server.</p> <p><b>InboundSecureMessaging</b> InboundSecureMessaging</p> <p><b>InboundBasicMessaging</b> InboundBasicMessaging</p>

#### properties.wmqJms

WebSphere MQ JMS activation specification

false

Attribute name	Data type	Default value	Description
CCSID	int Minimum: 1	819	The coded character set identifier for a connection.
applicationName	string		The name by which an application is registered with the queue manager.

Attribute name	Data type	Default value	Description
brokerCCDurSubQueue	string		The name of the queue from which non-durable subscription messages are retrieved for a ConnectionConsumer
brokerCCSubQueue	string		The name of the queue from which a connection consumer receives nondurable subscription messages
brokerControlQueue	string		The name of the broker control queue
brokerPubQueue	string		The name of the queue where published messages are sent (the stream queue)
brokerQueueManager	string		The name of the queue manager on which the broker is running
brokerSubQueue	string		The name of the queue from which a nondurable message consumer receives messages
brokerVersion	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>The version of the broker being used</p> <p>2      2</p> <p>1      1</p>
ccdtURL	string		A URL that identifies the name and location of the file containing the client channel definition table (CCDT) and specifies how the file can be accessed.
channel	string	SYSTEM.DEF.SVRCONN	The name of the MQI channel to use.
cleanupInterval	A period of time with millisecond precision		The interval, in milliseconds, between background runs of the publish/subscribe cleanup utility. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
cleanupLevel	<ul style="list-style-type: none"> <li>• SAFE</li> <li>• FORCE</li> <li>• NONDUR</li> <li>• NONE</li> <li>• STRONG</li> </ul>	SAFE	<p>The cleanup level for a broker-based subscription store.</p> <p><b>SAFE</b> SAFE</p> <p><b>FORCE</b> FORCE</p> <p><b>NONDUR</b> NONDUR</p> <p><b>NONE</b> NONE</p> <p><b>STRONG</b> STRONG</p>
clientId	string		The client identifier for a connection
cloneSupport	<ul style="list-style-type: none"> <li>• ENABLED</li> <li>• DISABLED</li> </ul>	DISABLED	<p>Whether two or more instances of the same durable topic subscriber can run simultaneously</p> <p><b>ENABLED</b> ENABLED</p> <p><b>DISABLED</b> DISABLED</p>
connectionNameList	string		<p>A list of TCP/IP connection names (hostname(port))used for communications. ConnectionNameList supersedes the hostname and port properties.</p>
destinationRef	A reference to top level adminObject element (string).		Destination
destinationType	<ul style="list-style-type: none"> <li>• javax.jms.Topic</li> <li>• javax.jms.Queue</li> </ul>	javax.jms.Queue	<p>The type of destination - javax.jms.Queue or javax.jms.Topic</p> <p><b>javax.jms.Topic</b> javax.jms.Topic</p> <p><b>javax.jms.Queue</b> javax.jms.Queue</p>
failIfQuiesce	boolean	true	Whether calls to certain methods fail if the queue manager is in a quiescing state.
headerCompression	<ul style="list-style-type: none"> <li>• SYSTEM</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing header data on a connection</p> <p><b>SYSTEM</b> SYSTEM</p> <p><b>NONE</b> NONE</p>

Attribute name	Data type	Default value	Description
hostName	string	localhost	The host name or IP address of the system on which the queue manager resides. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.
localAddress	string		For a connection to a queue manager, this property specifies either or both of the following, (1) The local network interface to be used, (2) The local port, or range of local ports, to be used
maxMessages	int Minimum: 0	1	The maximum number of messages that can be assigned to a server session at one time. If the activation spec is delivering messages to an MDB in an XA transaction, a value of 1 is used regardless of the setting of this property.
maxPoolDepth	int Minimum: 0	10	The maxPoolDepth property on the activation specification defines the number of available MDB (Message Driven Bean) instances. Decreasing the value of this property decreases the number of messages that can be delivered concurrently.
messageBatchSize	int Minimum: 0		Maximum number of messages to process in one batch.
messageCompression	<ul style="list-style-type: none"> <li>• RLE</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing message data on a connection</p> <p><b>RLE</b> RLE</p> <p><b>NONE</b> NONE</p>
messageRetention	boolean		Whether the connection consumer keeps unwanted messages on the input queue

Attribute name	Data type	Default value	Description
messageSelection	<ul style="list-style-type: none"> <li>• CLIENT</li> <li>• BROKER</li> </ul>	CLIENT	<p>Determines whether message selection is done by WebSphere MQ classes for JMS or by the broker.</p> <p><b>CLIENT</b> CLIENT</p> <p><b>BROKER</b> BROKER</p>
messageSelector	string		<p>Determines whether message selection is done by WebSphere MQ classes for JMS or by the broker. Message selection by the broker is not supported when brokerVersion has the value 1</p>
pollingInterval	A period of time with millisecond precision	5s	<p>If each message listener within a session has no suitable message on its queue, this value is the maximum interval, in milliseconds, that elapses before each message listener tries again to get a message from its queue. If it frequently happens that no suitable message is available for any of the message listeners in a session, consider increasing the value of this property. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.</p>

Attribute name	Data type	Default value	Description						
poolTimeout	A period of time with millisecond precision	5m	The time, in milliseconds, that an unused server session is held open in the server session pool before being closed due to inactivity. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.						
port	int Minimum: 1	1414	The port on which the queue manager listens. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.						
providerVersion	<ul style="list-style-type: none"> <li>• 7</li> <li>• 6</li> <li>• unspecified</li> </ul>	unspecified	<p>The version, release, modification level and fix pack of the queue manager to which the application intends to connect.</p> <table style="width: 100%; border: none;"> <tr> <td style="width: 50px;"><b>7</b></td> <td style="width: 50px;"><b>7</b></td> </tr> <tr> <td><b>6</b></td> <td><b>6</b></td> </tr> <tr> <td><b>unspecified</b></td> <td><b>unspecified</b></td> </tr> </table>	<b>7</b>	<b>7</b>	<b>6</b>	<b>6</b>	<b>unspecified</b>	<b>unspecified</b>
<b>7</b>	<b>7</b>								
<b>6</b>	<b>6</b>								
<b>unspecified</b>	<b>unspecified</b>								
queueManager	string		The name of the queue manager to connect to						
receiveCCSID	int Minimum: 0	0	Destination property that sets the target Coded character set identifier for queue manager message conversion. The value is ignored unless receive conversion is set to WMQ_RECEIVE_CONVERSION_QMG						
receiveConversion	<ul style="list-style-type: none"> <li>• QMGR</li> <li>• CLIENT_MSG</li> </ul>	CLIENT_MSG	<p>Destination property that determines if data conversion is going to be performed by the queue manager.</p> <p><b>QMGR</b> QMGR</p> <p><b>CLIENT_MSG</b> CLIENT_MSG</p>						

Attribute name	Data type	Default value	Description
receiveExit	string		Identifies a channel receive exit program, or a sequence of receive exit programs to be run in succession
receiveExitInit	string		The user data that is passed to channel receive exit programs when they are called
rescanInterval	A period of time with millisecond precision	5s	When a message consumer in the point-to-point domain uses a message selector to select which messages it wants to receive, WebSphere MQ classes for JMS searches the WebSphere MQ queue for suitable messages in the sequence determined by the <code>MsgDeliverySequence</code> attribute of the queue. When WebSphere MQ classes for JMS finds a suitable message and delivers it to the consumer, WebSphere MQ classes for JMS resumes the search for the next suitable message from its current position in the queue. WebSphere MQ classes for JMS continues to search the queue in this way until it reaches the end of the queue, or until the interval of time in milliseconds, as determined by the value of this property, has expired. In each case, WebSphere MQ classes for JMS returns to the beginning of the queue to continue its search, and a new time interval commences. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
securityExit	string		Identifies a channel security exit program

Attribute name	Data type	Default value	Description
securityExitInit	string		The user data that is passed to a channel security exit program when it is called
sendExit	string		Identifies a channel send exit program, or a sequence of send exit programs to be run in succession
sendExitInit	string		The user data that is passed to channel send exit programs when they are called
shareConvAllowed	boolean	true	Whether a client connection can share its socket with other top-level JMS connections from the same process to the same queue manager, if the channel definitions match
sparseSubscriptions	boolean	false	Controls the message retrieval policy of a TopicSubscriber object
sslCertStores	string		The Lightweight Directory Access Protocol (LDAP) servers that hold certificate revocation lists (CRLs) for use on an SSL connection
sslCipherSuite	string		The CipherSuite to use for an SSL connection
sslFipsRequired	boolean		Whether an SSL connection must use a CipherSuite that is supported by the IBM Java JSSE FIPS provider (IBMJSSEFIPS).
sslPeerName	string		For an SSL connection, a template that is used to check the distinguished name in the digital certificate provided by the queue manager
sslResetCount	int Minimum: 0 Maximum: 999999999	0	The total number of bytes sent and received by an SSL connection before the secret keys used by SSL are renegotiated

Attribute name	Data type	Default value	Description
startTimeout	A period of time with millisecond precision	10s	Configures the time duration (in milliseconds) within which the execution must start. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
statusRefreshInterval	A period of time with millisecond precision	1m	The interval, in milliseconds, between refreshes of the long running transaction that detects when a subscriber loses its connection to the queue manager. This property is relevant only if subscription store has the value QUEUE. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
subscriptionDurability	<ul style="list-style-type: none"> <li>• Durable</li> <li>• NonDurable</li> </ul>		<p>Whether a durable or nondurable subscription is used to deliver messages to an MDB subscribing to the topic</p> <p><b>Durable</b> Durable</p> <p><b>NonDurable</b> NonDurable</p>
subscriptionName	string		The name of the durable subscription

Attribute name	Data type	Default value	Description
subscriptionStore	<ul style="list-style-type: none"> <li>• MIGRATE</li> <li>• BROKER</li> <li>• QUEUE</li> </ul>	BROKER	Determines where WebSphere MQ classes for JMS stores persistent data about active subscriptions  <b>MIGRATE</b> MIGRATE  <b>BROKER</b> BROKER  <b>QUEUE</b> QUEUE
transportType	<ul style="list-style-type: none"> <li>• CLIENT</li> <li>• BINDINGS</li> </ul>	CLIENT	Whether a connection to a queue manager uses client mode or bindings mode.  <b>CLIENT</b> CLIENT  <b>BINDINGS</b> BINDINGS
wildcardFormat	<ul style="list-style-type: none"> <li>• CHAR</li> <li>• TOPIC</li> </ul>	TOPIC	Which version of wildcard syntax is to be used.  <b>CHAR</b> CHAR  <b>TOPIC</b> TOPIC

## JMS Connection Factory (jmsConnectionFactory)

Defines a JMS connection factory configuration.

- connectionManager
- containerAuthData
- properties.wasJms
- properties.wmqJms
- recoveryAuthData

Attribute name	Data type	Default value	Description
connectionManagerRef	A reference to top level connectionManager element (string).		Connection manager for a connection factory.
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.
id	string		A unique configuration ID.
jndiName	string		JNDI name for a resource.
recoveryAuthDataRef	A reference to top level authData element (string).		Authentication data for transaction recovery.

**connectionManager**

Connection manager for a connection factory.

false

Attribute name	Data type	Default value	Description
agedTimeout	A period of time with second precision	-1	Amount of time before a physical connection can be discarded by pool maintenance. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
connectionTimeout	A period of time with second precision	30s	Amount of time after which a connection request times out. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxConnectionsPerThread	int Minimum: 0		Limits the number of open connections on each thread.
maxIdleTime	A period of time with second precision	30m	Amount of time after which an unused or idle connection can be discarded during pool maintenance, if doing so does not reduce the pool below the minimum size. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxPoolSize	int Minimum: 0	50	Maximum number of physical connections for a pool. A value of 0 means unlimited.

Attribute name	Data type	Default value	Description
minPoolSize	int Minimum: 0		Minimum number of physical connections to maintain in the pool. The pool is not pre-populated. Aged timeout can override the minimum.
numConnectionsPerThreadLocal	int Minimum: 0		Caches the specified number of connections for each thread.
purgePolicy	<ul style="list-style-type: none"> <li>• ValidateAllConnections</li> <li>• FailingConnectionOnly</li> <li>• EntirePool</li> </ul>	EntirePool	<p>Specifies which connections to destroy when a stale connection is detected in a pool.</p> <p><b>ValidateAllConnections</b> When a stale connection is detected, connections are tested and those found to be bad are closed.</p> <p><b>FailingConnectionOnly</b> When a stale connection is detected, only the connection which was found to be bad is closed.</p> <p><b>EntirePool</b> When a stale connection is detected, all connections in the pool are marked stale, and when no longer in use, are closed.</p>
reapTime	A period of time with second precision	3m	Amount of time between runs of the pool maintenance thread. A value of -1 disables pool maintenance. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

#### containerAuthData

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

### properties.wasJms

A JMS connection factory is used to create connections to the associated JMS provider of JMS destinations, for both point-to-point and publish/subscribe messaging.

false

Attribute name	Data type	Default value	Description
busName	string	defaultBus	The name of a bus when connecting to the service integration bus in a full profile server.
clientID	string	clientID	The JMS client identifier needed for durable(and for shared non-durable) topic subscriptions on all connections. This identifier is required if the application is doing durable(and for shared non-durable) publish/subscribe messaging.
durableSubscriptionHome	string	defaultME	Durable subscription home defines ME name to which connection needs to be established.
nonPersistentMapping	<ul style="list-style-type: none"> <li>• BestEffortNonPersistent</li> <li>• ReliableNonPersistent</li> <li>• ExpressNonPersistent</li> </ul>	ExpressNonPersistent	<p>The reliability applied to Non-persistent JMS messages sent using this connection factory.</p> <p><b>BestEffortNonPersistent</b> BestEffortNonPersistent</p> <p><b>ReliableNonPersistent</b> ReliableNonPersistent</p> <p><b>ExpressNonPersistent</b> ExpressNonPersistent</p>

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
persistentMapping	<ul style="list-style-type: none"> <li>AssuredPersistent</li> <li>ReliablePersistent</li> </ul>	ReliablePersistent	<p>The reliability applied to persistent JMS messages sent using this connection factory.</p> <p><b>AssuredPersistent</b> AssuredPersistent</p> <p><b>ReliablePersistent</b> ReliablePersistent</p>
readAhead	<ul style="list-style-type: none"> <li>AlwaysOff</li> <li>Default</li> <li>AlwaysOn</li> </ul>	Default	<p>Read ahead is an optimization that preemptively assigns messages to consumers. This processes the consumer requests faster.</p> <p><b>AlwaysOff</b> AlwaysOff</p> <p><b>Default</b> Default</p> <p><b>AlwaysOn</b> AlwaysOn</p>
remoteServerAddress	string		<p>The remote server address that has triplets separated by a comma, with the syntax hostName:portNumber:chainName, used to connect to a bootstrap server. For example, Merlin:7276:BootstrapBasicMessaging. If hostName is not specified, the default is localhost. If portNumber is not specified, the default is 7276. If chainName is not specified, the default is BootstrapBasicMessaging. Refer to the information center for more information.</p>
shareDurableSubscription	string		Controls whether or not durable subscription can be shared across connections.
targetTransportChain	string		Transport chains specify the communication protocols that can be used to communicate with the service integration bus in a full profiles server.

Attribute name	Data type	Default value	Description
temporaryQueueNamePrefix	string	temp	The prefix of up to twelve characters used for the temporary queues created by applications that use this queue connection factory.
temporaryTopicNamePrefix	string	temp	The prefix of up to twelve characters used for the temporary topics created by applications that use this topic connection factory.
userName	string		It is recommended to use a container managed authentication alias instead of configuring this property.

### properties.wmqJms

WebSphere MQ JMS connection factory

false

Attribute name	Data type	Default value	Description
CCSID	int Minimum: 1	819	The coded character set identifier for a connection.
applicationName	string		The name by which an application is registered with the queue manager.
arbitraryProperties	string		Ability to specify properties not defined elsewhere
brokerCCSubQueue	string		The name of the queue from which a connection consumer receives nondurable subscription messages
brokerControlQueue	string		The name of the broker control queue
brokerPubQueue	string		The name of the queue where published messages are sent (the stream queue).
brokerQueueManager	string		The name of the queue manager on which the broker is running
brokerSubQueue	string		The name of the queue from which a nondurable message consumer receives messages
brokerVersion	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		The version of the broker being used  <b>2</b> 2 <b>1</b> 1

Attribute name	Data type	Default value	Description
ccdtURL	string		A URL that identifies the name and location of the file containing the client channel definition table (CCDT) and specifies how the file can be accessed.
channel	string		The name of the MQI channel to use.
cleanupInterval	A period of time with millisecond precision		The interval, in milliseconds, between background runs of the publish/subscribe cleanup utility. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
cleanupLevel	<ul style="list-style-type: none"> <li>• SAFE</li> <li>• FORCE</li> <li>• NONDUR</li> <li>• NONE</li> <li>• STRONG</li> </ul>	SAFE	<p>The cleanup level for a broker-based subscription store.</p> <p><b>SAFE</b> SAFE</p> <p><b>FORCE</b> FORCE</p> <p><b>NONDUR</b> NONDUR</p> <p><b>NONE</b> NONE</p> <p><b>STRONG</b> STRONG</p>
clientId	string		The client identifier for a connection
cloneSupport	<ul style="list-style-type: none"> <li>• ENABLED</li> <li>• DISABLED</li> </ul>	DISABLED	<p>Whether two or more instances of the same durable topic subscriber can run simultaneously.</p> <p><b>ENABLED</b> ENABLED</p> <p><b>DISABLED</b> DISABLED</p>
connectionNameList	string		A list of TCP/IP connection names (hostname(port)) used for communications. ConnectionNameList supersedes the hostname and port properties.

Attribute name	Data type	Default value	Description
failIfQuiesce	boolean	true	Whether calls to certain methods fail if the queue manager is in a quiescing state.
headerCompression	<ul style="list-style-type: none"> <li>• SYSTEM</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing header data on a connection</p> <p><b>SYSTEM</b> SYSTEM</p> <p><b>NONE</b> NONE</p>
hostName	string		The host name or IP address of the system on which the queue manager resides. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.
localAddress	string		For a connection to a queue manager, this property specifies either or both of the following, (1) The local network interface to be used, (2) The local port, or range of local ports, to be used
messageCompression	<ul style="list-style-type: none"> <li>• RLE</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing message data on a connection.</p> <p><b>RLE</b> RLE</p> <p><b>NONE</b> NONE</p>
messageSelection	<ul style="list-style-type: none"> <li>• CLIENT</li> <li>• BROKER</li> </ul>	CLIENT	<p>Determines whether message selection is done by WebSphere MQ classes for JMS or by the broker.</p> <p><b>CLIENT</b> CLIENT</p> <p><b>BROKER</b> BROKER</p>
password	Reversably encoded password (string)		The default password to use when creating a connection to the queue manager. (It is recommended to use a container managed authentication alias instead of configuring this property)

Attribute name	Data type	Default value	Description				
pollingInterval	A period of time with millisecond precision		If each message listener within a session has no suitable message on its queue, this value is the maximum interval, in milliseconds, that elapses before each message listener tries again to get a message from its queue. If it frequently happens that no suitable message is available for any of the message listeners in a session, consider increasing the value of this property. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.				
port	int Minimum: 1	1414	The port on which the queue manager listens. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.				
providerVersion	<ul style="list-style-type: none"> <li>• 7</li> <li>• 6</li> <li>• unspecified</li> </ul>	unspecified	<p>The version, release, modification level and fix pack of the queue manager to which the application intends to connect.</p> <table style="width: 100%; border: none;"> <tr> <td style="width: 50px;">7</td> <td>7</td> </tr> <tr> <td>6</td> <td>6</td> </tr> </table> <p><b>unspecified</b> unspecified</p>	7	7	6	6
7	7						
6	6						
pubAckInterval	int Minimum: 0	25	The number of messages published by a publisher before WebSphere MQ classes for JMS requests an acknowledgment from the broker				
queueManager	string		The name of the queue manager to connect to				
receiveExit	string		Identifies a channel receive exit program, or a sequence of receive exit programs to be run in succession				

Attribute name	Data type	Default value	Description
receiveExitInit	string		The user data that is passed to channel receive exit programs when they are called
rescanInterval	A period of time with millisecond precision	5s	When a message consumer in the point-to-point domain uses a message selector to select which messages it wants to receive, WebSphere MQ classes for JMS searches the WebSphere MQ queue for suitable messages in the sequence determined by the <code>MsgDeliverySequence</code> attribute of the queue. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
securityExit	string		Identifies a channel security exit program
securityExitInit	string		The user data that is passed to a channel security exit program when it is called
sendCheckCount	int Minimum: 0		The number of send calls to allow between checking for asynchronous put errors, within a single non-transacted JMS session.
sendExit	string		Identifies a channel send exit program, or a sequence of send exit programs to be run in succession.
sendExitInit	string		The user data that is passed to channel send exit programs when they are called.
shareConvAllowed	boolean	true	Whether a client connection can share its socket with other top-level JMS connections from the same process to the same queue manager, if the channel definitions match
sparseSubscriptions	boolean	false	Controls the message retrieval policy of a <code>TopicSubscriber</code> object.

Attribute name	Data type	Default value	Description
sslCertStores	string		The Lightweight Directory Access Protocol (LDAP) servers that hold certificate revocation lists (CRLs) for use on an SSL connection.
sslCipherSuite	string		The CipherSuite to use for an SSL connection.
sslFipsRequired	boolean		Whether an SSL connection must use a CipherSuite that is supported by the IBM Java JSSE FIPS provider (IBMJSSEFIPS).
sslPeerName	string		For an SSL connection, a template that is used to check the distinguished name in the digital certificate provided by the queue manager.
sslResetCount	int Minimum: 0 Maximum: 999999999	0	The total number of bytes sent and received by an SSL connection before the secret keys used by SSL are renegotiated.
statusRefreshInterval	A period of time with millisecond precision	1m	The interval, in milliseconds, between refreshes of the long running transaction that detects when a subscriber loses its connection to the queue manager. This property is relevant only if subscription store has the value QUEUE. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
subscriptionStore	<ul style="list-style-type: none"> <li>• MIGRATE</li> <li>• BROKER</li> <li>• QUEUE</li> </ul>	BROKER	<p>Determines where WebSphere MQ classes for JMS stores persistent data about active subscriptions.</p> <p><b>MIGRATE</b> MIGRATE</p> <p><b>BROKER</b> BROKER</p> <p><b>QUEUE</b> QUEUE</p>

Attribute name	Data type	Default value	Description
targetClientMatching	boolean	true	Whether a reply message, sent to the queue identified by the JMSReplyTo header field of an incoming message, has an MQRFH2 header only if the incoming message has an MQRFH2 header.
tempQPrefix	string		The prefix that is used to form the name of a WebSphere MQ dynamic queue.
tempTopicPrefix	string		When creating temporary topics, JMS generates a topic string of the form TEMP/TEMPTOPICPREFIX/unique_id, or if this property is left with the default value, just TEMP/unique_id. Specifying a non-empty TEMPTOPICPREFIX allows specific model queues to be defined for creating the managed queues for subscribers to temporary topics created under this connection.
temporaryModel	string		The name of the model queue from which JMS temporary queues are created. SYSTEM.JMS.TEMPQ.MODEL can be used by the JMS Layer to create queues which accept persistent messages, as the default value cannot. SYSTEM.DEFAULT.MODEL.QUEUE can be opened only once. SYSTEM.JMS.TEMPQ.MODEL can be opened more than once. SYSTEM.DEFAULT.MODEL.QUEUE is deprecated.
transportType	<ul style="list-style-type: none"> <li>• CLIENT</li> <li>• BINDINGS</li> </ul>	CLIENT	Whether a connection to a queue manager uses client mode or bindings mode.  <b>CLIENT</b> CLIENT  <b>BINDINGS</b> BINDINGS

Attribute name	Data type	Default value	Description
userName	string		The default user name to use when creating a connection to a queue manager. (It is recommended to use a container managed authentication alias instead of configuring this property)
wildcardFormat	<ul style="list-style-type: none"> <li>• CHAR</li> <li>• TOPIC</li> </ul>	TOPIC	Which version of wildcard syntax is to be used.  <b>CHAR</b> CHAR <b>TOPIC</b> TOPIC

### recoveryAuthData

Authentication data for transaction recovery.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

## JMS Destination (jmsDestination)

Defines a JMS destination configuration.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
jndiName	string		JNDI name for a resource.

## JMS Queue (jmsQueue)

Defines a JMS queue configuration.

- properties.wasJms
- properties.wmqJms

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
jndiName	string		JNDI name for a resource.

### properties.wasJms

The name of the queue that this JMS queue is assigned to.

false

Attribute name	Data type	Default value	Description
deliveryMode	<ul style="list-style-type: none"><li>• NonPersistent</li><li>• Application</li><li>• Persistent</li></ul>	Application	The delivery mode for messages sent to this destination. This controls the persistence of messages on this destination.  <b>NonPersistent</b> NonPersistent <b>Application</b> Application <b>Persistent</b> Persistent
priority	int  Minimum: 0  Maximum: 9		The relative priority for messages sent to this destination, in the range 0 to 9, with 0 as the lowest priority and 9 as the highest priority.
queueName	string	Default.Queue	The name of the associated Queue
readAhead	<ul style="list-style-type: none"><li>• AlwaysOff</li><li>• AsConnection</li><li>• AlwaysOn</li></ul>	AsConnection	Read ahead is an optimization that preemptively assigns messages to consumers. This processes the consumer requests faster.  <b>AlwaysOff</b> AlwaysOff <b>AsConnection</b> AsConnection <b>AlwaysOn</b> AlwaysOn
timeToLive	A period of time with second precision	0s	The default time in milliseconds from its dispatch time that the system must keep the messages live in the destination. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

#### properties.wmqJms

WebSphere MQ JMS Queue

false

Attribute name	Data type	Default value	Description
CCSID	int Minimum: 1	1208	The coded character set ID to be used for a connection or destination
arbitraryProperties	string		Ability to specify properties not defined elsewhere
baseQueueManagerName	string		Queue Manager name that has this queue defined on it
baseQueueName	string		Name of the Queue on the Queue Manager
encoding	string	NATIVE	How numeric data in the body of a message is represented when the message is sent to this destination. The property specifies the representation of binary integers, packed decimal integers, and floating point numbers.
expiry	string	APP	The period after which messages at a destination expire
failIfQuiesce	boolean	true	Whether calls to certain methods fail if the queue manager is in a quiescing state
persistence	<ul style="list-style-type: none"> <li>• APP</li> <li>• QDEF</li> <li>• HIGH</li> <li>• NON</li> <li>• PERS</li> </ul>	APP	<p>The persistence of messages sent to a destination</p> <p><b>APP</b> APP</p> <p><b>QDEF</b> QDEF</p> <p><b>HIGH</b> HIGH</p> <p><b>NON</b> NON</p> <p><b>PERS</b> PERS</p>
priority	<ul style="list-style-type: none"> <li>• 3</li> <li>• 2</li> <li>• 1</li> <li>• APP</li> <li>• 0</li> <li>• 7</li> <li>• 6</li> <li>• 5</li> <li>• QDEF</li> <li>• 4</li> <li>• 9</li> <li>• 8</li> </ul>	APP	<p>The priority for messages sent to a destination</p> <p><b>3</b> 3</p> <p><b>2</b> 2</p> <p><b>1</b> 1</p> <p><b>APP</b> APP</p> <p><b>0</b> 0</p> <p><b>7</b> 7</p> <p><b>6</b> 6</p> <p><b>5</b> 5</p> <p><b>QDEF</b> QDEF</p> <p><b>4</b> 4</p> <p><b>9</b> 9</p> <p><b>8</b> 8</p>

Attribute name	Data type	Default value	Description

## JMS Queue Connection Factory (jmsQueueConnectionFactory)

Defines a JMS queue connection factory configuration.

- connectionManager
- containerAuthData
- properties.wasJms
- properties.wmqJms
- recoveryAuthData

Attribute name	Data type	Default value	Description
connectionManagerRef	A reference to top level connectionManager element (string).		Connection manager for a connection factory.
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.
id	string		A unique configuration ID.
jndiName	string		JNDI name for a resource.
recoveryAuthDataRef	A reference to top level authData element (string).		Authentication data for transaction recovery.

### connectionManager

Connection manager for a connection factory.

false

Attribute name	Data type	Default value	Description
agedTimeout	A period of time with second precision	-1	Amount of time before a physical connection can be discarded by pool maintenance. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
connectionTimeout	A period of time with second precision	30s	Amount of time after which a connection request times out. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxConnectionsPerThread	int Minimum: 0		Limits the number of open connections on each thread.
maxIdleTime	A period of time with second precision	30m	Amount of time after which an unused or idle connection can be discarded during pool maintenance, if doing so does not reduce the pool below the minimum size. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxPoolSize	int Minimum: 0	50	Maximum number of physical connections for a pool. A value of 0 means unlimited.

Attribute name	Data type	Default value	Description
minPoolSize	int Minimum: 0		Minimum number of physical connections to maintain in the pool. The pool is not pre-populated. Aged timeout can override the minimum.
numConnectionsPerThreadLocal	int Minimum: 0		Caches the specified number of connections for each thread.
purgePolicy	<ul style="list-style-type: none"> <li>• ValidateAllConnections</li> <li>• FailingConnectionOnly</li> <li>• EntirePool</li> </ul>	EntirePool	<p>Specifies which connections to destroy when a stale connection is detected in a pool.</p> <p><b>ValidateAllConnections</b> When a stale connection is detected, connections are tested and those found to be bad are closed.</p> <p><b>FailingConnectionOnly</b> When a stale connection is detected, only the connection which was found to be bad is closed.</p> <p><b>EntirePool</b> When a stale connection is detected, all connections in the pool are marked stale, and when no longer in use, are closed.</p>
reapTime	A period of time with second precision	3m	Amount of time between runs of the pool maintenance thread. A value of -1 disables pool maintenance. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

### containerAuthData

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

### properties.wasJms

A JMS queue connection factory is used to create connections to the associated JMS provider of JMS queues, for point-to-point messaging.

false

Attribute name	Data type	Default value	Description
busName	string	defaultBus	The name of a bus when connecting to the service integration bus in a full profile server.
nonPersistentMapping	<ul style="list-style-type: none"> <li>BestEffortNonPersistent</li> <li>ReliableNonPersistent</li> <li>ExpressNonPersistent</li> </ul>	ExpressNonPersistent	<p>The reliability applied to Non-persistent JMS messages sent using this connection factory.</p> <p><b>BestEffortNonPersistent</b> BestEffortNonPersistent</p> <p><b>ReliableNonPersistent</b> ReliableNonPersistent</p> <p><b>ExpressNonPersistent</b> ExpressNonPersistent</p>
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
persistentMapping	<ul style="list-style-type: none"> <li>AssuredPersistent</li> <li>ReliablePersistent</li> </ul>	ReliablePersistent	<p>The reliability applied to persistent JMS messages sent using this connection factory.</p> <p><b>AssuredPersistent</b> AssuredPersistent</p> <p><b>ReliablePersistent</b> ReliablePersistent</p>

Attribute name	Data type	Default value	Description
readAhead	<ul style="list-style-type: none"> <li>AlwaysOff</li> <li>Default</li> <li>AlwaysOn</li> </ul>	Default	<p>Read ahead is an optimization that preemptively assigns messages to consumers. This processes the consumer requests faster.</p> <p><b>AlwaysOff</b> AlwaysOff</p> <p><b>Default</b> Default</p> <p><b>AlwaysOn</b> AlwaysOn</p>
remoteServerAddress	string		<p>The remote server address that has triplets separated by a comma, with the syntax <code>hostName:portNumber:chainName</code>, used to connect to a bootstrap server. For example, <code>Merlin:7276:BootstrapBasicMessaging</code>. If <code>hostName</code> is not specified, the default is <code>localhost</code>. If <code>portNumber</code> is not specified, the default is <code>7276</code>. If <code>chainName</code> is not specified, the default is <code>BootstrapBasicMessaging</code>. Refer to the information center for more information.</p>
targetTransportChain	string		<p>Transport chains specify the communication protocols that can be used to communicate with the service integration bus in a full profiles server.</p>
temporaryQueueNamePrefix	string	temp	<p>The prefix of up to twelve characters used for the temporary queues created by applications that use this queue connection factory.</p>
userName	string		<p>It is recommended to use a container managed authentication alias instead of configuring this property.</p>

#### **properties.wmqJms**

WebSphere MQ JMS queue connection factory

false

Attribute name	Data type	Default value	Description
CCSID	int Minimum: 1	819	The coded character set identifier for a connection.
applicationName	string		The name by which an application is registered with the queue manager.
arbitraryProperties	string		Ability to specify properties not defined elsewhere
ccdtURL	string		A URL that identifies the name and location of the file containing the client channel definition table (CCDT) and specifies how the file can be accessed.
channel	string		The name of the MQI channel to use.
clientId	string		The client identifier for a connection.
connectionNameList	string		A list of TCP/IP connection names (hostname(port))used for communications. ConnectionNameList supersedes the hostname and port properties.
failIfQuiesce	boolean	true	Whether calls to certain methods fail if the queue manager is in a quiescing state.
headerCompression	<ul style="list-style-type: none"> <li>• SYSTEM</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing header data on a connection</p> <p><b>SYSTEM</b> SYSTEM</p> <p><b>NONE</b> NONE</p>
hostName	string		The host name or IP address of the system on which the queue manager resides. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.
localAddress	string		For a connection to a queue manager, this property specifies either or both of the following, (1) The local network interface to be used, (2) The local port, or range of local ports, to be used

Attribute name	Data type	Default value	Description
messageCompression	<ul style="list-style-type: none"> <li>• RLE</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing message data on a connection.</p> <p><b>RLE</b> RLE <b>NONE</b> NONE</p>
password	Reversably encoded password (string)		The default password to use when creating a connection to the queue manager. (It is recommended to use a container managed authentication alias instead of configuring this property)
pollingInterval	A period of time with millisecond precision		<p>If each message listener within a session has no suitable message on its queue, this value is the maximum interval, in milliseconds, that elapses before each message listener tries again to get a message from its queue. If it frequently happens that no suitable message is available for any of the message listeners in a session, consider increasing the value of this property. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.</p>
port	<p>int</p> <p>Minimum: 1</p>	1414	The port on which the queue manager listens. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.

Attribute name	Data type	Default value	Description
providerVersion	<ul style="list-style-type: none"> <li>• 7</li> <li>• 6</li> <li>• unspecified</li> </ul>	unspecified	<p>The version, release, modification level and fix pack of the queue manager to which the application intends to connect.</p> <p>7        7</p> <p>6        6</p> <p><b>unspecified</b> unspecified</p>
queueManager	string		The name of the queue manager to connect to
receiveExit	string		Identifies a channel receive exit program, or a sequence of receive exit programs to be run in succession
receiveExitInit	string		The user data that is passed to channel receive exit programs when they are called
rescanInterval	A period of time with millisecond precision	5s	<p>When a message consumer in the point-to-point domain uses a message selector to select which messages it wants to receive, WebSphere MQ classes for JMS searches the WebSphere MQ queue for suitable messages in the sequence determined by the <code>MsgDeliverySequence</code> attribute of the queue. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.</p>
securityExit	string		Identifies a channel security exit program
securityExitInit	string		The user data that is passed to a channel security exit program when it is called
sendCheckCount	int Minimum: 0		The number of send calls to allow between checking for asynchronous put errors, within a single non-transacted JMS session.

Attribute name	Data type	Default value	Description
sendExit	string		Identifies a channel send exit program, or a sequence of send exit programs to be run in succession.
sendExitInit	string		The user data that is passed to channel send exit programs when they are called.
shareConvAllowed	boolean	true	Whether a client connection can share its socket with other top-level JMS connections from the same process to the same queue manager, if the channel definitions match
sslCertStores	string		The Lightweight Directory Access Protocol (LDAP) servers that hold certificate revocation lists (CRLs) for use on an SSL connection.
sslCipherSuite	string		The CipherSuite to use for an SSL connection.
sslFipsRequired	boolean		Whether an SSL connection must use a CipherSuite that is supported by the IBM Java JSSE FIPS provider (IBMJSEFIPS).
sslPeerName	string		For an SSL connection, a template that is used to check the distinguished name in the digital certificate provided by the queue manager.
sslResetCount	int Minimum: 0 Maximum: 999999999		The total number of bytes sent and received by an SSL connection before the secret keys used by SSL are renegotiated.
targetClientMatching	boolean	true	Whether a reply message, sent to the queue identified by the JMSReplyTo header field of an incoming message, has an MQRFH2 header only if the incoming message has an MQRFH2 header.
tempQPrefix	string		The prefix that is used to form the name of a WebSphere MQ dynamic queue.

Attribute name	Data type	Default value	Description
temporaryModel	string		The name of the model queue from which JMS temporary queues are created. SYSTEM.JMS.TEMPQ.MODEL can be used by the JMS Layer to create queues which accept persistent messages, as the default value cannot. SYSTEM.DEFAULT.MODEL.QUEUE can be opened only once. SYSTEM.JMS.TEMPQ.MODEL can be opened more than once. SYSTEM.DEFAULT.MODEL.QUEUE is deprecated.
transportType	<ul style="list-style-type: none"> <li>• CLIENT</li> <li>• BINDINGS</li> </ul>	CLIENT	Whether a connection to a queue manager uses client mode or bindings mode.  <b>CLIENT</b> CLIENT  <b>BINDINGS</b> BINDINGS
userName	string		The default user name to use when creating a connection to a queue manager. (It is recommended to use a container managed authentication alias instead of configuring this property)

### recoveryAuthData

Authentication data for transaction recovery.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

## JMS Topic (jmsTopic)

Defines a JMS topic configuration.

- properties.wasJms
- properties.wmqJms

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
jndiName	string		JNDI name for a resource.

### properties.wasJms

The name of the topic that this JMS topic is assigned to, in the topic space defined by the Topic space property.

false

Attribute name	Data type	Default value	Description
deliveryMode	<ul style="list-style-type: none"> <li>• NonPersistent</li> <li>• Application</li> <li>• Persistent</li> </ul>	Application	<p>The delivery mode for messages sent to this destination. This controls the persistence of messages on this destination.</p> <p><b>NonPersistent</b> NonPersistent</p> <p><b>Application</b> Application</p> <p><b>Persistent</b> Persistent</p>
priority	<p>int</p> <p>Minimum: 0</p> <p>Maximum: 9</p>		<p>The relative priority for messages sent to this destination, in the range 0 to 9, with 0 as the lowest priority and 9 as the highest priority.</p>
readAhead	<ul style="list-style-type: none"> <li>• AlwaysOff</li> <li>• AsConnection</li> <li>• AlwaysOn</li> </ul>	AsConnection	<p>Read ahead is an optimization that preemptively assigns messages to consumers. This processes the consumer requests faster.</p> <p><b>AlwaysOff</b> AlwaysOff</p> <p><b>AsConnection</b> AsConnection</p> <p><b>AlwaysOn</b> AlwaysOn</p>

Attribute name	Data type	Default value	Description
timeToLive	A period of time with second precision	0s	The default time in milliseconds from its dispatch time that the system must keep the messages live in the destination. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
topicName	string	Default.Topic	The name of the topic that this JMS topic is assigned to, in the topic space defined by the Topic space property.
topicSpace	string	Default.Topic.Space	A topic space is a location for publish/subscribe messaging.

#### properties.wmqJms

WebSphere MQ JMS Topic

false

Attribute name	Data type	Default value	Description
CCSID	int Minimum: 1	1208	The coded character set ID to be used for a connection or destination
arbitraryProperties	string		Ability to specify properties not defined elsewhere
baseTopicName	string		Topic string to open
brokerCCDurSubQueue	string	SYSTEM.JMS.D.CC.SUBSCRIBER.QUEUE	The name of the queue from which non-durable subscription messages are retrieved for a connection consumer
brokerDurSubQueue	string	SYSTEM.JMS.D.SUBSCRIBER.QUEUE	The name of the queue from which durable subscription messages are retrieved
brokerPubQueue	string		The name of the queue where published messages are sent (the stream queue)
brokerPubQueueManager	string		The name of the queue manager that owns the queue where messages published on the topic are sent

Attribute name	Data type	Default value	Description
brokerVersion	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>	1	<p>The version of the broker being used</p> <p><b>2</b>     2</p> <p><b>1</b>     1</p>
encoding	string	NATIVE	How numeric data in the body of a message is represented when the message is sent to this destination. The property specifies the representation of binary integers, packed decimal integers, and floating point numbers.
expiry	string	APP	The period after which messages at a destination expire
failIfQuiesce	boolean	true	Whether calls to certain methods fail if the queue manager is in a quiescing state
persistence	<ul style="list-style-type: none"> <li>• APP</li> <li>• QDEF</li> <li>• HIGH</li> <li>• NON</li> <li>• PERS</li> </ul>	APP	<p>The persistence of messages sent to a destination</p> <p><b>APP</b>    APP</p> <p><b>QDEF</b>   QDEF</p> <p><b>HIGH</b>   HIGH</p> <p><b>NON</b>    NON</p> <p><b>PERS</b>   PERS</p>

## JMS Topic Connection Factory (jmsTopicConnectionFactory)

Defines a JMS topic connection factory configuration.

- connectionManager
- containerAuthData
- properties.wasJms
- properties.wmqJms
- recoveryAuthData

Attribute name	Data type	Default value	Description
connectionManagerRef	A reference to top level connectionManager element (string).		Connection manager for a connection factory.
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.
id	string		A unique configuration ID.
jndiName	string		JNDI name for a resource.
recoveryAuthDataRef	A reference to top level authData element (string).		Authentication data for transaction recovery.

### connectionManager

Connection manager for a connection factory.

false

Attribute name	Data type	Default value	Description
agedTimeout	A period of time with second precision	-1	Amount of time before a physical connection can be discarded by pool maintenance. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
connectionTimeout	A period of time with second precision	30s	Amount of time after which a connection request times out. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxConnectionsPerThread	int Minimum: 0		Limits the number of open connections on each thread.
maxIdleTime	A period of time with second precision	30m	Amount of time after which an unused or idle connection can be discarded during pool maintenance, if doing so does not reduce the pool below the minimum size. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxPoolSize	int Minimum: 0	50	Maximum number of physical connections for a pool. A value of 0 means unlimited.

Attribute name	Data type	Default value	Description
minPoolSize	int Minimum: 0		Minimum number of physical connections to maintain in the pool. The pool is not pre-populated. Aged timeout can override the minimum.
numConnectionsPerThreadLocal	int Minimum: 0		Caches the specified number of connections for each thread.
purgePolicy	<ul style="list-style-type: none"> <li>• ValidateAllConnections</li> <li>• FailingConnectionOnly</li> <li>• EntirePool</li> </ul>	EntirePool	<p>Specifies which connections to destroy when a stale connection is detected in a pool.</p> <p><b>ValidateAllConnections</b> When a stale connection is detected, connections are tested and those found to be bad are closed.</p> <p><b>FailingConnectionOnly</b> When a stale connection is detected, only the connection which was found to be bad is closed.</p> <p><b>EntirePool</b> When a stale connection is detected, all connections in the pool are marked stale, and when no longer in use, are closed.</p>
reapTime	A period of time with second precision	3m	Amount of time between runs of the pool maintenance thread. A value of -1 disables pool maintenance. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

#### containerAuthData

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

### properties.wasJms

A JMS topic connection factory is used to create connections to the associated JMS provider of JMS destinations, for publish/subscribe messaging.

false

Attribute name	Data type	Default value	Description
busName	string	defaultBus	The name of a bus when connecting to the service integration bus in a full profile server.
clientID	string	clientID	The JMS client identifier needed for durable(and for shared non-durable) topic subscriptions on all connections. This identifier is required if the application is doing durable(and for shared non-durable) publish/subscribe messaging.
durableSubscriptionHome	string	defaultME	Durable subscription home defines ME name to which connection needs to be established.
nonPersistentMapping	<ul style="list-style-type: none"> <li>• BestEffortNonPersistent</li> <li>• ReliableNonPersistent</li> <li>• ExpressNonPersistent</li> </ul>	ExpressNonPersistent	<p>The reliability applied to Non-persistent JMS messages sent using this connection factory.</p> <p><b>BestEffortNonPersistent</b> BestEffortNonPersistent</p> <p><b>ReliableNonPersistent</b> ReliableNonPersistent</p> <p><b>ExpressNonPersistent</b> ExpressNonPersistent</p>

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
persistentMapping	<ul style="list-style-type: none"> <li>AssuredPersistent</li> <li>ReliablePersistent</li> </ul>	ReliablePersistent	<p>The reliability applied to persistent JMS messages sent using this connection factory.</p> <p><b>AssuredPersistent</b> AssuredPersistent</p> <p><b>ReliablePersistent</b> ReliablePersistent</p>
readAhead	<ul style="list-style-type: none"> <li>AlwaysOff</li> <li>Default</li> <li>AlwaysOn</li> </ul>	Default	<p>Read ahead is an optimization that preemptively assigns messages to consumers. This processes the consumer requests faster.</p> <p><b>AlwaysOff</b> AlwaysOff</p> <p><b>Default</b> Default</p> <p><b>AlwaysOn</b> AlwaysOn</p>
remoteServerAddress	string		<p>The remote server address that has triplets separated by a comma, with the syntax hostName:portNumber:chainName, used to connect to a bootstrap server. For example, Merlin:7276:BootstrapBasicMessaging. If hostName is not specified, the default is localhost. If portNumber is not specified, the default is 7276. If chainName is not specified, the default is BootstrapBasicMessaging. Refer to the information center for more information.</p>
shareDurableSubscription	string		Controls whether or not durable subscription can be shared across connections.
targetTransportChain	string		Transport chains specify the communication protocols that can be used to communicate with the service integration bus in a full profiles server.

Attribute name	Data type	Default value	Description
temporaryTopicNamePrefix	string	temp	The prefix of up to twelve characters used for the temporary topics created by applications that use this topic connection factory.
userName	string		It is recommended to use a container managed authentication alias instead of configuring this property.

### properties.wmqJms

WebSphere MQ JMS topic connection factory

false

Attribute name	Data type	Default value	Description
CCSID	int Minimum: 1	819	The coded character set identifier for a connection.
applicationName	string		The name by which an application is registered with the queue manager.
arbitraryProperties	string		Ability to specify properties not defined elsewhere
brokerCCSubQueue	string		The name of the queue from which a connection consumer receives nondurable subscription messages
brokerControlQueue	string		The name of the broker control queue
brokerPubQueue	string		The name of the queue where published messages are sent (the stream queue).
brokerQueueManager	string		The name of the queue manager on which the broker is running
brokerSubQueue	string		The name of the queue from which a nondurable message consumer receives messages
brokerVersion	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		The version of the broker being used  2        2 1        1
ccdtURL	string		A URL that identifies the name and location of the file containing the client channel definition table (CCDT) and specifies how the file can be accessed.

Attribute name	Data type	Default value	Description
channel	string		The name of the MQI channel to use.
cleanupInterval	A period of time with millisecond precision		The interval, in milliseconds, between background runs of the publish/subscribe cleanup utility. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
cleanupLevel	<ul style="list-style-type: none"> <li>• SAFE</li> <li>• FORCE</li> <li>• NONDUR</li> <li>• NONE</li> <li>• STRONG</li> </ul>	SAFE	<p>The cleanup level for a broker-based subscription store.</p> <p><b>SAFE</b> SAFE</p> <p><b>FORCE</b> FORCE</p> <p><b>NONDUR</b> NONDUR</p> <p><b>NONE</b> NONE</p> <p><b>STRONG</b> STRONG</p>
clientId	string		The client identifier for a connection
cloneSupport	<ul style="list-style-type: none"> <li>• ENABLED</li> <li>• DISABLED</li> </ul>	DISABLED	<p>Whether two or more instances of the same durable topic subscriber can run simultaneously.</p> <p><b>ENABLED</b> ENABLED</p> <p><b>DISABLED</b> DISABLED</p>
connectionNameList	string		A list of TCP/IP connection names (hostname(port)) used for communications. ConnectionNameList supersedes the hostname and port properties.
failIfQuiesce	boolean	true	Whether calls to certain methods fail if the queue manager is in a quiescing state.

Attribute name	Data type	Default value	Description
headerCompression	<ul style="list-style-type: none"> <li>• SYSTEM</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing header data on a connection</p> <p><b>SYSTEM</b> SYSTEM</p> <p><b>NONE</b> NONE</p>
hostName	string		<p>The host name or IP address of the system on which the queue manager resides. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.</p>
localAddress	string		<p>For a connection to a queue manager, this property specifies either or both of the following, (1) The local network interface to be used, (2) The local port, or range of local ports, to be used</p>
messageCompression	<ul style="list-style-type: none"> <li>• RLE</li> <li>• NONE</li> </ul>	NONE	<p>A list of the techniques that can be used for compressing message data on a connection.</p> <p><b>RLE</b> RLE</p> <p><b>NONE</b> NONE</p>
messageSelection	<ul style="list-style-type: none"> <li>• CLIENT</li> <li>• BROKER</li> </ul>	CLIENT	<p>Determines whether message selection is done by WebSphere MQ classes for JMS or by the broker.</p> <p><b>CLIENT</b> CLIENT</p> <p><b>BROKER</b> BROKER</p>
password	Reversably encoded password (string)		<p>The default password to use when creating a connection to the queue manager. (It is recommended to use a container managed authentication alias instead of configuring this property)</p>

Attribute name	Data type	Default value	Description						
pollingInterval	A period of time with millisecond precision		If each message listener within a session has no suitable message on its queue, this value is the maximum interval, in milliseconds, that elapses before each message listener tries again to get a message from its queue. If it frequently happens that no suitable message is available for any of the message listeners in a session, consider increasing the value of this property. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.						
port	int Minimum: 1	1414	The port on which the queue manager listens. The hostname and port properties are superseded by the ConnectionNameList property when it is specified.						
providerVersion	<ul style="list-style-type: none"> <li>• 7</li> <li>• 6</li> <li>• unspecified</li> </ul>	unspecified	<p>The version, release, modification level and fix pack of the queue manager to which the application intends to connect.</p> <table style="width: 100%; border: none;"> <tr> <td style="width: 50px;">7</td> <td>7</td> </tr> <tr> <td>6</td> <td>6</td> </tr> <tr> <td><b>unspecified</b></td> <td><b>unspecified</b></td> </tr> </table>	7	7	6	6	<b>unspecified</b>	<b>unspecified</b>
7	7								
6	6								
<b>unspecified</b>	<b>unspecified</b>								
pubAckInterval	int Minimum: 0	25	The number of messages published by a publisher before WebSphere MQ classes for JMS requests an acknowledgment from the broker						
queueManager	string		The name of the queue manager to connect to						
receiveExit	string		Identifies a channel receive exit program, or a sequence of receive exit programs to be run in succession						

Attribute name	Data type	Default value	Description
receiveExitInit	string		The user data that is passed to channel receive exit programs when they are called
rescanInterval	A period of time with millisecond precision	5s	When a message consumer in the point-to-point domain uses a message selector to select which messages it wants to receive, WebSphere MQ classes for JMS searches the WebSphere MQ queue for suitable messages in the sequence determined by the <code>MsgDeliverySequence</code> attribute of the queue. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
securityExit	string		Identifies a channel security exit program
securityExitInit	string		The user data that is passed to a channel security exit program when it is called
sendCheckCount	int Minimum: 0		The number of send calls to allow between checking for asynchronous put errors, within a single non-transacted JMS session.
sendExit	string		Identifies a channel send exit program, or a sequence of send exit programs to be run in succession.
sendExitInit	string		The user data that is passed to channel send exit programs when they are called.
shareConvAllowed	boolean	true	Whether a client connection can share its socket with other top-level JMS connections from the same process to the same queue manager, if the channel definitions match
sparseSubscriptions	boolean	false	Controls the message retrieval policy of a <code>TopicSubscriber</code> object.

Attribute name	Data type	Default value	Description
sslCertStores	string		The Lightweight Directory Access Protocol (LDAP) servers that hold certificate revocation lists (CRLs) for use on an SSL connection.
sslCipherSuite	string		The CipherSuite to use for an SSL connection.
sslFipsRequired	boolean		Whether an SSL connection must use a CipherSuite that is supported by the IBM Java JSSE FIPS provider (IBMJSSEFIPS).
sslPeerName	string		For an SSL connection, a template that is used to check the distinguished name in the digital certificate provided by the queue manager.
sslResetCount	int Minimum: 0 Maximum: 999999999	0	The total number of bytes sent and received by an SSL connection before the secret keys used by SSL are renegotiated.
statusRefreshInterval	A period of time with millisecond precision	1m	The interval, in milliseconds, between refreshes of the long running transaction that detects when a subscriber loses its connection to the queue manager. This property is relevant only if subscription store has the value QUEUE. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
subscriptionStore	<ul style="list-style-type: none"> <li>• MIGRATE</li> <li>• BROKER</li> <li>• QUEUE</li> </ul>	BROKER	<p>Determines where WebSphere MQ classes for JMS stores persistent data about active subscriptions.</p> <p><b>MIGRATE</b> MIGRATE</p> <p><b>BROKER</b> BROKER</p> <p><b>QUEUE</b> QUEUE</p>

Attribute name	Data type	Default value	Description
targetClientMatching	boolean	true	Whether a reply message, sent to the queue identified by the JMSReplyTo header field of an incoming message, has an MQRFH2 header only if the incoming message has an MQRFH2 header.
tempTopicPrefix	string		When creating temporary topics, JMS generates a topic string of the form TEMP/TEMPTOPICPREFIX/unique_id, or if this property is left with the default value, just TEMP/unique_id. Specifying a non-empty TEMPTOPICPREFIX allows specific model queues to be defined for creating the managed queues for subscribers to temporary topics created under this connection.
transportType	<ul style="list-style-type: none"> <li>• CLIENT</li> <li>• BINDINGS</li> </ul>	CLIENT	Whether a connection to a queue manager uses client mode or bindings mode.  <b>CLIENT</b> CLIENT <b>BINDINGS</b> BINDINGS
userName	string		The default user name to use when creating a connection to a queue manager. (It is recommended to use a container managed authentication alias instead of configuring this property)
wildcardFormat	<ul style="list-style-type: none"> <li>• CHAR</li> <li>• TOPIC</li> </ul>	TOPIC	Which version of wildcard syntax is to be used.  <b>CHAR</b> CHAR <b>TOPIC</b> TOPIC

**recoveryAuthData**

Authentication data for transaction recovery.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

## JNDI Entry (jndiEntry)

A single entry in the JNDI default namespace.

Attribute name	Data type	Default value	Description
decode	boolean	false	True if value needs to be decoded on lookup.
id	string		A unique configuration ID.
jndiName	string		The JNDI name to use for this entry.
value	string		The JNDI value to associate with the name.

## JNDI Object Factory (jndiObjectFactory)

ObjectFactory to be used by a JNDI Reference entry.

- library
  - file
  - fileset
  - folder

Attribute name	Data type	Default value	Description
className	string		ObjectFactory implementation class name.
id	string		A unique configuration ID.
libraryRef	A reference to top level library element (string).		Library containing the factory implementation class.
objectClassName	string	java.lang.Object	Type of object returned from the factory.

### library

Library containing the factory implementation class.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

### library > file

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

### library > fileset

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**library > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

## JNDI Reference Entry (jndiReferenceEntry)

Reference entry in the JNDI default namespace.

- factory
  - library
  - file
  - fileset
  - folder
- properties

Attribute name	Data type	Default value	Description
decode	boolean	false	True if value needs to be decoded on lookup.
factoryRef	A reference to top level jndiObjectFactory element (string).		Object factory for the reference entry.
id	string		A unique configuration ID.
jndiName	string		JNDI name for the reference entry.

**factory**

Object factory for the reference entry.

false

Attribute name	Data type	Default value	Description
className	string		ObjectFactory implementation class name.
libraryRef	A reference to top level library element (string).		Library containing the factory implementation class.
objectClassName	string	java.lang.Object	Type of object returned from the factory.

#### **factory > library**

Library containing the factory implementation class.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

#### **factory > library > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

#### **factory > library > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.

Attribute name	Data type	Default value	Description
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

#### **factory > library > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

#### **properties**

The properties for the reference entry.

false

## **JNDI URL Entry (jndiURLEntry)**

A single entry in the JNDI default namespace that is used for binding java.net.URL entries.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
jndiName	string		The JNDI name to use for this entry.

Attribute name	Data type	Default value	Description
value	string		The JNDI URL value to associate with the name.

## JPA Container (jpa)

Configuration properties for the Java Persistence API container.

- excludedApplication

Attribute name	Data type	Default value	Description
defaultJtaDataSourceJndiName	string		Default Java™ Transaction API (JTA) data source JNDI name to be used by applications running in this server. By default, data sources are JTA. Only data sources that are transactional are allowed in this field.
defaultNonJtaDataSourceJndiName	string		Default non-transactional data source JNDI name to be used by applications running in this server. Only data sources that have been marked as non-transactional are allowed in this field.
defaultPersistenceProvider	string		Default persistence provider class name. If this property is not specified, the default provider is dependent on which JPA feature is enabled.
entityManagerPoolCapacity	int	-1	EntityManager pool capacity per PersistenceContext reference. The minimum is 0 and the maximum is 500.

Attribute name	Data type	Default value	Description
ignoreDataSourceErrors	boolean		If true, errors that occur while attempting to lookup a data source specified by the <jta-data-source> or <non-jta-data-source> elements in the persistence.xml file are reported and ignored, which allows the persistence provider to determine a default data source. If false, the errors are propagated to the persistence provider so that the errors can be diagnosed more easily, but misconfigured applications might not work. By default, this property is true if JPA 2.0 is enabled and false otherwise.

#### excludedApplication

An application to be excluded from JPA processing.

false

string

## JSP Engine (jspEngine)

JSP 2.2 configuration

Attribute name	Data type	Default value	Description
disableJspRuntimeCompilation	boolean	false	Disable compilation of JSPs at runtime.
disableResourceInjection	boolean	false	Disable injection of resources into JSPs.
extendedDocumentRoot	string		Directory that the JSP engine will search for additional JSP files to serve.
jdkSourceLevel	<ul style="list-style-type: none"> <li>• 17</li> <li>• 18</li> <li>• 15</li> <li>• 16</li> <li>• 13</li> <li>• 14</li> </ul>	15	Default Java source level for JSPs compiled by the JSP engine. <b>17</b> 17 <b>18</b> 18 <b>15</b> 15 <b>16</b> 16 <b>13</b> 13 <b>14</b> 14
keepGenerated	boolean	false	Keep Java source files generated for JSPs.

Attribute name	Data type	Default value	Description
prepareJSPs	int		When this attribute is present, all JSPs larger than the value (in kilobytes) are compiled at application server startup. Set this to 0 to compile all JSPs.
recompileJspOnRestart	boolean	false	Recompile JSPs after an application is restarted. JSPs are recompiled on first access.
scratchdir	string		When this attribute is set, the JSPs are compiled to the specified directory instead of the server workarea directory.
useImplicitTagLibs	boolean	true	Allow JSPs to use jsx and tsx tag libs.
useInMemory	boolean	false	Generate Java source and classes in memory (without writing to disk).

## Keystore (keyStore)

A repository of security certificates used for SSL encryption.

- keyEntry

Attribute name	Data type	Default value	Description
fileBased	boolean	true	Specify true if the keystore is file based and false if the keystore is a SAF keyring or hardware keystore type.
id	string		A unique configuration ID.
location	A file, directory or url.	\${server.output.dir}/resources/security/key.jks	An absolute or relative path to the keystore file. If a relative path is provided, the server will attempt to locate the file in the \${server.config.dir}/resources/security directory. Use the keystore file for a file-based keystore, the keyring name for SAF keyrings, or the device configuration file for hardware cryptography devices. In the SSL minimal configuration, the location of the file is assumed to be \${server.config.dir}/resources/security/key.jks.

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		The password used to load the keystore file. The value can be stored in clear text or encoded form. Use the securityUtility tool to encode the password.
pollingRate	A period of time with millisecond precision	500ms	Rate at which the server checks for updates to a keystore file. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
readOnly	boolean	false	Specify true if the keystore is to be used by the server for reading and false if write operations will be performed by the server on the keystore.
type	string	jks	A keystore type supported by the target SDK.

Attribute name	Data type	Default value	Description
updateTrigger	<ul style="list-style-type: none"> <li>• mbean</li> <li>• polled</li> <li>• disabled</li> </ul>	mbean	<p>Keystore file update method or trigger.</p> <p><b>mbean</b> Server will only update the keystore when prompted by the FileNotificationMbean. The FileNotificationMbean is typically called by an external program such as an integrated development environment or a management application.</p> <p><b>polled</b> Server will scan for keystore file changes at the polling interval and update if the keystore file has detectable changes.</p> <p><b>disabled</b> Disables all update monitoring. Changes to the keystore file will not be applied while the server is running.</p>

### keyEntry

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
keyPassword	Reversably encoded password (string)		Password of the private key entry in the keystore.
name	string		Name of the private key entry in the keystore.

## LDAP User Registry (IdapRegistry)

Configuration properties for the LDAP user registry.

- activedFilters
- attributeConfiguration
  - attribute
  - externalIdAttribute
- contextPool

- customFilters
- domino50Filters
- edirectoryFilters
- failoverServers
  - server
- idsFilters
- iplanetFilters
- ldapCache
  - attributesCache
  - searchResultsCache
- ldapEntityType
  - objectClass
  - searchBase
- netscapeFilters
- securewayFilters

Attribute name	Data type	Default value	Description
activatedFiltersRef	A reference to top level activatedLdapFilterProperties element (string).		Specifies the list of default Microsoft Active Directory LDAP filters.
baseDN	string		Base distinguished name (DN) of the directory service, which indicates the starting point for LDAP searches in the directory service.
bindDN	string		Distinguished name (DN) for the application server, which is used to bind to the directory service.
bindPassword	Reversably encoded password (string)		Password for the bind DN. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
certificateFilter	string		Specifies the filter certificate mapping property for the LDAP filter. The filter is used to map attributes in the client certificate to entries in the LDAP registry. For example, the filter can be specified as: uid=\${SubjectCN}.

Attribute name	Data type	Default value	Description
certificateMapMode	<ul style="list-style-type: none"> <li>EXACT_DN</li> <li>CERTIFICATE_FILTER</li> </ul>		<p>Specifies whether to map x.509 certificates into an LDAP directory by EXACT_DN or CERTIFICATE_FILTER. Specify CERTIFICATE_FILTER to use the specified certificate filter for the mapping.</p> <p><b>EXACT_DN</b> exactDN</p> <p><b>CERTIFICATE_FILTER</b> certFilter</p>
connectTimeout	A period of time with millisecond precision	1m	<p>Maximum time for establishing a connection to the LDAP server. An error message will be logged if the specified time expires. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.</p>
customFiltersRef	A reference to top level customLdapFilterProperties element (string).		Specifies the list of default Custom LDAP filters.
domino50FiltersRef	A reference to top level domino50LdapFilterProperties element (string).		Specifies the list of default IBM Lotus Domino LDAP filters.
edirectoryFiltersRef	A reference to top level edirectoryLdapFilterProperties element (string).		Specifies the list of Novell eDirectory LDAP filters.
host	string		Address of the LDAP server in the form of an IP address or a domain name service (DNS) name.
id	string		A unique configuration ID.
idsFiltersRef	A reference to top level idsLdapFilterProperties element (string).		Specifies the list of default IBM Tivoli Directory Server LDAP filters.
ignoreCase	boolean	true	Perform a case-insensitive authentication check.
iplanetFiltersRef	A reference to top level iplanetLdapFilterProperties element (string).		Specifies the list of default Sun Java System Directory Server LDAP filters.

Attribute name	Data type	Default value	Description
ldapType	<ul style="list-style-type: none"> <li>• Sun Java System Directory Server</li> <li>• Netscape Directory Server</li> <li>• Microsoft Active Directory</li> <li>• IBM Tivoli Directory Server</li> <li>• IBM Lotus Domino</li> <li>• Custom</li> <li>• IBM SecureWay Directory Server</li> <li>• Novell eDirectory</li> </ul>		<p>Type of LDAP server to which a connection will be established.</p> <p><b>Sun Java System Directory Server</b> iplanet</p> <p><b>Netscape Directory Server</b> netscape</p> <p><b>Microsoft Active Directory</b> actived</p> <p><b>IBM Tivoli Directory Server</b> ibm_dir_server</p> <p><b>IBM Lotus Domino</b> domino50</p> <p><b>Custom</b> custom</p> <p><b>IBM SecureWay Directory Server</b> secureway</p> <p><b>Novell eDirectory</b> edirectory</p>
netscapeFiltersRef	A reference to top level netscapeLdapFilterProperties element (string).		Specifies the list of default Netscape Directory Server LDAP filters.
port	int		Port number of the LDAP server.
realm	string	LdapRegistry	The realm name that represents the user registry.
recursiveSearch	boolean	false	Performs a nested group search. Select this option only if the LDAP server does not support recursive server-side searches.
returnToPrimaryServer	boolean	true	A boolean value that indicates if the search should be done against the Primary Server.
reuseConnection	boolean	true	Requests the application server to reuse the LDAP server connection.

Attribute name	Data type	Default value	Description
searchTimeout	A period of time with millisecond precision	1m	Maximum time for an LDAP server to respond before a request is canceled. This is equivalent to a read timeout once the connection is established. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
securewayFiltersRef	A reference to top level securewayLdapFilterProperties element (string).		Specifies the list of default IBM SecureWay Directory Server LDAP filters.
sslEnabled	boolean	false	Indicates whether an SSL connection should be made to the LDAP server.
sslRef	A reference to top level ssl element (string).		ID of the SSL configuration to be used to connect to the SSL-enabled LDAP server.

#### activatedFilters

Specifies the list of default Microsoft Active Directory LDAP filters.

false

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)(objectcategory=group))	An LDAP filter clause for searching the user registry for groups.
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	memberOf:member	An LDAP filter that identifies user to group memberships.
userFilter	string	(&(sAMAccountName=%v)(objectcategory=user))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	user:sAMAccountName	An LDAP filter that maps the name of a user to an LDAP entry.

#### attributeConfiguration

The configuration that maps the LDAP attributes with the user registry schema (for example; Person, PersonAccount or Group) field names.

false

**attributeConfiguration > attribute**

Define the user registry schema field names to be mapped to the LDAP attribute.

false

Attribute name	Data type	Default value	Description
defaultValue	string		The default value of the attribute.
entityType	string		The entity type of the attribute.
id	string		A unique configuration ID.
name	string		The name of the LDAP attribute.
propertyName	string		The user registry schema field name that needs to be mapped with the LDAP attribute.
syntax	string		The attribute syntax.

**attributeConfiguration > externalIdAttribute**

Define the name of the LDAP attribute and its properties that needs to be mapped to the user registry externalId attribute.

false

Attribute name	Data type	Default value	Description
autoGenerate	boolean	false	When enabled, the externalId attribute value is generated automatically by the user registry instead of using the value that is stored in LDAP. By default it is disabled.
entityType	string		The entity type of the attribute.
id	string		A unique configuration ID.
name	string		The name of the LDAP attribute to be used for the user registry externalId attribute.
syntax	string		The attribute syntax.

**contextPool**

Properties of the context pool.

false

Attribute name	Data type	Default value	Description
enabled	boolean	true	A boolean value that determines if the context pool is enabled. Disabling it can cause performance degradation.

Attribute name	Data type	Default value	Description
initialSize	int	1	An integer value that determines the initial size of the context pool. Set this based on the load on the repository.
maxSize	int	0	An integer value that defines the maximum context pool size. Set this based on the maximum load on the repository.
preferredSize	int	3	The preferred size of the context pool. Set this based on the load on the repository.
timeout	A period of time with millisecond precision	0s	The duration after which the context pool times out. An integer that represents the time that an idle context instance can remain in the pool without being closed and removed from the pool. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
waitTime	A period of time with millisecond precision	3s	The duration after which the context pool times out. The time interval that the request waits until the context pool checks again if an idle context instance is available in the pool when the number of context instances reaches the maximum pool size. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

#### customFilters

Specifies the list of default Custom LDAP filters.

false

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)(!(objectclass=groupOfNames)(!(objectclass=groupOfUniqueNames)(objectclass=groupOfDynamicNames)))	An LDAP filter clause for searching the user registry for groups.
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	ibm-allGroups:member;ibm-allGroups:uniqueMember;groupOfNames:member;groupOfUniqueNames:member	An LDAP filter that identifies user to group memberships.
userFilter	string	(&(uid=%v)(objectclass=ePerson))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	*:uid	An LDAP filter that maps the name of a user to an LDAP entry.

### domino50Filters

Specifies the list of default IBM Lotus Domino LDAP filters.

false

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)(objectclass=dominoGroup))	An LDAP filter clause for searching the user registry for groups.
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	dominoGroup:member	An LDAP filter that identifies user to group memberships.
userFilter	string	(&(uid=%v)(objectclass=Person))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	person:uid	An LDAP filter that maps the name of a user to an LDAP entry.

### edirectoryFilters

Specifies the list of Novell eDirectory LDAP filters.

false

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)(objectclass=groupOfNames))	An LDAP filter clause for searching the user registry for groups.
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.

Attribute name	Data type	Default value	Description
groupMemberIdMap	string	groupOfNames:member	An LDAP filter that identifies user to group memberships.
userFilter	string	(&(cn=%v)(objectclass=Person))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	person:cn	An LDAP filter that maps the name of a user to an LDAP entry.

### failoverServers

List of LDAP failover servers.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		Configuration properties for LDAP failover servers. Specify it as a backup server for the primary LDAP servers. For example, <pre>&lt;failoverServers name="failoverLdapServers"&gt;&lt;server host="myfullyqualifiedhostname1" port="389"/&gt;&lt;server host="myfullyqualifiedhostname2" port="389"/&gt;&lt;/failoverServers&gt;</pre>

### failoverServers > server

Configuration properties for LDAP failover server.

false

Attribute name	Data type	Default value	Description
host	string		LDAP server host name, which can be either an IP address or a domain name service (DNS) name.
id	string		A unique configuration ID.
port	int		LDAP failover server port.

### idsFilters

Specifies the list of default IBM Tivoli Directory Server LDAP filters.

false

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)(!(objectclass=groupOfNames)(objectclass=groupOfUniqueNames)(objectclass=groupOfNames))	An LDAP filter clause for searching the user registry for groups.

Attribute name	Data type	Default value	Description
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	ibm-allGroups:member;ibm-allGroups:uniqueMember;groupOfNames:uniqueMember;groupOfUniqueNames:uniqueMember	An LDAP filter that identifies user to group memberships.
userFilter	string	(&(uid=%v)(objectclass=ePerson))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	*:uid	An LDAP filter that maps the name of a user to an LDAP entry.

### iplanetFilters

Specifies the list of default Sun Java System Directory Server LDAP filters.

false

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)(objectclass=ldapsubentry))	An LDAP filter clause for searching the user registry for groups.
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	nsRole:nsRole	An LDAP filter that identifies user to group memberships.
userFilter	string	(&(uid=%v)(objectclass=inetOrgPerson))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	inetOrgPerson:uid	An LDAP filter that maps the name of a user to an LDAP entry.

### ldapCache

Configure the attributes of the cache.

false

#### ldapCache > attributesCache

The attribute cache properties configuration.

false

Attribute name	Data type	Default value	Description
enabled	boolean	true	A Boolean value to indicate that the property is enabled.

Attribute name	Data type	Default value	Description
serverTTLAttribute	string		The time after which a cache entry expires. The subsequent call for this entry will be fetched directly from the server and then placed again in the cache.
size	int	2000	Defines the number of entities that can be stored in the cache. You can increase the size of the cache based on the number of entities that are required to be stored in the cache.
sizeLimit	int	2000	The size limit for the cache.
timeout	A period of time with millisecond precision	1200ms	Defines the maximum time that the contents of the LDAP attribute cache are available. When the specified time has elapsed, the LDAP attribute cache is cleared. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

#### ldapCache > searchResultsCache

The configuration for the search results cache.

false

Attribute name	Data type	Default value	Description
enabled	boolean	true	A Boolean value to indicate that the property is enabled.
resultsSizeLimit	int	2000	The maximum number of results that can be returned in the search.
size	int	2000	The size of the cache. The number of search results that are stored in the cache. This needs to be configured based on the number of search queries executed on the system and the hardware system resources available.

Attribute name	Data type	Default value	Description
timeout	A period of time with millisecond precision	1200ms	Defines the maximum time that the contents of the search results cache are available. When the specified time has elapsed, the search results cache is cleared. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

### **ldapEntityType**

Configure the LDAP object class, search filters, search bases and LDAP relative distinguished name (RDN) for Person, Group and Organizational Unit. For example, the Group entity type can have a search filter such as (&(ObjectCategory=Groupofnames)(ObjectClass=Groupofnames)) and the object class as Groupofnames with search base ou=iGroups,o=ibm,c=us.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		The name of the LDAP entity type.
searchFilter	string		A custom LDAP search expression used while searching for entity types. For example, searchFilter="(!(ObjectCategory=User)(ObjectClass=Groupofnames))"

#### **ldapEntityType > objectClass**

The object class defined for the given LDAP entity type in the LDAP server. For example, the object class for the group LDAP entity type can be Groupofnames.

false

string

#### **ldapEntityType > searchBase**

Specify the sub tree of the LDAP server for the search call for the given entity type which will override the base DN in search operations. For example, if the base DN is o=ibm,c=us and the search base for the PersonAccount entity type is defined to be ou=iUsers,o=ibm,c=us, then all search calls for PersonAccount will be made under subtree ou=iUsers,o=ibm,c=us. Multiple search bases can be configured for the same entity type.

false

string

### **netscapeFilters**

Specifies the list of default Netscape Directory Server LDAP filters.

false

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)(!(objectclass=groupOfNames)(!(objectclass=groupOfUniqueNames)))	An LDAP filter clause for groups.
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	groupOfNames:member;groupOfUniqueMembers	An LDAP filter that identifies user to group memberships.
userFilter	string	(&(uid=%v)(objectclass=inetOrgPerson)	An LDAP filter clause for searching the user registry for users.
userIdMap	string	inetOrgPerson:uid	An LDAP filter that maps the name of a user to an LDAP entry.

### securewayFilters

Specifies the list of default IBM SecureWay Directory Server LDAP filters.

false

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)(!(objectclass=groupOfNames)(!(objectclass=groupOfUniqueNames)))	An LDAP filter clause for groups.
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	groupOfNames:member;groupOfUniqueMembers	An LDAP filter that identifies user to group memberships.
userFilter	string	(&(uid=%v)(objectclass=ePerson))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	*:uid	An LDAP filter that maps the name of a user to an LDAP entry.

## Shared Library (library)

Shared Library

- file
- fileset
- folder

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
id	string		A unique configuration ID.
name	string		Name of shared library for administrators

### file

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

### fileset

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**WebSphere Optimized Local Adapters (WOLA) Connect (localAdaptersConnectService)**

Represents a z/OS Connect service implementation that uses WOLA to communicate with backend programs.

Attribute name	Data type	Default value	Description
connectionFactoryRef	A reference to top level connectionFactory element (string).		Reference to the configured connection factory element containing the JNDI name of the WOLA resource adapter connection factory to be used.
connectionWaitTimeout	int Minimum: 0 Maximum: 2147483647		Time to wait in seconds for an external address space application that matches the registration name to issue a WOLA Receive Request or Host Service API and become active.
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
linkTaskChanCtxContEncoding	string	cp819	Defines the encoding of the data in all context containers that are sent to the destination program. This attribute is used when using the CICS Link Server and when the linkTaskChanID and useCICSContainer (true) attributes are also configured.
linkTaskChanCtxContHttpHeaders	string		Defines the HTTP header name or list of comma-separated and case-sensitive HTTP header names that are passed to the destination program using the context container with the name of ZCONHTTPHeaders. The information contained in this context container is in JSON format: {httpHeaders:{"header1":"header1Value", ..., "header-n":"headerValue-n"}}. If the request contains multiple headers with the same name, the value that is used is the one for the first header in the request. This attribute is used when using the CICS Link Server and when the linkTaskChanID and useCICSContainer (true) attributes are also configured.
linkTaskChanID	string		Defines the CICS channel name to use for delivering and receiving payloads using CICS containers. This attribute is used when using the CICS Link Server and when the useCICSContainer (true) attribute is also configured.
linkTaskChanReqContID	string	ZCONReqData	Defines the name of the request container. This attribute is used when using the CICS Link Server and when the linkTaskChanID and useCICSContainer (true) attributes are also configured.

Attribute name	Data type	Default value	Description
linkTaskChanRespContID	string	ZCONRespData	Defines the name of the response container. This attribute is used when using the CICS Link Server and when the linkTaskChanID and useCICSContainer (true) attributes are also configured.
linkTaskChanType	int Minimum: 0	0	Defines the type of CICS containers (0=CHAR, 1=BIT) that are to be associated with the configured channel ID. When set to 0=CHAR (default), the encoding of the character data in the input/output containers are expected/returned in ASCII (CCSID 819) and the data is converted to or from EBCDIC (cp037) before/after it is sent to/from the destination program. Use the BIT type to avoid data type and encoding expectations. This attribute is used when using the CICS Link Server and when the linkTaskChanID and useCICSContainer (true) attributes are also configured.
linkTaskReqContID	string		Defines the name of the request, or input, container. This attribute is used when using the CICS Link Server and when the linkTaskRspContID and useCICSContainer (true) attributes are also configured.
linkTaskReqContType	int Minimum: 0	0	Defines the type of the request container (0=CHAR, 1=BIT). This attribute is used when using the CICS Link Server and when the linkTaskReqContID and useCICSContainer (true) attributes are also configured.

Attribute name	Data type	Default value	Description
linkTaskRspContID	string		Defines the name of the response, or output, container. This attribute is used when using the CICS Link Server and when the linkTaskReqContID and useCICSContainer (true) attributes are also configured.
linkTaskRspContType	int Minimum: 0	0	Defines the type of the response container (0=CHAR, 1=BIT). This attribute is used when using the CICS Link Server and when the linkTaskRspContID and useCICSContainer (true) attributes are also configured.
linkTaskTranID	string		Defines the name of the WOLA CICS Link Server link invocation task transaction ID. This attribute is used when using the CICS Link Server.
registerName	string		WOLA target register name. This name must match the name an external address space application is using for the register name on a WOLA Register API call, or the name used for RGN with a WOLA CICS Link Server.
serviceName	string		WOLA target service name. This name must match the name an external address space application is using for the service name on a WOLA Receive Request or Host Service API call, or the program name used for SVC with a WOLA CICS Link Server.
useCICSContainer	boolean	false	Defines the mechanism to use for data propagation. When set to true, the payload is passed to the target CICS application program using CICS containers. When set to false (default), the payload is passed the target CICS application program using a COMMAREA. This attribute is used when using the CICS Link Server.

## Logging (logging)

Controls the capture and output of log and trace messages.

Attribute name	Data type	Default value	Description
consoleLogLevel	<ul style="list-style-type: none"><li>• ERROR</li><li>• WARNING</li><li>• AUDIT</li><li>• OFF</li><li>• INFO</li></ul>	AUDIT	<p>The logging level used to filter messages written to system streams. The default value is audit.</p> <p><b>ERROR</b> Error messages will be written to the system error stream.</p> <p><b>WARNING</b> Warning messages will be written to the system output stream. Error messages will be written to the system error stream.</p> <p><b>AUDIT</b> Audit and warning messages will be written to the system output stream. Error messages will be written to the system error stream.</p> <p><b>OFF</b> No server output will be written to system streams. Only JVM output will be written to system streams.</p> <p><b>INFO</b> Info, audit, and warning messages will be written to the system output stream. Error messages will be written to the system error stream.</p>

Attribute name	Data type	Default value	Description
copySystemStreams	boolean	true	If true, write System.out to the system output stream and System.err to the system error stream. If false, System.out and System.err will write to configured logs like messages.log or trace.log, but not to the system streams. The default value is true.
hideMessage	string		The list of messages, separated by a comma, that are configured to be hidden from the console.log and message.log files. If the messages are configured to be hidden, then they are redirected to the trace.log file.
logDirectory	Path to a directory	\${server.output.dir}/logs	Location of the directory for log files. The default value is \${server.output.dir}/logs.
maxFileSize	int Minimum: 0	20	Maximum size of a log file, in megabytes, before being rolled over; a value of 0 means no limit.
maxFiles	int Minimum: 0	2	Maximum number of log files that will be kept, before the oldest file is removed; a value of 0 means no limit.
messageFileName	string	messages.log	Name of the file to which message output will be written relative to the configured log directory. The default value is messages.log.
suppressSensitiveTrace	boolean	false	The server trace can expose sensitive data when tracing untyped data, such as bytes received over a network connection. If true, prevent potentially sensitive information from being exposed in log and trace files. The default value is false.
traceFileName	string	trace.log	Name of the file to which trace output will be written relative to the configured log directory. The default value is trace.log.

Attribute name	Data type	Default value	Description
traceFormat	<ul style="list-style-type: none"> <li>• ENHANCED</li> <li>• BASIC</li> <li>• ADVANCED</li> </ul>	ENHANCED	<p>This format is used for the trace log.</p> <p><b>ENHANCED</b> Use the enhanced basic trace format.</p> <p><b>BASIC</b> Use the basic trace format.</p> <p><b>ADVANCED</b> Use the advanced trace format.</p>
traceSpecification	string	*=info	<p>A trace specification that conforms to the trace specification grammar and specifies the initial state for various trace components. An empty value is allowed and treated as 'disable all trace'. Any component that is not specified is initialized to a default state of *=info.</p>

## Logstash Collector (logstashCollector)

Logstash collector gathers data from various sources and forwards the data to a logstash server using Lumberjack protocol.

- source

Attribute name	Data type	Default value	Description
hostName	string		Host name of the logstash server.
port	int Minimum: 1 Maximum: 65535		Port number of the logstash server.
sslRef	A reference to top level ssl element (string).		Specifies an ID of the SSL repertoire that is used to connect to the logstash server.

### source

Specifies a source to be used by the logstash collector.

false

string

## LTPA Token (ltpa)

Lightweight Third Party Authentication (LTPA) token configuration.

Attribute name	Data type	Default value	Description
expiration	A period of time with minute precision	120m	Amount of time after which a token expires in minutes. Specify a positive integer followed by a unit of time, which can be hours (h) or minutes (m). For example, specify 30 minutes as 30m. You can include multiple values in a single entry. For example, 1h30m is equivalent to 90 minutes.
keysFileName	Path to a file	\${server.output.dir}/resources/security/ltpa.keys	Path of the file containing the token keys.
keysPassword	Reversably encoded password (string)	{xor}CDo9Hgw=	Password for the token keys. The value can be stored in clear text or encoded form. It is recommended to encode the password, use the securityUtility tool with the encode option.
monitorInterval	A period of time with millisecond precision	0ms	Rate at which the server checks for updates to the LTPA token keys file. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

## Mail Session Object (mailSession)

Configuration for a Mail Session Instance.

- property

Attribute name	Data type	Default value	Description
description	string		Description of the Mail Session
from	string		The E-Mail address used to send mail with the Mail Session instance.
host	string		The host of the Mail Session
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
jndiName	string		Name of the Mail Session reference that is used for JNDI look-up
mailSessionID	string		The ID of the specific Mail Session Instance
password	Reversably encoded password (string)		The User's password, usually needed in order to connect to the host.
storeProtocol	string	imap	The Store Protocol used by the Mail Session instance. The default store protocol is IMAP
transportProtocol	string	smtp	The Transport Protocol used by the Mail Session instance. The default transport protocol is SMTP
user	string		The User's e-mail address used on the Host.

#### property

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		The name of the extra property
value	string		The value of the property that matches the name

## Managed Executor (managedExecutorService)

Managed executor service

- contextService
  - baseContext
    - baseContext
    - classloaderContext
    - jeeMetadataContext
    - securityContext
    - syncToOSThreadContext
    - zosWLMContext
  - classloaderContext
  - jeeMetadataContext
  - securityContext
  - syncToOSThreadContext
  - zosWLMContext

Attribute name	Data type	Default value	Description
contextServiceRef	A reference to top level contextService element (string).	DefaultContextService	Configures how context is propagated to threads
id	string		A unique configuration ID.
jndiName	string		JNDI name

### contextService

Configures how context is propagated to threads

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
jndiName	string		JNDI name
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

### contextService > baseContext

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
id	string		A unique configuration ID.
jndiName	string		JNDI name
onError	<ul style="list-style-type: none"><li>• IGNORE</li><li>• FAIL</li><li>• WARN</li></ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**contextService > baseContext > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

com.ibm.ws.context.service-factory

**contextService > baseContext > classloaderContext**

Classloader context propagation configuration.

false

**contextService > baseContext > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**contextService > baseContext > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**contextService > baseContext > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**contextService > baseContext > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"><li>• Propagate</li><li>• PropagateOrNew</li><li>• New</li></ul>	Propagate	Indicates how the WLM context should be handled for non-Daemon work. <b>Propagate</b> Use the same WLM Context (if one exists). <b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists. <b>New</b> Always create a new WLM context.

**contextService > classloaderContext**

Classloader context propagation configuration.

false

**contextService > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**contextService > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**contextService > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**contextService > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"> <li>• Propagate</li> <li>• PropagateOrNew</li> <li>• New</li> </ul>	Propagate	<p>Indicates how the WLM context should be handled for non-Daemon work.</p> <p><b>Propagate</b> Use the same WLM Context (if one exists).</p> <p><b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists.</p> <p><b>New</b> Always create a new WLM context.</p>

## Managed Scheduled Executor (managedScheduledExecutorService)

Managed scheduled executor service

- contextService
  - baseContext
    - baseContext
    - classloaderContext
    - jeeMetadataContext
    - securityContext
    - syncToOSThreadContext
    - zosWLMContext

Attribute name	Data type	Default value	Description
contextServiceRef	A reference to top level contextService element (string).	DefaultContextService	Configures how context is propagated to threads
id	string		A unique configuration ID.
jndiName	string		JNDI name

### contextService

Configures how context is propagated to threads

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
jndiName	string		JNDI name

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**contextService > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
id	string		A unique configuration ID.
jndiName	string		JNDI name

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**contextService > baseContext > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

com.ibm.ws.context.service-factory

**contextService > baseContext > classloaderContext**

Classloader context propagation configuration.

false

**contextService > baseContext > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**contextService > baseContext > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**contextService > baseContext > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**contextService > baseContext > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"><li>• Propagate</li><li>• PropagateOrNew</li><li>• New</li></ul>	Propagate	Indicates how the WLM context should be handled for non-Daemon work.  <b>Propagate</b> Use the same WLM Context (if one exists).  <b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists.  <b>New</b> Always create a new WLM context.

**contextService > classloaderContext**

ClassLoader context propagation configuration.

false

**contextService > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**contextService > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**contextService > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**contextService > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"> <li>• Propagate</li> <li>• PropagateOrNew</li> <li>• New</li> </ul>	Propagate	<p>Indicates how the WLM context should be handled for non-Daemon work.</p> <p><b>Propagate</b> Use the same WLM Context (if one exists).</p> <p><b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists.</p> <p><b>New</b> Always create a new WLM context.</p>

## Managed Thread Factory (managedThreadFactory)

Managed thread factory

- contextService
  - baseContext
    - baseContext
    - classloaderContext
    - jeeMetadataContext
    - securityContext
    - syncToOSThreadContext
    - zosWLMContext
  - classloaderContext
  - jeeMetadataContext
  - securityContext
  - syncToOSThreadContext
  - zosWLMContext

Attribute name	Data type	Default value	Description
contextServiceRef	A reference to top level contextService element (string).	DefaultContextService	Configures how context is propagated to threads

Attribute name	Data type	Default value	Description
createDaemonThreads	boolean	false	Configures whether or not threads created by the managed thread factory should be daemon threads.
defaultPriority	int Minimum: 1 Maximum: 10		Default priority for threads created by the managed thread factory. If unspecified, the priority of the creating thread is used. Priority cannot exceed the maximum priority for the managed thread factory, in which case the maximum priority is used instead.
id	string		A unique configuration ID.
jndiName	string		JNDI name
maxPriority	int Minimum: 1 Maximum: 10		Maximum priority for threads created by the managed thread factory.

#### **contextService**

Configures how context is propagated to threads

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
jndiName	string		JNDI name

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**contextService > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
id	string		A unique configuration ID.
jndiName	string		JNDI name

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**contextService > baseContext > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

com.ibm.ws.context.service-factory

**contextService > baseContext > classloaderContext**

Classloader context propagation configuration.

false

**contextService > baseContext > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**contextService > baseContext > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**contextService > baseContext > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**contextService > baseContext > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"><li>• Propagate</li><li>• PropagateOrNew</li><li>• New</li></ul>	Propagate	Indicates how the WLM context should be handled for non-Daemon work. <b>Propagate</b> Use the same WLM Context (if one exists). <b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists. <b>New</b> Always create a new WLM context.

**contextService > classloaderContext**

Classloader context propagation configuration.

false

**contextService > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**contextService > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**contextService > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**contextService > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"> <li>• Propagate</li> <li>• PropagateOrNew</li> <li>• New</li> </ul>	Propagate	<p>Indicates how the WLM context should be handled for non-Daemon work.</p> <p><b>Propagate</b> Use the same WLM Context (if one exists).</p> <p><b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists.</p> <p><b>New</b> Always create a new WLM context.</p>

## Messaging Engine (messagingEngine)

A messaging engine is a component, running inside a server, that manages messaging resources. Applications are connected to a messaging engine when they send and receive messages.

- alias
- fileStore
- messagingSecurity
  - role
    - group
    - queuePermission
      - action
    - tempDestinationPermission
      - action
    - topicPermission
      - action
    - user
- queue
- topicSpace

### alias

An alias destination maps an alternative name for a bus destination. You can use an alias destination for point-to-point messaging or publish/subscribe messaging.

false

Attribute name	Data type	Default value	Description
forceReliability	<ul style="list-style-type: none"> <li>AssuredPersistent</li> <li>BestEffortNonPersistent</li> <li>ReliableNonPersistent</li> <li>ExpressNonPersistent</li> <li>ReliablePersistent</li> </ul>	AssuredPersistent	<p>The reliability assigned to a message produced to this destination when an explicit reliability has not been set by the producer.</p> <p><b>AssuredPersistent</b> AssuredPersistent</p> <p><b>BestEffortNonPersistent</b> BestEffortNonPersistent</p> <p><b>ReliableNonPersistent</b> ReliableNonPersistent</p> <p><b>ExpressNonPersistent</b> ExpressNonPersistent</p> <p><b>ReliablePersistent</b> ReliablePersistent</p>
id	string		The name of the alias queue or alias topic space.
sendAllowed	<ul style="list-style-type: none"> <li>false</li> <li>true</li> </ul>	true	<p>Producers can send messages to this destination.</p> <p><b>false</b>    false</p> <p><b>true</b>     true</p>
targetDestination	string	Default.Queue	The target destination parameter identifies a destination that might be within the same Bus as the alias destination. By default, if no property is set, it points to Default.Queue.

### fileStore

Messaging file store.

false

Attribute name	Data type	Default value	Description
fileStoreSize	long Minimum: 20	400	The combined size in megabytes for both permanent and temporary store. The file store size is equally divided between permanent and temporary store. For example, if you specify 400 MB as file store size then 200 MB is used for permanent store and 200 MB is used for temporary store.

Attribute name	Data type	Default value	Description
logFileSize	long Minimum: 10	10	Size in megabytes of the log file. The log file size cannot exceed half the size of the file store size. For a file store size set to 400 MB, the log file size cannot exceed 200 MB. The maximum recommended log file size is 25% of the file store size. For a file store size set to 400 MB, the maximum recommended setting for log file size would be 100 MB.
path	string	\${server.output.dir}/messaging/messageStore	Path to the file store.

### **messagingSecurity**

Security for the wasJmsServer-1.0 feature.

false

#### **messagingSecurity > role**

A set of permissions that are mapped to the users and groups

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		The name of the role

#### **messagingSecurity > role > group**

Groups that are assigned to the role

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		The group that is defined as part of the user registry

#### **messagingSecurity > role > queuePermission**

Permission that is defined on a queue for a set of users and groups

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
queueRef	string		Reference to the Queue defined in the Messaging Engine

#### **messagingSecurity > role > queuePermission > action**

Operations that are allowed on the destination

false

**messagingSecurity > role > tempDestinationPermission**

Permission that is defined on a temporary destination for a set of users and groups

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
prefix	string		Prefix defined for a temporary destination

**messagingSecurity > role > tempDestinationPermission > action**

Operations that are allowed on the destination

false

**messagingSecurity > role > topicPermission**

Permission that is defined on a topic for a set of users and groups

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
topicName	string		Name of the Topic inside the TopicSpace
topicSpaceRef	string	Default.Topic.Space	Reference to the TopicSpace defined in the Messaging Engine

**messagingSecurity > role > topicPermission > action**

Operations that are allowed on the destination

false

**messagingSecurity > role > user**

Users that are assigned to the particular role

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		The user that is defined as part of the registry

**queue**

A queue destination represents a message queue and is used for point-to-point messaging.

false

Attribute name	Data type	Default value	Description
exceptionDestination	string	_SYSTEM.Exception.Destination	The destination to which a message is forwarded by the system when it cannot be delivered to this destination.

Attribute name	Data type	Default value	Description
failedDeliveryPolicy	<ul style="list-style-type: none"> <li>KEEP_TRYING</li> <li>SEND_TO_EXCEPTION_DESTINATION</li> <li>DISCARD</li> </ul>	SEND_TO_EXCEPTION_DESTINATION	<p>Indicates that the messaging engine must take when the maxredeliverycount is reached for a message.</p> <p><b>KEEP_TRYING</b> KEEP_TRYING</p> <p><b>SEND_TO_EXCEPTION_DESTINATION</b> SEND_TO_EXCEPTION_DESTINATION</p> <p><b>DISCARD</b> DISCARD</p>
forceReliability	<ul style="list-style-type: none"> <li>AssuredPersistent</li> <li>BestEffortNonPersistent</li> <li>ReliableNonPersistent</li> <li>ExpressNonPersistent</li> <li>ReliablePersistent</li> </ul>	AssuredPersistent	<p>The reliability assigned to a message produced to this destination when an explicit reliability has not been set by the producer.</p> <p><b>AssuredPersistent</b> AssuredPersistent</p> <p><b>BestEffortNonPersistent</b> BestEffortNonPersistent</p> <p><b>ReliableNonPersistent</b> ReliableNonPersistent</p> <p><b>ExpressNonPersistent</b> ExpressNonPersistent</p> <p><b>ReliablePersistent</b> ReliablePersistent</p>
id	string		The name of the queue.
maintainStrictOrder	boolean	false	Maintains the order in which a producer sends messages to the destination.
maxMessageDepth	long Minimum: 1	50000	The maximum number of messages that the messaging engine can place on its message points.
maxRedeliveryCount	int	5	The maximum number of failed attempts to process a message. After this number of failed attempts, if an exception destination is configured, the message is forwarded from the intended destination to its exception destination. If an exception destination is not configured, a time interval between retry attempts is applied.
receiveAllowed	boolean	true	Clear this option (setting it to false) to prevent consumers from being able to receive messages from this destination.

Attribute name	Data type	Default value	Description
redeliveryInterval	long	5000	When no exception destination is configured, the time interval to apply between retry attempts, after the maximum failed deliveries limit is reached, for this destination.
sendAllowed	boolean	true	Producers can send messages to this destination.

### topicSpace

A topic space destination represents a set of "publish and subscribe" topics and is used for publish/subscribe messaging.

false

Attribute name	Data type	Default value	Description
exceptionDestination	string	_SYSTEM.Exception.Destination	The destination to which a message is forwarded by the system when it cannot be delivered to this destination.
failedDeliveryPolicy	<ul style="list-style-type: none"> <li>KEEP_TRYING</li> <li>SEND_TO_EXCEPTION_DESTINATION</li> <li>DISCARD</li> </ul>	SEND_TO_EXCEPTION_DESTINATION	<p>Actions that the messaging engine must take when the maxredeliverycount is reached for a message.</p> <p><b>KEEP_TRYING</b> KEEP_TRYING</p> <p><b>SEND_TO_EXCEPTION_DESTINATION</b> SEND_TO_EXCEPTION_DESTINATION</p> <p><b>DISCARD</b> DISCARD</p>
forceReliability	<ul style="list-style-type: none"> <li>AssuredPersistent</li> <li>BestEffortNonPersistent</li> <li>ReliableNonPersistent</li> <li>ExpressNonPersistent</li> <li>ReliablePersistent</li> </ul>	AssuredPersistent	<p>The reliability assigned to a message produced to this destination when an explicit reliability has not been set by the producer.</p> <p><b>AssuredPersistent</b> AssuredPersistent</p> <p><b>BestEffortNonPersistent</b> BestEffortNonPersistent</p> <p><b>ReliableNonPersistent</b> ReliableNonPersistent</p> <p><b>ExpressNonPersistent</b> ExpressNonPersistent</p> <p><b>ReliablePersistent</b> ReliablePersistent</p>
id	string		The name of the topic space.

Attribute name	Data type	Default value	Description
maintainStrictOrder	boolean	false	Maintains the order in which a producer sends messages to the destination.
maxMessageDepth	long Minimum: 1	50000	The maximum number of messages that the messaging engine can place on its message points.
maxRedeliveryCount	int	5	The maximum number of failed attempts to process a message. After this number of failed attempts, if an exception destination is configured, the message is forwarded from the intended destination to its exception destination. If an exception destination is not configured, a time interval between retry attempts is applied.
receiveAllowed	boolean	true	Clear this option (setting it to false) to prevent consumers from being able to receive messages from this destination.
redeliveryInterval	long	5000	When no exception destination is configured, the time interval to apply between retry attempts, after the maximum failed deliveries limit is reached, for this destination.
sendAllowed	boolean	true	Producers can send messages to this destination.

## Default Mime Types (mimeTypes)

Definition of mime types shared by all http virtual hosts

- type

### type

Definition of mime type as id=value. Use the extension as the id, and the associated type as the value.

false

string

## Mongo (mongo)

Configuration for a Mongo instance.

- hostNames
- library
  - file

- fileset
- folder
- ports

Attribute name	Data type	Default value	Description
autoConnectRetry	boolean		Retry connections to a server, for an interval up to the <code>maxAutoConnectRetryTime</code> , if the socket cannot be opened.
connectTimeout	A period of time with millisecond precision		Connection timeout for new connections. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
connectionsPerHost	int Minimum: 0		Limits the number of open connections to each host. Connections are pooled when not in use.
cursorFinalizerEnabled	boolean		Attempts to clean up <code>DBCursors</code> that are not closed.
description	string		Description of a Mongo instance.
id	string		A unique configuration ID.
libraryRef	A reference to top level library element (string).		Specifies a library that contains the MongoDB Java Driver.
maxAutoConnectRetryTime	A period of time with millisecond precision		Interval during which to retry attempts to open a connection to a server. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
maxWaitTime	A period of time with millisecond precision		Maximum amount of time to wait for an available connection. If negative, the connection request never times out. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>
password	Reversably encoded password (string)		Password for database user.
readPreference	<ul style="list-style-type: none"> <li>• primary</li> <li>• secondaryPreferred</li> <li>• secondary</li> <li>• primaryPreferred</li> <li>• nearest</li> </ul>		<p>Configures the read preference.</p> <p><b>primary</b> primary</p> <p><b>secondaryPreferred</b> secondaryPreferred</p> <p><b>secondary</b> secondary</p> <p><b>primaryPreferred</b> primaryPreferred</p> <p><b>nearest</b> nearest</p>
socketKeepAlive	boolean		Configures whether or not to keep sockets alive.

Attribute name	Data type	Default value	Description
socketTimeout	A period of time with millisecond precision		The socket timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
threadsAllowedToBlockForConnectionMultiplier	Minimum: 0		This value, multiplied by connectionsPerHost, establishes an upper limit on threads that are allowed to wait for an available connection.
user	string		Database user name.
writeConcern	<ul style="list-style-type: none"> <li>• ERRORS_IGNORED</li> <li>• ACKNOWLEDGED</li> <li>• SAFE</li> <li>• JOURNALED</li> <li>• NORMAL</li> <li>• REPLICAS_SAFE</li> <li>• FSYNC_SAFE</li> <li>• MAJORITY</li> <li>• FSYNCED</li> <li>• JOURNAL_SAFE</li> <li>• REPLICAS_SAFE</li> <li>• NONE</li> <li>• UNACKNOWLEDGED</li> </ul>		<p>The reliability of a write operation to the mongo server.</p> <p><b>ERRORS_IGNORED</b> ERRORS_IGNORED</p> <p><b>ACKNOWLEDGED</b> ACKNOWLEDGED</p> <p><b>SAFE</b> SAFE</p> <p><b>JOURNALED</b> JOURNALED</p> <p><b>NORMAL</b> NORMAL</p> <p><b>REPLICAS_SAFE</b> REPLICAS_SAFE</p> <p><b>FSYNC_SAFE</b> FSYNC_SAFE</p> <p><b>MAJORITY</b> MAJORITY</p> <p><b>FSYNCED</b> FSYNCED</p> <p><b>JOURNAL_SAFE</b> JOURNAL_SAFE</p> <p><b>REPLICAS_SAFE</b> REPLICAS_SAFE</p> <p><b>NONE</b> NONE</p> <p><b>UNACKNOWLEDGED</b> UNACKNOWLEDGED</p>

**hostNames**

List of host names. The ordering of this list must be consistent with the list of ports, such that the first element in the list of host names corresponds to the first element in the list of ports, and so forth.

false

string

**library**

Specifies a library that contains the MongoDB Java Driver.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

**library > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**library > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

#### library > folder

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

#### ports

List of port numbers. The ordering of this list must be consistent with the list of host names, such that the first element in the list of host names corresponds to the first element in the list of ports, and so forth.

false

## MongoDB DB (mongoDB)

Configuration for a MongoDB DB instance.

- mongo
  - hostNames
  - library
    - file
    - fileset
    - folder
  - ports

Attribute name	Data type	Default value	Description
databaseName	string		Name of the database.
id	string		A unique configuration ID.
jndiName	string		JNDI name for a MongoDB DB instance
mongoRef	A reference to top level mongo element (string).		Specifies the Mongo instance that this DB instance belongs to.

### mongo

Specifies the Mongo instance that this DB instance belongs to.

false

Attribute name	Data type	Default value	Description
autoConnectRetry	boolean		Retry connections to a server, for an interval up to the maxAutoConnectRetryTime, if the socket cannot be opened.
connectTimeout	A period of time with millisecond precision		Connection timeout for new connections. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
connectionsPerHost	int Minimum: 0		Limits the number of open connections to each host. Connections are pooled when not in use.
cursorFinalizerEnabled	boolean		Attempts to clean up DBCursors that are not closed.
description	string		Description of a Mongo instance.
libraryRef	A reference to top level library element (string).		Specifies a library that contains the MongoDB Java Driver.

Attribute name	Data type	Default value	Description
maxAutoConnectRetryTime	A period of time with millisecond precision		Interval during which to retry attempts to open a connection to a server. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
maxWaitTime	A period of time with millisecond precision		Maximum amount of time to wait for an available connection. If negative, the connection request never times out. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>
password	Reversably encoded password (string)		Password for database user.

Attribute name	Data type	Default value	Description
readPreference	<ul style="list-style-type: none"> <li>• primary</li> <li>• secondaryPreferred</li> <li>• secondary</li> <li>• primaryPreferred</li> <li>• nearest</li> </ul>		<p>Configures the read preference.</p> <p><b>primary</b> primary</p> <p><b>secondaryPreferred</b> secondaryPreferred</p> <p><b>secondary</b> secondary</p> <p><b>primaryPreferred</b> primaryPreferred</p> <p><b>nearest</b> nearest</p>
socketKeepAlive	boolean		Configures whether or not to keep sockets alive.
socketTimeout	A period of time with millisecond precision		The socket timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
threadsAllowedToBlockForConnectionMultiplier	<p>Minimum: 0</p>		This value, multiplied by connectionsPerHost, establishes an upper limit on threads that are allowed to wait for an available connection.
user	string		Database user name.

Attribute name	Data type	Default value	Description
writeConcern	<ul style="list-style-type: none"> <li>• ERRORS_IGNORED</li> <li>• ACKNOWLEDGED</li> <li>• SAFE</li> <li>• JOURNALED</li> <li>• NORMAL</li> <li>•</li> <li>• REPLICAS_SAFE</li> <li>• FSYNC_SAFE</li> <li>• MAJORITY</li> <li>• FSYNCED</li> <li>• JOURNAL_SAFE</li> <li>• REPLICAS_SAFE</li> <li>• NONE</li> <li>• UNACKNOWLEDGED</li> </ul>		<p>The reliability of a write operation to the mongo server.</p> <p><b>ERRORS_IGNORED</b> ERRORS_IGNORED</p> <p><b>ACKNOWLEDGED</b> ACKNOWLEDGED</p> <p><b>SAFE</b> SAFE</p> <p><b>JOURNALED</b> JOURNALED</p> <p><b>NORMAL</b> NORMAL</p> <p><b>REPLICAS_SAFE</b> REPLICAS_SAFE</p> <p><b>FSYNC_SAFE</b> FSYNC_SAFE</p> <p><b>MAJORITY</b> MAJORITY</p> <p><b>FSYNCED</b> FSYNCED</p> <p><b>JOURNAL_SAFE</b> JOURNAL_SAFE</p> <p><b>REPLICAS_SAFE</b> REPLICAS_SAFE</p> <p><b>NONE</b> NONE</p> <p><b>UNACKNOWLEDGED</b> UNACKNOWLEDGED</p>

**mongo > hostNames**

List of host names. The ordering of this list must be consistent with the list of ports, such that the first element in the list of host names corresponds to the first element in the list of ports, and so forth.

false

string

**mongo > library**

Specifies a library that contains the MongoDB Java Driver.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.

Attribute name	Data type	Default value	Description
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

**mongo > library > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**mongo > library > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**mongo > library > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**mongo > ports**

List of port numbers. The ordering of this list must be consistent with the list of host names, such that the first element in the list of host names corresponds to the first element in the list of ports, and so forth.

false

## Monitor (monitor)

Configuration for Monitoring Feature which includes enabled traditional PMI ,FineGrained and any future configurations updates.

Attribute name	Data type	Default value	Description
enableTraditionalPMI	boolean	false	Property to enable or disable Traditional PMI way of reporting.
filter	string		Allows user to enable/disable monitors based on group name such as WebContainer,JVM,ThreadPool,Session,Conn and so on.

## RRS Native Transaction Manager (nativeTransactionManager)

Configures the RRS Native Transaction Manager.

Attribute name	Data type	Default value	Description
resourceManagerNamePrefix	string	DEFAULT	The resource manager prefix to be used as part of the server generated resource manager name that is registered with Resource Recovery Services (RRS). The prefix must contain 1 to 8 alphanumeric (A-Z,a-z,0-9) and national (@,#,\$) character only. The prefix name of DEFAULT is a reserved prefix name that identifies a default server configuration and should not be used for securing server access.
shutdownTimeout	A period of time with millisecond precision	15s	The amount of time to wait before allowing the native context manager to stop if one or more native contexts are in-use. A native context is considered in-use if it contains an RRS unit of recovery with one or more interests. The timeout is specified by a positive integer followed by a unit of time, which can be milliseconds (ms), seconds (s), minutes (m) or hours (h). For example, fifteen seconds is specified as 15s. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

## Netscape Directory Server LDAP Filters (netscapeLdapFilterProperties)

Specifies the list of default Netscape Directory Server LDAP filters.

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)(1(objectclass=groupOfNames)(1(objectclass=groupOfUniqueNames))))	An LDAP filter clause for groups.

Attribute name	Data type	Default value	Description
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	groupOfNames:member;groupOfUniqueMembers	An LDAP filter that identifies user to group memberships.
id	string		A unique configuration ID.
userFilter	string	(&(uid=%v)(objectclass=inetOrgPerson))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	inetOrgPerson:uid	An LDAP filter that maps the name of a user to an LDAP entry.

## OAuth Role Map (oauth-roles)

OAuth web application security role map.

- authenticated
  - group
  - special-subject
  - user
- clientManager
  - group
  - special-subject
  - user

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

### authenticated

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

### authenticated > group

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		A group access ID in the general form group:realmName/groupUniqueId. A value will be generated if one is not specified.
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
name	string		Name of a group that has the security role.

**authenticated > special-subject**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
type	<ul style="list-style-type: none"> <li>• EVERYONE</li> <li>• ALL_AUTHENTICATED_USERS</li> </ul>		<p>One of the following special subject types: ALL_AUTHENTICATED_USERS, EVERYONE.</p> <p><b>EVERYONE</b> All users for every request, even if the request was not authenticated.</p> <p><b>ALL_AUTHENTICATED_USERS</b> All authenticated users.</p>

**authenticated > user**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		A user access ID in the general form user:realmName/userUniqueId. A value will be generated if one is not specified.
id	string		A unique configuration ID.
name	string		Name of a user who has the security role.

**clientManager**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

**clientManager > group**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		A group access ID in the general form group:realmName/groupUniqueId. A value will be generated if one is not specified.
id	string		A unique configuration ID.
name	string		Name of a group that has the security role.

#### clientManager > special-subject

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
type	<ul style="list-style-type: none"> <li>• EVERYONE</li> <li>• ALL_AUTHENTICATED_USERS</li> </ul>		<p>One of the following special subject types: ALL_AUTHENTICATED_USERS, EVERYONE.</p> <p><b>EVERYONE</b> All users for every request, even if the request was not authenticated.</p> <p><b>ALL_AUTHENTICATED_USERS</b> All authenticated users.</p>

#### clientManager > user

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		A user access ID in the general form user:realmName/userUniqueId. A value will be generated if one is not specified.
id	string		A unique configuration ID.
name	string		Name of a user who has the security role.

## OAuth Provider Definition (oauthProvider)

OAuth provider definition.

- autoAuthorizeClient
- databaseStore
  - dataSource

- connectionManager
- containerAuthData
- jaasLoginContextEntry
- jdbcDriver
  - library
    - file
    - fileset
    - folder
- properties
- properties.datadirect.sqlserver
- properties.db2.i.native
- properties.db2.i.toolbox
- properties.db2.jcc
- properties.derby.client
- properties.derby.embedded
- properties.informix
- properties.informix.jcc
- properties.microsoft.sqlserver
- properties.oracle
- properties.sybase
- recoveryAuthData
- grantType
- jwtGrantType
- library
  - file
  - fileset
  - folder
- localStore
  - client
    - functionalUserGroupIds
    - grantTypes
    - postLogoutRedirectUris
    - redirect
    - responseTypes
- mediatorClassname

Attribute name	Data type	Default value	Description
accessTokenLength	long	40	Length of the generated OAuth access token. The equivalent provider parameter in the full application server profile is <code>oauth20.access.token.length</code> .

Attribute name	Data type	Default value	Description
accessTokenLifetime	A period of time with second precision	7200	Time that access token is valid (seconds). The equivalent provider parameter in the full application server profile is <code>oauth20.token.lifetime.seconds</code> . Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
allowPublicClients	boolean	false	A value of false disables the access of public clients as detailed in the OAuth specification. The equivalent provider parameter in the full application server profile is <code>oauth20.allow.public.clients</code> .
authorizationCodeLength	long	30	Length of the generated authorization code. The equivalent provider parameter in the full application server profile is <code>oauth20.code.length</code> .
authorizationCodeLifetime	A period of time with second precision	60	Authorization code lifetime (seconds). The equivalent provider parameter in the full application server profile is <code>oauth20.code.lifetime.seconds</code> . Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
authorizationErrorTemplate	string		URL of a custom authorization error page template. The equivalent provider parameter in the full application server profile is <code>oauth20.authorization.error.template</code> .

Attribute name	Data type	Default value	Description
authorizationFormTemplate	string	template.html	URL of a custom authorization page template. The equivalent provider parameter in the full application server profile is <code>oauth20.authorization.form.template</code> .
authorizationGrantLifetime	A period of time with second precision	604800	Authorization grant lifetime (seconds). The equivalent provider parameter in the full application server profile is <code>oauth20.max.authorization.grant.lifetime.seconds</code> . Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
autoAuthorize	boolean	false	To use auto authorization, append the <code>autoAuthorize</code> parameter to requests with a value of true. The equivalent provider parameter in the full application server profile is <code>oauth20.autoauthorize.param</code> .
autoAuthorizeParam	string	autoauthz	To use auto authorization, append the <code>autoAuthorize</code> parameter to requests with a value of true. The equivalent provider parameter in the full application server profile is <code>oauth20.autoauthorize.param</code> .
certAuthentication	boolean	false	Enable the authentication of client certificate in the https request.
characterEncoding	string		Set request character encoding to this value. The equivalent provider parameter in the full application server profile is <code>characterEncoding</code> .
clientTokenCacheSize	long		Maximum number of entries in the client token cache.

Attribute name	Data type	Default value	Description
clientURISubstitutions	string		Optional value to replace client URI strings for dynamic hostnames. The equivalent provider parameter in the full application server profile is <code>oauth20.client.uri.substitutions</code> .
consentCacheEntryLifetime	A period of time with second precision	1800	Time that an entry in the consent cache is valid (seconds). Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
consentCacheSize	long Minimum: 0	1000	Maximum number of entries allowed in the consent cache.
coverageMapSessionMaxAge	A period of time with second precision	600	The max-age value (seconds) for the cache-control header of the coverage map service. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
customLoginURL	string	login.jsp	URL of a custom login page. The equivalent provider parameter in the full application server profile is <code>oauth20.authorization.loginURL</code> .
filter	string		URI filter selects requests to be authorized by this provider. The equivalent provider parameter in the full application server profile is <code>Filter</code> .
httpsRequired	boolean	true	SSL communication between the OAuth client and provider is required.
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
includeTokenInSubject	boolean	true	If the value is true, add the com.ibm.wsspi.security.oauth2.token.WSOAuth2Token as a private credential. The equivalent provider parameter in the full application server profile is includeToken.
issueRefreshToken	boolean	true	A value of false disables generation and the use of refresh tokens. The equivalent provider parameter in the full application server profile is oauth20.issue.refresh.token.
libraryRef	A reference to top level library element (string).		Reference to shared library containing the mediator plugin class.
oauthOnly	boolean	true	If the value is true, then requests matching the filter must have an access token or they will be failed. If false, then matching requests will be checked for other authentication data if no access token is present. The equivalent provider parameter in the full application server profile is oauthOnly.
refreshTokenLength	long	50	Length of generated refresh token. The equivalent provider parameter in the full application server profile is oauth20.refresh.token.length.
skipResourceOwnerValidation	boolean	false	If the value is true, skip validation of resource owner.
userClientTokenLimit	long		Token limit for each user and client combination.

#### **autoAuthorizeClient**

Name of a client that is allowed to use auto authorization. The equivalent provider parameter in the full application server profile is oauth20.autoauthorize.clients.

false

string

#### **databaseStore**

Clients are defined and tokens are cached in the database.

false

Attribute name	Data type	Default value	Description
cleanupExpiredTokenInterval	A period of time with second precision	3600	Expired token cleanup interval (seconds). The equivalent provider parameter in the full application server profile is <code>oauthjdbc.CleanupInterval</code> . Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
dataSourceRef	A reference to top level <code>dataSource</code> element (string).		Reference to the data source for the store.
password	Reversably encoded password (string)		Password used to access the database.
schema	string	OAuthDBSchema	Schema
user	string		User

#### databaseStore > dataSource

Reference to the data source for the store.

false

Attribute name	Data type	Default value	Description
beginTranForResultSetScrolling	boolean	true	Attempt transaction enlistment when result set scrolling interfaces are used.
beginTranForVendorAPIs	boolean	true	Attempt transaction enlistment when vendor interfaces are used.
commitOrRollbackOnCleanup	<ul style="list-style-type: none"> <li>• commit</li> <li>• rollback</li> </ul>		<p>Determines how to clean up connections that might be in a database unit of work (<code>AutoCommit=false</code>) when the connection is closed or returned to the pool.</p> <p><b>commit</b> Clean up the connection by committing.</p> <p><b>rollback</b> Clean up the connection by rolling back.</p>
connectionManagerRef	A reference to top level <code>connectionManager</code> element (string).		Connection manager for a data source.

Attribute name	Data type	Default value	Description
connectionSharing	<ul style="list-style-type: none"> <li>MatchOriginalRequest</li> <li>MatchCurrentState</li> </ul>	MatchOriginalRequest	<p>Specifies how connections are matched for sharing.</p> <p><b>MatchOriginalRequest</b> When sharing connections, match based on the original connection request.</p> <p><b>MatchCurrentState</b> When sharing connections, match based on the current state of the connection.</p>
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.
enableConnectionCasting	boolean	false	Indicates that connections obtained from the data source should be castable to interface classes that the JDBC vendor connection implementation implements. Enabling this option incurs additional overhead on each getConnection operation. If vendor JDBC interfaces are needed less frequently, it might be more efficient to leave this option disabled and use Connection.unwrap(interface) only where it is needed.

Attribute name	Data type	Default value	Description
isolationLevel	<ul style="list-style-type: none"> <li>• TRANSACTION_REPEATABLE_READ</li> <li>• TRANSACTION_READ_COMMITTED</li> <li>• TRANSACTION_SERIALIZABLE</li> <li>• TRANSACTION_READ_UNCOMMITTED</li> <li>• TRANSACTION_SNAPSHOT</li> </ul>		<p>Default transaction isolation level.</p> <p><b>TRANSACTION_REPEATABLE_READ</b> Dirty reads and non-repeatable reads are prevented; phantom reads can occur.</p> <p><b>TRANSACTION_READ_COMMITTED</b> Dirty reads are prevented; non-repeatable reads and phantom reads can occur.</p> <p><b>TRANSACTION_SERIALIZABLE</b> Dirty reads, non-repeatable reads and phantom reads are prevented.</p> <p><b>TRANSACTION_READ_UNCOMMITTED</b> Dirty reads, non-repeatable reads and phantom reads can occur.</p> <p><b>TRANSACTION_SNAPSHOT</b> Snapshot isolation for Microsoft SQL Server JDBC Driver and DataDirect Connect for JDBC driver.</p>
jaasLoginContextEntryRef	A reference to top level jaasLoginContextEntry element (string).		JAAS login context entry for authentication.
jdbcDriverRef	A reference to top level jdbcDriver element (string).		JDBC driver for a data source.
jndiName	string		JNDI name for a data source.

Attribute name	Data type	Default value	Description
queryTimeout	A period of time with second precision		Default query timeout for SQL statements. In a JTA transaction, syncQueryTimeoutWithTransactionTimeout can override this default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
recoveryAuthDataRef	A reference to top level authData element (string).		Authentication data for transaction recovery.
statementCacheSize	int Minimum: 0	10	Maximum number of cached statements per connection.
supplementalJDBCTrace	boolean		Supplements the JDBC driver trace that is logged when JDBC driver trace is enabled in bootstrap.properties. JDBC driver trace specifications include: com.ibm.ws.database.logwriter, com.ibm.ws.db2.logwriter, com.ibm.ws.derby.logwriter, com.ibm.ws.informix.logwriter, com.ibm.ws.oracle.logwriter, com.ibm.ws.sqlserver.logwriter, com.ibm.ws.sybase.logwriter
syncQueryTimeoutWithTransactionTimeout	boolean	false	Use the time remaining (if any) in a JTA transaction as the default query timeout for SQL statements.
transactional	boolean	true	Enable participation in transactions that are managed by the application server.
type	<ul style="list-style-type: none"> <li>javax.sql.DataSource</li> <li>javax.sql.XADataSource</li> <li>javax.sql.ConnectionPoolDataSource</li> </ul>		Type of data source. <b>javax.sql.DataSource</b> javax.sql.DataSource <b>javax.sql.XADataSource</b> javax.sql.XADataSource <b>javax.sql.ConnectionPoolDataSource</b> javax.sql.ConnectionPoolDataSource

**databaseStore > dataSource > connectionManager**

Connection manager for a data source.

false

Attribute name	Data type	Default value	Description
agedTimeout	A period of time with second precision	-1	Amount of time before a physical connection can be discarded by pool maintenance. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
connectionTimeout	A period of time with second precision	30s	Amount of time after which a connection request times out. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxConnectionsPerThread	int Minimum: 0		Limits the number of open connections on each thread.
maxIdleTime	A period of time with second precision	30m	Amount of time after which an unused or idle connection can be discarded during pool maintenance, if doing so does not reduce the pool below the minimum size. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxPoolSize	int Minimum: 0	50	Maximum number of physical connections for a pool. A value of 0 means unlimited.

Attribute name	Data type	Default value	Description
minPoolSize	int Minimum: 0		Minimum number of physical connections to maintain in the pool. The pool is not pre-populated. Aged timeout can override the minimum.
numConnectionsPerThreadLocal	int Minimum: 0		Caches the specified number of connections for each thread.
purgePolicy	<ul style="list-style-type: none"> <li>• ValidateAllConnections</li> <li>• FailingConnectionOnly</li> <li>• EntirePool</li> </ul>	EntirePool	<p>Specifies which connections to destroy when a stale connection is detected in a pool.</p> <p><b>ValidateAllConnections</b> When a stale connection is detected, connections are tested and those found to be bad are closed.</p> <p><b>FailingConnectionOnly</b> When a stale connection is detected, only the connection which was found to be bad is closed.</p> <p><b>EntirePool</b> When a stale connection is detected, all connections in the pool are marked stale, and when no longer in use, are closed.</p>
reapTime	A period of time with second precision	3m	Amount of time between runs of the pool maintenance thread. A value of -1 disables pool maintenance. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

**databaseStore > dataSource > containerAuthData**

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

**databaseStore > dataSource > jaasLoginContextEntry**

JAAS login context entry for authentication.

false

Attribute name	Data type	Default value	Description
loginModuleRef	List of references to top level jaasLoginModule elements (comma-separated string).	hashtable,userNameAndPassword,certificate,clientId	Word, certificate, clientId of a JAAS login module.
name	string		Name of a JAAS configuration entry.

**databaseStore > dataSource > jdbcDriver**

JDBC driver for a data source.

false

Attribute name	Data type	Default value	Description
javax.sql.ConnectionPoolDataSource	string		JDBC driver implementation of javax.sql.ConnectionPoolDataSource.
javax.sql.DataSource	string		JDBC driver implementation of javax.sql.DataSource.
javax.sql.XADataSource	string		JDBC driver implementation of javax.sql.XADataSource.
libraryRef	A reference to top level library element (string).		Identifies JDBC driver JARs and native files.

**databaseStore > dataSource > jdbcDriver > library**

Identifies JDBC driver JARs and native files.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

**databaseStore > dataSource > jdbcDriver > library > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**databaseStore > dataSource > jdbcDriver > library > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**databaseStore > dataSource > jdbcDriver > library > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**databaseStore > dataSource > properties**

List of JDBC vendor properties for the data source. For example, databaseName="dbname" serverName="localhost" portNumber="50000".

false

Attribute name	Data type	Default value	Description
URL	string		URL for connecting to the database.
databaseName	string		JDBC driver property: databaseName.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
serverName	string		Server where the database is running.

Attribute name	Data type	Default value	Description
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**databaseStore > dataSource > properties.datadirect.sqlserver**

Data source properties for the DataDirect Connect for JDBC driver for Microsoft SQL Server.

false

Attribute name	Data type	Default value	Description
JDBCBehavior	<ul style="list-style-type: none"> <li>• 1</li> <li>• 0</li> </ul>	0	JDBC driver property: JDBCBehavior. Values are: 0 (JDBC 4.0) or 1 (JDBC 3.0). <b>1</b> JDBC 3.0 <b>0</b> JDBC 4.0
XATransactionGroup	string		JDBC driver property: XATransactionGroup.
XMLDescribeType	<ul style="list-style-type: none"> <li>• longvarbinary</li> <li>• longvarchar</li> </ul>		JDBC driver property: XMLDescribeType. <b>longvarbinary</b> longvarbinary <b>longvarchar</b> longvarchar
accountingInfo	string		JDBC driver property: accountingInfo.
alternateServers	string		JDBC driver property: alternateServers.
alwaysReportTriggerResults	boolean		JDBC driver property: alwaysReportTriggerResults.
applicationName	string		JDBC driver property: applicationName.
authenticationMethod	<ul style="list-style-type: none"> <li>• ntlm</li> <li>• userIdPassword</li> <li>• kerberos</li> <li>• auto</li> </ul>		JDBC driver property: authenticationMethod. <b>ntlm</b> ntlm <b>userIdPassword</b> userIdPassword <b>kerberos</b> kerberos <b>auto</b> auto
bulkLoadBatchSize	long		JDBC driver property: bulkLoadBatchSize.
bulkLoadOptions	long		JDBC driver property: bulkLoadOptions.
clientHostName	string		JDBC driver property: clientHostName.
clientUser	string		JDBC driver property: clientUser.

Attribute name	Data type	Default value	Description
codePageOverride	string		JDBC driver property: codePageOverride.
connectionRetryCount	int		JDBC driver property: connectionRetryCount.
connectionRetryDelay	A period of time with second precision		JDBC driver property: connectionRetryDelay. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
convertNull	int		JDBC driver property: convertNull.
databaseName	string		JDBC driver property: databaseName.
dateTimeInputParameterType	<ul style="list-style-type: none"> <li>• dateTime</li> <li>• dateTimeOffset</li> <li>• auto</li> </ul>		JDBC driver property: dateTimeInputParameterType.  <b>dateTime</b> dateTime <b>dateTimeOffset</b> dateTimeOffset <b>auto</b> auto
dateTimeOutputParameterType	<ul style="list-style-type: none"> <li>• dateTime</li> <li>• dateTimeOffset</li> <li>• auto</li> </ul>		JDBC driver property: dateTimeOutputParameterType.  <b>dateTime</b> dateTime <b>dateTimeOffset</b> dateTimeOffset <b>auto</b> auto
describeInputParameters	<ul style="list-style-type: none"> <li>• describeIfString</li> <li>• noDescribe</li> <li>• describeIfDateTime</li> <li>• describeAll</li> </ul>		JDBC driver property: describeInputParameters.  <b>describeIfString</b> describeIfString <b>noDescribe</b> noDescribe <b>describeIfDateTime</b> describeIfDateTime <b>describeAll</b> describeAll

Attribute name	Data type	Default value	Description
describeOutputParameters	<ul style="list-style-type: none"> <li>describeIfString</li> <li>noDescribe</li> <li>describeIfDateTime</li> <li>describeAll</li> </ul>		JDBC driver property: describeOutputParameters. <b>describeIfString</b> describeIfString <b>noDescribe</b> noDescribe <b>describeIfDateTime</b> describeIfDateTime <b>describeAll</b> describeAll
enableBulkLoad	boolean		JDBC driver property: enableBulkLoad.
enableCancelTimeout	boolean		JDBC driver property: enableCancelTimeout.
encryptionMethod	<ul style="list-style-type: none"> <li>loginSSL</li> <li>requestSSL</li> <li>SSL</li> <li>noEncryption</li> </ul>		JDBC driver property: encryptionMethod. <b>loginSSL</b> loginSSL <b>requestSSL</b> requestSSL <b>SSL</b> SSL <b>noEncryption</b> noEncryption
failoverGranularity	<ul style="list-style-type: none"> <li>disableIntegrityCheck</li> <li>atomicWithRepositioning</li> <li>nonAtomic</li> <li>atomic</li> </ul>		JDBC driver property: failoverGranularity. <b>disableIntegrityCheck</b> disableIntegrityCheck <b>atomicWithRepositioning</b> atomicWithRepositioning <b>nonAtomic</b> nonAtomic <b>atomic</b> atomic
failoverMode	<ul style="list-style-type: none"> <li>connect</li> <li>select</li> <li>extended</li> </ul>		JDBC driver property: failoverMode. <b>connect</b> connect <b>select</b> select <b>extended</b> extended
failoverPreconnect	boolean		JDBC driver property: failoverPreconnect.
hostNameInCertificate	string		JDBC driver property: hostNameInCertificate.
initializationString	string		JDBC driver property: initializationString.
insensitiveResultSetBufferSize	int		JDBC driver property: insensitiveResultSetBufferSize.

Attribute name	Data type	Default value	Description
javaDoubleToString	boolean		JDBC driver property: javaDoubleToString.
loadBalancing	boolean		JDBC driver property: loadBalancing.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
longDataCacheSize	int Minimum: -1		JDBC driver property: longDataCacheSize.
netAddress	string		JDBC driver property: netAddress.
packetSize	int Minimum: -1 Maximum: 128		JDBC driver property: packetSize.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
queryTimeout	A period of time with second precision		JDBC driver property: queryTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
resultsetMetaDataOptions	int		JDBC driver property: resultSetMetaDataOptions.
selectMethod	<ul style="list-style-type: none"> <li>• direct</li> <li>• cursor</li> </ul>		JDBC driver property: selectMethod.  <b>direct</b> direct <b>cursor</b> cursor
serverName	string	localhost	Server where the database is running.
snapshotSerializable	boolean		JDBC driver property: snapshotSerializable.

Attribute name	Data type	Default value	Description
spyAttributes	string		JDBC driver property: spyAttributes.
stringInputParameterType	<ul style="list-style-type: none"> <li>varchar</li> <li>nvarchar</li> </ul>	varchar	JDBC driver property: stringInputParameterType. <b>varchar</b> varchar <b>nvarchar</b> nvarchar
stringOutputParameterType	<ul style="list-style-type: none"> <li>varchar</li> <li>nvarchar</li> </ul>	varchar	JDBC driver property: stringOutputParameterType. <b>varchar</b> varchar <b>nvarchar</b> nvarchar
suppressConnectionWarnings	boolean		JDBC driver property: suppressConnectionWarnings.
transactionMode	<ul style="list-style-type: none"> <li>explicit</li> <li>implicit</li> </ul>		JDBC driver property: transactionMode. <b>explicit</b> explicit <b>implicit</b> implicit
truncateFractionalSeconds	boolean		JDBC driver property: truncateFractionalSeconds.
trustStore	string		JDBC driver property: trustStore.
trustStorePassword	Reversably encoded password (string)		JDBC driver property: trustStorePassword.
useServerSideUpdatableCursors	boolean		JDBC driver property: useServerSideUpdatableCursors.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
validateServerCertificate	boolean		JDBC driver property: validateServerCertificate.

**databaseStore > dataSource > properties.db2.i.native**

Data source properties for the IBM DB2 for i Native JDBC driver.

false

Attribute name	Data type	Default value	Description
access	<ul style="list-style-type: none"> <li>read only</li> <li>all</li> <li>read call</li> </ul>	all	JDBC driver property: access. <b>read only</b> read only <b>all</b> all <b>read call</b> read call

Attribute name	Data type	Default value	Description
autoCommit	boolean	true	JDBC driver property: autoCommit.
batchStyle	<ul style="list-style-type: none"> <li>• 2.1</li> <li>• 2.0</li> </ul>	2.0	JDBC driver property: batchStyle. <b>2.1</b> 2.1 <b>2.0</b> 2.0
behaviorOverride	int		JDBC driver property: behaviorOverride.
blockSize	<ul style="list-style-type: none"> <li>• 512</li> <li>• 128</li> <li>• 0</li> <li>• 32</li> <li>• 64</li> <li>• 16</li> <li>• 8</li> <li>• 256</li> </ul>	32	JDBC driver property: blockSize. <b>512</b> 512 <b>128</b> 128 <b>0</b> 0 <b>32</b> 32 <b>64</b> 64 <b>16</b> 16 <b>8</b> 8 <b>256</b> 256
cursorHold	boolean	false	JDBC driver property: cursorHold.
cursorSensitivity	<ul style="list-style-type: none"> <li>• asensitive</li> <li>• sensitive</li> </ul>	asensitive	JDBC driver property: cursorSensitivity. Values are: 0 (TYPE_SCROLL_SENSITIVE_STATIC), 1 (TYPE_SCROLL_SENSITIVE_DYNAMIC), 2 (TYPE_SCROLL_ASENSITIVE). <b>asensitive</b> asensitive <b>sensitive</b> sensitive
dataTruncation	string	true	JDBC driver property: dataTruncation.
databaseName	string	*LOCAL	JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
dateFormat	<ul style="list-style-type: none"> <li>• dmy</li> <li>• iso</li> <li>• eur</li> <li>• ymd</li> <li>• julian</li> <li>• jis</li> <li>• usa</li> <li>• mdy</li> </ul>		JDBC driver property: dateFormat. <b>dmy</b> dmy <b>iso</b> iso <b>eur</b> eur <b>ymd</b> ymd <b>julian</b> julian <b>jis</b> jis <b>usa</b> usa <b>mdy</b> mdy
dateSeparator	<ul style="list-style-type: none"> <li>• \,</li> <li>• b</li> <li>• .</li> <li>• /</li> <li>• -</li> </ul>		JDBC driver property: dateSeparator. <b>\,</b> The comma character (,). <b>b</b> The character b <b>.</b> The period character (.). <b>/</b> The forward slash character (/). <b>-</b> The dash character (-).

directMap	boolean	true	JDBC driver property: directMap.
doEscapeProcessing	boolean	true	JDBC driver property: doEscapeProcessing.
fullErrors	boolean		JDBC driver property: fullErrors.
libraries	string		JDBC driver property: libraries.
lobThreshold	int Maximum: 500000	0	JDBC driver property: lobThreshold.

Attribute name	Data type	Default value	Description
lockTimeout	A period of time with second precision	0	JDBC driver property: lockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maximumPrecision	<ul style="list-style-type: none"> <li>• 31</li> <li>• 63</li> </ul>	31	JDBC driver property: maximumPrecision.  <b>31</b> 31 <b>63</b> 63
maximumScale	int Minimum: 0 Maximum: 63	31	JDBC driver property: maximumScale.
minimumDivideScale	int Minimum: 0 Maximum: 9	0	JDBC driver property: minimumDivideScale.
networkProtocol	int		JDBC driver property: networkProtocol.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
prefetch	boolean	true	JDBC driver property: prefetch.
queryOptimizeGoal	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>	2	JDBC driver property: queryOptimizeGoal. Values are: 1 (*FIRSTIO) or 2 (*ALLIO).  <b>2</b> *ALLIO <b>1</b> *FIRSTIO

Attribute name	Data type	Default value	Description
reuseObjects	boolean	true	JDBC driver property: reuseObjects.
serverName	string		Server where the database is running.
serverTraceCategories	int	0	JDBC driver property: serverTraceCategories.
systemNaming	boolean	false	JDBC driver property: systemNaming.
timeFormat	<ul style="list-style-type: none"> <li>• iso</li> <li>• eur</li> <li>• jis</li> <li>• usa</li> <li>• hms</li> </ul>		JDBC driver property: timeFormat.  <b>iso</b> iso <b>eur</b> eur <b>jis</b> jis <b>usa</b> usa <b>hms</b> hms
timeSeparator	<ul style="list-style-type: none"> <li>• \,</li> <li>• b</li> <li>• :</li> <li>• .</li> </ul>		JDBC driver property: timeSeparator.  \, The comma character (,). <b>b</b> The character b : The colon character (:). . The period character (.).
trace	boolean		JDBC driver property: trace.
transactionTimeout	A period of time with second precision	0	JDBC driver property: transactionTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
translateBinary	boolean	false	JDBC driver property: translateBinary.
translateHex	<ul style="list-style-type: none"> <li>• binary</li> <li>• character</li> </ul>	character	JDBC driver property: translateHex.  <b>binary</b> binary <b>character</b> character
useBlockInsert	boolean	false	JDBC driver property: useBlockInsert.

Attribute name	Data type	Default value	Description
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**databaseStore > dataSource > properties.db2.i.toolbox**

Data source properties for the IBM DB2 for i Toolbox JDBC driver.

false

Attribute name	Data type	Default value	Description
access	<ul style="list-style-type: none"> <li>• read only</li> <li>• all</li> <li>• read call</li> </ul>	all	JDBC driver property: access. <b>read only</b> read only <b>all</b> all <b>read call</b> read call
behaviorOverride	int		JDBC driver property: behaviorOverride.
bidiImplicitReordering	boolean	true	JDBC driver property: bidiImplicitReordering.
bidiNumericOrdering	boolean	false	JDBC driver property: bidiNumericOrdering.
bidiStringType	int		JDBC driver property: bidiStringType.
bigDecimal	boolean	true	JDBC driver property: bigDecimal.
blockCriteria	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> <li>• 0</li> </ul>	2	JDBC driver property: blockCriteria. Values are: 0 (no record blocking), 1 (block if FOR FETCH ONLY is specified), 2 (block if FOR UPDATE is specified).  <b>2</b> 2  <b>1</b> 1  <b>0</b> 0

Attribute name	Data type	Default value	Description

maximumScale	int Minimum: 0 Maximum: 63	31	JDBC driver property: maximumScale.
metaDataSource	int Minimum: 0 Maximum: 1	1	JDBC driver property: metaDataSource.
minimumDivideScale	int Minimum: 0 Maximum: 9	0	JDBC driver property: minimumDivideScale.
naming	<ul style="list-style-type: none"> <li>system</li> <li>sql</li> </ul>	sql	JDBC driver property: naming.  <b>system</b> system <b>sql</b> sql
package	string		JDBC driver property: package.
packageAdd	boolean	true	JDBC driver property: packageAdd.
packageCCSID	<ul style="list-style-type: none"> <li>13488</li> <li>1200</li> </ul>	13488	JDBC driver property: packageCCSID. Values are: 1200 (UCS-2) or 13488 (UTF-16).  <b>13488</b> 13488 (UTF-16) <b>1200</b> 1200 (UCS-2)
packageCache	boolean	false	JDBC driver property: packageCache.

Attribute name	Data type	Default value	Description
packageCriteria	<ul style="list-style-type: none"> <li>default</li> <li>select</li> </ul>	default	JDBC driver property: packageCriteria. <b>default</b> default <b>select</b> select
packageError	<ul style="list-style-type: none"> <li>exception</li> <li>none</li> <li>warning</li> </ul>	warning	JDBC driver property: packageError. <b>exception</b> exception <b>none</b> none <b>warning</b> warning
packageLibrary	string	QGPL	JDBC driver property: packageLibrary.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
prefetch	boolean	true	JDBC driver property: prefetch.
prompt	boolean	false	JDBC driver property: prompt.
proxyServer	string		JDBC driver property: proxyServer.
qaqqiniLibrary	string		JDBC driver property: qaqqiniLibrary.
queryOptimizeGoal	int Minimum: 0 Maximum: 2	0	JDBC driver property: queryOptimizeGoal. Values are: 1 (*FIRSTIO) or 2 (*ALLIO).
receiveBufferSize	int Minimum: 1		JDBC driver property: receiveBufferSize.
remarks	<ul style="list-style-type: none"> <li>system</li> <li>sql</li> </ul>	system	JDBC driver property: remarks. <b>system</b> system <b>sql</b> sql
rollbackCursorHold	boolean	false	JDBC driver property: rollbackCursorHold.
savePasswordWhenSerialized	boolean	false	JDBC driver property: savePasswordWhenSerialized.
secondaryUrl	string		JDBC driver property: secondaryUrl.
secure	boolean	false	JDBC driver property: secure.
sendBufferSize	int Minimum: 1		JDBC driver property: sendBufferSize.

Attribute name	Data type	Default value	Description
serverName	string		Server where the database is running.
serverTraceCategories	int	0	JDBC driver property: serverTraceCategories.
soLinger	A period of time with second precision		JDBC driver property: soLinger. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
soTimeout	A period of time with millisecond precision		JDBC driver property: soTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
sort	<ul style="list-style-type: none"> <li>• hex</li> <li>• table</li> <li>• language</li> </ul>	hex	JDBC driver property: sort. <b>hex</b> hex <b>table</b> table <b>language</b> language
sortLanguage	string		JDBC driver property: sortLanguage.
sortTable	string		JDBC driver property: sortTable.
sortWeight	<ul style="list-style-type: none"> <li>• unqiue</li> <li>• shared</li> </ul>		JDBC driver property: sortWeight. <b>unqiue</b> unique <b>shared</b> shared
tcpNoDelay	boolean		JDBC driver property: tcpNoDelay.
threadUsed	boolean	true	JDBC driver property: threadUsed.

Attribute name	Data type	Default value	Description
timeFormat	<ul style="list-style-type: none"> <li>• iso</li> <li>• eur</li> <li>• jis</li> <li>• usa</li> <li>• hms</li> </ul>		JDBC driver property: timeFormat. <b>iso</b> iso <b>eur</b> eur <b>jis</b> jis <b>usa</b> usa <b>hms</b> hms
timeSeparator	<ul style="list-style-type: none"> <li>•</li> <li>• \,</li> <li>• :</li> <li>• .</li> </ul>		JDBC driver property: timeSeparator.  The space character ( ). \, The comma character (,). : The colon character (:). . The period character (.).
toolboxTrace	<ul style="list-style-type: none"> <li>• diagnostic</li> <li>• information</li> <li>• conversion</li> <li>• error</li> <li>• thread</li> <li>• proxy</li> <li>• none</li> <li>• datastream</li> <li>• pcml</li> <li>• all</li> <li>• jdbc</li> <li>• warning</li> </ul>		JDBC driver property: toolboxTrace. <b>diagnostic</b> diagnostic <b>information</b> information <b>conversion</b> conversion <b>error</b> error <b>thread</b> thread <b>proxy</b> proxy <b>none</b> none <b>datastream</b> datastream <b>pcml</b> pcml <b>all</b> all <b>jdbc</b> jdbc <b>warning</b> warning
trace	boolean		JDBC driver property: trace.
translateBinary	boolean	false	JDBC driver property: translateBinary.
translateBoolean	boolean	true	JDBC driver property: translateBoolean.

Attribute name	Data type	Default value	Description
translateHex	<ul style="list-style-type: none"> <li>binary</li> <li>character</li> </ul>	character	JDBC driver property: translateHex.  <b>binary</b> binary <b>character</b> character
trueAutoCommit	boolean	false	JDBC driver property: trueAutoCommit.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
xaLooselyCoupledSupport	int  Minimum: 0  Maximum: 1	0	JDBC driver property: xaLooselyCoupledSupport.

**databaseStore > dataSource > properties.db2.jcc**

Data source properties for the IBM Data Server Driver for JDBC and SQLJ for DB2.

false

Attribute name	Data type	Default value	Description
activateDatabase	int		JDBC driver property: activateDatabase.
alternateGroupDatabaseName	string		JDBC driver property: alternateGroupDatabaseName.
alternateGroupPortNumber	string		JDBC driver property: alternateGroupPortNumber.
alternateGroupServerName	string		JDBC driver property: alternateGroupServerName.
blockingReadConnectionTimeout	A period of time with second precision		JDBC driver property: blockingReadConnectionTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
clientAccountingInformation	string		JDBC driver property: clientAccountingInformation.
clientApplicationInformation	string		JDBC driver property: clientApplicationInformation.
clientRerouteAlternatePortNumber	string		JDBC driver property: clientRerouteAlternatePortNumber.
clientRerouteAlternateServerName	string		JDBC driver property: clientRerouteAlternateServerName.

Attribute name	Data type	Default value	Description
clientUser	string		JDBC driver property: clientUser.
clientWorkstation	string		JDBC driver property: clientWorkstation.
connectionCloseWithInFlightTransaction	Transaction • 1		JDBC driver property: connectionCloseWithInFlightTransaction. 2 CONNECTION_CLOSE_WITH_ROLLBACK 1 CONNECTION_CLOSE_WITH_EXCEPTION
currentAlternateGroupEntry	int		JDBC driver property: currentAlternateGroupEntry.
currentFunctionPath	string		JDBC driver property: currentFunctionPath.
currentLocaleLcCtype	string		JDBC driver property: currentLocaleLcCtype.
currentLockTimeout	A period of time with second precision		JDBC driver property: currentLockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
currentPackagePath	string		JDBC driver property: currentPackagePath.
currentPackageSet	string		JDBC driver property: currentPackageSet.
currentSQLID	string		JDBC driver property: currentSQLID.
currentSchema	string		JDBC driver property: currentSchema.
cursorSensitivity	• 2 • 1 • 0		JDBC driver property: cursorSensitivity. Values are: 0 (TYPE_SCROLL_SENSITIVE_STATIC), 1 (TYPE_SCROLL_SENSITIVE_DYNAMIC), 2 (TYPE_SCROLL_ASENSITIVE). 2 TYPE_SCROLL_ASENSITIVE 1 TYPE_SCROLL_SENSITIVE_DYNAMIC 0 TYPE_SCROLL_SENSITIVE_STATIC
databaseName	string		JDBC driver property: databaseName.
deferPrepares	boolean	true	JDBC driver property: deferPrepares.

Attribute name	Data type	Default value	Description
driverType	<ul style="list-style-type: none"> <li>2</li> <li>4</li> </ul>	4	JDBC driver property: driverType. 2 Type 2 JDBC driver. 4 Type 4 JDBC driver.
enableAlternateGroupSeamlessACR	boolean		JDBC driver property: enableAlternateGroupSeamlessACR.
enableClientAffinitiesList	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableClientAffinitiesList. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
enableExtendedDescribe	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableExtendedDescribe. 2 NO 1 YES
enableExtendedIndicators	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableExtendedIndicators. 2 NO 1 YES
enableNamedParameterMarkers	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableNamedParameterMarkers. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
enableSeamlessFailover	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableSeamlessFailover. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
enableSysplexWLB	boolean		JDBC driver property: enableSysplexWLB.
fetchSize	int		JDBC driver property: fetchSize.
fullyMaterializeInputStreams	boolean		JDBC driver property: fullyMaterializeInputStreams.
fullyMaterializeInputStreamsOnBatchExecution	<ul style="list-style-type: none"> <li>1</li> </ul>		JDBC driver property: fullyMaterializeInputStreamsOnBatchExecution. 2 NO 1 YES
fullyMaterializeLobData	boolean		JDBC driver property: fullyMaterializeLobData.

Attribute name	Data type	Default value	Description
implicitRollbackOption	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> <li>• 0</li> </ul>		<p>JDBC driver property: implicitRollbackOption.</p> <p>2 IMPLICIT_ROLLBACK_OPTION_N 1 IMPLICIT_ROLLBACK_OPTION_N 0 IMPLICIT_ROLLBACK_OPTION_N</p>
interruptProcessingMode	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> <li>• 0</li> </ul>		<p>JDBC driver property: interruptProcessingMode.</p> <p>2 INTERRUPT_PROCESSING_MODI 1 INTERRUPT_PROCESSING_MODI 0 INTERRUPT_PROCESSING_MODI</p>
keepAliveTimeOut	A period of time with second precision		<p>JDBC driver property: keepAliveTimeOut. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.</p>
keepDynamic	int		JDBC driver property: keepDynamic.
kerberosServerPrincipal	string		JDBC driver property: kerberosServerPrincipal.
loginTimeout	A period of time with second precision		<p>JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.</p>
maxConnCachedParamBufferSize	int		JDBC driver property: maxConnCachedParamBufferSize.
maxRetriesForClientReroute	int		JDBC driver property: maxRetriesForClientReroute.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	50000	Port on which to obtain database connections.
profileName	string		JDBC driver property: profileName.

Attribute name	Data type	Default value	Description
queryCloseImplicit	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: queryCloseImplicit. Values are: 1 (QUERY_CLOSE_IMPLICIT_YES) or 2 (QUERY_CLOSE_IMPLICIT_NO).</p> <p>2        QUERY_CLOSE_IMPLICIT_NO 1        QUERY_CLOSE_IMPLICIT_YES</p>
queryDataSize	<p>int</p> <p>Minimum: 4096</p> <p>Maximum: 65535</p>		JDBC driver property: queryDataSize.
queryTimeoutInterruptProcessingMode	<p>int</p> <ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: queryTimeoutInterruptProcessingMode.</p> <p>2        INTERRUPT_PROCESSING_MODE_C 1        INTERRUPT_PROCESSING_MODE_S</p>
readOnly	boolean		JDBC driver property: readOnly.
recordTemporalHistory	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: recordTemporalHistory.</p> <p>2        NO 1        YES</p>
resultSetHoldability	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldability. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2        CLOSE_CURSORS_AT_COMMIT 1        HOLD_CURSORS_OVER_COMMIT</p>
resultSetHoldabilityForCatalogQueries	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldabilityForCatalogQueries. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2        CLOSE_CURSORS_AT_COMMIT 1        HOLD_CURSORS_OVER_COMMIT</p>
retrieveMessagesFromServerOnGetMessage	boolean	true	JDBC driver property: retrieveMessagesFromServerOnGetMessage.

Attribute name	Data type	Default value	Description
retryIntervalForClientReroute	A period of time with second precision		JDBC driver property: retryIntervalForClientReroute. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
securityMechanism	<ul style="list-style-type: none"> <li>• 3</li> <li>• 7</li> <li>• 4</li> <li>• 18</li> <li>• 15</li> <li>• 9</li> <li>• 16</li> <li>• 13</li> <li>• 11</li> <li>• 12</li> </ul>		<p>JDBC driver property: securityMechanism. Values are:</p> <ul style="list-style-type: none"> <li>3 (CLEAR_TEXT_PASSWORD_SECURITY),</li> <li>4 (USER_ONLY_SECURITY),</li> <li>7 (ENCRYPTED_PASSWORD_SECURITY),</li> <li>9 (ENCRYPTED_USER_AND_PASSWORD_SECURITY),</li> <li>11 (KERBEROS_SECURITY),</li> <li>12 (ENCRYPTED_USER_AND_DATA_SECURITY),</li> <li>13 (ENCRYPTED_USER_PASSWORD_AND_DATA_SECURITY),</li> <li>15 (PLUGIN_SECURITY),</li> <li>16 (ENCRYPTED_USER_ONLY_SECURITY),</li> <li>18 (TLS_CLIENT_CERTIFICATE_SECURITY).</li> </ul> <p>3 CLEAR_TEXT_PASSWORD_SECURITY  7 ENCRYPTED_PASSWORD_SECURITY  4 USER_ONLY_SECURITY  18 TLS_CLIENT_CERTIFICATE_SECURITY  15 PLUGIN_SECURITY  9 ENCRYPTED_USER_AND_PASSWORD_SECURITY  16 ENCRYPTED_USER_ONLY_SECURITY  13 ENCRYPTED_USER_PASSWORD_AND_DATA_SECURITY  11 KERBEROS_SECURITY  12 ENCRYPTED_USER_AND_DATA_SECURITY</p>
sendDataAsIs	boolean		JDBC driver property: sendDataAsIs.
serverName	string	localhost	Server where the database is running.
sessionTimeZone	string		JDBC driver property: sessionTimeZone.
sqljCloseStmtsWithOpenResultSet	boolean		JDBC driver property: sqljCloseStmtsWithOpenResultSet.

Attribute name	Data type	Default value	Description
sqljEnableClassLoaderSpecificProfiles	boolean		JDBC driver property: sqljEnableClassLoaderSpecificProfiles.
sslConnection	boolean		JDBC driver property: sslConnection.
streamBufferSize	int		JDBC driver property: streamBufferSize.
stripTrailingZerosForDecimalNumbers	Numbers <ul style="list-style-type: none"> <li>1</li> </ul>		JDBC driver property: stripTrailingZerosForDecimalNumbers. 2 NO 1 YES
sysSchema	string		JDBC driver property: sysSchema.
timerLevelForQueryTimeOut	<ul style="list-style-type: none"> <li>2</li> <li>1</li> <li>-1</li> </ul>		JDBC driver property: timerLevelForQueryTimeOut. 2 QUERYTIMEOUT_CONNECTION_LEVEL 1 QUERYTIMEOUT_STATEMENT_LEVEL -1 QUERYTIMEOUT_DISABLED
traceDirectory	string		JDBC driver property: traceDirectory.
traceFile	string		JDBC driver property: traceFile.
traceFileAppend	boolean		JDBC driver property: traceFileAppend.
traceFileCount	int		JDBC driver property: traceFileCount.
traceFileSize	int		JDBC driver property: traceFileSize.
traceLevel	int	0	Bitwise combination of the following constant values: TRACE_NONE=0, TRACE_CONNECTION_CALLS=1, TRACE_STATEMENT_CALLS=2, TRACE_RESULT_SET_CALLS=4, TRACE_DRIVER_CONFIGURATION=16, TRACE_CONNECTS=32, TRACE_DRDA_FLOWS=64, TRACE_RESULT_SET_META_DATA=128, TRACE_PARAMETER_META_DATA=256, TRACE_DIAGNOSTICS=512, TRACE_SQLJ=1024, TRACE_META_CALLS=8192, TRACE_DATASOURCE_CALLS=16384, TRACE_LARGE_OBJECT_CALLS=32768, TRACE_SYSTEM_MONITOR=131072, TRACE_TRACEPOINTS=262144, TRACE_ALL=-1.
traceOption	<ul style="list-style-type: none"> <li>1</li> <li>0</li> </ul>		JDBC driver property: traceOption 1 1 0 0

Attribute name	Data type	Default value	Description
translateForBitData	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: translateForBitData. 2 SERVER_ENCODING_REPRESENTATION 1 HEX_REPRESENTATION
updateCountForBatch	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: updateCountForBatch. 2 TOTAL_UPDATE_COUNT 1 NO_UPDATE_COUNT
useCachedCursor	boolean		JDBC driver property: useCachedCursor.
useIdentityValLocalForAutoGeneratedKeys	boolean		JDBC driver property: useIdentityValLocalForAutoGeneratedKeys.
useJDBC41DefinitionForGetColumns	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: useJDBC41DefinitionForGetColumns. 2 NO 1 YES
useJDBC4ColumnNameAndLabelSemantics	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: useJDBC4ColumnNameAndLabelSemantics. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
useTransactionRedirect	boolean		JDBC driver property: useTransactionRedirect.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
xaNetworkOptimization	boolean		JDBC driver property: xaNetworkOptimization.

**databaseStore > dataSource > properties.derby.client**

Data source properties for Derby Network Client JDBC driver.

false

Attribute name	Data type	Default value	Description
connectionAttributes	string		JDBC driver property: connectionAttributes.

Attribute name	Data type	Default value	Description
createDatabase	<ul style="list-style-type: none"> <li>false</li> <li>create</li> </ul>		<p>JDBC driver property: createDatabase.</p> <p><b>false</b> Do not automatically create the database.</p> <p><b>create</b> When the first connection is established, automatically create the database if it doesn't exist.</p>
databaseName	string		JDBC driver property: databaseName.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1527	Port on which to obtain database connections.
retrieveMessageText	boolean	true	JDBC driver property: retrieveMessageText.
securityMechanism	<ul style="list-style-type: none"> <li>3</li> <li>7</li> <li>4</li> <li>9</li> <li>8</li> </ul>	3	<p>JDBC driver property: securityMechanism. Values are:</p> <p>3 (CLEAR_TEXT_PASSWORD_SECURITY),</p> <p>4 (USER_ONLY_SECURITY),</p> <p>7 (ENCRYPTED_PASSWORD_SECURITY),</p> <p>8 (STRONG_PASSWORD_SUBSTITUTE_SECURITY),</p> <p>9 (ENCRYPTED_USER_AND_PASSWORD_SECURITY)</p> <p>3 CLEAR_TEXT_PASSWORD_SECURITY</p> <p>7 ENCRYPTED_PASSWORD_SECURITY</p> <p>4 USER_ONLY_SECURITY</p> <p>9 ENCRYPTED_USER_AND_PASSWORD_SECURITY</p> <p>8 STRONG_PASSWORD_SUBSTITUTE_SECURITY</p>

Attribute name	Data type	Default value	Description
serverName	string	localhost	Server where the database is running.
shutdownDatabase	<ul style="list-style-type: none"> <li>false</li> <li>shutdown</li> </ul>		JDBC driver property: shutdownDatabase. <b>false</b> Do not shut down the database. <b>shutdown</b> Shut down the database when a connection is attempted.
ssl	<ul style="list-style-type: none"> <li>basic</li> <li>off</li> <li>peerAuthentication</li> </ul>		JDBC driver property: ssl. <b>basic</b> basic <b>off</b> off <b>peerAuthentication</b> peerAuthentication
traceDirectory	string		JDBC driver property: traceDirectory.
traceFile	string		JDBC driver property: traceFile.
traceFileAppend	boolean		JDBC driver property: traceFileAppend.
traceLevel	int		Bitwise combination of the following constant values: TRACE_NONE=0, TRACE_CONNECTION_CALLS=1, TRACE_STATEMENT_CALLS=2, TRACE_RESULT_SET_CALLS=4, TRACE_DRIVER_CONFIGURATION=16, TRACE_CONNECTS=32, TRACE_DRDA_FLOWS=64, TRACE_RESULT_SET_META_DATA=128, TRACE_PARAMETER_META_DATA=256, TRACE_DIAGNOSTICS=512, TRACE_XA_CALLS=2048, TRACE_ALL=-1.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**databaseStore > dataSource > properties.derby.embedded**  
 Data source properties for Derby Embedded JDBC driver.  
 false

Attribute name	Data type	Default value	Description
connectionAttributes	string		JDBC driver property: connectionAttributes.

Attribute name	Data type	Default value	Description
createDatabase	<ul style="list-style-type: none"> <li>false</li> <li>create</li> </ul>		<p>JDBC driver property: createDatabase.</p> <p><b>false</b> Do not automatically create the database.</p> <p><b>create</b> When the first connection is established, automatically create the database if it doesn't exist.</p>
databaseName	string		JDBC driver property: databaseName.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
shutdownDatabase	<ul style="list-style-type: none"> <li>false</li> <li>shutdown</li> </ul>		<p>JDBC driver property: shutdownDatabase.</p> <p><b>false</b> Do not shut down the database.</p> <p><b>shutdown</b> Shut down the database when a connection is attempted.</p>
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**databaseStore > dataSource > properties.informix**

Data source properties for the Informix JDBC driver.

false

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
ifxCLIENT_LOCALE	string		JDBC driver property: ifxCLIENT_LOCALE.
ifxCPMAgeLimit	A period of time with second precision		JDBC driver property: ifxCPMAgeLimit. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxCPMInitPoolSize	int		JDBC driver property: ifxCPMInitPoolSize.
ifxCPMMaxConnections	int		JDBC driver property: ifxCPMMaxConnections.
ifxCPMMaxPoolSize	int		JDBC driver property: ifxCPMMaxPoolSize.
ifxCPMMinAgeLimit	A period of time with second precision		JDBC driver property: ifxCPMMinAgeLimit. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxCPMMinPoolSize	int		JDBC driver property: ifxCPMMinPoolSize.
ifxCPMServiceInterval	A period of time with millisecond precision		JDBC driver property: ifxCPMServiceInterval. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
ifxDBANSIWARN	boolean		JDBC driver property: ifxDBANSIWARN.
ifxDBCENTURY	string		JDBC driver property: ifxDBCENTURY.
ifxDBDATE	string		JDBC driver property: ifxDBDATE.
ifxDBSPACETEMP	string		JDBC driver property: ifxDBSPACETEMP.

Attribute name	Data type	Default value	Description
ifxDBTEMP	string		JDBC driver property: ifxDBTEMP.
ifxDBTIME	string		JDBC driver property: ifxDBTIME.
ifxDBUPSPACE	string		JDBC driver property: ifxDBUPSPACE.
ifxDB_LOCALE	string		JDBC driver property: ifxDB_LOCALE.
ifxDELIMIDENT	boolean		JDBC driver property: ifxDELIMIDENT.
ifxENABLE_TYPE_CACHE	boolean		JDBC driver property: ifxENABLE_TYPE_CACHE.
ifxFET_BUF_SIZE	int		JDBC driver property: ifxFET_BUF_SIZE.
ifxGL_DATE	string		JDBC driver property: ifxGL_DATE.
ifxGL_DATETIME	string		JDBC driver property: ifxGL_DATETIME.
ifxIFXHOST	string	localhost	JDBC driver property: ifxIFXHOST.
ifxIFX_AUTOFREE	boolean		JDBC driver property: ifxIFX_AUTOFREE.
ifxIFX_DIRECTIVES	string		JDBC driver property: ifxIFX_DIRECTIVES.
ifxIFX_LOCK_MODE_WAIT	A period of time with second precision	2s	JDBC driver property: ifxIFX_LOCK_MODE_WAIT. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxIFX_SOC_TIMEOUT	A period of time with millisecond precision		JDBC driver property: ifxIFX_SOC_TIMEOUT. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
ifxIFX_USEPUT	boolean		JDBC driver property: ifxIFX_USEPUT.

Attribute name	Data type	Default value	Description
ifxIFX_USE_STRENC	boolean		JDBC driver property: ifxIFX_USE_STRENC.
ifxIFX_XASPEC	string	y	JDBC driver property: ifxIFX_XASPEC.
ifxINFORMIXCONRETRY	int		JDBC driver property: ifxINFORMIXCONRETRY.
ifxINFORMIXCONTIME	A period of time with second precision		JDBC driver property: ifxINFORMIXCONTIME. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxINFORMIXOPCACHE	string		JDBC driver property: ifxINFORMIXOPCACHE.
ifxINFORMIXSTACKSIZE	int		JDBC driver property: ifxINFORMIXSTACKSIZE.
ifxJDBCTEMP	string		JDBC driver property: ifxJDBCTEMP.
ifxLDAP_IFXBASE	string		JDBC driver property: ifxLDAP_IFXBASE.
ifxLDAP_PASSWD	string		JDBC driver property: ifxLDAP_PASSWD.
ifxLDAP_URL	string		JDBC driver property: ifxLDAP_URL.
ifxLDAP_USER	string		JDBC driver property: ifxLDAP_USER.
ifxLOBCACHE	int		JDBC driver property: ifxLOBCACHE.
ifxNEWCODESET	string		JDBC driver property: ifxNEWCODESET.
ifxNEWLOCALE	string		JDBC driver property: ifxNEWLOCALE.
ifxNODEFDAC	string		JDBC driver property: ifxNODEFDAC.
ifxOPTCOMPIND	string		JDBC driver property: ifxOPTCOMPIND.
ifxOPTOFC	string		JDBC driver property: ifxOPTOFC.
ifxOPT_GOAL	string		JDBC driver property: ifxOPT_GOAL.
ifxPATH	string		JDBC driver property: ifxPATH.
ifxPDQPRIORITY	string		JDBC driver property: ifxPDQPRIORITY.

Attribute name	Data type	Default value	Description
ifxPLCONFIG	string		JDBC driver property: ifxPLCONFIG.
ifxPLOAD_LO_PATH	string		JDBC driver property: ifxPLOAD_LO_PATH.
ifxPROTOCOLTRACE	int		JDBC driver property: ifxPROTOCOLTRACE.
ifxPROTOCOLTRACEFILE	string		JDBC driver property: ifxPROTOCOLTRACEFILE.
ifxPROXY	string		JDBC driver property: ifxPROXY.
ifxPSORT_DBTEMP	string		JDBC driver property: ifxPSORT_DBTEMP.
ifxPSORT_NPROCS	boolean		JDBC driver property: ifxPSORT_NPROCS.
ifxSECURITY	string		JDBC driver property: ifxSECURITY.
ifxSQLH_FILE	string		JDBC driver property: ifxSQLH_FILE.
ifxSQLH_LOC	string		JDBC driver property: ifxSQLH_LOC.
ifxSQLH_TYPE	string		JDBC driver property: ifxSQLH_TYPE.
ifxSSLCONNECTION	string		JDBC driver property: ifxSSLCONNECTION.
ifxSTMT_CACHE	string		JDBC driver property: ifxSTMT_CACHE.
ifxTRACE	int		JDBC driver property: ifxTRACE.
ifxTRACEFILE	string		JDBC driver property: ifxTRACEFILE.
ifxTRUSTED_CONTEXT	string		JDBC driver property: ifxTRUSTED_CONTEXT.
ifxUSEV5SERVER	boolean		JDBC driver property: ifxUSEV5SERVER.
ifxUSE_DTENV	boolean		JDBC driver property: ifxUSE_DTENV.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1526	Port on which to obtain database connections.
roleName	string		JDBC driver property: roleName.
serverName	string		Server where the database is running.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**databaseStore > dataSource > properties.informix.jcc**

Data source properties for the IBM Data Server Driver for JDBC and SQLJ for Informix.

false

Attribute name	Data type	Default value	Description
DBANSIWARN	boolean		JDBC driver property: DBANSIWARN.
DBDATE	string		JDBC driver property: DBDATE.
DBPATH	string		JDBC driver property: DBPATH.
DBSPACETEMP	string		JDBC driver property: DBSPACETEMP.
DBTEMP	string		JDBC driver property: DBTEMP.
DBUPSPACE	string		JDBC driver property: DBUPSPACE.
DELIMIDENT	boolean		JDBC driver property: DELIMIDENT.
IFX_DIRECTIVES	<ul style="list-style-type: none"> <li>• ON</li> <li>• OFF</li> </ul>		JDBC driver property: IFX_DIRECTIVES. ON ON OFF OFF
IFX_EXTDIRECTIVES	<ul style="list-style-type: none"> <li>• ON</li> <li>• OFF</li> </ul>		JDBC driver property: IFX_EXTDIRECTIVES. ON ON OFF OFF
IFX_UPDESC	string		JDBC driver property: IFX_UPDESC.

Attribute name	Data type	Default value	Description
IFX_XASTDCOMPLIANCE_XAEND	<ul style="list-style-type: none"> <li>0</li> </ul>		JDBC driver property: IFX_XASTDCOMPLIANCE_XAEND. <b>1</b> 1 <b>0</b> 0
INFORMIXOPCACHE	string		JDBC driver property: INFORMIXOPCACHE.
INFORMIXSTACKSIZE	string		JDBC driver property: INFORMIXSTACKSIZE.
NODEFDAC	<ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul>		JDBC driver property: NODEFDAC. <b>yes</b> yes <b>no</b> no
OPTCOMPIND	<ul style="list-style-type: none"> <li>2</li> <li>1</li> <li>0</li> </ul>		JDBC driver property: OPTCOMPIND. <b>2</b> 2 <b>1</b> 1 <b>0</b> 0
OPTOFC	<ul style="list-style-type: none"> <li>1</li> <li>0</li> </ul>		JDBC driver property: OPTOFC. <b>1</b> 1 <b>0</b> 0
PDQPRIORITY	<ul style="list-style-type: none"> <li>HIGH</li> <li>LOW</li> <li>OFF</li> </ul>		JDBC driver property: PDQPRIORITY. <b>HIGH</b> HIGH <b>LOW</b> LOW <b>OFF</b> OFF
PSORT_DBTEMP	string		JDBC driver property: PSORT_DBTEMP.
PSORT_NPROCS	string Maximum: 10		JDBC driver property: PSORT_NPROCS.
STMT_CACHE	<ul style="list-style-type: none"> <li>1</li> <li>0</li> </ul>		JDBC driver property: STMT_CACHE. <b>1</b> 1 <b>0</b> 0
currentLockTimeout	A period of time with second precision	2s	JDBC driver property: currentLockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
deferPrepares	boolean		JDBC driver property: deferPrepares.
driverType	int	4	JDBC driver property: driverType.
enableNamedParameterMarkers	int		JDBC driver property: enableNamedParameterMarkers. Values are: 1 (YES) or 2 (NO).
enableSeamlessFailover	int		JDBC driver property: enableSeamlessFailover. Values are: 1 (YES) or 2 (NO).
enableSysplexWLB	boolean		JDBC driver property: enableSysplexWLB.
fetchSize	int		JDBC driver property: fetchSize.
fullyMaterializeLobData	boolean		JDBC driver property: fullyMaterializeLobData.
keepDynamic	int		JDBC driver property: keepDynamic.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1526	Port on which to obtain database connections.
progressiveStreaming	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		JDBC driver property: progressiveStreaming. Values are: 1 (YES) or 2 (NO).  2      NO 1      YES
queryDataSize	int  Minimum: 4096  Maximum: 10485760		JDBC driver property: queryDataSize.

Attribute name	Data type	Default value	Description
resultSetHoldability	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldability. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2 CLOSE_CURSORS_AT_COMMIT 1 HOLD_CURSORS_OVER_COMMIT</p>
resultSetHoldabilityForCatalogQueries	<ul style="list-style-type: none"> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldabilityForCatalogQueries. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2 CLOSE_CURSORS_AT_COMMIT 1 HOLD_CURSORS_OVER_COMMIT</p>
retrieveMessagesFromServerOnGetMessage	boolean	true	JDBC driver property: retrieveMessagesFromServerOnGetMessage.
securityMechanism	<ul style="list-style-type: none"> <li>• 3</li> <li>• 7</li> <li>• 4</li> <li>• 9</li> </ul>		<p>JDBC driver property: securityMechanism. Values are: 3 (CLEAR_TEXT_PASSWORD_SECURITY), 4 (USER_ONLY_SECURITY), 7 (ENCRYPTED_PASSWORD_SECURITY), 9 (ENCRYPTED_USER_AND_PASSWORD_SECURITY).</p> <p>3 CLEAR_TEXT_PASSWORD_SECURITY 7 ENCRYPTED_PASSWORD_SECURITY 4 USER_ONLY_SECURITY 9 ENCRYPTED_USER_AND_PASSWORD_SECURITY</p>
serverName	string	localhost	Server where the database is running.
traceDirectory	string		JDBC driver property: traceDirectory.
traceFile	string		JDBC driver property: traceFile.
traceFileAppend	boolean		JDBC driver property: traceFileAppend.

Attribute name	Data type	Default value	Description
traceLevel	int		Bitwise combination of the following constant values: TRACE_NONE=0, TRACE_CONNECTION_CALLS=1, TRACE_STATEMENT_CALLS=2, TRACE_RESULT_SET_CALLS=4, TRACE_DRIVER_CONFIGURATION=16, TRACE_CONNECTS=32, TRACE_DRDA_FLOWS=64, TRACE_RESULT_SET_META_DATA=128, TRACE_PARAMETER_META_DATA=256, TRACE_DIAGNOSTICS=512, TRACE_SQLJ=1024, TRACE_META_CALLS=8192, TRACE_DATASOURCE_CALLS=16384, TRACE_LARGE_OBJECT_CALLS=32768, TRACE_SYSTEM_MONITOR=131072, TRACE_TRACEPOINTS=262144, TRACE_ALL=-1.
useJDBC4ColumnNameAndLabelSemantics	boolean		JDBC driver property: useJDBC4ColumnNameAndLabelSemantics. Values are: 1 (YES) or 2 (NO).
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**databaseStore > dataSource > properties.microsoft.sqlserver**  
Data source properties for Microsoft SQL Server JDBC Driver.

false

Attribute name	Data type	Default value	Description
URL	string		URL for connecting to the database. Example: jdbc:sqlserver://localhost:1433;databaseName=myDB.
applicationIntent	<ul style="list-style-type: none"> <li>ReadOnly</li> <li>ReadWrite</li> </ul>		JDBC driver property: applicationIntent. <b>ReadOnly</b> ReadOnly <b>ReadWrite</b> ReadWrite
applicationName	string		JDBC driver property: applicationName.
authenticationScheme	<ul style="list-style-type: none"> <li>NativeAuthentication</li> <li>JavaKerberos</li> </ul>		JDBC driver property: authenticationScheme. <b>NativeAuthentication</b> NativeAuthentication <b>JavaKerberos</b> JavaKerberos

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
encrypt	boolean		JDBC driver property: encrypt.
failoverPartner	string		JDBC driver property: failoverPartner.
hostNameInCertificate	string		JDBC driver property: hostNameInCertificate.
instanceName	string		JDBC driver property: instanceName.
integratedSecurity	boolean		JDBC driver property: integratedSecurity.
lastUpdateCount	boolean		JDBC driver property: lastUpdateCount.
lockTimeout	A period of time with millisecond precision		JDBC driver property: lockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
multiSubnetFailover	boolean		JDBC driver property: multiSubnetFailover.
packetSize	int Minimum: 512 Maximum: 32767		JDBC driver property: packetSize.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.

Attribute name	Data type	Default value	Description
responseBuffering	<ul style="list-style-type: none"> <li>full</li> <li>adaptive</li> </ul>		JDBC driver property: responseBuffering. <b>full</b> full <b>adaptive</b> adaptive
selectMethod	<ul style="list-style-type: none"> <li>direct</li> <li>cursor</li> </ul>		JDBC driver property: selectMethod. <b>direct</b> direct <b>cursor</b> cursor
sendStringParametersAsUnicode	boolean	false	JDBC driver property: sendStringParametersAsUnicode.
sendTimeAsDatetime	boolean		JDBC driver property: sendTimeAsDatetime.
serverName	string	localhost	Server where the database is running.
trustServerCertificate	boolean		JDBC driver property: trustServerCertificate.
trustStore	string		JDBC driver property: trustStore.
trustStorePassword	Reversably encoded password (string)		JDBC driver property: trustStorePassword.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
workstationID	string		JDBC driver property: workstationID.
xopenStates	boolean		JDBC driver property: xopenStates.

#### databaseStore > dataSource > properties.oracle

Data source properties for Oracle JDBC driver.

false

Attribute name	Data type	Default value	Description
ONSConfiguration	string		JDBC driver property: ONSConfiguration.
TNSEntryName	string		JDBC driver property: TNSEntryName.
URL	string		URL for connecting to the database. Examples: jdbc:oracle:thin://localhost:1521/sample or jdbc:oracle:oci://localhost:1521/sample.
connectionProperties	string		JDBC driver property: connectionProperties.

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
driverType	<ul style="list-style-type: none"> <li>oci</li> <li>thin</li> </ul>	thin	JDBC driver property: driverType.  <b>oci</b> oci <b>thin</b> thin
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
networkProtocol	string		JDBC driver property: networkProtocol.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1521	Port on which to obtain database connections.
serverName	string	localhost	Server where the database is running.
serviceName	string		JDBC driver property: serviceName.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**databaseStore > dataSource > properties.sybase**

Data source properties for Sybase JDBC driver.

false

Attribute name	Data type	Default value	Description
SERVER_INITIATED_TRANSACTIONS	<ul style="list-style-type: none"> <li>false</li> <li>true</li> </ul>	false	JDBC driver property: SERVER_INITIATED_TRANSACTIONS.  <b>false</b> false <b>true</b> true
connectionProperties	string	SELECT_OPENS_CURSOR=true	JDBC driver property: connectionProperties.
databaseName	string		JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
networkProtocol	<ul style="list-style-type: none"> <li>• SSL</li> <li>• socket</li> </ul>		JDBC driver property: networkProtocol.  <b>SSL</b> SSL <b>socket</b> socket
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	5000	Port on which to obtain database connections.
resourceManagerName	string		JDBC driver property: resourceManagerName.
serverName	string	localhost	Server where the database is running.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
version	int		JDBC driver property: version.

**databaseStore > dataSource > recoveryAuthData**

Authentication data for transaction recovery.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

**grantType**

An access token grant type (as detailed in the OAuth specification) that is allowed for the provider. The equivalent provider parameter in the full application server profile is `oauth20.grant.types.allowed`.

false

string

**jwtGrantType**

The `grant_type` for JWT Token handler

false

Attribute name	Data type	Default value	Description
clockSkew	A period of time with second precision	300s	The time difference allowed between OpenID Connect Client and OpenID Connect Provider systems when they are not synchronized. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
iatRequired	boolean	false	The iat claim in a jwt token is required.
maxJtiCacheSize	long Minimum: 1	10000	The maximum size of cache, which keeps jti data of jwt token, to prevent the jti from being reused.
tokenMaxLifetime	A period of time with second precision	7200s	The time indicates the maximum lifetime of an alive jwt token since its issued-at-time. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

**library**

Reference to shared library containing the mediator plugin class.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

### library > file

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

### library > fileset

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

### library > folder

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

### localStore

Clients are defined in server.xml and tokens are cached in the server.

false

Attribute name	Data type	Default value	Description
tokenStoreSize	long	2000	Token store size

### localStore > client

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
applicationType	<ul style="list-style-type: none"> <li>• native</li> <li>• web</li> </ul>	web	The type of application best describing the client. <b>native</b> native <b>web</b> web
displayname	string		Display name of the client.
enabled	boolean	true	Client is enabled if true, disabled if false.

Attribute name	Data type	Default value	Description
functionalUserId	string		A user identifier to be associated with access tokens obtained by this client using the client credentials grant type. When this client parameter is specified, the value is returned in the functional_user_id response parameter from the introspect endpoint.
id	string		A unique configuration ID.
introspectTokens	boolean	false	Boolean value specifying whether the client is allowed to access the introspection endpoint to introspect tokens issued by the authorization server.
name	string		Name of the client (sometimes referred to as the Id).
preAuthorizedScope	string		Space separated list of scope values that the client can use when requesting access tokens that are deemed to have been pre-approved by the resource owner and therefore does not require the resource owner's consent.
scope	string		Specify by spaces the list of scopes of the client.
secret	Reversably encoded password (string)		Secret key of the client.
sessionManaged	boolean	false	Boolean indicating whether the client participates in OpenID session management.
subjectType	<ul style="list-style-type: none"> <li>public</li> </ul>		Subject type requested for response to this client. <b>public</b> public
tokenEndpointAuthMethod	<ul style="list-style-type: none"> <li>client_secret_post</li> <li>none</li> <li>client_secret_basic</li> </ul>	client_secret_basic	The requested authentication method for the token endpoint of the client. <b>client_secret_post</b> client_secret_post <b>none</b> none <b>client_secret_basic</b> client_secret_basic

**localStore > client > functionalUserGroupIds**

A list of group ids to be associated with access tokens obtained by this client using the client credentials grant type. When this client parameter is specified, the value is returned in the functional\_user\_groupIds response parameter from the introspect endpoint.

false

string

**localStore > client > grantTypes**

Grant types the client may use.

false

**localStore > client > postLogoutRedirectUris**

Array of URLs supplied by the RP to which it may request that the end-user's user agent be redirected using the post\_logout\_redirect\_uri parameter after a logout has been performed.

false

string

**localStore > client > redirect**

Array of redirect URIs for use in redirect-based flows such as the authorization code and implicit grant types of the client. The first redirect URI is used as a default, when none is specified in a request.

false

string

**localStore > client > responseTypes**

Response types the client may use.

false

**mediatorClassname**

Mediator plugin class name. The equivalent provider parameter in the full application server profile is oauth20.mediator.classnames.

false

string

## OpenId Authentication (openId)

A variety of custom properties are available for OpenId authentication.

- authFilter
  - host
  - remoteAddress
  - requestUrl
  - userAgent
  - webApp
- userInfo

Attribute name	Data type	Default value	Description
authFilterRef	A reference to top level authFilter element (string).		Specifies the authentication filter reference.

Attribute name	Data type	Default value	Description
authenticationMode	<ul style="list-style-type: none"> <li>• checkid_immediate</li> <li>• checkid_setup</li> </ul>	checkid_setup	<p>Specifies the OpenID provider authentication mode either checkid_immediate or checkid_setup. checkid_setup is the default authentication mode.</p> <p><b>checkid_immediate</b> The checkid_immediate disables the browser interact with the user.</p> <p><b>checkid_setup</b> The checkid_setup enables the openID provider to interact with the user, to request authentication or self-registration before returning a result to the openId relying party.</p>
hashAlgorithm	<ul style="list-style-type: none"> <li>• SHA256</li> <li>• SHA1</li> </ul>	SHA256	<p>Specifies the hash algorithm that is used to sign and encrypt the OpenID provider response parameters.</p> <p><b>SHA256</b> Secure hash algorithm SHA256</p> <p><b>SHA1</b> Secure hash algorithm SHA1</p>
hostNameVerificationEnabled	boolean	true	Specifies whether enable host name verification or not.
httpsRequired	boolean	true	Require SSL communication between the OpenID relying party and provider service.
mapIdentityToRegistryUser	boolean	false	Specifies whether to map identity to registry user. The user registry is not used to create the user subject.
providerIdentifier	string		Specifies a default OpenID provider URL where users get the Open IDs.
realmIdentifier	string		Specifies the attribute for the OpenID provider name.

Attribute name	Data type	Default value	Description
sslRef	A reference to top level ssl element (string).		Specifies an ID of the SSL configuration is used to connect to the OpenID provider.
useClientIdentity	boolean	false	Specifies whether to use the client OpenID identity to create a user subject. If set to true, only the OpenID client identity is used. If set to false and the first element of userInfoRef is found, we use it to create a user subject. Otherwise, we use the OpenID identity to create a user subject.
userInfoRef	List of references to top level userInfo elements (comma-separated string).	email	Specifies a list of userInfo references separated by commas for the OpenID provider to include in the response.

#### **authFilter**

Specifies the authentication filter reference.

false

#### **authFilter > host**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
name	string		Specifies the name.

#### **authFilter > remoteAddress**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
ip	string		Specifies the IP address.

Attribute name	Data type	Default value	Description
matchType	<ul style="list-style-type: none"> <li>lessThan</li> <li>equals</li> <li>greaterThan</li> <li>contains</li> <li>notContain</li> </ul>	contains	Specifies the match type. <b>lessThan</b> Less than <b>equals</b> Equals <b>greaterThan</b> Greater than <b>contains</b> Contains <b>notContain</b> Not contain

**authFilter > requestUrl**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>equals</li> <li>contains</li> <li>notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
urlPattern	string		Specifies the URL pattern.

**authFilter > userAgent**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
agent	string		Specifies the user agent
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>equals</li> <li>contains</li> <li>notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain

**authFilter > webApp**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
name	string		Specifies the name.

### userInfo

Specifies a list of userInfo references separated by commas for the OpenID provider to include in the response.

false

Attribute name	Data type	Default value	Description
alias	string	email	Specifies an alias name.
count	int Minimum: 1	1	Specifies how much userInfo is included in the response of the openID provider.
id	string		A unique configuration ID.
required	boolean	true	Specifies whether user information is required or not.
uriType	string	http://axschema.org/contact/email	Specifies a URI type.

## OpenID Connect Client (openidConnectClient)

OpenID Connect client.

- audiences
- authFilter
  - host
  - remoteAddress
  - requestUrl
  - userAgent
  - webApp

Attribute name	Data type	Default value	Description
authFilterRef	A reference to top level authFilter element (string).		Specifies the authentication filter reference.
authnSessionDisabled	boolean	true	An authentication session cookie will not be created for inbound propagation. The client is expected to send a valid OAuth token for every request.
authorizationEndpointUrl	string		Specifies an Authorization end point URL.

Attribute name	Data type	Default value	Description
clientId	string		Identity of the client.
clientSecret	Reversably encoded password (string)		Secret key of the client.
createSession	boolean	true	Specifies whether to create an HttpSession if the current HttpSession does not exist.
disableIssChecking	boolean	false	Do not check for the issuer while validating the json response for inbound token propagation.
disableLtpaCookie	boolean	false	Do not create an LTPA Token during processing of the OAuth token. Create a cookie of the specific Service Provider instead.
grantType	<ul style="list-style-type: none"> <li>implicit</li> <li>authorization_code</li> </ul>	authorization_code	<p>Specifies the grant type to use for this client.</p> <p><b>implicit</b> Implicit grant type</p> <p><b>authorization_code</b> Authorization code grant type</p>
groupIdIdentifier	string	groupIds	Specifies a JSON attribute in the ID token that is used as the name of the group that the authenticated principal is a member of.
headerName	string		The name of the header which carries the inbound token in the request.
hostNameVerificationEnabled	boolean	false	Specifies whether to enable host name verification.
httpsRequired	boolean	true	Require SSL communication between the OpenID relying party and provider service.
id	string		A unique configuration ID.
inboundPropagation	<ul style="list-style-type: none"> <li>supported</li> <li>none</li> <li>required</li> </ul>	none	<p>Controls the operation of the token inbound propagation of the OpenID relying party.</p> <p><b>supported</b> Support inbound token propagation</p> <p><b>none</b> Do not support inbound token propagation</p> <p><b>required</b> Require inbound token propagation</p>

Attribute name	Data type	Default value	Description
includeIdTokenInSubject	boolean	true	Specifies whether to include ID token in the client subject.
initialStateCacheCapacity	int Minimum: 0	3000	Specifies the beginning capacity of state cache. The capacity grows bigger when needed by itself.
isClientSideRedirectSupported	boolean	true	Specifies whether the client supports redirect at client side.
issuerIdentifier	string		An Issuer Identifier is a case-sensitive URL using the HTTPS scheme that contains scheme, host and optionally port number and path components.
jwkEndpointUrl	string		Specifies a JWK end point URL.
mapIdentityToRegistryUser	boolean	false	Specifies whether to map the identity to a registry user. If this is set to false, then the user registry is not used to create the user subject.
nonceEnabled	boolean	false	Enable the nonce parameter in the authorization code flow.
reAuthnCushion	A period of time with millisecond precision	0s	The time period to authenticate a user again when its tokens are about to expire. The expiration time of an ID token is specified by its exp claim. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
reAuthnOnAccessTokenExpiration	boolean	true	Authenticate a user again when its authenticating access token expires and disableLtpaCookie is set to true.
realmIdentifier	string	realmName	Specifies a JSON attribute in the ID token that is used as the realm name.

Attribute name	Data type	Default value	Description
realmName	string		Specifies a realm name to be used to create the user subject when the mapIdentityToRegistryUser is set to false.
redirectToRPHostAndPort	string		Specifies a redirect OpenID relying party host and port number.
scope	tokenType	openid profile	OpenID Connect scope (as detailed in the OpenID Connect specification) that is allowed for the provider.
signatureAlgorithm	<ul style="list-style-type: none"> <li>• HS256</li> <li>• none</li> <li>• RS256</li> </ul>	HS256	<p>Specifies the signature algorithm that will be used to verify the signature of the ID token.</p> <p><b>HS256</b> Use the HS256 signature algorithm to sign and verify tokens</p> <p><b>none</b> Tokens are not required to be signed</p> <p><b>RS256</b> Use the RS256 signature algorithm to sign and verify tokens</p>
sslRef	A reference to top level ssl element (string).		Specifies an ID of the SSL configuration that is used to connect to the OpenID Connect provider.
tokenEndpointAuthMethod	<ul style="list-style-type: none"> <li>• post</li> <li>• basic</li> </ul>	post	<p>The method to use for sending credentials to the token endpoint of the OpenID Connect provider in order to authenticate the client.</p> <p><b>post</b> post</p> <p><b>basic</b> basic</p>
tokenEndpointUrl	string		Specifies a token end point URL.
trustAliasName	string		Key alias name to locate public key for signature validation with asymmetric algorithm.
trustStoreRef	A reference to top level keyStore element (string).		A keystore containing the public key necessary for verifying the signature of the ID token.

Attribute name	Data type	Default value	Description
uniqueUserIdentifier	string	uniqueSecurityName	Specifies a JSON attribute in the ID token that is used as the unique user name as it applies to the WSCredential in the subject.
userIdentifier	string		Specifies a JSON attribute in the ID token that is used as the user principal name in the subject. If no value is specified, the JSON attribute "sub" is used.
userIdentityToCreateSubject	string	sub	Specifies a user identity in the ID token used to create the user subject.
validationEndpointUrl	string		The endpoint URL for validating the token inbound propagation. The type of endpoint is decided by the validationMethod.
validationMethod	<ul style="list-style-type: none"> <li>• introspect</li> <li>• userinfo</li> </ul>	introspect	<p>The method of validation on the token inbound propagation.</p> <p><b>introspect</b> Validate inbound tokens using token introspection</p> <p><b>userinfo</b> Validate inbound tokens using the userinfo end point</p>

**audiences**

The trusted audience list that is verified against the aud claim in the JSON web token.

false

string

**authFilter**

Specifies the authentication filter reference.

false

**authFilter > host**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
name	string		Specifies the name.

#### **authFilter > remoteAddress**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
ip	string		Specifies the IP address.
matchType	<ul style="list-style-type: none"> <li>• lessThan</li> <li>• equals</li> <li>• greaterThan</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>lessThan</b> Less than <b>equals</b> Equals <b>greaterThan</b> Greater than <b>contains</b> Contains <b>notContain</b> Not contain

#### **authFilter > requestUrl**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
urlPattern	string		Specifies the URL pattern.

#### **authFilter > userAgent**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
agent	string		Specifies the user agent
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain

**authFilter > webApp**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
name	string		Specifies the name.

## OpenID Connect Server Provider (openidConnectProvider)

OpenID Connect server provider

Attribute name	Data type	Default value	Description
allowDefaultSsoCookieName	boolean	false	When this property is set to true, the default SSO cookie name, ltpaToken2, is used if a custom SSO cookie name is not configured. If a custom cookie name is configured for SSO, that cookie name is used. If a custom cookie name is not configured and this property is set to false, an auto-generated SSO cookie name will be used.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
idTokenLifetime	A period of time with second precision	2h	Time that ID token is valid (seconds). Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
issuerIdentifier	string		Specify an issuer identifier for the issuer of the response.
jwkEnabled	boolean	false	Enables or disables JWK.
jwkRotationTime	A period of time with minute precision	720m	Amount of time after which a new JWK will be generated. Specify a positive integer followed by a unit of time, which can be hours (h) or minutes (m). For example, specify 30 minutes as 30m. You can include multiple values in a single entry. For example, 1h30m is equivalent to 90 minutes.
jwkSigningKeySize	<ul style="list-style-type: none"> <li>• 4096</li> <li>• 1024</li> <li>• 2048</li> </ul>	2048	Size measured in bits of the signing key. <b>4096</b> 4096 bits <b>1024</b> 1024 bits <b>2048</b> 2048 bits
keyAliasName	string		Key alias name to locate the private key for signing with an asymmetric algorithm.
keyStoreRef	A reference to top level keyStore element (string).	opKeyStore	A keystore containing the private key necessary for signing with an asymmetric algorithm.
oauthProviderRef	A reference to top level oauthProvider element (string).		A reference to the ID of an OAuth provider.
sessionManaged	boolean	false	Indicate by true or false whether session management is supported. Default is false.

Attribute name	Data type	Default value	Description
signatureAlgorithm	<ul style="list-style-type: none"> <li>• HS256</li> <li>• none</li> <li>• RS256</li> </ul>	HS256	Specify the signature algorithm that will be used to sign the ID token.  <b>HS256</b> HMAC using SHA-256 hash  <b>none</b> No signature  <b>RS256</b> RSASSA-PKCS-v1_5 using SHA-256 hash
trustStoreRef	A reference to top level keyStore element (string).		A keystore containing the public key necessary for verifying a signature of the JWT token.

### claimToUserRegistryMap

Specify the user registry key for the claim.

false

Attribute name	Data type	Default value	Description
address	string	postalAddress	Specify the user registry key that will be retrieved for the address claim.
email	string	mail	Specify the user registry key that will be retrieved for the email claim.
given_name	string	givenName	Specify the user registry key that will be retrieved for the given_name claim.
name	string	displayName	Specify the user registry key that will be retrieved for the name claim.
phone_number	string	telephoneNumber	Specify the user registry key that will be retrieved for the phone_number claim.
picture	string	photoURL	Specify the user registry key that will be retrieved for the picture claim.

### claimToUserRegistryMap > property

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		Specify the name of the property
value	string		Specify the value of the property

**customClaims**

The extra claims to be put in the payloads of the ID Token, in addition to the default realmName, uniqueSecurityName and groupIds claims.

false

string

**discovery**

Discovery is based on OpenID Connect and Jazz Authorization Server Profile.

false

Attribute name	Data type	Default value	Description
claimsParameterSupported	boolean	false	Indicate by true or false whether claims parameter is supported.
requestParameterSupported	boolean	false	Indicate by true or false whether request parameter is supported.
requestUriParameterSupported	boolean	false	Indicate by true or false whether request URI parameter is supported.
requireRequestUriRegistration	boolean	false	Indicate by true or false whether require request URI registration is supported.

**discovery > claimsSupported**

Specify by comma the list of claims that will be supported.

false

string

**discovery > grantTypesSupported**

Specify by comma the list of the grant types that will be used.

false

**discovery > idTokenSigningAlgValuesSupported**

Specify the signature algorithm that will be used to sign the ID token.

false

**discovery > responseModesSupported**

Specify by comma the list of the response modes that will be used.

false

**discovery > responseTypesSupported**

Specify by comma the list of the response types that will be supported by the OP.

false

**discovery > scopesSupported**

Specify by comma the list of scopes that will be supported.

false

string

**discovery > tokenEndpointAuthMethodsSupported**

Specify by comma the list of the token endpoint authentication methods that will be used.

false

**oauthProvider**

A reference to the ID of an OAuth provider.

false

Attribute name	Data type	Default value	Description
accessTokenLength	long	40	Length of the generated OAuth access token. The equivalent provider parameter in the full application server profile is <code>oauth20.access.token.length</code> .
accessTokenLifetime	A period of time with second precision	7200	Time that access token is valid (seconds). The equivalent provider parameter in the full application server profile is <code>oauth20.token.lifetime.seconds</code> . Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
allowPublicClients	boolean	false	A value of false disables the access of public clients as detailed in the OAuth specification. The equivalent provider parameter in the full application server profile is <code>oauth20.allow.public.clients</code> .
authorizationCodeLength	long	30	Length of the generated authorization code. The equivalent provider parameter in the full application server profile is <code>oauth20.code.length</code> .

Attribute name	Data type	Default value	Description
authorizationCodeLifetime	A period of time with second precision	60	Authorization code lifetime (seconds). The equivalent provider parameter in the full application server profile is <code>oauth20.code.lifetime.seconds</code> . Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
authorizationErrorTemplate	string		URL of a custom authorization error page template. The equivalent provider parameter in the full application server profile is <code>oauth20.authorization.error.template</code> .
authorizationFormTemplate	string	template.html	URL of a custom authorization page template. The equivalent provider parameter in the full application server profile is <code>oauth20.authorization.form.template</code> .
authorizationGrantLifetime	A period of time with second precision	604800	Authorization grant lifetime (seconds). The equivalent provider parameter in the full application server profile is <code>oauth20.max.authorization.grant.lifetime.seconds</code> . Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
autoAuthorize	boolean	false	To use auto authorization, append the <code>autoAuthorize</code> parameter to requests with a value of true. The equivalent provider parameter in the full application server profile is <code>oauth20.autoauthorize.param</code> .

Attribute name	Data type	Default value	Description
autoAuthorizeParam	string	autoauthz	To use auto authorization, append the autoAuthorize parameter to requests with a value of true. The equivalent provider parameter in the full application server profile is oauth20.autoauthorize.param.
certAuthentication	boolean	false	Enable the authentication of client certificate in the https request.
characterEncoding	string		Set request character encoding to this value. The equivalent provider parameter in the full application server profile is characterEncoding.
clientTokenCacheSize	long		Maximum number of entries in the client token cache.
clientURISubstitutions	string		Optional value to replace client URI strings for dynamic hostnames. The equivalent provider parameter in the full application server profile is oauth20.client.uri.substitutions.
consentCacheEntryLifetime	A period of time with second precision	1800	Time that an entry in the consent cache is valid (seconds). Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
consentCacheSize	long Minimum: 0	1000	Maximum number of entries allowed in the consent cache.
coverageMapSessionMaxAge	A period of time with second precision	600	The max-age value (seconds) for the cache-control header of the coverage map service. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
customLoginURL	string	login.jsp	URL of a custom login page. The equivalent provider parameter in the full application server profile is <code>oauth20.authorization.loginURL</code> .
filter	string		URI filter selects requests to be authorized by this provider. The equivalent provider parameter in the full application server profile is <code>Filter</code> .
httpsRequired	boolean	true	SSL communication between the OAuth client and provider is required.
includeTokenInSubject	boolean	true	If the value is true, add the <code>com.ibm.wsspi.security.oauth20.token.WSOAuth</code> as a private credential. The equivalent provider parameter in the full application server profile is <code>includeToken</code> .
issueRefreshToken	boolean	true	A value of false disables generation and the use of refresh tokens. The equivalent provider parameter in the full application server profile is <code>oauth20.issue.refresh.token</code> .
libraryRef	A reference to top level library element (string).		Reference to shared library containing the mediator plugin class.
oauthOnly	boolean	true	If the value is true, then requests matching the filter must have an access token or they will be failed. If false, then matching requests will be checked for other authentication data if no access token is present. The equivalent provider parameter in the full application server profile is <code>oauthOnly</code> .
refreshTokenLength	long	50	Length of generated refresh token. The equivalent provider parameter in the full application server profile is <code>oauth20.refresh.token.length</code> .
skipResourceOwnerValidation	boolean	false	If the value is true, skip validation of resource owner.
userClientTokenLimit	long		Token limit for each user and client combination.

**oauthProvider > autoAuthorizeClient**

Name of a client that is allowed to use auto authorization. The equivalent provider parameter in the full application server profile is `oauth20.autoauthorize.clients`.

false

string

**oauthProvider > databaseStore**

Clients are defined and tokens are cached in the database.

false

Attribute name	Data type	Default value	Description
<code>cleanupExpiredTokenInterval</code>	A period of time with second precision	3600	Expired token cleanup interval (seconds). The equivalent provider parameter in the full application server profile is <code>oauthjdbc.CleanupInterval</code> . Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
<code>dataSourceRef</code>	A reference to top level <code>dataSource</code> element (string).		Reference to the data source for the store.
<code>password</code>	Reversably encoded password (string)		Password used to access the database.
<code>schema</code>	string	<code>OAuthDBSchema</code>	Schema
<code>user</code>	string		User

**oauthProvider > databaseStore > dataSource**

Reference to the data source for the store.

false

Attribute name	Data type	Default value	Description
<code>beginTranForResultSetScrollingApps</code>	boolean	true	Attempt transaction enlistment when result set scrolling interfaces are used.
<code>beginTranForVendorAPIs</code>	boolean	true	Attempt transaction enlistment when vendor interfaces are used.

Attribute name	Data type	Default value	Description
commitOrRollbackOnCleanup	<ul style="list-style-type: none"> <li>• commit</li> <li>• rollback</li> </ul>		<p>Determines how to clean up connections that might be in a database unit of work (AutoCommit=false) when the connection is closed or returned to the pool.</p> <p><b>commit</b> Clean up the connection by committing.</p> <p><b>rollback</b> Clean up the connection by rolling back.</p>
connectionManagerRef	A reference to top level connectionManager element (string).		Connection manager for a data source.
connectionSharing	<ul style="list-style-type: none"> <li>• MatchOriginalRequest</li> <li>• MatchCurrentState</li> </ul>	MatchOriginalRequest	<p>Specifies how connections are matched for sharing.</p> <p><b>MatchOriginalRequest</b> When sharing connections, match based on the original connection request.</p> <p><b>MatchCurrentState</b> When sharing connections, match based on the current state of the connection.</p>
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

Attribute name	Data type	Default value	Description
enableConnectionCasting	boolean	false	Indicates that connections obtained from the data source should be castable to interface classes that the JDBC vendor connection implementation implements. Enabling this option incurs additional overhead on each getConnection operation. If vendor JDBC interfaces are needed less frequently, it might be more efficient to leave this option disabled and use Connection.unwrap(interface) only where it is needed.
isolationLevel	<ul style="list-style-type: none"> <li>• TRANSACTION_REPEATABLE_READ</li> <li>• TRANSACTION_READ_COMMITTED</li> <li>• TRANSACTION_SERIALIZABLE</li> <li>• TRANSACTION_READ_UNCOMMITTED</li> <li>• TRANSACTION_SNAPSHOT</li> </ul>		<p>Default transaction isolation level.</p> <p><b>TRANSACTION_REPEATABLE_READ</b> Dirty reads and non-repeatable reads are prevented; phantom reads can occur.</p> <p><b>TRANSACTION_READ_COMMITTED</b> Dirty reads are prevented; non-repeatable reads and phantom reads can occur.</p> <p><b>TRANSACTION_SERIALIZABLE</b> Dirty reads, non-repeatable reads and phantom reads are prevented.</p> <p><b>TRANSACTION_READ_UNCOMMITTED</b> Dirty reads, non-repeatable reads and phantom reads can occur.</p> <p><b>TRANSACTION_SNAPSHOT</b> Snapshot isolation for Microsoft SQL Server JDBC Driver and DataDirect Connect for JDBC driver.</p>

Attribute name	Data type	Default value	Description
jaasLoginContextEntryRef	A reference to top level jaasLoginContextEntry element (string).		JAAS login context entry for authentication.
jdbcDriverRef	A reference to top level jdbcDriver element (string).		JDBC driver for a data source.
jndiName	string		JNDI name for a data source.
queryTimeout	A period of time with second precision		Default query timeout for SQL statements. In a JTA transaction, syncQueryTimeoutWithTransactionTimeout can override this default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
recoveryAuthDataRef	A reference to top level authData element (string).		Authentication data for transaction recovery.
statementCacheSize	int Minimum: 0	10	Maximum number of cached statements per connection.
supplementalJDBCTrace	boolean		Supplements the JDBC driver trace that is logged when JDBC driver trace is enabled in bootstrap.properties. JDBC driver trace specifications include: com.ibm.ws.database.logwriter, com.ibm.ws.db2.logwriter, com.ibm.ws.derby.logwriter, com.ibm.ws.informix.logwriter, com.ibm.ws.oracle.logwriter, com.ibm.ws.sqlserver.logwriter, com.ibm.ws.sybase.logwriter
syncQueryTimeoutWithTransactionTimeout	boolean	false	Use the time remaining (if any) in a JTA transaction as the default query timeout for SQL statements.
transactional	boolean	true	Enable participation in transactions that are managed by the application server.

Attribute name	Data type	Default value	Description
type	<ul style="list-style-type: none"> <li>• javax.sql.DataSource</li> <li>• javax.sql.XADataSource</li> <li>• javax.sql.ConnectionPoolDataSource</li> </ul>		Type of data source. <b>javax.sql.DataSource</b> javax.sql.DataSource <b>javax.sql.XADataSource</b> javax.sql.XADataSource <b>javax.sql.ConnectionPoolDataSource</b> javax.sql.ConnectionPoolDataSource

**oauthProvider > databaseStore > dataSource > connectionManager**

Connection manager for a data source.

false

Attribute name	Data type	Default value	Description
agedTimeout	A period of time with second precision	-1	Amount of time before a physical connection can be discarded by pool maintenance. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
connectionTimeout	A period of time with second precision	30s	Amount of time after which a connection request times out. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxConnectionsPerThread	int Minimum: 0		Limits the number of open connections on each thread.

Attribute name	Data type	Default value	Description
maxIdleTime	A period of time with second precision	30m	Amount of time after which an unused or idle connection can be discarded during pool maintenance, if doing so does not reduce the pool below the minimum size. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxPoolSize	int Minimum: 0	50	Maximum number of physical connections for a pool. A value of 0 means unlimited.
minPoolSize	int Minimum: 0		Minimum number of physical connections to maintain in the pool. The pool is not pre-populated. Aged timeout can override the minimum.
numConnectionsPerThreadLocal	int Minimum: 0		Caches the specified number of connections for each thread.

Attribute name	Data type	Default value	Description
purgePolicy	<ul style="list-style-type: none"> <li>• ValidateAllConnections</li> <li>• FailingConnectionOnly</li> <li>• EntirePool</li> </ul>	EntirePool	<p>Specifies which connections to destroy when a stale connection is detected in a pool.</p> <p><b>ValidateAllConnections</b> When a stale connection is detected, connections are tested and those found to be bad are closed.</p> <p><b>FailingConnectionOnly</b> When a stale connection is detected, only the connection which was found to be bad is closed.</p> <p><b>EntirePool</b> When a stale connection is detected, all connections in the pool are marked stale, and when no longer in use, are closed.</p>
reapTime	A period of time with second precision	3m	Amount of time between runs of the pool maintenance thread. A value of -1 disables pool maintenance. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

**oauthProvider > databaseStore > dataSource > containerAuthData**

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

**oauthProvider > databaseStore > dataSource > jaasLoginContextEntry**

JAAS login context entry for authentication.

false

Attribute name	Data type	Default value	Description
loginModuleRef	List of references to top level jaasLoginModule elements (comma-separated string).	hashtable,userNameAndPassword,certificateURL	Word certificateURL of a JAAS login module.
name	string		Name of a JAAS configuration entry.

**oauthProvider > databaseStore > dataSource > jdbcDriver**

JDBC driver for a data source.

false

Attribute name	Data type	Default value	Description
javax.sql.ConnectionPoolDataSource	string		JDBC driver implementation of javax.sql.ConnectionPoolDataSource.
javax.sql.DataSource	string		JDBC driver implementation of javax.sql.DataSource.
javax.sql.XADataSource	string		JDBC driver implementation of javax.sql.XADataSource.
libraryRef	A reference to top level library element (string).		Identifies JDBC driver JARs and native files.

**oauthProvider > databaseStore > dataSource > jdbcDriver > library**

Identifies JDBC driver JARs and native files.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

**oauthProvider > databaseStore > dataSource > jdbcDriver > library > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**oauthProvider > databaseStore > dataSource > jdbcDriver > library > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**oauthProvider > databaseStore > dataSource > jdbcDriver > library > folder**  
 Id of referenced folder  
 false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**oauthProvider > databaseStore > dataSource > properties**

List of JDBC vendor properties for the data source. For example, databaseName="dbname" serverName="localhost" portNumber="50000".

false

Attribute name	Data type	Default value	Description
URL	string		URL for connecting to the database.
databaseName	string		JDBC driver property: databaseName.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
serverName	string		Server where the database is running.

Attribute name	Data type	Default value	Description
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**oauthProvider > databaseStore > dataSource > properties.datadirect.sqlserver**

Data source properties for the DataDirect Connect for JDBC driver for Microsoft SQL Server.

false

Attribute name	Data type	Default value	Description
JDBCBehavior	<ul style="list-style-type: none"> <li>• 1</li> <li>• 0</li> </ul>	0	JDBC driver property: JDBCBehavior. Values are: 0 (JDBC 4.0) or 1 (JDBC 3.0).  <b>1</b> JDBC 3.0 <b>0</b> JDBC 4.0
XATransactionGroup	string		JDBC driver property: XATransactionGroup.
XMLDescribeType	<ul style="list-style-type: none"> <li>• longvarbinary</li> <li>• longvarchar</li> </ul>		JDBC driver property: XMLDescribeType.  <b>longvarbinary</b> longvarbinary  <b>longvarchar</b> longvarchar
accountingInfo	string		JDBC driver property: accountingInfo.
alternateServers	string		JDBC driver property: alternateServers.
alwaysReportTriggerResults	boolean		JDBC driver property: alwaysReportTriggerResults.
applicationName	string		JDBC driver property: applicationName.
authenticationMethod	<ul style="list-style-type: none"> <li>• ntlm</li> <li>• userIdPassword</li> <li>• kerberos</li> <li>• auto</li> </ul>		JDBC driver property: authenticationMethod.  <b>ntlm</b> ntlm <b>userIdPassword</b> userIdPassword  <b>kerberos</b> kerberos  <b>auto</b> auto
bulkLoadBatchSize	long		JDBC driver property: bulkLoadBatchSize.
bulkLoadOptions	long		JDBC driver property: bulkLoadOptions.
clientHostName	string		JDBC driver property: clientHostName.

Attribute name	Data type	Default value	Description
clientUser	string		JDBC driver property: clientUser.
codePageOverride	string		JDBC driver property: codePageOverride.
connectionRetryCount	int		JDBC driver property: connectionRetryCount.
connectionRetryDelay	A period of time with second precision		JDBC driver property: connectionRetryDelay. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
convertNull	int		JDBC driver property: convertNull.
databaseName	string		JDBC driver property: databaseName.
dateTimeInputParameterType	<ul style="list-style-type: none"> <li>• dateTime</li> <li>• dateTimeOffset</li> <li>• auto</li> </ul>		JDBC driver property: dateTimeInputParameterType.  <b>dateTime</b> dateTime <b>dateTimeOffset</b> dateTimeOffset <b>auto</b> auto
dateTimeOutputParameterType	<ul style="list-style-type: none"> <li>• dateTime</li> <li>• dateTimeOffset</li> <li>• auto</li> </ul>		JDBC driver property: dateTimeOutputParameterType.  <b>dateTime</b> dateTime <b>dateTimeOffset</b> dateTimeOffset <b>auto</b> auto
describeInputParameters	<ul style="list-style-type: none"> <li>• describeIfString</li> <li>• noDescribe</li> <li>• describeIfDateTime</li> <li>• describeAll</li> </ul>		JDBC driver property: describeInputParameters.  <b>describeIfString</b> describeIfString <b>noDescribe</b> noDescribe <b>describeIfDateTime</b> describeIfDateTime <b>describeAll</b> describeAll

Attribute name	Data type	Default value	Description
describeOutputParameters	<ul style="list-style-type: none"> <li>describeIfString</li> <li>noDescribe</li> <li>describeIfDateTime</li> <li>describeAll</li> </ul>		JDBC driver property: describeOutputParameters. <b>describeIfString</b> describeIfString <b>noDescribe</b> noDescribe <b>describeIfDateTime</b> describeIfDateTime <b>describeAll</b> describeAll
enableBulkLoad	boolean		JDBC driver property: enableBulkLoad.
enableCancelTimeout	boolean		JDBC driver property: enableCancelTimeout.
encryptionMethod	<ul style="list-style-type: none"> <li>loginSSL</li> <li>requestSSL</li> <li>SSL</li> <li>noEncryption</li> </ul>		JDBC driver property: encryptionMethod. <b>loginSSL</b> loginSSL <b>requestSSL</b> requestSSL <b>SSL</b> SSL <b>noEncryption</b> noEncryption
failoverGranularity	<ul style="list-style-type: none"> <li>disableIntegrityCheck</li> <li>atomicWithRepositioning</li> <li>nonAtomic</li> <li>atomic</li> </ul>		JDBC driver property: failoverGranularity. <b>disableIntegrityCheck</b> disableIntegrityCheck <b>atomicWithRepositioning</b> atomicWithRepositioning <b>nonAtomic</b> nonAtomic <b>atomic</b> atomic
failoverMode	<ul style="list-style-type: none"> <li>connect</li> <li>select</li> <li>extended</li> </ul>		JDBC driver property: failoverMode. <b>connect</b> connect <b>select</b> select <b>extended</b> extended
failoverPreconnect	boolean		JDBC driver property: failoverPreconnect.
hostNameInCertificate	string		JDBC driver property: hostNameInCertificate.
initializationString	string		JDBC driver property: initializationString.
insensitiveResultSetBufferSize	int		JDBC driver property: insensitiveResultSetBufferSize.

Attribute name	Data type	Default value	Description
javaDoubleToString	boolean		JDBC driver property: javaDoubleToString.
loadBalancing	boolean		JDBC driver property: loadBalancing.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
longDataCacheSize	int Minimum: -1		JDBC driver property: longDataCacheSize.
netAddress	string		JDBC driver property: netAddress.
packetSize	int Minimum: -1 Maximum: 128		JDBC driver property: packetSize.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
queryTimeout	A period of time with second precision		JDBC driver property: queryTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
resultsetMetaDataOptions	int		JDBC driver property: resultSetMetaDataOptions.
selectMethod	<ul style="list-style-type: none"> <li>• direct</li> <li>• cursor</li> </ul>		JDBC driver property: selectMethod.  <b>direct</b> direct <b>cursor</b> cursor
serverName	string	localhost	Server where the database is running.
snapshotSerializable	boolean		JDBC driver property: snapshotSerializable.

Attribute name	Data type	Default value	Description
spyAttributes	string		JDBC driver property: spyAttributes.
stringInputParameterType	<ul style="list-style-type: none"> <li>varchar</li> <li>nvarchar</li> </ul>	varchar	JDBC driver property: stringInputParameterType. <b>varchar</b> varchar <b>nvarchar</b> nvarchar
stringOutputParameterType	<ul style="list-style-type: none"> <li>varchar</li> <li>nvarchar</li> </ul>	varchar	JDBC driver property: stringOutputParameterType. <b>varchar</b> varchar <b>nvarchar</b> nvarchar
suppressConnectionWarnings	boolean		JDBC driver property: suppressConnectionWarnings.
transactionMode	<ul style="list-style-type: none"> <li>explicit</li> <li>implicit</li> </ul>		JDBC driver property: transactionMode. <b>explicit</b> explicit <b>implicit</b> implicit
truncateFractionalSeconds	boolean		JDBC driver property: truncateFractionalSeconds.
trustStore	string		JDBC driver property: trustStore.
trustStorePassword	Reversably encoded password (string)		JDBC driver property: trustStorePassword.
useServerSideUpdatableCursors	boolean		JDBC driver property: useServerSideUpdatableCursors.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
validateServerCertificate	boolean		JDBC driver property: validateServerCertificate.

**oauthProvider > databaseStore > dataSource > properties.db2.i.native**

Data source properties for the IBM DB2 for i Native JDBC driver.

false

Attribute name	Data type	Default value	Description
access	<ul style="list-style-type: none"> <li>read only</li> <li>all</li> <li>read call</li> </ul>	all	JDBC driver property: access. <b>read only</b> read only <b>all</b> all <b>read call</b> read call

Attribute name	Data type	Default value	Description
autoCommit	boolean	true	JDBC driver property: autoCommit.
batchStyle	<ul style="list-style-type: none"> <li>• 2.1</li> <li>• 2.0</li> </ul>	2.0	JDBC driver property: batchStyle. <b>2.1</b> 2.1 <b>2.0</b> 2.0

directMap	boolean	true	JDBC driver property: directMap.
doEscapeProcessing	boolean	true	JDBC driver property: doEscapeProcessing.
fullErrors	boolean		JDBC driver property: fullErrors.
libraries	string		JDBC driver property: libraries.
lobThreshold	int Maximum: 500000	0	JDBC driver property: lobThreshold.

Attribute name	Data type	Default value	Description
lockTimeout	A period of time with second precision	0	JDBC driver property: lockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maximumPrecision	<ul style="list-style-type: none"> <li>• 31</li> <li>• 63</li> </ul>	31	JDBC driver property: maximumPrecision.  <b>31</b> 31 <b>63</b> 63
maximumScale	int Minimum: 0 Maximum: 63	31	JDBC driver property: maximumScale.
minimumDivideScale	int Minimum: 0 Maximum: 9	0	JDBC driver property: minimumDivideScale.
networkProtocol	int		JDBC driver property: networkProtocol.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
prefetch	boolean	true	JDBC driver property: prefetch.
queryOptimizeGoal	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>	2	JDBC driver property: queryOptimizeGoal. Values are: 1 (*FIRSTIO) or 2 (*ALLIO).  <b>2</b> *ALLIO <b>1</b> *FIRSTIO

Attribute name	Data type	Default value	Description
reuseObjects	boolean	true	JDBC driver property: reuseObjects.
serverName	string		Server where the database is running.
serverTraceCategories	int	0	JDBC driver property: serverTraceCategories.
systemNaming	boolean	false	JDBC driver property: systemNaming.
timeFormat	<ul style="list-style-type: none"> <li>• iso</li> <li>• eur</li> <li>• jis</li> <li>• usa</li> <li>• hms</li> </ul>		JDBC driver property: timeFormat.  <b>iso</b> iso <b>eur</b> eur <b>jis</b> jis <b>usa</b> usa <b>hms</b> hms
timeSeparator	<ul style="list-style-type: none"> <li>• \,</li> <li>• b</li> <li>• :</li> <li>• .</li> </ul>		JDBC driver property: timeSeparator.  \, The comma character (,). <b>b</b> The character b : The colon character (:). . The period character (.).
trace	boolean		JDBC driver property: trace.
transactionTimeout	A period of time with second precision	0	JDBC driver property: transactionTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
translateBinary	boolean	false	JDBC driver property: translateBinary.
translateHex	<ul style="list-style-type: none"> <li>• binary</li> <li>• character</li> </ul>	character	JDBC driver property: translateHex.  <b>binary</b> binary <b>character</b> character
useBlockInsert	boolean	false	JDBC driver property: useBlockInsert.

Attribute name	Data type	Default value	Description
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**oauthProvider > databaseStore > dataSource > properties.db2.i.toolbox**

maximumScale	int Minimum: 0 Maximum: 63	31	JDBC driver property: maximumScale.
metaDataSource	int Minimum: 0 Maximum: 1	1	JDBC driver property: metaDataSource.
minimumDivideScale	int Minimum: 0 Maximum: 9	0	JDBC driver property: minimumDivideScale.
naming	<ul style="list-style-type: none"> <li>• system</li> <li>• sql</li> </ul>	sql	JDBC driver property: naming.  <b>system</b> system <b>sql</b> sql
package	string		JDBC driver property: package.
packageAdd	boolean	true	JDBC driver property: packageAdd.
packageCCSID	<ul style="list-style-type: none"> <li>• 13488</li> <li>• 1200</li> </ul>	13488	JDBC driver property: packageCCSID. Values are: 1200 (UCS-2) or 13488 (UTF-16).  <b>13488</b> 13488 (UTF-16) <b>1200</b> 1200 (UCS-2)
packageCache	boolean	false	JDBC driver property: packageCache.

Attribute name	Data type	Default value	Description
packageCriteria	<ul style="list-style-type: none"> <li>default</li> <li>select</li> </ul>	default	JDBC driver property: packageCriteria. <b>default</b> default <b>select</b> select
packageError	<ul style="list-style-type: none"> <li>exception</li> <li>none</li> <li>warning</li> </ul>	warning	JDBC driver property: packageError. <b>exception</b> exception <b>none</b> none <b>warning</b> warning
packageLibrary	string	QGPL	JDBC driver property: packageLibrary.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
prefetch	boolean	true	JDBC driver property: prefetch.
prompt	boolean	false	JDBC driver property: prompt.
proxyServer	string		JDBC driver property: proxyServer.
qaqqiniLibrary	string		JDBC driver property: qaqqiniLibrary.
queryOptimizeGoal	int Minimum: 0 Maximum: 2	0	JDBC driver property: queryOptimizeGoal. Values are: 1 (*FIRSTIO) or 2 (*ALLIO).
receiveBufferSize	int Minimum: 1		JDBC driver property: receiveBufferSize.
remarks	<ul style="list-style-type: none"> <li>system</li> <li>sql</li> </ul>	system	JDBC driver property: remarks. <b>system</b> system <b>sql</b> sql
rollbackCursorHold	boolean	false	JDBC driver property: rollbackCursorHold.
savePasswordWhenSerialized	boolean	false	JDBC driver property: savePasswordWhenSerialized.
secondaryUrl	string		JDBC driver property: secondaryUrl.
secure	boolean	false	JDBC driver property: secure.
sendBufferSize	int Minimum: 1		JDBC driver property: sendBufferSize.

Attribute name	Data type	Default value	Description
serverName	string		Server where the database is running.
serverTraceCategories	int	0	JDBC driver property: serverTraceCategories.
soLinger	A period of time with second precision		JDBC driver property: soLinger. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
soTimeout	A period of time with millisecond precision		JDBC driver property: soTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
sort	<ul style="list-style-type: none"> <li>• hex</li> <li>• table</li> <li>• language</li> </ul>	hex	JDBC driver property: sort. <b>hex</b> hex <b>table</b> table <b>language</b> language
sortLanguage	string		JDBC driver property: sortLanguage.
sortTable	string		JDBC driver property: sortTable.
sortWeight	<ul style="list-style-type: none"> <li>• unqiue</li> <li>• shared</li> </ul>		JDBC driver property: sortWeight. <b>unqiue</b> unique <b>shared</b> shared
tcpNoDelay	boolean		JDBC driver property: tcpNoDelay.
threadUsed	boolean	true	JDBC driver property: threadUsed.

Attribute name	Data type	Default value	Description
timeFormat	<ul style="list-style-type: none"> <li>• iso</li> <li>• eur</li> <li>• jis</li> <li>• usa</li> <li>• hms</li> </ul>		JDBC driver property: timeFormat. <b>iso</b> iso <b>eur</b> eur <b>jis</b> jis <b>usa</b> usa <b>hms</b> hms

trace	boolean		JDBC driver property: trace.
translateBinary	boolean	false	JDBC driver property: translateBinary.
translateBoolean	boolean	true	JDBC driver property: translateBoolean.

Attribute name	Data type	Default value	Description
translateHex	<ul style="list-style-type: none"> <li>binary</li> <li>character</li> </ul>	character	JDBC driver property: translateHex.  <b>binary</b> binary <b>character</b> character
trueAutoCommit	boolean	false	JDBC driver property: trueAutoCommit.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
xaLooselyCoupledSupport	int  Minimum: 0  Maximum: 1	0	JDBC driver property: xaLooselyCoupledSupport.

**oauthProvider > databaseStore > dataSource > properties.db2.jcc**

Data source properties for the IBM Data Server Driver for JDBC and SQLJ for DB2.

false

Attribute name	Data type	Default value	Description
activateDatabase	int		JDBC driver property: activateDatabase.
alternateGroupDatabaseName	string		JDBC driver property: alternateGroupDatabaseName.
alternateGroupPortNumber	string		JDBC driver property: alternateGroupPortNumber.
alternateGroupServerName	string		JDBC driver property: alternateGroupServerName.
blockingReadConnectionTimeout	A period of time with second precision		JDBC driver property: blockingReadConnectionTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
clientAccountingInformation	string		JDBC driver property: clientAccountingInformation.
clientApplicationInformation	string		JDBC driver property: clientApplicationInformation.
clientRerouteAlternatePortNumber	string		JDBC driver property: clientRerouteAlternatePortNumber.
clientRerouteAlternateServerName	string		JDBC driver property: clientRerouteAlternateServerName.

Attribute name	Data type	Default value	Description
clientUser	string		JDBC driver property: clientUser.
clientWorkstation	string		JDBC driver property: clientWorkstation.
connectionCloseWithInFlightTransaction	Transaction • 1		JDBC driver property: connectionCloseWithInFlightTransaction. 2 CONNECTION_CLOSE_WITH_ROLLBACK 1 CONNECTION_CLOSE_WITH_EXCEPTION
currentAlternateGroupEntry	int		JDBC driver property: currentAlternateGroupEntry.
currentFunctionPath	string		JDBC driver property: currentFunctionPath.
currentLocaleLcCtype	string		JDBC driver property: currentLocaleLcCtype.
currentLockTimeout	A period of time with second precision		JDBC driver property: currentLockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
currentPackagePath	string		JDBC driver property: currentPackagePath.
currentPackageSet	string		JDBC driver property: currentPackageSet.
currentSQLID	string		JDBC driver property: currentSQLID.
currentSchema	string		JDBC driver property: currentSchema.
cursorSensitivity	• 2 • 1 • 0		JDBC driver property: cursorSensitivity. Values are: 0 (TYPE_SCROLL_SENSITIVE_STATIC), 1 (TYPE_SCROLL_SENSITIVE_DYNAMIC), 2 (TYPE_SCROLL_ASENSITIVE). 2 TYPE_SCROLL_ASENSITIVE 1 TYPE_SCROLL_SENSITIVE_DYNAMIC 0 TYPE_SCROLL_SENSITIVE_STATIC
databaseName	string		JDBC driver property: databaseName.
deferPrepares	boolean	true	JDBC driver property: deferPrepares.

Attribute name	Data type	Default value	Description
driverType	<ul style="list-style-type: none"> <li>2</li> <li>4</li> </ul>	4	JDBC driver property: driverType. 2 Type 2 JDBC driver. 4 Type 4 JDBC driver.
enableAlternateGroupSeamlessACR	boolean		JDBC driver property: enableAlternateGroupSeamlessACR.
enableClientAffinitiesList	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableClientAffinitiesList. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
enableExtendedDescribe	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableExtendedDescribe. 2 NO 1 YES
enableExtendedIndicators	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableExtendedIndicators. 2 NO 1 YES
enableNamedParameterMarkers	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableNamedParameterMarkers. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
enableSeamlessFailover	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: enableSeamlessFailover. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
enableSysplexWLB	boolean		JDBC driver property: enableSysplexWLB.
fetchSize	int		JDBC driver property: fetchSize.
fullyMaterializeInputStreams	boolean		JDBC driver property: fullyMaterializeInputStreams.
fullyMaterializeInputStreamsOnBatchExecution	<ul style="list-style-type: none"> <li>1</li> </ul>		JDBC driver property: fullyMaterializeInputStreamsOnBatchExecution. 2 NO 1 YES
fullyMaterializeLobData	boolean		JDBC driver property: fullyMaterializeLobData.

Attribute name	Data type	Default value	Description
implicitRollbackOption	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> <li>• 0</li> </ul>		<p>JDBC driver property: implicitRollbackOption.</p> <p>2 IMPLICIT_ROLLBACK_OPTION_CLOSE</p> <p>1 IMPLICIT_ROLLBACK_OPTION_NO</p> <p>0 IMPLICIT_ROLLBACK_OPTION_NO</p>
interruptProcessingMode	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> <li>• 0</li> </ul>		<p>JDBC driver property: interruptProcessingMode.</p> <p>2 INTERRUPT_PROCESSING_MODE_C</p> <p>1 INTERRUPT_PROCESSING_MODE_S</p> <p>0 INTERRUPT_PROCESSING_MODE_D</p>
keepAliveTimeOut	A period of time with second precision		<p>JDBC driver property: keepAliveTimeOut. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.</p>
keepDynamic	int		JDBC driver property: keepDynamic.
kerberosServerPrincipal	string		JDBC driver property: kerberosServerPrincipal.
loginTimeout	A period of time with second precision		<p>JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.</p>
maxConnCachedParamBufferSize	int		JDBC driver property: maxConnCachedParamBufferSize.
maxRetriesForClientReroute	int		JDBC driver property: maxRetriesForClientReroute.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	50000	Port on which to obtain database connections.
profileName	string		JDBC driver property: profileName.

Attribute name	Data type	Default value	Description
queryCloseImplicit	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: queryCloseImplicit. Values are: 1 (QUERY_CLOSE_IMPLICIT_YES) or 2 (QUERY_CLOSE_IMPLICIT_NO).</p> <p>2        QUERY_CLOSE_IMPLICIT_NO 1        QUERY_CLOSE_IMPLICIT_YES</p>
queryDataSize	<p>int</p> <p>Minimum: 4096</p> <p>Maximum: 65535</p>		JDBC driver property: queryDataSize.
queryTimeoutInterruptProcessingMode	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: queryTimeoutInterruptProcessingMode.</p> <p>2        INTERRUPT_PROCESSING_MODAL 1        INTERRUPT_PROCESSING_MODAL</p>
readOnly	boolean		JDBC driver property: readOnly.
recordTemporalHistory	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: recordTemporalHistory.</p> <p>2        NO 1        YES</p>
resultSetHoldability	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldability. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2        CLOSE_CURSORS_AT_COMMIT 1        HOLD_CURSORS_OVER_COMMIT</p>
resultSetHoldabilityForCatalogQueries	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldabilityForCatalogQueries. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2        CLOSE_CURSORS_AT_COMMIT 1        HOLD_CURSORS_OVER_COMMIT</p>
retrieveMessagesFromServerOnGetMessage	boolean	true	JDBC driver property: retrieveMessagesFromServerOnGetMessage.

Attribute name	Data type	Default value	Description
retryIntervalForClientReroute	A period of time with second precision		JDBC driver property: retryIntervalForClientReroute. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
securityMechanism	<ul style="list-style-type: none"> <li>• 3</li> <li>• 7</li> <li>• 4</li> <li>• 18</li> <li>• 15</li> <li>• 9</li> <li>• 16</li> <li>• 13</li> <li>• 11</li> <li>• 12</li> </ul>		<p>JDBC driver property: securityMechanism. Values are:</p> <ul style="list-style-type: none"> <li>3 (CLEAR_TEXT_PASSWORD_SECURITY),</li> <li>4 (USER_ONLY_SECURITY),</li> <li>7 (ENCRYPTED_PASSWORD_SECURITY),</li> <li>9 (ENCRYPTED_USER_AND_PASSWORD_SECURITY),</li> <li>11 (KERBEROS_SECURITY),</li> <li>12 (ENCRYPTED_USER_AND_DATA_SECURITY),</li> <li>13 (ENCRYPTED_USER_PASSWORD_AND_DATA_SECURITY),</li> <li>15 (PLUGIN_SECURITY),</li> <li>16 (ENCRYPTED_USER_ONLY_SECURITY),</li> <li>18 (TLS_CLIENT_CERTIFICATE_SECURITY).</li> </ul> <p>3 CLEAR_TEXT_PASSWORD_SECURITY  7 ENCRYPTED_PASSWORD_SECURITY  4 USER_ONLY_SECURITY  18 TLS_CLIENT_CERTIFICATE_SECURITY  15 PLUGIN_SECURITY  9 ENCRYPTED_USER_AND_PASSWORD_SECURITY  16 ENCRYPTED_USER_ONLY_SECURITY  13 ENCRYPTED_USER_PASSWORD_AND_DATA_SECURITY  11 KERBEROS_SECURITY  12 ENCRYPTED_USER_AND_DATA_SECURITY</p>
sendDataAsIs	boolean		JDBC driver property: sendDataAsIs.
serverName	string	localhost	Server where the database is running.
sessionTimeZone	string		JDBC driver property: sessionTimeZone.
sqljCloseStmtsWithOpenResultSet	boolean		JDBC driver property: sqljCloseStmtsWithOpenResultSet.

Attribute name	Data type	Default value	Description
sqljEnableClassLoaderSpecificProfiles	boolean		JDBC driver property: sqljEnableClassLoaderSpecificProfiles.
sslConnection	boolean		JDBC driver property: sslConnection.
streamBufferSize	int		JDBC driver property: streamBufferSize.
stripTrailingZerosForDecimalNumbers	Numbers <ul style="list-style-type: none"> <li>• 1</li> </ul>		JDBC driver property: stripTrailingZerosForDecimalNumbers. 2 NO 1 YES
sysSchema	string		JDBC driver property: sysSchema.
timerLevelForQueryTimeOut	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> <li>• -1</li> </ul>		JDBC driver property: timerLevelForQueryTimeOut. 2 QUERYTIMEOUT_CONNECTION 1 QUERYTIMEOUT_STATEMENT_L -1 QUERYTIMEOUT_DISABLED
traceDirectory	string		JDBC driver property: traceDirectory.
traceFile	string		JDBC driver property: traceFile.
traceFileAppend	boolean		JDBC driver property: traceFileAppend.
traceFileCount	int		JDBC driver property: traceFileCount.
traceFileSize	int		JDBC driver property: traceFileSize.
traceLevel	int	0	Bitwise combination of the following constant values: TRACE_NONE=0, TRACE_CONNECTION_CALLS=1, TRACE_STATEMENT_CALLS=2, TRACE_RESULT_SET_CALLS=4, TRACE_DRIVER_CONFIGURATION=16, TRACE_CONNECTS=32, TRACE_DRDA_FLOWS=64, TRACE_RESULT_SET_META_DATA=128, TRACE_PARAMETER_META_DATA=256, TRACE_DIAGNOSTICS=512, TRACE_SQLJ=1024, TRACE_META_CALLS=8192, TRACE_DATASOURCE_CALLS=16384, TRACE_LARGE_OBJECT_CALLS=32768, TRACE_SYSTEM_MONITOR=131072, TRACE_TRACEPOINTS=262144, TRACE_ALL=-1.
traceOption	<ul style="list-style-type: none"> <li>• 1</li> <li>• 0</li> </ul>		JDBC driver property: traceOption 1 1 0 0

Attribute name	Data type	Default value	Description
translateForBitData	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: translateForBitData. 2 SERVER_ENCODING_REPRESENTATION 1 HEX_REPRESENTATION
updateCountForBatch	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: updateCountForBatch. 2 TOTAL_UPDATE_COUNT 1 NO_UPDATE_COUNT
useCachedCursor	boolean		JDBC driver property: useCachedCursor.
useIdentityValLocalForAutoGeneratedKeys	boolean		JDBC driver property: useIdentityValLocalForAutoGeneratedKeys.
useJDBC41DefinitionForGetColumns	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: useJDBC41DefinitionForGetColumns. 2 NO 1 YES
useJDBC4ColumnNameAndLabelSemantics	<ul style="list-style-type: none"> <li>2</li> <li>1</li> </ul>		JDBC driver property: useJDBC4ColumnNameAndLabelSemantics. Values are: 1 (YES) or 2 (NO). 2 NO 1 YES
useTransactionRedirect	boolean		JDBC driver property: useTransactionRedirect.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
xaNetworkOptimization	boolean		JDBC driver property: xaNetworkOptimization.

**oauthProvider > databaseStore > dataSource > properties.derby.client**

Data source properties for Derby Network Client JDBC driver.

false

Attribute name	Data type	Default value	Description
connectionAttributes	string		JDBC driver property: connectionAttributes.

Attribute name	Data type	Default value	Description
createDatabase	<ul style="list-style-type: none"> <li>false</li> <li>create</li> </ul>		<p>JDBC driver property: createDatabase.</p> <p><b>false</b> Do not automatically create the database.</p> <p><b>create</b> When the first connection is established, automatically create the database if it doesn't exist.</p>
databaseName	string		JDBC driver property: databaseName.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1527	Port on which to obtain database connections.
retrieveMessageText	boolean	true	JDBC driver property: retrieveMessageText.
securityMechanism	<ul style="list-style-type: none"> <li>3</li> <li>7</li> <li>4</li> <li>9</li> <li>8</li> </ul>	3	<p>JDBC driver property: securityMechanism. Values are:</p> <p>3 (CLEAR_TEXT_PASSWORD_SECURITY),</p> <p>4 (USER_ONLY_SECURITY),</p> <p>7 (ENCRYPTED_PASSWORD_SECURITY),</p> <p>8 (STRONG_PASSWORD_SUBSTITUTE_SECURITY),</p> <p>9 (ENCRYPTED_USER_AND_PASSWORD_SECURITY)</p> <p>3 CLEAR_TEXT_PASSWORD_SECURITY</p> <p>7 ENCRYPTED_PASSWORD_SECURITY</p> <p>4 USER_ONLY_SECURITY</p> <p>9 ENCRYPTED_USER_AND_PASSWORD_SECURITY</p> <p>8 STRONG_PASSWORD_SUBSTITUTE_SECURITY</p>

Attribute name	Data type	Default value	Description
serverName	string	localhost	Server where the database is running.
shutdownDatabase	<ul style="list-style-type: none"> <li>false</li> <li>shutdown</li> </ul>		JDBC driver property: shutdownDatabase. <b>false</b> Do not shut down the database. <b>shutdown</b> Shut down the database when a connection is attempted.

user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**oauthProvider > databaseStore > dataSource > properties.informix**

Data source properties for the Informix JDBC driver.

false

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
ifxCLIENT_LOCALE	string		JDBC driver property: ifxCLIENT_LOCALE.
ifxCPMAgeLimit	A period of time with second precision		JDBC driver property: ifxCPMAgeLimit. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxCPMInitPoolSize	int		JDBC driver property: ifxCPMInitPoolSize.
ifxCPMMaxConnections	int		JDBC driver property: ifxCPMMaxConnections.
ifxCPMMaxPoolSize	int		JDBC driver property: ifxCPMMaxPoolSize.
ifxCPMMinAgeLimit	A period of time with second precision		JDBC driver property: ifxCPMMinAgeLimit. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxCPMMinPoolSize	int		JDBC driver property: ifxCPMMinPoolSize.
ifxCPMServiceInterval	A period of time with millisecond precision		JDBC driver property: ifxCPMServiceInterval. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
ifxDBANSIWARN	boolean		JDBC driver property: ifxDBANSIWARN.
ifxDBCENTURY	string		JDBC driver property: ifxDBCENTURY.
ifxDBDATE	string		JDBC driver property: ifxDBDATE.
ifxDBSPACETEMP	string		JDBC driver property: ifxDBSPACETEMP.

Attribute name	Data type	Default value	Description
ifxDBTEMP	string		JDBC driver property: ifxDBTEMP.
ifxDBTIME	string		JDBC driver property: ifxDBTIME.
ifxDBUPSPACE	string		JDBC driver property: ifxDBUPSPACE.
ifxDB_LOCALE	string		JDBC driver property: ifxDB_LOCALE.
ifxDELIMIDENT	boolean		JDBC driver property: ifxDELIMIDENT.
ifxENABLE_TYPE_CACHE	boolean		JDBC driver property: ifxENABLE_TYPE_CACHE.
ifxFET_BUF_SIZE	int		JDBC driver property: ifxFET_BUF_SIZE.
ifxGL_DATE	string		JDBC driver property: ifxGL_DATE.
ifxGL_DATETIME	string		JDBC driver property: ifxGL_DATETIME.
ifxIFXHOST	string	localhost	JDBC driver property: ifxIFXHOST.
ifxIFX_AUTOFREE	boolean		JDBC driver property: ifxIFX_AUTOFREE.
ifxIFX_DIRECTIVES	string		JDBC driver property: ifxIFX_DIRECTIVES.
ifxIFX_LOCK_MODE_WAIT	A period of time with second precision	2s	JDBC driver property: ifxIFX_LOCK_MODE_WAIT. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxIFX_SOC_TIMEOUT	A period of time with millisecond precision		JDBC driver property: ifxIFX_SOC_TIMEOUT. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
ifxIFX_USEPUT	boolean		JDBC driver property: ifxIFX_USEPUT.

Attribute name	Data type	Default value	Description
ifxIFX_USE_STRENC	boolean		JDBC driver property: ifxIFX_USE_STRENC.
ifxIFX_XASPEC	string	y	JDBC driver property: ifxIFX_XASPEC.
ifxINFORMIXCONRETRY	int		JDBC driver property: ifxINFORMIXCONRETRY.
ifxINFORMIXCONTIME	A period of time with second precision		JDBC driver property: ifxINFORMIXCONTIME. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxINFORMIXOPCACHE	string		JDBC driver property: ifxINFORMIXOPCACHE.
ifxINFORMIXSTACKSIZE	int		JDBC driver property: ifxINFORMIXSTACKSIZE.
ifxJDBCTEMP	string		JDBC driver property: ifxJDBCTEMP.
ifxLDAP_IFXBASE	string		JDBC driver property: ifxLDAP_IFXBASE.
ifxLDAP_PASSWD	string		JDBC driver property: ifxLDAP_PASSWD.
ifxLDAP_URL	string		JDBC driver property: ifxLDAP_URL.
ifxLDAP_USER	string		JDBC driver property: ifxLDAP_USER.
ifxLOBCACHE	int		JDBC driver property: ifxLOBCACHE.
ifxNEWCODESET	string		JDBC driver property: ifxNEWCODESET.
ifxNEWLOCALE	string		JDBC driver property: ifxNEWLOCALE.
ifxNODEFDAC	string		JDBC driver property: ifxNODEFDAC.
ifxOPTCOMPIND	string		JDBC driver property: ifxOPTCOMPIND.
ifxOPTOFC	string		JDBC driver property: ifxOPTOFC.
ifxOPT_GOAL	string		JDBC driver property: ifxOPT_GOAL.
ifxPATH	string		JDBC driver property: ifxPATH.
ifxPDQPRIORITY	string		JDBC driver property: ifxPDQPRIORITY.

Attribute name	Data type	Default value	Description
ifxPLCONFIG	string		JDBC driver property: ifxPLCONFIG.
ifxPLOAD_LO_PATH	string		JDBC driver property: ifxPLOAD_LO_PATH.
ifxPROTOCOLTRACE	int		JDBC driver property: ifxPROTOCOLTRACE.
ifxPROTOCOLTRACEFILE	string		JDBC driver property: ifxPROTOCOLTRACEFILE.
ifxPROXY	string		JDBC driver property: ifxPROXY.
ifxPSORT_DBTEMP	string		JDBC driver property: ifxPSORT_DBTEMP.
ifxPSORT_NPROCS	boolean		JDBC driver property: ifxPSORT_NPROCS.
ifxSECURITY	string		JDBC driver property: ifxSECURITY.
ifxSQLH_FILE	string		JDBC driver property: ifxSQLH_FILE.
ifxSQLH_LOC	string		JDBC driver property: ifxSQLH_LOC.
ifxSQLH_TYPE	string		JDBC driver property: ifxSQLH_TYPE.
ifxSSLCONNECTION	string		JDBC driver property: ifxSSLCONNECTION.
ifxSTMT_CACHE	string		JDBC driver property: ifxSTMT_CACHE.
ifxTRACE	int		JDBC driver property: ifxTRACE.
ifxTRACEFILE	string		JDBC driver property: ifxTRACEFILE.
ifxTRUSTED_CONTEXT	string		JDBC driver property: ifxTRUSTED_CONTEXT.
ifxUSEV5SERVER	boolean		JDBC driver property: ifxUSEV5SERVER.
ifxUSE_DTENV	boolean		JDBC driver property: ifxUSE_DTENV.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1526	Port on which to obtain database connections.
roleName	string		JDBC driver property: roleName.
serverName	string		Server where the database is running.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**oauthProvider > databaseStore > dataSource > properties.informix.jcc**

Data source properties for the IBM Data Server Driver for JDBC and SQLJ for Informix.  
false

Attribute name	Data type	Default value	Description
DBANSIWARN	boolean		JDBC driver property: DBANSIWARN.
DBDATE	string		JDBC driver property: DBDATE.
DBPATH	string		JDBC driver property: DBPATH.
DBSPACETEMP	string		JDBC driver property: DBSPACETEMP.
DBTEMP	string		JDBC driver property: DBTEMP.
DBUPSPACE	string		JDBC driver property: DBUPSPACE.
DELIMIDENT	boolean		JDBC driver property: DELIMIDENT.
IFX_DIRECTIVES	<ul style="list-style-type: none"> <li>• ON</li> <li>• OFF</li> </ul>		JDBC driver property: IFX_DIRECTIVES. <b>ON</b> ON <b>OFF</b> OFF

queryDataSize	int  Minimum: 4096  Maximum: 10485760		JDBC driver property: queryDataSize.

Attribute name	Data type	Default value	Description
resultSetHoldability	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldability. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2 CLOSE_CURSORS_AT_COMMIT 1 HOLD_CURSORS_OVER_COMMIT</p>
resultSetHoldabilityForCatalogQueries	<ul style="list-style-type: none"> <li>• 1</li> </ul>		<p>JDBC driver property: resultSetHoldabilityForCatalogQueries. Values are: 1 (HOLD_CURSORS_OVER_COMMIT) or 2 (CLOSE_CURSORS_AT_COMMIT).</p> <p>2 CLOSE_CURSORS_AT_COMMIT 1 HOLD_CURSORS_OVER_COMMIT</p>
retrieveMessagesFromServerOnGetMessage	boolean	true	<p>JDBC driver property: retrieveMessagesFromServerOnGetMessage.</p>
securityMechanism	<ul style="list-style-type: none"> <li>• 3</li> <li>• 7</li> <li>• 4</li> <li>• 9</li> </ul>		<p>JDBC driver property: securityMechanism. Values are: 3 (CLEAR_TEXT_PASSWORD_SECURITY), 4 (USER_ONLY_SECURITY), 7 (ENCRYPTED_PASSWORD_SECURITY), 9 (ENCRYPTED_USER_AND_PASSWORD_SECURITY).</p> <p>3 CLEAR_TEXT_PASSWORD_SECURITY 7 ENCRYPTED_PASSWORD_SECURITY 4 USER_ONLY_SECURITY 9 ENCRYPTED_USER_AND_PASSWORD_SECURITY</p>
serverName	string	localhost	Server where the database is running.
traceDirectory	string		JDBC driver property: traceDirectory.
traceFile	string		JDBC driver property: traceFile.
traceFileAppend	boolean		JDBC driver property: traceFileAppend.

Attribute name	Data type	Default value	Description
traceLevel	int		Bitwise combination of the following constant values: TRACE_NONE=0, TRACE_CONNECTION_CALLS=1, TRACE_STATEMENT_CALLS=2, TRACE_RESULT_SET_CALLS=4, TRACE_DRIVER_CONFIGURATION=16, TRACE_CONNECTS=32, TRACE_DRDA_FLOWS=64, TRACE_RESULT_SET_META_DATA=128, TRACE_PARAMETER_META_DATA=256, TRACE_DIAGNOSTICS=512, TRACE_SQLJ=1024, TRACE_META_CALLS=8192, TRACE_DATASOURCE_CALLS=16384, TRACE_LARGE_OBJECT_CALLS=32768, TRACE_SYSTEM_MONITOR=131072, TRACE_TRACEPOINTS=262144, TRACE_ALL=-1.
useJDBC4ColumnNameAndLabelSemantics	boolean		JDBC driver property: useJDBC4ColumnNameAndLabelSemantics. Values are: 1 (YES) or 2 (NO).
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**oauthProvider > databaseStore > dataSource > properties.microsoft.sqlserver**

Data source properties for Microsoft SQL Server JDBC Driver.

false

Attribute name	Data type	Default value	Description
URL	string		URL for connecting to the database. Example: jdbc:sqlserver://localhost:1433;databaseName=myDB.
applicationIntent	<ul style="list-style-type: none"> <li>ReadOnly</li> <li>ReadWrite</li> </ul>		JDBC driver property: applicationIntent. <b>ReadOnly</b> ReadOnly <b>ReadWrite</b> ReadWrite
applicationName	string		JDBC driver property: applicationName.
authenticationScheme	<ul style="list-style-type: none"> <li>NativeAuthentication</li> <li>JavaKerberos</li> </ul>		JDBC driver property: authenticationScheme. <b>NativeAuthentication</b> NativeAuthentication <b>JavaKerberos</b> JavaKerberos

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
encrypt	boolean		JDBC driver property: encrypt.
failoverPartner	string		JDBC driver property: failoverPartner.
hostNameInCertificate	string		JDBC driver property: hostNameInCertificate.
instanceName	string		JDBC driver property: instanceName.
integratedSecurity	boolean		JDBC driver property: integratedSecurity.
lastUpdateCount	boolean		JDBC driver property: lastUpdateCount.
lockTimeout	A period of time with millisecond precision		JDBC driver property: lockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
multiSubnetFailover	boolean		JDBC driver property: multiSubnetFailover.
packetSize	int Minimum: 512 Maximum: 32767		JDBC driver property: packetSize.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.

Attribute name	Data type	Default value	Description
responseBuffering	<ul style="list-style-type: none"> <li>full</li> <li>adaptive</li> </ul>		JDBC driver property: responseBuffering. <b>full</b> full <b>adaptive</b> adaptive
selectMethod	<ul style="list-style-type: none"> <li>direct</li> <li>cursor</li> </ul>		JDBC driver property: selectMethod. <b>direct</b> direct <b>cursor</b> cursor
sendStringParametersAsUnicode	boolean	false	JDBC driver property: sendStringParametersAsUnicode.
sendTimeAsDatetime	boolean		JDBC driver property: sendTimeAsDatetime.
serverName	string	localhost	Server where the database is running.
trustServerCertificate	boolean		JDBC driver property: trustServerCertificate.
trustStore	string		JDBC driver property: trustStore.
trustStorePassword	Reversably encoded password (string)		JDBC driver property: trustStorePassword.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
workstationID	string		JDBC driver property: workstationID.
xopenStates	boolean		JDBC driver property: xopenStates.

**oauthProvider > databaseStore > dataSource > properties.oracle**

Data source properties for Oracle JDBC driver.

false

Attribute name	Data type	Default value	Description
ONSConfiguration	string		JDBC driver property: ONSConfiguration.
TNSEntryName	string		JDBC driver property: TNSEntryName.
URL	string		URL for connecting to the database. Examples: jdbc:oracle:thin://localhost:1521/sample or jdbc:oracle:oci://localhost:1521/sample.
connectionProperties	string		JDBC driver property: connectionProperties.

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
driverType	<ul style="list-style-type: none"> <li>oci</li> <li>thin</li> </ul>	thin	JDBC driver property: driverType.  <b>oci</b> oci <b>thin</b> thin
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
networkProtocol	string		JDBC driver property: networkProtocol.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1521	Port on which to obtain database connections.
serverName	string	localhost	Server where the database is running.
serviceName	string		JDBC driver property: serviceName.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**oauthProvider > databaseStore > dataSource > properties.sybase**

Data source properties for Sybase JDBC driver.

false

Attribute name	Data type	Default value	Description
SERVER_INITIATED_TRANSACTIONS	<ul style="list-style-type: none"> <li>false</li> <li>true</li> </ul>	false	JDBC driver property: SERVER_INITIATED_TRANSACTIONS.  <b>false</b> false <b>true</b> true
connectionProperties	string	SELECT_OPENS_CURSOR=true	JDBC driver property: connectionProperties.
databaseName	string		JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
networkProtocol	<ul style="list-style-type: none"> <li>• SSL</li> <li>• socket</li> </ul>		JDBC driver property: networkProtocol.  <b>SSL</b> SSL <b>socket</b> socket
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	5000	Port on which to obtain database connections.
resourceManagerName	string		JDBC driver property: resourceManagerName.
serverName	string	localhost	Server where the database is running.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
version	int		JDBC driver property: version.

**oauthProvider > databaseStore > dataSource > recoveryAuthData**

Authentication data for transaction recovery.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

**oauthProvider > grantType**

An access token grant type (as detailed in the OAuth specification) that is allowed for the provider. The equivalent provider parameter in the full application server profile is `oauth20.grant.types.allowed`.

false

string

**oauthProvider > jwtGrantType**

The `grant_type` for JWT Token handler

false

Attribute name	Data type	Default value	Description
clockSkew	A period of time with second precision	300s	The time difference allowed between OpenID Connect Client and OpenID Connect Provider systems when they are not synchronized. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
iatRequired	boolean	false	The iat claim in a jwt token is required.
maxJtiCacheSize	long Minimum: 1	10000	The maximum size of cache, which keeps jti data of jwt token, to prevent the jti from being reused.
tokenMaxLifetime	A period of time with second precision	7200s	The time indicates the maximum lifetime of an alive jwt token since its issued-at-time. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

**oauthProvider > library**

Reference to shared library containing the mediator plugin class.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

**oauthProvider > library > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**oauthProvider > library > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**oauthProvider > library > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**oauthProvider > localStore**

Clients are defined in server.xml and tokens are cached in the server.

false

Attribute name	Data type	Default value	Description
tokenStoreSize	long	2000	Token store size

**oauthProvider > localStore > client**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
applicationType	<ul style="list-style-type: none"> <li>• native</li> <li>• web</li> </ul>	web	The type of application best describing the client. <b>native</b> native <b>web</b> web
displayname	string		Display name of the client.
enabled	boolean	true	Client is enabled if true, disabled if false.

Attribute name	Data type	Default value	Description
functionalUserId	string		A user identifier to be associated with access tokens obtained by this client using the client credentials grant type. When this client parameter is specified, the value is returned in the functional_user_id response parameter from the introspect endpoint.
id	string		A unique configuration ID.
introspectTokens	boolean	false	Boolean value specifying whether the client is allowed to access the introspection endpoint to introspect tokens issued by the authorization server.
name	string		Name of the client (sometimes referred to as the Id).
preAuthorizedScope	string		Space separated list of scope values that the client can use when requesting access tokens that are deemed to have been pre-approved by the resource owner and therefore does not require the resource owner's consent.
scope	string		Specify by spaces the list of scopes of the client.
secret	Reversably encoded password (string)		Secret key of the client.
sessionManaged	boolean	false	Boolean indicating whether the client participates in OpenID session management.
subjectType	<ul style="list-style-type: none"> <li>public</li> </ul>		Subject type requested for response to this client. <b>public</b> public
tokenEndpointAuthMethod	<ul style="list-style-type: none"> <li>client_secret_post</li> <li>none</li> <li>client_secret_basic</li> </ul>	client_secret_basic	The requested authentication method for the token endpoint of the client. <b>client_secret_post</b> client_secret_post <b>none</b> none <b>client_secret_basic</b> client_secret_basic

**oauthProvider > localStore > client > functionalUserGroupIds**

A list of group ids to be associated with access tokens obtained by this client using the client credentials grant type. When this client parameter is specified, the value is returned in the functional\_user\_groupIds response parameter from the introspect endpoint.

false

string

**oauthProvider > localStore > client > grantTypes**

Grant types the client may use.

false

**oauthProvider > localStore > client > postLogoutRedirectUris**

Array of URLs supplied by the RP to which it may request that the end-user's user agent be redirected using the post\_logout\_redirect\_uri parameter after a logout has been performed.

false

string

**oauthProvider > localStore > client > redirect**

Array of redirect URIs for use in redirect-based flows such as the authorization code and implicit grant types of the client. The first redirect URI is used as a default, when none is specified in a request.

false

string

**oauthProvider > localStore > client > responseTypes**

Response types the client may use.

false

**oauthProvider > mediatorClassName**

Mediator plugin class name. The equivalent provider parameter in the full application server profile is oauth20.mediator.classnames.

false

string

**scopeToClaimMap**

Specify the claims for the scope.

false

Attribute name	Data type	Default value	Description
address	string	address	Specify a comma-separated list of claims associated with the address scope.
email	string	email, email_verified	Specify a comma-separated list of claims associated with the email scope.
phone	string	phone_number, phone_number_verified	Specify a comma-separated list of claims associated with the phone scope.

Attribute name	Data type	Default value	Description
profile	string	name, family_name, given_name, middle_name, nickname, preferred_username, profile, picture, website, gender, birthdate, zoneinfo, locale, updated_at	Specify a comma-separated list of claims associated with the profile scope.

**scopeToClaimMap > property**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		Specify the name of the property
value	string		Specify the value of the property

## Object Request Broker (ORB) (orb)

Configuration for a server or client ORB. Specify either the nameService attribute for a client ORB or one or more iiopEndpoint references for a server ORB.

- clientPolicy.clientContainerCsiv2
  - layers
    - authenticationLayer
      - mechanisms
    - transportLayer
- clientPolicy.csiv2
  - layers
    - attributeLayer
      - identityAssertionTypes
    - authenticationLayer
      - mechanisms
    - transportLayer
- iiopEndpoint
  - iiopsOptions
  - tcpOptions
- serverPolicy.csiv2
  - layers
    - attributeLayer
      - identityAssertionTypes
    - authenticationLayer
      - mechanisms
    - transportLayer

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
iiopEndpointRef	List of references to top level iiopEndpoint elements (comma-separated string).	defaultIiopEndpoint	Optional IIOP Endpoint describing the ports open for this ORB
nameService	string	corbaname::localhost:2809	Optional URL for the remote name service, for example corbaname::localhost:2809

### **clientPolicy.clientContainerCsiV2**

Common Secure Interoperability Version 2 (CSIv2) for outgoing Internet Inter-ORB Protocol (IIOP) requests.

false

#### **clientPolicy.clientContainerCsiV2 > layers**

Specify the CSIv2 layers like transport, authentication, and attribute.

false

#### **clientPolicy.clientContainerCsiV2 > layers > authenticationLayer**

Determine the authentication mechanisms and association options to be performed by the client for outgoing CSIv2 requests.

false

Attribute name	Data type	Default value	Description
establishTrustInClient	<ul style="list-style-type: none"> <li>• Required</li> <li>• Never</li> <li>• Supported</li> </ul>	Supported	<p>Specify if this association option is Supported, Required, or Never used for this layer. It indicates the authentication requirements at the authentication layer.</p> <p><b>Required</b> The association option is required</p> <p><b>Never</b> The association option must not be used</p> <p><b>Supported</b> The association option is supported</p>
password	Reversably encoded password (string)		The user password that is used with the user name.
user	string		The user name that is used to login to the remote server.

#### **clientPolicy.clientContainerCsiV2 > layers > authenticationLayer > mechanisms**

Specifies authentication mechanisms as a comma separated list. For example: GSSUP

false

string

**clientPolicy.clientContainerCsiv2 > layers > transportLayer**

Configure how to trust the client.

false

Attribute name	Data type	Default value	Description
sslEnabled	boolean	true	Indicate by true or false whether SSL is enabled for CSiv2 requests. Default is true and is the recommended value. If this attribute is set to false, sensitive information such as passwords and tokens are sent over unsecured channels when using IIOP.
sslRef	A reference to top level ssl element (string).		Specify the SSL configuration needed to establish a secure connection.

**clientPolicy.csiv2**

Common Secure Interoperability Version 2 (CSiv2) for outgoing Internet Inter-ORB Protocol (IIOP) requests.

false

**clientPolicy.csiv2 > layers**

Specify the CSiv2 layers like transport, authentication, and attribute.

false

**clientPolicy.csiv2 > layers > attributeLayer**

Determine the attribute layer options to be performed by the client for outgoing CSiv2 requests.

false

Attribute name	Data type	Default value	Description
identityAssertionEnabled	boolean	false	Indicate by true or false whether identity assertion is enabled. Default is false.
trustedIdentity	string		The trusted identity used to assert an entity to the remote server.
trustedPassword	Reversably encoded password (string)		Specify the password that is used with the trusted identity.

**clientPolicy.csiv2 > layers > attributeLayer > identityAssertionTypes**

Specify the supported identity token types for identity assertion.

false

**clientPolicy.csiv2 > layers > authenticationLayer**

Determine the authentication mechanisms and association options to be performed by the client for outgoing CSiv2 requests.

false

Attribute name	Data type	Default value	Description
establishTrustInClient	<ul style="list-style-type: none"> <li>Required</li> <li>Never</li> <li>Supported</li> </ul>	Supported	<p>Specify if this association option is Supported, Required, or Never used for this layer. It indicates authentication requirements at the authentication layer.</p> <p><b>Required</b> The association option is required</p> <p><b>Never</b> The association option must not be used</p> <p><b>Supported</b> The association option is supported</p>

**clientPolicy.csiv2 > layers > authenticationLayer > mechanisms**

Specifies authentication mechanisms as a comma separated list. For example: GSSUP, LTPA

false

string

**clientPolicy.csiv2 > layers > transportLayer**

Configure how to trust the client.

false

Attribute name	Data type	Default value	Description
sslEnabled	boolean	true	Indicate by true or false whether SSL is enabled for CSiv2 requests. Default is true and is the recommended value. If this attribute is set to false, sensitive information such as passwords and tokens are sent over unsecured channels when using IIOp.
sslRef	A reference to top level ssl element (string).		Specify the SSL configuration needed to establish a secure connection.

**iioEndpoint**

Optional IIOp Endpoint describing the ports open for this ORB

false

Attribute name	Data type	Default value	Description
host	string	localhost	IP address, domain name server (DNS) host name with domain name suffix, or just the DNS host name

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
iiopPort	int		Port for the unsecured server socket opened by this IIOP endpoint
tcpOptionsRef	A reference to top level tcpOptions element (string).	defaultTCPOptions	TCP protocol options for the IIOP endpoint

### **iiopEndpoint > iiopsOptions**

Specification of a secured server socket opened by this IIOP endpoint

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
iiopsPort	int		Specify the port to be configured with the SSL options.
sessionTimeout	A period of time with second precision	1d	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
sslRef	A reference to top level ssl element (string).		The default SSL configuration repertoire. The default value is defaultSSLSettings.
suppressHandshakeErrors	boolean	false	Disable logging of SSL handshake errors. SSL handshake errors can occur during normal operation, however these messages can be useful when SSL is behaving unexpectedly.

### **iiopEndpoint > tcpOptions**

TCP protocol options for the IIOP endpoint

false

Attribute name	Data type	Default value	Description
inactivityTimeout	A period of time with millisecond precision	60s	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
soReuseAddr	boolean	true	Enables immediate rebind to a port with no active listener.

### **serverPolicy.csiv2**

Common Secure Interoperability Version 2 (CSIV2) for incoming Internet Inter-ORB Protocol (IIOP) requests.

false

#### **serverPolicy.csiv2 > layers**

Specify the CSIV2 layers like transport, authentication, and attribute.

false

#### **serverPolicy.csiv2 > layers > attributeLayer**

Determine the attribute layer options that are claimed by the server for incoming CSIV2 requests.

false

Attribute name	Data type	Default value	Description
identityAssertionEnabled	boolean	false	Indicate by true or false whether identity assertion is enabled. Default is false.
trustedIdentities	string		Specify a pipe ( )-separated list of server identities, which are trusted to perform identity assertion to this server. A value of "*" is also accepted to indicate implicit trust (trust anyone).

#### **serverPolicy.csiv2 > layers > attributeLayer > identityAssertionTypes**

Specify the supported identity token types for identity assertion.

false

#### **serverPolicy.csiv2 > layers > authenticationLayer**

Determine the authentication mechanisms and association options that are claimed by the server for incoming CSIV2 requests.

false

Attribute name	Data type	Default value	Description
establishTrustInClient	<ul style="list-style-type: none"><li>• Required</li><li>• Never</li><li>• Supported</li></ul>	Required	<p>Specify if this association option is Supported, Required, or Never used for this layer. It indicates authentication requirements at the authentication layer.</p> <p><b>Required</b> The association option is required</p> <p><b>Never</b> The association option must not be used</p> <p><b>Supported</b> The association option is supported</p>

**serverPolicy.csiv2 > layers > authenticationLayer > mechanisms**

Specifies authentication mechanisms as a comma separated list. For example: GSSUP, LTPA

false

string

**serverPolicy.csiv2 > layers > transportLayer**

Configure how to trust the client.

false

Attribute name	Data type	Default value	Description
sslEnabled	boolean	true	Indicate by true or false whether SSL is enabled for CSiv2 requests. Default is true and is the recommended value. If this attribute is set to false, sensitive information such as passwords and tokens are sent over unsecured channels when using IIOP.
sslRef	A reference to top level ssl element (string).		Specify the SSL configuration needed to establish a secure connection.

## OSGi Application (osgiApplication)

Defines the properties of an osgi application.

- application-bnd
  - security-role
  - group
  - run-as

- special-subject
- user

Attribute name	Data type	Default value	Description
autoStart	boolean	true	Indicates whether or not the server automatically starts the application.
id	string		A unique configuration ID.
location	A file, directory or url.		Location of an application expressed as an absolute path or a path relative to the server-level apps directory.
name	string		Name of an application.
suppressUncoveredHttpMethodWarning	boolean	false	Option to suppress uncovered HTTP method warning message during application deployment.

### application-bnd

Binds general deployment information included in the application to specific resources.

false

Attribute name	Data type	Default value	Description
version	string		Version of the application bindings specification.

### application-bnd > security-role

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		Name of a security role.

### application-bnd > security-role > group

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		Group access ID
id	string		A unique configuration ID.
name	string		Name of a group possessing a security role.

### application-bnd > security-role > run-as

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
password	Reversably encoded password (string)		Password of a user required to access a bean from another bean. The value can be stored in clear text or encoded form. To encode the password, use the securityUtility tool with the encode option.
userid	string		ID of a user required to access a bean from another bean.

**application-bnd > security-role > special-subject**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
type	<ul style="list-style-type: none"> <li>• EVERYONE</li> <li>• ALL_AUTHENTICATED_USERS</li> </ul>		<p>One of the following special subject types: ALL_AUTHENTICATED_USERS, EVERYONE.</p> <p><b>EVERYONE</b> Everyone</p> <p><b>ALL_AUTHENTICATED_USERS</b> All authenticated users</p>

**application-bnd > security-role > user**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		A user access ID in the general form user:realmName/userUniqueId. A value will be generated if one is not specified.
id	string		A unique configuration ID.
name	string		Name of a user possessing a security role.

## OSGi Applications (osgiApplications)

Settings for all OSGi applications

Attribute name	Data type	Default value	Description
enable.debug	boolean	false	When this option is set to true, OSGi applications that fail to start remain installed to allow the application to be debugged.

## OSGi Library (osgiLibrary)

Enables OSGi applications to use packages provided by a shared library.

- library
  - file
  - fileset
  - folder
- package

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
libraryRef	A reference to top level library element (string).		The shared library reference to use for the OSGi library.

### library

The shared library reference to use for the OSGi library.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

### library > file

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**library > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**library > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

## package

A package export specification for a package that the system makes available for use by OSGi applications.

false

string

## Package (package)

The package configuration element.

Attribute name	Data type	Default value	Description
clusterName	string	default	The name of the cluster mapped to the package.
id	string		A unique configuration ID.
name	string	default	The name of the package.

## Persistent Scheduled Executor (persistentExecutor)

Schedules and runs persistent tasks.

- contextService
  - baseContext
    - baseContext
    - classloaderContext
    - jeeMetadataContext
    - securityContext
    - syncToOSThreadContext
    - zosWLMContext
  - classloaderContext
  - jeeMetadataContext
  - securityContext
  - syncToOSThreadContext
  - zosWLMContext

Attribute name	Data type	Default value	Description
contextServiceRef	A reference to top level contextService element (string).	DefaultContextService	Configures how context is captured and propagated to threads.
enableTaskExecution	boolean	true	Determines whether or not this instance may run tasks.
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
initialPollDelay	A period of time with millisecond precision	0	Duration of time to wait before this instance might poll the persistent store for tasks to run. A value of -1 delays polling until it is started programmatically. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
pollInterval	A period of time with millisecond precision	-1	Interval between polling for tasks to run. A value of -1 disables all polling after the initial poll. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
pollSize	int Minimum: 1		The maximum number of task entries to find when polling the persistent store for tasks to run. If unspecified, there is no limit.
retryInterval	A period of time with millisecond precision	1m	The amount of time that must pass between the second and subsequent consecutive retries of a failed task. The first retry occurs immediately, regardless of the value of this attribute. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
retryLimit	short Minimum: -1 Maximum: 10000	10	Limit of consecutive retries for a task that has failed or rolled back, after which the task is considered permanently failed and does not attempt further retries. A value of -1 allows for unlimited retries.
taskStoreRef	A reference to top level databaseStore element (string).	defaultDatabaseStore	Persistent store for scheduled tasks.

### contextService

Configures how context is captured and propagated to threads.

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
jndiName	string		JNDI name

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**contextService > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

Attribute name	Data type	Default value	Description
baseContextRef	A reference to top level contextService element (string).		Specifies a base context service from which to inherit context that is not already defined on this context service.
id	string		A unique configuration ID.
jndiName	string		JNDI name

Attribute name	Data type	Default value	Description
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Determines the action to take in response to configuration errors. For example, if securityContext is configured for this contextService, but the security feature is not enabled, then onError determines whether to fail, raise a warning, or ignore the parts of the configuration which are incorrect.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>

**contextService > baseContext > baseContext**

Specifies a base context service from which to inherit context that is not already defined on this context service.

false

com.ibm.ws.context.service-factory

**contextService > baseContext > classloaderContext**

Classloader context propagation configuration.

false

**contextService > baseContext > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**contextService > baseContext > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**contextService > baseContext > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**contextService > baseContext > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"><li>• Propagate</li><li>• PropagateOrNew</li><li>• New</li></ul>	Propagate	<p>Indicates how the WLM context should be handled for non-Daemon work.</p> <p><b>Propagate</b> Use the same WLM Context (if one exists).</p> <p><b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists.</p> <p><b>New</b> Always create a new WLM context.</p>

**contextService > classloaderContext**

Classloader context propagation configuration.

false

**contextService > jeeMetadataContext**

Makes the namespace of the application component that submits a contextual task available to the task.

false

**contextService > securityContext**

When specified, the security context of the work initiator is propagated to the unit of work.

false

**contextService > syncToOSThreadContext**

When specified, the identity of the runAs Subject for the unit of work is synchronized with the Operating System identity.

false

**contextService > zosWLMContext**

Indicates that the z/OS WLM Context should be managed as part of the thread context.

false

Attribute name	Data type	Default value	Description
daemonTransactionClass	string	ASYNCDMN	The Transaction Class name provided to WLM to classify work when a new WLM context is created for Daemon work.
defaultTransactionClass	string	ASYNCBN	The Transaction Class name provided to WLM to classify work when a new WLM context is being created for non-Daemon work.
wlm	<ul style="list-style-type: none"> <li>• Propagate</li> <li>• PropagateOrNew</li> <li>• New</li> </ul>	Propagate	<p>Indicates how the WLM context should be handled for non-Daemon work.</p> <p><b>Propagate</b> Use the same WLM Context (if one exists).</p> <p><b>PropagateOrNew</b> Use the same WLM context or create a new one if no current context exists.</p> <p><b>New</b> Always create a new WLM context.</p>

## Web Server Plugin (pluginConfiguration)

Properties used when generating the web server plugin configuration file

- httpEndpoint
  - accessLogging
  - httpOptions
  - sslOptions
  - tcpOptions

Attribute name	Data type	Default value	Description
connectTimeout	A period of time with second precision	5s	Identifies the maximum amount of time that the application server should maintain a connection with the web server. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
extendedHandshake	boolean	false	If true, the web server plugin uses an extended handshake to determine if the application server is running.
httpEndpointRef	A reference to top level httpEndpoint element (string).	defaultHttpEndpoint	Specify the identifier of the http endpoint to include in the generated plugin-cfg.xml file. The endpoint defines the server in the cluster. The default value is 'defaultHttpEndpoint'.
ipv6Preferred	boolean	false	Used when resolving an application server host name of {null} or {0}, to prefer the type of address when possible
logDirLocation	Path to a directory		Deprecated: Identifies the directory where the http_plugin.log file is located. See Log file name.
logFileName	Path to a file	\${pluginInstallRoot}/logs/\${webserverName}/http_plugin.log	A fully qualified path to to the web server plug-in log file. Directory component must already exist. For Apache-based web servers, a path that begins with a pipe character is interpreted as an external piped logger. If specified, the path overrides logDirLocation.
pluginInstallRoot	string	/opt/IBM/WebSphere/Plugins	Web server plugin installation location in file system of web server host
serverIOTimeout	A period of time with second precision	900s	Identifies the maximum amount of time that the web server plugin waits to send a request or receive a response from the application server. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
serverIOTimeoutRetry	int Minimum: -1 Maximum: 65535	-1	Limits the number of request retries after a read or write timeout. The default value, {-1}, applies no additional limits, so retries are limited by the number of available servers in the cluster. A {0} value indicates there should be no retries. This value is scoped to the server cluster and does not apply to connection failures or timeouts due to the HTTP plug-in Connection timeout, or to web socket timeouts.
sslCertlabel	string		Specifies the label of the certificate within the keyring that the plug-in is to use when the web container requests a client certificate from the plug-in.
sslKeyringLocation	string	\${pluginInstallRoot}/ config/\${webserverName}/ plugin-key.kdb	The fully qualified path to the SSL keyring file on the web server host
sslStashfileLocation	string	\${pluginInstallRoot}/ config/\${webserverName}/ plugin-key.sth	The fully qualified path to the SSL stashfile on the web server host
waitForContinue	boolean	false	If false (the default value), the web server plugin sends the "Expect: 100-continue" header with HTTP requests that have a message body. When set to true, the web server plugin sends the "Expect: 100-continue" header with every HTTP request. Consider setting this value to true if you have a firewall between the web server and the application server, and are sensitive to requests retries with no request body.
webserverName	string	webserver1	Name of the web server where this configuration will be used. Used to generate the plugin log file location if that is not specified explicitly by Log file name or directory.

Attribute name	Data type	Default value	Description
webservicePort	int Minimum: -1 Maximum: 65535	80	Web server HTTP port
webserviceSecurePort	int Minimum: -1 Maximum: 65535	443	Web server HTTPS port
wsServerIOTimeout	A period of time with second precision		Identifies the maximum amount of time that the web server plugin waits to send a request or receive a websocket response from the application server. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
wsServerIdleTimeout	A period of time with second precision		Identifies the maximum amount of time that the web server plugin waits to terminate an idle websocket connection. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

### httpEndpoint

Specify the identifier of the http endpoint to include in the generated plugin-cfg.xml file. The endpoint defines the server in the cluster. The default value is 'defaultHttpEndpoint'.

false

Attribute name	Data type	Default value	Description
accessLoggingRef	A reference to top level httpAccessLogging element (string).		HTTP access logging configuration for the endpoint.
enabled	boolean	true	Toggle the availability of an endpoint. When true, this endpoint will be activated by the dispatcher to handle HTTP requests.

Attribute name	Data type	Default value	Description
host	string	localhost	IP address, domain name server (DNS) host name with domain name suffix, or just the DNS host name, used by a client to request a resource. Use '*' for all available network interfaces.
httpOptionsRef	A reference to top level httpOptions element (string).	defaultHttpOptions	HTTP protocol options for the endpoint.
httpPort	int Minimum: -1 Maximum: 65535		The port used for client HTTP requests. Use -1 to disable this port.
httpsPort	int Minimum: -1 Maximum: 65535		The port used for client HTTP requests secured with SSL (https). Use -1 to disable this port.
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Action to take after a failure to start an endpoint.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>
sslOptionsRef	A reference to top level sslOptions element (string).		SSL protocol options for the endpoint.
tcpOptionsRef	A reference to top level tcpOptions element (string).	defaultTCPOptions	TCP protocol options for the endpoint.

### httpEndpoint > accessLogging

HTTP access logging configuration for the endpoint.

false

Attribute name	Data type	Default value	Description
enabled	boolean	true	Enable access logging.

Attribute name	Data type	Default value	Description
filePath	Path to a file	\${server.output.dir}/logs/http_access.log	Directory path and name of the access log file. Standard variable substitutions, such as \${server.output.dir}, can be used when specifying the directory path.
logFormat	string	%h %u %{t}W "%r" %s %b	Specifies the log format that is used when logging client access information.
maxFileSize	int Minimum: 0	20	Maximum size of a log file, in megabytes, before being rolled over; a value of 0 means no limit.
maxFiles	int Minimum: 0	2	Maximum number of log files that will be kept, before the oldest file is removed; a value of 0 means no limit.

#### httpEndpoint > httpOptions

HTTP protocol options for the endpoint.

false

Attribute name	Data type	Default value	Description
keepAliveEnabled	boolean	true	Enables persistent connections (HTTP keepalive). If true, connections are kept alive for reuse by multiple sequential requests and responses. If false, connections are closed after the response is sent.
maxKeepAliveRequests	int Minimum: -1	100	Maximum number of persistent requests that are allowed on a single HTTP connection if persistent connections are enabled. A value of -1 means unlimited.

Attribute name	Data type	Default value	Description
<code>persistTimeout</code>	A period of time with second precision	30s	Amount of time that a socket will be allowed to remain idle between requests. This setting only applies if persistent connections are enabled. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
<code>readTimeout</code>	A period of time with second precision	60s	Amount of time to wait for a read request to complete on a socket after the first read occurs. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
<code>removeServerHeader</code>	boolean	false	Removes server implementation information from HTTP headers and also disables the default Liberty profile welcome page.
<code>writeTimeout</code>	A period of time with second precision	60s	Amount of time to wait on a socket for each portion of the response data to be transmitted. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

**httpEndpoint > sslOptions**

SSL protocol options for the endpoint.

false

Attribute name	Data type	Default value	Description
sessionTimeout	A period of time with second precision	1d	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
sslRef	A reference to top level ssl element (string).		The default SSL configuration repertoire. The default value is defaultSSLSettings.
suppressHandshakeErrors	boolean	false	Disable logging of SSL handshake errors. SSL handshake errors can occur during normal operation, however these messages can be useful when SSL is behaving unexpectedly.

#### httpEndpoint > tcpOptions

TCP protocol options for the endpoint.

false

Attribute name	Data type	Default value	Description
inactivityTimeout	A period of time with millisecond precision	60s	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
soReuseAddr	boolean	true	Enables immediate rebind to a port with no active listener.

## Quick Start Security (quickStartSecurity)

Simple administrative security configuration.

Attribute name	Data type	Default value	Description
userName	string		Single user defined as part of the quick start security configuration. This user is granted the Administrator role.
userPassword	Reversably encoded password (string)		Password for the single user defined as part of the quick start security configuration. It is recommended that you encode this password. To do so, use the securityUtility tool with the encode option.

## Remote File Access (remoteFileAccess)

This element contains artifacts that control the level of file access exposed for remote connections.

- readDir
- writeDir

### readDir

A directory that remote clients are allowed to read from. There can be multiple readDir elements, and each represents a single directory that may refer to variables or absolute paths. Default is `#{wlp.install.dir}`, `#{wlp.user.dir}` and `#{server.output.dir}`

false

Path to a directory

### writeDir

A directory that remote clients are allowed to read from and write to. There can be multiple writeDir elements, and each represents a single directory that may refer to variables or absolute paths. Default is an empty set of directories.

false

Path to a directory

## Request Timing (requestTiming)

Provides warnings and diagnostic information for the slow or hung requests.

Attribute name	Data type	Default value	Description
hungRequestThreshold	A period of time with millisecond precision	10m	Duration of time that a request can run before being considered hung. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
includeContextInfo	boolean	true	Indicates if the context information details are included in the log output.
sampleRate	int Minimum: 1	1	Rate at which the sampling should happen for the slow request tracking. To sample one out of every n requests, set sampleRate to n. To sample all requests, set sampleRate to 1.
slowRequestThreshold	A period of time with millisecond precision	10s	Duration of time that a request can run before being considered slow. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

## Resource Adapter (resourceAdapter)

Defines a resource adapter installation.

- classloader
  - commonLibrary
    - file
    - fileset
    - folder
  - privateLibrary
    - file
    - fileset
    - folder

- customize

Attribute name	Data type	Default value	Description
autoStart	boolean		Configures whether a resource adapter starts automatically upon deployment of the resource adapter or lazily upon injection or lookup of a resource.
id	string		A unique configuration ID.
location	A file, directory or url.		Defines the path of the RAR file to install.
suppressUncoveredHttpMethodWarning	boolean	false	Option to suppress uncovered HTTP method warning message during application deployment.

### classloader

Defines the settings for an application classloader.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
classProviderRef	List of references to top level resourceAdapter elements (comma-separated string).		List of class provider references. When searching for classes or resources, this class loader will delegate to the specified class providers after searching its own class path.
commonLibraryRef	List of references to top level library elements (comma-separated string).		List of library references. Library class instances are shared with other classloaders.
delegation	<ul style="list-style-type: none"> <li>• parentFirst</li> <li>• parentLast</li> </ul>	parentFirst	Controls whether parent classloader is used before or after this classloader. If parent first is selected then delegate to immediate parent before searching the classpath. If parent last is selected then search the classpath before delegating to the immediate parent.  <b>parentFirst</b> Parent first  <b>parentLast</b> Parent last

Attribute name	Data type	Default value	Description
privateLibraryRef	List of references to top level library elements (comma-separated string).		List of library references. Library class instances are unique to this classloader, independent of class instances from other classloaders.

**classloader > commonLibrary**

List of library references. Library class instances are shared with other classloaders.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
id	string		A unique configuration ID.
name	string		Name of shared library for administrators

**classloader > commonLibrary > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**classloader > commonLibrary > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.

Attribute name	Data type	Default value	Description
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**classloader > commonLibrary > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**classloader > privateLibrary**

List of library references. Library class instances are unique to this classloader, independent of class instances from other classloaders.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
id	string		A unique configuration ID.
name	string		Name of shared library for administrators

**classloader > privateLibrary > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**classloader > privateLibrary > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**classloader > privateLibrary > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**customize**

Customizes the configuration properties element for the activation specification, administered object, or connection factory with the specified interface and/or implementation class.

false

Attribute name	Data type	Default value	Description
implementation	string		Fully qualified implementation class name for which the configuration properties element should be customized.
interface	string		Fully qualified interface class name for which the configuration properties element should be customized.

Attribute name	Data type	Default value	Description
suffix	string		Overrides the default suffix for the configuration properties element. For example, "CustomConnectionFactory" in properties.rarModule1.CustomConnectionFactory. The suffix is useful to disambiguate when multiple types of connection factories, administered objects, or endpoint activations are provided by a resource adapter. If a configuration properties element customization omits the suffix or leaves it blank, no suffix is used.

## Real-Time Communications (rtcomm)

Defines the configuration that is related to the Rtcomm feature and all its related components. All the real-time capabilities associated with the Rtcomm feature are configured under this single entity.

- callQueue
- gateway
  - allowFromSipEndpoint
    - sslOptions
    - tcpOptions
- iceServerURL

Attribute name	Data type	Default value	Description
alternateEndpointRoutingEnabled	boolean	false	Enables the alternate endpoint routing option. Administrators that want to control endpoint routing must enable this option.
messageServerHost	string	localhost	The host of the MQTT broker. The specified host can be an IP address or domain name server (DNS) hostname.
messageServerPort	int	1883	The port the MQTT broker listens on. The port is any valid port number.

Attribute name	Data type	Default value	Description
rtcommTopicPath	string	/rtcomm/	The MQTT topic path that is associated with this feature. All Rtcomm topic names configured within Rtcomm Options are prepended with this path. To create a unique name space for this Rtcomm instance within a message broker, modify this path to be unique.
sharedSubscriptionPath	string		Specifies the shared subscription path that is prepended to the topic path. This path is required by message brokers when using shared subscriptions.
sslEnabled	boolean	false	Uses SSL between the Rtcomm feature and the MQTT broker.
sslRef	A reference to top level ssl element (string).		ID of the SSL configuration to be used to connect to the SSL-enabled MQTT broker.

### callQueue

Defines a single instance of a call queue. This instance fully encapsulates all the configuration related to a single queue.

false

Attribute name	Data type	Default value	Description
callQueueID	string	callQueueID	The name that is associated with the call queue topic. This is the destination endpoint ID that a caller uses to call into a specific queue.
description	string		Specifies the description of this call queue instance. This description is returned in service query responses and can be used to better inform the client about the queue.
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
timeout	A period of time with second precision	600s	The number of seconds to wait before terminating a call that is waiting in this queue. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

### gateway

A WebRTC gateway that provides connectivity from Rtcomm to SIP networks

false

Attribute name	Data type	Default value	Description
allowFromSipEndpointRef	List of references to top level sipEndpoint elements (comma-separated string).	defaultSipUAEndpoint	List of SIP endpoints for this connector.
externalPR	string		Host:port address of a SIP Proxy/Registrar. If assigned, all outgoing SIP messages are forwarded to this address
sipContainer	boolean	false	Outgoing SIP messages are routed to SIP applications installed locally

### gateway > allowFromSipEndpoint

List of SIP endpoints for this connector.

false

Attribute name	Data type	Default value	Description
bindRetries	int	60	The number of retries that are attempted when port binding is unsuccessful.
bindRetryDelay	A period of time with millisecond precision	5000ms	The delay between retries in milliseconds. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
host	string	localhost	The IP of the endpoint host
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
sipTCPPort	int	5060	The TCP port number
sipTLSport	int	5061	The TLS port number
sipUDPPort	int	5060	The UDP port number
sslOptionsRef	A reference to top level sslOptions element (string).		Defines SSL protocol settings
tcpOptionsRef	A reference to top level tcpOptions element (string).	defaultTCPOptions	Defines TCP protocol settings

**gateway > allowFromSipEndpoint > sslOptions**

Defines SSL protocol settings

false

Attribute name	Data type	Default value	Description
sessionTimeout	A period of time with second precision	1d	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
sslRef	A reference to top level ssl element (string).		The default SSL configuration repertoire. The default value is defaultSSLSettings.
suppressHandshakeErrors	boolean	false	Disable logging of SSL handshake errors. SSL handshake errors can occur during normal operation, however these messages can be useful when SSL is behaving unexpectedly.

**gateway > allowFromSipEndpoint > tcpOptions**

Defines TCP protocol settings

false

Attribute name	Data type	Default value	Description
inactivityTimeout	A period of time with millisecond precision	60s	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
soReuseAddr	boolean	true	Enables immediate rebind to a port with no active listener.

#### iceServerURL

Specifies the Interactive Connectivity Establishment (ICE) Server URL(s) available for client use. The client can request the list of ICE Server URL(s) for use with WebRTC by using an Rtcomm service query. This following is an example format for an ICE Server URL: - stun:hostname:port.

false

string

### SAF Authorization (safAuthorization)

Controls the security credential domain for SAF.

Attribute name	Data type	Default value	Description
enableDelegation	boolean	false	Enable RunAs delegation via SAF EJBROLE profiles.
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
racRouteLog	<ul style="list-style-type: none"> <li>• NOSTAT</li> <li>• ASIS</li> <li>• NOFAIL</li> <li>• NONE</li> </ul>	NONE	<p>Specifies the types of access attempts to log.</p> <p><b>NOSTAT</b> The attempt is not recorded. No logging occurs and no resource statistics are updated.</p> <p><b>ASIS</b> Records the event in the manner specified in the profile that protects the resource, or by other methods such as the SETROPTS option.</p> <p><b>NOFAIL</b> If the authorization check fails, the attempt is not recorded. If the authorization check succeeds, the attempt is recorded as in ASIS.</p> <p><b>NONE</b> The attempt is not recorded.</p>
roleMapper	string	com.ibm.ws.security.authorization.OGSAuthorizationSAFRoleMapperImpl	OGSAuthorizationSAFRoleMapperImpl the SAF role mapper service provider.

## SAF Credentials (safCredentials)

Controls the operation of the SAF credentials.

Attribute name	Data type	Default value	Description
mapDistributedIdentities	boolean		Use distributed identity filters to map the distributed identities to SAF user IDs.
profilePrefix	string	BBGZDFLT	Profile prefix used to specify the SAF APPL-ID when creating SAF credentials and authorizing users against SAF resource profiles.
unauthenticatedUser	string	WSGUEST	SAF user ID of the unauthenticated user.

## SAF User Registry (safRegistry)

Configuration properties for a SAF user registry.

Attribute name	Data type	Default value	Description
enableFailover	boolean	true	Enable failover from authorized SAF services (e.g. initACEE) to unauthorized USS services (e.g. __passwd) if the server does not have access to the WLP z/OS System Security Access Domain.
realm	string		The realm name represents the user registry.

## SAF Role Mapper (safRoleMapper)

Defines how to generate SAF EJBROLE resource profile names from application role names.

Attribute name	Data type	Default value	Description
profilePattern	string	%profilePrefix%.%resource%.%role%	Pattern to use for generating EJBROLE resource profile names from application role names.
toUpperCase	boolean	false	Convert EJBROLE resource profile name to uppercase.

## SAML Web SSO 2.0 Authentication (samlWebSso20)

Controls the operation of the Security Assertion Markup Language Web SSO 2.0 Mechanism.

- audiences
- authFilter
  - host
  - remoteAddress
  - requestUrl
  - userAgent
  - webApp
- authnContextClassRef
- headerName
- pkixTrustEngine
  - crl
  - trustedIssuers
  - x509Certificate

Attribute name	Data type	Default value	Description
allowCreate	boolean		Allow the IdP to create a new account if the requesting user does not have one.

Attribute name	Data type	Default value	Description
allowCustomCacheKey	boolean	true	Allow generating a custom cache key to access the authentication cache and get the subject.
authFilterRef	A reference to top level authFilter element (string).		Specifies the authentication filter reference.
authnContextComparisonType	<ul style="list-style-type: none"> <li>• minimum</li> <li>• better</li> <li>• maximum</li> <li>• exact</li> </ul>	exact	<p>When an authnContextClassRef is specified, the authnContextComparisonType can be set.</p> <p><b>minimum</b> Minimum. The authentication context in the authentication statement must be at least as strong as one of the authentication contexts specified.</p> <p><b>better</b> Better. The authentication context in the authentication statement must be stronger than any one of the authentication contexts specified.</p> <p><b>maximum</b> Maximum. The authentication context in the authentication statement must be as strong as possible without exceeding the strength of at least one of the authentication contexts specified.</p> <p><b>exact</b> Exact. The authentication context in the authentication statement must be an exact match of at least one of the authentication contexts specified.</p>

Attribute name	Data type	Default value	Description
authnRequestTime	A period of time with millisecond precision	10m	Specifies the life time period of an authnRequest which is generated and sent from the service provider to an IdP for requesting a SAML Token. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
authnRequestsSigned	boolean	true	Indicates whether the <samlp:AuthnRequest> messages sent by this service provider will be signed.
clockSkew	A period of time with millisecond precision	5m	This is used to specify the allowed clock skew in minutes when validating the SAML token. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
createSession	boolean	true	Specifies whether to create an HttpSession if the current HttpSession does not exist.
customizeNameIDFormat	string		Specifies the customized URI reference corresponding to a name identifier format that is not defined in the SAML core specification.
disableLtpaCookie	boolean	true	Do not create an LTPA Token during processing of the SAML Assertion. Create a cookie of the specific Service Provider instead.
enabled	boolean	true	The service provider is enabled if true and disabled if false.

Attribute name	Data type	Default value	Description
errorPageURL	string		Specifies an error page to be displayed if the SAML validation fails. If this attribute is not specified, and the received SAML is invalid, the user will be redirected back to the SAML IdP to restart SSO.
forceAuthn	boolean	false	Indicates whether the IdP should force the user to re-authenticate.
groupIdIdentifier	string		Specifies a SAML attribute that is used as the name of the group that the authenticated principal is a member of. There is no default value.
httpsRequired	boolean	true	Enforce using SSL communication when accessing a SAML WebSSO service provider end point such as acs or metadata.
id	string		A unique configuration ID.
idpMetadata	string	`\${server.config.dir}/resources/security/idpMetadata.xml`	Specifies the IdP metadata file.
inboundPropagation	<ul style="list-style-type: none"> <li>• none</li> <li>• required</li> </ul>	none	<p>Controls the operation of the Security Assertion Markup Language Web SSO 2.0 for the inbound propagation of the Web Services Mechanisms.</p> <p><b>none</b>   %inboundPropagation.none  <b>required</b>   %inboundPropagation.required</p>
includeTokenInSubject	boolean	true	Specifies whether to include a SAML assertion in the subject.
includeX509InSPMetadata	boolean	true	Specifies whether to include the x509 certificate in the Liberty SP metadata.
isPassive	boolean	false	Indicates IdP must not take control of the end user interface.
keyAlias	string		Key alias name to locate the private key for signing and decryption. This is optional if the keystore has exactly one key entry, or if it has one key with an alias of 'samlsp'.

Attribute name	Data type	Default value	Description
keyStoreRef	A reference to top level keyStore element (string).		A keystore containing the private key for the signing of the AuthnRequest, and the decryption of EncryptedAssertion element. The default is the server's default.
loginPageURL	string		Specifies the SAML IdP login application URL to which an unauthenticated request is redirected. This attribute triggers IdP-initiated SSO, and it is only required for IdP-initiated SSO.
mapToUserRegistry	<ul style="list-style-type: none"> <li>• User</li> <li>• No</li> <li>• Group</li> </ul>	No	<p>Specifies how to map an identity to a registry user. The options are No, User, and Group. The default is No, and the user registry is not used to create the user subject.</p> <p><b>User</b> Map a SAML identity to a user defined in the registry</p> <p><b>No</b> Do not map a SAML identity to a user or group in the registry</p> <p><b>Group</b> Map a SAML identity to a group defined in the user registry</p>

Attribute name	Data type	Default value	Description
nameIDFormat	<ul style="list-style-type: none"> <li>• encrypted</li> <li>• customize</li> <li>• persistent</li> <li>• x509SubjectName</li> <li>• email</li> <li>• transient</li> <li>• entity</li> <li>• unspecified</li> <li>• kerberos</li> <li>• windowsDomainQualifiedName</li> </ul>	email	<p>Specifies the URI reference corresponding to a name identifier format defined in the SAML core specification.</p> <p><b>encrypted</b> urn:oasis:names:tc:SAML:2.0:nameid-format:encrypted</p> <p><b>customize</b> Customized Name ID Format.</p> <p><b>persistent</b> urn:oasis:names:tc:SAML:2.0:nameid-format:persistent</p> <p><b>x509SubjectName</b> urn:oasis:names:tc:SAML:1.1:nameid-format:X509SubjectName</p> <p><b>email</b> urn:oasis:names:tc:SAML:1.1:nameid-format:emailAddress</p> <p><b>transient</b> urn:oasis:names:tc:SAML:2.0:nameid-format:transient</p> <p><b>entity</b> urn:oasis:names:tc:SAML:2.0:nameid-format:entity</p> <p><b>unspecified</b> urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified</p> <p><b>kerberos</b> urn:oasis:names:tc:SAML:2.0:nameid-format:kerberos</p> <p><b>windowsDomainQualifiedName</b> urn:oasis:names:tc:SAML:1.1:nameid-format:WindowsDomainQualifiedName</p>
reAuthnCushion	A period of time with millisecond precision	0m	<p>The time period to authenticate again when a SAML Assertion is about to expire, which is indicated by either the statement NotOnOrAfter or the attribute SessionNotOnOrAfter of the SAML Assertion. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.</p>

Attribute name	Data type	Default value	Description
reAuthnOnAssertionExpire	boolean	false	Authenticate the incoming HTTP request again when a SAML Assertion is about to expire.
realmIdentifier	string		Specifies a SAML attribute that is used as the realm name. If no value is specified, the Issuer SAML assertion element value is used.
realmName	string		Specifies a realm name when mapToUserRegistry is set to No or Group.
sessionNotOnOrAfter	A period of time with millisecond precision	120m	Indicates an upper bound on SAML session durations, after which the Liberty SP should ask the user to re-authenticate to the IdP. If the SAML token returned from the IdP does not contain a sessionNotOnOrAfter assertion, the value specified by this attribute is used. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
signatureMethodAlgorithm	<ul style="list-style-type: none"> <li>• SHA256</li> <li>• SHA128</li> <li>• SHA1</li> </ul>	SHA256	<p>Indicates the required algorithm by this service provider.</p> <p><b>SHA256</b> SHA-256 signature algorithm</p> <p><b>SHA128</b> %signatureMethodAlgorithm.SHA128</p> <p><b>SHA1</b> SHA-1 signature algorithm</p>
spHostAndPort	string		Specifies a SAML service provider host name and port number.
targetPageUrl	string		The default landing page for the IdP-initiated SSO if the relayState is missing.

Attribute name	Data type	Default value	Description
tokenReplayTimeout	A period of time with millisecond precision	30m	This property is used to specify how long the Liberty SP should prevent token replay. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
userIdentifier	string		Specifies a SAML attribute that is used as the user principal name in the subject. If no value is specified, the NameID SAML assertion element value is used.
userUniqueIdentifier	string		Specifies a SAML attribute that is used as the unique user name as it applies to the WSCredential in the subject. The default is the same as the userIdentifier attribute value.
wantAssertionsSigned	boolean	true	Indicates a requirement for the <saml:Assertion> elements received by this service provider to be signed.

### audiences

The list of audiences which are trusted to verify the audience of the SAML Token. If the value is "ANY", then all audiences are trusted.

false

string

### authFilter

Specifies the authentication filter reference.

false

#### authFilter > host

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
name	string		Specifies the name.

**authFilter > remoteAddress**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
ip	string		Specifies the IP address.
matchType	<ul style="list-style-type: none"> <li>• lessThan</li> <li>• equals</li> <li>• greaterThan</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>lessThan</b> Less than <b>equals</b> Equals <b>greaterThan</b> Greater than <b>contains</b> Contains <b>notContain</b> Not contain

**authFilter > requestUrl**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
urlPattern	string		Specifies the URL pattern.

**authFilter > userAgent**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
agent	string		Specifies the user agent
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain

#### **authFilter > webApp**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
name	string		Specifies the name.

#### **authnContextClassRef**

A URI reference identifying an authentication context class that describes the authentication context declaration. The default is null.

false

string

#### **headerName**

The header name of the HTTP request which stores the SAML Token.

false

string

#### **pkixTrustEngine**

Specifies the PKIX trust information that is used to evaluate the trustworthiness and validity of XML signatures in a SAML response. Do not specify multiple pkixTrustEngine in a samlWebSso20.

false

Attribute name	Data type	Default value	Description
trustAnchorRef	A reference to top level keyStore element (string).		A keystore containing the public key necessary for verifying the signature of the SAMLResponse and Assertion.

#### **pkixTrustEngine > crl**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
path	string		Specifies the path to the crl.

#### **pkixTrustEngine > trustedIssuers**

Specifies the identities of trusted IdP issuers. If the value is "ALL\_ISSUERS", then all IdP identities are trusted.

false

string

#### **pkixTrustEngine > x509Certificate**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
path	string		Specifies the path to the x509 certificate.

## **Scaling Definitions (scalingDefinitions)**

Defines the policies for the scaling controller

- defaultScalingPolicy
  - hostGroup
  - in
  - metric
  - out
- scalingPolicy
  - bind
  - hostGroup
  - in
  - metric
  - out

#### **defaultScalingPolicy**

Defines default criteria for starting or stopping Liberty servers based on demand for resources

false

Attribute name	Data type	Default value	Description
enabled	boolean	true	Indicates whether the scaling policy is enabled
max	int Minimum: -1	-1	Maximum number of cluster members that can be running at the same time
min	int Minimum: 0	2	Minimum number of cluster members to start

Attribute name	Data type	Default value	Description
name	<ul style="list-style-type: none"> <li>vertical</li> <li>horizontal</li> </ul>	horizontal	Indicates whether to scale horizontally or vertically. <b>vertical</b> Vertical <b>horizontal</b> Horizontal

#### **defaultScalingPolicy > hostGroup**

Defines criteria for determining which hosts can be used to provision new cluster members.

false

Attribute name	Data type	Default value	Description
tags	string		A space-delimited list of administrative metadata tags. A host is eligible to provision new cluster members if it has one of the tags.

#### **defaultScalingPolicy > in**

Defines detailed controls for reducing the number of servers

false

Attribute name	Data type	Default value	Description
amount	int Minimum: 1	1	The amount by which to scale, in the units defined by the units attribute.
minInterval	A period of time with millisecond precision	15m	The minimum amount of time between a scaling change. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
units	<ul style="list-style-type: none"> <li>percentage</li> <li>instance</li> </ul>	instance	The units by which to scale. <b>percentage</b> Amount is a percentage relative to the current number of instances. <b>instance</b> Amount is a number of instances.

**defaultScalingPolicy > metric**

Defines resource usage criteria for starting or removing a server

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
max	int Minimum: 0 Maximum: 100	90	The average percentage of the metric above which to scale out
min	int Minimum: 0 Maximum: 100	30	The average percentage of the metric below which to scale in
name	<ul style="list-style-type: none"> <li>• heap</li> <li>• cpu</li> <li>• memory</li> </ul>		Name of the scaling policy <b>heap</b> Heap <b>cpu</b> CPU <b>memory</b> Memory

**defaultScalingPolicy > out**

Defines detailed controls for increasing the number of servers

false

Attribute name	Data type	Default value	Description
amount	int Minimum: 1	1	The amount by which to scale, in the units defined by the units attribute.
minInterval	A period of time with millisecond precision	5m	The minimum amount of time between a scaling change. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
units	<ul style="list-style-type: none"> <li>percentage</li> <li>instance</li> </ul>	instance	<p>The units by which to scale.</p> <p><b>percentage</b> Amount is a percentage relative to the current number of instances.</p> <p><b>instance</b> Amount is a number of instances.</p>

### scalingPolicy

Defines criteria for starting or stopping Liberty servers based on demand for resources

false

Attribute name	Data type	Default value	Description
enabled	boolean	true	Indicates whether the scaling policy is enabled
id	string		A unique configuration ID.
max	int Minimum: -1	-1	Maximum number of cluster members that can be running at the same time
min	int Minimum: 0	2	Minimum number of cluster members to start
name	<ul style="list-style-type: none"> <li>vertical</li> <li>horizontal</li> </ul>	horizontal	<p>Indicates whether to scale horizontally or vertically.</p> <p><b>vertical</b> Vertical</p> <p><b>horizontal</b> Horizontal</p>

### scalingPolicy > bind

Defines the names of the clusters to which the policy is applied

false

Attribute name	Data type	Default value	Description
clusters	string		A comma-separated list of cluster names. A cluster name can be wildcarded with an asterisk at the end of the name only.

### scalingPolicy > hostGroup

Defines criteria for determining which hosts can be used to provision new cluster members.

false

Attribute name	Data type	Default value	Description
tags	string		A space-delimited list of administrative metadata tags. A host is eligible to provision new cluster members if it has one of the tags.

**scalingPolicy > in**

Defines detailed controls for reducing the number of servers

false

Attribute name	Data type	Default value	Description
amount	int Minimum: 1	1	The amount by which to scale, in the units defined by the units attribute.
minInterval	A period of time with millisecond precision	15m	The minimum amount of time between a scaling change. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
units	<ul style="list-style-type: none"> <li>• percentage</li> <li>• instance</li> </ul>	instance	<p>The units by which to scale.</p> <p><b>percentage</b> Amount is a percentage relative to the current number of instances.</p> <p><b>instance</b> Amount is a number of instances.</p>

**scalingPolicy > metric**

Defines resource usage criteria for starting or removing a server

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
max	int Minimum: 0 Maximum: 100		The average percentage of the metric above which to scale out

Attribute name	Data type	Default value	Description
min	int Minimum: 0 Maximum: 100		The average percentage of the metric below which to scale in
name	<ul style="list-style-type: none"> <li>• heap</li> <li>• cpu</li> <li>• memory</li> </ul>		Name of the scaling policy <b>heap</b> Heap <b>cpu</b> CPU <b>memory</b> Memory

### scalingPolicy > out

Defines detailed controls for increasing the number of servers

false

Attribute name	Data type	Default value	Description
amount	int Minimum: 1	1	The amount by which to scale, in the units defined by the units attribute.
minInterval	A period of time with millisecond precision	5m	The minimum amount of time between a scaling change. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
units	<ul style="list-style-type: none"> <li>• percentage</li> <li>• instance</li> </ul>	instance	The units by which to scale. <b>percentage</b> Amount is a percentage relative to the current number of instances. <b>instance</b> Amount is a number of instances.

## Scaling Member (scalingMember)

Defines the properties of a scaling member.

Attribute name	Data type	Default value	Description
metadataMonitorEnabled	boolean	false	Monitor the configuration directory for metadata file additions or updates, and publish to the collective controller.
metadataMonitorInterval	A period of time with millisecond precision	5s	Rate at which the server checks for metadata file additions or updates. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
metadataUpdateTrigger	<ul style="list-style-type: none"> <li>• timed</li> <li>• external</li> </ul>	timed	<p>Determines the method for triggering the update of metadata.</p> <p><b>timed</b> Server will scan for metadata changes at the polling interval and publish to the collective controller.</p> <p><b>external</b> Server will only update metadata when prompted by the FileNotificationMbean. The FileNotificationMbean is typically called by an external program such as an integrated development environment or a management application.</p>

## IBM SecureWay Directory Server LDAP Filters (securewayLdapFilterProperties)

Specifies the list of default IBM SecureWay Directory Server LDAP filters.

Attribute name	Data type	Default value	Description
groupFilter	string	(&(cn=%v)(!(objectclass=groupOfNames)(objectclass=groupOfUniqueNames)))	An LDAP filter clause for searching the user registry for groups.
groupIdMap	string	*:cn	An LDAP filter that maps the name of a group to an LDAP entry.
groupMemberIdMap	string	groupOfNames:member;groupOfUniqueNames:uniqueMember	An LDAP filter that identifies user to group memberships.
id	string		A unique configuration ID.
userFilter	string	(&(uid=%v)(objectclass=ePerson))	An LDAP filter clause for searching the user registry for users.
userIdMap	string	*:uid	An LDAP filter that maps the name of a user to an LDAP entry.

## Server Commands MBean (serverCommands)

Server Commands MBean configuration

Attribute name	Data type	Default value	Description
javadumpTimeout	A period of time with second precision	60s	Amount of time to wait for remote server to generate Java heap dump or thread dump. The default value is 60 seconds. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
startServerTimeout	A period of time with second precision	60s	Amount of time to wait for remote server to start. The default value is 60 seconds. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
stopServerTimeout	A period of time with second precision	60s	Amount of time to wait for remote server to stop. The default value is 60 seconds. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

## SIP Application Router (sipApplicationRouter)

Configuration for the SIP application router

Attribute name	Data type	Default value	Description
carProvider	string	*	The fully qualified domain name (FQDN) of the custom application router provider. Set to an asterisk (*) to use an arbitrary available provider.
enable.car	boolean	true	Applications are routed using the available custom application router; otherwise, the default application router is used.
sipDarConfiguration	Path to a file		The location of the default application router (DAR) properties file. This value is mapped to JSR 289 javax.servlet.sip.ar.dar.configuration. The DAR must be configured as specified in JSR 289.
sipNoRouteErrorCode	int	403	The error response code that is sent by the SIP container when no active servlet can be mapped to an incoming initial request.

## SIP Container (sipContainer)

Configuration for the SIP servlets container

- sipIntrospect
- sipTasksDispatcher

Attribute name	Data type	Default value	Description
dispatcherMessageQueueSize	int	1000	The maximum number of tasks that a SIP container queue can contain before it declares an overload state.
invalidateSessionOnShutdown	boolean	false	When the SIP container shuts down, the sessions are no longer valid. By default, sessions remain active until they expire.
markInternalResponse	boolean	false	Mark internally generated responses by setting the com.ibm.websphere.sip.container.internal.mark attribute on the response.
maxAppSessions	int	120000	The maximum number of SIP application sessions allowed at once.
maxMessageRate	int	5000	The maximum number of messages allowed per averaging period.
maxResponseTime	A period of time with millisecond precision	0ms	The maximum response time allowed in milliseconds. When set to 0, the response time is unlimited. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
messageQueueBurstFactor	int	10	The burst factor for the message queue size. The message queue size is set to (dispatcher message queue size) * (message queue burst factor). Setting a burst factor handles bursts in traffic by providing additional space in the queue before new messages are dropped.
msgArrivalTimeAttr	boolean	false	Save the message arrival time as an attribute of the message.

### sipIntrospect

Configuration for the SIP introspect

false

Attribute name	Data type	Default value	Description
method	<ul style="list-style-type: none"> <li>• VERBOSE</li> <li>• SUCCINCT</li> </ul>	SUCCINCT	<p>The level of SIP state details to include when generating server dump.</p> <p><b>VERBOSE</b> Includes the detailed state of the SIP application sessions and the SIP sessions in the server dump.</p> <p><b>SUCCINCT</b> Server dumps include only the SIP application sessions and SIP sessions IDs</p>

### sipTasksDispatcher

Configuration for the executor of parallel SIP tasks

false

Attribute name	Data type	Default value	Description
concurrentContainerTasks	int	15	The maximum number of concurrent SIP tasks that can be dispatched to the executor.

## SIP Endpoint (sipEndpoint)

Configuration for the SIP endpoint

- sslOptions
- tcpOptions

Attribute name	Data type	Default value	Description
bindRetries	int	60	The number of retries that are attempted when port binding is unsuccessful.
bindRetryDelay	A period of time with millisecond precision	5000ms	The delay between retries in milliseconds. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
host	string	localhost	The IP of the endpoint host
id	string		A unique configuration ID.
sipTCPPort	int	5060	The TCP port number

Attribute name	Data type	Default value	Description
sipTLSPort	int	5061	The TLS port number
sipUDPPort	int	5060	The UDP port number
sslOptionsRef	A reference to top level sslOptions element (string).		Defines SSL protocol settings
tcpOptionsRef	A reference to top level tcpOptions element (string).	defaultTCPOptions	Defines TCP protocol settings

### sslOptions

Defines SSL protocol settings

false

Attribute name	Data type	Default value	Description
sessionTimeout	A period of time with second precision	1d	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
sslRef	A reference to top level ssl element (string).		The default SSL configuration repertoire. The default value is defaultSSLSettings.
suppressHandshakeErrors	boolean	false	Disable logging of SSL handshake errors. SSL handshake errors can occur during normal operation, however these messages can be useful when SSL is behaving unexpectedly.

### tcpOptions

Defines TCP protocol settings

false

Attribute name	Data type	Default value	Description
inactivityTimeout	A period of time with millisecond precision	60s	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
soReuseAddr	boolean	true	Enables immediate rebind to a port with no active listener.

## SIP Stack (sipStack)

Configuration for the SIP stack

- commaSeparatedHeaders
- hideMessageHeaders
- sipQuotedParameters

Attribute name	Data type	Default value	Description
acceptNonUtf8Bytes	boolean	false	Accept byte sequences that are not encoded in UTF-8.
auto100OnInvite	boolean	true	The SIP container automatically sends a 100 response code when an INVITE request is received.
auto482OnMergedRequests	boolean	false	The SIP container automatically sends a 482 response code when a merged request is received. This behavior is defined in the SIP RFC 3261 Section 8.2.2.2.

Attribute name	Data type	Default value	Description
compactHeaders	<ul style="list-style-type: none"> <li>• API</li> <li>• Never</li> <li>• Always</li> <li>• MtuExceeds</li> </ul>	MtuExceeds	<p>Defines when the SIP stack uses compact headers when encoding a message.</p> <p><b>API</b> Headers are sent according to JSR289 <code>javax.servlet.sip.SipServletRequest</code>.</p> <p><b>Never</b> Headers are never sent in compact form</p> <p><b>Always</b> Headers are always sent in compact form</p> <p><b>MtuExceeds</b> Headers are sent in compact form only when MTU is exceeded</p>
forceConnectionReuse	boolean	true	Connections are reused in subsequent requests even if the alias parameter exists in the via header.
hideMessageBody	boolean	false	Hide message content in the SIP container logs.
hideMessageReqUri	boolean	false	Hide the message request URI in the SIP container logs.
networkAddressCacheTtl	string		The amount of time that the SIP container keeps a cached <code>InetAddress</code> entry and does not resolve it again.
pathMtu	int	1500	The maximum transmission unit (MTU) for outbound UDP requests, as defined in RFC 3261-18.1.1.
timerA	A period of time with millisecond precision	500ms	The initial INVITE request retransmit interval for UDP only, in milliseconds, as defined in RFC 3261. The default value equals T1. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
timerB	A period of time with millisecond precision	32000ms	The INVITE client transaction timeout timer, in milliseconds, as defined in RFC 3261. The default value equals 64*T1. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
timerD	A period of time with millisecond precision	32000ms	The wait time for INVITE response retransmits, in milliseconds, as defined in RFC 3261. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
timerE	A period of time with millisecond precision	500ms	The initial non-INVITE request retransmit interval for UDP only, in milliseconds, as defined in RFC 3261. The default value equals T1. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
timerF	A period of time with millisecond precision	32000ms	The non-INVITE transaction timeout timer, in milliseconds, as defined in RFC 3261. The default value equals $64 \cdot T1$ . Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
timerG	A period of time with millisecond precision	500ms	The initial INVITE response retransmit interval, in milliseconds, as defined in RFC 3261. The default value equals $T1$ . Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
timerH	A period of time with millisecond precision	32000ms	The wait time for ACK receipts, in milliseconds, as defined in RFC 3261. The default value equals $64 \cdot T1$ . Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
timerI	A period of time with millisecond precision	5000ms	The wait time for ACK retransmits, in milliseconds, as defined in RFC 3261. The default value equals T4. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
timerJ	A period of time with millisecond precision	32000ms	The wait time for non-INVITE request retransmits, in milliseconds, as defined in RFC 3261. The default value equals 64*T1. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
timerK	A period of time with millisecond precision	5000ms	The wait time for non-INVITE response retransmits, in milliseconds, as defined in RFC 3261. The default value equals T4. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

Attribute name	Data type	Default value	Description
timerT1	A period of time with millisecond precision	500ms	The round-trip time (RTT) estimate, in milliseconds, as defined in RFC 3261. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
timerT2	A period of time with millisecond precision	4000ms	The maximum retransmit interval, in milliseconds, for non-INVITE requests and INVITE responses, as defined in RFC 3261. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
timerT4	A period of time with millisecond precision	5000ms	The maximum duration that a message remains in the network in milliseconds, as defined in RFC 3261. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

#### **commaSeparatedHeaders**

A list of header fields that should be comma-separated. If there are multiple values of the same header, the headers are not duplicated and the value will be in the same header separated by a comma.

false

string

#### **hideMessageHeaders**

A comma-separated list of headers that is not output to the SIP container logs.

false

string

### sipQuotedParameters

A list of header parameters with values that are quoted.

false

string

## Spnego Authentication (spnego)

Controls the operation of the Simple and Protected GSS-API Negotiation Mechanism.

- authFilter
  - host
  - remoteAddress
  - requestUrl
  - userAgent
  - webApp

Attribute name	Data type	Default value	Description
authFilterRef	A reference to top level authFilter element (string).		Specifies the authentication filter reference.
canonicalHostName	boolean	true	Controls whether you want to use the canonical host name.
disableFailOverToAppAuthType	boolean	true	Specifies that SPNEGO is used to log in to WebSphere Application Server first. However, if the login fails, then the application authentication mechanism is used to log in to the WebSphere Application Server.
includeClientGSSCredentialInSubject	boolean	true	Specifies whether the client delegation credentials should be stored in a client subject.
krb5Config	string		Specifies the fully qualified Kerberos configuration path and name. Standard variable substitutions, such as \${server.config.dir}, can be used when specifying the directory path.

Attribute name	Data type	Default value	Description
krb5Keytab	string		Specifies the fully qualified Kerberos keytab path and name. Standard variable substitutions, such as <code>\${server.config.dir}</code> , can be used when specifying the directory path. The Kerberos keytab file contains a list of keys that are analogous to user passwords. It is important for hosts to protect their Kerberos keytab files by storing them on the local disk.
ntlmTokenReceivedErrorPageURL	URL		Specifies the URL of a resource that contains the content which SPNEGO includes in the HTTP response, which is displayed by the browser client application.
servicePrincipalNames	string		Specifies a list of Kerberos service principal names separated by a comma.
spnegoNotSupportedErrorPageURL	URL		Specifies the URL of a resource that contains the content which SPNEGO includes in the HTTP response that is displayed by the browser client application if it does not support SPNEGO authentication.
trimKerberosRealmNameFromPrincipal	boolean	true	Specifies whether SPNEGO removes the suffix of the Kerberos principal user name, starting from the <code>@</code> that precedes the Kerberos realm name. If this attribute is set to true, the suffix of the principal user name is removed. If this attribute is set to false, the suffix of the principal name is retained.

#### **authFilter**

Specifies the authentication filter reference.

false

#### **authFilter > host**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
name	string		Specifies the name.

**authFilter > remoteAddress**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
ip	string		Specifies the IP address.
matchType	<ul style="list-style-type: none"> <li>• lessThan</li> <li>• equals</li> <li>• greaterThan</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>lessThan</b> Less than <b>equals</b> Equals <b>greaterThan</b> Greater than <b>contains</b> Contains <b>notContain</b> Not contain

**authFilter > requestUrl**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
urlPattern	string		Specifies the URL pattern.

**authFilter > userAgent**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
agent	string		Specifies the user agent
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain

#### **authFilter > webApp**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
matchType	<ul style="list-style-type: none"> <li>• equals</li> <li>• contains</li> <li>• notContain</li> </ul>	contains	Specifies the match type. <b>equals</b> Equals <b>contains</b> Contains <b>notContain</b> Not contain
name	string		Specifies the name.

## SSL Repertoire (ssl)

An SSL repertoire with an ID, a defined keystore, and an optional truststore.

Attribute name	Data type	Default value	Description
clientAuthentication	boolean	false	Specifies whether client authentication is enabled. If set to true then client authentication is required and the client must provide a certificate for the server trusts.
clientAuthenticationSupported	boolean	false	Specifies whether a client authentication is supported. If set to true then the client authentication support means the server will check trust from a client if the client presents a certificate.

Attribute name	Data type	Default value	Description
clientKeyAlias	string		Specifies the alias of the certificate in the keystore that is used as the key to send to a server that has client authentication enabled. This attribute is only needed if the keystore has more than one key entry.
enabledCiphers	string		Specifies a custom list of ciphers. Separate each cipher in the list with a space. The supported cipher will depend on the underlying JRE used. Please check the JRE for valid ciphers.
id	string		A unique configuration ID.
keyStoreRef	A reference to top level keyStore element (string).		A keystore containing key entries for the SSL repertoire. This attribute is required.
securityLevel	<ul style="list-style-type: none"> <li>• MEDIUM</li> <li>• CUSTOM</li> <li>• HIGH</li> <li>• LOW</li> </ul>	HIGH	<p>Specifies the cipher suite group used by the SSL handshake. HIGH are 3DES and 128 bit and higher ciphers, MEDIUM are DES and 40 bit ciphers, LOW are ciphers without encryption. If the enabledCiphers attribute is used the securityLevel list is ignored.</p> <p><b>MEDIUM</b> %repertoire.MEDIUM</p> <p><b>CUSTOM</b> %repertoire.CUSTOM</p> <p><b>HIGH</b> Cipher suites 3DES and 128 bit and higher</p> <p><b>LOW</b> %repertoire.LOW</p>
serverKeyAlias	string		Specifies the alias of the certificate in the keystore used as the server's key. This attribute is only needed if the keystore has more then one key entry.

Attribute name	Data type	Default value	Description
sslProtocol	string		The SSL handshake protocol. Protocol values can be found in the documentation for the underlying JRE's Java Secure Socket Extension (JSSE) provider. When using the IBM JRE the default value is SSL_TLS and when using the Oracle JRE the default value is SSL.
trustStoreRef	A reference to top level keyStore element (string).	\${keyStoreRef}	A keystore containing trusted certificate entries used by the SSL repertoire for signing verification. This attribute is optional. If unspecified, the same keystore is used for both key and trusted certificate entries.

## SSL Default Repertoire (sslDefault)

The default repertoire for SSL services.

Attribute name	Data type	Default value	Description
sslRef	A reference to top level ssl element (string).	defaultSSLConfig	The name of the SSL repertoire that will be used as the default. The default SSL repertoire called defaultSSLConfig is used if none is specified.

## SSL Options (sslOptions)

The SSL protocol configuration for a transport.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
sessionTimeout	A period of time with second precision	1d	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
sslRef	A reference to top level ssl element (string).		The default SSL configuration repertoire. The default value is defaultSSLSettings.
suppressHandshakeErrors	boolean	false	Disable logging of SSL handshake errors. SSL handshake errors can occur during normal operation, however these messages can be useful when SSL is behaving unexpectedly.

## Stack Group (stackGroup)

The stack group configuration.

- deployVariable
- installable
- package

Attribute name	Data type	Default value	Description
deployVariableRef	List of references to top level deployVariable elements (comma-separated string).		The deploy variable configuration element.
electionPort	int	20020	The election port number to use for vertically deployed stack groups. Ensure all stacks deployed to the same host use the same election port.
id	string		A unique configuration ID.
installDir	Path to a directory		The target installation directory for user packages from this stack group. The default value is the /wlp.usr directory. Use a period (.) and not a slash (/ or \) before the usr sub-directory.
installableRef	List of references to top level installable elements (comma-separated string).		The installable configuration element
jreInstallDir	Path to a directory		The target installation directory for "jre" type installables from this stack group. The default value is the /wlp.jre directory. Use a period (.) and not a slash (/ or \) before the jre sub-directory.
name	string		Name for the stack group. The attribute has no default value.

Attribute name	Data type	Default value	Description
otherInstallDir	Path to a directory		The target installation directory for "other" type installables from this stack group. The default value is the /wlp.other directory. Use a period (.) and not a slash (/ or \) before the other sub-directory.
packageRef	List of references to top level package elements (comma-separated string).		The package configuration element.
transferTimeout	A period of time with second precision	10m	The maximum file transfer time in seconds to wait while transferring an individual file of this stack group to a target host. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
wlpInstallDir	Path to a directory		The target installation directory for "wlp" type installables from this stack group. The default value is the /wlp directory.

### deployVariable

The deploy variable configuration element.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
increment	int	0	Increment value for the deployVariable.
name	string		Name for the deployVariable.
value	string		Initial value of the deployVariable.

### installable

The installable configuration element

false

Attribute name	Data type	Default value	Description
expand	string		Specifies whether to expand the installable during deployment. Valid values are yes, no, or auto. Overrides the default behavior determined by the installable file type. A no value disables unzip for installable zip files. The default value is auto, which determines whether to expand or not expand based on the installable file type. For example, auto selects to expand the zip file type.
id	string		A unique configuration ID.
installDir	string		Absolute path to the installable target directory.
name	string	default	The name of the installable archive file, for example, wlp.8555.zip.
sourceDir	string		Absolute path to the installable archive file. The default value is the path: <code>\${WLP_STACK_GROUPS_DIR}/stack_name/installables</code>
type	string		The installable type. Valid values are wlp, jre, or other. This attribute overrides the type prefix of the installable name.

### package

The package configuration element.

false

Attribute name	Data type	Default value	Description
clusterName	string	default	The name of the cluster mapped to the package.
id	string		A unique configuration ID.
name	string	default	The name of the package.

## Stack Manager (stackManager)

The stack manager service configuration.

Attribute name	Data type	Default value	Description
controllerUser	string		The user ID of the controller to be used for this stack manager.

Attribute name	Data type	Default value	Description
controllerUserPassword	Reversably encoded password (string)		The password of the controller user to be used for this stack manager.
groupsDir	string		The directory containing the packages and installables for this stack manager.
id	string		A unique configuration ID.
scanningEnabled	boolean	true	Monitor the stack groups directory for additions, updates, and deletions.
scanningInterval	A period of time with millisecond precision	5000	The interval at which the controller will check for stack group additions, updates, and deletions. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

## Sync-to-OS-thread (syncToOSThread)

Enables and configures the Sync-to-OS-thread.

Attribute name	Data type	Default value	Description
appEnabled	boolean	false	Enable sync-to-OS-thread for applications.
id	string		A unique configuration ID.
j2cEnabled	boolean	false	Enable sync-to-OS-thread for j2c connectors that support native thread identity.

## TCP Options (tcpOptions)

Defines TCP protocol settings.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
inactivityTimeout	A period of time with millisecond precision	60s	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
soReuseAddr	boolean	true	Enables immediate rebind to a port with no active listener.
addressExcludeList	string		A list of addresses that are not allowed to make inbound connections on this channel. IPv4 or IPv6 addresses can be specified. All values in an IPv4 or IPv6 address must be represented by a number, or an asterisk that is used as a wildcard character.
addressIncludeList	string		A list of addresses that are allowed to make inbound connections on this channel. IPv4 or IPv6 addresses can be specified. All values in an IPv4 or IPv6 address must be represented by a number, or an asterisk that is used as a wildcard character.
hostNameExcludeList	string		A list of host names that are not allowed to make inbound connections on this channel. Host names can start with an asterisk, which is used as a wildcard character. However, an asterisk must not appear elsewhere in the address. For example, *.abc.com is valid, but *.abc.* is invalid.

Attribute name	Data type	Default value	Description
hostNameIncludeList	string		A list of host names that are allowed to make inbound connections on this channel. Host names can start with an asterisk, which is used as a wildcard character. However, an asterisk must not appear elsewhere in the address. For example, *.abc.com is valid, but *.abc.* is invalid.
maxOpenConnections	integer	128000	The maximum number of open connections per HTTP Endpoint. The range of possible values is between 1 and 1280000. This value is not strictly enforced to the exact value that is configured due to the timing of connections opening and closing.

For more information, see TCP transport channel settings.

## Timed Operation (timedOperation)

Timed operations help WebSphere Application Server administrators see when certain actions in their application server are operating more slowly than expected.

Attribute name	Data type	Default value	Description
enableReport	boolean	true	Enables periodic generation of report to the logs detailing the ten longest timed operations, grouped by type, and sorted within each group by expected duration
maxNumberTimedOperations	int	10000	A warning is logged when the total number of timed operations reaches this value.
reportFrequency	A period of time with hour precision		Frequency of generating report to the logs detailing the ten longest timed operations, grouped by type, and sorted within each group by average of actual duration. Specify a positive integer followed by the unit of time, which can be hours (h). For example, specify 12 hours as 12h.

## Transaction Manager (transaction)

Configuration properties for the Transaction Manager service

- dataSource
  - connectionManager
  - containerAuthData
  - jaasLoginContextEntry
  - jdbcDriver
    - library
      - file
      - fileset
      - folder
  - properties
  - properties.datadirect.sqlserver
  - properties.db2.i.native
  - properties.db2.i.toolbox
  - properties.db2.jcc
  - properties.derby.client
  - properties.derby.embedded
  - properties.informix
  - properties.informix.jcc
  - properties.microsoft.sqlserver
  - properties.oracle
  - properties.sybase
  - recoveryAuthData

Attribute name	Data type	Default value	Description
acceptHeuristicHazard	boolean	true	Specifies whether all applications on this server accept the possibility of a heuristic hazard occurring in a two-phase transaction that contains a one-phase resource.
clientInactivityTimeout	A period of time with second precision	60s	Maximum duration between transactional requests from a remote client. Any period of client inactivity that exceeds this timeout results in the transaction being rolled back in this application server. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
dataSourceRef	A reference to top level dataSource element (string).		This is an optional property. By default the transaction service stores its recovery logs in a file. As an alternative it is possible to store the logs in an RDBMS. This is achieved by setting this property which defines a non-transactional data source where the transaction logs will be stored.
defaultMaxShutdownDelay	A period of time with second precision	2s	Default maximum shutdown delay. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
enableLoggingForHeuristicReporting	boolean	false	Specifies whether the application server logs about-to-commit-one-phase-resource events from transactions that involve both a one-phase commit resource and two-phase commit resources.
heuristicRetryInterval	A period of time with second precision	60s	Amount of time that the application server waits before retrying a completion signal, such as commit or rollback, after a transient exception from a resource manager or remote partner. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
heuristicRetryWait	int	5	The number of times that the application server retries a completion signal, such as commit or rollback. Retries occur after a transient exception from a resource manager or remote partner.

Attribute name	Data type	Default value	Description
lpsHeuristicCompletion	<ul style="list-style-type: none"> <li>• COMMIT</li> <li>• MANUAL</li> <li>• ROLLBACK</li> </ul>	ROLLBACK	<p>Specifies the direction that is used to complete a transaction that has a heuristic outcome; either the application server commits or rolls back the transaction, or depends on manual completion by the administrator. Allowed values are: COMMIT, ROLLBACK and MANUAL</p> <p><b>COMMIT</b> Commit</p> <p><b>MANUAL</b> Manual</p> <p><b>ROLLBACK</b> Rollback</p>
propogatedOrBMTTranLifetime	Time period of time with second precision	0	Upper limit of the transaction timeout for transactions that run in this server. This value should be greater than or equal to the value specified for the total transaction timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
recoverOnStartup	boolean	false	Specifies whether the server should begin transaction recovery at server startup.
recoveryGroup	string		Name of the recovery group that this server belongs too. Members of a recovery group can recover the transaction logs of other servers in the group.
recoveryIdentity	string		Unique identity of this server for transaction peer recovery.
timeoutGracePeriodEnabled	boolean	false	Specifies whether there is a delay between a transaction timeout and the abnormal ending of the servant region that was running the transaction.

Attribute name	Data type	Default value	Description
totalTranLifetimeTimeout	A period of time with second precision	120s	Default maximum time allowed for transactions started on this server to complete. Any such transactions that do not complete before this timeout occurs are rolled back. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
transactionLogDBTableSuffix	string		When recovery logs are stored in an RDBMS table, this property allows the table name to be post-pended with a string to make it unique for this Server.
transactionLogDirectory	string	\${server.output.dir}/tranlog/	A directory for this server where the transaction service stores log files for recovery.
transactionLogSize	int	1024	Specifies the size of transaction log files in Kilobytes.
waitForRecovery	boolean	false	Specifies whether the server should wait for transaction recovery to complete before accepting new transactional work.

#### dataSource

This is an optional property. By default the transaction service stores its recovery logs in a file. As an alternative it is possible to store the logs in an RDBMS. This is achieved by setting this property which defines a non-transactional data source where the transaction logs will be stored.

false

Attribute name	Data type	Default value	Description
beginTranForResultSetScrolling	boolean	true	Attempt transaction enlistment when result set scrolling interfaces are used.
beginTranForVendorAPIs	boolean	true	Attempt transaction enlistment when vendor interfaces are used.

Attribute name	Data type	Default value	Description
commitOrRollbackOnCleanup	<ul style="list-style-type: none"> <li>• commit</li> <li>• rollback</li> </ul>		<p>Determines how to clean up connections that might be in a database unit of work (AutoCommit=false) when the connection is closed or returned to the pool.</p> <p><b>commit</b> Clean up the connection by committing.</p> <p><b>rollback</b> Clean up the connection by rolling back.</p>
connectionManagerRef	A reference to top level connectionManager element (string).		Connection manager for a data source.
connectionSharing	<ul style="list-style-type: none"> <li>• MatchOriginalRequest</li> <li>• MatchCurrentState</li> </ul>	MatchOriginalRequest	<p>Specifies how connections are matched for sharing.</p> <p><b>MatchOriginalRequest</b> When sharing connections, match based on the original connection request.</p> <p><b>MatchCurrentState</b> When sharing connections, match based on the current state of the connection.</p>
containerAuthDataRef	A reference to top level authData element (string).		Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

Attribute name	Data type	Default value	Description
enableConnectionCasting	boolean	false	Indicates that connections obtained from the data source should be castable to interface classes that the JDBC vendor connection implementation implements. Enabling this option incurs additional overhead on each getConnection operation. If vendor JDBC interfaces are needed less frequently, it might be more efficient to leave this option disabled and use Connection.unwrap(interface) only where it is needed.
isolationLevel	<ul style="list-style-type: none"> <li>• TRANSACTION_REPEATABLE_READ</li> <li>• TRANSACTION_READ_COMMITTED</li> <li>• TRANSACTION_SERIALIZABLE</li> <li>• TRANSACTION_READ_UNCOMMITTED</li> <li>• TRANSACTION_SNAPSHOT</li> </ul>		<p>Default transaction isolation level.</p> <p><b>TRANSACTION_REPEATABLE_READ</b> Dirty reads and non-repeatable reads are prevented; phantom reads can occur.</p> <p><b>TRANSACTION_READ_COMMITTED</b> Dirty reads are prevented; non-repeatable reads and phantom reads can occur.</p> <p><b>TRANSACTION_SERIALIZABLE</b> Dirty reads, non-repeatable reads and phantom reads are prevented.</p> <p><b>TRANSACTION_READ_UNCOMMITTED</b> Dirty reads, non-repeatable reads and phantom reads can occur.</p> <p><b>TRANSACTION_SNAPSHOT</b> Snapshot isolation for Microsoft SQL Server JDBC Driver and DataDirect Connect for JDBC driver.</p>

Attribute name	Data type	Default value	Description
jaasLoginContextEntryRef	A reference to top level jaasLoginContextEntry element (string).		JAAS login context entry for authentication.
jdbcDriverRef	A reference to top level jdbcDriver element (string).		JDBC driver for a data source.
jndiName	string		JNDI name for a data source.
queryTimeout	A period of time with second precision		Default query timeout for SQL statements. In a JTA transaction, syncQueryTimeoutWithTransactionTimeout can override this default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
recoveryAuthDataRef	A reference to top level authData element (string).		Authentication data for transaction recovery.
statementCacheSize	int Minimum: 0	10	Maximum number of cached statements per connection.
supplementalJDBCTrace	boolean		Supplements the JDBC driver trace that is logged when JDBC driver trace is enabled in bootstrap.properties. JDBC driver trace specifications include: com.ibm.ws.database.logwriter, com.ibm.ws.db2.logwriter, com.ibm.ws.derby.logwriter, com.ibm.ws.informix.logwriter, com.ibm.ws.oracle.logwriter, com.ibm.ws.sqlserver.logwriter, com.ibm.ws.sybase.logwriter
syncQueryTimeoutWithTransactionTimeout	boolean	false	Use the time remaining (if any) in a JTA transaction as the default query timeout for SQL statements.
transactional	boolean	true	Enable participation in transactions that are managed by the application server.

Attribute name	Data type	Default value	Description
type	<ul style="list-style-type: none"> <li>javax.sql.DataSource</li> <li>javax.sql.XADataSource</li> <li>javax.sql.ConnectionPoolDataSource</li> </ul>		Type of data source. <b>javax.sql.DataSource</b> javax.sql.DataSource <b>javax.sql.XADataSource</b> javax.sql.XADataSource <b>javax.sql.ConnectionPoolDataSource</b> javax.sql.ConnectionPoolDataSource

**dataSource > connectionManager**

Connection manager for a data source.

false

Attribute name	Data type	Default value	Description
agedTimeout	A period of time with second precision	-1	Amount of time before a physical connection can be discarded by pool maintenance. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
connectionTimeout	A period of time with second precision	30s	Amount of time after which a connection request times out. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxConnectionsPerThread	int Minimum: 0		Limits the number of open connections on each thread.

Attribute name	Data type	Default value	Description
maxIdleTime	A period of time with second precision	30m	Amount of time after which an unused or idle connection can be discarded during pool maintenance, if doing so does not reduce the pool below the minimum size. A value of -1 disables this timeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maxPoolSize	int Minimum: 0	50	Maximum number of physical connections for a pool. A value of 0 means unlimited.
minPoolSize	int Minimum: 0		Minimum number of physical connections to maintain in the pool. The pool is not pre-populated. Aged timeout can override the minimum.
numConnectionsPerThreadLocal	int Minimum: 0		Caches the specified number of connections for each thread.

Attribute name	Data type	Default value	Description
purgePolicy	<ul style="list-style-type: none"> <li>• ValidateAllConnections</li> <li>• FailingConnectionOnly</li> <li>• EntirePool</li> </ul>	EntirePool	<p>Specifies which connections to destroy when a stale connection is detected in a pool.</p> <p><b>ValidateAllConnections</b> When a stale connection is detected, connections are tested and those found to be bad are closed.</p> <p><b>FailingConnectionOnly</b> When a stale connection is detected, only the connection which was found to be bad is closed.</p> <p><b>EntirePool</b> When a stale connection is detected, all connections in the pool are marked stale, and when no longer in use, are closed.</p>
reapTime	A period of time with second precision	3m	Amount of time between runs of the pool maintenance thread. A value of -1 disables pool maintenance. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

**dataSource > containerAuthData**

Default authentication data for container managed authentication that applies when bindings do not specify an authentication-alias for a resource reference with res-auth=CONTAINER.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

**dataSource > jaasLoginContextEntry**

JAAS login context entry for authentication.

false

Attribute name	Data type	Default value	Description
loginModuleRef	List of references to top level jaasLoginModule elements (comma-separated string).	hashtable,userNameAndPassword,certificate,trustID	Word certificate trustID of a JAAS login module.
name	string		Name of a JAAS configuration entry.

**dataSource > jdbcDriver**

JDBC driver for a data source.

false

Attribute name	Data type	Default value	Description
javax.sql.ConnectionPoolDataSource	string		JDBC driver implementation of javax.sql.ConnectionPoolDataSource.
javax.sql.DataSource	string		JDBC driver implementation of javax.sql.DataSource.
javax.sql.XADataSource	string		JDBC driver implementation of javax.sql.XADataSource.
libraryRef	A reference to top level library element (string).		Identifies JDBC driver JARs and native files.

**dataSource > jdbcDriver > library**

Identifies JDBC driver JARs and native files.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

**dataSource > jdbcDriver > library > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**dataSource > jdbcDriver > library > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**dataSource > jdbcDriver > library > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**dataSource > properties**

List of JDBC vendor properties for the data source. For example, `databaseName="dbname" serverName="localhost" portNumber="50000"`.

false

Attribute name	Data type	Default value	Description
URL	string		URL for connecting to the database.
databaseName	string		JDBC driver property: databaseName.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
serverName	string		Server where the database is running.

Attribute name	Data type	Default value	Description
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**dataSource > properties.datadirect.sqlserver**

Data source properties for the DataDirect Connect for JDBC driver for Microsoft SQL Server.

false

Attribute name	Data type	Default value	Description
JDBCBehavior	<ul style="list-style-type: none"> <li>• 1</li> <li>• 0</li> </ul>	0	JDBC driver property: JDBCBehavior. Values are: 0 (JDBC 4.0) or 1 (JDBC 3.0).  <b>1</b> JDBC 3.0 <b>0</b> JDBC 4.0
XATransactionGroup	string		JDBC driver property: XATransactionGroup.
XMLDescribeType	<ul style="list-style-type: none"> <li>• longvarbinary</li> <li>• longvarchar</li> </ul>		JDBC driver property: XMLDescribeType.  <b>longvarbinary</b> longvarbinary <b>longvarchar</b> longvarchar
accountingInfo	string		JDBC driver property: accountingInfo.
alternateServers	string		JDBC driver property: alternateServers.
alwaysReportTriggerResults	boolean		JDBC driver property: alwaysReportTriggerResults.
applicationName	string		JDBC driver property: applicationName.
authenticationMethod	<ul style="list-style-type: none"> <li>• ntlm</li> <li>• userIdPassword</li> <li>• kerberos</li> <li>• auto</li> </ul>		JDBC driver property: authenticationMethod.  <b>ntlm</b> ntlm <b>userIdPassword</b> userIdPassword <b>kerberos</b> kerberos <b>auto</b> auto
bulkLoadBatchSize	long		JDBC driver property: bulkLoadBatchSize.
bulkLoadOptions	long		JDBC driver property: bulkLoadOptions.
clientHostName	string		JDBC driver property: clientHostName.
clientUser	string		JDBC driver property: clientUser.

Attribute name	Data type	Default value	Description
codePageOverride	string		JDBC driver property: codePageOverride.
connectionRetryCount	int		JDBC driver property: connectionRetryCount.
connectionRetryDelay	A period of time with second precision		JDBC driver property: connectionRetryDelay. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
convertNull	int		JDBC driver property: convertNull.
databaseName	string		JDBC driver property: databaseName.
dateTimeInputParameterType	<ul style="list-style-type: none"> <li>• dateTime</li> <li>• dateTimeOffset</li> <li>• auto</li> </ul>		JDBC driver property: dateTimeInputParameterType.  <b>dateTime</b> dateTime <b>dateTimeOffset</b> dateTimeOffset <b>auto</b> auto
dateTimeOutputParameterType	<ul style="list-style-type: none"> <li>• dateTime</li> <li>• dateTimeOffset</li> <li>• auto</li> </ul>		JDBC driver property: dateTimeOutputParameterType.  <b>dateTime</b> dateTime <b>dateTimeOffset</b> dateTimeOffset <b>auto</b> auto
describeInputParameters	<ul style="list-style-type: none"> <li>• describeIfString</li> <li>• noDescribe</li> <li>• describeIfDateTime</li> <li>• describeAll</li> </ul>		JDBC driver property: describeInputParameters.  <b>describeIfString</b> describeIfString <b>noDescribe</b> noDescribe <b>describeIfDateTime</b> describeIfDateTime <b>describeAll</b> describeAll

Attribute name	Data type	Default value	Description
describeOutputParameters	<ul style="list-style-type: none"> <li>describeIfString</li> <li>noDescribe</li> <li>describeIfDateTime</li> <li>describeAll</li> </ul>		JDBC driver property: describeOutputParameters. <b>describeIfString</b> describeIfString <b>noDescribe</b> noDescribe <b>describeIfDateTime</b> describeIfDateTime <b>describeAll</b> describeAll
enableBulkLoad	boolean		JDBC driver property: enableBulkLoad.
enableCancelTimeout	boolean		JDBC driver property: enableCancelTimeout.
encryptionMethod	<ul style="list-style-type: none"> <li>loginSSL</li> <li>requestSSL</li> <li>SSL</li> <li>noEncryption</li> </ul>		JDBC driver property: encryptionMethod. <b>loginSSL</b> loginSSL <b>requestSSL</b> requestSSL <b>SSL</b> SSL <b>noEncryption</b> noEncryption
failoverGranularity	<ul style="list-style-type: none"> <li>disableIntegrityCheck</li> <li>atomicWithRepositioning</li> <li>nonAtomic</li> <li>atomic</li> </ul>		JDBC driver property: failoverGranularity. <b>disableIntegrityCheck</b> disableIntegrityCheck <b>atomicWithRepositioning</b> atomicWithRepositioning <b>nonAtomic</b> nonAtomic <b>atomic</b> atomic
failoverMode	<ul style="list-style-type: none"> <li>connect</li> <li>select</li> <li>extended</li> </ul>		JDBC driver property: failoverMode. <b>connect</b> connect <b>select</b> select <b>extended</b> extended
failoverPreconnect	boolean		JDBC driver property: failoverPreconnect.
hostNameInCertificate	string		JDBC driver property: hostNameInCertificate.
initializationString	string		JDBC driver property: initializationString.
insensitiveResultSetBufferSize	int		JDBC driver property: insensitiveResultSetBufferSize.

Attribute name	Data type	Default value	Description
javaDoubleToString	boolean		JDBC driver property: javaDoubleToString.
loadBalancing	boolean		JDBC driver property: loadBalancing.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
longDataCacheSize	int Minimum: -1		JDBC driver property: longDataCacheSize.
netAddress	string		JDBC driver property: netAddress.
packetSize	int Minimum: -1 Maximum: 128		JDBC driver property: packetSize.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
queryTimeout	A period of time with second precision		JDBC driver property: queryTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
resultsetMetaDataOptions	int		JDBC driver property: resultSetMetaDataOptions.
selectMethod	<ul style="list-style-type: none"> <li>• direct</li> <li>• cursor</li> </ul>		JDBC driver property: selectMethod.  <b>direct</b> direct <b>cursor</b> cursor
serverName	string	localhost	Server where the database is running.
snapshotSerializable	boolean		JDBC driver property: snapshotSerializable.

Attribute name	Data type	Default value	Description
spyAttributes	string		JDBC driver property: spyAttributes.
stringInputParameterType	<ul style="list-style-type: none"> <li>varchar</li> <li>nvarchar</li> </ul>	varchar	JDBC driver property: stringInputParameterType. <b>varchar</b> varchar <b>nvarchar</b> nvarchar
stringOutputParameterType	<ul style="list-style-type: none"> <li>varchar</li> <li>nvarchar</li> </ul>	varchar	JDBC driver property: stringOutputParameterType. <b>varchar</b> varchar <b>nvarchar</b> nvarchar
suppressConnectionWarnings	boolean		JDBC driver property: suppressConnectionWarnings.
transactionMode	<ul style="list-style-type: none"> <li>explicit</li> <li>implicit</li> </ul>		JDBC driver property: transactionMode. <b>explicit</b> explicit <b>implicit</b> implicit
truncateFractionalSeconds	boolean		JDBC driver property: truncateFractionalSeconds.
trustStore	string		JDBC driver property: trustStore.
trustStorePassword	Reversably encoded password (string)		JDBC driver property: trustStorePassword.
useServerSideUpdatableCursors	boolean		JDBC driver property: useServerSideUpdatableCursors.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
validateServerCertificate	boolean		JDBC driver property: validateServerCertificate.

#### dataSource > properties.db2.i.native

Data source properties for the IBM DB2 for i Native JDBC driver.

false

Attribute name	Data type	Default value	Description
access	<ul style="list-style-type: none"> <li>read only</li> <li>all</li> <li>read call</li> </ul>	all	JDBC driver property: access. <b>read only</b> read only <b>all</b> all <b>read call</b> read call

Attribute name	Data type	Default value	Description
autoCommit	boolean	true	JDBC driver property: autoCommit.
batchStyle	<ul style="list-style-type: none"> <li>• 2.1</li> <li>• 2.0</li> </ul>	2.0	JDBC driver property: batchStyle. <b>2.1</b> 2.1 <b>2.0</b> 2.0
behaviorOverride	int		JDBC driver property: behaviorOverride.
blockSize	<ul style="list-style-type: none"> <li>• 512</li> <li>• 128</li> <li>• 0</li> <li>• 32</li> <li>• 64</li> <li>• 16</li> <li>• 8</li> <li>• 256</li> </ul>	32	JDBC driver property: blockSize. <b>512</b> 512 <b>128</b> 128 <b>0</b> 0 <b>32</b> 32 <b>64</b> 64 <b>16</b> 16 <b>8</b> 8 <b>256</b> 256
cursorHold	boolean	false	JDBC driver property: cursorHold.
cursorSensitivity	<ul style="list-style-type: none"> <li>• asensitive</li> <li>• sensitive</li> </ul>	asensitive	JDBC driver property: cursorSensitivity. Values are: 0 (TYPE_SCROLL_SENSITIVE_STATIC), 1 (TYPE_SCROLL_SENSITIVE_DYNAMIC), 2 (TYPE_SCROLL_ASENSITIVE). <b>asensitive</b> asensitive <b>sensitive</b> sensitive
dataTruncation	string	true	JDBC driver property: dataTruncation.
databaseName	string	*LOCAL	JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
dateFormat	<ul style="list-style-type: none"> <li>• dmy</li> <li>• iso</li> <li>• eur</li> <li>• ymd</li> <li>• julian</li> <li>• jis</li> <li>• usa</li> <li>• mdy</li> </ul>		JDBC driver property: dateFormat. <b>dmy</b> dmy <b>iso</b> iso <b>eur</b> eur <b>ymd</b> ymd <b>julian</b> julian <b>jis</b> jis <b>usa</b> usa <b>mdy</b> mdy

directMap	boolean	true	JDBC driver property: directMap.
doEscapeProcessing	boolean	true	JDBC driver property: doEscapeProcessing.
fullErrors	boolean		JDBC driver property: fullErrors.
libraries	string		JDBC driver property: libraries.
lobThreshold	int Maximum: 500000	0	JDBC driver property: lobThreshold.

Attribute name	Data type	Default value	Description
lockTimeout	A period of time with second precision	0	JDBC driver property: lockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
maximumPrecision	<ul style="list-style-type: none"> <li>• 31</li> <li>• 63</li> </ul>	31	JDBC driver property: maximumPrecision.  <b>31</b> 31 <b>63</b> 63
maximumScale	int Minimum: 0 Maximum: 63	31	JDBC driver property: maximumScale.
minimumDivideScale	int Minimum: 0 Maximum: 9	0	JDBC driver property: minimumDivideScale.
networkProtocol	int		JDBC driver property: networkProtocol.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.
prefetch	boolean	true	JDBC driver property: prefetch.
queryOptimizeGoal	<ul style="list-style-type: none"> <li>• 2</li> <li>• 1</li> </ul>	2	JDBC driver property: queryOptimizeGoal. Values are: 1 (*FIRSTIO) or 2 (*ALLIO).  <b>2</b> *ALLIO <b>1</b> *FIRSTIO

Attribute name	Data type	Default value	Description
reuseObjects	boolean	true	JDBC driver property: reuseObjects.
serverName	string		Server where the database is running.
serverTraceCategories	int	0	JDBC driver property: serverTraceCategories.
systemNaming	boolean	false	JDBC driver property: systemNaming.
timeFormat	<ul style="list-style-type: none"> <li>• iso</li> <li>• eur</li> <li>• jis</li> <li>• usa</li> <li>• hms</li> </ul>		JDBC driver property: timeFormat.  <b>iso</b> iso <b>eur</b> eur <b>jis</b> jis <b>usa</b> usa <b>hms</b> hms
timeSeparator	<ul style="list-style-type: none"> <li>• \,</li> <li>• b</li> <li>• :</li> <li>• .</li> </ul>		JDBC driver property: timeSeparator.  \, The comma character (,). <b>b</b> The character b : The colon character (:). . The period character (.).
trace	boolean		JDBC driver property: trace.
transactionTimeout	A period of time with second precision	0	JDBC driver property: transactionTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
translateBinary	boolean	false	JDBC driver property: translateBinary.
translateHex	<ul style="list-style-type: none"> <li>• binary</li> <li>• character</li> </ul>	character	JDBC driver property: translateHex.  <b>binary</b> binary <b>character</b> character
useBlockInsert	boolean	false	JDBC driver property: useBlockInsert.

Attribute name	Data type	Default value	Description
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

maximumScale	int Minimum: 0 Maximum: 63	31	JDBC driver property: maximumScale.
metaDataSource	int Minimum: 0 Maximum: 1	1	JDBC driver property: metaDataSource.
minimumDivideScale	int Minimum: 0 Maximum: 9	0	JDBC driver property: minimumDivideScale.
naming	<ul style="list-style-type: none"> <li>• system</li> <li>• sql</li> </ul>	sql	JDBC driver property: naming.  <b>system</b> system <b>sql</b> sql
package	string		JDBC driver property: package.
packageAdd	boolean	true	JDBC driver property: packageAdd.
packageCCSID	<ul style="list-style-type: none"> <li>• 13488</li> <li>• 1200</li> </ul>	13488	JDBC driver property: packageCCSID. Values are: 1200 (UCS-2) or 13488 (UTF-16).  <b>13488</b> 13488 (UTF-16) <b>1200</b> 1200 (UCS-2)
packageCache	boolean	false	JDBC driver property: packageCache.

Attribute name	Data type	Default value	Description
packageCriteria	<ul style="list-style-type: none"> <li>default</li> <li>select</li> </ul>	default	JDBC driver property: packageCriteria. <b>default</b> default <b>select</b> select
packageError	<ul style="list-style-type: none"> <li>exception</li> <li>none</li> <li>warning</li> </ul>	warning	JDBC driver property: packageError. <b>exception</b> exception <b>none</b> none <b>warning</b> warning
packageLibrary	string	QGPL	JDBC driver property: packageLibrary.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
prefetch	boolean	true	JDBC driver property: prefetch.
prompt	boolean	false	JDBC driver property: prompt.
proxyServer	string		JDBC driver property: proxyServer.
qaqqiniLibrary	string		JDBC driver property: qaqqiniLibrary.
queryOptimizeGoal	int Minimum: 0 Maximum: 2	0	JDBC driver property: queryOptimizeGoal. Values are: 1 (*FIRSTIO) or 2 (*ALLIO).
receiveBufferSize	int Minimum: 1		JDBC driver property: receiveBufferSize.
remarks	<ul style="list-style-type: none"> <li>system</li> <li>sql</li> </ul>	system	JDBC driver property: remarks. <b>system</b> system <b>sql</b> sql
rollbackCursorHold	boolean	false	JDBC driver property: rollbackCursorHold.
savePasswordWhenSerialized	boolean	false	JDBC driver property: savePasswordWhenSerialized.
secondaryUrl	string		JDBC driver property: secondaryUrl.
secure	boolean	false	JDBC driver property: secure.
sendBufferSize	int Minimum: 1		JDBC driver property: sendBufferSize.

Attribute name	Data type	Default value	Description
serverName	string		Server where the database is running.
serverTraceCategories	int	0	JDBC driver property: serverTraceCategories.
soLinger	A period of time with second precision		JDBC driver property: soLinger. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
soTimeout	A period of time with millisecond precision		JDBC driver property: soTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
sort	<ul style="list-style-type: none"> <li>• hex</li> <li>• table</li> <li>• language</li> </ul>	hex	JDBC driver property: sort. <b>hex</b> hex <b>table</b> table <b>language</b> language
sortLanguage	string		JDBC driver property: sortLanguage.
sortTable	string		JDBC driver property: sortTable.
sortWeight	<ul style="list-style-type: none"> <li>• unqiue</li> <li>• shared</li> </ul>		JDBC driver property: sortWeight. <b>unqiue</b> unique <b>shared</b> shared
tcpNoDelay	boolean		JDBC driver property: tcpNoDelay.
threadUsed	boolean	true	JDBC driver property: threadUsed.

Attribute name	Data type	Default value	Description
timeFormat	<ul style="list-style-type: none"> <li>• iso</li> <li>• eur</li> <li>• jis</li> <li>• usa</li> <li>• hms</li> </ul>		JDBC driver property: timeFormat. <b>iso</b> iso <b>eur</b> eur <b>jis</b> jis <b>usa</b> usa <b>hms</b> hms
timeSeparator	<ul style="list-style-type: none"> <li>•</li> <li>• \,</li> <li>• :</li> <li>• .</li> </ul>		JDBC driver property: timeSeparator.  The space character ( ). \, The comma character (,). : The colon character (:). . The period character (.).

trace	boolean		JDBC driver property: trace.
translateBinary	boolean	false	JDBC driver property: translateBinary.
translateBoolean	boolean	true	JDBC driver property: translateBoolean.

Attribute name	Data type	Default value	Description
translateHex	<ul style="list-style-type: none"> <li>binary</li> <li>character</li> </ul>	character	JDBC driver property: translateHex.  <b>binary</b> binary <b>character</b> character
trueAutoCommit	boolean	false	JDBC driver property: trueAutoCommit.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
xaLooselyCoupledSupport	int  Minimum: 0  Maximum: 1	0	JDBC driver property: xaLooselyCoupledSupport.

#### dataSource > properties.db2.jcc

Data source properties for the IBM Data Server Driver for JDBC and SQLJ for DB2.

false

Attribute name	Data type	Default value	Description
activateDatabase	int		JDBC driver property: activateDatabase.
alternateGroupDatabaseName	string		JDBC driver property: alternateGroupDatabaseName.
alternateGroupPortNumber	string		JDBC driver property: alternateGroupPortNumber.
alternateGroupServerName	string		JDBC driver property: alternateGroupServerName.
blockingReadConnectionTimeout	A period of time with second precision		JDBC driver property: blockingReadConnectionTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
clientAccountingInformation	string		JDBC driver property: clientAccountingInformation.
clientApplicationInformation	string		JDBC driver property: clientApplicationInformation.
clientRerouteAlternatePortNumber	string		JDBC driver property: clientRerouteAlternatePortNumber.
clientRerouteAlternateServerName	string		JDBC driver property: clientRerouteAlternateServerName.

Attribute name	Data type	Default value	Description
clientUser	string		JDBC driver property: clientUser.
clientWorkstation	string		JDBC driver property: clientWorkstation.
connectionCloseWithInFlightTransaction	Transaction • 1		JDBC driver property: connectionCloseWithInFlightTransaction. 2 CONNECTION_CLOSE_WITH_ROLLBACK 1 CONNECTION_CLOSE_WITH_EXCEPTION
currentAlternateGroupEntry	int		JDBC driver property: currentAlternateGroupEntry.
currentFunctionPath	string		JDBC driver property: currentFunctionPath.
currentLocaleLcCtype	string		JDBC driver property: currentLocaleLcCtype.
currentLockTimeout	A period of time with second precision		JDBC driver property: currentLockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
currentPackagePath	string		JDBC driver property: currentPackagePath.
currentPackageSet	string		JDBC driver property: currentPackageSet.
currentSQLID	string		JDBC driver property: currentSQLID.
currentSchema	string		JDBC driver property: currentSchema.
cursorSensitivity	• 2 • 1 • 0		JDBC driver property: cursorSensitivity. Values are: 0 (TYPE_SCROLL_SENSITIVE_STATIC), 1 (TYPE_SCROLL_SENSITIVE_DYNAMIC), 2 (TYPE_SCROLL_ASENSITIVE). 2 TYPE_SCROLL_ASENSITIVE 1 TYPE_SCROLL_SENSITIVE_DYNAMIC 0 TYPE_SCROLL_SENSITIVE_STATIC

user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

#### dataSource > properties.informix

Data source properties for the Informix JDBC driver.

false

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
ifxCLIENT_LOCALE	string		JDBC driver property: ifxCLIENT_LOCALE.
ifxCPMAgeLimit	A period of time with second precision		JDBC driver property: ifxCPMAgeLimit. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxCPMInitPoolSize	int		JDBC driver property: ifxCPMInitPoolSize.
ifxCPMMaxConnections	int		JDBC driver property: ifxCPMMaxConnections.
ifxCPMMaxPoolSize	int		JDBC driver property: ifxCPMMaxPoolSize.
ifxCPMMinAgeLimit	A period of time with second precision		JDBC driver property: ifxCPMMinAgeLimit. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxCPMMinPoolSize	int		JDBC driver property: ifxCPMMinPoolSize.
ifxCPMServiceInterval	A period of time with millisecond precision		JDBC driver property: ifxCPMServiceInterval. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
ifxDBANSIWARN	boolean		JDBC driver property: ifxDBANSIWARN.
ifxDBCENTURY	string		JDBC driver property: ifxDBCENTURY.
ifxDBDATE	string		JDBC driver property: ifxDBDATE.
ifxDBSPACETEMP	string		JDBC driver property: ifxDBSPACETEMP.

Attribute name	Data type	Default value	Description
ifxDBTEMP	string		JDBC driver property: ifxDBTEMP.
ifxDBTIME	string		JDBC driver property: ifxDBTIME.
ifxDBUPSPACE	string		JDBC driver property: ifxDBUPSPACE.
ifxDB_LOCALE	string		JDBC driver property: ifxDB_LOCALE.
ifxDELIMIDENT	boolean		JDBC driver property: ifxDELIMIDENT.
ifxENABLE_TYPE_CACHE	boolean		JDBC driver property: ifxENABLE_TYPE_CACHE.
ifxFET_BUF_SIZE	int		JDBC driver property: ifxFET_BUF_SIZE.
ifxGL_DATE	string		JDBC driver property: ifxGL_DATE.
ifxGL_DATETIME	string		JDBC driver property: ifxGL_DATETIME.
ifxIFXHOST	string	localhost	JDBC driver property: ifxIFXHOST.
ifxIFX_AUTOFREE	boolean		JDBC driver property: ifxIFX_AUTOFREE.
ifxIFX_DIRECTIVES	string		JDBC driver property: ifxIFX_DIRECTIVES.
ifxIFX_LOCK_MODE_WAIT	A period of time with second precision	2s	JDBC driver property: ifxIFX_LOCK_MODE_WAIT. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxIFX_SOC_TIMEOUT	A period of time with millisecond precision		JDBC driver property: ifxIFX_SOC_TIMEOUT. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
ifxIFX_USEPUT	boolean		JDBC driver property: ifxIFX_USEPUT.

Attribute name	Data type	Default value	Description
ifxIFX_USE_STRENC	boolean		JDBC driver property: ifxIFX_USE_STRENC.
ifxIFX_XASPEC	string	y	JDBC driver property: ifxIFX_XASPEC.
ifxINFORMIXCONRETRY	int		JDBC driver property: ifxINFORMIXCONRETRY.
ifxINFORMIXCONTIME	A period of time with second precision		JDBC driver property: ifxINFORMIXCONTIME. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
ifxINFORMIXOPCACHE	string		JDBC driver property: ifxINFORMIXOPCACHE.
ifxINFORMIXSTACKSIZE	int		JDBC driver property: ifxINFORMIXSTACKSIZE.
ifxJDBCTEMP	string		JDBC driver property: ifxJDBCTEMP.
ifxLDAP_IFXBASE	string		JDBC driver property: ifxLDAP_IFXBASE.
ifxLDAP_PASSWD	string		JDBC driver property: ifxLDAP_PASSWD.
ifxLDAP_URL	string		JDBC driver property: ifxLDAP_URL.
ifxLDAP_USER	string		JDBC driver property: ifxLDAP_USER.
ifxLOBCACHE	int		JDBC driver property: ifxLOBCACHE.
ifxNEWCODESET	string		JDBC driver property: ifxNEWCODESET.
ifxNEWLOCALE	string		JDBC driver property: ifxNEWLOCALE.
ifxNODEFDAC	string		JDBC driver property: ifxNODEFDAC.
ifxOPTCOMPIND	string		JDBC driver property: ifxOPTCOMPIND.
ifxOPTOFC	string		JDBC driver property: ifxOPTOFC.
ifxOPT_GOAL	string		JDBC driver property: ifxOPT_GOAL.
ifxPATH	string		JDBC driver property: ifxPATH.
ifxPDQPRIORITY	string		JDBC driver property: ifxPDQPRIORITY.

Attribute name	Data type	Default value	Description
ifxPLCONFIG	string		JDBC driver property: ifxPLCONFIG.
ifxPLOAD_LO_PATH	string		JDBC driver property: ifxPLOAD_LO_PATH.
ifxPROTOCOLTRACE	int		JDBC driver property: ifxPROTOCOLTRACE.
ifxPROTOCOLTRACEFILE	string		JDBC driver property: ifxPROTOCOLTRACEFILE.
ifxPROXY	string		JDBC driver property: ifxPROXY.
ifxPSORT_DBTEMP	string		JDBC driver property: ifxPSORT_DBTEMP.
ifxPSORT_NPROCS	boolean		JDBC driver property: ifxPSORT_NPROCS.
ifxSECURITY	string		JDBC driver property: ifxSECURITY.
ifxSQLH_FILE	string		JDBC driver property: ifxSQLH_FILE.
ifxSQLH_LOC	string		JDBC driver property: ifxSQLH_LOC.
ifxSQLH_TYPE	string		JDBC driver property: ifxSQLH_TYPE.
ifxSSLCONNECTION	string		JDBC driver property: ifxSSLCONNECTION.
ifxSTMT_CACHE	string		JDBC driver property: ifxSTMT_CACHE.
ifxTRACE	int		JDBC driver property: ifxTRACE.
ifxTRACEFILE	string		JDBC driver property: ifxTRACEFILE.
ifxTRUSTED_CONTEXT	string		JDBC driver property: ifxTRUSTED_CONTEXT.
ifxUSEV5SERVER	boolean		JDBC driver property: ifxUSEV5SERVER.
ifxUSE_DTENV	boolean		JDBC driver property: ifxUSE_DTENV.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1526	Port on which to obtain database connections.
roleName	string		JDBC driver property: roleName.
serverName	string		Server where the database is running.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

**dataSource > properties.informix.jcc**

Data source properties for the IBM Data Server Driver for JDBC and SQLJ for Informix.

false

Attribute name	Data type	Default value	Description
DBANSIWARN	boolean		JDBC driver property: DBANSIWARN.
DBDATE	string		JDBC driver property: DBDATE.
DBPATH	string		JDBC driver property: DBPATH.
DBSPACETEMP	string		JDBC driver property: DBSPACETEMP.
DBTEMP	string		JDBC driver property: DBTEMP.
DBUPSPACE	string		JDBC driver property: DBUPSPACE.
DELIMIDENT	boolean		JDBC driver property: DELIMIDENT.
IFX_DIRECTIVES	<ul style="list-style-type: none"> <li>• ON</li> <li>• OFF</li> </ul>		JDBC driver property: IFX_DIRECTIVES. <b>ON</b> ON <b>OFF</b> OFF

Values are: 3 (CLEAR_TEXT_PASSWORD_SECURITY), 4 (USER_ONLY_SECURITY), 7 (ENCRYPTED_PASSWORD_SECURITY), 9 (ENCRYPTED_USER_AND_PASSWORD_SECURITY).</p> <p>3 CLEAR_TEXT_PASSWORD_SECURITY 7 ENCRYPTED_PASSWORD_SECURITY 4 USER_ONLY_SECURITY 9 ENCRYPTED_USER_AND_PASSWORD_SECURITY</p>
serverName	string	localhost	Server where the database is running.
traceDirectory	string		JDBC driver property: traceDirectory.
traceFile	string		JDBC driver property: traceFile.
traceFileAppend	boolean		JDBC driver property: traceFileAppend.

Attribute name	Data type	Default value	Description
traceLevel	int		Bitwise combination of the following constant values: TRACE_NONE=0, TRACE_CONNECTION_CALLS=1, TRACE_STATEMENT_CALLS=2, TRACE_RESULT_SET_CALLS=4, TRACE_DRIVER_CONFIGURATION=16, TRACE_CONNECTS=32, TRACE_DRDA_FLOWS=64, TRACE_RESULT_SET_META_DATA=128, TRACE_PARAMETER_META_DATA=256, TRACE_DIAGNOSTICS=512, TRACE_SQLJ=1024, TRACE_META_CALLS=8192, TRACE_DATASOURCE_CALLS=16384, TRACE_LARGE_OBJECT_CALLS=32768, TRACE_SYSTEM_MONITOR=131072, TRACE_TRACEPOINTS=262144, TRACE_ALL=-1.
useJDBC4ColumnNameAndLabelSemantics	int		JDBC driver property: useJDBC4ColumnNameAndLabelSemantics. Values are: 1 (YES) or 2 (NO).
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

#### dataSource > properties.microsoft.sqlserver

Data source properties for Microsoft SQL Server JDBC Driver.

false

Attribute name	Data type	Default value	Description
URL	string		URL for connecting to the database. Example: jdbc:sqlserver://localhost:1433;databaseName=myDB.
applicationIntent	<ul style="list-style-type: none"> <li>ReadOnly</li> <li>ReadWrite</li> </ul>		JDBC driver property: applicationIntent. <b>ReadOnly</b> ReadOnly <b>ReadWrite</b> ReadWrite
applicationName	string		JDBC driver property: applicationName.
authenticationScheme	<ul style="list-style-type: none"> <li>NativeAuthentication</li> <li>JavaKerberos</li> </ul>		JDBC driver property: authenticationScheme. <b>NativeAuthentication</b> NativeAuthentication <b>JavaKerberos</b> JavaKerberos

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
encrypt	boolean		JDBC driver property: encrypt.
failoverPartner	string		JDBC driver property: failoverPartner.
hostNameInCertificate	string		JDBC driver property: hostNameInCertificate.
instanceName	string		JDBC driver property: instanceName.
integratedSecurity	boolean		JDBC driver property: integratedSecurity.
lastUpdateCount	boolean		JDBC driver property: lastUpdateCount.
lockTimeout	A period of time with millisecond precision		JDBC driver property: lockTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
multiSubnetFailover	boolean		JDBC driver property: multiSubnetFailover.
packetSize	int Minimum: 512 Maximum: 32767		JDBC driver property: packetSize.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int		Port on which to obtain database connections.

Attribute name	Data type	Default value	Description
responseBuffering	<ul style="list-style-type: none"> <li>full</li> <li>adaptive</li> </ul>		JDBC driver property: responseBuffering. <b>full</b> full <b>adaptive</b> adaptive
selectMethod	<ul style="list-style-type: none"> <li>direct</li> <li>cursor</li> </ul>		JDBC driver property: selectMethod. <b>direct</b> direct <b>cursor</b> cursor
sendStringParametersAsUnicode	boolean	false	JDBC driver property: sendStringParametersAsUnicode.
sendTimeAsDatetime	boolean		JDBC driver property: sendTimeAsDatetime.
serverName	string	localhost	Server where the database is running.
trustServerCertificate	boolean		JDBC driver property: trustServerCertificate.
trustStore	string		JDBC driver property: trustStore.
trustStorePassword	Reversably encoded password (string)		JDBC driver property: trustStorePassword.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
workstationID	string		JDBC driver property: workstationID.
xopenStates	boolean		JDBC driver property: xopenStates.

#### dataSource > properties.oracle

Data source properties for Oracle JDBC driver.

false

Attribute name	Data type	Default value	Description
ONSConfiguration	string		JDBC driver property: ONSConfiguration.
TNSEntryName	string		JDBC driver property: TNSEntryName.
URL	string		URL for connecting to the database. Examples: jdbc:oracle:thin:@//localhost:1521/sample or jdbc:oracle:oci:@//localhost:1521/sample.
connectionProperties	string		JDBC driver property: connectionProperties.

Attribute name	Data type	Default value	Description
databaseName	string		JDBC driver property: databaseName.
driverType	<ul style="list-style-type: none"> <li>oci</li> <li>thin</li> </ul>	thin	JDBC driver property: driverType.  <b>oci</b> oci <b>thin</b> thin
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
networkProtocol	string		JDBC driver property: networkProtocol.
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	1521	Port on which to obtain database connections.
serverName	string	localhost	Server where the database is running.
serviceName	string		JDBC driver property: serviceName.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.

#### dataSource > properties.sybase

Data source properties for Sybase JDBC driver.

false

Attribute name	Data type	Default value	Description
SERVER_INITIATED_TRANSACTIONS	<ul style="list-style-type: none"> <li>false</li> <li>true</li> </ul>	false	JDBC driver property: SERVER_INITIATED_TRANSACTIONS.  <b>false</b> false <b>true</b> true
connectionProperties	string	SELECT_OPENS_CURSOR=true	JDBC driver property: connectionProperties.
databaseName	string		JDBC driver property: databaseName.

Attribute name	Data type	Default value	Description
loginTimeout	A period of time with second precision		JDBC driver property: loginTimeout. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
networkProtocol	<ul style="list-style-type: none"> <li>• SSL</li> <li>• socket</li> </ul>		JDBC driver property: networkProtocol.  <b>SSL</b> SSL <b>socket</b> socket
password	Reversably encoded password (string)		It is recommended to use a container managed authentication alias instead of configuring this property.
portNumber	int	5000	Port on which to obtain database connections.
resourceManagerName	string		JDBC driver property: resourceManagerName.
serverName	string	localhost	Server where the database is running.
user	string		It is recommended to use a container managed authentication alias instead of configuring this property.
version	int		JDBC driver property: version.

**dataSource > recoveryAuthData**

Authentication data for transaction recovery.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user to use when connecting to the EIS. The value can be stored in clear text or encoded form. It is recommended that you encode the password. To do so, use the securityUtility tool with the encode option.
user	string		Name of the user to use when connecting to the EIS.

## Trust Association Interceptor (trustAssociation)

Controls the operation of the trust association interceptor (TAI).

- interceptors
  - library
    - file
    - fileset
    - folder
  - properties

Attribute name	Data type	Default value	Description
failOverToAppAuthType	boolean	false	Allow an interceptor to fall back to the application authentication mechanism.
id	string		A unique configuration ID.
invokeForUnprotectedURI	boolean	false	Controls whether the TAI is invoked for an unprotected URI.

### interceptors

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
className	string		Fully-qualified package name of the interceptor class.
enabled	boolean	true	Enables or disables the interceptor.
id	string		A unique configuration ID.
invokeAfterSSO	boolean	true	Invoke an interceptor after single sign-on (SSO).
invokeBeforeSSO	boolean	false	Invoke an interceptor before single sign-on (SSO).
libraryRef	A reference to top level library element (string).		A reference to the ID of the shared library configuration.

### interceptors > library

A reference to the ID of the shared library configuration.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.

Attribute name	Data type	Default value	Description
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
name	string		Name of shared library for administrators

**interceptors > library > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**interceptors > library > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

#### interceptors > library > folder

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

#### interceptors > properties

Collection of properties for the interceptor.

false

## User Information (userInfo)

Specifies the user information that is included in the response of the openID provider.

Attribute name	Data type	Default value	Description
alias	string	email	Specifies an alias name.
count	int Minimum: 1	1	Specifies how much userInfo is included in the response of the openID provider.
id	string		A unique configuration ID.
required	boolean	true	Specifies whether user information is required or not.
uriType	string	http://axschema.org/contact/email	Specifies a URI type.

## Variable Declaration (variable)

Declare a new variable by specifying the name and value for the variable.

Attribute name	Data type	Default value	Description
name	string		The name of the variable.
value	string		The value to be assigned to the variable.

## Virtual Host (virtualHost)

A virtual host provides a logical grouping for configuring web applications to a particular host name. The default virtual host (default\_host) is suitable for most simple configurations.

- allowFromEndpoint
  - accessLogging
  - httpOptions
  - sslOptions
  - tcpOptions
- hostAlias

Attribute name	Data type	Default value	Description
allowFromEndpointRef	List of references to top level httpEndpoint elements (comma-separated string).		Specify the identifier of one or more HTTP endpoints to restrict inbound traffic for this virtual host to the specified endpoints.
enabled	boolean	true	Enable this virtual host.
id	string		A unique configuration ID.

### allowFromEndpoint

Specify the identifier of one or more HTTP endpoints to restrict inbound traffic for this virtual host to the specified endpoints.

false

Attribute name	Data type	Default value	Description
accessLoggingRef	A reference to top level httpAccessLogging element (string).		HTTP access logging configuration for the endpoint.
enabled	boolean	true	Toggle the availability of an endpoint. When true, this endpoint will be activated by the dispatcher to handle HTTP requests.
host	string	localhost	IP address, domain name server (DNS) host name with domain name suffix, or just the DNS host name, used by a client to request a resource. Use '*' for all available network interfaces.

Attribute name	Data type	Default value	Description
httpOptionsRef	A reference to top level httpOptions element (string).	defaultHttpOptions	HTTP protocol options for the endpoint.
httpPort	int Minimum: -1 Maximum: 65535		The port used for client HTTP requests. Use -1 to disable this port.
httpsPort	int Minimum: -1 Maximum: 65535		The port used for client HTTP requests secured with SSL (https). Use -1 to disable this port.
id	string		A unique configuration ID.
onError	<ul style="list-style-type: none"> <li>• IGNORE</li> <li>• FAIL</li> <li>• WARN</li> </ul>	WARN	<p>Action to take after a failure to start an endpoint.</p> <p><b>IGNORE</b> Server will not issue any warning and error messages when it incurs a configuration error.</p> <p><b>FAIL</b> Server will issue a warning or error message on the first error occurrence and then stop the server.</p> <p><b>WARN</b> Server will issue warning and error messages when it incurs a configuration error.</p>
sslOptionsRef	A reference to top level sslOptions element (string).		SSL protocol options for the endpoint.
tcpOptionsRef	A reference to top level tcpOptions element (string).	defaultTCPOptions	TCP protocol options for the endpoint.

#### **allowFromEndpoint > accessLogging**

HTTP access logging configuration for the endpoint.

false

Attribute name	Data type	Default value	Description
enabled	boolean	true	Enable access logging.
filePath	Path to a file	\${server.output.dir}/logs/http_access.log	Directory path and name of the access log file. Standard variable substitutions, such as \${server.output.dir}, can be used when specifying the directory path.

Attribute name	Data type	Default value	Description
logFormat	string	%h %u %{t}W "%r" %s %b	Specifies the log format that is used when logging client access information.
maxFileSize	int Minimum: 0	20	Maximum size of a log file, in megabytes, before being rolled over; a value of 0 means no limit.
maxFiles	int Minimum: 0	2	Maximum number of log files that will be kept, before the oldest file is removed; a value of 0 means no limit.

**allowFromEndpoint > httpOptions**

HTTP protocol options for the endpoint.

false

Attribute name	Data type	Default value	Description
keepAliveEnabled	boolean	true	Enables persistent connections (HTTP keepalive). If true, connections are kept alive for reuse by multiple sequential requests and responses. If false, connections are closed after the response is sent.
maxKeepAliveRequests	int Minimum: -1	100	Maximum number of persistent requests that are allowed on a single HTTP connection if persistent connections are enabled. A value of -1 means unlimited.
persistTimeout	A period of time with second precision	30s	Amount of time that a socket will be allowed to remain idle between requests. This setting only applies if persistent connections are enabled. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
readTimeout	A period of time with second precision	60s	Amount of time to wait for a read request to complete on a socket after the first read occurs. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
removeServerHeader	boolean	false	Removes server implementation information from HTTP headers and also disables the default Liberty profile welcome page.
writeTimeout	A period of time with second precision	60s	Amount of time to wait on a socket for each portion of the response data to be transmitted. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

#### **allowFromEndpoint > sslOptions**

SSL protocol options for the endpoint.

false

Attribute name	Data type	Default value	Description
sessionTimeout	A period of time with second precision	1d	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

Attribute name	Data type	Default value	Description
sslRef	A reference to top level ssl element (string).		The default SSL configuration repertoire. The default value is defaultSSLSettings.
suppressHandshakeErrors	boolean	false	Disable logging of SSL handshake errors. SSL handshake errors can occur during normal operation, however these messages can be useful when SSL is behaving unexpectedly.

### allowFromEndpoint > tcpOptions

TCP protocol options for the endpoint.

false

Attribute name	Data type	Default value	Description
inactivityTimeout	A period of time with millisecond precision	60s	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
soReuseAddr	boolean	true	Enables immediate rebind to a port with no active listener.

### hostAlias

Associate a host and port with this virtual host, using the host:port syntax. The specified host can be an IP address, domain name server (DNS) hostname with a domain name suffix, the DNS hostname, or \* for a wildcard match on all hostnames. Note that IPv6 addresses must be enclosed in [].

false

string

## WAS JMS Endpoint (wasJmsEndpoint)

Configuration properties for WAS JMS incoming connection requests.

- sslOptions
- tcpOptions

Attribute name	Data type	Default value	Description
enabled	boolean	true	Toggle the availability of WAS JMS Endpoint.

Attribute name	Data type	Default value	Description
host	string	localhost	IP address, domain name server (DNS) host name with domain name suffix, or just the DNS host name, used by a client to request a resource. Use '*' for all available network interfaces.
sslOptionsRef	A reference to top level sslOptions element (string).		SSL protocol options for the WAS JMS endpoint.
tcpOptionsRef	A reference to top level tcpOptions element (string).	defaultTCPOptions	TCP protocol options for the WAS JMS endpoint.
wasJmsPort	int Minimum: -1 Maximum: 65535	7276	The port used for WAS JMS client messaging application connection requests. Use -1 to disable this port.
wasJmsSSLPort	int Minimum: -1 Maximum: 65535	7286	The port used for WAS JMS client messaging application connection requests secured with SSL. Use -1 to disable this port.

### sslOptions

SSL protocol options for the WAS JMS endpoint.

false

Attribute name	Data type	Default value	Description
sessionTimeout	A period of time with second precision	1d	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
sslRef	A reference to top level ssl element (string).		The default SSL configuration repertoire. The default value is defaultSSLSettings.
suppressHandshakeErrors	boolean	false	Disable logging of SSL handshake errors. SSL handshake errors can occur during normal operation, however these messages can be useful when SSL is behaving unexpectedly.

### tcpOptions

TCP protocol options for the WAS JMS endpoint.

false

Attribute name	Data type	Default value	Description
inactivityTimeout	A period of time with millisecond precision	60s	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
soReuseAddr	boolean	true	Enables immediate rebind to a port with no active listener.

### WAS JMS Outbound (wasJmsOutbound)

Configuration properties for WAS JMS outgoing connection requests.

- sslOptions
- tcpOptions

Attribute name	Data type	Default value	Description
id	string		The name of the WAS JMS outbound.
sslOptionsRef	A reference to top level sslOptions element (string).		SSL protocol options for WAS JMS outbound
tcpOptionsRef	A reference to top level tcpOptions element (string).	defaultTCPOptions	TCP protocol options for WAS JMS outbound
useSSL	boolean	false	Set the value to true to enable the secure communication channel

### sslOptions

SSL protocol options for WAS JMS outbound

false

Attribute name	Data type	Default value	Description
sessionTimeout	A period of time with second precision	1d	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
sslRef	A reference to top level ssl element (string).		The default SSL configuration repertoire. The default value is defaultSSLSettings.
suppressHandshakeErrors	boolean	false	Disable logging of SSL handshake errors. SSL handshake errors can occur during normal operation, however these messages can be useful when SSL is behaving unexpectedly.

### tcpOptions

TCP protocol options for WAS JMS outbound

false

Attribute name	Data type	Default value	Description
inactivityTimeout	A period of time with millisecond precision	60s	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
soReuseAddr	boolean	true	Enables immediate rebind to a port with no active listener.

## Web Container Application Security (webAppSecurity)

Configures web container application security.

Attribute name	Data type	Default value	Description
allowAuthenticationFailOverToAuthMethod	<ul style="list-style-type: none"> <li>• FORM</li> <li>• BASIC</li> </ul>		<p>Specifies the authentication fail over method that will be used when the certificate authentication fails. Valid values are BASIC and FORM.</p> <p><b>FORM</b> %allowAuthenticationFailOverToAuthMethod</p> <p><b>BASIC</b> %allowAuthenticationFailOverToAuthMethod</p>
allowFailOverToBasicAuth	boolean	false	<p>Specifies whether to fail over to basic authentication when certificate authentication fails. The equivalent custom property in the full application server profile is com.ibm.wsspi.security.web.failOverToBasicAuth</p>
allowLogoutPageRedirectToAnyHost	boolean	false	<p>Warning, security risk: Setting this property to true may open your systems to potential URL redirect attacks. If set to true, any host can be specified for the logout page redirect. If set to false, and the logout page points to a different host, or one not listed in the logout page redirect domain list, then a generic logout page is displayed. The equivalent custom property in the full application server profile is com.ibm.websphere.security.allowAnyLogoutE</p>

Attribute name	Data type	Default value	Description
displayAuthenticationRealm	boolean	false	Warning, security risk: if this property is set to true, and the user registry's realm name contains sensitive information, it is displayed to the user. For example, if an LDAP configuration is used, the LDAP server hostname and port are displayed. This configuration controls what the HTTP basic authentication login window displays when the realm name is not defined in the application web.xml. If the realm name is defined in the application web.xml file, this property is ignored. If set to true, the realm name displayed will be the user registry realm name for the LTPA authentication mechanism. If set to false, the realm name displayed will be "Default Realm". The equivalent custom property in the full application server profile is <code>com.ibm.websphere.security.displayRealm</code> .
httpOnlyCookies	boolean	true	Specifies whether the HTTP only (HttpOnly) cookies option is enabled.
includePathInWASReqURL	boolean	false	Setting the Path parameter can allow the client/browser to manage multiple WASReqURL cookies during multiple concurrent logins on the same user agent. The equivalent custom property in the full application server profile is <code>com.ibm.websphere.security.setContextRoot</code> .
loginFormURL	string		Specifies the global URL of a form login page including the root context. The form login page must be part of the WAR file. If a form login application does not specify the form login page in the web.xml file, it uses the global form login URL.

Attribute name	Data type	Default value	Description
logoutOnHttpSessionExpire	boolean	false	Specifies whether users will be logged out after the HTTP session timer expires. If set to false, the user credential will stay active until the Single Sign-On token timeout occurs. The equivalent custom property in the full application server profile is <code>com.ibm.ws.security.web.logoutOnHTTPSession</code>
logoutPageRedirectDomainNames	String		A pipe ( ) separated list of domain names that are allowed for the logout page redirect (localhost is implied). The equivalent custom property in the full application server profile is <code>com.ibm.websphere.security.logoutExitPageDomainNames</code>
postParamCookieSize	int	16384	Size of the POST parameter cookie. If the size of the cookie is larger than the browser limit, unexpected behavior may occur. The value of this property must be a positive integer and represents the maximum size of the cookie in bytes. The equivalent custom property in the full application server profile is <code>com.ibm.websphere.security.util.postParamMaxCookieSize</code>
postParamSaveMethod	<ul style="list-style-type: none"> <li>• Cookie</li> <li>• Session</li> <li>• None</li> </ul>	Cookie	<p>Specifies where POST parameters are stored upon redirect. Valid values are cookie (POST parameters are stored in a cookie), session (POST parameters are stored in the HTTP Session) and none (POST parameters are not preserved). The equivalent custom property in the full application server profile is <code>com.ibm.websphere.security.util.postParamSaveMethod</code></p> <p><b>Cookie</b>    Cookie</p> <p><b>Session</b>    Session</p> <p><b>None</b>    None</p>

Attribute name	Data type	Default value	Description
preserveFullyQualifiedReferrer	boolean	false	Warning, security risk: Setting this to true may open your systems to potential URL redirect attacks. This property specifies whether the fully qualified referrer URL for form login redirects is preserved. If false, the host for the referrer URL is removed and the redirect is to localhost. The equivalent custom property in the full application server profile is <code>com.ibm.websphere.security.util.fullyQualifiedReferrer</code> .
singleSignonEnabled	boolean	true	Specifies whether single sign-on is enabled.
ssoCookieName	string	LtpaToken2	Customizes the SSO cookie name. A custom cookie name allows you to logically separate authentication between SSO domains and to enable customized authentication to a particular environment. Before setting this value, consider that setting a custom cookie name can cause an authentication failure. For example, a connection to a server that has a custom cookie property set sends this custom cookie to the browser. A subsequent connection to a server that uses either the default cookie name or a different cookie name, is not able to authenticate the request via a validation of the in-bound cookie. The equivalent custom property in the full application server profile is <code>com.ibm.websphere.security.customSSOCookieName</code> .
ssoDomainNames	string		A pipe ( ) separated list of domain names that SSO Cookies should be presented. The equivalent custom property in the full application server profile is <code>com.ibm.ws.security.config.SingleSignonConfig</code> .

Attribute name	Data type	Default value	Description
ssoRequiresSSL	boolean	false	Specifies whether a SSO cookie is sent over SSL. The equivalent property in the full application server profile is requiresSSL.
ssoUseDomainFromURL	boolean	false	Specifies whether to use the domain name from the request URL for the cookie domain.
trackLoggedOutSSOCookies	boolean	false	Specifies whether to track LTPA single signon tokens that are logged out on a server so that it can not be reused on the same server.
useAuthenticationDataForUnprotectedResource	boolean	true	Specifies whether authentication data can be used when accessing an unprotected resource. The unprotected resource can access validated authenticated data that it previously could not access. This option enables the unprotected resource to call the getRemoteUser, isUserInRole, and getUserPrincipal methods to retrieve an authenticated identity. The equivalent custom property in the full application server profile is com.ibm.wsspi.security.webAuthReq=pers
useOnlyCustomCookieName	boolean	false	Specifies whether to use only the custom cookie name.
wasReqURLRedirectDomainNames	String		A pipe (!) separated list of domain names that are allowed for the WASReqURL page redirect. The hostname found on the form login request is implied.
webAlwaysLogin	boolean	false	Specifies whether the login() method will throw an exception when an identity has already been authenticated.

## Web Application (webApplication)

Defines the properties of a web application.

- application-bnd
  - security-role
  - group

- run-as
- special-subject
- user
- classloader
  - commonLibrary
    - file
    - fileset
    - folder
  - privateLibrary
    - file
    - fileset
    - folder

Attribute name	Data type	Default value	Description
autoStart	boolean	true	Indicates whether or not the server automatically starts the application.
contextRoot	string		Context root of an application.
id	string		A unique configuration ID.
location	A file, directory or url.		Location of an application expressed as an absolute path or a path relative to the server-level apps directory.
name	string		Name of an application.
suppressUncoveredHttpMethodWarning	boolean	false	Option to suppress uncovered HTTP method warning message during application deployment.

### application-bnd

Binds general deployment information included in the application to specific resources.

false

Attribute name	Data type	Default value	Description
version	string		Version of the application bindings specification.

### application-bnd > security-role

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	string		Name of a security role.

### application-bnd > security-role > group

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		Group access ID
id	string		A unique configuration ID.
name	string		Name of a group possessing a security role.

**application-bnd > security-role > run-as**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
password	Reversably encoded password (string)		Password of a user required to access a bean from another bean. The value can be stored in clear text or encoded form. To encode the password, use the securityUtility tool with the encode option.
userid	string		ID of a user required to access a bean from another bean.

**application-bnd > security-role > special-subject**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
type	<ul style="list-style-type: none"><li>• EVERYONE</li><li>• ALL_AUTHENTICATED_USERS</li></ul>		One of the following special subject types: ALL_AUTHENTICATED_USERS, EVERYONE.  <b>EVERYONE</b> Everyone  <b>ALL_AUTHENTICATED_USERS</b> All authenticated users

**application-bnd > security-role > user**

A unique configuration ID.

false

Attribute name	Data type	Default value	Description
access-id	string		A user access ID in the general form user:realmName/userUniqueId. A value will be generated if one is not specified.
id	string		A unique configuration ID.
name	string		Name of a user possessing a security role.

### classloader

Defines the settings for an application classloader.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
classProviderRef	List of references to top level resourceAdapter elements (comma-separated string).		List of class provider references. When searching for classes or resources, this class loader will delegate to the specified class providers after searching its own class path.
commonLibraryRef	List of references to top level library elements (comma-separated string).		List of library references. Library class instances are shared with other classloaders.
delegation	<ul style="list-style-type: none"> <li>parentFirst</li> <li>parentLast</li> </ul>	parentFirst	Controls whether parent classloader is used before or after this classloader. If parent first is selected then delegate to immediate parent before searching the classpath. If parent last is selected then search the classpath before delegating to the immediate parent.  <b>parentFirst</b> Parent first  <b>parentLast</b> Parent last
privateLibraryRef	List of references to top level library elements (comma-separated string).		List of library references. Library class instances are unique to this classloader, independent of class instances from other classloaders.

**classloader > commonLibrary**

List of library references. Library class instances are shared with other classloaders.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
id	string		A unique configuration ID.
name	string		Name of shared library for administrators

**classloader > commonLibrary > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**classloader > commonLibrary > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).

Attribute name	Data type	Default value	Description
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**classloader > commonLibrary > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

**classloader > privateLibrary**

List of library references. Library class instances are unique to this classloader, independent of class instances from other classloaders.

false

Attribute name	Data type	Default value	Description
apiTypeVisibility	string	spec,ibm-api,api	The types of API package this library's class loader will be able to see, as a comma-separated list of any combination of the following: spec, ibm-api, api, third-party.
description	string		Description of shared library for administrators
filesetRef	List of references to top level fileset elements (comma-separated string).		Id of referenced Fileset
id	string		A unique configuration ID.
name	string		Name of shared library for administrators

**classloader > privateLibrary > file**

Id of referenced File

false

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
name	Path to a file		Fully qualified filename

**classloader > privateLibrary > fileset**

Id of referenced Fileset

false

Attribute name	Data type	Default value	Description
caseSensitive	boolean	true	Boolean to indicate whether or not the search should be case sensitive (default: true).
dir	Path to a directory	\${server.config.dir}	The base directory to search for files.
excludes	string		The comma or space separated list of file name patterns to exclude from the search results, by default no files are excluded.
id	string		A unique configuration ID.
includes	string	*	The comma or space separated list of file name patterns to include in the search results (default: *).
scanInterval	A period of time with millisecond precision	0	Scanning interval to check the fileset for changes as a long with a time unit suffix h-hour, m-minute, s-second, ms-millisecond (e.g. 2ms or 5s). Disabled (scanInterval=0) by default. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

**classloader > privateLibrary > folder**

Id of referenced folder

false

Attribute name	Data type	Default value	Description
dir	Path to a directory		Directory or folder to be included in the library classpath for locating resource files
id	string		A unique configuration ID.

## Web Container (webContainer)

Configuration for the web container.

Attribute name	Data type	Default value	Description
allowExpressionFactoryPerApp	boolean	false	Toggle to load the ExpressionFactory that is set by the application. Enable this custom property if you are using a custom EL implementation (for example, JUEL) that needs to set its own ExpressionFactory.
allowIncludeSendError	boolean	false	Allow RequestDispatch to send errors on Include methods. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.allowincludesend
asyncMaxSizeTaskPool	int	5000	Maximum size of tasks in the Async task pool before automatically purging canceled tasks. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.asyncmaxsizetask
asyncPurgeInterval	int	30000	Time interval to wait between each required purge of the cancelled task pool. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.asyncpurgeinterval
asyncTimeoutDefault	int	30000	Async servlet timeout value used when a timeout value has not been explicitly specified. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.asynctimeoutdefa
asyncTimerThreads	int	2	Maximum number of threads to use for async servlet timeout processing. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.asynctimerthreads

Attribute name	Data type	Default value	Description
channelWriteType	string	async	When set to 'sync', responses will be written synchronously; otherwise, responses will be written asynchronously. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.channelwritetype.
copyAttributesKeySet	boolean	false	Web container will return an enumeration of a copy of the list of attributes to the servlet to avoid a concurrent access error by the servlet. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.copyattributeskeyset.
decodeUrlAsUtf8	boolean	true	Decode URLs using an encoding setting of UTF-8.
decodeUrlPlusSign	boolean	false	Decode the plus sign when it is part of the URL. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.decodeurlplussign.
defaultHeadRequestBehavior	boolean	false	Restore the behavior where the HEAD request is not subject to the security constraint defined for the GET method. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.DefaultHeadRequestBehavior.
defaultTraceRequestBehavior	boolean	false	Restore HTTP TRACE processing. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.DefaultTraceRequestBehavior.
deferServletLoad	boolean	true	Defer servlet loading and initialization until the first request.
deferServletRequestListenerDestroyOnError	boolean	false	Toggle if you want to defer ServletRequestListener destroy when there is an error serving the request. The default value is false. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.deferServletRequestListenerDestroyOnError.
directoryBrowsingEnabled	boolean	false	Enable directory browsing of an application.

Attribute name	Data type	Default value	Description
disableXPoweredBy	boolean	false	Disable setting the X-Powered-By header. The equivalent custom property in the full application server profile is <code>com.ibm.ws.webcontainer.disablexpoweredby</code>
disallowAllFileServing	boolean	false	Disables all file serving by applications. The equivalent custom property in the full application server profile is <code>com.ibm.ws.webcontainer.disallowAllFileServing</code>
disallowServeServletsByClassName	boolean	true	Disallows the use of <code>serveServletsByClassNameEnabled</code> on the application server level. The equivalent custom property in the full application server profile is <code>com.ibm.ws.webcontainer.disallowserveservletsbyclassname</code>
dispatcherRethrowsError	boolean	true	Web container will re-throw errors allowing interested resources to process them. The equivalent custom property in the full application server profile is <code>com.ibm.ws.webcontainer.dispatcherRethrowsError</code>
doNotServeByClassName	string		A semi-colon delimited list of classes to be completely disallowed from being served by classname. The equivalent custom property in the full application server profile is <code>com.ibm.ws.webcontainer.donotservebyclassname</code>
emptyServletMappings	boolean	false	Toggle if you want to return an empty collection, instead of null, when no servlet mappings are added. The default value is false. The equivalent custom property in the full application server profile is <code>com.ibm.ws.webcontainer.emptyServletMappings</code>
enableDefaultIsELIgnoredInTags	boolean	false	Always evaluate whether to ignore EL expressions in tag files. If parent JSP files have different <code>isELIgnored</code> settings, the setting will be re-evaluated in the tag file. The equivalent custom property in the full application server profile is <code>com.ibm.ws.jsp.enabledefaultisignoredintags</code>

Attribute name	Data type	Default value	Description
enableErrorExceptionTypeFirst	boolean	false	Web container is updated to search and use the exception-type before the error-code. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.enableErrorExceptionTypeFirst
enableJspMappingOverride	boolean	false	Allow the JSP mapping to be overridden so that the application can serve the JSP contents itself. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.enablejspmappingoverride
enableMultiReadOfPostData	boolean	false	Retain post data for multiple read accesses. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.enablemultireadofpostdata
exposeWebInfOnDispatch	boolean	false	If true, a servlet can access files in the WEB-INF directory. If false (default), a servlet cannot access files the WEB-INF directory.
fileServingEnabled	boolean	true	Enable file serving if this setting was not explicitly specified for the application.
fileWrapperEvents	boolean	false	Web container will generate SMF and PMI data when serving the static files. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.fileWrapperEvents
httpsIndicatorHeader	string		For SSL offloading, set to the name of the HTTP header variable inserted by the SSL accelerator/proxy/load balancer.
ignoreSemiColonOnRedirectToWelcomePage	boolean	false	Toggle to ignore the trailing semi-colon when redirecting to the welcome page. The default value is false. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.ignoreSemiColonOnRedirectToWelcomePage

Attribute name	Data type	Default value	Description
ignoreSessiononStaticFileRequests	boolean	false	Improves performance by preventing the web container from accessing a session for static file requests involving filters. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.IgnoreSessiononStaticFileRequests
invokeFilterInitAtStartup	boolean	true	Web container will call the filter's init() method at application startup. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.invokeFilterInitAtStartup
listeners	string		A comma separated list of listener classes.
logServletContainerInitializationClassLoadingErrors	boolean	false	Log servlet container class loading errors as warnings rather than logging them only when debug is enabled. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.logServletContainerInitializationClassLoadingErrors
metaInfResourcesCacheSize	int	20	Initial size (number of entries) of the meta-inf resource cache. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.metaInfResourcesCacheSize
parseUtf8PostData	boolean	false	Web container will detect non URL encoded UTF-8 post data and include it in the parameter values. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.parseUtf8PostData
serveServletsByClassnameEnabled	boolean	false	Enable servlets to be accessed in a web application using a class name if not explicitly specified.
setContentLengthOnClose	boolean	true	Toggle to set content length when an application explicitly closes the response. The default value is true; however, set this value to false if an application response contains double-byte characters.

Attribute name	Data type	Default value	Description
skipMetaInfResourcesProcessing	boolean	false	Do not search the meta-inf directory for application resources. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.skipmetainfresources.
suppressHtmlRecursiveErrors	boolean	false	Suppresses the exception information from appearing in the HTML output when there is a recursive error that cannot be handled by an application's configured error page. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.suppressHtmlRecursiveErrors.
symbolicLinksCacheSize	int	1000	Initial size of the symbolic link cache. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.SymbolicLinksCacheSize.
tolerateSymbolicLinks	boolean	false	Enables the web container to support the use of symbolic links. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.TolerateSymbolicLinks.
useSemiColonAsDelimiterInURI	boolean	false	Toggle to use the semi-colon as a delimiter in the request URI. The default value is false. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.useSemiColonAsDelimiterInURI.
xPoweredBy	string		Alternative string for the X-Powered-By header setting. The equivalent custom property in the full application server profile is com.ibm.ws.webcontainer.xpoweredby. There is no default value for this property. If the property is not set, the value of the X-Powered-By header is set to Servlet/<servlet spec version>, as defined by the Servlet specification.

## WLM Classification (wlmClassification)

Contains, as child elements, the classification rules WLM will use when classifying requests.

- httpClassification

Attribute name	Data type	Default value	Description
classificationName	string	null	Optional classification name
id	string		A unique configuration ID.

### httpClassification

An element representing a rule used by WLM for classifying incoming HTTP requests.

false

Attribute name	Data type	Default value	Description
host	string	*	Defines which host to map the transaction class to
method	string	*	Defines the HTTP method to map to
port	string	*	Defines which port to map the transaction class to
resource	string	*	Defines the URI to use when mapping transaction class
transactionClass	string		Defines the priority

## WebSphere MQ Messaging (wmqJmsClient)

WebSphere MQ messaging

Attribute name	Data type	Default value	Description
connectionConcurrency	int Minimum: 0	1	The maximum number of MDBs that can be supplied by each connection
id	string		A unique configuration ID.
logWriterEnabled	boolean	true	A flag to enable or disable the sending of a diagnostic trace to a LogWriter object provided by the application server
maxConnections	int Minimum: 0	50	The maximum number of connections to a WebSphere MQ queue manager
nativeLibraryPath	string		Absolute path to the location of the WebSphere MQ Java JNI library (mqjbnd.dll or equivalent)
reconnectionRetryCount	int Minimum: 0	5	The maximum number of attempts made to reconnect to a WebSphere MQ queue manager if a connection fails

Attribute name	Data type	Default value	Description
reconnectionRetryInterval	A period of time with millisecond precision	5m	The time, in milliseconds, that the WebSphere MQ feature waits before making another attempt to reconnect to a WebSphere MQ queue manager. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
startupRetryCount	int Minimum: 0	0	Number of times to retry creating a connection on startup
startupRetryInterval	A period of time with millisecond precision	30s	The time to wait, in milliseconds, between each retry attempt when connecting on startup. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.

## WS-AtomicTransaction (wsAtomicTransaction)

Configuration properties for the Web Services Atomic Transaction feature.

Attribute name	Data type	Default value	Description
clientAuth	boolean	false	Specifies whether additional client authentication is enabled for the WS-AtomicTransaction protocol when SSL is enabled.
externalURLPrefix	string		Optionally specifies the host and port address of a proxy server used to route the WS-AtomicTransaction protocol.

Attribute name	Data type	Default value	Description
sslEnabled	boolean	false	When set to true, WS-AtomicTransaction internal event messages sent between the WS-AT coordinator and participant are encrypted using SSL.
sslRef	A reference to top level ssl element (string).	defaultSSLConfig	Specifies the SSL configuration to be used for the WS-AtomicTransaction protocol when SSL is enabled.

## WS-Security Client (wsSecurityClient)

Web Services Security default configuration for client.

- encryptionProperties
- signatureProperties

Attribute name	Data type	Default value	Description
ws-security.callback-handler	string		Password callback handler implementation class.
ws-security.encryption.username	string		Alias used for accessing encryption keystore.
ws-security.password	Reversably encoded password (string)		User password information needed to create Username Token.
ws-security.signature.username	string		Alias used for accessing signature keystore.
ws-security.username	string		User information to create Username Token.

### encryptionProperties

Required encryption configuration.

false

Attribute name	Data type	Default value	Description
org.apache.ws.security.crypto.provider	string		The provider used to load certificates. Defaults to keystore provider.
org.apache.ws.security.crypto.file	string		The location of the keystore
org.apache.ws.security.crypto.keystore.alias	string		The default keystore alias to use, if none is specified.
org.apache.ws.security.crypto.keystore.password	Reversably encoded password (string)		Password to access keystore file.
org.apache.ws.security.crypto.keystore.private.password	Reversably encoded password (string)		The default password used to load the private key.
org.apache.ws.security.crypto.keystore.provider	string		The provider used to load keystores. Defaults to installed provider.
org.apache.ws.security.crypto.keystore.type	string		JKS, JCEKS or PKCS11

Attribute name	Data type	Default value	Description
org.apache.ws.security.crypto	string.truststore.file		The location of the truststore
org.apache.ws.security.crypto	ReversibleTrustStore password (string)		The truststore password.
org.apache.ws.security.crypto	string.truststore.type		The truststore type.
org.apache.ws.security.crypto	string.x509crl.file		The location of an (X509) CRL file to use.
org.apache.ws.security.crypto	string.provider	org.apache.ws.security.components.crypto.provider	Provides the URL to create Crypto instances. Defaults to "org.apache.ws.security.components.crypto.Mer...

### signatureProperties

Required signature configuration.

false

Attribute name	Data type	Default value	Description
org.apache.ws.security.crypto	string.cert.provider		The provider used to load certificates. Defaults to keystore provider.
org.apache.ws.security.crypto	string.file		The location of the keystore
org.apache.ws.security.crypto	string.keystore.alias		The default keystore alias to use, if none is specified.
org.apache.ws.security.crypto	ReversibleTrustStore password (string)		Password to access keystore file.
org.apache.ws.security.crypto	ReversibleTrustStore private password (string)		The default password used to load the private key.
org.apache.ws.security.crypto	string.keystore.provider		The provider used to load keystores. Defaults to installed provider.
org.apache.ws.security.crypto	string.keystore.type		JKS, JCEKS or PKCS11
org.apache.ws.security.crypto	string.truststore.file		The location of the truststore
org.apache.ws.security.crypto	ReversibleTrustStore password (string)		The truststore password.
org.apache.ws.security.crypto	string.truststore.type		The truststore type.
org.apache.ws.security.crypto	string.x509crl.file		The location of an (X509) CRL file to use.
org.apache.ws.security.crypto	string.provider	org.apache.ws.security.components.crypto.provider	Provides the URL to create Crypto instances. Defaults to "org.apache.ws.security.components.crypto.Mer...

## WS-Security Provider (wsSecurityProvider)

Web Services Security default configuration for provider.

- callerToken
- encryptionProperties
- samlToken

- audienceRestrictions
- signatureProperties

Attribute name	Data type	Default value	Description
ws-security.callback-handler	string		Password callback handler implementation class.
ws-security.enable.nonce.cache	boolean	true	Whether to cache UsernameToken nonces.
ws-security.encryption.username	string		Alias used for accessing encryption keystore.
ws-security.signature.username	string		Alias used for accessing signature keystore.
ws-security.username	string		User information to create Username Token.

### callerToken

Caller token.

false

Attribute name	Data type	Default value	Description
allowCustomCacheKey	boolean	true	Allow the generation of a custom cache key to access the authentication cache and get the subject.
groupIdIdentifier	string		Specifies a SAML attribute that is used as the name of the group that the authenticated principal is a member of. There is no default value.
includeTokenInSubject	boolean	true	Specifies whether to include a SAML assertion in the subject.
mapToUserRegistry	<ul style="list-style-type: none"> <li>• User</li> <li>• No</li> <li>• Group</li> </ul>	No	<p>Specifies how to map an identity to a registry user. The options are No, User, and Group. The default is No, and the user registry is not used to create the user subject.</p> <p><b>User</b> Map a SAML identity to a user defined in the registry</p> <p><b>No</b> Do not map a SAML identity to a user or group in the registry</p> <p><b>Group</b> Map a SAML identity to a group defined in the user registry</p>

Attribute name	Data type	Default value	Description
name	string		Specify token name. The options are Usenamtoken, X509token, Samltoken.
realmIdentifier	string		Specifies a SAML attribute that is used as the realm name. The default is issuer.
realmName	string		Specifies a realm name when mapToUserRegistry is set to No or Group.
userIdentifier	string		Specifies a SAML attribute that is used as the user principal name in the subject. The default is NameID assertion.
userUniqueIdentifier	string		Specifies a SAML attribute that is used as the unique user name as it applies to the WSCredential in the subject. The default is the same as the userIdentifier attribute value.

### encryptionProperties

Required encryption configuration.

false

Attribute name	Data type	Default value	Description
org.apache.ws.security.crypto.provider	string.cert.provider		The provider used to load certificates. Defaults to keystore provider.
org.apache.ws.security.crypto.keystore.file	string.file		The location of the keystore
org.apache.ws.security.crypto.keystore.alias	string.keystore.alias		The default keystore alias to use, if none is specified.
org.apache.ws.security.crypto.keystore.password	Reversible keystore password (string)		Password to access keystore file.
org.apache.ws.security.crypto.keystore.private.password	Reversible keystore private password (string)		The default password used to load the private key.
org.apache.ws.security.crypto.keystore.provider	string.keystore.provider		The provider used to load keystores. Defaults to installed provider.
org.apache.ws.security.crypto.keystore.type	string.keystore.type		JKS, JCEKS or PKCS11
org.apache.ws.security.crypto.truststore.file	string.truststore.file		The location of the truststore
org.apache.ws.security.crypto.truststore.password	Reversible truststore password (string)		The truststore password.
org.apache.ws.security.crypto.truststore.type	string.truststore.type		The truststore type.
org.apache.ws.security.crypto.x509crl.file	string.x509crl.file		The location of an (X509) CRL file to use.

Attribute name	Data type	Default value	Description
org.apache.ws.security.crypto.provider	string	org.apache.ws.security.components.crypto.provider	Specifies the name of the Crypto instances. Defaults to "org.apache.ws.security.components.crypto.M...

### samlToken

Specifies the properties that are used to evaluate the trustworthiness and validity of a SAML Assertion.

false

Attribute name	Data type	Default value	Description
clockSkew	A period of time with millisecond precision	5m	This is used to specify the allowed clock skew in minutes when validating the SAML token. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
requiredSubjectConfirmationMethod	bearer	bearer	Specify whether the Subject Confirmation Method is required in the SAML Assertion. Default is true. <b>bearer</b> bearer
timeToLive	A period of time with millisecond precision	30m	Specify the default life time of a SAML Assertion in the case it does not define the NoOnOrAfter condition. Default is 30 minutes. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
wantAssertionsSigned	boolean	true	Indicates a requirement for the <saml:Assertion> elements received by this service provider to be signed.

### samlToken > audienceRestrictions

Specify the allowed audiences of the SAML Assertion. Default is all audiences allowed.

false

string

### signatureProperties

Required signature configuration.

false

Attribute name	Data type	Default value	Description
org.apache.ws.security.crypto.provider	string.cert.provider		The provider used to load certificates. Defaults to keystore provider.
org.apache.ws.security.crypto.keystore.file	string.file		The location of the keystore
org.apache.ws.security.crypto.keystore.alias	string.keystore.alias		The default keystore alias to use, if none is specified.
org.apache.ws.security.crypto.keystore.password	string.keystore.password (string)		Password to access keystore file.
org.apache.ws.security.crypto.keystore.private.password	string.keystore.private.password (string)		The default password used to load the private key.
org.apache.ws.security.crypto.keystore.provider	string.keystore.provider		The provider used to load keystores. Defaults to installed provider.
org.apache.ws.security.crypto.keystore.type	string.keystore.type		JKS, JCEKS or PKCS11
org.apache.ws.security.crypto.truststore.file	string.truststore.file		The location of the truststore
org.apache.ws.security.crypto.truststore.password	string.truststore.password (string)		The truststore password.
org.apache.ws.security.crypto.truststore.type	string.truststore.type		The truststore type.
org.apache.ws.security.crypto.x509crl.file	string.x509crl.file		The location of an (X509) CRL file to use.
org.apache.ws.security.crypto.provider	string	org.apache.ws.security.components.crypto.provider	Provides the provider to use to create Crypto instances. Defaults to "org.apache.ws.security.components.crypto.Mer...

## WAS WebSocket Outbound (wsocOutbound)

Configuration properties for WAS WebSocket outgoing connection requests.

- httpOptions
- sslOptions
- tcpOptions

Attribute name	Data type	Default value	Description
httpOptionsRef	A reference to top level httpOptions element (string).	defaultHttpOptions	HTTP protocol options for WAS WebSocket outbound
sslOptionsRef	A reference to top level sslOptions element (string).		SSL protocol options for WAS WebSocket outbound
tcpOptionsRef	A reference to top level tcpOptions element (string).	defaultTCPOptions	TCP protocol options for WAS WebSocket outbound

## httpOptions

HTTP protocol options for WAS WebSocket outbound

false

Attribute name	Data type	Default value	Description
keepAliveEnabled	boolean	true	Enables persistent connections (HTTP keepalive). If true, connections are kept alive for reuse by multiple sequential requests and responses. If false, connections are closed after the response is sent.
maxKeepAliveRequests	int Minimum: -1	100	Maximum number of persistent requests that are allowed on a single HTTP connection if persistent connections are enabled. A value of -1 means unlimited.
persistTimeout	A period of time with second precision	30s	Amount of time that a socket will be allowed to remain idle between requests. This setting only applies if persistent connections are enabled. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
readTimeout	A period of time with second precision	60s	Amount of time to wait for a read request to complete on a socket after the first read occurs. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
removeServerHeader	boolean	false	Removes server implementation information from HTTP headers and also disables the default Liberty profile welcome page.

Attribute name	Data type	Default value	Description
writeTimeout	A period of time with second precision	60s	Amount of time to wait on a socket for each portion of the response data to be transmitted. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.

### sslOptions

SSL protocol options for WAS WebSocket outbound

false

Attribute name	Data type	Default value	Description
sessionTimeout	A period of time with second precision	1d	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), or seconds (s). For example, specify 30 seconds as 30s. You can include multiple values in a single entry. For example, 1m30s is equivalent to 90 seconds.
sslRef	A reference to top level ssl element (string).		The default SSL configuration repertoire. The default value is defaultSSLSettings.
suppressHandshakeErrors	boolean	false	Disable logging of SSL handshake errors. SSL handshake errors can occur during normal operation, however these messages can be useful when SSL is behaving unexpectedly.

### tcpOptions

TCP protocol options for WAS WebSocket outbound

false

Attribute name	Data type	Default value	Description
inactivityTimeout	A period of time with millisecond precision	60s	Amount of time to wait for a read or write request to complete on a socket. This value is overridden by protocol-specific timeouts. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
soReuseAddr	boolean	true	Enables immediate rebind to a port with no active listener.

## z/OS Connect Data Transformer (zosConnectDataXform)

Defines a z/OS Connect data transformer.

Attribute name	Data type	Default value	Description
bindFileLoc	string		File system path where the bind files are located.
bindFileSuffix	string		Suffix name that is associated with the bind files.
id	string		A unique configuration ID.
pollingRate	A period of time with millisecond precision	2s	Rate at which the server checks for updates to data transformation related files such as bind or schema files. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
requestSchemaLoc	string		File system path where the request schema files are located.
requestSchemaSuffix	string		Suffix name that is associated with the request schema files.

Attribute name	Data type	Default value	Description
responseSchemaLoc	string		File system path where the response schema files are located.
responseSchemaSuffix	string		Suffix name that is associated with the response schema files.
updateTrigger	<ul style="list-style-type: none"> <li>• mbean</li> <li>• polled</li> <li>• disabled</li> </ul>	polled	<p>Update trigger for data transformation files such as bind and schema files.</p> <p><b>mbean</b> Server reloads data transformation files when prompted by an MBean called by an external program such as an integrated development environment or a management application.</p> <p><b>polled</b> Server scans for changes at the polling interval and reload any files that have detectable changes.</p> <p><b>disabled</b> Disables all update monitoring. Data transformation file changes will not be applied while the server is running.</p>

## z/OS Connect Interceptors (zosConnectInterceptors)

Bundles 1 to N interceptors.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
interceptorRef	List of references to top level auditInterceptor elements (comma-separated string).		The identifier of one or more interceptors.

## z/OS Connect Manager (zosConnectManager)

Defines global configuration settings for z/OS Connect.

- globalInterceptorsRef

Attribute name	Data type	Default value	Description
asyncRequestTimeout	A period of time with millisecond precision		<p>Timeout value that is associated with all service endpoints when processing asynchronous work. It specifies the time in milliseconds in which requests have to complete. This timeout value overrides the web container's <code>asyncTimeoutDefault</code> attribute value. If neither <code>asyncRequestTimeout</code> nor <code>asyncTimeoutDefault</code> are configured, the timeout used is the <code>asyncTimeoutDefault</code> attribute default value (i.e. 30 seconds). If <code>asyncRequestTimeout</code> is not configured, but the <code>asyncTimeoutDefault</code> attribute is, the <code>asyncTimeoutDefault</code>'s configured value is used. A timeout may occur at any time during z/OS Connect's processing of the request. The request might still be active after the timeout is detected and a response is sent to the client. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.</p>
globalAdminGroup	string		Administrative group name that is associated with all service endpoints. It is the name of the security group that the user needs to be in before administrative functions are permitted.
globalDataXformRef	A reference to top level <code>zosConnectDataXform</code> element (string).		Reference name that identifies the data transformation handler that is associated with all service endpoints.

Attribute name	Data type	Default value	Description
globalInvokeGroup	string		Invoke group name that is associated with all service endpoints. It contains the name of the security group that the user needs to be in before invoke calls are permitted.
globalOperationsGroup	string		Operations group name that is associated with all service endpoints. It is the name of the security group that the user needs to be in before operations such as start, stop, or status is permitted.
operationMode	<ul style="list-style-type: none"> <li>• SYNC</li> <li>• ASYNC</li> </ul>	ASYNC	<p>Specifies the mode in which all z/OS Connect requests are processed.</p> <p><b>SYNC</b> Synchronous mode of operation</p> <p><b>ASYNC</b> Asynchronous mode of operation</p>
preserveJsonObjectPayloadOrder	boolean	false	Indicates if the order of entries in a JSON object payload should be preserved. This setting applies to requests associated with all service endpoints.
preserveJsonPayloadCharForm	boolean	false	Indicates if the JSON payload's characters should flow unchanged through z/OS Connect during a service invocation and schema retrievals when using z/OS Connect's data transformer. When it is set to false, UTF-8 encoded characters might be converted to its respective escaped unicode representation. For this attribute to take effect, the attribute definition <code>preserveJsonObjectPayloadOrder</code> must be configured and set to true.
requireAuth	boolean	true	Indicates if users must provide security credentials in order for z/OS Connect to process requests. This setting applies to requests associated with all service endpoints.

Attribute name	Data type	Default value	Description
requireSecure	boolean	true	Indicates if requests must be made by using the secure HTTPS channel. This setting applies to requests associated with all service endpoints.
setUTF8ResponseEncoding	boolean	false	Indicates if the character encoding in the HTTP response should be set to UTF-8.

### globalInterceptorsRef

Reference name that identifies the set of configured interceptors that is associated with all service endpoints. If service endpoints do not require global interceptors association, the runGlobalInterceptors attribute under the zosConnectService element can be set to false.

false

tokenType

## z/OS Connect Endpoint (zosConnectService)

Defines the configuration settings for a service endpoint.

- interceptorsRef

Attribute name	Data type	Default value	Description
adminGroup	string		Administrative group name that is associated with a service endpoint. It is the name of the security group that the user needs to be in before administrative functions are permitted. If it is configured along with its global counterpart globalAdminGroup that is defined under element zosConnectManager, the value defined under adminGroup is used.
dataXformRef	A reference to top level zosConnectDataXform element (string).		Reference name that identifies the data transformation handler that is associated with a service endpoint. If configured along with its global data transformation handler counterpart globalDataXformRef that is defined under element zosConnectManager, the data transformer defined for the service endpoint is used.
id	string		A unique configuration ID.

Attribute name	Data type	Default value	Description
invokeGroup	string		Invoke group name that is associated with a service endpoint. It contains the name of the security group that the user needs to be in before invoke calls are permitted. If it is configured along with its global counterpart globalInvokeGroup that is defined under element zosConnectManager, the value defined under invokeGroup is used.
invokeURI	string		<p>URI or list of comma-separated URIs to associate with a service endpoint. InvokeURIs can end with a wildcard character in the form /a/b/* or x/y* to generically match a service endpoint invocation. Specifying multiple wildcard characters (i.e. /a/b/**) or wildcard characters in the middle of the requestURI (i.e. /a/*/c) is not supported. If service endpoints with configured invokeURIs using the wildcard character are associated with overlapping invokeURIs, the service endpoint associated with the most specific invokeURI is matched. For instance, if a service endpoint request is issued with the following:  https://host:port/a/b/c  going to a server with the following configuration:  service1 -&gt;  invokeURI="/a/b/c/*" and  service2 -&gt;  invokeURI="/a/b/*", z/OS Connect will match the request to service1. Configured invokeURI entries must start with the / character. The use of an invokeURI is equivalent to a service request where the action=invoke query parameter is specified.</p>

Attribute name	Data type	Default value	Description
operationsGroup	string		Operations group name that is associated with a service endpoint. It is the name of the security group that the user needs to be in before operations such as start, stop, or status is permitted. If it is configured along with its global counterpart, globalOperationsGroupdefined under element zosConnectManager, the value defined under operationsGroup is used.
requireAuth	boolean		Indicates if users must provide security credentials in order for z/OS Connect to process requests associated with a service endpoint. If it is configured along with its global counterpart requireAuth that is defined under the zosConnectManager element, the value defined for the service endpoint is used.
requireSecure	boolean		Indicates if requests associated with a service endpoint must be made by using the secure HTTPS channel. If it is configured along with its global counterpart requireSecure that is defined under the zosConnectManager element, the value defined for the service endpoint is used.
runGlobalInterceptors	boolean	true	Indicates whether global interceptors should run for requests associated with a service endpoint. By default z/OS Connect processes all global and service endpoint specific interceptors .

Attribute name	Data type	Default value	Description
serviceAsyncRequestTimeout	A period of time with millisecond precision		Timeout value that is associated with a service endpoint when processing asynchronous work. It specifies the time in milliseconds in which requests have to complete. This timeout value overrides the web container's <code>asyncTimeoutDefault</code> attribute value. If neither <code>asyncRequestTimeout</code> nor <code>asyncTimeoutDefault</code> are configured, the timeout used is the <code>asyncTimeoutDefault</code> attribute default value (i.e. 30 seconds). If <code>asyncRequestTimeout</code> is not configured, but the <code>asyncTimeoutDefault</code> attribute is, the <code>asyncTimeoutDefault</code> 's configured value is used. If configured along with its global counterpart: <code>asyncRequestTimeout</code> defined under element <code>zosConnectManager</code> , the value defined under <code>serviceAsyncRequestTimeout</code> is used. A timeout may occur at any time during z/OS Connect's processing of the request. The request may still be active after the timeout is detected and a response is sent to the client. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
serviceDescription	string		Description that is associated with a service endpoint.
serviceGroupingName	string		Name that can be used to group or associate a set of service endpoints together.

Attribute name	Data type	Default value	Description
serviceName	string		Name that is associated with a service endpoint. This name identifies a service endpoint to a client.
serviceRef	A reference to top level localAdaptersConnectService element (string).		Reference name that identifies the service endpoint that is registered with z/OS Connect.

### interceptorsRef

Reference name that identifies the set of configured interceptors that is associated with a service endpoint. If it is configured along with its global interceptors counterpart globalInterceptorsRef that is defined under the zosConnectManager element, z/OS Connect processes both sets of interceptors. If the runGlobalInterceptors attribute for the service endpoint is set to false, z/OS connect will only process the set of interceptors configured for the service endpoint.

false

tokenType

## z/OS Connect REST Client (zosConnectServiceRestClient)

Allows requests to be routed from z/OS Connect to a remote REST endpoint.

- basicAuth

Attribute name	Data type	Default value	Description
basicAuthRef	A reference to top level zosConnectServiceRestClientBasicAuth element (string).	BasicAuth	Reference name that identifies the basic authentication data to be used for connecting to a remote REST endpoint.
connectionTimeout	A period of time with millisecond precision	30s	The connection timeout specifies the amount of time that the client will attempt to establish a connection to the remote endpoint before it times out. If the timeout value is set to 0, the client will attempt to open a connection indefinitely. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
host	string		IP address, domain name server (DNS) host name with domain name suffix, or just the DNS host name, used to route the request.

Attribute name	Data type	Default value	Description
httpMethod	string		Name of the HTTP method to be used when routing HTTP requests. If no method is specified, the method used is the one in the original request.
id	string		A unique configuration ID.
port	string		Port used for routing HTTP or HTTPS requests.
receiveTimeout	A period of time with millisecond precision	60s	The receive timeout specifies the amount of time that the client will wait for a response from the remote endpoint before it times out. If the timeout value is set to 0, the client will wait for a response indefinitely. Specify a positive integer followed by a unit of time, which can be hours (h), minutes (m), seconds (s), or milliseconds (ms). For example, specify 500 milliseconds as 500ms. You can include multiple values in a single entry. For example, 1s500ms is equivalent to 1.5 seconds.
sslCertsRef	A reference to top level keyStore element (string).		An SSL repertoire with an ID, a defined keystore, and truststore.
uri	string		URI that identifies the resource to contact when routing HTTP requests. If no URI is specified everything after the port number from the original request is used.

### basicAuth

Reference name that identifies the basic authentication data to be used for connecting to a remote REST endpoint.

false

Attribute name	Data type	Default value	Description
password	Reversably encoded password (string)		Password of the user under which the request will be routed. The value can be stored in clear text or encoded. It is recommended that the password be encoded. To do so, use the securityUtility shipped with WebSphere Liberty profile.

Attribute name	Data type	Default value	Description
userName	string		Name of the user under which the request will be routed.

## z/OS Connect Rest Client Basic Authentication (zosConnectServiceRestClientBasicAuth)

Basic authentication data for connecting to a remote REST endpoint.

Attribute name	Data type	Default value	Description
id	string		A unique configuration ID.
password	Reversably encoded password (string)		Password of the user under which the request will be routed. The value can be stored in clear text or encoded. It is recommended that the password be encoded. To do so, use the securityUtility shipped with WebSphere Liberty profile.
userName	string		Name of the user under which the request will be routed.

## WOLA (zosLocalAdapters)

WebSphere Optimized Local Adapters.

Attribute name	Data type	Default value	Description
useCicsTaskUserId	boolean	false	If security is enabled in the WOLA client, this setting controls which user ID is propagated to this Liberty profile server when a WOLA request is sent from the client to the server. If you enable this setting, the user ID of the task that makes the request is propagated. If you do not enable this setting, the user ID of the client address space is propagated. This setting is applicable only to CICS clients.
wolaGroup	string		The WOLA group name is the first part of the 3-part WOLA name. The name cannot contain lowercase letters.

Attribute name	Data type	Default value	Description
wolaName2	string		The 2nd part of the 3-part WOLA name. The name cannot contain lowercase letters.
wolaName3	string		The 3rd part of the 3-part WOLA name. The name cannot contain lowercase letters.

## z/OS Logging (zosLogging)

Configuration properties for logging on z/OS.

Attribute name	Data type	Default value	Description
enableLogToMVS	boolean	false	Enable routing of USS-started server messages to the MVS console.
hardCopyMessage	string		A comma-separated list of message IDs to be written to the hardcopy log.
wtoMessage	string		A comma-separated list of message IDs to be written to operator.

## WLM Native Enclave Manager (zosWorkloadManager)

WLM Native Enclave Manager Configuration.

Attribute name	Data type	Default value	Description
collectionName	string	\${wlp.server.name}	A collection name to be used for classifying work requests. The name is supplied to native services IWMCLSFY or __server_classify. Only the first 18 characters will be used.

---

## Liberty: Feature management

Features are the units of functionality by which you control the pieces of the runtime environment that are loaded into a particular server.

Use the configuration file `server.xml` to declare which features you want to load. The set of features is enclosed within the `<featureManager>` element, and each feature within the `<feature>` subelement. For example:

```
<server>
  <featureManager>
    <feature>servlet-3.0</feature>
    <feature>localConnector-1.0</feature>
  </featureManager>
</server>
```

You can specify any feature in the server configuration file. Some features include other features within them. The same feature can be included in one or more other features. At run time, the feature manager computes the combined list of content that is required to support the requested set of features.

For information about the main available features, see “Liberty features” on page 826. For information about the restrictions that apply to each feature, see “Liberty:Runtime environment known issues and restrictions” on page 2333.

## Dynamic changes to feature configuration

When you change the feature configuration, the feature manager recalculates the list of required bundles, stops and uninstalls those bundles that are no longer required, and installs and starts any additions. Therefore, all features are designed to cope with other features that are being dynamically added or removed.

8.5.5.4

### Singleton Features

With the delivery of the first set of features for Java EE 7, there are now two versions of the same feature:

- `servlet-3.0`
- `servlet-3.1`

Unlike other application servers, you can choose which version of this feature to use in a server configuration. `servlet-3.0` preserves behavior for existing applications, while `servlet-3.1` provides new capabilities for new or modified applications. Although there is a choice of specification versions, no additional configuration properties are required, or provided, to control individual differences between the two versions.

The servlet feature is a singleton feature, which means that you can configure only one version for use in a server: either `servlet-3.0` or `servlet-3.1`. If you have applications that need different versions of the servlet feature, you must deploy them in different servers. Many other features include the servlet feature as a dependency. In the WebSphere Liberty product, these features have been updated to work with either version. This ensures that you can configure a complete “stack” of features when you use `servlet-3.1`, but features from other sources might not have been updated to “tolerate” `servlet-3.1`. To enable features to “tolerate” `servlet-3.1`, modify the feature manifest as follows:

```
Subsystem-Content: com.ibm.websphere.appserver.servlet-3.0; ibm.tolerates:="3.1"; type="osgi.subsystem.feature"
```

If your server configuration includes multiple versions of a singleton feature, either through direct configuration in the `server.xml` file, or through feature dependencies, that configuration is in error and neither version of that feature is loaded. This error results in a message similar to the following:

```
[ERROR ] CWWKF0033E: The singleton features servlet-3.1 and servlet-3.0 cannot be loaded at the same time. The configured
```

To resolve this problem, ensure that the configured features all specify, or tolerate, the same version of that singleton feature. If you have hard requirements on both feature versions, you must move some of your applications to a different server. For more information on tolerating singleton features, see [Tolerating singleton features](#).

8.5.5.0

### Superseded features

The **superseded** label on a feature indicates that a new feature or a combination of features might provide an advantage over using the superseded feature. For example, new, finer-grained features might be used in place of the superseded one in order to reduce the server footprint by excluding content that might not be necessary. The new feature or features might not completely replace the function of the superseded feature, so you must consider your scenario before deciding whether to change your

configuration. Superseded features remain completely supported and valid for use in your configuration; the **superseded** label just provides an indication that you might be able to improve your configuration.

**8.5.5.0** Very occasionally, a feature that includes other features is superseded by a new version of the feature that does not include all those features; the features that are not included in the new version are considered to be *separated*. If your application needs to use the functions of a separated feature, you must explicitly add the separated feature to your configuration.

For example, featureA and featureB have the following conditions:

- featureA-1.0 includes featureB-1.0
- featureA-2.0 does not include featureB-1.0 (or any later versions of featureB)

If your application uses featureB functions, either of these configurations will work:

- Include featureA-1.0 in your server.xml file
- Include featureA-2.0 and featureB-1.0 in your server.xml file

## Liberty features

Features are the units of functionality by which you control the pieces of the runtime environment that are loaded into a particular server.

The following table lists the Liberty features that are supported for each WebSphere Application Server Liberty edition.

**Tip:** To install all features that apply your Liberty edition, you can install a feature bundle add-on. WebSphere Application Server Network Deployment Liberty has two bundles: The `ndMemberBundle` add-on contains most features and is for servers that are clustered and auto-scaled in a Liberty collective, and the `ndControllerBundle` add-on contains a small set of features only for managing Liberty collectives.

## Feature descriptions

The following list contains information about the features you can add to your server configuration. Including a feature in the configuration might cause one or more additional features to be loaded automatically. For example, if you include the `wab-1.0` feature, the `servlet-3.0` and `blueprint-1.0` features are loaded automatically. Each feature includes a brief description, and an example of how the feature is declared within the `<featureManager>` element inside the `server.xml` file. For example:

```
<server>
  <featureManager>
    <feature>servlet-3.0</feature>
    <feature>localConnector-1.0</feature>
  </featureManager>
</server>
```

### Java EE 7 Web Profile

#### 8.5.5.6 Bean validation

```
<feature>beanValidation-1.1</feature>
```

The `beanValidation-1.1` feature provides validations for JavaBeans at each layer of an application. The validation can be applied to all layers of JavaBeans in an application by using annotations or a `validation.xml` deployment descriptor.

See “Bean validation feature restrictions” on page 2337.

For `beanValidation-1.1` feature configuration information, see “Bean Validation 1.1” on page 863.

#### 8.5.5.6 CDI

```
<feature>cdi-1.2</feature>
```

The `cdi-1.2` feature enables support for the Contexts and Dependency Injection 1.2 specification on Liberty.

See “Administering Contexts and Dependency Injection applications on Liberty” on page 1725.

For `cdi-1.2` feature configuration information, see “Contexts and Dependency Injection 1.2” on page 868.

### Enterprise Java Beans (EJB) Lite

```
8.5.5.6 <feature>ejbLite-3.2</feature>
```

The `ejbLite-3.2` feature provides support for EJB applications that are written to the EJB Lite subset of the EJB 3.2 specification.

Note that the EJB 3.2 Lite API Group does not include the embeddable EJB container, and the product does not provide an EJB 3.2 embeddable container.

Also, the following features are not compatible with the `ejbLite-3.2` feature:

- `cdi-1.0`
- `jmsMdb-3.1`
- `mdb-3.1`

See “Developing EJB applications on Liberty” on page 2116.

For `ejbLite-3.2` feature configuration information, see “Enterprise JavaBeans Lite 3.2” on page 875.

### Expression Language 3.0

```
<feature>el-3.0</feature>
```

This feature enables support for the Expression Language (EL) 3.0.

See “Configuring Liberty for Expression Language 3.0” on page 1721.

For `el-3.0` feature configuration information, see “Expression Language 3.0” on page 878.

#### 8.5.5.6 Java API for RESTful Web Services (JAX-RS)

```
<feature>jaxrs-2.0</feature>
```

The `jaxrs-2.0` feature provides support for the Java API for RESTful Web Services on Liberty.

See “Configuring JAX-RS 2.0 client” on page 2162 and “JAX-RS 2.0 integration with EJB and CDI” on page 2171.

For `jaxrs-2.0` feature configuration information, see “Java RESTful Services 2.0” on page 914.

#### 8.5.5.6 Java EE Client API for JAX-RS 2.0

```
<feature>jaxrsClient-2.0</feature>
```

The `jaxrsClient-2.0` feature provides support for Java Client API for JAX-RS 2.0

See “Configuring JAX-RS 2.0 client” on page 2162 and “JAX-RS 2.0 integration with EJB and CDI” on page 2171.

For `jaxrsClient-2.0` feature configuration information, see “Java RESTful Services Client 2.0” on page 914.

### Java Database Connectivity (JDBC)

```
<feature>jdbc-4.1</feature>
```

You can take an existing application that uses Java Database Connectivity (JDBC) and a data source, and deploy the application to a server. The `jdbc-4.1` feature provides support for applications that access a database.

See “Configuring relational database connectivity in Liberty” on page 1672.

For `jdbc-4.1` feature configuration information, see “Java Database Connectivity 4.1” on page 895.

### Java Naming and Directory Interface (JNDI)

```
<feature>jndi-1.0</feature>
```

The `jndi-1.0` feature provides support for a single JNDI entry definition in the server configuration of Liberty.

See “Developing with the JNDI default namespace in a Liberty feature” on page 1819.

For `jndi-1.0` feature configuration information, see “Java Naming and Directory Interface” on page 902.

#### 8.5.5.6 **Java Persistence API 2.1**

`<feature>jpa-2.1</feature>`

The `jpa-2.1` feature provides support for applications that use application-managed and container-managed JPA written to the JPA 2.1 specification and is backed by EclipseLink.

See “Java Persistence API (JPA) feature overview” on page 1016.

For `jpa-2.1` feature configuration information, see “Java Persistence API 2.1” on page 906.

#### 8.5.5.6 **JavaServer Faces (JSF)**

`<feature>jsf-2.2</feature>`

This feature enables support for web applications that use the Java Server Faces (JSF) 2.2 framework. This framework simplifies the construction of user interfaces.

See “Configuring Liberty for JavaServer Faces 2.2” on page 1722.

For `jsf-2.2` feature configuration information, see “JavaServer Faces 2.2” on page 927.

### **JavaScript Object Notation Processing**

`<feature>jsonp-1.0</feature>`

The Java API for JSON Processing (JSON-P) feature provides a standardized method for constructing and manipulating data to be rendered in JavaScript Object Notation (JSON).

For `jsonp-1.0` feature configuration information, see “JavaScript Object Notation Processing” on page 924.

### **JavaServer Pages (JSP)**

`<feature>jsp-2.3</feature>`

This feature enables support for Java Server Pages (JSPs) that are written to the JSP 2.3 specification. This framework simplifies the construction of user interfaces. Enabling this feature also enables the Expression Language (EL) version 3.0 feature. `el-3.0`.

See “Configuring Liberty for JavaServer Pages 2.3” on page 1724.

For `jsp-2.3` feature configuration information, see “JavaServer Pages 2.3” on page 928.

### **Managed Beans**

`<feature>managedBeans-1.0</feature>`

The `managedBeans-1.0` feature provides support for the Managed Beans 1.0 specification (JSR-316). This feature enables use of the `javax.annotation.ManagedBean` annotation.

For `managedBeans-1.0` feature configuration information, see “Java EE Managed Bean 1.0” on page 897.

### **Servlet 3.1**

`<feature>servlet-3.1</feature>`

The `servlet-3.1` feature enables support for HTTP Servlets that are written to the Java Servlet 3.1 specification.

See “Configuring Liberty for Servlet 3.1” on page 1713 and “Servlet 3.1 behavior changes” on page 1714.

For `servlet-3.1` feature configuration information, see “Java Servlets 3.1” on page 917.

#### 8.5.5.6 **Web Profile 7.0**

`<feature>webProfile-7.0</feature>`

This feature provides a convenient combination of the Liberty features that are required to support the Java EE 7 Web Profile.

See “Java EE 7 in Liberty” on page 4.

For webProfile-7.0 feature configuration information, see “Java EE Web Profile 7.0” on page 899.

## WebSocket

```
<feature>websocket-1.0</feature>
```

```
<feature>websocket-1.1</feature>
```

WebSocket is a standard protocol that enables a web browser or client application and a web server application to communicate by using one full duplex connection.

See Liberty: WebSocket and “Developing WebSocket applications in Liberty” on page 2137.

For websocket-1.0 feature configuration information, see “Java WebSocket 1.0” on page 921.

For websocket-1.1 feature configuration information, see “Java WebSocket 1.1” on page 922.

## Java EE 7 Full Platform

### 8.5.5.6 Application Client Support

```
<feature>appClientSupport-1.0</feature>
```

The appClientSupport-1.0 feature enables the server to process Java EE metadata inside the client module of an application, for example, read the deployment descriptor XML file and/or annotations and make them available to other modules in the application if necessary. It also enables the remote application client process to communicate with the server to do JNDI lookups.

The appClientSupport-1.0 feature is enabled in the server.xml file only.

For appClientSupport-1.0 feature configuration information, see “Application Client Support for Server” on page 856.

### 8.5.5.6 Application Client Container Security

```
<feature>appSecurityClient-1.0</feature>
```

To enable security on the client container, add the appSecurityClient-1.0 feature to your client.xml file.

The appSecurityClient-1.0 feature enables SSL, CSIV2, and JAAS on the client. You must configure SSL to ensure communications between the client and server are secure and encrypted.

See “Security on the Liberty application client container” on page 1001 and “Configuring security for the Liberty application client container and its applications” on page 1984.

For appSecurityClient-1.0 feature configuration information, see “Application Security for Client 1.0” on page 858.

### 8.5.5.6 Batch

```
<feature>batch-1.0</feature>
```

The batch-1.0 feature enables the use of the JSR-352 programming model.

See “Java batch and managed batch overview” on page 2208.

For batch-1.0 feature configuration information, see “Batch API 1.0” on page 860.

## Managed Executors and Thread Factories

```
<feature>concurrent-1.0</feature>
```

The concurrent-1.0 feature enables the creation of managed executor services that allow applications to submit tasks to run concurrently, with thread context that is managed by

the application server. The feature also enables the creation of managed thread factories to create threads that run with the thread context of the component that looks up the managed thread factory.

See “Configuring managed scheduled executors” on page 1637.

For concurrent-1.0 feature configuration information, see “Concurrency Utilities for Java EE 1.0” on page 866.

## Enterprise Java Beans (EJB)

**8.5.5.6** <feature>ejb-3.2</feature>

The `ejb-3.2` feature provides support for EJB applications that are written to the EJB 3.2 specification.

This feature includes the following features:

- **8.5.5.6** <feature>ejbLite-3.2</feature>

This feature gives support for EJB applications that are written to the EJB Lite subset of the EJB 3.2 specification. For `ejbLite-3.2` feature configuration information, see “Enterprise JavaBeans Lite 3.2” on page 875.

- **8.5.5.6** <feature>ejbHome-3.2</feature>

This feature gives support for the EJB 2.x APIs. For `ejbHome-3.2` feature configuration information, see “Enterprise JavaBeans Home Interfaces 3.2” on page 873.

- **8.5.5.6** <feature>ejbPersistentTimer-3.2</feature>

This feature gives support for persistent EJB timers. For `ejbPersistentTimer-3.2` feature configuration information, see “Enterprise JavaBeans Persistent Timers 3.2” on page 876.

- **8.5.5.6** <feature>ejbRemote-3.2</feature>

This feature gives support for remote EJB interfaces. For `ejbRemote-3.2` feature configuration information, see “Enterprise JavaBeans Remote 3.2” on page 876.

- **8.5.5.6** <feature>mdb-3.2</feature>

This feature gives support for message-driven beans. For `mdb-3.2` feature configuration information, see “Message-Driven Beans 3.2” on page 935.

The `mdb-3.2` feature supersedes the `jmsMdb-3.2` feature. For information about the `jmsMdb-3.2` feature, see “Deploying message-driven beans to connect to WebSphere MQ” on page 2201.

If full EJB 3.2 support is not required, various combinations of these features can be used to provide the support that you need.

See “Developing EJB applications on Liberty” on page 2116.

For `ejb-3.2` feature configuration information, see “Enterprise JavaBeans 3.2” on page 873.

### **8.5.5.6** J2EE Management 1.1

<feature>j2eeManagement-1.1</feature>

The `j2eeManagement-1.1` feature provides standard interfaces to manageable aspects of Java EE 7 and enables applications to use the interfaces defined in the JSR 77 specification.

To invoke Management EJB APIs, the server configuration must have both the `j2eeManagement-1.1` and `ejbRemote-3.2` features in a feature manager. After both features are in the server configuration, you can invoke Management EJB API through JNDI name lookup. The Management EJB binding name (JNDI lookup name) is `ejb/mejb/MEJB`.

See “j2eeManagement-1.1 feature restrictions” on page 2338.

For `j2eeManagement-1.1` feature configuration information, see “J2EE Management 1.1” on page 880.

#### 8.5.5.6 **Java Authorization Contract for Containers 1.5**

```
<feature>jacc-1.5</feature>
```

The jacc-1.5 feature enables support for Java Authorization Contract for Containers (JACC) version 1.5. In order to add the jacc-1.5 feature to your server, you need to add the third party JACC provider which is not a part of the WebSphere Application Server Liberty.

See “Developing a Java Authorization Contract for Containers (JACC) Authorization Provider” on page 2009.

For jacc-1.5 feature configuration information, see “Java Authorization Contract for Containers 1.5” on page 891.

#### 8.5.5.6 **Java Authentication SPI for Containers 1.1**

```
<feature>jaspic-1.1</feature>
```

The jaspic-1.1 feature enables support for securing the server runtime environment and applications using Java Authentication SPI for Containers (JASPIC) providers as defined in JSR-196.

See “Configuring a Java Authentication SPI for Containers (JASPIC) User Feature” on page 1871.

For jaspic-1.1 feature configuration information, see “Java Authentication SPI for Containers 1.1” on page 890.

#### 8.5.5.6 **Java EE**

```
<feature>javaee-7.0</feature>
```

This feature provides a convenient combination of the Liberty features that are required to support the Java EE 7.0 Full Platform.

See “Java EE 7 in Liberty” on page 4.

For javaee-7.0 feature configuration information, see “Java EE Full Platform 7.0” on page 896.

#### 8.5.5.6 **Java EE Application Client 7.0**

```
<feature>javaeeClient-7.0</feature>
```

This feature enables support for Java EE Application Client 7.0.

See “Creating a Liberty application client manually” on page 1446.

For javaeeClient-7.0 feature configuration information, see “Java EE V7 Application Client” on page 898.

#### 8.5.5.6 **JavaMail API**

```
<feature>javaMail-1.5</feature>
```

The JavaMail API supports communication between external mail servers and Liberty applications. See “Administering JavaMail on Liberty” on page 1730.

For javaMail-1.5 feature configuration information, see “JavaMail 1.5” on page 923.

#### **Java Architecture for XML Binding (JAXB)**

```
<feature>jaxb-2.2</feature>
```

The jaxb-2.2 feature provides support for the Java Architecture for XML Binding (JAXB) on Liberty.

See JAXB and “jaxb-2.2 feature restriction” on page 2338.

For jaxb-2.2 feature configuration information, see “Java XML Bindings 2.2” on page 922.

#### **Java API for XML-Based Web Services (JAX-WS)**

```
<feature>jaxws-2.2</feature>
```

The jaxws-2.2 feature provides support for the Java API for XML-Based Web Services on Liberty.

- For web applications that support the JAX-WS programming model, you must enable the servlet-3.0 and jaxws-2.2 server features in the server.xml file.
- For EJB applications that support the JAX-WS programming model, you must enable the ejbLite-3.1, servlet-3.0, and jaxws-2.2 server features in the server.xml file.
- For applications that use the global handler services, you must enable the jaxrs-1.1 or the jaxws-2.2 feature in the server.xml file.

See “Deploying JAX-WS applications to Liberty” on page 2178 and “jaxws-2.2 feature restrictions” on page 2339.

For jaxws-2.2 feature configuration information, see “Java Web Services 2.2” on page 920.

#### 8.5.5.6 **Java EE Connector Architecture 1.7**

```
<feature>jca-1.7</feature>
```

The jca-1.7 feature provides configuration elements to define instances of connection factories, administered objects, and activation specifications, and to associate these instances with an installed resource adapter.

For jca-1.7 feature configuration information, see “Java Connector Architecture 1.7” on page 893.

#### **Java EE Connector Architecture Inbound Security**

```
<feature>jcaInboundSecurity-1.0</feature>
```

The jcaInboundSecurity-1.0 feature enables security inflow for resource adapters.

For jcaInboundSecurity-1.0 feature configuration information, see “Java Connector Architecture 1.0 Security Inflow” on page 891.

#### 8.5.5.6 **Java Message Service 2.0**

```
<feature>jms-2.0</feature>
```

The jms-2.0 feature enables the configuration of resource adapters to access messaging systems using the Java Message Service API. This also includes the configuration JMS connection factories, queues, topics and activation specifications. Any JMS resource adapter that complies with the JCA 1.6 specification can be used.

See “Enabling JMS messaging for Liberty” on page 1121 and “Deploying messaging applications to Liberty” on page 2195.

For jms-2.0 feature configuration information, see Java Messaging Service 2.0.

#### **Embedded Liberty Messaging features**

```
8.5.5.6 <feature>wasJmsClient-2.0</feature>
```

The wasJmsClient-2.0 feature supersedes the wasJmsClient-1.1 feature. The wasJmsClient-2.0 feature is compliant with the JMS 2.0 specification and is supported only on IBM JDK 7 or later.

See “Enabling JMS messaging for Liberty” on page 1121 and “Deploying messaging applications to Liberty” on page 2195.

For wasJmsClient-2.0 feature configuration information, see “JMS 2.0 Client for Message Server” on page 884.

```
<feature>wasJmsSecurity-1.0</feature>
```

The wasJmsSecurity-1.0 feature supports secure connections to the messaging engine. When the wasJmsSecurity-1.0 feature is enabled, it starts authenticating and authorizing the users who are trying to connect to the messaging engine. The user is authenticated against the registry that is defined in the server.xml file. When the user wants to access a

destination such as a topic or a queue, then the user must be granted the required permissions. The access to the destination is defined in the `<messagingSecurity>` element (the child element of the `messagingEngine` element) in the `server.xml` file. If the `wasJmsSecurity-1.0` feature is added and the `<messagingSecurity>` element is not defined in the `server.xml` file, then the users cannot connect to the messaging engine or perform any messaging action (for example, sending or receiving messages from the destinations). For `wasJmsSecurity-1.0` feature configuration information, see “Message Server Security 1.0” on page 933.

**Notes:**

- Configuring the user registry is a prerequisite for the `wasJmsSecurity-1.0` feature. Ensure that a user registry is configured before the `wasJmsSecurity-1.0` feature is enabled.
- When you enable the `wasJmsSecurity-1.0` feature, you must also configure the `<messagingSecurity>` element, which is the child element of the `<messagingEngine>` element, in the `server.xml` file. This configuration enables authorized users to access messaging destinations.

```
<feature>wasJmsServer-1.0</feature>
```

The `wasJmsServer-1.0` feature enables the JMS messaging engine run time to be initialized. The messaging run time is responsible for providing the application connectivity, managing the state of destinations such as topics or queues, and handling quality of service, security, and transactions. This feature also provides support for the inbound connections from the remote messaging applications. The remote messaging applications can connect to the JMS messaging engine through TCP/IP over SSL or non-SSL.

To connect using SSL, you must enable the SSL feature.

See “Enabling secure JMS messaging for Liberty” on page 1126.

For `wasJmsServer-1.0` feature configuration information, see “Message Server 1.0” on page 932.

## Extended Programming Models

### 8.5.5.9 Cloudant integration

```
<feature>cloudant-1.0</feature>
```

This feature enables connections to Cloudant by providing a connector instance configured in the server configuration. The connector instance can be injected or accessed through JNDI. Applications use the Cloudant client library to use the connector instance.

For `cloudant-1.0` feature configuration information, see “Cloudant Integration 1.0” on page 864.

### CouchDB

```
<feature>couchdb-1.0</feature>
```

The `couchdb-1.0` feature provides support for CouchDB instances and associated database connections. Access to CouchDB connections is available either by JNDI lookup or resource injection.

See “Configuring CouchDB connectivity with the ektorp client library in Liberty” on page 1686.

For `couchdb-1.0` feature configuration information, see “CouchDB Integration 1.0” on page 869.

### Cache Service

```
<feature>distributedMap-1.0</feature>
```

This feature provides a local cache service that can be accessed by using the DistributedMap API. A default cache is bound in JNDI at services/cache/distributedmap. You can distribute a cache by adding a network cache provider such as WebSphere eXtreme Scale.

For distributedMap-1.0 feature configuration information, see “Distributed Map interface for Dynamic Caching” on page 870.

### JavaScript Object Notation (JSON4J) Library

```
<feature>json-1.0</feature>
```

The json-1.0 feature provides access to the JSON4J library that provides a set of JSON handling classes for Java environments. The JSON4J library provides a simple Java model for constructing and manipulating data to be rendered as JSON data.

See Using JSON content in JAX-RS application requests and responses and JSON4J Libraries API.

For json-1.0 feature configuration information, see “JavaScript Object Notation for Java” on page 924.

### MongoDB

```
<feature>mongodb-2.0</feature>
```

The mongodb-2.0 feature provides support for MongoDB instances and associated database connections. Access to MongoDB connections is available either by JNDI lookup or resource injection. The native com.mongodb API performs the database manipulation.

See “Configuring MongoDB connectivity in Liberty” on page 1683.

For mongodb-2.0 feature configuration information, see “MongoDB Integration 2.0” on page 936.

#### 8.5.5.7 Real-Time Communications

```
<feature>rtcomm-1.0</feature>
```

The Liberty Real-Time Communications feature enables a highly-scalable call signalling engine that can be used to connect WebRTC clients into real-time audio/video/data calls. The feature supports both registration of clients as well as the exchange of signalling needed to create a WebRTC peer connection between two endpoints.

For rtcomm-1.0 feature configuration information, see “Real-Time Communications” on page 947.

#### 8.5.5.7 RTComm Gateway

```
<feature>rtcommGateway-1.0</feature>
```

The rtcommGateway-1.0 feature adds the capability for connecting Session Initiation Protocol (SIP) with RTComm WebRTC endpoints for the exchange of audio and video streams.

For rtcommGateway-1.0 feature configuration information, see “WebRTC Rtcomm Gateway” on page 958.

#### 8.5.5.7 SIP Servlet

```
<feature>sipServlet-1.1</feature>
```

The sipServlet-1.1 feature provides support for SIP Servlet Specification 1.1, also known as JSR 289. Session Initiation Protocol (SIP) is a control protocol for many interactive services, including audio, video, and peer-to-peer communication.

See “Liberty: Session Initiation Protocol (SIP)” on page 1033 and “Administering Session Initiation Protocol (SIP) on Liberty” on page 1728.

For sipServlet-1.1 feature configuration information, see “SIP Servlet” on page 949.

## Enterprise OSGi

## Blueprint

```
<feature>blueprint-1.0</feature>
```

The `blueprint-1.0` feature enables support for deploying OSGi applications that use the OSGi blueprint container specification. With the OSGi Applications support in WebSphere Application Server, you can develop and deploy modular applications that use Java EE and OSGi technologies.

See “Locating OSGi applications” on page 1818 and OSGi Applications.

For `blueprint-1.0` feature configuration information, see “OSGi Blueprint” on page 938.

## OSGi application integration

```
<feature>osgiAppIntegration-1.0</feature>
```

Use the `osgiAppIntegration-1.0` feature to enable the OSGi applications that are available within the same Java virtual machine to share their services with each other.

For more information about `Application-ImportService` and `Application-ExportService` headers, see Application manifest files.

For `osgiAppIntegration-1.0` feature configuration information, see “OSGi Application Integration” on page 938.

### 8.5.5.9 OSGi bundle

```
<feature>osgiBundle-1.0</feature>
```

This feature enables support for deploying OSGi applications. With the OSGi Applications support, you can develop and deploy modular applications that use Java EE and OSGi technologies.

For `osgiBundle-1.0` feature configuration information, see `osgiBundle-1.0`.

## OSGi JPA

```
<feature>osgi.jpa-1.0</feature>
```

The `osgi.jpa-1.0` feature provides JPA support for OSGi applications on Liberty.

See “Deploying OSGi applications to Liberty” on page 2149.

For `osgi.jpa-1.0` feature configuration information, see “OSGi Java Persistence API” on page 942.

## Web application bundle (WAB)

```
<feature>wab-1.0</feature>
```

This feature enables support for warnings to be logged when certain operations in the application server are running more slowly than expected. The `wab-1.0` feature provides support for WABs that are inside enterprise bundles. The `wab-1.0` feature provides support for WABs that are inside enterprise bundles.

This feature supports the following resources packaged inside a WAB:

- Static web content and JSPs.
- HTTP servlets written to the Servlet 3.0 specification.
- Blueprint applications.

If you include the `wab-1.0` feature, you also include the `servlet-3.0` and `blueprint-1.0` features.

See “Deploying OSGi applications to Liberty” on page 2149.

For `wab-1.0` feature configuration information, see “OSGi Web Application Bundles” on page 943.

## Operations

### 8.5.5.8

## API Discovery

```
<feature>apiDiscovery-1.0</feature>
```

The `apiDiscovery-1.0` feature enables you to discover your REST API documentation. Use the feature to find REST APIs that are available on a Liberty server and then use the Swagger user interface to invoke the found REST endpoints. See “Discovering REST API documentation on a Liberty server” on page 2260.

## Security

```
<feature>appSecurity-2.0</feature>
```

This version of the `appSecurity` feature provides only certain aspects of security, based explicitly on the presence of other features. Additionally, it does not automatically include the `servlet-3.0` or `ldapRegistry-3.0` features, thereby reducing the server footprint. To secure web applications, you must include the `servlet-3.0` feature. To enable EJB security, you must include the `ejbLite-3.1` feature. To support an LDAP user registry, you must include the `ldapRegistry-3.0` feature.

### Note:

- The `appSecurity-2.0` feature supersedes `appSecurity-1.0`. The features are the same except that `appSecurity-2.0` does not automatically include `servlet-3.0` or `ldapRegistry-3.0`. You can choose to use the `appSecurity-2.0` version instead in your server configuration. See “Superseded features” on page 825.
  - To enable web security, you must specify the `servlet-3.0` feature in the `server.xml` file.
  - To enable support for LDAP, you must specify the `ldapRegistry-3.0` feature in the `server.xml` file.

The `appSecurity-1.0` and `appSecurity-2.0` features provide support for securing the server runtime environment and applications. The following aspects are supported:

- Basic user registry
- Lightweight Directory Access Protocol (LDAP) user registry
- Basic authorization
- Web application security
  - Basic authentication login
  - Form-login Form-logout
  - Programmatic APIs: `getRemoteUser`, `getUserPrincipal`, `isUserInRole`, `authenticate`, `logout`, and `login`.
- **8.5.5.0** EJB application security
  - All security annotations and all security elements that can be specified in the `ejb-jar.xml` file.
  - Programmatic APIs: `getCallerPrincipal`, `isCallerInRole`, and `getCallerIdentity`. The `getCallerIdentity` API is not supported for Singleton session beans.
  - EJB extension settings in the `ibm-ejb-jar-ext.xml` file for **run-as-mode** of `CALLER_IDENTITY` and `SPECIFIED_IDENTITY` (`SYSTEM_IDENTITY` is not supported).

When you add the `appSecurity-1.0` or `appSecurity-2.0` feature to your server, you must also configure a user registry, such as the basic user registry or the LDAP user registry.

See Chapter 8, “Securing Liberty and its applications,” on page 1829 and “`appSecurity-2.0` feature restrictions” on page 2335..

For `appSecurity-1.0` feature configuration information, see “Application Security 1.0” on page 857

page 857.

For appSecurity-2.0 feature configuration information, see “Application Security 2.0” on page 857.

#### 8.5.5.6 **Managed Batch**

```
<feature>batchManagement-1.0</feature>
```

The batchManagement-1.0 feature provides a REST interface for remote job submission and the batchManager command-line client utility.

See “Java batch and managed batch overview” on page 2208

For batchManagement-1.0 feature configuration information, see “Batch Management” on page 861.

#### 8.5.5.7 **Basic Extensions using Liberty Libraries (BELL)**

```
<feature>bells-1.0</feature>
```

This feature enables the configuration of Basic Extensions using Liberty Libraries (BELL). Use this feature to extend some parts of the server runtime using libraries, rather than using Liberty features. BELL uses the Java Service Loader pattern to provide the implementation class name.

For bells-1.0 feature configuration information, see “Basic Extensions using Liberty Libraries” on page 859.

#### 8.5.5.9 **Bluemix Utility**

```
<feature>bluemixUtility-1.0</feature>
```

This feature makes it easier to configure access to IBM Bluemix managed services. See “Setting up a Liberty server to use Bluemix services” on page 1529.

For bluemixUtility-1.0 feature configuration information, see bluemixUtility-1.0.

#### 8.5.5.6 **Event Logging**

```
<feature>eventLogging-1.0</feature>
```

The eventLogging-1.0 feature logs a record of events, such as the JDBC requests and servlet requests, and their durations.

See “Event Logging” on page 2319.

For eventLogging-1.0 feature configuration information, see Event Logging.

### **ldapRegistry-3.0**

```
<feature>ldapRegistry-3.0</feature>
```

The ldapRegistry-3.0 feature provides support for LDAP user registry. The version 3.0 of the ldapRegistry-3.0 feature is compliant with the LDAP Version 3 specifications. The ldapRegistry-3.0 feature is not automatically enabled by the appSecurity-2.0 feature. Using this feature, you can federate multiple LDAP repositories. Two or more LDAP repositories can be configured in the server.xml file, and you can get the consolidated results from multiple repositories for all LDAP operations.

For ldapRegistry-3.0 feature configuration information, see “LDAP User Registry” on page 930.

### **Local JMX Connector**

```
<feature>localConnector-1.0</feature>
```

The localConnector-1.0 feature provides a local JMX connector that is built into the JVM. The JMX connector can be used only on the same host machine by someone running under the same user ID and the same JDK. It enables local access by JMX clients such as jConsole, or other JMX clients that use the Attach API.

See “Connecting to Liberty by using JMX” on page 1641.

For localConnector-1.0 feature configuration information, see “JMX Local Connector” on page 887.

#### 8.5.5.9 logstashCollector-1.0

```
<feature>logstashCollector-1.0</feature>
```

This feature gathers data from various sources and forwards the data to a Logstash server using Lumberjack protocol.

For logstashCollector-1.0 feature configuration information, see logstashCollector-1.0.

#### Monitoring

```
<feature>monitor-1.0</feature>
```

The monitor-1.0 feature provides Performance Monitoring Infrastructure (PMI) support on Liberty.

See Chapter 11, “Monitoring the Liberty server runtime environment,” on page 2267.

For monitor-1.0 feature configuration information, see “Performance Monitoring” on page 946.

#### OAuth

```
<feature>oauth-2.0</feature>
```

The oauth-2.0 feature provides support for securing access to resources using the OAuth 2.0 protocol.

For oauth-2.0 feature configuration information, see “OAuth” on page 936.

#### OpenID

```
<feature>openid-2.0</feature>
```

This feature enables users to authenticate themselves to multiple entities without the need to manage multiple accounts or sets of credentials. Liberty supports OpenID 2.0 and plays a role as a Relying Party in web single-sign-on. Accessing various entities like websites often requires a unique account that is associated with each entity. OpenID enables a single set of credentials that are handled by an OpenID Provider to grant access to any number of entities that support OpenID. See “OpenID” on page 1873.

For openid-2.0 feature configuration information, see “OpenID” on page 943.

#### OpenID Connect Client

```
<feature>openidConnectClient-1.0</feature>
```

This feature enables web applications to integrate OpenID Connect Client 1.0 for authenticating users instead of, or in addition to, the configured user registry. See “OpenID Connect” on page 1875.

For openidConnectClient-1.0 feature configuration information, see “OpenID Connect Client” on page 944.

#### OpenID Connect Provider

```
<feature>openidConnectServer-1.0</feature>
```

This feature enables web applications to integrate OpenID Connect Server 1.0 for authenticating users instead of, or in addition to, the configured user registry. See “OpenID Connect” on page 1875.

For openidConnectServer-1.0 feature configuration information, see “OpenID Connect Provider” on page 945.

#### OSGi Console

```
<feature>osgiConsole-1.0</feature>
```

This feature enables an OSGi console to aid the debugging of the runtime environment. It can be used to display information about bundles, packages, and services. This information can be useful when developing your own features for product extensions.

See “Using an OSGi console” on page 1587.

For `osgiConsole-1.0` feature configuration information, see “OSGi Debug Console” on page 941.

#### 8.5.5.9 Password Utilities

```
<feature>passwordUtilities-1.0</feature>
```

This feature enables support for obtaining AuthData from an application using security plug-points.

For `passwordUtilities-1.0` feature configuration information, see `passwordUtilities-1.0`.

#### 8.5.5.6 Request Timing

```
<feature>requestTiming-1.0</feature>
```

The `requestTiming-1.0` provides warnings and diagnostic information for the slow or hung requests.

See “Slow and hung request detection” on page 2321.

For `requestTiming-1.0` feature configuration information, see Request Timing.

### REST connector 1.0

```
<feature>restConnector-1.0</feature>
```

The `restConnector-1.0` feature provides a secure JMX connector that can be used locally or remotely using any JDK. It enables remote access by JMX clients through a REST-based connector and requires SSL and basic user security configuration.

See “Connecting to Liberty by using JMX” on page 1641 and, for details on REST connectors, see “Configuring secure JMX connection to Liberty” on page 1642.

**8.5.5.6** For information about using REST APIs to transfer files, see “Liberty: File transfer” on page 1660. For information about using REST APIs to transfer files to and from collective controllers, collective members, and registered hosts of a collective, see “Transferring files in a Liberty collective” on page 1660. To use the REST APIs, you add the `restConnector-1.0` feature to the server configuration.

For `restConnector-1.0` feature configuration information, see “JMX REST Connector 1.0” on page 887.

#### 8.5.5.7 SAML Web Browser SSO

```
<feature>samlWeb-2.0</feature>
```

The `samlWeb-2.0` feature enables web applications to delegate user authentication to a SAML identity provider instead of a configured user registry.

For `samlWeb-2.0` feature configuration information, see “SAML web single sign-on version 2.0” on page 948.

### Server status

```
<feature>serverStatus-1.0</feature>
```

The `serverStatus-1.0` feature enables Liberty servers to automatically publish their status to WebSphere Application Server deployment managers and job managers that are aware of the server as a resource in their Job configuration. The known states are Started and Stopped.

See Submitting jobs to manage Liberty servers and Installing Liberty server resources using the job manager.

For serverStatus-1.0 feature configuration information, see “Job Manager Integration” on page 929.

### **Session Persistence**

`<feature>sessionDatabase-1.0</feature>`

The sessionDatabase-1.0 feature provides session affinity and failover support on Liberty.

See “Configuring session persistence for Liberty” on page 1610.

For sessionDatabase-1.0 feature configuration information, see “Database Session Persistence” on page 870.

### **SPNEGO**

`<feature>spnego-1.0</feature>`

This feature enables users to log in to the Microsoft Domain controller once and access protected applications on Liberty servers without getting prompted again.

For more information on configuring SPNEGO on the Liberty server, see “Configuring SPNEGO authentication in Liberty” on page 1879.

For spnego-1.0 feature configuration information, see “Simple and Protected GSSAPI Negotiation Mechanism” on page 952.

### **Secure Sockets Layer (SSL)**

`<feature>ssl-1.0</feature>`

The ssl-1.0 feature provides support for Secure Sockets Layer (SSL) connections. To use the secure HTTPS listener, you must enable this feature. Liberty provides a dummy keystore and a dummy truststore, which are the same as those provided by previous versions of WebSphere Application Server. The secure HTTPS listener is not started unless the ssl-1.0 feature is enabled. If the feature is unavailable, the HTTPS listener is stopped. To specify the SSL certificates, add a pointer in the server.xml file; see “Securing communications in Liberty” on page 1833. To change the HTTPS port, set the `<httpsPort>` attribute of the `<httpEndpoint>` element in the server.xml file; see “Specifying Liberty bootstrap properties” on page 1437.

For ssl-1.0 feature configuration information, see “Secure Socket Layer” on page 951.

### **Timed Operations**

`<feature>timedOperations-1.0</feature>`

This feature enables support for warnings to be logged when certain operations in the application server are running more slowly than expected.

See “Liberty: Timed operations and JDBC calls” on page 2318.

For timedOperations-1.0 feature configuration information, see “Timed Operations” on page 955.

### **Dynamic caching service**

`<feature>webCache-1.0</feature>`

This feature enables local caching for web responses. It includes the Cache Service (distributedMap) feature and performs automatic caching of web application responses to improve response times and throughput. To customize the response caching, you can include a cache-spec.xml file in your applications. You can distribute the cache by adding a network cache provider such as WebSphere eXtreme Scale.

For webCache-1.0 feature configuration information, see “Web Response Cache” on page 957.

8.5.5.6

#### WebSphere MQ Messaging feature

`<feature>wmqJmsClient-2.0</feature>`

The `wmqJmsClient-2.0` feature provides applications with access to message queues hosted on IBM MQ through the JMS 2.0 API.

See “Deploying JMS applications to Liberty to use the IBM MQ messaging provider” on page 2197.

For `wmqJmsClient-2.0` feature configuration information, see “JMS 2.0 Client for IBM MQ” on page 883.

#### Web services security

`<feature>wsSecurity-1.1</feature>`

The `wsSecurity-1.1` feature provides support for securing web services at the message level. To secure web services messages, you must enable this feature and the `appSecurity-2.0` and `jaxws-2.2` features. Web services security policies defined in a WSDL file are ignored and are not enforced unless the `wsSecurity-1.1` feature is enabled.

See “Web services security” on page 2018.

For `wsSecurity-1.1` feature configuration information, see “Web Service Security” on page 957.

8.5.5.9

#### Web Services Atomic Transaction

`<feature>wsAtomicTransaction-1.2</feature>`

The `wsAtomicTransaction` is an interoperable transaction protocol. It enables you to flow distributed transactions by using Web service messages, and coordinate in an interoperable manner between heterogeneous transaction infrastructures.

For `wsAtomicTransaction-1.2` configuration information in Liberty, see “Web Services Atomic Transaction in Liberty” on page 2190.

### Systems Management

#### Administrative Center

`<feature>adminCenter-1.0</feature>`

The `adminCenter-1.0` feature is a web-based graphical interface for managing Liberty servers and applications and other resources from a web browser on a cell phone, tablet, or computer.

See “Administering Liberty using Admin Center” on page 1741 and “Admin Center feature restrictions” on page 2337.

For `adminCenter-1.0` feature configuration information, see “Admin Center” on page 855.

#### Cluster member

`<feature>clusterMember-1.0</feature>`

To add a member to a collective, add the `clusterMember-1.0` feature and optionally `<clusterMember name="cluster_name"/>` to its server configuration. The cluster name is published to the controller, and this server becomes part of the specified cluster.

See “Configuring a Liberty server cluster” on page 1155.

For `clusterMember-1.0` feature configuration information, see “Static Cluster Member” on page 953.

#### Collective controller

`<feature>collectiveController-1.0</feature>`

The `collectiveController-1.0` feature enables controller functionality for a management collective and includes a management repository MBean that is accessible using the

JMX/REST connector that is provided by the `restConnector-1.0` feature. The collective controller acts as a storage and collaboration mechanism to which collective members can connect. The `collectiveController-1.0` feature includes a `ServerCommandMbean` that can be used to remote start or stop servers that are managed by the collective controller. The `collectiveController-1.0` feature and its capabilities are available only in IBM WebSphere Application Server Liberty Network Deployment. The feature is not available in IBM WebSphere Application Server Liberty, IBM WebSphere Application Server Liberty - Express, or IBM WebSphere Application Server Liberty Core.

See “Setting up the server-management environment for Liberty by using collectives” on page 1134.

For `collectiveController-1.0` feature configuration information, see “Collective Controller” on page 864.

### Collective member

```
<feature>collectiveMember-1.0</feature>
```

The `collectiveMember-1.0` feature enables a server to be a member of a management collective, allowing it to be managed by the collective controller.

See “Setting up the server-management environment for Liberty by using collectives” on page 1134.

For `collectiveMember-1.0` feature configuration information, see “Collective Member” on page 866.

### Dynamic Routing

```
<feature>dynamicRouting-1.0</feature>
```

The Intelligent Management feature of the WebSphere plugin for Apache and IHS provides On Demand Router (ODR) capabilities for the plugin. This feature enables a server to run the dynamic routing service. The plugin can then connect to the ODR in order to dynamically route to all servers in the liberty collective.

See “Setting up dynamic routing for Liberty collectives” on page 1493.

For `dynamicRouting-1.0` feature configuration information, see “Dynamic Routing” on page 872.

8.5.5.7

### Health Analyzer

```
<feature>healthAnalyzer-1.0</feature>
```

The Health Analyzer feature provides health data collection for the health manager for the Intelligent Management feature Health Management. The health analyzer feature provides monitoring services to a member server. It registers as an analytics handler, collects the necessary stats (PMI, HealthCenter) via the analytics collector and analyses the conditions.

See “Configuring health management for Liberty” on page 1519.

For `healthAnalyzer-1.0` feature configuration information, see “Health Analyzer” on page 879.

8.5.5.7

### Health Manager

```
<feature>healthManager-1.0</feature>
```

The Health Manager feature provides health monitoring and automatic actions based on health policies for the Intelligent Management feature Health Management. The health

manager feature embodies the core functions of health management. Selecting this feature will also enable the default condition plugins. This feature requires the presence of the `collectiveController` feature.

See “Configuring health management for Liberty” on page 1519.

For `healthManager-1.0` feature configuration information, see “Health Manager” on page 880.

### Scaling Controller

```
<feature>scalingController-1.0</feature>
```

The `scalingController-1.0` feature makes scaling decisions for Liberty. Multiple servers can run the Scaling Controller feature for high availability purposes. Only one server is actively making scaling decisions at any time. If that server is stopped, another server that is running the Scaling Controller feature can take over making scaling decisions.

See “Setting up auto scaling for Liberty collectives” on page 1503.

For `scalingController-1.0` feature configuration information, see “Scaling Controller” on page 950.

### Scaling Member

```
<feature>scalingMember-1.0</feature>
```

The `scalingMember-1.0` feature can be added to the **featureManagement** element of the `server.xml` of servers that are collective members. This will enable auto clustering of the collective members and will allow the servers to dynamically start/stop based on criteria specified by the scaling policy. This feature works in conjunction with the scaling controller feature. The scaling controller feature should be enabled in the collective controllers that are part of the collective.

See “Setting up auto scaling for Liberty collectives” on page 1503.

For `scalingMember-1.0` feature configuration information, see “Scaling Member” on page 951.

## z/OS

### z/OS Connect

```
<feature>zosConnect-1.0</feature>
```

The `zosConnect-1.0` feature is service that encapsulates calling z/OS target applications using REST calls.

**z/OS** See “Setting up z/OS Connect” on page 1536.

**z/OS** For `zosConnect-1.0` feature configuration information, see “z/OS Connect” on page 959.

#### 8.5.5.7 z/OS Connect 1.2

```
<feature>zosConnect-1.2</feature>
```

This feature provides a gateway between mobile, cloud, and web clients and z/OS back-end systems, such as CICS Transaction Server, IMS, and batch applications. It provides RESTful APIs and enables you to route HTTP requests to remote REST endpoints. It also accepts and returns JSON payloads and communicates with back-end systems by providing a data transformation service that converts JSON payloads to/from byte arrays consumable by z/OS native-language applications written in Cobol, PL/I, and C.

For more information, see “IBM z/OS Connect overview” on page 1020

**z/OS** For `zosConnect-1.2` feature configuration information, see “z/OS Connect 1.2” on page 960.

### **z/OS optimized local adapters**

`<feature>zosLocalAdapters-1.0</feature>`

The `zosLocalAdapters-1.0` feature enables high-performance calling between native-language applications on z/OS and business logic in a Liberty server environment.

**z/OS** See “Optimized local adapters on Liberty for z/OS” on page 1690 and “Enabling the Liberty server environment to use optimized local adapters” on page 1697.

**z/OS** For `zosLocalAdapters-1.0` feature configuration information, see “z/OS Optimized Local Adapters” on page 961.

### **z/OS security**

`<feature>zosSecurity-1.0</feature>`

The `zosSecurity-1.0` feature provides support on the z/OS platform for basic interactions with the SAF Registry, including authenticating users, and retrieving users, groups, or groups associated with users, from the SAF Registry.

**z/OS** See “Activating and configuring the SAF registry on z/OS” on page 1857.

**z/OS** For `zosSecurity-1.0` feature configuration information, see “z/OS SAF Integration” on page 962.

### **z/OS transaction management**

`<feature>zosTransaction-1.0</feature>`

Specifying this feature enables the application server to synchronize and appropriately manage transactional activity between the Resource Recovery Services (RRS), the transaction manager of the application server, and the resource manager.

**z/OS** See “Enabling a DB2 JDBC Type 2 driver on z/OS” on page 1681 and “Liberty:Runtime environment known issues and restrictions” on page 2333.

**z/OS** For `zosTransaction-1.0` feature configuration information, see “z/OS Transaction Management” on page 963.

### **z/OS workload management**

`<feature>zosWlm-1.0</feature>`

The `zosWlm-1.0` feature provides access to z/OS native workload management (WLM) services.

**z/OS** See “Enabling workload management for Liberty on z/OS” on page 1736.

**z/OS** For `zosWlm-1.0` feature configuration information, see “z/OS Workload Management” on page 963.

## **Java EE 6 Web Profile**

### **Bean validation**

`<feature>beanValidation-1.0</feature>`

The `beanValidation-1.0` feature provides validations for JavaBeans at each layer of an application. The validation can be applied to all layers of JavaBeans in an application by using annotations or a `validation.xml` deployment descriptor.

See “Bean validation feature restrictions” on page 2337.

For `beanValidation-1.0` feature configuration information, see “Bean Validation 1.0” on page 862.

**CDI** `<feature>cdi-1.0</feature>`

The `cdi-1.0` feature enables support for the Contexts and Dependency Injection 1.0 specification on Liberty.

See “Administering Contexts and Dependency Injection applications on Liberty” on page 1725.

For `cdi-1.0` feature configuration information, see “Contexts and Dependency Injection 1.0” on page 867.

### **Enterprise JavaBeans (EJB) Lite subset**

```
<feature>ejbLite-3.1</feature>
```

The `ejbLite-3.1` feature provides support for EJB applications written to the EJB Lite subset of the EJB 3.1 specification.

The following functions are supported:

- An EJB module packaged in an EAR file.
- EJBs packaged in a WAR file.
- The `@Stateful`, `@Stateless`, `@Singleton`, and `@EJB` annotations.
- The `javax.annotation.security` annotations.
- Injection of JPA `EntityManager`, `EntityManagerFactory`, and JDBC `DataSource` into all types of session bean types.
- `ejb-jar.xml`.
- EJB interceptors.
- No-Interface View.
- Bean managed transactions (`UserTransaction`).

See “`ejbLite-3.1` feature restrictions” on page 2338.

For `ejbLite-3.1` feature configuration information, see “Enterprise JavaBeans Lite 3.1” on page 874.

### **Java Database Connectivity (JDBC)**

```
<feature>jdbc-4.0</feature>
```

You can take an existing application that uses Java Database Connectivity (JDBC) and a data source, and deploy the application to a server. The `jdbc-4.0` feature provides support for applications that access a database.

See “Deploying an existing JDBC application to Liberty” on page 2150.

For `jdbc-4.0` feature configuration information, see “Java Database Connectivity 4.0” on page 894.

### **Java Naming and Directory Interface (JNDI)**

```
<feature>jndi-1.0</feature>
```

The `jndi-1.0` feature provides support for a single JNDI entry definition in the server configuration of Liberty.

For `jndi-1.0` feature configuration information, see “Java Naming and Directory Interface” on page 902.

### **Java Persistence API (JPA)**

```
<feature>jpa-2.0</feature>
```

The `jpa-2.0` feature provides support for applications that use application-managed and container-managed JPA written to the JPA 2.0 specification. The support is built on Apache OpenJPA with extensions to support the container-managed programming model.

Extended Persistence Context is now available for use with Stateful Session beans.

See “Deploying a JPA application to Liberty” on page 2157.

For jpa-2.0 feature configuration information, see “Java Persistence API 2.0” on page 903.

### **JavaServer Faces (JSF)**

```
<feature>jsf-2.0</feature>
```

The jsf-2.0 feature provides support for web applications that use the JSF framework. This framework simplifies the construction of user interfaces. If you include the jsf-2.0 feature, you also include the jsp-2.2 feature, because the JSF framework is an extension of the JSP framework.

For jsf-2.0 feature configuration information, see “JavaServer Faces 2.0” on page 925.

### **JavaServer Pages (JSP)**

```
<feature>jsp-2.2</feature>
```

If you include the jsf-2.0 feature, you also include the jsp-2.2 feature, because the JSF framework is an extension of the JSP framework. If you include the jsp-2.2 feature, you also include the servlet-3.0 feature.

See “jsp-2.2 feature restrictions” on page 2339.

For jsp-2.2 feature configuration information, see “JavaServer Pages 2.2” on page 927.

### **Servlet 3.0**

```
<feature>servlet-3.0</feature>
```

The servlet-3.0 feature provides support for HTTP Servlets written to the Java Servlet 3.0 specification.

See Chapter 8, “Securing Liberty and its applications,” on page 1829.

For servlet-3.0 feature configuration information, see “Java Servlets 3.0” on page 915.

### **Web Profile**

```
<feature>webProfile-6.0</feature>
```

This feature provides a convenient combination of the Liberty features that are required to support the Java EE 6.0 Web Profile.

For webProfile-6.0 feature configuration information, see “Java EE Web Profile 6.0” on page 899.

## **Java EE 6 Technologies**

### **Java Architecture for XML Binding (JAXB)**

```
<feature>jaxb-2.2</feature>
```

The jaxb-2.2 feature provides support for the Java Architecture for XML Binding (JAXB) on Liberty.

See JAXB and “jaxb-2.2 feature restriction” on page 2338.

For jaxb-2.2 feature configuration information, see “Java XML Bindings 2.2” on page 922.

### **Java API for RESTful Web Services (JAX-RS)**

```
<feature>jaxrs-1.1</feature>
```

The jaxrs-1.1 feature provides support for the Java API for RESTful Web Services on Liberty.

- For EJB applications that use the jaxrs-1.1 server feature, you must enable the ejbLite-3.1 feature in the server.xml file.
- For JAX-RS applications that use CDI, you must enable the cdi-1.0 feature in the server.xml file.
- For applications that use the global handler services, you must enable the jaxrs-1.1 or the jaxws-2.2 feature in the server.xml file.

For jaxrs-1.1 feature configuration information, see “Java RESTful Services 1.1” on page 911.

### **Java API for XML-Based Web Services (JAX-WS)**

```
<feature>jaxws-2.2</feature>
```

The jaxws-2.2 feature provides support for the Java API for XML-Based Web Services on Liberty.

- For web applications that support the JAX-WS programming model, you must enable the servlet-3.0 and jaxws-2.2 server features in the server.xml file.
- For EJB applications that support the JAX-WS programming model, you must enable the ejbLite-3.1, servlet-3.0, and jaxws-2.2 server features in the server.xml file.
- For applications that use the global handler services, you must enable the jaxrs-1.1 or the jaxws-2.2 feature in the server.xml file.

See “jaxws-2.2 feature restrictions” on page 2339.

For jaxws-2.2 feature configuration information, see “Java Web Services 2.2” on page 920.

### **Java EE Connector Architecture**

```
<feature>jca-1.6</feature>
```

The jca-1.6 feature provides configuration elements to define instances of connection factories, administered objects, and activation specifications, and to associate these instances with an installed resource adapter.

For jca-1.6 feature configuration information, see “Java Connector Architecture 1.6” on page 892.

### **Java EE Connector Architecture Inbound Security**

```
<feature>jcaInboundSecurity-1.0</feature>
```

The jcaInboundSecurity-1.0 feature enables security inflow for resource adapters.

For jcaInboundSecurity-1.0 feature configuration information, see “Java Connector Architecture 1.0 Security Inflow” on page 891.

### **Java Message Service 1.1**

```
<feature>jms-1.1</feature>
```

The jms-1.1 feature enables the configuration of resource adapters to access messaging systems using the Java Message Service API. This also includes the configuration JMS connection factories, queues, topics, and activation specifications. Any JMS resource adapter that complies with the JCA 1.6 specification can be used.

For jms-1.1 feature configuration information, see “Java Message Service 1.1” on page 900.

### **Message-Driven beans**

```
<feature>jmsMdb-3.1</feature>
```

The jmsMdb-3.1 feature provides support for deploying and configuring the JMS resources that are required for the message-driven beans (MDB) to run within Liberty. This feature enables MDB to interact with either the embedded Liberty messaging or WebSphere MQ.

For jmsMdb-3.1 feature configuration information, see “JMS Message-Driven Beans 3.1” on page 885.

### **Message-Driven Beans 3.1**

```
<feature>mdb-3.1</feature>
```

The mdb-3.1 feature enables the use of Message-Driven Enterprise JavaBeans. MDBs allow asynchronous processing of messages within a Java EE component.

For mdb-3.1 feature configuration information, see “Message-Driven Beans 3.1” on page 934.

### **Embedded Liberty Messaging features**

`<feature>wasJmsClient-1.1</feature>`

The `wasJmsClient-1.1` feature enables support for JMS resource configurations (such as the connection factories, activation specifications, and queue and topic resources) and also provides the client libraries that are required by the messaging applications to connect to the JMS server on Liberty.

See “Enabling JMS messaging for Liberty” on page 1121 and “Deploying messaging applications to Liberty” on page 2195.

For `wasJmsClient-1.1` feature configuration information, see “JMS 1.1 Client for Message Server” on page 882.

`<feature>wasJmsSecurity-1.0</feature>`

The `wasJmsSecurity-1.0` feature supports secure connections to the messaging engine. When the `wasJmsSecurity-1.0` feature is enabled, it starts authenticating and authorizing the users who are trying to connect to the messaging engine. The user is authenticated against the registry that is defined in the `server.xml` file. When the user wants to access a destination such as a topic or a queue, then the user must be granted the required permissions. The access to the destination is defined in the `<messagingSecurity>` element (the child element of the `messagingEngine` element) in the `server.xml` file. If the `wasJmsSecurity-1.0` feature is added and the `<messagingSecurity>` element is not defined in the `server.xml` file, then the users cannot connect to the messaging engine or perform any messaging action (for example, sending or receiving messages from the destinations). For `wasJmsSecurity-1.0` feature configuration information, see “Message Server Security 1.0” on page 933.

#### **Notes:**

- Configuring the user registry is a prerequisite for the `wasJmsSecurity-1.0` feature. Ensure that a user registry is configured before the `wasJmsSecurity-1.0` feature is enabled.
- When you enable the `wasJmsSecurity-1.0` feature, you must also configure the `<messagingSecurity>` element, which is the child element of the `<messagingEngine>` element, in the `server.xml` file. This configuration enables authorized users to access messaging destinations.

`<feature>wasJmsServer-1.0</feature>`

The `wasJmsServer-1.0` feature enables the JMS messaging engine run time to be initialized. The messaging run time is responsible for providing the application connectivity, managing the state of destinations such as topics or queues, and handling quality of service, security, and transactions. This feature also provides support for the inbound connections from the remote messaging applications. The remote messaging applications can connect to the JMS messaging engine through TCP/IP over SSL or non-SSL.

To connect using SSL, you must enable the SSL feature.

See “Enabling secure JMS messaging for Liberty” on page 1126.

For `wasJmsServer-1.0` feature configuration information, see “Message Server 1.0” on page 932.

### **WebSphere MQ Messaging feature**

`<feature>wmqJmsClient-1.1</feature>`

The `wmqJmsClient-1.1` feature enables applications to use JMS messaging that connects to a IBM MQ server.

See “Deploying JMS applications to Liberty to use the IBM MQ messaging provider” on page 2197.

For `wmqJmsClient-1.1` feature configuration information, see “JMS 1.1 Client for IBM MQ” on page 881.

## API Discovery 1.0

Enables discovery and exposure of REST APIs within Liberty.

### Enabling this feature

To enable the API Discovery 1.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>apiDiscovery-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the API Discovery 1.0 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.apiDiscovery-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `distributedMap-1.0` - Distributed Map interface for Dynamic Caching
- `json-1.0` - JavaScript Object Notation for Java
- `servlet-3.0` - Java Servlets 3.0
- `servlet-3.1` - Java Servlets 3.1
- `ssl-1.0` - Secure Socket Layer

### Third party API packages provided by this feature

- `io.swagger.annotations`

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the API Discovery 1.0 feature:

- `administrator-role`
- `apiDiscovery`
- `authCache`
- `authentication`
- `authorization-roles`
- `basicRegistry`
- `channelfw`
- `classloading`
- `httpAccessLogging`
- `httpDispatcher`
- `httpEncoding`
- `httpEndpoint`
- `httpOptions`
- `httpProxyRedirect`

- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- mimeTypees
- quickStartSecurity
- tcpOptions
- trustAssociation
- virtualHost

## Admin Center

The adminCenter-1.0 feature enables the Liberty Admin Center, a web-based graphical interface for deploying, monitoring and managing Liberty servers in standalone and collective environments.

### Enabling this feature

To enable the Admin Center feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>adminCenter-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Admin Center feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.adminCenter-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- distributedMap-1.0 - Distributed Map interface for Dynamic Caching
- json-1.0 - JavaScript Object Notation for Java
- jsp-2.2 - JavaServer Pages 2.2
- jsp-2.3 - JavaServer Pages 2.3
- restConnector-1.0 - JMX REST Connector 1.0
- restConnector-2.0 - JMX REST Connector 2.0
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1
- ssl-1.0 - Secure Socket Layer

### Feature configuration elements

You can use the following elements in your server.xml file to configure the Admin Center feature:

- administrator-role
- authCache
- authentication
- authorization-roles
- basicRegistry
- channelfw
- classloading
- httpAccessLogging
- httpDispatcher

- httpEncoding
- httpEndpoint
- httpOptions
- httpProxyRedirect
- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- mimeTypes
- quickStartSecurity
- tcpOptions
- trustAssociation
- virtualHost

## Application Client Support for Server

This feature enables the Liberty server to process client modules and support remote client containers.

### Enabling this feature

To enable the Application Client Support for Server feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>appClientSupport-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Application Client Support for Server feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.appClientSupport-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- jndi-1.0 - Java Naming and Directory Interface

### Features that enable this feature

- javaee-7.0 - Java EE Full Platform 7.0

### Feature configuration elements

You can use the following elements in your server.xml file to configure the Application Client Support for Server feature:

- application
- applicationManager
- applicationMonitor
- channelfw
- classloading
- enterpriseApplication
- iiopEndpoint
- iiopServerPolicies
- javaPermission
- library

- orb
- tcpOptions
- webApplication

## Application Security 1.0

This feature is superseded by appSecurity-2.0. Support for securing the server runtime environment and applications. This feature enables servlet-3.0 and web application security, support for LDAP and basic user registries, and SSL. To support secure EJB applications, you must add the ejbLite-3.1 feature. When you add this feature to your server, you need to configure a user registry, such as the basic user registry or the LDAP user registry.

### Enabling this feature

To enable the Application Security 1.0 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>appSecurity-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Application Security 1.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.appSecurity-1.0; type="osgi.subsystem.feature"
```

### Features that this feature is superseded by

- ldapRegistry-3.0 - LDAP User Registry
- servlet-3.0 - Java Servlets 3.0
- appSecurity-2.0 - Application Security 2.0

### Features that this feature enables

- appSecurity-2.0 - Application Security 2.0
- ldapRegistry-3.0 - LDAP User Registry
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

### Features that enable this feature

- passwordUtilities-1.0 - Password Utilities

## Application Security 2.0

This feature enables support for securing the server runtime environment and applications; it includes a basic user registry. This feature supersedes appSecurity-1.0 and does not include servlet-3.0 or support for the LDAP user registry. To secure web applications, add the servlet-3.0 feature. To secure EJB applications, add the ejbLite-3.1 feature. To use LDAP, add the ldapRegistry-3.0 feature. When you add the appSecurity-2.0 feature to your server, you need to configure a user registry, such as the basic user registry or the LDAP user registry.

### Enabling this feature

To enable the Application Security 2.0 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>appSecurity-2.0</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Application Security 2.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:  
`com.ibm.websphere.appserver.appSecurity-2.0; type="osgi.subsystem.feature"`

## Features that this feature enables

- ssl-1.0 - Secure Socket Layer

## Features that enable this feature

- appSecurity-1.0 - Application Security 1.0
- constrainedDelegation-1.0 - Kerberos Constrained Delegation for SPNEGO
- jacc-1.5 - Java Authorization Contract for Containers 1.5
- jaspic-1.1 - Java Authentication SPI for Containers 1.1
- oauth-2.0 - OAuth
- openid-2.0 - OpenID
- passwordUtilities-1.0 - Password Utilities
- samlWeb-2.0 - SAML web single sign-on version 2.0
- spnego-1.0 - Simple and Protected GSSAPI Negotiation Mechanism
- webProfile-6.0 - Java EE Web Profile 6.0
- webProfile-7.0 - Java EE Web Profile 7.0
- wsSecurity-1.1 - Web Service Security

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Application Security 2.0 feature:

- administrator-role
- authCache
- authentication
- basicRegistry
- classloading
- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- quickStartSecurity

## Application Security for Client 1.0

Support for securing the client container runtime environment and applications. This feature enables application security, CSIV2 and SSL on the client.

## Enabling this feature

To enable the Application Security for Client 1.0 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>appSecurityClient-1.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Application Security for Client 1.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.appSecurityClient-1.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- ssl-1.0 - Secure Socket Layer

## IBM API packages provided by this feature

- com.ibm.websphere.security
- com.ibm.websphere.security.auth.callback
- com.ibm.wsspi.security.auth.callback

## Feature configuration elements

You can use the following elements in your server.xml file to configure the Application Security for Client 1.0 feature:

- channelfw
- jaasLoginContextEntry
- jaasLoginModule
- orb
- tcpOptions

## Basic Extensions using Liberty Libraries

This feature enables the configuration of Basic Extensions using Liberty Libraries (BELL).

## Enabling this feature

To enable the Basic Extensions using Liberty Libraries feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>bells-1.0</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Basic Extensions using Liberty Libraries feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.bells-1.0; type="osgi.subsystem.feature"
```

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Basic Extensions using Liberty Libraries feature:

- `bell`
- `classloading`
- `library`

## Batch API 1.0

This feature enables support for the Java Batch 1.0 API specified by JSR-352.

### Enabling this feature

To enable the Batch API 1.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>batch-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Batch API 1.0 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.batch-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `jdbc-4.0` - Java Database Connectivity 4.0
- `jdbc-4.1` - Java Database Connectivity 4.1
- `jndi-1.0` - Java Naming and Directory Interface
- `servlet-3.1` - Java Servlets 3.1

### Features that enable this feature

- `batchManagement-1.0` - Batch Management
- `javaee-7.0` - Java EE Full Platform 7.0

### Standard API packages provided by this feature

- `javax.batch.api`
- `javax.batch.api.chunk`
- `javax.batch.api.chunk.listener`
- `javax.batch.api.listener`
- `javax.batch.api.partition`
- `javax.batch.operations`
- `javax.batch.runtime`
- `javax.batch.runtime.context`
- `javax.inject`

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Batch API 1.0 feature:

- `batchPersistence`
- `classloading`
- `databaseStore`

- transaction

## Batch Management

This feature provides managed batch support for the Java batch container. This includes the Batch REST management interface, job logging support, and a command line utility for external scheduler integration.

### Enabling this feature

To enable the Batch Management feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>batchManagement-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Batch Management feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.batchManagement-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- batch-1.0 - Batch API 1.0
- distributedMap-1.0 - Distributed Map interface for Dynamic Caching
- jdbc-4.0 - Java Database Connectivity 4.0
- jdbc-4.1 - Java Database Connectivity 4.1
- json-1.0 - JavaScript Object Notation for Java
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1
- ssl-1.0 - Secure Socket Layer

### Standard API packages provided by this feature

- javax.batch.api
- javax.batch.api.chunk
- javax.batch.api.chunk.listener
- javax.batch.api.listener
- javax.batch.api.partition
- javax.batch.operations
- javax.batch.runtime
- javax.batch.runtime.context

### Feature configuration elements

You can use the following elements in your server.xml file to configure the Batch Management feature:

- administrator-role
- authCache
- authentication
- authorization-roles
- basicRegistry
- batchJobLogging
- channelfw
- classloading

- httpAccessLogging
- httpDispatcher
- httpEncoding
- httpEndpoint
- httpOptions
- httpProxyRedirect
- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- mimeTypees
- quickStartSecurity
- tcpOptions
- transaction
- trustAssociation
- virtualHost

## Bean Validation 1.0

The Bean Validation 1.0 specification provides an annotation based model for validating JavaBeans. It can be used to assert and maintain the integrity of data as it travels through an application.

### Enabling this feature

To enable the Bean Validation 1.0 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>beanValidation-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Bean Validation 1.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.beanValidation-1.0; type="osgi.subsystem.feature"
```

### Features that enable this feature

- jpa-2.0 - Java Persistence API 2.0
- jsf-2.0 - JavaServer Faces 2.0
- osgi.jpa-1.0 - OSGi Java Persistence API
- webProfile-6.0 - Java EE Web Profile 6.0

### Standard API packages provided by this feature

- javax.validation
- javax.validation.bootstrap
- javax.validation.constraints
- javax.validation.groups
- javax.validation.metadata
- javax.validation.spi

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Bean Validation 1.0 feature:

- `classloading`
- `library`

## Bean Validation 1.1

The Bean Validation 1.1 specification provides an annotation based model for validating JavaBeans. It can be used to assert and maintain the integrity of data as it travels through an application.

## Enabling this feature

To enable the Bean Validation 1.1 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>beanValidation-1.1</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Bean Validation 1.1 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.beanValidation-1.1; type="osgi.subsystem.feature"
```

## Features that this feature enables

- `el-3.0` - Expression Language 3.0

## Features that enable this feature

- `javaeeClient-7.0` - Java EE V7 Application Client
- `jpa-2.0` - Java Persistence API 2.0
- `jsf-2.0` - JavaServer Faces 2.0
- `osgi.jpa-1.0` - OSGi Java Persistence API
- `webProfile-7.0` - Java EE Web Profile 7.0

## Standard API packages provided by this feature

- `javax.validation`
- `javax.validation.bootstrap`
- `javax.validation.constraints`
- `javax.validation.constraintvalidation`
- `javax.validation.executable`
- `javax.validation.groups`
- `javax.validation.metadata`
- `javax.validation.spi`

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Bean Validation 1.1 feature:

- `classloading`
- `library`
- `transaction`

## Cloudant Integration 1.0

This feature enables connections to Cloudant by providing a connector instance configured in the server configuration, which can be injected or accessed through JNDI. Applications use the Cloudant client library to utilize the connector instance.

### Enabling this feature

To enable the Cloudant Integration 1.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>cloudant-1.0</feature>
```

### Supported Java Versions

- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Cloudant Integration 1.0 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.cloudant-1.0; type="osgi.subsystem.feature"
```

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Cloudant Integration 1.0 feature:

- `authData`
- `classloading`
- `cloudant`
- `cloudantDatabase`
- `library`

## Collective Controller

The collective controller feature allows a server to become the controller for a management collective. The collective controller acts as a command and control mechanism for administrative functions for the collective, and serves as a storage and collaboration mechanism for the collective and cluster members.

### Enabling this feature

To enable the Collective Controller feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>collectiveController-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Collective Controller feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.collectiveController-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `collectiveMember-1.0` - Collective Member
- `distributedMap-1.0` - Distributed Map interface for Dynamic Caching
- `json-1.0` - JavaScript Object Notation for Java
- `restConnector-1.0` - JMX REST Connector 1.0

- restConnector-2.0 - JMX REST Connector 2.0
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1
- ssl-1.0 - Secure Socket Layer

### **Features that enable this feature**

- dynamicRouting-1.0 - Dynamic Routing
- healthManager-1.0 - Health Manager
- scalingController-1.0 - Scaling Controller

### **IBM API packages provided by this feature**

- com.ibm.websphere.collective.controller
- com.ibm.websphere.collective.repository

### **Feature configuration elements**

You can use the following elements in your `server.xml` file to configure the Collective Controller feature:

- administrator-role
- authCache
- authentication
- authorization-roles
- basicRegistry
- channelfw
- classloading
- clusterPluginConfig
- collectiveController
- collectiveRepository
- deployManager
- deployRule
- deployVariable
- hostAccess
- httpAccessLogging
- httpDispatcher
- httpEncoding
- httpEndpoint
- httpOptions
- httpProxyRedirect
- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- mimeTypeypes
- quickStartSecurity
- serverCommands
- tcpOptions
- trustAssociation

- virtualHost

## Collective Member

This feature enables a server to be a member of a management collective.

### Enabling this feature

To enable the Collective Member feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>collectiveMember-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Collective Member feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.collectiveMember-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- restConnector-1.0 - JMX REST Connector 1.0
- restConnector-2.0 - JMX REST Connector 2.0
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

### Features that enable this feature

- clusterMember-1.0 - Static Cluster Member
- collectiveController-1.0 - Collective Controller
- healthAnalyzer-1.0 - Health Analyzer
- scalingMember-1.0 - Scaling Member

### SPI packages provided by this feature

- com.ibm.wsspi.collective.repository
- com.ibm.wsspi.collective.repository.publisher

### Feature configuration elements

You can use the following elements in your server.xml file to configure the Collective Member feature:

- collectiveCertificate
- collectiveMember
- hostAuthInfo
- hostSingleton

## Concurrency Utilities for Java EE 1.0

This feature enables the creation of managed executors that allow applications to submit tasks to run concurrently, with thread context that is managed by the application server. It also enables the creation of managed thread factories to create threads that run with the thread context of the component that looks up the managed thread factory.

### Enabling this feature

To enable the Concurrency Utilities for Java EE 1.0 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>concurrent-1.0</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Concurrency Utilities for Java EE 1.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.concurrent-1.0; type="osgi.subsystem.feature"
```

## Features that enable this feature

- javaee-7.0 - Java EE Full Platform 7.0

## Standard API packages provided by this feature

- javax.enterprise.concurrent

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Concurrency Utilities for Java EE 1.0 feature:

- `classloading`
- `contextService`
- `managedExecutorService`
- `managedScheduledExecutorService`
- `managedThreadFactory`

## Contexts and Dependency Injection 1.0

The Contexts and Dependency Injection specification makes it easier to integrate Java EE components of different types. It provides a common mechanism to inject component such as EJBs or Managed Beans into other components such as JSPs or other EJBs.

## Enabling this feature

To enable the Contexts and Dependency Injection 1.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>cdi-1.0</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Contexts and Dependency Injection 1.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.cdi-1.0; type="osgi.subsystem.feature"
```

## Features that enable this feature

- webProfile-6.0 - Java EE Web Profile 6.0

## Standard API packages provided by this feature

- javax.decorator
- javax.enterprise.context
- javax.enterprise.context.spi
- javax.enterprise.event
- javax.enterprise.inject
- javax.enterprise.inject.spi
- javax.enterprise.util
- javax.inject
- javax.interceptor

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Contexts and Dependency Injection 1.0 feature:

- `cdiContainer`
- `classloading`
- `transaction`

## Contexts and Dependency Injection 1.2

The Contexts and Dependency Injection specification makes it easier to integrate Java EE components of different types. It provides a common mechanism to inject component such as EJBs or Managed Beans into other components such as JSPs or other EJBs.

## Enabling this feature

To enable the Contexts and Dependency Injection 1.2 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>cdi-1.2</feature>
```

## Supported Java Versions

- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Contexts and Dependency Injection 1.2 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.cdi-1.2; type="osgi.subsystem.feature"
```

## Features that enable this feature

- `javaeeClient-7.0` - Java EE V7 Application Client
- `microProfile-1.0` - Micro Profile 1.0
- `webProfile-7.0` - Java EE Web Profile 7.0

## Standard API packages provided by this feature

- javax.decorator
- javax.enterprise.context
- javax.enterprise.context.spi

- javax.enterprise.event
- javax.enterprise.inject
- javax.enterprise.inject.spi
- javax.enterprise.util
- javax.inject
- javax.interceptor

### Third party API packages provided by this feature

- org.jboss.weld.context
- org.jboss.weld.context.api
- org.jboss.weld.context.beanstore
- org.jboss.weld.context.bound
- org.jboss.weld.context.conversation

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Contexts and Dependency Injection 1.2 feature:

- application
- applicationManager
- applicationMonitor
- cdi12
- classloading
- javaPermission
- library
- transaction

### CouchDB Integration 1.0

This feature enables connections to CouchDB by providing a connector instance configured in the server configuration, which can be injected or accessed through JNDI. Applications use the ektor client library to utilize the connector instance to work with CouchDB.

### Enabling this feature

To enable the CouchDB Integration 1.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>couchdb-1.0</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the CouchDB Integration 1.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.couchdb-1.0; type="osgi.subsystem.feature"
```

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the CouchDB Integration 1.0 feature:

- `classloading`
- `couchdb`
- `library`

## Database Session Persistence

This feature enables persistence of HTTP sessions to a datasource using JDBC. Persisting HTTP session data to a database allows recovery of the data after a server restart or unexpected server failure. Failover of HTTP sessions can be achieved by configuring multiple servers to persist data to the same location

### Enabling this feature

To enable the Database Session Persistence feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>sessionDatabase-1.0</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Database Session Persistence feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.sessionDatabase-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `jdbc-4.0` - Java Database Connectivity 4.0
- `jdbc-4.1` - Java Database Connectivity 4.1
- `jndi-1.0` - Java Naming and Directory Interface

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Database Session Persistence feature:

- `classloading`
- `httpSession`
- `httpSessionDatabase`
- `transaction`

## Distributed Map interface for Dynamic Caching

This feature provides a local cache service which can be accessed through the `DistributedMap` API. A default cache is bound in JNDI at `"services/cache/distributedmap"`. Caches can be distributed through addition of a network cache provider such as WebSphere eXtreme Scale.

### Enabling this feature

To enable the Distributed Map interface for Dynamic Caching feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>distributedMap-1.0</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Distributed Map interface for Dynamic Caching feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.distributedMap-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- jndi-1.0 - Java Naming and Directory Interface

### Features that enable this feature

- adminCenter-1.0 - Admin Center
- apiDiscovery-1.0 - API Discovery 1.0
- batchManagement-1.0 - Batch Management
- collectiveController-1.0 - Collective Controller
- dynamicRouting-1.0 - Dynamic Routing
- oauth-2.0 - OAuth
- openidConnectClient-1.0 - OpenID Connect Client
- restConnector-1.0 - JMX REST Connector 1.0
- restConnector-2.0 - JMX REST Connector 2.0
- samlWeb-2.0 - SAML web single sign-on version 2.0
- scim-1.0 - System for Cross-domain Identity Management
- webCache-1.0 - Web Response Cache
- wsAtomicTransaction-1.2 - WS-AT Service
-  zosConnect-1.0 - z/OS Connect
-  zosConnect-1.2 - z/OS Connect 1.2

### IBM API packages provided by this feature

- com.ibm.websphere.cache
- com.ibm.websphere.cache.exception
- com.ibm.websphere.exception
- com.ibm.ws.cache.spi
- com.ibm.wsspi.cache

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Distributed Map interface for Dynamic Caching feature:

- classloading
- distributedMap
- library

## Dynamic Routing

The Intelligent Management feature of the WebSphere plug-in for Apache and IHS provides On Demand Router capabilities for the plug-in. This feature enables a server to run a REST service to which the plug-in can connect in order to dynamically route to all servers in the liberty collective.

### Enabling this feature

To enable the Dynamic Routing feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>dynamicRouting-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Dynamic Routing feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.dynamicRouting-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- collectiveController-1.0 - Collective Controller
- distributedMap-1.0 - Distributed Map interface for Dynamic Caching
- json-1.0 - JavaScript Object Notation for Java
- restConnector-1.0 - JMX REST Connector 1.0
- restConnector-2.0 - JMX REST Connector 2.0
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1
- ssl-1.0 - Secure Socket Layer

### IBM API packages provided by this feature

- com.ibm.websphere.dynamic.routing

### Feature configuration elements

You can use the following elements in your server.xml file to configure the Dynamic Routing feature:

- administrator-role
- authCache
- authentication
- authorization-roles
- basicRegistry
- channelfw
- classloading
- dynamicRouting
- httpAccessLogging
- httpDispatcher
- httpEncoding
- httpEndpoint
- httpOptions
- httpProxyRedirect
- jaasLoginContextEntry
- jaasLoginModule

- library
- ltpa
- mimeTypees
- quickStartSecurity
- tcpOptions
- trustAssociation
- virtualHost

## Enterprise JavaBeans 3.2

This feature enables support for Enterprise JavaBeans written to the EJB 3.2 specification.

### Enabling this feature

To enable the Enterprise JavaBeans 3.2 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>ejb-3.2</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Enterprise JavaBeans 3.2 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.ejb-3.2; type="osgi.subsystem.feature"
```

### Features that this feature enables

- ejbHome-3.2 - Enterprise JavaBeans Home Interfaces 3.2
- ejbLite-3.2 - Enterprise JavaBeans Lite 3.2
- ejbPersistentTimer-3.2 - Enterprise JavaBeans Persistent Timers 3.2
- ejbRemote-3.2 - Enterprise JavaBeans Remote 3.2
- mdb-3.2 - Message-Driven Beans 3.2

### Features that enable this feature

- javaee-7.0 - Java EE Full Platform 7.0

### Feature configuration elements

You can use the following elements in your server.xml file to configure the Enterprise JavaBeans 3.2 feature:

- classloading
- transaction

## Enterprise JavaBeans Home Interfaces 3.2

This feature enables the use of home interfaces in Enterprise JavaBeans.

### Enabling this feature

To enable the Enterprise JavaBeans Home Interfaces 3.2 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>ejbHome-3.2</feature>
```

### Supported Java Versions

- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Enterprise JavaBeans Home Interfaces 3.2 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.ejbHome-3.2; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `ejbLite-3.2` - Enterprise JavaBeans Lite 3.2

### Features that enable this feature

- `ejb-3.2` - Enterprise JavaBeans 3.2

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Enterprise JavaBeans Home Interfaces 3.2 feature:

- `classloading`
- `transaction`

## Enterprise JavaBeans Lite 3.1

This feature enables support for Enterprise JavaBeans written to the EJB Lite subset of the EJB 3.1 specification.

### Enabling this feature

To enable the Enterprise JavaBeans Lite 3.1 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>ejbLite-3.1</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Enterprise JavaBeans Lite 3.1 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.ejbLite-3.1; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `jndi-1.0` - Java Naming and Directory Interface

### Features that enable this feature

- `webProfile-6.0` - Java EE Web Profile 6.0
- `z/OS` `zosLocalAdapters-1.0` - z/OS Optimized Local Adapters

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Enterprise JavaBeans Lite 3.1 feature:

- `application`

- applicationManager
- applicationMonitor
- classloading
- ejbApplication
- ejbContainer
- enterpriseApplication
- javaPermission
- library
- transaction
- webApplication

## Enterprise JavaBeans Lite 3.2

This feature enables support for Enterprise JavaBeans written to the EJB Lite subset of the EJB 3.2 specification.

### Enabling this feature

To enable the Enterprise JavaBeans Lite 3.2 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>ejbLite-3.2</feature>
```

### Supported Java Versions

- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Enterprise JavaBeans Lite 3.2 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.ejbLite-3.2; type="osgi.subsystem.feature"
```

### Features that this feature enables

- jndi-1.0 - Java Naming and Directory Interface

### Features that enable this feature

- ejb-3.2 - Enterprise JavaBeans 3.2
- ejbHome-3.2 - Enterprise JavaBeans Home Interfaces 3.2
- ejbPersistentTimer-3.2 - Enterprise JavaBeans Persistent Timers 3.2
- ejbRemote-3.2 - Enterprise JavaBeans Remote 3.2
- webProfile-7.0 - Java EE Web Profile 7.0
-  zosLocalAdapters-1.0 - z/OS Optimized Local Adapters

### IBM API packages provided by this feature

- com.ibm.websphere.ejbcontainer.mbean

### Feature configuration elements

You can use the following elements in your server.xml file to configure the Enterprise JavaBeans Lite 3.2 feature:

- application

- applicationManager
- applicationMonitor
- classloading
- ejbApplication
- ejbContainer
- enterpriseApplication
- javaPermission
- library
- transaction
- webApplication

## Enterprise JavaBeans Persistent Timers 3.2

This feature enables the use of persistent timers in Enterprise JavaBeans.

### Enabling this feature

To enable the Enterprise JavaBeans Persistent Timers 3.2 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>ejbPersistentTimer-3.2</feature>
```

### Supported Java Versions

- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Enterprise JavaBeans Persistent Timers 3.2 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.ejbPersistentTimer-3.2; type="osgi.subsystem.feature"
```

### Features that this feature enables

- ejbLite-3.2 - Enterprise JavaBeans Lite 3.2
- jdbc-4.1 - Java Database Connectivity 4.1
- jndi-1.0 - Java Naming and Directory Interface

### Features that enable this feature

- ejb-3.2 - Enterprise JavaBeans 3.2

### Feature configuration elements

You can use the following elements in your server.xml file to configure the Enterprise JavaBeans Persistent Timers 3.2 feature:

- classloading
- databaseStore
- persistentExecutor
- transaction

## Enterprise JavaBeans Remote 3.2

This feature enables the use of remote interfaces in Enterprise JavaBeans.

## Enabling this feature

To enable the Enterprise JavaBeans Remote 3.2 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>ejbRemote-3.2</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Enterprise JavaBeans Remote 3.2 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.ejbRemote-3.2; type="osgi.subsystem.feature"
```

## Features that this feature enables

- `ejbLite-3.2` - Enterprise JavaBeans Lite 3.2

## Features that enable this feature

- `ejb-3.2` - Enterprise JavaBeans 3.2

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Enterprise JavaBeans Remote 3.2 feature:

- `channelfw`
- `classloading`
- `iiopEndpoint`
- `iiopServerPolicies`
- `orb`
- `tcpOptions`
- `transaction`

## Event Logging

Logs a record of events, such as JDBC requests and servlet requests, and their durations.

## Enabling this feature

To enable the Event Logging feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>eventLogging-1.0</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Event Logging feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.eventLogging-1.0; type="osgi.subsystem.feature"
```

## SPI packages provided by this feature

- `com.ibm.wsspi.event.logging`

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Event Logging feature:

- `eventLogging`

## Expression Language 3.0

This feature enables support for the Expression Language (EL) 3.0.

### Enabling this feature

To enable the Expression Language 3.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>el-3.0</feature>
```

### Supported Java Versions

- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Expression Language 3.0 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.el-3.0; type="osgi.subsystem.feature"
```

### Features that enable this feature

- `beanValidation-1.1` - Bean Validation 1.1
- `jsp-2.3` - JavaServer Pages 2.3
- `webProfile-7.0` - Java EE Web Profile 7.0

### Standard API packages provided by this feature

- `javax.el`

## Federated User Registry

This feature enables support for federation of multiple user registries.

### Enabling this feature

To enable the Federated User Registry feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>federatedRegistry-1.0</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Federated User Registry feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.federatedRegistry-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- ssl-1.0 - Secure Socket Layer

### Features that enable this feature

- ldapRegistry-3.0 - LDAP User Registry
- scim-1.0 - System for Cross-domain Identity Management

### SPI packages provided by this feature

- com.ibm.wsspi.security.wim
- com.ibm.wsspi.security.wim.exception
- com.ibm.wsspi.security.wim.model

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Federated User Registry feature:

- federatedRepository

### Health Analyzer

The Health Analyzer feature provides health data collection for the Health Manager.

### Enabling this feature

To enable the Health Analyzer feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>healthAnalyzer-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Health Analyzer feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.health.healthAnalyzer-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- collectiveMember-1.0 - Collective Member
- json-1.0 - JavaScript Object Notation for Java
- restConnector-1.0 - JMX REST Connector 1.0
- restConnector-2.0 - JMX REST Connector 2.0
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Health Analyzer feature:

- channelfw
- classloading
- httpAccessLogging
- httpDispatcher
- httpEncoding
- httpEndpoint
- httpOptions

- httpProxyRedirect
- mimeTypes
- tcpOptions
- virtualHost

## Health Manager

The Health Manager feature provides health monitoring and automatic actions based on Health Policy.

### Enabling this feature

To enable the Health Manager feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>healthManager-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Health Manager feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.health.healthManager-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- collectiveController-1.0 - Collective Controller
- json-1.0 - JavaScript Object Notation for Java
- restConnector-1.0 - JMX REST Connector 1.0
- restConnector-2.0 - JMX REST Connector 2.0
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

### Feature configuration elements

You can use the following elements in your server.xml file to configure the Health Manager feature:

- healthPolicy

## J2EE Management 1.1

This feature allows applications to utilize the interfaces defined in the JSR77 specification.

### Enabling this feature

To enable the J2EE Management 1.1 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>j2eeManagement-1.1</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the J2EE Management 1.1 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.j2eeManagement-1.1; type="osgi.subsystem.feature"
```

### Features that enable this feature

- javaee-7.0 - Java EE Full Platform 7.0

## Standard API packages provided by this feature

- javax.management.j2ee
- javax.management.j2ee.statistics
- org.omg.stub.javax.management.j2ee

## IBM API packages provided by this feature

- com.ibm.websphere.management.j2ee

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the J2EE Management 1.1 feature:

- channelfw
- classloading
- orb
- tcpOptions
- transaction

## JMS 1.1 Client for IBM MQ

This feature provides applications with access to message queues hosted on WebSphere MQ through the JMS 1.1 API.

## Enabling this feature

To enable the JMS 1.1 Client for IBM MQ feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>wmqJmsClient-1.1</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the JMS 1.1 Client for IBM MQ feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.wmqJmsClient-1.1; type="osgi.subsystem.feature"
```

## Standard API packages provided by this feature

- javax.jms

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the JMS 1.1 Client for IBM MQ feature:

- activationSpec
- adminObject
- application
- applicationManager
- applicationMonitor
- authData

- classloading
- connectionFactory
- connectionManager
- javaPermission
- jmsActivationSpec
- jmsConnectionFactory
- jmsDestination
- jmsQueue
- jmsQueueConnectionFactory
- jmsTopic
- jmsTopicConnectionFactory
- library
- resourceAdapter
- transaction
- wmqJmsClient

## **JMS 1.1 Client for Message Server**

This feature provides applications with access to message queues hosted on WebSphere Application Server through the JMS 1.1 API. It enables access both to the messaging engine enabled via the wasJmsServer feature, and to a service integration bus hosted in a full profile server.

### **Enabling this feature**

To enable the JMS 1.1 Client for Message Server feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>wasJmsClient-1.1</feature>
```

### **Supported Java Versions**

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### **Developing a feature that depends on this feature**

If you are developing a feature that depends on the JMS 1.1 Client for Message Server feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.wasJmsClient-1.1; type="osgi.subsystem.feature"
```

### **Standard API packages provided by this feature**

- javax.jms

### **Feature configuration elements**

You can use the following elements in your server.xml file to configure the JMS 1.1 Client for Message Server feature:

- activationSpec
- adminObject
- application
- applicationManager
- applicationMonitor

- authData
- channelfw
- classloading
- connectionFactory
- connectionManager
- javaPermission
- jmsActivationSpec
- jmsConnectionFactory
- jmsDestination
- jmsQueue
- jmsQueueConnectionFactory
- jmsTopic
- jmsTopicConnectionFactory
- library
- resourceAdapter
- tcpOptions
- transaction
- wasJmsOutbound

## **JMS 2.0 Client for IBM MQ**

This feature provides applications with access to message queues hosted on IBM MQ through the JMS 2.0 API.

### **Enabling this feature**

To enable the JMS 2.0 Client for IBM MQ feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>wmqJmsClient-2.0</feature>
```

### **Supported Java Versions**

- JavaSE-1.7
- JavaSE-1.8

### **Developing a feature that depends on this feature**

If you are developing a feature that depends on the JMS 2.0 Client for IBM MQ feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.wmqJmsClient-2.0; type="osgi.subsystem.feature"
```

### **Feature configuration elements**

You can use the following elements in your server.xml file to configure the JMS 2.0 Client for IBM MQ feature:

- activationSpec
- adminObject
- application
- applicationManager
- applicationMonitor
- authData

- classloading
- connectionFactory
- connectionManager
- javaPermission
- jmsActivationSpec
- jmsConnectionFactory
- jmsDestination
- jmsQueue
- jmsQueueConnectionFactory
- jmsTopic
- jmsTopicConnectionFactory
- library
- resourceAdapter
- transaction
- wmqJmsClient

## JMS 2.0 Client for Message Server

The wasJmsClient-2.0 feature provides applications with access to the message queues that are hosted on WebSphere Application Server through the JMS 2.0 API. This feature supersedes wasJmsClient-1.1. The wasJmsClient-2.0 feature is compliant with JMS 2.0 specifications and is supported only on JDK 7 or later. It enables access to the messaging engine that is enabled through the wasJmsServer feature, and also to the service integration bus that is hosted on a full profile server.

### Enabling this feature

To enable the JMS 2.0 Client for Message Server feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>wasJmsClient-2.0</feature>
```

### Supported Java Versions

- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the JMS 2.0 Client for Message Server feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.wasJmsClient-2.0; type="osgi.subsystem.feature"
```

### Features that enable this feature

- javaee-7.0 - Java EE Full Platform 7.0
- javaeeClient-7.0 - Java EE V7 Application Client

### Standard API packages provided by this feature

- javax.jms

### Feature configuration elements

You can use the following elements in your server.xml file to configure the JMS 2.0 Client for Message Server feature:

- activationSpec

- adminObject
- application
- applicationManager
- applicationMonitor
- authData
- channelfw
- classloading
- connectionFactory
- connectionManager
- javaPermission
- jmsActivationSpec
- jmsConnectionFactory
- jmsDestination
- jmsQueue
- jmsQueueConnectionFactory
- jmsTopic
- jmsTopicConnectionFactory
- library
- resourceAdapter
- tcpOptions
- transaction
- wasJmsOutbound

### **JMS Message-Driven Beans 3.1**

This feature enables the use of JMS Message-Driven Enterprise JavaBeans written to the EJB 3.1 specification. MDBs allow asynchronous processing of messages within a Java EE component.

#### **Enabling this feature**

To enable the JMS Message-Driven Beans 3.1 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>jmsMdb-3.1</feature>
```

#### **Supported Java Versions**

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

#### **Developing a feature that depends on this feature**

If you are developing a feature that depends on the JMS Message-Driven Beans 3.1 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jmsMdb-3.1; type="osgi.subsystem.feature"
```

#### **Features that this feature is superseded by**

- mdb-3.1 - Message-Driven Beans 3.1

### Features that this feature enables

- jca-1.6 - Java Connector Architecture 1.6
- jndi-1.0 - Java Naming and Directory Interface

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the JMS Message-Driven Beans 3.1 feature:

- application
- applicationManager
- applicationMonitor
- classloading
- ejbApplication
- ejbContainer
- enterpriseApplication
- javaPermission
- library
- transaction
- webApplication

### JMS Message-Driven Beans 3.2

This feature is superseded by `mdb-3.2`. Both features provide identical function; only the feature names are different. `mdb-3.2` is the preferred feature name.

### Enabling this feature

To enable the JMS Message-Driven Beans 3.2 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>jmsMdb-3.2</feature>
```

### Supported Java Versions

- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the JMS Message-Driven Beans 3.2 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jmsMdb-3.2; type="osgi.subsystem.feature"
```

### Features that this feature is superseded by

- `mdb-3.2` - Message-Driven Beans 3.2

### Features that this feature enables

- `mdb-3.2` - Message-Driven Beans 3.2

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the JMS Message-Driven Beans 3.2 feature:

- classloading

- transaction

## JMX Local Connector

This feature allows the use of a local JMX connector that is built into the JVM to access JMX resources in the server. The JMX connector can only be used on the same host machine by a client that has the same user ID and the same JDK as the server process. It enables local access by JMX clients such as jConsole, or other JMX clients that use the Attach API.

### Enabling this feature

To enable the JMX Local Connector feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>localConnector-1.0</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the JMX Local Connector feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.localConnector-1.0; type="osgi.subsystem.feature"
```

## JMX REST Connector 1.0

A secure JMX connector that can be used locally or remotely using any JDK. It enables remote access by JMX clients via a REST-based connector and requires SSL and basic user security configuration. This feature is superseded by the restConnector-2.0 feature. This feature enables the jaxrs-1.1 feature.

### Enabling this feature

To enable the JMX REST Connector 1.0 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>restConnector-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the JMX REST Connector 1.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.restConnector-1.0; type="osgi.subsystem.feature"
```

### Features that this feature is superseded by

- jaxrs-1.1 - Java RESTful Services 1.1
- json-1.0 - JavaScript Object Notation for Java
- restConnector-2.0 - JMX REST Connector 2.0

### Features that this feature enables

- distributedMap-1.0 - Distributed Map interface for Dynamic Caching
- json-1.0 - JavaScript Object Notation for Java
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1
- ssl-1.0 - Secure Socket Layer

## Features that enable this feature

- adminCenter-1.0 - Admin Center
- clusterMember-1.0 - Static Cluster Member
- collectiveController-1.0 - Collective Controller
- collectiveMember-1.0 - Collective Member
- dynamicRouting-1.0 - Dynamic Routing
- healthAnalyzer-1.0 - Health Analyzer
- healthManager-1.0 - Health Manager
- scalingController-1.0 - Scaling Controller
- scalingMember-1.0 - Scaling Member

## IBM API packages provided by this feature

- com.ibm.websphere.filetransfer
- com.ibm.websphere.jmx.connector.rest
- com.ibm.ws.jmx.connector.client.rest

## SPI packages provided by this feature

- com.ibm.wsspi.collective.plugins
- com.ibm.wsspi.collective.plugins.helpers

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the JMX REST Connector 1.0 feature:

- administrator-role
- authCache
- authentication
- authorization-roles
- basicRegistry
- channelfw
- classloading
- httpAccessLogging
- httpDispatcher
- httpEncoding
- httpEndpoint
- httpOptions
- httpProxyRedirect
- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- mimeTypees
- quickStartSecurity
- remoteFileAccess
- tcpOptions
- trustAssociation
- virtualHost

## JMX REST Connector 2.0

A secure JMX connector that can be used locally or remotely using any JDK. It enables remote access by JMX clients via a REST-based connector and requires SSL and basic user security configuration. This feature supersedes the restConnector-1.0 feature and does not include the jaxrs-1.1 feature.

### Enabling this feature

To enable the JMX REST Connector 2.0 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>restConnector-2.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the JMX REST Connector 2.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.restConnector-2.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- distributedMap-1.0 - Distributed Map interface for Dynamic Caching
- json-1.0 - JavaScript Object Notation for Java
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1
- ssl-1.0 - Secure Socket Layer

### Features that enable this feature

- adminCenter-1.0 - Admin Center
- clusterMember-1.0 - Static Cluster Member
- collectiveController-1.0 - Collective Controller
- collectiveMember-1.0 - Collective Member
- dynamicRouting-1.0 - Dynamic Routing
- healthAnalyzer-1.0 - Health Analyzer
- healthManager-1.0 - Health Manager
- scalingController-1.0 - Scaling Controller
- scalingMember-1.0 - Scaling Member

### IBM API packages provided by this feature

- com.ibm.websphere.filetransfer
- com.ibm.websphere.jmx.connector.rest
- com.ibm.ws.jmx.connector.client.rest

### SPI packages provided by this feature

- com.ibm.wsspi.collective.plugins
- com.ibm.wsspi.collective.plugins.helpers

### Feature configuration elements

You can use the following elements in your server.xml file to configure the JMX REST Connector 2.0 feature:

- administrator-role
- authCache

- authentication
- authorization-roles
- basicRegistry
- channelfw
- classloading
- httpAccessLogging
- httpDispatcher
- httpEncoding
- httpEndpoint
- httpOptions
- httpProxyRedirect
- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- mimeTypees
- quickStartSecurity
- remoteFileAccess
- tcpOptions
- trustAssociation
- virtualHost

## Java Authentication SPI for Containers 1.1

This feature enables support for securing the server runtime environment and applications using Java Authentication SPI for Containers (JASPIC) providers as defined in JSR-196

### Enabling this feature

To enable the Java Authentication SPI for Containers 1.1 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>jaspic-1.1</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Authentication SPI for Containers 1.1 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jaspic-1.1; type="osgi.subsystem.feature"
```

### Features that this feature enables

- appSecurity-2.0 - Application Security 2.0
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

### Features that enable this feature

- javaee-7.0 - Java EE Full Platform 7.0

## Standard API packages provided by this feature

- javax.security.auth.message
- javax.security.auth.message.callback
- javax.security.auth.message.config
- javax.security.auth.message.module

## SPI packages provided by this feature

- com.ibm.wsspi.security.jaspi

## Java Authorization Contract for Containers 1.5

This feature enables support for Java Authorization Contract for Containers (JACC) version 1.5. In order to add the jacc-1.5 feature to your server, you need to add the third party JACC provider which is not a part of the WebSphere Application Server Liberty profile.

## Enabling this feature

To enable the Java Authorization Contract for Containers 1.5 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>jacc-1.5</feature>
```

## Supported Java Versions

- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Authorization Contract for Containers 1.5 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jacc-1.5; type="osgi.subsystem.feature"
```

## Features that this feature enables

- appSecurity-2.0 - Application Security 2.0

## Features that enable this feature

- javaee-7.0 - Java EE Full Platform 7.0

## Standard API packages provided by this feature

- javax.security.jacc

## IBM API packages provided by this feature

- com.ibm.wsspi.security.authorization.jacc

## Feature configuration elements

You can use the following elements in your server.xml file to configure the Java Authorization Contract for Containers 1.5 feature:

- classloading

## Java Connector Architecture 1.0 Security Inflow

This feature enables security inflow for resource adapters.

## Enabling this feature

To enable the Java Connector Architecture 1.0 Security Inflow feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>jcaInboundSecurity-1.0</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Connector Architecture 1.0 Security Inflow feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jcaInboundSecurity-1.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- jca-1.6 - Java Connector Architecture 1.6
- jca-1.7 - Java Connector Architecture 1.7
- ssl-1.0 - Secure Socket Layer

## Features that enable this feature

- javaee-7.0 - Java EE Full Platform 7.0

## Standard API packages provided by this feature

- javax.security.auth.message.callback

## Feature configuration elements

You can use the following elements in your server.xml file to configure the Java Connector Architecture 1.0 Security Inflow feature:

- administrator-role
- authCache
- authentication
- basicRegistry
- classloading
- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- quickStartSecurity
- transaction

## Java Connector Architecture 1.6

This feature enables the configuration of resource adapters to access Enterprise Information Systems (EIS) from applications. The configuration of a resource adapter also includes the configuration of connection factories, administered objects and activation specifications. Any resource adapter that complies with the JCA 1.6 specification can be used. High performance connection pooling is also provided.

## Enabling this feature

To enable the Java Connector Architecture 1.6 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>jca-1.6</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Connector Architecture 1.6 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jca-1.6; type="osgi.subsystem.feature"
```

## Features that enable this feature

- jcaInboundSecurity-1.0 - Java Connector Architecture 1.0 Security Inflow
- jms-1.1 - Java Message Service 1.1
- jmsMdb-3.1 - JMS Message-Driven Beans 3.1
- mdb-3.1 - Message-Driven Beans 3.1
-  zosLocalAdapters-1.0 - z/OS Optimized Local Adapters

## Feature configuration elements

You can use the following elements in your server.xml file to configure the Java Connector Architecture 1.6 feature:

- activationSpec
- adminObject
- application
- applicationManager
- applicationMonitor
- authData
- classloading
- connectionFactory
- connectionManager
- javaPermission
- library
- resourceAdapter
- transaction

## Java Connector Architecture 1.7

This feature enables the configuration of resource adapters to access Enterprise Information Systems (EIS) from applications. The configuration of a resource adapter also includes the configuration of connection factories, administered objects and activation specifications. Any resource adapter that complies with the JCA 1.7 specification or lower can be used. High performance connection pooling is also provided.

## Enabling this feature

To enable the Java Connector Architecture 1.7 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>jca-1.7</feature>
```

## Supported Java Versions

- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Connector Architecture 1.7 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jca-1.7; type="osgi.subsystem.feature"
```

## Features that enable this feature

- javaee-7.0 - Java EE Full Platform 7.0
- jcaInboundSecurity-1.0 - Java Connector Architecture 1.0 Security Inflow
- jms-2.0 - Java Message Service 2.0
- mdb-3.2 - Message-Driven Beans 3.2
-  zosLocalAdapters-1.0 - z/OS Optimized Local Adapters

## Feature configuration elements

You can use the following elements in your server.xml file to configure the Java Connector Architecture 1.7 feature:

- activationSpec
- adminObject
- application
- applicationManager
- applicationMonitor
- authData
- classloading
- connectionFactory
- connectionManager
- javaPermission
- library
- resourceAdapter
- transaction

## Java Database Connectivity 4.0

This feature enables the configuration of DataSources to access Databases from applications. Any database that complies with the JDBC 4.0 specification can be used; customized configuration of many specific providers is included. High performance connection pooling is also provided.

## Enabling this feature

To enable the Java Database Connectivity 4.0 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>jdbc-4.0</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Database Connectivity 4.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jdbc-4.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- jndi-1.0 - Java Naming and Directory Interface

### Features that enable this feature

- batch-1.0 - Batch API 1.0
- batchManagement-1.0 - Batch Management
- jpa-2.0 - Java Persistence API 2.0
- osgi.jpa-1.0 - OSGi Java Persistence API
- sessionDatabase-1.0 - Database Session Persistence
- webProfile-6.0 - Java EE Web Profile 6.0

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java Database Connectivity 4.0 feature:

- `authData`
- `classloading`
- `connectionManager`
- `dataSource`
- `jdbcDriver`
- `library`
- `transaction`

### Java Database Connectivity 4.1

This feature enables the configuration of `DataSources` to access Databases from applications. Any JDBC driver that complies with the JDBC 4.1, 4.0, 3.0, or 2.x specification can be used; customized configuration of many specific providers is included. High performance connection pooling is also provided.

### Enabling this feature

To enable the Java Database Connectivity 4.1 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>jdbc-4.1</feature>
```

### Supported Java Versions

- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Database Connectivity 4.1 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jdbc-4.1; type="osgi.subsystem.feature"
```

## Features that enable this feature

- batch-1.0 - Batch API 1.0
- batchManagement-1.0 - Batch Management
- ejbPersistentTimer-3.2 - Enterprise JavaBeans Persistent Timers 3.2
- javaeeClient-7.0 - Java EE V7 Application Client
- jpa-2.0 - Java Persistence API 2.0
- jpa-2.1 - Java Persistence API 2.1
- osgi.jpa-1.0 - OSGi Java Persistence API
- sessionDatabase-1.0 - Database Session Persistence
- webProfile-6.0 - Java EE Web Profile 6.0
- webProfile-7.0 - Java EE Web Profile 7.0

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java Database Connectivity 4.1 feature:

- authData
- classloading
- connectionManager
- dataSource
- jdbcDriver
- library
- transaction

## Java EE Full Platform 7.0

This feature combines the Liberty features that support the Java EE 7.0 Full Platform.

## Enabling this feature

To enable the Java EE Full Platform 7.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>javaee-7.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Java EE Full Platform 7.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.javaee-7.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- appClientSupport-1.0 - Application Client Support for Server
- batch-1.0 - Batch API 1.0
- concurrent-1.0 - Concurrency Utilities for Java EE 1.0
- ejb-3.2 - Enterprise JavaBeans 3.2

- j2eeManagement-1.1 - J2EE Management 1.1
- jacc-1.5 - Java Authorization Contract for Containers 1.5
- jaspic-1.1 - Java Authentication SPI for Containers 1.1
- javaMail-1.5 - JavaMail 1.5
- jaxws-2.2 - Java Web Services 2.2
- jca-1.7 - Java Connector Architecture 1.7
- jcaInboundSecurity-1.0 - Java Connector Architecture 1.0 Security Inflow
- servlet-3.1 - Java Servlets 3.1
- wasJmsClient-2.0 - JMS 2.0 Client for Message Server
- wasJmsSecurity-1.0 - Message Server Security 1.0
- wasJmsServer-1.0 - Message Server 1.0
- webProfile-7.0 - Java EE Web Profile 7.0

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java EE Full Platform 7.0 feature:

- `classloading`
- `transaction`

### Java EE Managed Bean 1.0

This feature enables support for the Managed Beans 1.0 specification. Managed Beans provide a common foundation for different Java EE components types that are managed by a container. Common services provided to Managed Beans include resource injection, lifecycle management and the use of interceptors.

### Enabling this feature

To enable the Java EE Managed Bean 1.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>managedBeans-1.0</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Java EE Managed Bean 1.0 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.managedBeans-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `jndi-1.0` - Java Naming and Directory Interface

### Features that enable this feature

- `javaeeClient-7.0` - Java EE V7 Application Client
- `webProfile-6.0` - Java EE Web Profile 6.0
- `webProfile-7.0` - Java EE Web Profile 7.0

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java EE Managed Bean 1.0 feature:

- `classloading`
- `ejbContainer`
- `library`
- `transaction`

## Java EE V7 Application Client

This feature enables support for Java EE 7 Application Client.

### Enabling this feature

To enable the Java EE V7 Application Client feature, add the following element declaration inside the `featureManager` element in your `client.xml` file:

```
<feature>javaeeClient-7.0</feature>
```

### Features that this feature enables

- `beanValidation-1.1` - Bean Validation 1.1
- `cdi-1.2` - Contexts and Dependency Injection 1.2
- `javaMail-1.5` - JavaMail 1.5
- `jaxb-2.2` - Java XML Bindings 2.2
- `jdbc-4.1` - Java Database Connectivity 4.1
- `jndi-1.0` - Java Naming and Directory Interface
- `jpa-2.1` - Java Persistence API 2.1
- `jsonp-1.0` - JavaScript Object Notation Processing
- `managedBeans-1.0` - Java EE Managed Bean 1.0
- `wasJmsClient-2.0` - JMS 2.0 Client for Message Server

## Feature configuration elements

You can use the following elements in your `client.xml` file to configure the Java EE V7 Application Client feature:

- `application`
- `applicationManager`
- `applicationMonitor`
- `channelfw`
- `classloading`
- `ejbApplication`
- `ejbContainer`
- `enterpriseApplication`
- `javaPermission`
- `library`
- `orb`
- `tcpOptions`
- `transaction`
- `webApplication`

## Java EE Web Profile 6.0

This feature provides a convenient combination of the Liberty features that are required to support the Java EE Web Profile.

### Enabling this feature

To enable the Java EE Web Profile 6.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>webProfile-6.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Java EE Web Profile 6.0 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.webProfile-6.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `appSecurity-2.0` - Application Security 2.0
- `beanValidation-1.0` - Bean Validation 1.0
- `cdi-1.0` - Contexts and Dependency Injection 1.0
- `ejbLite-3.1` - Enterprise JavaBeans Lite 3.1
- `jdbc-4.0` - Java Database Connectivity 4.0
- `jdbc-4.1` - Java Database Connectivity 4.1
- `jndi-1.0` - Java Naming and Directory Interface
- `jpa-2.0` - Java Persistence API 2.0
- `jsf-2.0` - JavaServer Faces 2.0
- `jsp-2.2` - JavaServer Pages 2.2
- `managedBeans-1.0` - Java EE Managed Bean 1.0
- `servlet-3.0` - Java Servlets 3.0

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java EE Web Profile 6.0 feature:

- `classloading`
- `transaction`

## Java EE Web Profile 7.0

This feature combines the Liberty features that support the Java EE 7.0 Web Profile.

### Enabling this feature

To enable the Java EE Web Profile 7.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>webProfile-7.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Java EE Web Profile 7.0 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.webProfile-7.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- appSecurity-2.0 - Application Security 2.0
- beanValidation-1.1 - Bean Validation 1.1
- cdi-1.2 - Contexts and Dependency Injection 1.2
- ejbLite-3.2 - Enterprise JavaBeans Lite 3.2
- el-3.0 - Expression Language 3.0
- jaxrs-2.0 - Java RESTful Services 2.0
- jdbc-4.1 - Java Database Connectivity 4.1
- jndi-1.0 - Java Naming and Directory Interface
- jpa-2.1 - Java Persistence API 2.1
- jsf-2.2 - JavaServer Faces 2.2
- jsonp-1.0 - JavaScript Object Notation Processing
- jsp-2.3 - JavaServer Pages 2.3
- managedBeans-1.0 - Java EE Managed Bean 1.0
- servlet-3.1 - Java Servlets 3.1
- websocket-1.1 - Java WebSocket 1.1

## Features that enable this feature

- javaee-7.0 - Java EE Full Platform 7.0

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java EE Web Profile 7.0 feature:

- classloading
- transaction

## Java Message Service 1.1

This feature enables the configuration of resource adapters to access messaging systems using the Java Message Service API. This also includes the configuration JMS connection factories, queues, topics and activation specifications. Any JMS resource adapter that complies with the JCA 1.6 specification can be used.

## Enabling this feature

To enable the Java Message Service 1.1 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>jms-1.1</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Message Service 1.1 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jms-1.1; type="osgi.subsystem.feature"
```

## Features that this feature enables

- jca-1.6 - Java Connector Architecture 1.6

## Standard API packages provided by this feature

- javax.jms

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java Message Service 1.1 feature:

- activationSpec
- adminObject
- application
- applicationManager
- applicationMonitor
- authData
- classloading
- connectionFactory
- connectionManager
- javaPermission
- jmsActivationSpec
- jmsConnectionFactory
- jmsDestination
- jmsQueue
- jmsQueueConnectionFactory
- jmsTopic
- jmsTopicConnectionFactory
- library
- resourceAdapter
- transaction

## Java Message Service 2.0

This feature enables the configuration of resource adapters to access messaging systems using the Java Message Service API. This also includes the configuration JMS connection factories, queues, topics and activation specifications. Any JMS resource adapter that complies with the JCA 1.7 specification can be used.

## Enabling this feature

To enable the Java Message Service 2.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>jms-2.0</feature>
```

## Supported Java Versions

- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Message Service 2.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jms-2.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- jca-1.7 - Java Connector Architecture 1.7

## Standard API packages provided by this feature

- javax.jms

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java Message Service 2.0 feature:

- activationSpec
- adminObject
- application
- applicationManager
- applicationMonitor
- authData
- classloading
- connectionFactory
- connectionManager
- javaPermission
- jmsActivationSpec
- jmsConnectionFactory
- jmsDestination
- jmsQueue
- jmsQueueConnectionFactory
- jmsTopic
- jmsTopicConnectionFactory
- library
- resourceAdapter
- transaction

## Java Naming and Directory Interface

This feature enables the use of Java Naming and Directory Interface (JNDI) to access server configured resources such as DataSources or JMS Connection Factories. It also allows access to Java primitives configured in the server as a `jndiEntry`.

## Enabling this feature

To enable the Java Naming and Directory Interface feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>jndi-1.0</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Naming and Directory Interface feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jndi-1.0; type="osgi.subsystem.feature"
```

## Features that enable this feature

- appClientSupport-1.0 - Application Client Support for Server
- batch-1.0 - Batch API 1.0
- distributedMap-1.0 - Distributed Map interface for Dynamic Caching
- ejbLite-3.1 - Enterprise JavaBeans Lite 3.1
- ejbLite-3.2 - Enterprise JavaBeans Lite 3.2
- ejbPersistentTimer-3.2 - Enterprise JavaBeans Persistent Timers 3.2
- javaeeClient-7.0 - Java EE V7 Application Client
- jdbc-4.0 - Java Database Connectivity 4.0
- jmsMdb-3.1 - JMS Message-Driven Beans 3.1
- jpa-2.0 - Java Persistence API 2.0
- jpa-2.1 - Java Persistence API 2.1
- managedBeans-1.0 - Java EE Managed Bean 1.0
- mdb-3.1 - Message-Driven Beans 3.1
- mdb-3.2 - Message-Driven Beans 3.2
- osgi.jpa-1.0 - OSGi Java Persistence API
- sessionDatabase-1.0 - Database Session Persistence
- webProfile-6.0 - Java EE Web Profile 6.0
- webProfile-7.0 - Java EE Web Profile 7.0
-  zosLocalAdapters-1.0 - z/OS Optimized Local Adapters
-  zosRequestLogging-1.0 - z/OS Request Logging

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java Naming and Directory Interface feature:

- classloading
- jndiEntry
- jndiObjectFactory
- jndiReferenceEntry
- jndiURLEntry
- library

## Java Persistence API 2.0

This feature enables support for applications that use application-managed and container-managed JPA written to the Java Persistence API 2.0 specification. The support is built on top of Apache OpenJPA with extensions to support the container-managed programming model.

## Enabling this feature

To enable the Java Persistence API 2.0 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>jpa-2.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Persistence API 2.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jpa-2.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- beanValidation-1.0 - Bean Validation 1.0
- beanValidation-1.1 - Bean Validation 1.1
- jdbc-4.0 - Java Database Connectivity 4.0
- jdbc-4.1 - Java Database Connectivity 4.1
- jndi-1.0 - Java Naming and Directory Interface
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

## Features that enable this feature

- osgi.jpaa-1.0 - OSGi Java Persistence API
- webProfile-6.0 - Java EE Web Profile 6.0

## Standard API packages provided by this feature

- javax.persistence
- javax.persistence.criteria
- javax.persistence.metamodel
- javax.persistence.spi

## Third party API packages provided by this feature

- org.apache.openjpa.abstractstore
- org.apache.openjpa.ant
- org.apache.openjpa.audit
- org.apache.openjpa.conf
- org.apache.openjpa.datacache
- org.apache.openjpa.ee
- org.apache.openjpa.enhance
- org.apache.openjpa.event
- org.apache.openjpa.instrumentation
- org.apache.openjpa.instrumentation.jmx
- org.apache.openjpa.jdbc.ant
- org.apache.openjpa.jdbc.conf
- org.apache.openjpa.jdbc.identifier
- org.apache.openjpa.jdbc.kernel
- org.apache.openjpa.jdbc.kernel.exps
- org.apache.openjpa.jdbc.meta

- org.apache.openjpa.jdbc.meta.strats
- org.apache.openjpa.jdbc.schema
- org.apache.openjpa.jdbc.sql
- org.apache.openjpa.kernel
- org.apache.openjpa.kernel.exps
- org.apache.openjpa.kernel.jpql
- org.apache.openjpa.lib.ant
- org.apache.openjpa.lib.conf
- org.apache.openjpa.lib.encryption
- org.apache.openjpa.lib.graph
- org.apache.openjpa.lib.identifier
- org.apache.openjpa.lib.instrumentation
- org.apache.openjpa.lib.jdbc
- org.apache.openjpa.lib.log
- org.apache.openjpa.lib.meta
- org.apache.openjpa.lib.rop
- org.apache.openjpa.lib.util
- org.apache.openjpa.lib.util.concurrent
- org.apache.openjpa.lib.util.svn
- org.apache.openjpa.lib.xml
- org.apache.openjpa.meta
- org.apache.openjpa.persistence
- org.apache.openjpa.persistence.criteria
- org.apache.openjpa.persistence.jdbc
- org.apache.openjpa.persistence.meta
- org.apache.openjpa.persistence.osgi
- org.apache.openjpa.persistence.query
- org.apache.openjpa.persistence.util
- org.apache.openjpa.persistence.validation
- org.apache.openjpa.slice
- org.apache.openjpa.slice.jdbc
- org.apache.openjpa.util
- org.apache.openjpa.validation
- org.apache.openjpa.xmlstore

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java Persistence API 2.0 feature:

- classloading
- jpa
- library
- transaction

## Java Persistence API 2.1

This feature enables support for applications that use application-managed and container-managed JPA written to the Java Persistence API 2.1 specification. The support is built on top of EclipseLink to support the container-managed programming model.

### Enabling this feature

To enable the Java Persistence API 2.1 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>jpa-2.1</feature>
```

### Supported Java Versions

- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Persistence API 2.1 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jpa-2.1; type="osgi.subsystem.feature"
```

### Features that this feature enables

- jdbc-4.1 - Java Database Connectivity 4.1
- jndi-1.0 - Java Naming and Directory Interface

### Features that enable this feature

- javaeeClient-7.0 - Java EE V7 Application Client
- webProfile-7.0 - Java EE Web Profile 7.0

### Standard API packages provided by this feature

- javax.persistence
- javax.persistence.criteria
- javax.persistence.metamodel
- javax.persistence.spi

### Third party API packages provided by this feature

- org.eclipse.persistence
- org.eclipse.persistence.annotations
- org.eclipse.persistence.config
- org.eclipse.persistence.core.descriptors
- org.eclipse.persistence.core.mappings
- org.eclipse.persistence.core.mappings.converters
- org.eclipse.persistence.core.queries
- org.eclipse.persistence.core.sessions
- org.eclipse.persistence.descriptors
- org.eclipse.persistence.descriptors.copying
- org.eclipse.persistence.descriptors.invalidation
- org.eclipse.persistence.descriptors.partitioning
- org.eclipse.persistence.dynamic

- org.eclipse.persistence.eis
- org.eclipse.persistence.eis.interactions
- org.eclipse.persistence.eis.mappings
- org.eclipse.persistence.exceptions
- org.eclipse.persistence.exceptions.i18n
- org.eclipse.persistence.expressions
- org.eclipse.persistence.expressions.spatial
- org.eclipse.persistence.history
- org.eclipse.persistence.internal.cache
- org.eclipse.persistence.internal.codegen
- org.eclipse.persistence.internal.core.databaseaccess
- org.eclipse.persistence.internal.core.descriptors
- org.eclipse.persistence.internal.core.helper
- org.eclipse.persistence.internal.core.queries
- org.eclipse.persistence.internal.core.sessions
- org.eclipse.persistence.internal.databaseaccess
- org.eclipse.persistence.internal.descriptors.changetracking
- org.eclipse.persistence.internal.dynamic
- org.eclipse.persistence.internal.expressions
- org.eclipse.persistence.internal.helper
- org.eclipse.persistence.internal.helper.linkedlist
- org.eclipse.persistence.internal.history
- org.eclipse.persistence.internal.indirection
- org.eclipse.persistence.internal.jpa
- org.eclipse.persistence.internal.jpa.deployment

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java Persistence API 2.1 feature:

- classloading
- jpa
- library
- transaction

## Java RESTful Services 1.1

This feature enables support for Java API for RESTful Web Services 1.1. JAX-RS annotations can be used to define web service clients and endpoints that comply with the REST architectural style. Endpoints are accessed through a common interface that is based on the HTTP standard methods.

### Enabling this feature

To enable the Java RESTful Services 1.1 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>jaxrs-1.1</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Java RESTful Services 1.1 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jaxrs-1.1; type="osgi.subsystem.feature"
```

### Features that this feature enables

- json-1.0 - JavaScript Object Notation for Java
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

### Standard API packages provided by this feature

- javax.ws.rs
- javax.ws.rs.core
- javax.ws.rs.ext

### IBM API packages provided by this feature

- com.ibm.websphere.jaxrs.providers.json4j
- com.ibm.websphere.jaxrs.server

### Third party API packages provided by this feature

- org.apache.wink.client
- org.apache.wink.client.handlers
- org.apache.wink.client.internal
- org.apache.wink.client.internal.handlers
- org.apache.wink.client.internal.log
- org.apache.wink.common
- org.apache.wink.common.annotations
- org.apache.wink.common.categories
- org.apache.wink.common.http
- org.apache.wink.common.internal
- org.apache.wink.common.internal.application
- org.apache.wink.common.internal.contexts
- org.apache.wink.common.internal.http
- org.apache.wink.common.internal.i18n
- org.apache.wink.common.internal.lifecycle
- org.apache.wink.common.internal.log
- org.apache.wink.common.internal.model
- org.apache.wink.common.internal.model.admin
- org.apache.wink.common.internal.properties
- org.apache.wink.common.internal.providers.entity
- org.apache.wink.common.internal.providers.entity.app
- org.apache.wink.common.internal.providers.entity.atom
- org.apache.wink.common.internal.providers.entity.csv
- org.apache.wink.common.internal.providers.entity.json
- org.apache.wink.common.internal.providers.entity.xml
- org.apache.wink.common.internal.providers.error
- org.apache.wink.common.internal.providers.header
- org.apache.wink.common.internal.providers.multipart
- org.apache.wink.common.internal.registry
- org.apache.wink.common.internal.registry.metadata

## Java RESTful Services 2.0

This feature enables support for Java API for RESTful Web Services. JAX-RS annotations can be used to define web service clients and endpoints that comply with the REST architectural style. Endpoints are accessed through a common interface that is based on the HTTP standard methods.

### Enabling this feature

To enable the Java RESTful Services 2.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>jaxrs-2.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Java RESTful Services 2.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jaxrs-2.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `jaxrsClient-2.0` - Java RESTful Services Client 2.0
- `json-1.0` - JavaScript Object Notation for Java
- `servlet-3.1` - Java Servlets 3.1

### Features that enable this feature

- `microProfile-1.0` - Micro Profile 1.0
- `webProfile-7.0` - Java EE Web Profile 7.0

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java RESTful Services 2.0 feature:

- `classloading`
- `library`

## Java RESTful Services Client 2.0

This feature enables support for Java Client API for JAX-RS 2.0.

### Enabling this feature

To enable the Java RESTful Services Client 2.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>jaxrsClient-2.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Java RESTful Services Client 2.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jaxrsClient-2.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `json-1.0` - JavaScript Object Notation for Java
- `servlet-3.1` - Java Servlets 3.1

## Features that enable this feature

- jaxrs-2.0 - Java RESTful Services 2.0
-  zosConnect-1.2 - z/OS Connect 1.2

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java RESTful Services Client 2.0 feature:

- classloading
- library

## Java Servlets 3.0

This feature enables support for HTTP Servlets written to the Java Servlet 3.0 specification. The servlets can be packaged in Java EE specified WAR or EAR files. If servlet security is required, an `appSecurity` feature should also be configured; in the absence of a security feature any security constraints for the application will be ignored.

## Enabling this feature

To enable the Java Servlets 3.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>servlet-3.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Servlets 3.0 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.servlet-3.0; type="osgi.subsystem.feature"
```

## Features that enable this feature

- adminCenter-1.0 - Admin Center
- apiDiscovery-1.0 - API Discovery 1.0
- appSecurity-1.0 - Application Security 1.0
- batchManagement-1.0 - Batch Management
- clusterMember-1.0 - Static Cluster Member
- collectiveController-1.0 - Collective Controller
- collectiveMember-1.0 - Collective Member
- dynamicRouting-1.0 - Dynamic Routing
- healthAnalyzer-1.0 - Health Analyzer
- healthManager-1.0 - Health Manager
- httpWhiteboard-1.0 - OSGi Http Whiteboard
- jaspic-1.1 - Java Authentication SPI for Containers 1.1
- jaxrs-1.1 - Java RESTful Services 1.1
- jpa-2.0 - Java Persistence API 2.0
- jsf-2.0 - JavaServer Faces 2.0
- jsp-2.2 - JavaServer Pages 2.2
- oauth-2.0 - OAuth
- openid-2.0 - OpenID
- openidConnectClient-1.0 - OpenID Connect Client

- openidConnectServer-1.0 - OpenID Connect Provider
- osgi.jpaa-1.0 - OSGi Java Persistence API
- passwordUtilities-1.0 - Password Utilities
- restConnector-1.0 - JMX REST Connector 1.0
- restConnector-2.0 - JMX REST Connector 2.0
- rtcommGateway-1.0 - WebRTC Rtcomm Gateway
- rtcommGateway-1.0 - WebRTC Rtcomm Gateway
- samlWeb-2.0 - SAML web single sign-on version 2.0
- scalingController-1.0 - Scaling Controller
- scalingMember-1.0 - Scaling Member
- scim-1.0 - System for Cross-domain Identity Management
- sipServlet-1.1 - SIP Servlet
- spnego-1.0 - Simple and Protected GSSAPI Negotiation Mechanism
- wab-1.0 - OSGi Web Application Bundles
- webCache-1.0 - Web Response Cache
- webProfile-6.0 - Java EE Web Profile 6.0
- wsAtomicTransaction-1.2 - WS-AT Service
- wsSecuritySaml-1.1 - WSSecurity SAML
-  zosConnect-1.0 - z/OS Connect
-  zosConnect-1.2 - z/OS Connect 1.2

### Standard API packages provided by this feature

- javax.servlet
- javax.servlet.annotation
- javax.servlet.descriptor
- javax.servlet.http
- javax.servlet.resources

### IBM API packages provided by this feature

- com.ibm.websphere.servlet.container
- com.ibm.websphere.servlet.context
- com.ibm.websphere.servlet.error
- com.ibm.websphere.servlet.event
- com.ibm.websphere.servlet.session
- com.ibm.websphere.webcontainer
- com.ibm.wsspi.servlet.session

### SPI packages provided by this feature

- com.ibm.websphere.servlet.filter
- com.ibm.websphere.servlet.request
- com.ibm.websphere.servlet.response
- com.ibm.websphere.webcontainer.async
- com.ibm.ws.webcontainer.extension
- com.ibm.ws.webcontainer.spiadapter.collaborator
- com.ibm.wsspi.webcontainer
- com.ibm.wsspi.webcontainer.collaborator

- com.ibm.wsspi.webcontainer.extension
- com.ibm.wsspi.webcontainer.filter
- com.ibm.wsspi.webcontainer.metadata
- com.ibm.wsspi.webcontainer.osgi.extension
- com.ibm.wsspi.webcontainer.servlet
- com.ibm.wsspi.webcontainer.webapp

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java Servlets 3.0 feature:

- application
- applicationManager
- applicationMonitor
- channelfw
- classloading
- cors
- enterpriseApplication
- httpAccessLogging
- httpDispatcher
- httpEncoding
- httpEndpoint
- httpOptions
- httpProxyRedirect
- httpSession
- javaPermission
- library
- mimeTypeypes
- pluginConfiguration
- tcpOptions
- virtualHost
- webApplication
- webContainer

## Java Servlets 3.1

This feature enables support for HTTP Servlets written to the Java Servlet 3.1 specification. You can package servlets in Java EE specified WAR or EAR files. If servlet security is required, you should also configure an `appSecurity` feature. Without a security feature, any security constraints for the application are ignored.

### Enabling this feature

To enable the Java Servlets 3.1 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>servlet-3.1</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Servlets 3.1 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

com.ibm.websphere.appserver.servlet-3.1; type="osgi.subsystem.feature"

### Features that enable this feature

- adminCenter-1.0 - Admin Center
- apiDiscovery-1.0 - API Discovery 1.0
- appSecurity-1.0 - Application Security 1.0
- batch-1.0 - Batch API 1.0
- batchManagement-1.0 - Batch Management
- clusterMember-1.0 - Static Cluster Member
- collectiveController-1.0 - Collective Controller
- collectiveMember-1.0 - Collective Member
- dynamicRouting-1.0 - Dynamic Routing
- healthAnalyzer-1.0 - Health Analyzer
- healthManager-1.0 - Health Manager
- httpWhiteboard-1.0 - OSGi Http Whiteboard
- jaspic-1.1 - Java Authentication SPI for Containers 1.1
- javaee-7.0 - Java EE Full Platform 7.0
- jaxrs-1.1 - Java RESTful Services 1.1
- jaxrs-2.0 - Java RESTful Services 2.0
- jaxrsClient-2.0 - Java RESTful Services Client 2.0
- jpa-2.0 - Java Persistence API 2.0
- jsf-2.0 - JavaServer Faces 2.0
- jsf-2.2 - JavaServer Faces 2.2
- jsp-2.2 - JavaServer Pages 2.2
- jsp-2.3 - JavaServer Pages 2.3
- oauth-2.0 - OAuth
- openid-2.0 - OpenID
- openidConnectClient-1.0 - OpenID Connect Client
- openidConnectServer-1.0 - OpenID Connect Provider
- osgi.jpa-1.0 - OSGi Java Persistence API
- passwordUtilities-1.0 - Password Utilities
- restConnector-1.0 - JMX REST Connector 1.0
- restConnector-2.0 - JMX REST Connector 2.0
- rtcomm-1.0 - Real-Time Communications
- rtcommGateway-1.0 - WebRTC Rtcomm Gateway
- samlWeb-2.0 - SAML web single sign-on version 2.0
- scalingController-1.0 - Scaling Controller
- scalingMember-1.0 - Scaling Member
- scim-1.0 - System for Cross-domain Identity Management
- sipServlet-1.1 - SIP Servlet
- spnego-1.0 - Simple and Protected GSSAPI Negotiation Mechanism
- wab-1.0 - OSGi Web Application Bundles
- webCache-1.0 - Web Response Cache
- webProfile-7.0 - Java EE Web Profile 7.0
- websocket-1.0 - Java WebSocket 1.0

- websocket-1.1 - Java WebSocket 1.1
- wsAtomicTransaction-1.2 - WS-AT Service
- wsSecuritySaml-1.1 - WSSecurity SAML
-  zosConnect-1.0 - z/OS Connect
-  zosConnect-1.2 - z/OS Connect 1.2

### Standard API packages provided by this feature

- javax.servlet
- javax.servlet.annotation
- javax.servlet.descriptor
- javax.servlet.http
- javax.servlet.resources

### IBM API packages provided by this feature

- com.ibm.websphere.servlet.container
- com.ibm.websphere.servlet.context
- com.ibm.websphere.servlet.error
- com.ibm.websphere.servlet.event
- com.ibm.websphere.servlet.session
- com.ibm.websphere.webcontainer
- com.ibm.wsspi.servlet.session

### SPI packages provided by this feature

- com.ibm.websphere.servlet.filter
- com.ibm.websphere.servlet.request
- com.ibm.websphere.servlet.response
- com.ibm.websphere.webcontainer.async
- com.ibm.ws.webcontainer.extension
- com.ibm.ws.webcontainer.spiadapter.collaborator
- com.ibm.wsspi.webcontainer
- com.ibm.wsspi.webcontainer.collaborator
- com.ibm.wsspi.webcontainer.extension
- com.ibm.wsspi.webcontainer.filter
- com.ibm.wsspi.webcontainer.metadata
- com.ibm.wsspi.webcontainer.osgi.extension
- com.ibm.wsspi.webcontainer.servlet
- com.ibm.wsspi.webcontainer.webapp

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java Servlets 3.1 feature:

- application
- applicationManager
- applicationMonitor
- channelfw
- classloading

- cors
- enterpriseApplication
- httpAccessLogging
- httpDispatcher
- httpEncoding
- httpEndpoint
- httpOptions
- httpProxyRedirect
- httpSession
- javaPermission
- library
- mimeTypeypes
- pluginConfiguration
- tcpOptions
- virtualHost
- webApplication
- webContainer

## Java Web Services 2.2

This feature enables support for Java API for XML-Based Web Services 2.2. JAX-WS web services and clients communicate using XML. Annotations can be used to simplify the development of JAX-WS clients and endpoints.

### Enabling this feature

To enable the Java Web Services 2.2 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>jaxws-2.2</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Java Web Services 2.2 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jaxws-2.2; type="osgi.subsystem.feature"
```

### Features that this feature enables

- jaxb-2.2 - Java XML Bindings 2.2

### Features that enable this feature

- javaee-7.0 - Java EE Full Platform 7.0
- wsAtomicTransaction-1.2 - WS-AT Service
- wsSecurity-1.1 - Web Service Security

### Standard API packages provided by this feature

- javax.wsdl
- javax.wsdl.extensions
- javax.wsdl.extensions.http
- javax.wsdl.extensions.mime
- javax.wsdl.extensions.schema

- javax.wsdl.extensions.soap
- javax.wsdl.extensions.soap12
- javax.wsdl.factory
- javax.wsdl.xml
- javax.xml.ws
- javax.xml.ws.handler
- javax.xml.ws.handler.soap
- javax.xml.ws.http
- javax.xml.ws.soap
- javax.xml.ws.spi
- javax.xml.ws.spi.http
- javax.xml.ws.wsaddressing

### **SPI packages provided by this feature**

- com.ibm.wsspi.webservices.handler

### **Feature configuration elements**

You can use the following elements in your `server.xml` file to configure the Java Web Services 2.2 feature:

- classloading
- library

### **Java WebSocket 1.0**

This feature enables support for WebSocket applications written to the Java API for WebSocket 1.0 specification.

### **Enabling this feature**

To enable the Java WebSocket 1.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>websocket-1.0</feature>
```

### **Developing a feature that depends on this feature**

If you are developing a feature that depends on the Java WebSocket 1.0 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.websocket-1.0; type="osgi.subsystem.feature"
```

### **Features that this feature enables**

- servlet-3.1 - Java Servlets 3.1

### **Standard API packages provided by this feature**

- javax.websocket
- javax.websocket.server

### **IBM API packages provided by this feature**

- com.ibm.websphere.wsoc

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java WebSocket 1.0 feature:

- `wsocOutbound`

## Java WebSocket 1.1

This feature enables support for WebSocket applications written to the Java API for WebSocket 1.1 specification.

### Enabling this feature

To enable the Java WebSocket 1.1 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>websocket-1.1</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Java WebSocket 1.1 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.websocket-1.1; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `servlet-3.1` - Java Servlets 3.1

### Features that enable this feature

- `webProfile-7.0` - Java EE Web Profile 7.0

### Standard API packages provided by this feature

- `javax.websocket`
- `javax.websocket.server`

### IBM API packages provided by this feature

- `com.ibm.websphere.wsoc`

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java WebSocket 1.1 feature:

- `wsocOutbound`

## Java XML Bindings 2.2

This feature enables support for the Java Architecture for XML Binding 2.2 specification, which provides easy mapping of Java classes to XML documents.

### Enabling this feature

To enable the Java XML Bindings 2.2 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>jaxb-2.2</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Java XML Bindings 2.2 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jaxb-2.2; type="osgi.subsystem.feature"
```

### Features that enable this feature

- javaeeClient-7.0 - Java EE V7 Application Client
- jaxws-2.2 - Java Web Services 2.2

### Standard API packages provided by this feature

- javax.xml.bind
- javax.xml.bind.annotation
- javax.xml.bind.annotation.adapters
- javax.xml.bind.attachment
- javax.xml.bind.helpers
- javax.xml.bind.util

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Java XML Bindings 2.2 feature:

- classloading
- library

### JavaMail 1.5

This feature allows applications to utilize the JavaMail 1.5 API.

### Enabling this feature

To enable the JavaMail 1.5 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>javaMail-1.5</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the JavaMail 1.5 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.javaMail-1.5; type="osgi.subsystem.feature"
```

### Features that enable this feature

- javaee-7.0 - Java EE Full Platform 7.0
- javaeeClient-7.0 - Java EE V7 Application Client

### Standard API packages provided by this feature

- javax.mail
- javax.mail.event
- javax.mail.internet
- javax.mail.search
- javax.mail.util

### Third party API packages provided by this feature

- com.sun.mail
- com.sun.mail.auth
- com.sun.mail.handlers
- com.sun.mail.iap
- com.sun.mail.imap
- com.sun.mail.imap.protocol
- com.sun.mail.pop3
- com.sun.mail.smtp
- com.sun.mail.util
- com.sun.mail.util.logging

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the JavaMail 1.5 feature:

- mailSession

### JavaScript Object Notation Processing

The Java API for JSON Processing (JSON-P) feature provides a standardized method for constructing and manipulating data to be rendered in JavaScript Object Notation (JSON).

### Enabling this feature

To enable the JavaScript Object Notation Processing feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>jsonp-1.0</feature>
```

### Supported Java Versions

- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the JavaScript Object Notation Processing feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jsonp-1.0; type="osgi.subsystem.feature"
```

### Features that enable this feature

- javaeeClient-7.0 - Java EE V7 Application Client
- microProfile-1.0 - Micro Profile 1.0
- webProfile-7.0 - Java EE Web Profile 7.0

### Standard API packages provided by this feature

- javax.json
- javax.json.spi
- javax.json.stream

### JavaScript Object Notation for Java

This feature provides access to the JavaScript Object Notation (JSON4J) library. The JSON4J library provides a simple Java model for constructing and manipulating data to be rendered as JSON data.

## Enabling this feature

To enable the JavaScript Object Notation for Java feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>json-1.0</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the JavaScript Object Notation for Java feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.json-1.0; type="osgi.subsystem.feature"
```

## Features that enable this feature

- adminCenter-1.0 - Admin Center
- apiDiscovery-1.0 - API Discovery 1.0
- batchManagement-1.0 - Batch Management
- collectiveController-1.0 - Collective Controller
- dynamicRouting-1.0 - Dynamic Routing
- healthAnalyzer-1.0 - Health Analyzer
- healthManager-1.0 - Health Manager
- jaxrs-1.1 - Java RESTful Services 1.1
- jaxrs-2.0 - Java RESTful Services 2.0
- jaxrsClient-2.0 - Java RESTful Services Client 2.0
- oauth-2.0 - OAuth
- restConnector-1.0 - JMX REST Connector 1.0
- restConnector-2.0 - JMX REST Connector 2.0
- rtcomm-1.0 - Real-Time Communications
- scalingController-1.0 - Scaling Controller
- scalingMember-1.0 - Scaling Member
- scim-1.0 - System for Cross-domain Identity Management
-  zosConnect-1.0 - z/OS Connect
-  zosConnect-1.2 - z/OS Connect 1.2

## IBM API packages provided by this feature

- com.ibm.json.java
- com.ibm.json.xml

## JavaServer Faces 2.0

This feature enables support for web applications that use the Java Server Faces (JSF) framework. This framework simplifies the construction of user interfaces.

## Enabling this feature

To enable the JavaServer Faces 2.0 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>jsf-2.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the JavaServer Faces 2.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jsf-2.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- beanValidation-1.0 - Bean Validation 1.0
- beanValidation-1.1 - Bean Validation 1.1
- jsp-2.2 - JavaServer Pages 2.2
- jsp-2.3 - JavaServer Pages 2.3
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

## Features that enable this feature

- webProfile-6.0 - Java EE Web Profile 6.0

## Standard API packages provided by this feature

- javax.faces
- javax.faces.application
- javax.faces.bean
- javax.faces.component
- javax.faces.component.behavior
- javax.faces.component.html
- javax.faces.component.visit
- javax.faces.context
- javax.faces.convert
- javax.faces.el
- javax.faces.event
- javax.faces.lifecycle
- javax.faces.model
- javax.faces.render
- javax.faces.validator
- javax.faces.view
- javax.faces.view.facelets
- javax.faces.webapp
- javax.persistence

## Feature configuration elements

You can use the following elements in your server.xml file to configure the JavaServer Faces 2.0 feature:

- classloading
- transaction

## JavaServer Faces 2.2

This feature enables support for web applications that use the Java Server Faces (JSF) 2.2 framework. This framework simplifies the construction of user interfaces.

### Enabling this feature

To enable the JavaServer Faces 2.2 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>jsf-2.2</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the JavaServer Faces 2.2 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jsf-2.2; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `jsp-2.3` - JavaServer Pages 2.3
- `servlet-3.1` - Java Servlets 3.1

### Features that enable this feature

- `webProfile-7.0` - Java EE Web Profile 7.0

### Standard API packages provided by this feature

- `javax.faces`
- `javax.faces.application`
- `javax.faces.bean`
- `javax.faces.component`
- `javax.faces.component.behavior`
- `javax.faces.component.html`
- `javax.faces.component.visit`
- `javax.faces.context`
- `javax.faces.convert`
- `javax.faces.el`
- `javax.faces.event`
- `javax.faces.flow`
- `javax.faces.flow.builder`
- `javax.faces.lifecycle`
- `javax.faces.model`
- `javax.faces.render`
- `javax.faces.validator`
- `javax.faces.view`
- `javax.faces.view.facelets`
- `javax.faces.webapp`

## JavaServer Pages 2.2

This feature enables support for Java Server Pages (JSPs) that are written to the JSP 2.2 specification. This framework simplifies the construction of user interfaces.

## Enabling this feature

To enable the JavaServer Pages 2.2 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>jsp-2.2</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the JavaServer Pages 2.2 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jsp-2.2; type="osgi.subsystem.feature"
```

## Features that this feature enables

- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

## Features that enable this feature

- adminCenter-1.0 - Admin Center
- jsf-2.0 - JavaServer Faces 2.0
- oauth-2.0 - OAuth
- openidConnectClient-1.0 - OpenID Connect Client
- openidConnectServer-1.0 - OpenID Connect Provider
- webCache-1.0 - Web Response Cache
- webProfile-6.0 - Java EE Web Profile 6.0

## Standard API packages provided by this feature

- javax.el
- javax.servlet.jsp
- javax.servlet.jsp.el
- javax.servlet.jsp.jstl.core
- javax.servlet.jsp.jstl.fmt
- javax.servlet.jsp.jstl.sql
- javax.servlet.jsp.jstl.tlv
- javax.servlet.jsp.resources
- javax.servlet.jsp.tagext

## SPI packages provided by this feature

- com.ibm.wsspi.jsp.taglib.config

## Feature configuration elements

You can use the following elements in your server.xml file to configure the JavaServer Pages 2.2 feature:

- jspEngine

## JavaServer Pages 2.3

This feature enables support for Java Server Pages (JSPs) that are written to the JSP 2.3 specification. This framework simplifies the construction of user interfaces. Enabling this feature also enables the Expression Language (EL) version 3.0 feature.

## Enabling this feature

To enable the JavaServer Pages 2.3 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>jsp-2.3</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the JavaServer Pages 2.3 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.jsp-2.3; type="osgi.subsystem.feature"
```

## Features that this feature enables

- el-3.0 - Expression Language 3.0
- servlet-3.1 - Java Servlets 3.1

## Features that enable this feature

- adminCenter-1.0 - Admin Center
- jsf-2.0 - JavaServer Faces 2.0
- jsf-2.2 - JavaServer Faces 2.2
- oauth-2.0 - OAuth
- openidConnectClient-1.0 - OpenID Connect Client
- openidConnectServer-1.0 - OpenID Connect Provider
- webCache-1.0 - Web Response Cache
- webProfile-7.0 - Java EE Web Profile 7.0

## Standard API packages provided by this feature

- javax.el
- javax.servlet.jsp
- javax.servlet.jsp.el
- javax.servlet.jsp.jstl.core
- javax.servlet.jsp.jstl.fmt
- javax.servlet.jsp.jstl.sql
- javax.servlet.jsp.jstl.tlv
- javax.servlet.jsp.tagext

## SPI packages provided by this feature

- com.ibm.wsspi.jsp.taglib.config

## Feature configuration elements

You can use the following elements in your server.xml file to configure the JavaServer Pages 2.3 feature:

- jspEngine

## Job Manager Integration

This feature enables Liberty profile servers to automatically publish their status to the WebSphere Application Server Job Managers. This feature is required for the Job Manager to discover server instances that it did not start.

## Enabling this feature

To enable the Job Manager Integration feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>serverStatus-1.0</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Job Manager Integration feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.serverStatus-1.0; type="osgi.subsystem.feature"
```

## LDAP User Registry

This feature enables support for using an LDAP server as a user registry. Any server that supports LDAP Version 3.0 may be used. Multiple LDAP registries can be configured, and then federated to achieve a single logical registry view.

## Enabling this feature

To enable the LDAP User Registry feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>ldapRegistry-3.0</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the LDAP User Registry feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.ldapRegistry-3.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- federatedRegistry-1.0 - Federated User Registry

## Features that enable this feature

- appSecurity-1.0 - Application Security 1.0
- oauth-2.0 - OAuth

## Feature configuration elements

You can use the following elements in your server.xml file to configure the LDAP User Registry feature:

- activeLdapFilterProperties
- administrator-role
- classloading

- customLdapFilterProperties
- domino50LdapFilterProperties
- edirectoryLdapFilterProperties
- idsLdapFilterProperties
- iplanetLdapFilterProperties
- ldapRegistry
- library
- netscapeLdapFilterProperties
- securewayLdapFilterProperties

## Logstash Collector 1.0

Logstash collector gathers data from various sources and forwards the data to a Logstash server using Lumberjack protocol.

### Enabling this feature

To enable the Logstash Collector 1.0 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>logstashCollector-1.0</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Logstash Collector 1.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.logstashCollector-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- ssl-1.0 - Secure Socket Layer

### Feature configuration elements

You can use the following elements in your server.xml file to configure the Logstash Collector 1.0 feature:

- channelfw
- classloading
- httpAccessLogging
- httpDispatcher
- httpEncoding
- httpEndpoint
- httpOptions
- httpProxyRedirect
- logstashCollector
- mimeTypeypes
- tcpOptions
- virtualHost

## Media Server Control

The Liberty Media Server Control feature (mediaServerControl-1.0) enables the ability to access media servers via the JSR309 API. For applications to use this API, a driver implementation of JSR309 must be installed.

### Enabling this feature

To enable the Media Server Control feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>mediaServerControl-1.0</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Media Server Control feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.mediaServerControl-1.0; type="osgi.subsystem.feature"
```

### Standard API packages provided by this feature

- javax.media.mscontrol
- javax.media.mscontrol.join
- javax.media.mscontrol.mediagroup
- javax.media.mscontrol.mediagroup.http
- javax.media.mscontrol.mediagroup.rtp
- javax.media.mscontrol.mediagroup.signals
- javax.media.mscontrol.mixer
- javax.media.mscontrol.networkconnection
- javax.media.mscontrol.resource
- javax.media.mscontrol.resource.common
- javax.media.mscontrol.resource.enums
- javax.media.mscontrol.resource.video
- javax.media.mscontrol.spi
- javax.media.mscontrol.vxml

## Message Server 1.0

This feature enables an embedded messaging server that is JMS compliant. Applications can send and receive messages using the wasJmsClient feature.

### Enabling this feature

To enable the Message Server 1.0 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>wasJmsServer-1.0</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7

- JavaSE-1.8

### **Developing a feature that depends on this feature**

If you are developing a feature that depends on the Message Server 1.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.wasJmsServer-1.0; type="osgi.subsystem.feature"
```

### **Features that enable this feature**

- javaee-7.0 - Java EE Full Platform 7.0

### **IBM API packages provided by this feature**

- com.ibm.websphere.messaging.mbean

### **Feature configuration elements**

You can use the following elements in your `server.xml` file to configure the Message Server 1.0 feature:

- channelfw
- classloading
- messagingEngine
- tcpOptions
- transaction
- wasJmsEndpoint
- wasJmsOutbound

### **Message Server Security 1.0**

This feature enables the WebSphere Embedded Messaging Server to authenticate and authorize access from JMS clients.

### **Enabling this feature**

To enable the Message Server Security 1.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>wasJmsSecurity-1.0</feature>
```

### **Supported Java Versions**

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### **Developing a feature that depends on this feature**

If you are developing a feature that depends on the Message Server Security 1.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.wasJmsSecurity-1.0; type="osgi.subsystem.feature"
```

### **Features that this feature enables**

- ssl-1.0 - Secure Socket Layer

### **Features that enable this feature**

- javaee-7.0 - Java EE Full Platform 7.0

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Message Server Security 1.0 feature:

- administrator-role
- authCache
- authentication
- basicRegistry
- classloading
- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- quickStartSecurity

## Message-Driven Beans 3.1

This feature enables the use of Message-Driven Enterprise JavaBeans. MDBs allow asynchronous processing of messages within a Java EE component.

### Enabling this feature

To enable the Message-Driven Beans 3.1 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>mdb-3.1</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Message-Driven Beans 3.1 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.mdb-3.1; type="osgi.subsystem.feature"
```

### Features that this feature enables

- jca-1.6 - Java Connector Architecture 1.6
- jndi-1.0 - Java Naming and Directory Interface

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Message-Driven Beans 3.1 feature:

- application
- applicationManager
- applicationMonitor
- classloading
- ejbApplication
- ejbContainer

- enterpriseApplication
- javaPermission
- library
- transaction
- webApplication

## Message-Driven Beans 3.2

This feature enables the use of Message-Driven Enterprise JavaBeans written to the EJB 3.2 specification. MDBs allow asynchronous processing of messages within a Java EE component.

### Enabling this feature

To enable the Message-Driven Beans 3.2 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>mdb-3.2</feature>
```

### Supported Java Versions

- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Message-Driven Beans 3.2 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.mdb-3.2; type="osgi.subsystem.feature"
```

### Features that this feature enables

- jca-1.7 - Java Connector Architecture 1.7
- jndi-1.0 - Java Naming and Directory Interface

### Features that enable this feature

- ejb-3.2 - Enterprise JavaBeans 3.2
- jmsMdb-3.2 - JMS Message-Driven Beans 3.2

### Feature configuration elements

You can use the following elements in your server.xml file to configure the Message-Driven Beans 3.2 feature:

- application
- applicationManager
- applicationMonitor
- classloading
- ejbApplication
- ejbContainer
- enterpriseApplication
- javaPermission
- library
- transaction
- webApplication

## Micro Profile 1.0

This feature combines the Liberty features that support the Micro Profile for enterprise Java.

### Enabling this feature

To enable the Micro Profile 1.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>microProfile-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Micro Profile 1.0 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.microProfile-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- cdi-1.2 - Contexts and Dependency Injection 1.2
- jaxrs-2.0 - Java RESTful Services 2.0
- jsonp-1.0 - JavaScript Object Notation Processing

## MongoDB Integration 2.0

This feature enables the usage of the MongoDB Java Driver and allows DB instances to be configured in the server configuration, injected into managed components such as EJBs, and accessed through JNDI. Applications interact with these DB instances via the MongoDB APIs

### Enabling this feature

To enable the MongoDB Integration 2.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>mongodb-2.0</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the MongoDB Integration 2.0 feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.mongodb-2.0; type="osgi.subsystem.feature"
```

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the MongoDB Integration 2.0 feature:

- classloading
- library
- mongo
- mongoDB

## OAuth

This feature enables web applications to integrate OAuth 2.0 for authenticating and authorizing users.

## Enabling this feature

To enable the OAuth feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>oauth-2.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the OAuth feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.oauth-2.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- `appSecurity-2.0` - Application Security 2.0
- `distributedMap-1.0` - Distributed Map interface for Dynamic Caching
- `json-1.0` - JavaScript Object Notation for Java
- `jsp-2.2` - JavaServer Pages 2.2
- `jsp-2.3` - JavaServer Pages 2.3
- `ldapRegistry-3.0` - LDAP User Registry
- `servlet-3.0` - Java Servlets 3.0
- `servlet-3.1` - Java Servlets 3.1
- `ssl-1.0` - Secure Socket Layer

## Features that enable this feature

- `openidConnectClient-1.0` - OpenID Connect Client
- `openidConnectServer-1.0` - OpenID Connect Provider

## IBM API packages provided by this feature

- `com.ibm.oauth.core.api.attributes`
- `com.ibm.oauth.core.api.config`
- `com.ibm.oauth.core.api.error`
- `com.ibm.oauth.core.api.error.oauth20`
- `com.ibm.oauth.core.api.oauth20.mediator`
- `com.ibm.websphere.security.oauth20`
- `com.ibm.websphere.security.openidconnect.token`
- `com.ibm.wsspi.security.oauth20.token`

## SPI packages provided by this feature

- `com.ibm.wsspi.security.oauth20`
- `com.ibm.wsspi.security.openidconnect`

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the OAuth feature:

- `administrator-role`
- `authCache`
- `authentication`
- `authorization-roles`
- `basicRegistry`

- classloading
- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- oauth-roles
- oauthProvider
- quickStartSecurity
- trustAssociation

## OSGi Application Integration

This feature adds local application-to-application integration for OSGi Applications.

### Enabling this feature

To enable the OSGi Application Integration feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>osgiAppIntegration-1.0</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the OSGi Application Integration feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.ws.eba.app.integration-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- blueprint-1.0 - OSGi Blueprint

### Feature configuration elements

You can use the following elements in your server.xml file to configure the OSGi Application Integration feature:

- classloading
- transaction

## OSGi Blueprint

This feature enables support for deploying OSGi applications that use the OSGi blueprint container specification. With the OSGi Applications support in WebSphere Application Server, you can develop and deploy modular applications that use Java EE and OSGi technologies.

### Enabling this feature

To enable the OSGi Blueprint feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>blueprint-1.0</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the OSGi Blueprint feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.blueprint-1.0; type="osgi.subsystem.feature"
```

## Features that enable this feature

- osgi.jpa-1.0 - OSGi Java Persistence API
- osgiAppIntegration-1.0 - OSGi Application Integration
- wab-1.0 - OSGi Web Application Bundles

## Standard API packages provided by this feature

- org.apache.aries.blueprint
- org.apache.aries.blueprint.ext
- org.apache.aries.blueprint.ext.evaluator
- org.apache.aries.blueprint.mutable
- org.apache.aries.blueprint.services
- org.apache.aries.blueprint.utils
- org.apache.aries.util
- org.osgi.framework
- org.osgi.framework.hooks.bundle
- org.osgi.framework.hooks.resolver
- org.osgi.framework.hooks.service
- org.osgi.framework.hooks.weaving
- org.osgi.framework.launch
- org.osgi.framework.namespace
- org.osgi.framework.startlevel
- org.osgi.framework.wiring
- org.osgi.resource
- org.osgi.service.blueprint
- org.osgi.service.blueprint.container
- org.osgi.service.blueprint.reflect
- org.osgi.service.component
- org.osgi.service.condpermadmin
- org.osgi.service.jndi
- org.osgi.service.packageadmin
- org.osgi.service.startlevel
- org.osgi.service.url
- org.osgi.util.tracker

## Third party API packages provided by this feature

- org.apache.aries.transaction.exception

## SPI packages provided by this feature

- org.apache.aries.blueprint
- org.apache.aries.blueprint.ext
- org.apache.aries.blueprint.ext.evaluator
- org.apache.aries.blueprint.mutable
- org.apache.aries.blueprint.services
- org.apache.aries.util
- org.osgi.service.cm
- org.osgi.service.subsystem

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the OSGi Blueprint feature:

- application
- applicationManager
- applicationMonitor
- bundleRepository
- classloading
- javaPermission
- library
- osgiApplication
- osgiApplications
- osgiLibrary
- transaction

## OSGi Bundle

This feature enables support for deploying OSGi applications. With the OSGi Applications support in WebSphere Application Server, you can develop and deploy modular applications that use Java EE and OSGi technologies.

## Enabling this feature

To enable the OSGi Bundle feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>osgiBundle-1.0</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the OSGi Bundle feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.osgiBundle-1.0; type="osgi.subsystem.feature"
```

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the OSGi Bundle feature:

- `application`
- `applicationManager`
- `applicationMonitor`
- `bundleRepository`
- `classloading`
- `javaPermission`
- `library`
- `osgiApplication`
- `osgiApplications`
- `osgiLibrary`

## OSGi Debug Console

This feature enables an OSGi console to aid debug of the runtime. It can be used to display information about bundles, packages and services which may be useful when developing your own features for product extensions.

### Enabling this feature

To enable the OSGi Debug Console feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>osgiConsole-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the OSGi Debug Console feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.osgiConsole-1.0; type="osgi.subsystem.feature"
```

## OSGi Http Whiteboard

This feature enables deploying modular Web applications written using Servlet technologies and the OSGi HTTP Whiteboard specification.

### Enabling this feature

To enable the OSGi Http Whiteboard feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>httpWhiteboard-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the OSGi Http Whiteboard feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.httpWhiteboard-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `servlet-3.0` - Java Servlets 3.0
- `servlet-3.1` - Java Servlets 3.1

## Standard API packages provided by this feature

- org.osgi.service.http
- org.osgi.service.http.context
- org.osgi.service.http.whiteboard

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the OSGi Http Whiteboard feature:

- channelfw
- classloading
- httpAccessLogging
- httpDispatcher
- httpEncoding
- httpEndpoint
- httpOptions
- httpProxyRedirect
- httpWhiteboard
- mimeTypeypes
- tcpOptions
- virtualHost

## OSGi Java Persistence API

This feature is superseded by the `blueprint-1.0` and `jpa-2.0` features. When those features are both added to the server, this feature is added automatically.

## Enabling this feature

To enable the OSGi Java Persistence API feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>osgi.jpa-1.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the OSGi Java Persistence API feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.osgi.jpa-1.0; type="osgi.subsystem.feature"
```

## Features that this feature is superseded by

- `blueprint-1.0` - OSGi Blueprint
- `jpa-2.0` - Java Persistence API 2.0

## Features that this feature enables

- `beanValidation-1.0` - Bean Validation 1.0
- `beanValidation-1.1` - Bean Validation 1.1
- `blueprint-1.0` - OSGi Blueprint
- `jdbc-4.0` - Java Database Connectivity 4.0
- `jdbc-4.1` - Java Database Connectivity 4.1
- `jndi-1.0` - Java Naming and Directory Interface
- `jpa-2.0` - Java Persistence API 2.0

- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the OSGi Java Persistence API feature:

- classloading
- transaction

### OSGi Web Application Bundles

This feature enables OSGi applications that contain Web Application Bundles (WABs). Web application bundles are OSGi bundles that are internally structured in the same way as a war file and support the same web components.

### Enabling this feature

To enable the OSGi Web Application Bundles feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>wab-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the OSGi Web Application Bundles feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.wab-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- blueprint-1.0 - OSGi Blueprint
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

### Features that enable this feature

- wsAtomicTransaction-1.2 - WS-AT Service

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the OSGi Web Application Bundles feature:

- classloading
- transaction

### OpenID

This feature enables web applications to integrate OpenID 2.0 for authenticating users instead of, or in addition to, the configured user registry.

### Enabling this feature

To enable the OpenID feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>openid-2.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the OpenID feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.openid-2.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- appSecurity-2.0 - Application Security 2.0
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the OpenID feature:

- `authFilter`
- `openId`
- `userInfo`

## OpenID Connect Client

This feature enables web applications to integrate OpenID Connect Client 1.0 for authenticating users instead of, or in addition to, the configured user registry.

### Enabling this feature

To enable the OpenID Connect Client feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>openidConnectClient-1.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the OpenID Connect Client feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.openidConnectClient-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- distributedMap-1.0 - Distributed Map interface for Dynamic Caching
- jsp-2.2 - JavaServer Pages 2.2
- jsp-2.3 - JavaServer Pages 2.3
- oauth-2.0 - OAuth
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1
- ssl-1.0 - Secure Socket Layer

### IBM API packages provided by this feature

- `com.ibm.websphere.security.openidconnect`

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the OpenID Connect Client feature:

- `administrator-role`
- `authCache`

- authFilter
- authentication
- authorization-roles
- basicRegistry
- classloading
- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- openidConnectClient
- quickStartSecurity
- trustAssociation

## OpenID Connect Provider

This feature enables web applications to integrate OpenID Connect Server 1.0 for authenticating users instead of, or in addition to, the configured user registry.

### Enabling this feature

To enable the OpenID Connect Provider feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>openidConnectServer-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the OpenID Connect Provider feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.openidConnectServer-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- jsp-2.2 - JavaServer Pages 2.2
- jsp-2.3 - JavaServer Pages 2.3
- oauth-2.0 - OAuth
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

### IBM API packages provided by this feature

- com.ibm.websphere.security.openidconnect

### Feature configuration elements

You can use the following elements in your server.xml file to configure the OpenID Connect Provider feature:

- openidConnectProvider

### Password Utilities

This feature enables support for obtaining the values of the user and password attributes of authData elements from an application, and also allows the use of the com.ibm.websphere.crypto.PasswordUtil class as an API.

## Enabling this feature

To enable the Password Utilities feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>passwordUtilities-1.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Password Utilities feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.passwordUtilities-1.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- appSecurity-1.0 - Application Security 1.0
- appSecurity-2.0 - Application Security 2.0
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

## IBM API packages provided by this feature

- com.ibm.websphere.crypto
- com.ibm.websphere.security.auth.data
- com.ibm.websphere.security.jca

## Feature configuration elements

You can use the following elements in your server.xml file to configure the Password Utilities feature:

- authData
- classloading
- jaasLoginContextEntry
- jaasLoginModule
- transaction

## Performance Monitoring

This feature enables the Performance Monitoring Infrastructure (PMI) for other features the server is running. Monitoring data is accessible through standard MXBeans; access through the traditional WebSphere Perf MBean can be enabled.

## Enabling this feature

To enable the Performance Monitoring feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>monitor-1.0</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Performance Monitoring feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.monitor-1.0; type="osgi.subsystem.feature"
```

## IBM API packages provided by this feature

- `com.ibm.websphere.monitor.jmx`

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Performance Monitoring feature:

- `classloading`
- `monitor`

## Real-Time Communications

The Liberty Real-Time Communications feature (`rtcomm-1.0`) enables a highly-scalable signaling infrastructure that can be used to connect WebRTC clients and other types of IoT nodes into real-time audio/video/data interactions.

## Enabling this feature

To enable the Real-Time Communications feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>rtcomm-1.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Real-Time Communications feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.rtcomm-1.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- `json-1.0` - JavaScript Object Notation for Java
- `servlet-3.1` - Java Servlets 3.1

## Features that enable this feature

- `rtcommGateway-1.0` - WebRTC Rtcomm Gateway

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Real-Time Communications feature:

- `rtcomm`

## Request Timing

Provides warnings and diagnostic info for slow or hung requests.

## Enabling this feature

To enable the Request Timing feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>requestTiming-1.0</feature>
```

## Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Request Timing feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.requestTiming-1.0; type="osgi.subsystem.feature"
```

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Request Timing feature:

- `requestTiming`

## SAML web single sign-on version 2.0

This feature enables web applications to use SAML web single sign-on version 2.0 function.

## Enabling this feature

To enable the SAML web single sign-on version 2.0 feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>samlWeb-2.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the SAML web single sign-on version 2.0 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.samlWeb-2.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- `appSecurity-2.0` - Application Security 2.0
- `distributedMap-1.0` - Distributed Map interface for Dynamic Caching
- `servlet-3.0` - Java Servlets 3.0
- `servlet-3.1` - Java Servlets 3.1
- `ssl-1.0` - Secure Socket Layer

## Features that enable this feature

- `wsSecuritySaml-1.1` - WSSecurity SAML

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the SAML web single sign-on version 2.0 feature:

- `administrator-role`
- `authCache`
- `authFilter`
- `authentication`
- `authorization-roles`
- `basicRegistry`

- classloading
- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- quickStartSecurity
- samlWebSso20
- trustAssociation

## SIP Servlet

This feature enables support for SIP Servlets written to the Java SipServlet 1.1 specification. The servlets can be packaged in Java EE specified WAR, SAR or EAR files. If servlet security is required, an appSecurity feature should also be configured; in the absence of a security feature any security constraints for the application will be ignored.

### Enabling this feature

To enable the SIP Servlet feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>sipServlet-1.1</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the SIP Servlet feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.sipServlet-1.1; type="osgi.subsystem.feature"
```

### Features that this feature enables

- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

### Features that enable this feature

- rtcommGateway-1.0 - WebRTC Rtcomm Gateway

### Standard API packages provided by this feature

- javax.servlet.sip
- javax.servlet.sip.annotation
- javax.servlet.sip.ar
- javax.servlet.sip.ar.spi

### IBM API packages provided by this feature

- com.ibm.websphere.sip
- com.ibm.websphere.sip.resolver
- com.ibm.websphere.sip.resolver.events
- com.ibm.websphere.sip.resolver.exception
- com.ibm.websphere.sip.unmatchedMessages
- com.ibm.websphere.sip.unmatchedMessages.events

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the SIP Servlet feature:

- `channelfw`
- `domainResolver`
- `sipApplicationRouter`
- `sipContainer`
- `sipEndpoint`
- `sipStack`
- `tcpOptions`

## Scaling Controller

The Scaling Controller feature manages Liberty clusters by starting and stopping servers based on Scaling Policy.

### Enabling this feature

To enable the Scaling Controller feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>scalingController-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Scaling Controller feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.scalingController-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `collectiveController-1.0` - Collective Controller
- `json-1.0` - JavaScript Object Notation for Java
- `restConnector-1.0` - JMX REST Connector 1.0
- `restConnector-2.0` - JMX REST Connector 2.0
- `servlet-3.0` - Java Servlets 3.0
- `servlet-3.1` - Java Servlets 3.1

### IBM API packages provided by this feature

- `com.ibm.websphere.scaling.manager.stack`

### SPI packages provided by this feature

- `com.ibm.wsspi.scaling.action.consumer`
- `com.ibm.wsspi.scaling.action.controller`

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Scaling Controller feature:

- `installable`
- `package`
- `scalingDefinitions`
- `stackGroup`
- `stackManager`

## Scaling Member

The Scaling Member feature allows a Liberty clustered server to be managed by a Liberty Scaling Controller server. The Scaling Controller directs the Scaling Member to start and stop based on Scaling Controller policies.

### Enabling this feature

To enable the Scaling Member feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>scalingMember-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Scaling Member feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.scalingMember-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `clusterMember-1.0` - Static Cluster Member
- `collectiveMember-1.0` - Collective Member
- `json-1.0` - JavaScript Object Notation for Java
- `restConnector-1.0` - JMX REST Connector 1.0
- `restConnector-2.0` - JMX REST Connector 2.0
- `servlet-3.0` - Java Servlets 3.0
- `servlet-3.1` - Java Servlets 3.1

### IBM API packages provided by this feature

- `com.ibm.websphere.scaling.member`

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Scaling Member feature:

- `scalingMember`

## Secure Socket Layer

This feature enables support for Secure Sockets Layer (SSL) connections. The secure HTTPS listener is not started unless the `ssl-1.0` feature is enabled and a keystore is configured.

### Enabling this feature

To enable the Secure Socket Layer feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>ssl-1.0</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Secure Socket Layer feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.ssl-1.0; type="osgi.subsystem.feature"
```

## Features that enable this feature

- adminCenter-1.0 - Admin Center
- apiDiscovery-1.0 - API Discovery 1.0
- appSecurity-2.0 - Application Security 2.0
- appSecurityClient-1.0 - Application Security for Client 1.0
- batchManagement-1.0 - Batch Management
- collectiveController-1.0 - Collective Controller
- dynamicRouting-1.0 - Dynamic Routing
- federatedRegistry-1.0 - Federated User Registry
- jcaInboundSecurity-1.0 - Java Connector Architecture 1.0 Security Inflow
- logstashCollector-1.0 - Logstash Collector 1.0
- oauth-2.0 - OAuth
- openidConnectClient-1.0 - OpenID Connect Client
- restConnector-1.0 - JMX REST Connector 1.0
- restConnector-2.0 - JMX REST Connector 2.0
- samlWeb-2.0 - SAML web single sign-on version 2.0
- scim-1.0 - System for Cross-domain Identity Management
- wasJmsSecurity-1.0 - Message Server Security 1.0
- wsAtomicTransaction-1.2 - WS-AT Service
-  zosConnect-1.0 - z/OS Connect
-  zosConnect-1.2 - z/OS Connect 1.2

## IBM API packages provided by this feature

- com.ibm.websphere.ssl

## SPI packages provided by this feature

- com.ibm.wsspi.ssl

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Secure Socket Layer feature:

- channelfw
- keyStore
- ssl
- sslDefault
- sslOptions
- tcpOptions

## Simple and Protected GSSAPI Negotiation Mechanism

This feature enables web applications to integrate SPNEGO 1.0 for authenticating users instead of, or in addition to, the configured user registry.

## Enabling this feature

To enable the Simple and Protected GSSAPI Negotiation Mechanism feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>spnego-1.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Simple and Protected GSSAPI Negotiation Mechanism feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.spnego-1.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- appSecurity-2.0 - Application Security 2.0
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

## Feature configuration elements

You can use the following elements in your server.xml file to configure the Simple and Protected GSSAPI Negotiation Mechanism feature:

- authFilter
- spnego

## Static Cluster Member

This feature allows a collective member to participate in a static cluster.

## Enabling this feature

To enable the Static Cluster Member feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>clusterMember-1.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the Static Cluster Member feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.clusterMember-1.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- collectiveMember-1.0 - Collective Member
- restConnector-1.0 - JMX REST Connector 1.0
- restConnector-2.0 - JMX REST Connector 2.0
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

## Features that enable this feature

- scalingMember-1.0 - Scaling Member

## IBM API packages provided by this feature

- com.ibm.websphere.cluster.member

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Static Cluster Member feature:

- `clusterMember`

## System for Cross-domain Identity Management

This feature enables support for invoking User Management API using SCIM REST Services.

### Enabling this feature

To enable the System for Cross-domain Identity Management feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>scim-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the System for Cross-domain Identity Management feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.scim-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- `distributedMap-1.0` - Distributed Map interface for Dynamic Caching
- `federatedRegistry-1.0` - Federated User Registry
- `json-1.0` - JavaScript Object Notation for Java
- `servlet-3.0` - Java Servlets 3.0
- `servlet-3.1` - Java Servlets 3.1
- `ssl-1.0` - Secure Socket Layer

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the System for Cross-domain Identity Management feature:

- `administrator-role`
- `authCache`
- `authentication`
- `authorization-roles`
- `basicRegistry`
- `channelfw`
- `classloading`
- `httpAccessLogging`
- `httpDispatcher`
- `httpEncoding`
- `httpEndpoint`
- `httpOptions`
- `httpProxyRedirect`
- `jaasLoginContextEntry`
- `jaasLoginModule`
- `library`

- ltpa
- mimeTypees
- quickStartSecurity
- tcpOptions
- trustAssociation
- virtualHost

## Timed Operations

This feature enables support for logging warnings when certain operations in the application server are running more slowly than expected.

### Enabling this feature

To enable the Timed Operations feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>timedOperations-1.0</feature>
```

### Supported Java Versions

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Timed Operations feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.timedOperations-1.0; type="osgi.subsystem.feature"
```

### SPI packages provided by this feature

- com.ibm.wsspi.timedoperations

### Feature configuration elements

You can use the following elements in your server.xml file to configure the Timed Operations feature:

- timedOperation

## WS-AT Service

This feature enables support for Atomic Transaction for XML-Based Web Services 2.2.

### Enabling this feature

To enable the WS-AT Service feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>wsAtomicTransaction-1.2</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the WS-AT Service feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.wsAtomicTransaction-1.2; type="osgi.subsystem.feature"
```

### Features that this feature enables

- distributedMap-1.0 - Distributed Map interface for Dynamic Caching
- jaxws-2.2 - Java Web Services 2.2
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1
- ssl-1.0 - Secure Socket Layer
- wab-1.0 - OSGi Web Application Bundles

### SPI packages provided by this feature

- com.ibm.wsspi.webservices.wsat

### Feature configuration elements

You can use the following elements in your `server.xml` file to configure the WS-AT Service feature:

- administrator-role
- authCache
- authentication
- authorization-roles
- basicRegistry
- classloading
- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- quickStartSecurity
- transaction
- trustAssociation
- wsAtomicTransaction

### WSSecurity SAML

This feature enables the SAML Assertion in the Web Service Security version 1.1 function.

### Enabling this feature

To enable the WSSecurity SAML feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>wsSecuritySaml-1.1</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the WSSecurity SAML feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.wsSecuritySaml-1.1; type="osgi.subsystem.feature"
```

### Features that this feature enables

- samlWeb-2.0 - SAML web single sign-on version 2.0
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1
- wsSecurity-1.1 - Web Service Security

## Web Response Cache

This feature enables local caching for web responses. It includes the distributedMap feature and performs automatic caching of web application responses to improve response times and throughput. Applications can include a cache-spec.xml file to customize the response caching. The cache may be distributed through addition of a network cache provider such as WebSphere eXtreme Scale.

### Enabling this feature

To enable the Web Response Cache feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>webCache-1.0</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Web Response Cache feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.webCache-1.0; type="osgi.subsystem.feature"
```

### Features that this feature enables

- distributedMap-1.0 - Distributed Map interface for Dynamic Caching
- jsp-2.2 - JavaServer Pages 2.2
- jsp-2.3 - JavaServer Pages 2.3
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1

### IBM API packages provided by this feature

- com.ibm.websphere.command
- com.ibm.websphere.command.web
- com.ibm.websphere.servlet.cache

### SPI packages provided by this feature

- com.ibm.wsspi.cache.web

## Web Service Security

This feature provides support for securing JAX-WS web services using a WS-Security policy.

### Enabling this feature

To enable the Web Service Security feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>wsSecurity-1.1</feature>
```

### Developing a feature that depends on this feature

If you are developing a feature that depends on the Web Service Security feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.wsSecurity-1.1; type="osgi.subsystem.feature"
```

### Features that this feature enables

- appSecurity-2.0 - Application Security 2.0
- jaxws-2.2 - Java Web Services 2.2

## Features that enable this feature

- wsSecuritySaml-1.1 - WSSecurity SAML

## Third party API packages provided by this feature

- org.apache.ws.security
- org.apache.ws.security.action
- org.apache.ws.security.cache
- org.apache.ws.security.components.crypto
- org.apache.ws.security.conversation
- org.apache.ws.security.conversation.dkalgo
- org.apache.ws.security.handler
- org.apache.ws.security.message
- org.apache.ws.security.message.token
- org.apache.ws.security.processor
- org.apache.ws.security.saml
- org.apache.ws.security.saml.ext
- org.apache.ws.security.saml.ext.bean
- org.apache.ws.security.saml.ext.builder
- org.apache.ws.security.spnego
- org.apache.ws.security.str
- org.apache.ws.security.transform
- org.apache.ws.security.util
- org.apache.ws.security.validate

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Web Service Security feature:

- wsSecurityClient
- wsSecurityProvider

## WebRTC Rtcomm Gateway

This feature allows the Rtcomm framework to connect with SIP networks.

## Enabling this feature

To enable the WebRTC Rtcomm Gateway feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>rtcommGateway-1.0</feature>
```

## Developing a feature that depends on this feature

If you are developing a feature that depends on the WebRTC Rtcomm Gateway feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.rtcommGateway-1.0; type="osgi.subsystem.feature"
```

## Features that this feature enables

- rtcomm-1.0 - Real-Time Communications
- servlet-3.0 - Java Servlets 3.0
- servlet-3.0 - Java Servlets 3.0

- servlet-3.1 - Java Servlets 3.1
- sipServlet-1.1 - SIP Servlet

## **z/OS Connect**

This feature provides a gateway between mobile, cloud, and web clients and z/OS back-end systems such as CICS Transaction Server, IMS, and batch applications. It provides RESTful APIs and accepts and returns JSON payloads. The feature enables communication with back-end systems by providing a data transformation service that converts JSON payloads to/from byte arrays consumable by z/OS native-language applications written in Cobol, PL/I, and C.

### **Enabling this feature**

To enable the z/OS Connect feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>zosConnect-1.0</feature>
```

### **Developing a feature that depends on this feature**

If you are developing a feature that depends on the z/OS Connect feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.zosConnect-1.0; type="osgi.subsystem.feature"
```

### **Features that this feature enables**

- distributedMap-1.0 - Distributed Map interface for Dynamic Caching
- json-1.0 - JavaScript Object Notation for Java
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1
- ssl-1.0 - Secure Socket Layer

### **SPI packages provided by this feature**

- com.ibm.wsspi.zos.connect

### **Feature configuration elements**

You can use the following elements in your server.xml file to configure the z/OS Connect feature:

- administrator-role
- auditInterceptor
- authCache
- authentication
- authorization-roles
- authorizationInterceptor
- basicRegistry
- classloading
- fileSystemloggerInterceptor
- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- quickStartSecurity
- trustAssociation

- zosConnectDataXform
- zosConnectInterceptors
- zosConnectManager
- zosConnectService

## **z/OS Connect 1.2**

This feature provides a gateway between mobile, cloud, and web clients and z/OS back-end systems such as CICS Transaction Server, IMS, and batch applications. It provides RESTful APIs and enables you to route HTTP requests to remote REST endpoints. It also accepts and returns JSON payloads and communicates with back-end systems by providing a data transformation service that converts JSON payloads to/from byte arrays consumable by z/OS native-language applications written in Cobol, PL/I, and C.

### **Enabling this feature**

To enable the z/OS Connect 1.2 feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>zsoConnect-1.2</feature>
```

### **Developing a feature that depends on this feature**

If you are developing a feature that depends on the z/OS Connect 1.2 feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.zosConnect-1.2; type="osgi.subsystem.feature"
```

### **Features that this feature enables**

- distributedMap-1.0 - Distributed Map interface for Dynamic Caching
- jaxrsClient-2.0 - Java RESTful Services Client 2.0
- json-1.0 - JavaScript Object Notation for Java
- servlet-3.0 - Java Servlets 3.0
- servlet-3.1 - Java Servlets 3.1
- ssl-1.0 - Secure Socket Layer

### **SPI packages provided by this feature**

- com.ibm.wsspi.zos.connect

### **Feature configuration elements**

You can use the following elements in your server.xml file to configure the z/OS Connect 1.2 feature:

- administrator-role
- auditInterceptor
- authCache
- authentication
- authorization-roles
- authorizationInterceptor
- basicRegistry
- classloading
- fileSystemloggerInterceptor
- jaasLoginContextEntry
- jaasLoginModule

- library
- ltpa
- quickStartSecurity
- trustAssociation
- zosConnectDataXform
- zosConnectInterceptors
- zosConnectManager
- zosConnectService
- zosConnectServiceRestClient
- zosConnectServiceRestClientBasicAuth

## **z/OS Optimized Local Adapters**

This feature enables high-performance calling between native-language applications on z/OS and business logic in a Liberty profile server environment.

### **Enabling this feature**

To enable the z/OS Optimized Local Adapters feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>zosLocalAdapters-1.0</feature>
```

### **Supported Java Versions**

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### **Developing a feature that depends on this feature**

If you are developing a feature that depends on the z/OS Optimized Local Adapters feature, include the following item in the `Subsystem-Content` header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.zosLocalAdapters-1.0; type="osgi.subsystem.feature"
```

### **Features that this feature enables**

- `ejbLite-3.1` - Enterprise JavaBeans Lite 3.1
- `ejbLite-3.2` - Enterprise JavaBeans Lite 3.2
- `jca-1.6` - Java Connector Architecture 1.6
- `jca-1.7` - Java Connector Architecture 1.7
- `jndi-1.0` - Java Naming and Directory Interface
-  `zosSecurity-1.0` - z/OS SAF Integration

### **IBM API packages provided by this feature**

- `com.ibm.websphere.ola`

### **Feature configuration elements**

You can use the following elements in your `server.xml` file to configure the z/OS Optimized Local Adapters feature:

- `channelfw`
- `classloading`
- `tcpOptions`

- transaction
- zosLocalAdapters

## **z/OS SAF Integration**

This feature enables the server to use the SAF Registry in the z/OS platform for authenticating users and authorizing access to applications.

### **Enabling this feature**

To enable the z/OS SAF Integration feature, add the following element declaration inside the featureManager element in your server.xml file:

```
<feature>zosSecurity-1.0</feature>
```

### **Supported Java Versions**

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### **Developing a feature that depends on this feature**

If you are developing a feature that depends on the z/OS SAF Integration feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.zosSecurity-1.0; type="osgi.subsystem.feature"
```

z/OS

### **Features that enable this feature**

-  zosLocalAdapters-1.0 - z/OS Optimized Local Adapters

### **IBM API packages provided by this feature**

- com.ibm.websphere.security.auth.callback

### **Feature configuration elements**

You can use the following elements in your server.xml file to configure the z/OS SAF Integration feature:

- administrator-role
- authCache
- authentication
- classloading
- jaasLoginContextEntry
- jaasLoginModule
- library
- ltpa
- safAuthorization
- safCredentials
- safRegistry
- safRoleMapper

## **z/OS Transaction Management**

This feature enables the application server to synchronize and appropriately manage transactional activity between the Resource Recovery Services (RRS), the transaction manager of the application server, and the resource manager.

### **Enabling this feature**

To enable the z/OS Transaction Management feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>zosTransaction-1.0</feature>
```

### **Supported Java Versions**

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### **Developing a feature that depends on this feature**

If you are developing a feature that depends on the z/OS Transaction Management feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.zosTransaction-1.0; type="osgi.subsystem.feature"
```

### **Feature configuration elements**

You can use the following elements in your `server.xml` file to configure the z/OS Transaction Management feature:

- `classloading`
- `nativeTransactionManager`
- `transaction`

## **z/OS Workload Management**

This feature provides access to z/OS native workload management (WLM) services. Configuration can be used to classify HTTP traffic in the server so that it can be managed by WLM along with other work in the system.

### **Enabling this feature**

To enable the z/OS Workload Management feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<feature>zosWlm-1.0</feature>
```

### **Supported Java Versions**

- JavaSE-1.6
- JavaSE-1.7
- JavaSE-1.8

### **Developing a feature that depends on this feature**

If you are developing a feature that depends on the z/OS Workload Management feature, include the following item in the Subsystem-Content header in the feature manifest file for your new feature:

```
com.ibm.websphere.appserver.zosWlm-1.0; type="osgi.subsystem.feature"
```

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the z/OS Workload Management feature:

- `channelfw`
- `classloading`
- `httpAccessLogging`
- `httpDispatcher`
- `httpEncoding`
- `httpEndpoint`
- `httpOptions`
- `httpProxyRedirect`
- `mimeTypes`
- `tcpOptions`
- `virtualHost`
- `wlmClassification`
- `zosWorkloadManager`

---

## Liberty Kernel

The kernel

### IBM API packages provided by this feature

- `com.ibm.websphere.config.mbeans`
- `com.ibm.websphere.logging`
- `com.ibm.websphere.logging.hpel`
- `com.ibm.websphere.logging.hpel.reader`
- `com.ibm.websphere.logging.hpel.reader.filters`
- `com.ibm.websphere.logging.hpel.writer`

### SPI packages provided by this feature

- `com.ibm.websphere.crypto`
- `com.ibm.websphere.ras`
- `com.ibm.websphere.ras`
- `com.ibm.websphere.ras.annotation`
- `com.ibm.websphere.ras.annotation`
- `com.ibm.ws.ffdc`
- `com.ibm.ws.ffdc`
- `com.ibm.wsspi.config`
- `com.ibm.wsspi.kernel.filemonitor`
- `com.ibm.wsspi.kernel.service.location`
- `com.ibm.wsspi.kernel.service.utils`
- `com.ibm.wsspi.logging`
- `com.ibm.wsspi.logging`
- `com.ibm.wsspi.security.crypto`
- `com.ibm.wsspi.threading`
- `org.eclipse.equinox.log`

- org.eclipse.osgi.framework.console
- org.eclipse.osgi.framework.eventmgr
- org.eclipse.osgi.framework.log
- org.eclipse.osgi.service.datalocation
- org.eclipse.osgi.service.debug
- org.eclipse.osgi.service.environment
- org.eclipse.osgi.service.localization
- org.eclipse.osgi.service.resolver
- org.eclipse.osgi.service.runnable
- org.eclipse.osgi.service.security
- org.eclipse.osgi.service.urlconversion
- org.eclipse.osgi.signedcontent
- org.eclipse.osgi.storagemanager
- org.eclipse.osgi.util
- org.osgi.service.cm
- org.osgi.service.component
- org.osgi.service.coordinator
- org.osgi.service.event
- org.osgi.service.log
- org.osgi.service.metatype

## Feature configuration elements

You can use the following elements in your `server.xml` file to configure the Liberty Kernel feature:

- config
- executor
- featureManager
- fileset
- include
- logging
- variable
- zosLogging

---

## Liberty: Liberty Repository

8.5.5.2

The Liberty Repository provides an online mechanism to deliver Liberty and additional content, enabling a single point of access for various asset types. The Liberty Repository provides early access to supported new content, including new product capabilities, when they are delivered, rather than waiting for a new release.

The Liberty Repository also enables fast and simple integration with open source, more refined access to runtime capabilities, and quick access to configuration and administration resources for developers and operations teams.

**Important:** Product documentation that is marked with the  icon indicates information about assets that are available only from the Liberty Repository.

## Assets

Asset types available from the Liberty Repository are as follows:

### *Addons*

Artifacts that are packaged to add new capabilities over an existing Liberty installation.

### *Admin Scripts*

Sample scripts for common Liberty administrative tasks.

### *Config Snippets*

Samples of Liberty server configurations for specific tasks.

### *Features*

Individual units of server functionality that can be installed into the Liberty runtime environment.

### *Open Source Integration*

Artifacts that provide simple Liberty integration with commonly used open source projects.

### *Products*

Simple archive installation packages of the Liberty server runtime environment.

### *Product Samples*

Sample server applications that demonstrate the use of Liberty runtime capabilities.

### *Tools*

Tools to enable development and test of Liberty-based applications and runtime extensions.

## Features

The Liberty Repository enables immediate access to fully supported and production-ready features, without the need to wait for new product releases. The features that you add inherit the same support as your existing installation. For a full list of features that are available from the Liberty Repository, see “Liberty features” on page 826.

8.5.5.6

### Offline access to Liberty Repository assets

In addition to accessing assets in the public, online Liberty Repository, you can create the following types of repositories to enable on-premises or offline access to Liberty Repository assets:

#### **Liberty Asset Repository Service**

An open-source service that you can use to create an on-premises repository that is remotely accessible behind the firewall of an enterprise. To get started with the service, see the WASdev/tool.lars project on GitHub.

#### **Local directory-based repository**

Local directory-based repositories that you create when you download assets by using the **installUtility download** command. For more information about the command, see “Downloading assets using the installUtility command” on page 1400.

You can populate these repositories with your own customized content or download Liberty Repository assets by using the **installUtility download** command. As an alternative to downloading individual assets, you can download and extract a `wlp-featureRepo-<version>.zip` file from IBM Fix Central. The .zip file contains a directory-based repository of all features and addons for the particular fix pack of the Liberty. After you populate the repositories, you can install assets from them by using IBM Installation Manager or the **installUtility install** command.

8.5.5.8

For Version 8.5.5.8 and later, you can use Installation Manager and the **installUtility** command to work with repository assets in an archive file. You can access assets directly from the

wlp-featureRepo-<version>.zip file and your own compressed directory-based repositories without extracting the archives.

## Ways to access the Liberty Repository

You can access the Liberty Repository in the following ways:

### WASdev.net website

You can access the Liberty Repository from the Downloads page on WASdev.net, an IBM developerWorks® website for Java application developers. You can browse and download content, filter by asset type, filter by product edition, and search on asset title, description, or edition.

Click any asset from the results of your search, filters, or both to take you to the asset details page. The asset details page provides an asset summary, a description of the asset, installation instructions, and configuration instructions. Links to related assets are also included with compatibility information.

### Developer tools

The Liberty Repository is integrated in developer tools. These tools allow:

- Installation of the server runtime environment from an archive
- Installation of additional content, including features, samples and open source integrations
- Post-installation content
- Runtime and feature dependency awareness, searching and filtering, and configuration snippet inclusion

### Installers

Assets can be installed from the Liberty Repository by using IBM Installation Manager and command-line utilities.

- IBM Installation Manager: If you have IBM Installation Manager installed, you can download and install assets from the Liberty Repository when you install IBM WebSphere Application Server V8.5.5.2 Liberty or later, or upgrade from a previous version of Liberty. In Version 8.5.5.6 or later, you can also install assets from a local directory-based repository or an instance of the Liberty Asset Repository Service.
- Command-line utilities:
  - **8.5.5.6 installUtility**: Find, obtain information about, and install assets that are in a local directory-based repository, an instance of the Liberty Asset Repository Service, or the public Liberty Repository.
  - **featureManager**: Install a feature from the public Liberty Repository and obtain details of features that are already installed.

For more information on the different methods available for installing Liberty Repository assets, see “Installing Liberty Repository assets” on page 1391.

To access the IBM WebSphere Liberty Repository with limited internet access or through a firewall, ensure that you have access to the following hosts and ports:

- public.dhe.ibm.com on port 443
- asset-websphere.ibm.com on port 443

---

## Liberty profile: Product extension

**8.5.5.0**

You can expand the capability of Liberty by writing product extensions.

You can write your own Liberty features and install them onto an existing Liberty server, or you can package them for delivery to your users.

Liberty provides various System Programming Interfaces (SPIs) that you can use to extend the runtime environment; you can also use more advanced features such as operating the Liberty server from your Java applications programmatically.

## Product extension

A product extension is a directory on disk that is structured like the Liberty installation directory, `${wlp.install.dir}`. It is defined to the Liberty installation through a file in the `${wlp.install.dir}/etc/extensions` directory called `extension-name.properties`. The contents of the product extension directory are then used to extend Liberty. Multiple product extensions can be installed together but they must have unique names; this is enforced through the naming of the properties files. The default product extension location, `${wlp.user.dir}/extension`, does not require a properties file; content under this location is automatically detected and is known to the runtime as the “usr” product extension.

Product extensions usually contain one or more Liberty features but can have any content that extends the Liberty environment, for example scripts or resources.

**Best practice:** **8.5.5.0** Install your product extensions into directories that are not affected by updates to the Liberty environment. For more information, see “What might be modified by applying service or an upgrade?” on page 20.

### 8.5.5.0

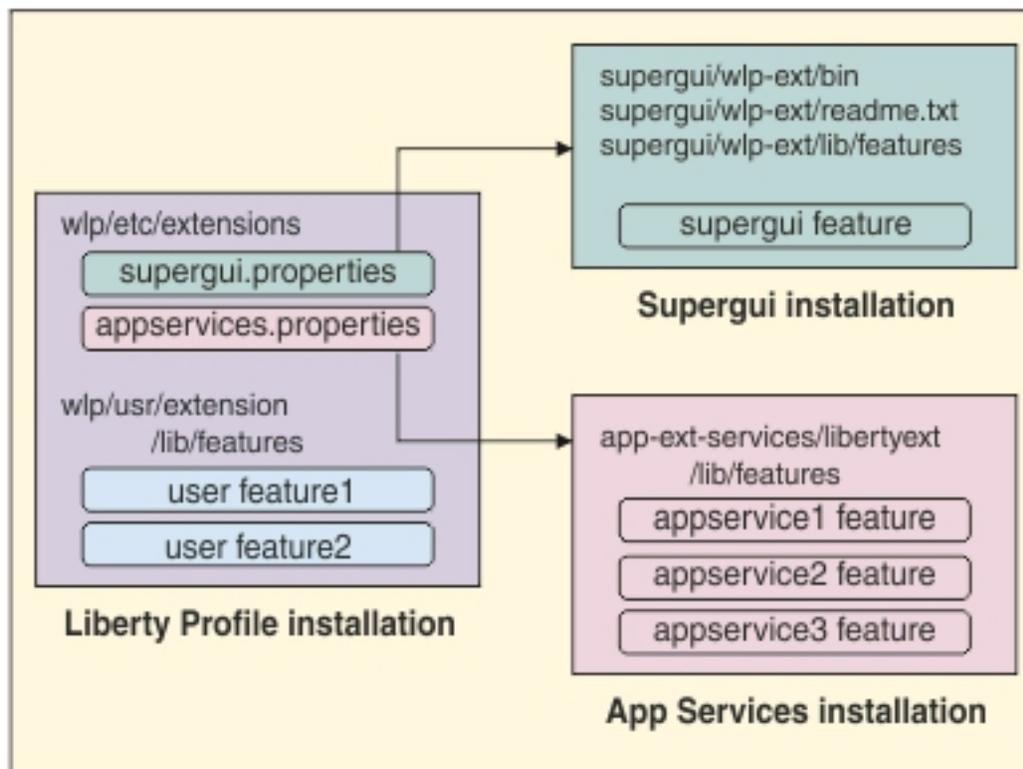

Figure 5.

### 8.5.5.0

The product extension file has the following properties:

```
com.ibm.websphere.productId=your_product_id
com.ibm.websphere.productInstall=absolute_or_relative_file_path
```

**Note:** When a relative file path is used, it must be a peer of the `${wlp.install.dir}` value.

**8.5.5.0**

For example:

```
com.ibm.websphere.productId=org.acme.supergui  
com.ibm.websphere.productInstall=supergui/wlp-ext
```

## Feature

A Liberty feature consists of a definition file (feature manifest), and a collection of OSGi bundles that provide classes and services corresponding to a particular capability in the Liberty runtime environment.

## Scenarios for using a Liberty feature instead of a regular application

Implementing a function as a Liberty feature instead of as an application might be appropriate in a number of scenarios. The following list describes some of the benefits of using a feature:

- Features are controlled through feature manager configuration, so they are separate from user application management.
- Feature code has access to the Liberty SPI, which allows deeper integration with the runtime environment.
- Features can receive user-specified configuration from the `server.xml` file, and expose their configuration settings in the development tools without the tools having to be changed.
- Features can easily expose classes and services to each other and to user applications.
- Features can be extremely lightweight with no application container dependencies.
- Features can be used to augment a particular programming model. For example, a User Feature can add support for custom Blueprint namespace handlers or Blueprint annotations to the OSGi Application programming model.

**Note:** Features cannot generally be directly portable to other application servers; if portability is important you should use specification-compliant applications.

## Developing a simple feature

See “Developing a Liberty feature manually” on page 1771, “Creating a Liberty feature by using developer tools” on page 1782, and “Liberty feature manifest files” on page 1773.

## Using a feature in the server

To use a user-written feature in the Liberty server, you must install it into a product extension directory. This might be the predefined “user product extension” location or an extension that is located outside the Liberty installation directory. Then you can add the feature name into the server configuration.

The user product extension is a predefined directory where the server looks for additional features. The feature definition `.mf` file must be copied into the `${wlp.user.dir}/extension/lib/features` directory and the bundle `.jar` files must be copied into the `${wlp.user.dir}/extension/lib` directory.

User-written features are added to the server configuration in the same way as product features. To avoid name clashes with features from different providers, features that are part of a product extension must be prefixed with the extension name. For features in the `usr/extension/lib` directory, the default prefix is `usr:.`

For example, if you have installed a feature called `simple-1.0` into the `${wlp.user.dir}/extension/lib` directory, you must configure that feature into the `server.xml` as follows:

```
<featureManager>
  <feature>usr:simple-1.0</feature>
</featureManager>
```

If you have installed a feature called `myFeature` into your own location, and defined a product extension in the `#{wlp.install.dir}/etc/extensions/myExt.properties` file, you must configure that feature into the `server.xml` file as follows:

```
<featureManager>
  <feature>myExt:myFeature</feature>
</featureManager>
```

When you start the server, the feature is detected by the feature manager and the bundles are installed into the OSGi framework and started.

See also “Adding and removing Liberty features” on page 1587 and “Liberty: Feature management” on page 824.

## Programmatically using a feature from applications

Features can expose classes and services to applications.

To expose Java classes for application use, you must list the class packages in the `IBM-API-Package` header in the feature manifest. Listing the class packages in the `IBM-API-Package` header makes the classes visible to the application class loaders. Visibility of API packages can be controlled through the API visibility type. See “Specifying API and SPI packages for a Liberty feature project” on page 1784.

To allow services to be used by OSGi applications, you must list them in the `IBM-API-Service` header in the feature manifest. A feature provides OSGi services so that you can refer to those services programmatically from your applications.

Services should generally be registered into the OSGi Service Registry (SR) to allow applications (or other features) to locate them. OSGi applications and other features can perform a direct lookup from the SR, or can use capabilities such as Blueprint or OSGi Declarative Services to inject their service dependencies. Java EE applications are more likely to locate services through JNDI; in Liberty there is a federation of the SR and JNDI that allows Java EE applications to use JNDI to locate services in the SR. For more information, see “Working with the OSGi service registry” on page 1789.

## Exposing a feature as a web application

To expose a Liberty feature as a web application, you can publish the OSGi bundles in the feature as web application bundles (WABs). In addition to the OSGi headers that a bundle requires, you can specify the web application context path by using the `Web-ContextPath` header.

For example:

```
Web-ContextPath: myWABapp
Bundle-ClassPath: WEB-INF/classes
```

## Configuration injection and processing

A major benefit of using features is that they can be easily configured by the user in the `server.xml` file (and included files). The configuration files are monitored and parsed by the Liberty profile kernel and the resulting sets of properties can be injected into the relevant component each time they change.

Liberty configuration is managed by the OSGi Configuration Admin (CA) service in the kernel and can be accessed according to that specification. Sets of configuration properties are identified by a persisted identity (PID) that is used to associate the element in the `server.xml` file with the component that registers to receive the properties.

For example, if you register your feature with the CA service using a PID of `com.acme.console`, a user can specify the following configuration in the `server.xml` file:

```
<com.acme.console color="blue" size="17"/>
```

And your feature will receive the properties:

- `color="blue"`
- `size="17"`

You can optionally provide metadata that describes your configuration properties by using OSGi Metatype descriptors. The use of descriptors causes your configuration metadata to be included in the configuration schema that is generated by Liberty and is used by the Developer Tools, so your configuration properties are automatically presented to application developers as they configure their server.

**8.5.5.0** For more details on receiving and describing configuration properties, see “Enabling a service to receive configuration data” on page 1796.

## Declarative Services in the Liberty

Larger or more complex features often benefit from the use of OSGi Declarative Services (DS) to enable the feature to be composed of multiple services, and to manage the injection of dependencies and configuration properties. The use of DS allows lazy activation of services, deferring the loading of Java classes until the service is used, and ordering the activation of services based on dependencies. Most of the features in the Liberty product are managed by DS.

**8.5.5.0** See also “Composing advanced features by using OSGi Declarative Services” on page 1793.

---

## Liberty: Security

Liberty security provides protection for web resources in accordance with the Servlet 3.0 specification and EJB resources in accordance with the `ejbLite` 3.1 specification. The Liberty security also provides protection for the JMX connections when you are using the REST connector.

The following diagram shows a typical security process involved when accessing a protected web resource. To make the security process work, you must configure the appropriate security features and the configurations that are required for the authentication and authorization.

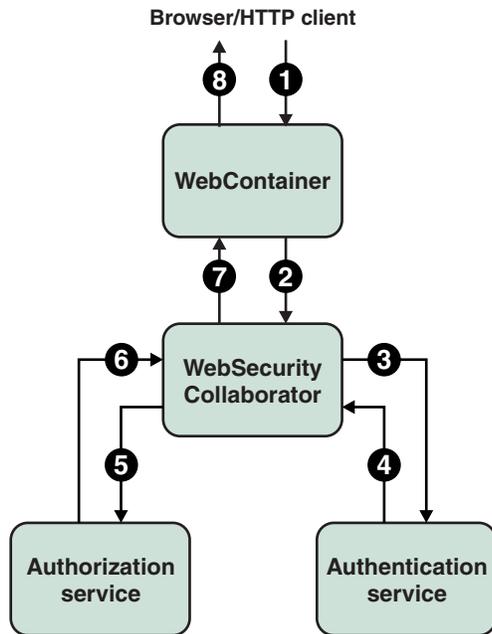

Figure 6. Typical security flow for web resources

1. An HTTP client requests a web resource in the WebContainer.
2. The WebContainer delegates the security check to the WebSecurity Collaborator.
3. The WebSecurity Collaborator prompts the user to enter credentials if absent, and uses the Authentication service to authenticate the user.
4. The Authentication service authenticates, creates, and returns the subject if authenticated successfully. Otherwise, the Authentication service reports an exception for the authentication failure.
5. The WebSecurity Collaborator uses the Authorization service to perform a user authorization check.
6. The Authorization service returns the authorization result to the WebSecurity Collaborator.
7. The WebSecurity Collaborator returns the result of the security check about whether the user is authorized.
8. The WebContainer serves or rejects the requested resource.

The following sections provides a summary of the primary security components in Liberty:

- “Quick start” on page 973
- “Authentication” on page 973
- “Authorization” on page 973
- “Secure Socket Layer (SSL)” on page 973
- “Single Sign-On (SSO)” on page 973
- “Web security-related properties” on page 973
- “Security public APIs” on page 973
- “Management security” on page 974
- **z/OS** “ z/OS® security” on page 974
- “Authentication aliases” on page 974
- “Configuration examples and samples” on page 974
- “Security compatibility and differences” on page 974
- “Configuring Lightweight Directory Access Protocol (LDAP)” on page 974
- “Troubleshooting” on page 975

- **Distributed operating systems** “Tools” on page 975

## Quick start

With the `quickStartSecurity` element, you can configure a single user security environment in Liberty. See “Liberty:Quick overview of security” on page 975 for details of how the security workflow is when you use the `quickStartSecurity` element, and “Getting started with security in Liberty” on page 1829 for a sample task.

## Authentication

Authentication confirms the identity of a user. The most common form of authentication is user name and password, such as through either basic authentication or form login for web applications. When a user is authenticated, the source of a request is represented as a Subject object at the run time. This process involves performing access control checks when a user accesses a resource, based on the authorization rules configured for the resource. See “Liberty:Authentication” on page 976 for more concepts and “Authenticating users in Liberty” on page 1850 for detailed tasks.

## Authorization

Authorization determines whether to grant a user access to resources within the system. The Java EE model uses subjects, resources, and roles to determine what can and cannot be allowed. This process involves checking the user credentials such as the user ID and password, certificates, and tokens, and creating a subject based on the authenticated user. See “Liberty: Authorization” on page 999 for more concepts and “Authorizing access to resources in Liberty” on page 1939 for detailed tasks.

## Secure Socket Layer (SSL)

SSL provides transport level security. See “Enabling SSL communication in Liberty” on page 1834 for detailed tasks.

## Single Sign-On (SSO)

SSO enables access to applications without the user being prompted to login multiple times. See Concept of SSO for more details and “Customizing SSO configuration using LTPA cookies in Liberty” on page 1887 for the detailed task.

## Web security-related properties

There are many configuration properties that you can configure as part of web security, such as SSO and client certificate authentication, for your applications. See for available attributes and see “Configuring web security related properties in Liberty” on page 1994 for some examples.

## Security public APIs

Liberty contains public APIs that you can use to implement security functions. The security public APIs in Liberty are a subset of the traditional security public APIs. The main classes are `WSSecurityHelper`, `WSSubject`, and `RegistryHelper`. These classes contain a subset of the methods that are available in the WebSphere Application Server traditional versions. There is also a new class `WebSecurityHelper`. See “Liberty:Security public APIs” on page 1004.

The Java API documentation for each Liberty API is available in a separate `.zip` file in one of the javadoc subdirectories of the `{wlp.install.dir}/dev` directory.

See “Developing extensions to the Liberty security infrastructure” on page 1998 for some examples.

## Management security

Management security means that you can manage Liberty by using a remote JMX client. To secure remote connections using the REST connector, see “Connecting to Liberty by using JMX” on page 1641. You can also develop your own JMX client application as described in “Developing a JMX Java client for Liberty” on page 1645.

z/OS

## z/OS® security

The System Authorization Facility (SAF) on the z/OS platform is supported in Liberty for authentication and authorization. See “Enabling z/OS authorized services in Liberty for z/OS” on page 1942 and Configuring SAF Authorization for detailed tasks.

## Authentication aliases

Authentication data aliases provide the security support for database connectivity. See “Configuring authentication aliases for Liberty” on page 1997.

## Configuration examples and samples

8.5.5.0

There are several security configuration examples on the WASdev.net website for reference when configuring security for your applications on Liberty.

## Security compatibility and differences

You can learn about the main differences in the security capability between the traditional and Liberty. See “Configuration differences between the traditional and Liberty: security” on page 1008.

## Configuring Lightweight Directory Access Protocol (LDAP)

After selecting the LDAP User Registry item to add to the server configuration, the **LDAP User Registry Details** panel will display a list for the supported LDAP server types. If you select a supported LDAP server type, the LDAP filters associated with the selected LDAP server type will not automatically pre-populated.

Each of the supported LDAP server types has a default set of filters defined. After the **LDAP User Registry** item and server type has been added, the associated LDAP filters can be configured by selecting the **LDAP User Registry** configuration and adding the required LDAP filter:

- Active Directory LDAP filters
- Custom LDAP filters
- Domino LDAP filters
- eDirectory LDAP filters
- IBM Directory Server LDAP filters
- iPlanet LDAP filters
- Netscape LDAP filters
- SecureWay LDAP filters

Selecting any of the LDAP filters will display the default values for the filter types:

- user filter
- group filter
- user ID map
- group ID map

- group member ID map

If the default filters are used, the `server.xml` file is not updated with any filter information. If any of the filters are changed, only the changed filter types will be updated in the `server.xml`.

**Note:** If you do not specify or select a reference ID using the **Browse** button, the default filters associated with selected LDAP server type will be used.

Alternatively, you can add an LDAP filter to the server configuration. An ID must be specified to associate the reference to this particular filter configuration, in order to associate it with the LDAP User Registry configuration. If this method of configuring the LDAP filters is used, the reference ID will then be selected on the **LDAP User Registry Details** panel (located using the **Browse** button under the respective LDAP filter type).

If you are using Eclipse-based developer tools to configure LDAP, verify the configuration saved against the samples in `wlp/templates/config/ldapRegistry.xml`.

For more information, see “Configuring LDAP user registries in Liberty” on page 1852.

## Troubleshooting

Use the troubleshooting information to solve security-related problems when you use Liberty. See “Troubleshooting security” on page 2298 and “Troubleshooting LDAP” on page 2300.

### Distributed operating systems

## Tools

Configure security by using the Eclipse-based developer tools for Liberty. See “Editing the Liberty configuration by using developer tools” on page 1556. Specific information about tools and security configuration is available in “Configuring TAI on Liberty by using developer tools” on page 1891 and “Configuring JAAS on Liberty by using developer tools” on page 1870.

## Liberty:Quick overview of security

To understand the basic workflow of security in Liberty, some common security terms are detailed along with an example.

### Security key terms

#### Authentication

Authentication confirms the identity of a user. The most common form of authentication is user name and password, such as through basic authentication or form login for web applications. When a user is authenticated, the source of a request is represented as a Subject object at run time.

#### Authorization

Authorization determines whether a user has access to a given role within the system. The Java EE model uses subjects, roles, and role mappings to determine if access is allowed.

**Role** A role is defined within the Java EE application. Some roles, such as the Administrator role, are predefined by the system. Other roles are defined by the application developer. In Java EE, subjects are usually granted or denied access to a role based on the roles they perform within the application.

#### Subject

A subject is both a general term and a Java object: `javax.security.auth.Subject`. Generally, the term subject means active entities within the system, such as users on the system, and even the system process itself.

## Security workflow example

The following example demonstrates how the security is applied when a user requests access to a resource. For example, a user Bob wants to access a servlet `myWebApp`. See the code samples in “Getting started with security in Liberty” on page 1829.

To access the servlet `myWebApp`, the following conditions must be true:

1. Bob must be able to log in to the system because the servlet is protected.
2. Bob must be in the `testing` role because the servlet is restricted by using an `auth-constraint` element in the deployment descriptor.

If Bob cannot log in to the system, or Bob is not in the `testing` role, then the access to the servlet `myWebApp` is denied.

Another user Alice can log in to the system because Alice is a valid user. But Alice is not in the `testing` role. An HTTP 403 error (Access Denied/Forbidden) displays when Alice logs in.

## Liberty:Authentication

Authentication in the Liberty security is to confirm the identity of a user.

To access a protected web resource, the user must provide credential data, such as user ID and password. The authentication process involves collecting this user credential information (based on how the web application was configured to collect this data) and validating it against the configured registry. When the credential information is verified, a JAAS subject is created for that user. The subject contains additional information about the user, such as the groups that the user belongs to, and the tokens created for the user. The information in this subject is then used during the authorization process to determine whether the user can access the resource.

The following diagram illustrates a typical authentication process flow for a web resource.

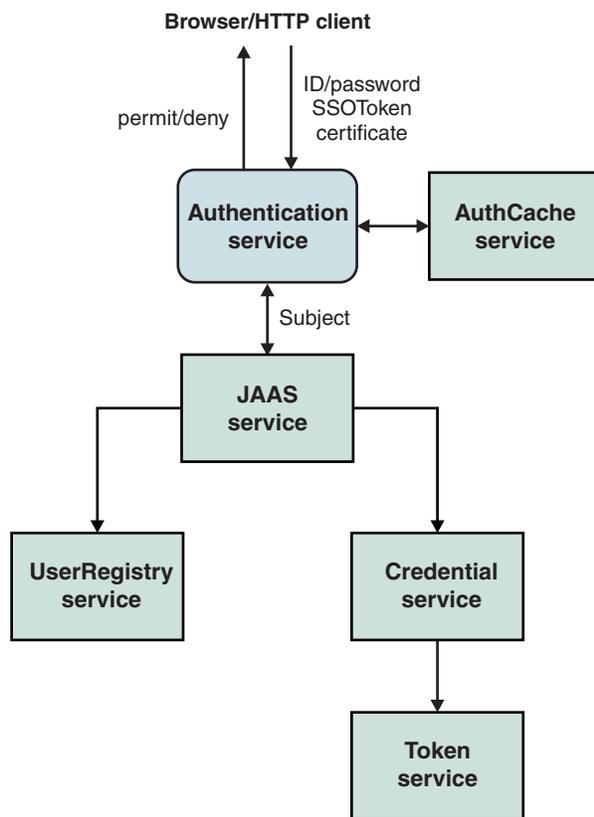

Figure 7. Overview of authentication process

The authentication process involves gathering credential data from the user, checking the cache to see whether the subject exists for that user and in its absence calling the JAAS service to perform the authentication to create a subject. The JAAS service calls a set of login modules to handle the authentication. One or more of the login modules creates the subject depending on the credential data. The login module then calls the registry that is configured to validate the credential information. If the validation is successful, the authentication process collects and creates relevant information for that user, including the groups that the user belongs to and the single sign-on (SSO) token used for SSO capability, and stores them in the subject as relevant credentials. You can also customize the information saved in the subject by plugging in custom login modules during this process.

When the authentication is successful, the SSO token that is created during the process is sent back to the browser in a cookie. The default name of the configurable cookie is `ltpaToken2`. On subsequent calls, the token information is used to authenticate the user. If this authentication fails, the authentication service tries to use other authentication data, such as the user ID and password, if they still exist in the request.

**Note:** To support user IDs and passwords that contain non US-ASCII characters, form login method is required for web applications. For more information, see `autoRequestEncoding` and `autoResponseEncoding`.

The following sections describe these concepts in detail:

- “User registries” on page 978
- “Authentication cache” on page 978
- “JAAS configuration” on page 978
- “JAAS login modules” on page 979

- “Callback handler” on page 980
- “Credentials and tokens” on page 980
- “LTPA” on page 980
-  **8.5.5.5** “SPNEGO” on page 981
-  **8.5.5.8** “Kerberos constrained delegation for SPNEGO” on page 982
- “Single sign-on (SSO)” on page 982
-  **8.5.5.7** “SAML Web Browser SSO” on page 982
- “Pluggable authentication” on page 983
- “Identity assertion” on page 983
- “RunAs() authentication” on page 984
- “Proxy login module” on page 984
- “Certificate login” on page 985
- “Hash table login module” on page 985

## User registries

When validating the authentication data of a user, the login modules call the user registry that is configured to validate the user information. Liberty supports both a simple configuration-based user registry and a more robust LDAP-based registry. For more information, see “Configuring a user registry for Liberty” on page 1851.

**8.5.5.0** Using the LDAP registry, you can also federate multiple repositories and execute the LDAP operations on two or more registries. The Liberty user can configure the LDAP registry federation feature either directly in the `server.xml` file or can configure in the **LDAP Registry Federation** section in the developer tool. After the configuration of the federated repositories, you can obtain a consolidated result of the federated repositories on any operation that you want to perform. For example, if you want to perform a search operation for all user names that starts with *test*, you can perform a search across the set of LDAP registries and get the consolidated search result which can then be sent back to the calling program.

## Authentication cache

Because creating a subject is relatively expensive, Liberty provides an authentication cache to store a subject after the authentication of a user is successful. The default expiration time for the cache is 10 minutes. If the user does not log back in within 10 minutes, the subject is removed and the process of authentication repeats to create a subject for that user. Changes to the configuration that affect the creation of the subject, such as adding a login module or changing the LTPA keys, will cause the authentication cache to be cleared. If the subject is cached and the information in the registry changes, the cache is updated with the information in the registry. You can configure the cache timeout period, and the cache size, and you can also disable or enable caching. For more information, see “Configuring the authentication cache in Liberty” on page 1867.

## JAAS configuration

JAAS configuration defines a set of login modules to create the subject. Liberty supports the following JAAS configurations:

### **system.WEB\_INBOUND**

Used when accessing web resources such as servlets and JSPs.

### **WSLogin**

Used by applications when using the programmatic login. It is also used by applications running

in an application client container, but unlike the `ClientContainerJAAS` configuration, it does not recognize the `CallbackHandler` handler that is specified in the client application module's deployment descriptor.

#### **system.DEFAULT**

Used for login when no JAAS configuration is specified.

#### **8.5.5.4 system.DESERIALIZE\_CONTEXT**

Used when a security context is being deserialized. This JAAS configuration handles authentication to re-create the subjects that were active on the thread at the time the security context was serialized. You can specify this JAAS configuration and add your own custom JAAS login modules by editing the JAAS configuration entry in the `server.xml` file to ensure that the propagated subjects contain your custom information.

#### **8.5.5.6 ClientContainer**

Used by applications running in an application client container. This JAAS login configuration recognizes the `CallbackHandler` handler that is specified in the client application module's deployment descriptor, if one is specified.

The `system.WEB_INBOUND` and `system.DEFAULT` configurations have these default login modules in this order: **hashtable**, **userNameAndPassword**, **certificate**, and **token**. The `WSLogin` configuration has the proxy login module as the default login module, and the proxy delegates all the operations to the real login module in `system.DEFAULT`.

No explicit configuration is required unless you want to customize by using the custom login modules. Depending on the requirement, you can customize specific login configurations. For example, if you want all the web resource logins to be customized, you must add custom login modules only to the `system.WEB_INBOUND` configuration. See “Configuring a JAAS custom login module for Liberty” on page 1868.

## **JAAS login modules**

JAAS configuration uses a set of login modules to create the subject. Liberty provides a set of login modules in each of the login configurations. Depending on the authentication data, a particular login module creates the subject. The authentication data is passed to the login modules by using the callback handler, as specified in the JAAS specification. For example, if the user ID and password callback handler is being used for authentication, the **userNameAndPassword** login module handles the authentication. If a `SingleSignOnToken` credential is presented as the authentication data, only the **token** login module handles the authentication.

The following default login modules are supported in Liberty:

#### **userNameAndPassword**

Handles the authentication when user name and password are used as the authentication data.

#### **certificate**

Handles the authentication when an X509 certificate is used as the authentication data of mutual SSL.

**token** Handles the authentication when an SSO token is presented as the authentication data. During the authentication process, an SSO token is created and sent back to the HTTP client (browser) in a cookie. On subsequent requests, this cookie is sent back by the browser and the server extracts the token from the cookie to authenticate the user when the single sign-on is enabled.

#### **hashtable**

Used when the authenticated data is sent through a predefined hash table. For more information about the hash table login, see “Hash table login module” on page 985. This login module is also used by the security run time when authentication is performed using identity only; for example, in the case of `runAs`.

**proxy** The default login module for WSLLogin. See “Proxy login module” on page 984.

The login modules are called in the order that they are configured. The default order is **hashtable**, **userNameAndPassword**, **certificate**, **token**. If you must customize the login process by using custom login modules, you can provide them and configure them in the order you need. Typically, place a custom login module first in the list of login modules so that it is called first. When a custom login module is used, you must specify all the login module information in the configuration along with the custom login module in the required order.

When a login module determines that it can handle the authentication, it first makes sure that the authentication data that is passed in is valid. For example, for user name and password authentication, the configured user registry is called to verify the authentication information. For token authentication, the token must be decrypted and valid for the verification to succeed.

When the authentication data is validated, the login modules create credentials with additional data for the user including the groups and the SSO token. A custom login module can add additional data to the subject by creating its own credentials. For the Liberty authorization to work, the subject must contain the `WSCredential`, `WSPrincipal`, and `SingleSignonToken` credentials. The `WSCredential` credential contains the groups information, with additional information that is required by the security runtime environment.

## Callback handler

The Liberty supports various callback handlers for providing data to the login modules during the JAAS authentication process. A custom login module can use the callback handler information to authenticate itself. For example, if the callback handler needs to access some information in an `HttpServletRequest` object, it can do so by using that specific callback handler.

The following callback handlers and factories for programmatic JAAS login are supported in Liberty:

- `com.ibm.websphere.security.auth.callback.WSCallbackHandlerImpl`
- `com.ibm.wsspi.security.auth.callback.WSCallbackHandlerFactory`

The Java API documentation for each Liberty API is available in a separate `.zip` file in one of the javadoc subdirectories of the `{wlp.install.dir}/dev` directory.

See “Developing JAAS custom login modules for a system login configuration” on page 2002.

## Credentials and tokens

As mentioned in the `loginModule` section, credentials are created as part of the subject creation process. Liberty creates the `WSCredential`, `SingleSignonToken`, and `WSPrincipal` credentials. The `SingleSignonToken` credential contains the token that is sent back to the browser in a cookie for SSO to work. This token contains the user information and an expiration time. It is signed and encrypted by using the Lightweight Third Party Authentication (LTPA) keys that are generated during the first server startup. The default expiration time is 2 hours and is an absolute time, not based on user activities. After the 2 hours, the token expires and the user must log in again to access the resource.

## LTPA

LTPA is intended for distributed and multiple application server environments. In Liberty, LTPA supports SSO and security in a distributed environment through cryptography. This support enables LTPA to encrypt, digitally sign, and securely transmit authentication-related data, and later decrypt and verify the signature.

Application servers can securely communicate using the LTPA protocol. The protocol also provides the SSO feature, whereby a user is required to authenticate only when connecting to a domain name system

(DNS). Then the user can access resources in other Liberty servers in the same domain without getting prompted. The realm names on each system in the DNS domain are case-sensitive and must match identically.

The LTPA protocol uses cryptographic keys to encrypt and decrypt user data that passes between the servers. These keys must be shared between different servers for the resources in one server to access resources in other servers, assuming that all the servers involved use the same user registry. LTPA requires that the configured user registry must be a centrally shared repository so that users and groups are the same, regardless of the server.

When using LTPA, a token is created that contains the user information and an expiration time, and is signed by the keys. The LTPA token is time sensitive. All participating servers must have their time and date synchronized. If not, LTPA tokens are prematurely expired and cause authentication or validation failures. Coordinated Universal Time (UTC) is used by default, and all other servers must have the same UTC time. See your operating system documentation for information about how to ensure the same UTC time among servers.

The LTPA token passes to other servers through cookies for web resources when SSO is enabled.

If the receiving servers use the same keys as the originating server, the token can be decrypted to obtain the user information, which then is validated to make sure that the token is not expired and that the user information in the token is valid in its registry. On successful validation, the resources in the receiving servers are accessible after the authorization check.

Each server must have valid credentials. When the credentials expire, the server is required to communicate to the user registry to authenticate. Extending the time that the LTPA token remains cached presents a slightly increased security risk to be considered when defining your security policies.

If key sharing is required between different Liberty servers, copy the keys from one server to another. For security purposes, the keys are encrypted with a randomly-generated key, and a user-defined password is used to protect the keys. This same password is needed when importing the keys into another server. The password is used only to protect the keys, and is not used to generate the keys.

When security is enabled, LTPA is configured by default during the Liberty server start time. For more information about the LTPA support, see “Configuring LTPA in Liberty” on page 1872.

8.5.5.5

## SPNEGO

Simple and Protected GSS-API Negotiation Mechanism (SPNEGO) enables users to log in to the Microsoft Domain controller once and access protected applications on Liberty servers without getting prompted again.

When SPNEGO web authentication is enabled, and the browser client accesses a protected resource on the Liberty server, SPNEGO is responsible for authenticating access to the secured resource that is identified in the HTTP request. The browser client creates a SPNEGO token and sends it to the Liberty server as part of the HTTP request. The WebSphere Application Server validates and retrieves the user identity from the SPNEGO token. The identity is used to establish a secure context between the user and the application server.

For more information about SPNEGO, see  8.5.5.5 SPNEGO. For further information on configuring SPNEGO on the Liberty server, see  8.5.5.5 Configuring SPNEGO authentication in Liberty.

8.5.5.8

## Kerberos constrained delegation for SPNEGO

The Kerberos constrained delegation feature provides two APIs that are used to create out-bound SPNEGO tokens for back end services that support SPNEGO authentication, such as .NET servers and other Liberty servers.

The Kerberos v5 extension called S4U (Services for Users) comprises two parts:

### S4U2self

Allows a Liberty server to obtain a service ticket to itself on behalf of a user. This can be used with any form of authentication that is supported by Liberty. S4U2self is the Kerberos Protocol Transition extension.

### S4U2proxy

Allows a Liberty server to obtain service tickets to trusted services on behalf of a user. These service tickets are obtained by using the user's service ticket to the Liberty service. The services are constrained by the Kerberos Key Distribution Center (KDC) administrator. S4U2proxy is the Kerberos Constrained Delegation extension.

## Single sign-on (SSO)

SSO enables users to log in in one place (one server for example) and access applications on other servers without getting prompted again. To make SSO work, the LTPA keys must be exchanged across different Liberty servers, the user registries must be the same, and the token must not have expired. To exchange the LTPA keys, you can copy the `ltpa.keys` file from one server to another and restart the server to use the new LTPA keys. The registries that are used by all the servers participating in the SSO domain must be the same.

When a user is authenticated in one Liberty server, the SSO token created for the user during the authentication process is put in the cookie that is sent to the HTTP client, for example a browser. If there is another request from that client to access another set of applications on a different server, but in the same DNS that was configured as part of the SSO configuration in the first server, the cookie is sent along with the request. The receiving server tries to authenticate the user using the token in the cookie. If both conditions are met, the receiving server validates the token and creates a subject based on the user in this server, without prompting the user to log in again. If the token cannot be validated (for example, it cannot decrypt or verify the token because of LTPA key mismatch), the user is prompted to enter the credential information again.

Any application that is configured to use the `Form-login` attribute must have SSO to be configured for that server. When the user is authenticated for a `form-login`, the token is sent back to the browser that will be used for authorizing the user when the resource is accessed.

See “Customizing SSO configuration using LTPA cookies in Liberty” on page 1887.

8.5.5.7

## SAML Web Browser SSO

SAML Web Browser SSO enables web applications to delegate user authentication to a SAML identity provider instead of a configured user registry.

For further information on configuring SAML Web Browser SSO on the Liberty server, see “SAML 2.0 Web Browser Single-Sign-On” on page 994.

## Pluggable authentication

Use the following ways to customize the authentication process:

- Provide a custom login module. Most of the authentication process is built around JAAS login modules, so you can plug in custom login modules before, after, or between the login modules provided by Liberty. See “Configuring a JAAS custom login module for Liberty” on page 1868.
- Implement Trust Association Interceptor (TAI) to handle all web resource-based authentication. See “Developing a custom TAI for Liberty” on page 1998.

For more details about the JAAS login module and TAI, see Advanced authentication in WebSphere Application Server.

## Identity assertion

Besides authentication that requires a requesting entity to prove its identity, Liberty also supports identity assertion. This is a relaxed form of authentication that does not require identity proof, but rather accepts the identity based on a trust relationship with the entity that vouches for the asserted identity.

Use the following ways to assert identities in Liberty

1. Use the hash table login. See “Developing JAAS custom login modules for a system login configuration” on page 2002.
2. Use `IdentityAssertionLoginModule`. You can allow an application or system provider to assert an identity with trust validation. To use `IdentityAssertionLoginModule`, use the JAAS login framework, where trust validation is accomplished in one custom login module and credential creation is accomplished in `IdentityAssertionLoginModule`. You can use the two login modules to create a JAAS login configuration that can be used to assert an identity.

The following two custom login modules are required:

### User implemented login module (trust validation)

The user implemented login module performs whatever the user requires in trust verification. When trust is verified, the trust verification status and the login identity must be put into a map in the share state of the login module, so that the credential creation login module can use the information. Store this map in the following property:

```
com.ibm.wsspi.security.common.auth.module.IdentityAssertionLoginModule.state
```

This property consists of the following properties:

- `com.ibm.wsspi.security.common.auth.module.IdentityAssertionLoginModule.trusted`

This property is set to true if trusted and false if not trusted.

- `com.ibm.wsspi.security.common.auth.module.IdentityAssertionLoginModule.principal`

This property contains the principal of the identity.

- `com.ibm.wsspi.security.common.auth.module.IdentityAssertionLoginModule.certificates`

This property contains the certificate of the identity.

### Identity assertion login module (credential creation)

The following module creates the credential:

```
com.ibm.wsspi.security.common.auth.module.IdentityAssertionLoginModule
```

This module relies on the trust state information in the shared state of the login context.

The identity assertion login module looks for the trust information in the shared state property:

```
com.ibm.wsspi.security.common.auth.module.IdentityAssertionLoginModule.state
```

This property contains the trust status and the identity to log in, and must include the following property:

- ```
com.ibm.wsspi.security.common.auth.module.IdentityAssertionLoginModule.trusted
```

This property is set to true when trusted and false when not trusted.

- ```
com.ibm.wsspi.security.common.auth.module.IdentityAssertionLoginModule.principal
```

This property contains the principal of the identity to log in if a principal is used.

- ```
com.ibm.wsspi.security.common.auth.module.IdentityAssertionLoginModule.certificates
```

This property contains an array of a certificate chain that contains the identity to log in if a certificate is used.

A `WSLoginFailedException` message is returned if the state, trust, or identity information is missing. The login module then logs in with the identity, and the subject contains the new identity.

See “Customizing an application login to perform an identity assertion by using JAAS” on page 2013.

## RunAs() authentication

When you have successfully authenticated after calling a servlet, the servlet can make subsequent calls, for example to other servlets. These subsequent calls are normally made under the same security identity that you originally used to log in to the servlet. This identity is known as the caller identity. Alternatively, you can choose to delegate to a different identity by using the `RunAs` specification, so that any subsequent calls that the servlet makes run under this other identity. To summarize, you have two options to propagate the security identity:

- Propagate the caller identity, which is the default behavior.
- Delegate to the `RunAs` identity that you can specify by using the `RunAs` specification.

After the server authenticates the original user, the server then authenticates the `RunAs` user. If this authentication fails, the server falls back to propagate the caller identity.

To use the `RunAs` specification, you must update the deployment descriptor of your application to include the `run-as` element or `@RunAs` annotation. Set this element to the security role that you want to delegate to.

See “Configuring `RunAs` authentication in Liberty” on page 1888.

## Proxy login module

The proxy login module class loads the application server login module and delegates all the operations to the real login module implementation. The real login module implementation is specified as the `delegate` option in the option configuration. The proxy login module is required because the application class loaders do not have visibility of shared library class loaders of the application server product. With an application programmatic login that uses the `Login()` method of the `LoginContext` class with JAAS login context entry `WSLogin`, the proxy login module delegates all the work to the JAAS login context entry `system.DEFAULT`.

## Certificate login

With the certificate login feature, you can authenticate web requests such as servlets by using client side X509 certificates instead of supplying a user ID and password.

Certificate authentication works by associating a user in the user registry with the distinguished name in the client certificate of a web request. Trust is established by having the client certificate trusted by the server, for example the signer of the client certificate must be in the trust store of the server. This mechanism eliminates the need for users to supply a password to establish trust.

See “Securing communications in Liberty” on page 1833.

## Hash table login module

Look up the required attributes from the user registry, put the attributes in a hash table, and then add the hash table to the shared state. If the identity is switched in this login module, you must add the hash table to the shared state. If the identity is not switched, but the value of the `requiresLogin` code is true, you can create the hash table of attributes. You do not have to create a hash table in this situation, because Liberty handles the login for you. However, you might consider creating a hash table to gather attributes in special cases. For example, if you are using your own special user registry, then creating a `UserRegistry` implementation, using a hash table, and letting the server gather the user attributes for you, might be a simple solution.

The following rules define in more details about how a hash table login is completed. You must use a `java.util.Hashtable` object in either the Subject (public or private credential set) or the shared-state `HashMap`. The `com.ibm.wsspi.security.token.AttributeNameConstants` class defines the keys that contain the user information. If the `Hashtable` object is put into the shared state of the login context using a custom login module that is listed before the hashtable login module, the value of the `java.util.Hashtable` object is searched using the following key within the shared-state `hashMap`:

### Property

`com.ibm.wsspi.security.cred.propertiesObject`

### Reference to the property

`AttributeNameConstants.WSCREDENTIAL_PROPERTIES_KEY`

### Explanation

This key searches for the `Hashtable` object that contains the required properties in the shared state of the login context.

### Expected result

A `java.util.Hashtable` object.

If a `java.util.Hashtable` object is found inside the Subject or within the shared state area, verify that the following properties are present in the hash table:

- `com.ibm.wsspi.security.cred.uniqueId`

### Reference to the property

`AttributeNameConstants.WSCREDENTIAL_UNIQUEID`

### Returns

`java.util.String`

### Explanation

The value of the property must be a unique representation of the user. For the Liberty default implementation, this property represents the information that is stored in the application authorization configuration. The information is in the application deployment descriptor after it is deployed and the user-to-role mapping is performed. See the expected format examples if the user to role mapping is performed by looking up a user registry implementation of Liberty.

## Expected format examples

Table 7. Format examples for `uniqueId`. This table gives expected format examples.

| User Registry | Format (UniqueUserId) value                  |
|---------------|----------------------------------------------|
| LDAP          | ldapRegistryRealm/cn=kevin,o=mycompany,c=use |
| Basic         | basicRegistryRealm/kelvin                    |

The `com.ibm.wsspi.security.cred.uniqueId` property is required.

- `com.ibm.wsspi.security.cred.securityName`

### Reference to the property

`AttributeNameConstants.WSCREDENTIAL_SECURITYNAME`

### Returns

`java.util.String`

### Explanation

This property searches for **securityName** of the authentication user. This name is commonly called the display name or short name. Liberty uses the **securityName** attribute for the `getRemoteUser`, `getUserPrincipal`, and `getCallerPrincipal` application programming interfaces (APIs). To ensure compatibility with the default implementation for the **securityName** value, call the public `String` `getUserSecurityName(String uniqueUserId)` `UserRegistry` method.

## Expected format examples

Table 8. Format examples for `securityName`. This table gives expected format examples.

| User Registry | Format (securityName) value |
|---------------|-----------------------------|
| LDAP          | kevin                       |
| Basic         | kevin                       |

The `com.ibm.wsspi.security.cred.securityname` property is required.

- `com.ibm.wsspi.security.cred.group`

### Reference to the property

`AttributeNameConstants.WSCREDENTIAL_GROUP`

### Returns

`java.util.ArrayList`

### Explanation

This key searches for the array list of groups to which the user belongs. The groups are specified in the `realm_name/user_name` format. The format of these groups is important because the groups are used by the Liberty authorization engine for group-to-role mappings in the deployment descriptor. The format that is provided must match the format expected by the Liberty default implementation. When you use a third-party authorization provider, you must use the format that is expected by the third-party provider. To ensure compatibility with the default implementation for the unique group IDs value, call the public `List` `getUniqueGroupIds(String uniqueUserId)` `UserRegistry` method.

## Expected format examples

Table 9. Format examples for `group`. This table gives some format examples when configuring inbound identity mapping.

| User Registry | Format (group) value                      |
|---------------|-------------------------------------------|
| LDAP          | ldapRegistryRealm/cn=group1,o=Groups,c=US |
| Basic         | basicRegistryRealm/group1                 |

The `com.ibm.wsspi.security.cred.group` property is required. A user is not required to be associated groups.

- `com.ibm.wsspi.security.cred.cacheKey`

#### Reference to the property

`AttributeNameConstants.WSCREDENTIAL_CACHE_KEY`

#### Returns

`java.lang.Object`

#### Explanation

This key property can specify an object that represents the unique properties of the login, including the user-specific information and the user dynamic attributes that might affect uniqueness. For example, when the user logs in from location A, which might affect their access control, the cache key must include location A so that the received Subject is the correct Subject for the current location.

This `com.ibm.wsspi.security.cred.cacheKey` property is not required. When this property is not specified, the cache lookup is the value that is specified for `WSCREDENTIAL_UNIQUEID`. When this information is found in the `java.util.Hashtable` object, Liberty creates a Subject similar to the Subject that goes through the normal login process, at least for LTPA. The new Subject contains a `WSCredential` object and a `WSPrincipal` object that is fully populated with the information found in the `Hashtable` object.

## Single sign-on for HTTP requests using SPNEGO web authentication

8.5.5.5

You can securely negotiate and authenticate HTTP requests for protected resources in the WebSphere Application Server by using the Simple and Protected GSS-API Negotiation Mechanism (SPNEGO) as the web authentication service for WebSphere Application Server.

The following sections describe SPNEGO web authentication in more detail:

- “What is SPNEGO?”
- “SPNEGO web authentication in a single Kerberos realm” on page 988
- “SPNEGO web authentication in trusted Kerberos realms” on page 989
- “Support information for SPNEGO web authentication with a browser client” on page 991

### What is SPNEGO?

SPNEGO is a standard specification that is defined in The Simple and Protected GSS-API Negotiation Mechanism (IETF RFC 2478).

When Liberty server security is enabled, and SPNEGO web authentication is enabled, SPNEGO is initialized when processing a first inbound HTTP request. When the authentication filter is not specified, or the authentication filter is specified and the criteria is met, SPNEGO is responsible for authenticating access to the protected resource that is identified in the HTTP request.

In addition to WebSphere Application Server security runtime services, some external components are required to enable the operation of SPNEGO. These external components include:

-  Microsoft Windows Servers with Active Directory domain and associated Kerberos Key Distribution Center (KDC).
- A client application, for example, Microsoft .NET, or web service and J2EE client that supports the SPNEGO web authentication mechanism, as defined in IETF RFC 2478. Microsoft Internet Explorer and Mozilla Firefox are browser examples. Any browser that is being used must be configured to use the SPNEGO web authentication mechanism.

The authentication of HTTP requests is triggered by the user (the client-side), which generates an SPNEGO token. WebSphere Application Server receives this token. Specifically, the SPNEGO web authentication decodes and retrieves the user identity from the SPNEGO token. The identity is then used to make authorization decisions.

SPNEGO web authentication is a server-side solution in the WebSphere Application Server. Client-side applications are responsible for generating the SPNEGO token for use by SPNEGO web authentication. The user identity in the WebSphere Application Server security registry must be identical to the identity that the SPNEGO web authentication retrieves. An identical match does occur when Microsoft Windows Active Directory server is the Lightweight Directory Access Protocol (LDAP) server that is used in WebSphere Application Server. A custom login module is available as a plug-in to support custom mapping of the identity from the Active Directory to the WebSphere Application Server security registry.

WebSphere Application Server validates the identity against its security registry. If the validation is successful, the client GSS delegation credential is retrieved and placed in the client subject, and a Lightweight Third Party Authentication (LTPA) security token is created. It then returns the LTPA cookie to the user in the HTTP response. Subsequent HTTP requests from this same user to access more protected resources in the WebSphere Application Server use the LTPA security token that is previously created to avoid repeated login challenges.

### SPNEGO web authentication in a single Kerberos realm

SPNEGO web authentication is supported in a single Kerberos realm (domain). The challenge-response handshake process is shown in the following figure:

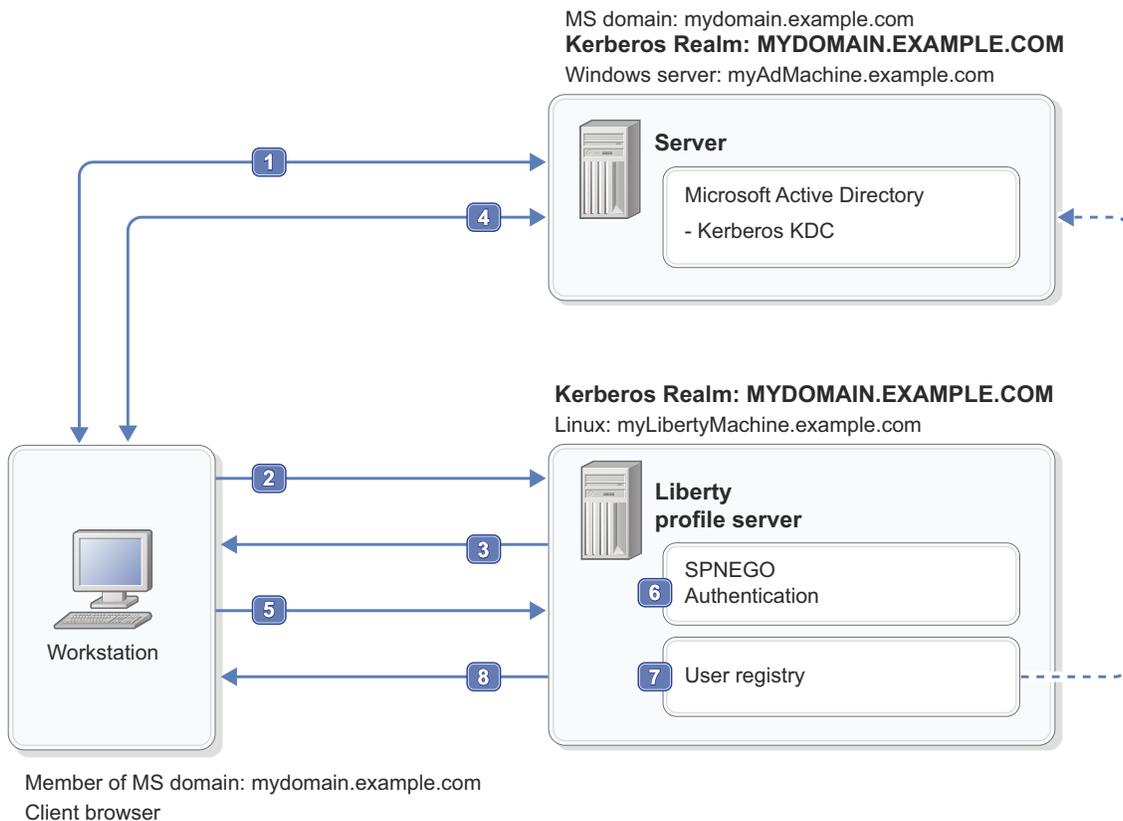

Figure 8. SPNEGO web authentication in a single Kerberos realm

In the previous figure, the following events occur:

1. To begin, the user logs on to the Microsoft domain controller MYDOMAIN.EXAMPLE.COM from the workstation.
2. Next, the user attempts to access the Web application. The user requests a protected Web resource using a client browser, which sends an HTTP GET request to the Liberty server.
3. SPNEGO authentication in the Liberty server answers the client browser with an HTTP 401 challenge header that contains the Authenticate: Negotiate status.
4. The client browser recognizes the negotiate header because the client browser is configured to support integrated Windows authentication. The client parses the requested URL for the host name. The client uses the host name to form the target Kerberos service principal name (SPN) HTTP/myLibertyMachine.example.com to request a Kerberos service ticket from the Kerberos ticket-granting service (TGS) in the Microsoft Kerberos KDC (TGS\_REQ). The TGS then issues a Kerberos service ticket (TGS\_REP) to the client. The Kerberos service ticket (SPNEGO token) proves both the user's identity and permissions to the service (Liberty server).
5. The client browser then responds to the Liberty server Authenticate: Negotiate challenge with the SPNEGO token that is obtained in the previous step in the request HTTP header.
6. SPNEGO authentication in the Liberty server sees the HTTP header with the SPNEGO token, validates the SPNEGO token, and gets the identity (principal) of the user.
7. After the Liberty server gets the identity of the user, it validates the user in its user registry and performs the authorization checks.
8. If access is granted, the Liberty server sends the response with an HTTP 200. The Liberty server also includes an LTPA cookie in the response. This LTPA cookie is used for subsequent requests.

**Note:** Other clients (for example, web services, .NET and J2EE) that support SPNEGO do not have to follow the challenge-response handshake process as shown previously. Those clients can obtain a ticket-granting ticket (TGT) and a Kerberos service ticket for the target server, create an SPNEGO token, insert it in the HTTP header, and then follow the normal process for creating an HTTP request.

### **SPNEGO web authentication in trusted Kerberos realms**

SPNEGO web authentication is also supported in trusted Kerberos realms. The challenge-response handshake process is shown in the following figure:

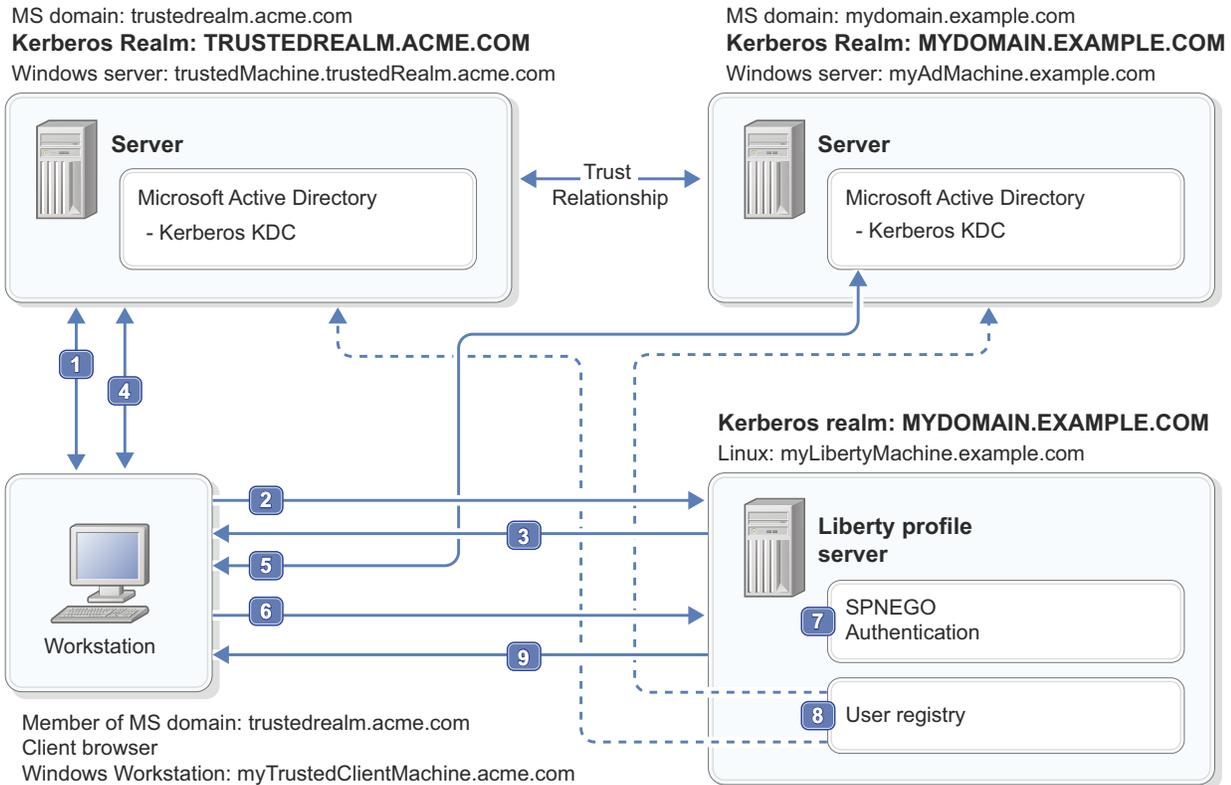

Figure 9. SPNEGO web authentication in a trusted Kerberos realm

In the previous figure, the following events occur:

1. The user logs in to the Microsoft domain controller TRUSTEDREALM.ACME.COM.
2. From a client browser, the user makes a request for a protected Web resource that is hosted on a Liberty server in the original Microsoft domain controller, MYDOMAIN.EXAMPLE.COM.
3. The Liberty server answers the client browser with an HTTP 401 challenge header that contains the `Authenticate: Negotiate` status.
4. The client browser is configured to support integrated Windows authentication. The client browser parses the URL by using the host name of the workstation that hosts the Liberty server application. The client browser uses the host name as an attribute to request a Kerberos cross-realm ticket (TGS\_REQ) for MYDOMAIN.EXAMPLE.COM from realm TRUSTEDREALM.ACME.COM.
5. The client browser uses the Kerberos cross-realm ticket from step 4 to request a Kerberos service ticket from realm MYDOMAIN.EXAMPLE.COM. The Kerberos service ticket (SPNEGO token) proves the user's identity and permissions to the service (Liberty server).
6. The client browser then responds to the Liberty server `Authenticate: Negotiate` challenge with the SPNEGO token that is obtained in the previous step in the request HTTP header.
7. The Liberty server receives the request and checks the HTTP header with the SPNEGO token. It then extracts the Kerberos service ticket, validates the ticket, and gets the identity (principal) of the user.
8. After the Liberty server gets the identity of the user, it validates the user in its user registry and performs the authorization checks.
9. If access is granted, the Liberty server sends the response with an HTTP 200. The Liberty server also includes an LTPA cookie in the response. This LTPA cookie is used for subsequent requests.

**Note:** No modification is required to the Liberty server to support more trusted realms. A trust relationship between the necessary Active Directory realms is the only requirement for SPNEGO to work with trusted realms.

In the trusted Kerberos realms environment, be aware that the Kerberos trusted realm setup has to be completed on each of the Kerberos KDCs. See your Kerberos Administrator and User's guide for more information about how to set up Kerberos trusted realms.

## Support information for SPNEGO web authentication with a browser client

The following scenarios are supported:

- Cross-forest trusts
- Domain trust within the same forest
- Kerberos realm trust

The following scenarios are not supported:

- Forest external trusts
- Domain external trusts

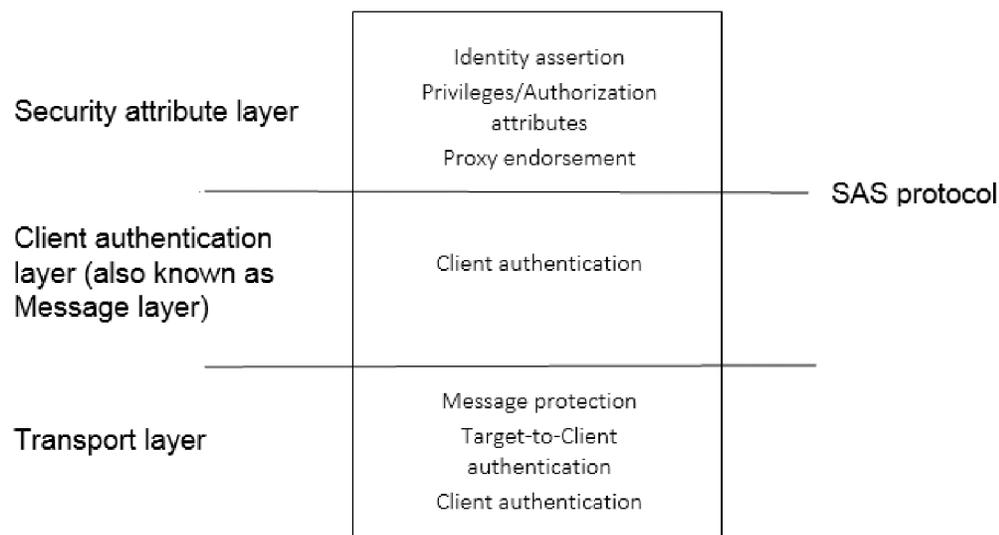

For further information on configuring SPNEGO on the Liberty server, see  [8.5.5.5](#) Configuring SPNEGO authentication in Liberty.

## Common Secure Interoperability version 2 (CSIv2)

8.5.5.6

The Common Secure Interoperability version 2 (CSIv2) is an architecture to satisfy the CORBA security interoperability requirements for authentication, delegation, and privileges. The SAS protocol is used in the CSIv2 architecture to exchange tokens in the service contexts of GIOP request and reply messages for the establishment of security contexts. Transport layer security (SSL/TLS) is required by SAS, and it provides two more layers on top for client authentication and delegation.

The SAS protocol is divided into two layers. The authentication layer is used to perform client authentication where sufficient authentication might not be accomplished in the transport. The attribute layer might be used by a client to push or deliver security attributes, like an identity to a target server where they might be applied in access control decisions. The transport is referred to as another layer in the CSIv2 documentation for ease of discussion, although it is not part of the SAS protocol message and the SAS message sits on top of the transport.

## CSIV2 identity assertion

The CSIV2 identity assertion support in the attribute layer is used to assert an identity from a client process to a server process when the request is performed by using RMI/IIOP.

An assertion is a declaration of one entity to another to accept an identity on its behalf. A client can assert an identity that represents the subject that was effective at the time it started the remote resource. In addition to the identity token that is representing the user, the client process also sends its own identity in either the authentication layer or the transport layer. The target server ensures that the client process is able to assert an identity by performing a trust validation. If the target server trusts the client, then the server uses the asserted identity to create a server-side subject that represents the user that was effective at the client process at the time of invocation.

The client can assert a user who is using a Principal Name identity token. The format of the principal name depends on the user registry that is configured at the client process. The anonymous identity token type is also supported and the server uses the unauthenticated subject when it receives such token.

For information on configuring the CSIV2 attribute layer with identity assertion, see “Configuring inbound CSIV2 attribute layer” on page 1974 or “Configuring outbound CSIV2 attribute layer” on page 1979.

## CSIV2 authentication layer

The CSIV2 authentication layer is used to carry authentication information from a client process to a server process when the request is performed by using RMI/IIOP.

The CSIV2 authentication layer can contain a token that is sent by the client that the server can then use to authenticate the client. Various token types are supported in the authentication layer. For example, the GSSUP token is used to transmit the client's user name and password, which is validated against the user registry of the target server. The Lightweight Third Party Authentication (LTPA) token is a token that represents the client's user without having to transmit a password, but the user must be authenticated at the client process before the remote method invocation and both the client and server processes must share LTPA keys.

With either token type, the token is used to authenticate the remote user at the server process and create a Subject representation of the Subject that was effective at the client side before the client started the remote object. When identity assertion is also enabled, the authentication layer can contain the security information that represents the client identity while the identity assertion token represents the actual remote user at invocation time.

For information on configuring the CSIV2 authentication layer, see “Configuring inbound CSIV2 authentication layer” on page 1976 or “Configuring outbound CSIV2 authentication layer” on page 1981.

## CSIV2 transport layer

The Common Secure Interoperability version 2 (CSIV2) transport layer support is used to protect the SAS protocol request message and support client certificate authentication from a client process to a server process.

The main function of the transport layer is to provide the security characteristics of the transmission of the SAS protocol messages from a client to a server process. The messages can be protected by using encryption, signing, or both. The Liberty SSL support is used as the underlying mechanism that is providing such characteristics.

A second function of the transport layer is to provide a source of authentication material when the authentication layer is not used. If identity assertion is enabled and the authentication layer is not

enabled, then the client process identity is obtained from the transport's client certificate chain. The target server process authenticates the client's certificate chain by mapping it to a user in its user registry. The certificate chain issuer distinguished name is used to determine if the client is trusted to assert an identity.

If no identity assertion and authentication layer are enabled, the subject that is obtained from mapping the client certificate chain is used as the caller subject when the actual remote method call is started at the target server process. This also applies when the target server's authentication layer is supported, but not required, and the client did not send an authentication token and an identity token.

For information on configuring the CSIV2 attribute layer with identity assertion, see [Configuring inbound CSIV2 transport layer](#) or [Configuring outbound CSIV2 transport layer](#).

## Key terms

### ORB – Object Request Broker.

It mediates object method invocations among entities, which might or might not be collocated in the same process.

### Security context

Information that is used to prescribe what the security characteristics are for a particular operation on an object in an ORB. For example, the identity that is to be used during the invocation of the object operation.

### Client security service or CSS

The entity that is initiating a SAS protocol request to establish a security context in the Target Security Service for an operation on an object in the target's ORB.

### Target security service or TSS

The entity that is receiving a SAS protocol request for the establishment of a security context in relationship to an operation on an object in its ORB. It accepts or denies a request to establish or use a security context.

### Client authentication

A token-based mechanism that is used to authenticate the client. GSSUP (Username Password GSS) is the minimum requirement, but there might be others, like LTPA.

### Identity assertion

Mechanism by which an intermediary entity vouches for another entity and the TSS uses the asserted identity for the invocation principal. The TSS can decide whether it trusts the proxy that is asserting the identity or not.

### Stateless

The security context is only used during the duration of a single request and it is not reused for subsequent requests.

### Stateful

The security context can be reused by multiple requests after it is established and until it is invalidated by the TSS or the CSS.

### Transport layer security

The security support that is provided by the underlying transport.

## Authentication on the Liberty application client container

8.5.5.6

The authentication requirements on the client are the same as on the server, but some of the mechanisms to authenticate on the client are different than on the server.

Authentication is required on the client when accessing a protected resource on the server. Follow one of these methods to provide the authentication information:

- Specify a user and password in the `client.xml` file: The credentials are sent to the server using the CSIV2 protocol and it is recommended that you encrypt or encode the password. For further details, see [Configuring the outbound CSIV2 authentication layer in the Liberty application client container](#).

- **Client certificate authentication:** The client presents the server a certificate, which is authenticated and mapped to a user in the registry for authorization checks. To configure the server, see [Configuring inbound CSIV2 transport layer](#). To configure the client, see [Configuring the outbound CSIV2 transport layer in the Liberty application client container](#).
- **Perform a programmatic login:** Programmatic login is a type of form login that supports application presentation login forms for authentication. This approach requires the application developer to collect the user's credentials and authenticate that user. For further details, see [Configuring a JAAS programmatic login on the Liberty application client container](#).

As on the server, you can use a custom login module to either make more authentication decisions or add information to the subject to make finer-grained authorization decisions inside your client application. For further details, see [Configuring a JAAS custom login module for the Liberty application client container](#).

## SAML 2.0 Web Browser Single-Sign-On

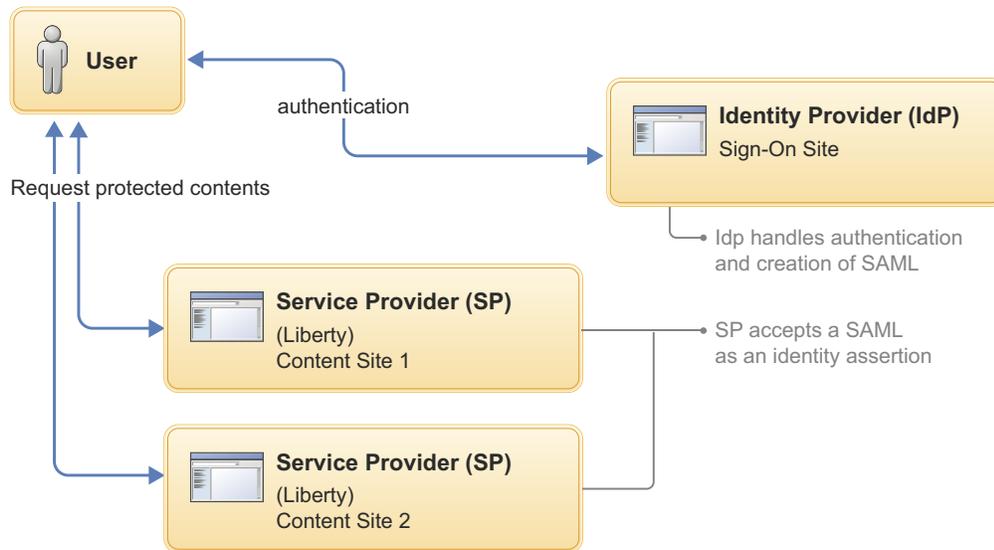

8.5.5.7

SAML Web Browser Single-Sign-On (SSO) enables web applications to delegate user authentication to a SAML identity provider instead of a configured user registry.

Security Assertion Markup Language (SAML) is an OASIS open standard for representing and exchanging user identity, authentication, and attribute information. A SAML assertion is an XML formatted token that is used to transfer user identity and attribute information from the identity provider of a user to a trusted service provider as part of the completion of a single sign-on request. A SAML assertion provides a vendor neutral means of transferring information between federation business partners. Using SAML, an enterprise service provider can contact a separate enterprise identity provider to authenticate users who are trying to access secure content.

The WebSphere Application Server Liberty supports the SAML web browser single sign-on profile with HTTP Post bindings, and acts as a SAML service provider. A web user authenticates to a SAML identity provider, which produces a SAML assertion, and the WebSphere SAML service provider uses the SAML assertion to establish a security context for the web user.

The SAML web SSO flow includes three actors: the end user, the identity provider (IdP), and the service provider (SP). The user always authenticates to the IdP, and the SP relies on IdP assertion to identify the user.

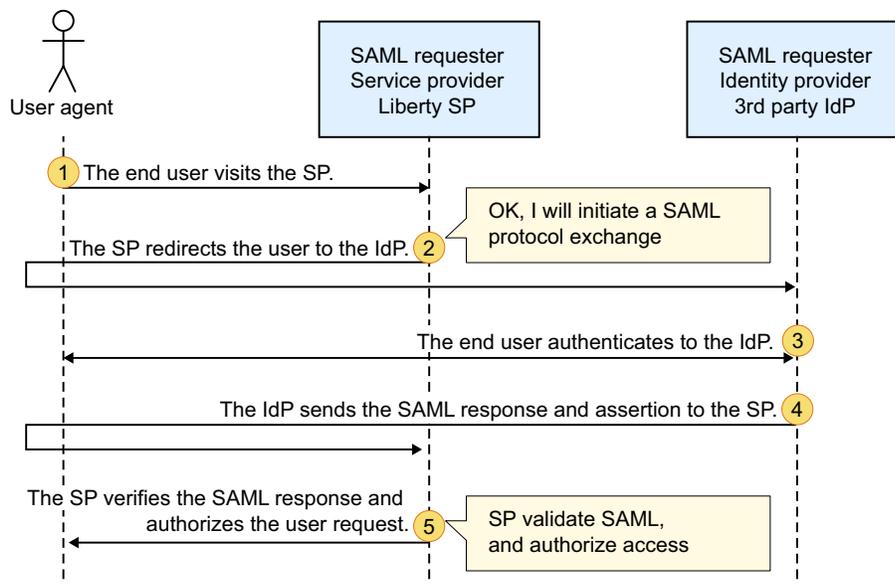

1. User requests a service from SP.
2. SP requests a user identity (SAML) from the IdP via redirect.
3. IdP asks user to login  
(There is no sign-in if user has been authenticated).
4. SP obtains SAML
5. SP makes an access control decision on the basis of SAML assertion

Figure 10. Key Concepts in Web Single-Sign-On

## Liberty SAML Web Browser SSO Scenarios

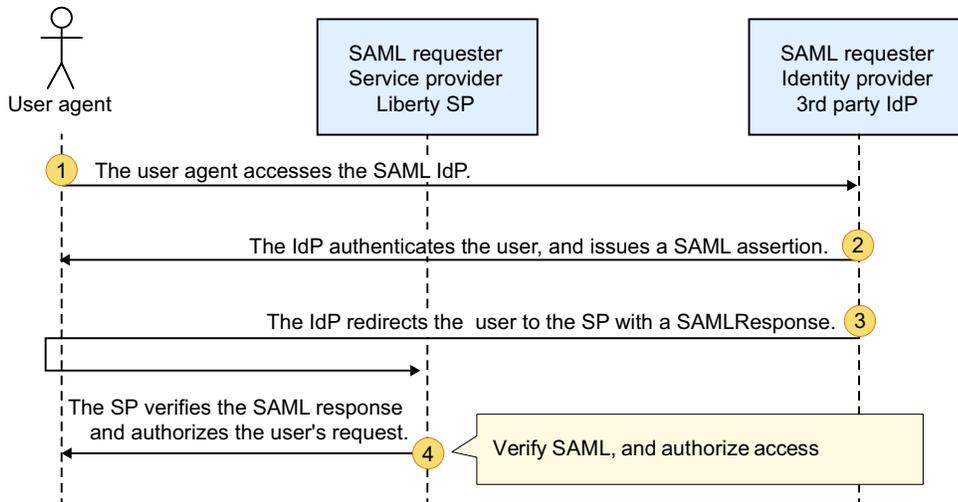

Figure 11. Scenario 1: SP-Initiated solicited Web SSO (End user starting at SP)

1. The end user visits the SP.
2. The SP redirects the user to the IdP.
3. The end user authenticates to the IdP.

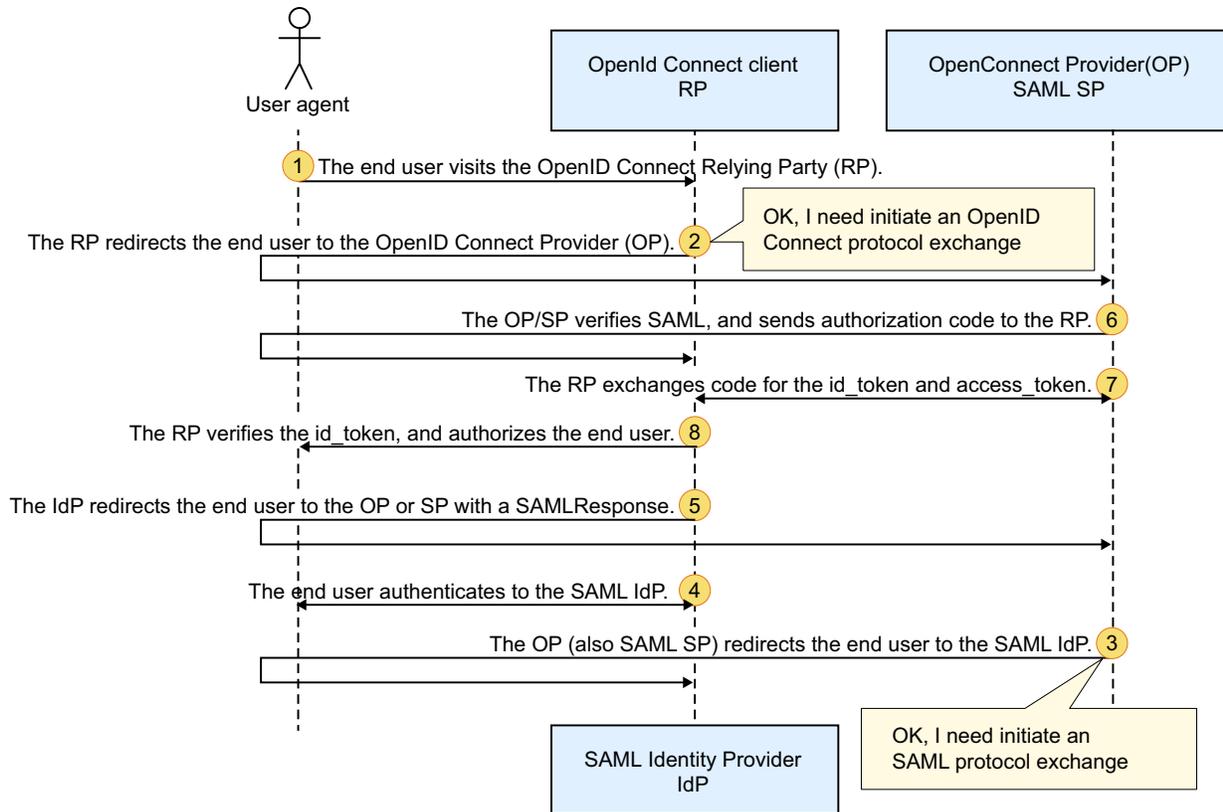

4. The IdP sends the SAML response and assertion to the SP.
5. The SP verifies the SAML response and authorizes the user request.

Figure 12. Scenario 2: IdP-Initiated unsolicited Web SSO (End user starting at IdP)

1. The user agent accesses the SAML IdP.
2. The IdP authenticates the user, and issues a SAML assertion.
3. The IdP redirects the user to the SP with a SAMLResponse
4. The SP verifies the SAML response and authorizes the user's request.

Figure 13. Scenario 3: OpenID Connect provider and SAML service provider

1. The end user visits the OpenID Connect Relying Party (RP).
2. The RP redirects the end user to the OpenID Connect Provider (OP).
3. The OP (also SAML SP) redirects the end user to the SAML IdP.
4. The end user authenticates to the SAML IdP.
5. The IdP redirects the end user to the OP or SP with a SAMLResponse.
6. The OP/SP verifies SAML, and sends authorization code to the RP.
7. The RP exchanges code for the id\_token and access\_token.
8. The RP verifies the id\_token, and authorizes the end user.

## Federation of user registries

8.5.5.8

User registry federation is used when user and group information is spread across multiple registries. For example, the information might be in two different LDAPs, in two subtrees of the same LDAP, in a file, or the users are of a system. The information might even be in a custom user data repository. With registries federated, you can search and use these distributed user information in a unified manner with continuous store of information. Using federated registry, you can use the unified view for authentication and authorization of users in Liberty.

**Note:** Quick start security (quickStartSecurity) cannot be federated with other user registries such as the LDAP, basic, SAF, and custom registries.

### How are user registries federated?

LDAP registries are federated by default. If more than one LDAP registry is configured in the server.xml, then the registries are automatically federated and no additional configuration is needed. They can be two separate LDAPs or two subtrees in the same LDAP.

If one or more LDAP registries are configured with one or more of basic, SAF, or custom registries, those registries are also federated without any additional configuration. The following example shows a basic registry federated with an LDAP:

```
<server description="Federation">
  <featureManager>
    <feature>appSecurity-2.0</feature>
    <feature>servlet-3.0</feature>
  <feature>ldapRegistry-3.0</feature>
  </featureManager>

  <basicRegistry id="basic" realm="SampleBasicRealm">
    <user name="admin" password="password" />
    <user name="user1" password="password" />
    <user name="user2" password="password" />
    <group name="memberlessGroup" />
    <group name="adminGroup">
      <member name="admin"/>
    </group>
    <group name="users">
      <member name="user1"/>
      <member name="user2"/>
    </group>
  </basicRegistry>

  <ldapRegistry id="LDAP1" realm="SampleLdapIDSRealm" host="LDAPHOST1.ibm.com" port="389" ignoreCase="true"
baseDN="o=ibm,c=us"
ldapType="IBM Tivoli Directory Server"
searchTimeout="8m"
recursiveSearch="true">
  </ldapRegistry>
</server>
```

If you want to federate two basic registries or a basic registry with a SAF or custom registry, you can do so by including the federatedRegistry-1.0 in addition to the appSecurity-2.0 feature as shown in the following example.

```
<feature>appSecurity-2.0</feature>
<feature>federatedRegistry-1.0</feature>
```

The following example shows the federation of two basic registries:

```
<server description="Federation">
  <featureManager>
    <feature>appSecurity-2.0</feature>
    <feature>federatedRegistry-1.0</feature>
  </featureManager>

  <basicRegistry id="basic1" realm="SampleBasicRealm1">
    <user name="admin" password="password" />
    <user name="user1" password="password" />
    <user name="user2" password="password" />
    <group name="memberlessGroup" />
    <group name="adminGroup">
      <member name="admin"/>
    </group>
    <group name="users">
      <member name="user1"/>
      <member name="user2"/>
    </group>
  </basicRegistry>

  <basicRegistry id="basic2" realm="SampleBasicRealm2">
    <user name="user3" password="password123" />
    <user name="user4" password="password123" />
    <group name="memberlessGroup2" />
    <group name="users2">
      <member name="user3"/>
    </group>
  </basicRegistry>
</server>
```

```
        <member name="user4"/>
    </group>
</basicRegistry>
</server>
```

## Liberty: Authorization

Authorization in Liberty determines whether a user has access to a certain role within the system.

Authorization specifies access rights to resources. It usually follows authentication that confirms an identity. Whereas authentication answers the question: “Are you who you say you are?”; authorization answers the question: “Do you have permission to do what you are trying to do?”

The following sections describe these concepts in detail:

- “Authorization for administrative functions”
- “Authorization for applications”
- “Special subjects” on page 1000
- “Access IDs and authorization” on page 1001

### Authorization for administrative functions

When an entity attempts to access a resource, the authorization service determines whether that entity has the required rights to access the resource. This concept holds true whether an entity is accessing an application or performing administrative functions. The main difference between authorizing access to an application and access to an administrative function lies in how the users are mapped to roles. For authorization of applications, use the `application-bnd` element in the `server.xml` file or the `ibm-application-bnd.xml/xmi` file to map the users to roles. For authorization of administrative functions, use the `administrator-role` element in the `server.xml` file to map the users to the administrator role. For more information about administrative security, see “Connecting to Liberty by using JMX” on page 1641.

### Authorization for applications

The following diagram describes how authorization works for applications:

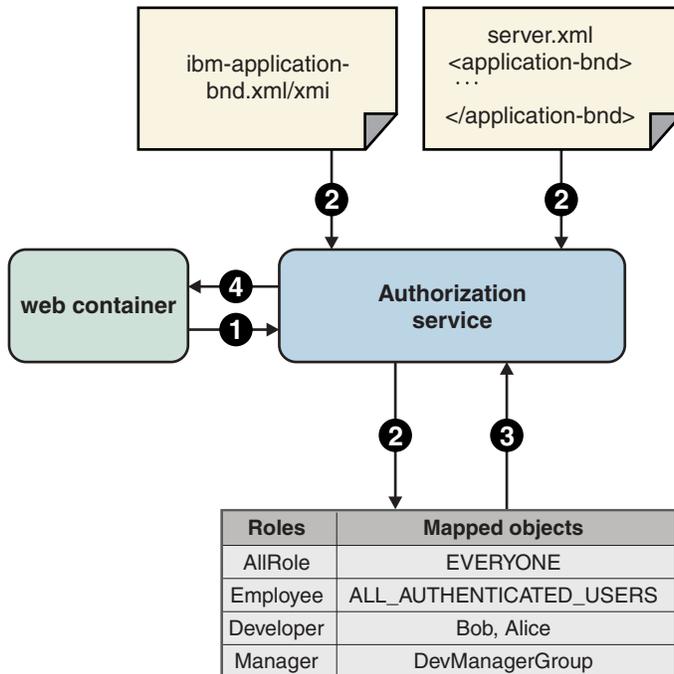

Figure 14. Overview of authorization process

1. An authorization is made when an entity attempts to access a resource in an application that is served by Liberty. The web container calls the authorization service to determine whether a user has permission to access a certain resource, given a set of one or more required roles. The required roles are determined by the `auth-constraint` elements in the deployment descriptor and `@ServletSecurity` annotations.
2. The authorization service determines what objects the required role is mapped to. This step is accomplished by processing the mappings that are defined in the `ibm-application-bnd.xmi` file or the `ibm-application-bnd.xml` file, and the `application-bnd` element of the `server.xml` file. The mappings from these two sources are merged. If the same role is present in both sources, only the role mapping in the `server.xml` file is used. The advantage of using the `server.xml` file for mapping roles to users is that your application does not need to be packaged into an EAR file and it is easier to update. Alternatively, using the `ibm-application-bnd.xmi/xml` file makes your application portable to other servers and other traditional servers that do not support the `server.xml` file.
3. If the required role is mapped to the **EVERYONE** special subject, then the authorization service returns immediately to allow anyone access. If the role is mapped to the **ALL\_AUTHENTICATED\_USERS** special subject and the user is authenticated, then the authorization service grants access to the user. If none of these conditions are met, then the authorization service determines what users and groups are mapped to the required role. The authorization service grants access to the resource if the user is mapped to the required role or if the user is part of a group that is mapped to the role.
4. The authorization service returns a result back to the web container to indicate whether the user is granted or denied access.

## Special subjects

When you map entities to roles, you can map a special subject instead of a specific user or group. A special subject is an extension to the concept of a subject. A special subject can represent a group of users that fall under a specific category.

The following two types of special subjects are available:

- **EVERYONE**: represents any entity on the system, which means that no security is available because everyone is allowed access and you are not prompted to enter credentials.

- ALL\_AUTHENTICATED\_USERS: represents any entity that successfully authenticates to the server.

To map a special subject to a user, update either the `ibm-application-bnd.xml/xmi` file or the `server.xml` file, where the `application-bnd` is under the `application` element. In this example, the role that is named `AllAuthenticated` is mapped to the special subject `ALL_AUTHENTICATED_USERS`:

```
<application-bnd>
  <security-role name="AllAuthenticated">
    <special-subject type="ALL_AUTHENTICATED_USERS" />
  </security-role>
</application-bnd>
```

See “Configuring authorization for applications in Liberty” on page 1939.

## Access IDs and authorization

When you authorize a user or group, the server needs a way to uniquely identify that user or group. The unique ID of the user and group serve this purpose and are used to build the authorization configuration. These IDs are determined by the user registry implementation: the unique user ID is the value of `getUniqueUserId()`, and the unique group ID is the value of `getUniqueGroupId()`. You can also choose to explicitly specify an access ID for the user or group in the authorization configuration. These explicit access IDs are used instead of the values that are returned by the user registry implementation. To specify an access ID in the `ibm-application-bnd.xml/xmi` file or the `server.xml` file, where the `application-bnd` is under the `application` element, use the **access-id** attribute for the user or group element.

In this example, an access ID is specified for the user `Bob` and the group `developers`:

```
<application-bnd>
  <security-role name="Employee">
    <user name="Bob" access-id="user:MyRealm/Bob"/>
    <group name="developers" access-id="group:myRealm/developers"/>
  </security-role>
</application-bnd>
```

**Note:** The **access-id** attribute is used for the authorization check. If it is not specified, it is determined from the registry that is configured by using the user or group name. However, you must specify the **access-id** attribute as shown in the example when the users or groups do not belong to the active registry. Such as when you are using a programmatic login.

## Security on the Liberty application client container

8.5.5.6

Security on the Liberty application client container includes SSL, JAAS, and CSIV2.

Application clients are client programs that run in their own Java virtual machines. The Liberty application client container provides system services for these clients, including security. The security services on the client are a subset of those that are available on the server.

### Enabling security on the client

To enable security on the client, add the `appSecurityClient-1.0` feature to your `client.xml` file.

```
<featureManager>
  <feature>javaeeClient-7.0</feature>
  <feature>appSecurityClient-1.0</feature>
</featureManager>
```

The `appSecurityClient-1.0` feature enables SSL, CSiv2, and JAAS on the client. You must configure SSL to ensure communications between the client and server are secure and encrypted. For more information, see [Enabling SSL communication for the Liberty application client container](#). CSiv2 provides a protocol for the client to send authentication information to the server. The client in a Liberty application client container is not able to assert identities or propagate security attributes. To understand more about CSiv2 and how to configure it on the client, see [Common Secure Interoperability version 2 \(CSiv2\)](#), and [Configuring Common Secure Interoperability version 2 \(CSiv2\) in the Liberty application client container](#). The JAAS framework on the client enables a client application to gather credentials from the user that is using callbacks, and authenticate that user by using login modules. For more information about authenticating users on the client, see [“Authentication on the Liberty application client container”](#) on page 993.

## Liberty: Java 2 Security

8.5.5.7

Java 2 Security functionality is supported in WebSphere Application Server Liberty. Java 2 Security provides a policy-based, fine-grained access control mechanism that increases overall system integrity by checking for permissions before allowing access to certain protected system resources.

Java 2 Security is independent of Java Platform, Enterprise Edition role-based authorization. Java 2 Security guards access to system resources such as file input and output, sockets, and properties; whereas Java Platform, Enterprise Edition security guards access to web resources such as servlets and JSP files.

### Java 2 Security for deployers and administrators

Before you enable Java 2 Security, you need to make sure that all the applications are granted the required permissions, otherwise, applications might fail to run. By default, applications are granted the permissions per the Java Platform, Enterprise Edition 7.0 specification. If an application is not prepared for Java 2 Security or if the application provider does not provide a `permissions.xml` file as part of the application, then the application might cause Java 2 Security access control exceptions at run time when Java 2 Security is enabled. Even if the application is running, it might not run correctly.

### Java 2 Security for application developers

Application developers must understand the permissions that are granted in the default WebSphere policy and the permission requirements of the Java SDK APIs. You need to know whether the APIs that your application calls require extra permissions or not. For more information about which Java APIs require permissions, see [Permissions in the Java 2 SDK](#).

Permissions are added to an application by way of the `permissions.xml` file, and the codebase that is associated with the listed permissions is based on the location of the file. For a stand-alone `.war` application, the `permissions.xml` file is bundled under the `META-INF` directory and all specified permissions apply to all modules included in the `.war` file. For a `.ear` application, the `permissions.xml` is bundled directly under the `META-INF` directory for the `.ear` itself, and the specified permissions apply to all modules included in the `.ear` file.

**Note:** In the case of an `.ear` application, `permissions.xml` files that are bundled under the `META-INF` directory of any module other than the `.ear` are ignored.

### Enabling Java 2 Security

Java 2 Security functions are part of the kernel extension and are enabled at bootstrap time by updating the `bootstrap.properties` file with the `websphere.java.security` property.

If the `websphere.java.security` property is specified in the `bootstrap.properties` file, Java 2 Security is enforced; otherwise, no permission checking occurs.

## Specifying restricted permissions

Liberty provides a mechanism to specify restricted permissions when it runs a web or EJB application component. A restricted permission ensures no instance of that permission is granted to a bundle or application. They provide a mechanism to prevent applications from granting themselves more permissions than what must be allowed, for example, the permission to exit VM.

Restricted permissions are specified in the `server.xml` and `client.xml` files. The following example shows how the `PropertyPermission` that is used to write the System property `os.name` is restricted. This syntax is identical in both the `server.xml` and `client.xml` files:

```
<javaPermission className="java.security.PropertyPermission" name="os.name" actions="write" restriction="true" />
```

## Granting permissions

OSGi bundles can self-regulate the permissions that are granted to the libraries/classes within the bundle through the `permissions.perm` file.

Applications can also self-regulate permissions that are granted through the `permissions.xml` file, or by specifying the permission grants in the `server.xml` and `client.xml` files.

## OSGi bundle permissions

The OSGi specification provides a mechanism to specify permissions for a bundle through the `permissions.perm` file in the `OSGI-INF` directory of the bundle. The mechanism allows fine-grained access control of permissions for the bundle.

The `permissions.perm` file specifies the maximum permissions that the bundles require.

**Important:** An empty `permissions.perm` file is not equivalent to no `permissions.perm` file. Make sure that you have a non-empty `permissions.perm` file if you want restricted permissions.

## Declaring permissions in the `server.xml` and `client.xml` for applications

Permissions without a specified codebase, which are defined in the `server.xml` and `client.xml` files apply to all applications on that Liberty server.

You can specify the permissions to be granted in the `server.xml` and `client.xml` files as given in the following example. In this example, the `PropertyPermission` that enables all System properties to be read is granted:

```
<javaPermission className="java.util.PropertyPermission" name="*" actions="read" />
```

You can specify the permissions to be restricted in the `server.xml` and `client.xml` files. The following example shows how the `PropertyPermission` that is used to write the System property `os.name` is restricted. This syntax is identical in both the `server.xml` and `client.xml` files:

```
<javaPermission className="java.security.PropertyPermission" name="os.name" actions="write" restriction="true" />
```

### Notes:

- A restricted permission has **restriction** set to *true*.
- If an application attempts to grant itself a permission that is defined as a restricted permission, the restricted permission takes precedence over the grant and disallows the grant.

## Declaring permissions in permissions.xml for applications

The permissions.xml file is a new file that is introduced by the Java EE7 specification. It is packaged under the META-INF directory for an application.

For applications packaged as a stand-alone .war file, the permissions that are specified at the META-INF/WAR level apply to all modules and libraries that are packaged within the .war file.

For applications that are packages in an .ear file, the declaration of permissions must be at the .ear file level. This permission set is applied to all modules and libraries that are packaged within the .ear file or within its contained modules. Any permissions.xml file within such packaged modules is ignored, regardless of whether a permissions.xml file is supplied for the .ear file itself.

For applications that are packaged in a .rar file, the declaration of permissions must be at the META-INF/RAR level.

## No-rethrow option

When Java 2 Security is enabled, the JDK Security Manager throws an java.security.AccessControl exception by default when a permission violation occurs. If the exception is not handled, it might cause a runtime failure. To help the developers when they are preparing their applications for Java 2 Security, a no-rethrow option is available. The no-rethrow option allows the AccessControl exception to be logged in the console.log and messages.log but does not cause the application to fail. The no-rethrow option is enabled by specifying websphere.java.security.norethrow=true in the bootstrap.properties file. The no-rethrow option is not enabled by default, hence you must enable this property by specifying it in the bootstrap.properties file.

**Note:** Because this property does not allow the Security Manager to throw the exception, the Security Manager technically does not enforce Java 2 Security. The no-rethrow property must not be used in a production environment.

## Dynamic updates

Dynamic updates to the permission files such as the permissions.perm, permissions.xml, server.xml, and client.xml are not supported. Updates to permissions require a Liberty server restart.

## Liberty:Security public APIs

Security public APIs in Liberty provide a way of extending the security infrastructure.

Liberty contains public APIs that you can use to implement security functions. The security public APIs in Liberty are a subset of the traditional security public APIs. The main classes are WSSecurityHelper, WSSubject, and RegistryHelper. These classes contain a subset of the methods that are available in the WebSphere Application Server traditional versions. There is also a new class WebSecurityHelper.

The following sections describe those main classes. There are also other classes such as UserRegistry, WSCredential, and other exception classes.

All the security public APIs supported by Liberty are in the Java API documentation. The Java API documentation for each Liberty server API is available in a separate .zip file in one of the javadoc subdirectories of the \${wlp.install.dir}/dev directory.

### WSSecurityHelper

This class contains only the methods isServerSecurityEnabled() and isGlobalSecurityEnabled(). These calls return true if appSecurity-2.0 or zosSecurity-1.0, among others, is enabled. Otherwise, the methods return false. These methods are carried over from the traditional WSSecurityHelper class for compatibility.

**Note:**

- There are no cells in Liberty, so there is no distinction in Liberty between global security and server security. Therefore, both methods return the same value.
- The method `revokeSSOCookies(javax.servlet.http.HttpServletRequest req, javax.servlet.http.HttpServletResponse res)` is not supported in Liberty. Instead, you can use the Servlet 3.0 logout function.
- The method `getLTPACookieFromSSOToken()` is renamed to a new public API class: `WebSecurityHelper`.

**WSSubject**

This class provides utility methods for querying and setting the security thread context. All methods from the traditional `WSSubject` are supported in Liberty.

**Note:** Java 2 Security is supported but not enabled by default in Liberty. So by default, the Java 2 security checks in `WSSubject` are not performed.

**RegistryHelper**

This class provides access to the `UserRegistry` object and trusted realm information. In Liberty, it contains the following subset of the traditional methods:

```
public static UserRegistry getUserRegistry(String realmName) throws WSSecurityException
public static List<String> getInboundTrustedRealms(String realmName) throws
WSSecurityException
public static boolean isRealmInboundTrusted(String inboundRealm, String localRealm)
```

**Note:** This method involves dynamic information that could change as OSGI dynamic services change. The values that are retrieved can become stale. The `UserRegistry` references should never be cached.

**WebSecurityHelper**

This class contains the renamed `getLTPACookieFromSSOToken()` method, which was moved from `WSSecurityHelper`:

```
public static Cookie getSSOCookieFromSSOToken() throws Exception
```

**Security public API code examples**

The following examples demonstrate how to use security public APIs in Liberty to do a programmatic login and operate on the Subject.

- Example 1: Create a Subject and use it for authorization
- Example 2: Create a Subject and make it as the current Subject on the thread
- Example 3: Get information of the current Subject on the thread

**Example 1: Create a Subject and use it for authorization**

This example demonstrates how to use `WSSecurityHelper`, `WSSubject`, and `UserRegistry` to do a programmatic login to create a Java Subject, then perform an action and use that Subject for any authorization that is required.

**Note:** The following code uses `WSSecurityHelper` to check if security is enabled before doing further security processing. This check is used extensively because of the modular nature of Liberty: If security is not enabled, then the security run time is not loaded. `WSSecurityHelper` is always loaded, even if security is not enabled.

```
import java.rmi.RemoteException;
import java.security.PrivilegedAction;

import javax.security.auth.Subject;
import javax.security.auth.callback.CallbackHandler;
```

```

import javax.security.auth.login.LoginContext;
import javax.security.auth.login.LoginException;

import com.ibm.websphere.security.CustomRegistryException;
import com.ibm.websphere.security.UserRegistry;
import com.ibm.websphere.security.WSSecurityException;
import com.ibm.websphere.security.WSSecurityHelper;
import com.ibm.websphere.security.auth.WSSubject;
import com.ibm.websphere.security.auth.callback.WSCallbackHandlerImpl;
import com.ibm.wsspi.security.registry.RegistryHelper;
public class myServlet {

    ...
    if (WSSecurityHelper.isServerSecurityEnabled()) {
        UserRegistry ur = null;
        try {
            ur = RegistryHelper.getUserRegistry(null);
        } catch (WSSecurityException e1) {
            // record some diagnostic info
            return;
        }
        String userid = "user1";
        String password = "user1password";
        try {
            if (ur.isValidUser(userid)) {
                // create a Subject, authenticating with
                // a userid and password
                CallbackHandler wscbh = new WSCallbackHandlerImpl(userid, password);
                LoginContext ctx;
                ctx = new LoginContext("WSLogin", wscbh);
                ctx.login();
                Subject subject = ctx.getSubject();
                // Perform an action using the Subject for
                // any required authorization
                WSSubject.doAs(subject, action);
            }
        } catch (CustomRegistryException e) {
            // record some diagnostic info
            return;
        } catch (RemoteException e) {
            // record some diagnostic info
            return;
        } catch (LoginException e) {
            // record some diagnostic info
            return;
        }
    }
    ...
    private final PrivilegedAction action = new PrivilegedAction() {
        @Override
        public Object run() {
            // do something useful here
            return null;
        }
    };
}

```

### Example 2: Create a Subject and make it the current Subject on the thread

The following example demonstrates how to use WSSecurityHelper and WSSubject to do a programmatic login to create a Java Subject. Make that Subject the current Subject on the thread, and then restore the original security thread context.

**Note:** The following code uses WSSecurityHelper to check if security is enabled before doing further security processing.

```

import javax.security.auth.Subject;
import javax.security.auth.callback.CallbackHandler;
import javax.security.auth.login.LoginContext;
import javax.security.auth.login.LoginException;

import com.ibm.websphere.security.WSSecurityException;
import com.ibm.websphere.security.WSSecurityHelper;
import com.ibm.websphere.security.auth.WSSubject;
import com.ibm.websphere.security.auth.callback.WSCallbackHandlerImpl;
...
if (WSSecurityHelper.isServerSecurityEnabled()) {
    CallbackHandler wscbh = new WSCallbackHandlerImpl("user1", "user1password");
    LoginContext ctx;
    try {
        // create a Subject, authenticating with
        // a userid and password
        ctx = new LoginContext("WSLogin", wscbh);
        ctx.login();
        Subject mySubject = ctx.getSubject();
        Subject oldSubject = null;
        try {
            // Save a ref to the current Subject on the thread
            oldSubject = WSSubject.getRunAsSubject();
            // Make mySubject the current Subject on the thread
            WSSubject.setRunAsSubject(mySubject);
            // Do something useful here. Any authorization
            // required will be performed using mySubject
        } catch (WSSecurityException e) {
            // record some diagnostic info
            return;
        } finally {
            // Put the original Subject back on the thread context
            if (oldSubject != null) {
                try {
                    WSSubject.setRunAsSubject(oldSubject);
                } catch (WSSecurityException e) {
                    // record some diagnostic info
                }
            }
        }
    } catch (LoginException e) {
        // record some diagnostic info
        return;
    }
}

```

### Example 3: Get information of the current Subject on the thread

The following example demonstrates how to use `WSSecurityHelper`, `WSSubject`, and `WSCredential` to get information about the current Subject on the thread.

**Note:** The following code uses `WSSecurityHelper` to check if security is enabled before doing further security processing.

```

import java.util.ArrayList;
import java.util.Iterator;
import java.util.Set;

import javax.security.auth.Subject;
import javax.security.auth.login.CredentialExpiredException;

import com.ibm.websphere.security.WSSecurityException;
import com.ibm.websphere.security.WSSecurityHelper;
import com.ibm.websphere.security.auth.CredentialDestroyedException;
import com.ibm.websphere.security.auth.WSSubject;
import com.ibm.websphere.security.cred.WSCredential;
...
if (WSSecurityHelper.isServerSecurityEnabled()) {
    // Get the caller's subject

```

```

Subject callerSubject;
try {
    callerSubject = WSSubject.getCallerSubject();
} catch (WSSecurityException e) {
    // record some diagnostic info
    return;
}
WSCredential wsCred = null;
Set<WSCredential> wsCredentials =
    callerSubject.getPublicCredentials(WSCredential.class);
Iterator<WSCredential> wsCredentialsIterator = wsCredentials.iterator();
if (wsCredentialsIterator.hasNext()) {
    wsCred = wsCredentialsIterator.next();
    try {
        // Print out the groups
        ArrayList<String> groups = wsCred.getGroupIds();
        for (String group : groups) {
            System.out.println("Group name: " + group);
        }
    } catch (CredentialExpiredException e) {
        // record some diagnostic info
        return;
    } catch (CredentialDestroyedException e) {
        // record some diagnostic info
        return;
    }
}
}
}
}

```

## Configuration differences between the traditional and Liberty: security

The configuration differences in the security capability between Liberty and traditional indicates the items that you might need to know during applications migration.

Liberty security supports only a subset of security features in the traditional. Unless the support is explicitly mentioned in Liberty documentation, you must assume that the support is not available yet.

The following security features are not included in Liberty:

- Not all public APIs and SPIs are supported. The Java API documentation for each Liberty API is available in a separate .zip file in one of the javadoc subdirectories of the `#{wlp.install.dir}/dev` directory.
- Horizontal propagation.
- SecurityAdmin MBean support, therefore methods such as clearing the authentication cache are not available.
- Java 2 Connector (J2C) principal mapping modules support.
- Multiple security domain support.
-   CSIV2 security attribute propagation.
-   Kerberos authentication.
-   SPNEGO on non-IBM JDK.
- Security auditing subsystem that is part of the security infrastructure of the server.
-  SAF delegation.
-  SAF authorization is not supported with a user registry that is not on the local operating system.
-  SAF distributed identity mapping.

In Liberty, you can configure user-to-role mappings and RunAs users in the `application-bnd` element of the `server.xml` file. **8.5.5.0** For a Run-As entry, the password is optional. In the traditional, you can only configure the Run-AS entry in the `ibm-application-bnd.xml/xmi` file. **8.5.5.0** For a Run-As entry, the password is required. See “Configuring authorization for applications in Liberty” on page 1939.

In Liberty, role names can be referenced by the `HttpServletRequest.isUserInRole` and `EJBContext.isCallerInRole` APIs or by elements in the deployment descriptor without first declaring the role names using the `@DeclareRoles` annotation or the `<security-role/>` element in the deployment descriptor. However, roles must be declared before being used in WebSphere Application Server traditional.

## Liberty: The limits to protection through password encryption

**8.5.5.0**

Liberty supports Advanced Encryption Standard (AES) encryption for passwords that are stored in the `server.xml` file. When you use this option for protecting system passwords in the Liberty configuration, you need to understand the limits to the protection it provides.

Encrypting a password in the Liberty configuration does not guarantee that the password is secure or protected; it only means that someone who can see the encrypted password, but does not know the encryption key, cannot easily recover the password. The application server process requires access to both the encrypted password and the decryption key, so both these data items need to be stored on the file system that is accessible to the server runtime environment. The encryption key is also required by anyone who encrypts a password that is placed in the server configuration. For an attacker that has access to exactly the same set of files as the Liberty server instance, applying AES encryption to the password therefore provides no additional security over and above “exclusive or” (XOR) encoding.

Nonetheless, there are still reasons why you might consider encrypting passwords in the Liberty configuration. The Liberty configuration is designed to be highly composable and sharable. The administration subsystem of traditional (the administrative console and `wsadmin` scripting) prevents an administrator from gaining access to an XOR-encoded password. Liberty is designed to be configured without an administration subsystem, and so any XOR-encoded password is visible to any administrator. Given these design features, consider the following scenarios:

- The passwords are not sensitive, so encoding them provides little value.
- The passwords are sensitive, so either the configuration files containing the password are security sensitive and access needs to be controlled, or the passwords are encrypted and the encoding key is then protected as security sensitive.

The encryption key used for decrypting can be overridden from the default by setting the `wlp.password.encryption.key` property. This property should not be set in the `server.xml` file that stores the password, but in a separate configuration file that is included by the `server.xml` file. This separate configuration file should contain only a single property declaration, and should be stored outside the normal configuration directory for the server. This ensures that the file containing the key is not included when you are running the `server dump` or `package` command. The encryption key property can also be specified as a bootstrap property. If you choose this option, you should put the encryption key in a separate properties file that is included in the `server bootstrap.properties` file.

For information about using XOR or AES to protect your passwords see the related links, especially “Liberty:securityUtility command” on page 1844.

---

## Liberty:JMS messaging

8.5.5.0

Liberty supports asynchronous messaging as a method of communication that is based on the Java Message Service (JMS) programming interface. The JMS interface provides a common way for Java programs (clients and Java EE applications) to create, send, receive, and read asynchronous requests as JMS messages. With Liberty, you can configure multiple JMS messaging providers, which can be used by the JMS applications.

The following JMS messaging providers are supported in Liberty:

- Liberty embedded messaging engine, as the JMS messaging provider
- Service integration bus, which is the default messaging provider of WebSphere Application Server traditional
- IBM MQ messaging provider, which uses the IBM MQ system as the provider

Your applications can use messaging resources from any of the three JMS providers. The choice of the provider is made based either on your messaging requirements or for integration with an existing messaging system. For example, you might want your applications to connect locally to the Liberty messaging provider without the need to configure any external messaging provider, in which case you would use the Liberty embedded messaging engine. Alternatively, you might want to integrate with your existing messaging infrastructure, such as IBM MQ. In such cases, you can either connect directly by using the IBM MQ messaging provider or configure a service integration bus with links to the IBM MQ network and then access the bus through the default messaging provider.

### Liberty JMS messaging providers

8.5.5.6

Different JMS messaging providers are supported in Liberty.

#### Liberty embedded JMS messaging provider

8.5.5.6

Liberty messaging is an embedded messaging feature in Liberty. It is a composable, flexible, and dynamic JMS messaging engine that runs within Liberty. Liberty messaging is both JMS 1.1 and JMS 2.0 specifications compliant and supports both the point-to-point and publish/subscribe messaging models.

Liberty messaging runs only in the Liberty run time, and you can use the Liberty feature manager to enable or disable the messaging features as required. Because the messaging run time is highly composable, you can enable the basic messaging features for the run time, and dynamically enable more messaging features, such as security, transactions, and remote communication, based on your requirement.

Liberty messaging can be classified into two parts:

- JMS Server run time: Provides all the runtime capabilities for connections, transactions, persistence, security, and so on.
- JMS Client connectivity: Provides the resource adapter support to allow JMS clients to perform synchronous and asynchronous messaging activities.

The messaging engine runs as a singleton instance in a Liberty, which means that at any specific time, there can be only one messaging engine that is running in a Liberty kernel.

## Liberty messaging architecture

Liberty messaging is highly composable and dynamic in nature. Liberty messaging consists of several other internal messaging subcomponents, which are implemented as OSGi bundles, that can be enabled or disabled based on the user requirements. OSGi services are used to manage component lifecycles and the injection of dependencies and configurations.

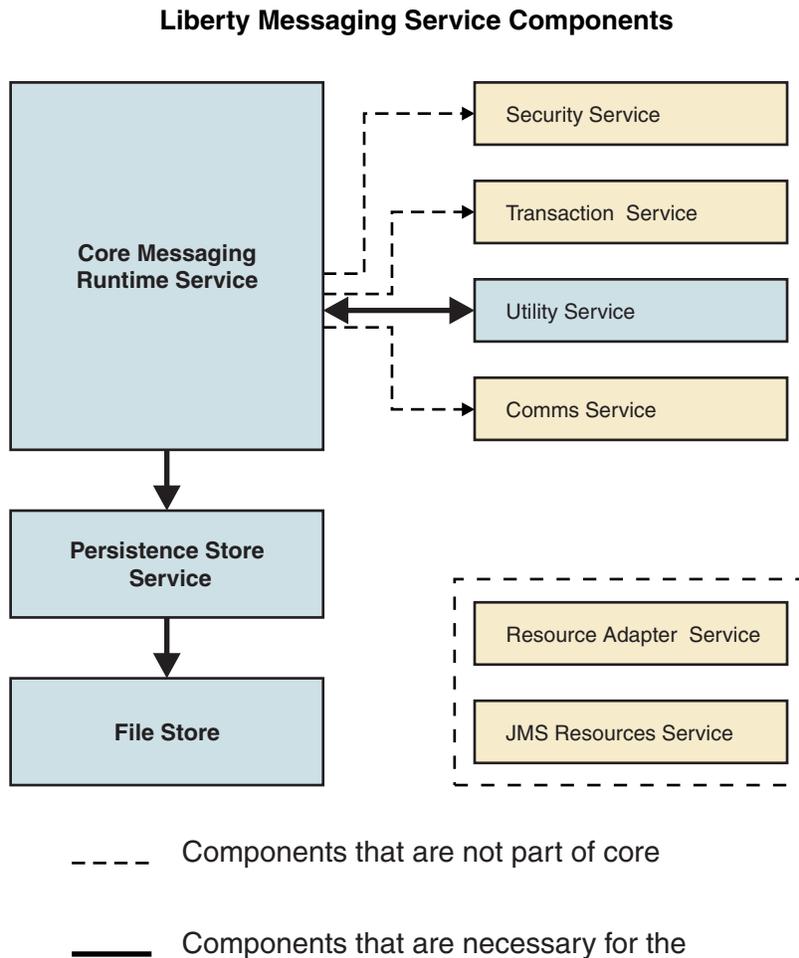

Figure 15. Liberty messaging architecture

The messaging run time and the other messaging subcomponents are run as OSGi bundles in an OSGi framework. This enables the Liberty kernel to load or unload the messaging bundles based on the usage. For example, if the user does not use the messaging security, then the bundles that are related to the messaging security are not initialized.

## Application deployment

Liberty messaging supports three types of JMS application connectivity. The application can run in any of the following ways:

- In a Liberty that is hosting the messaging engine.
- In a different Liberty that is not hosting any messaging engine.
- In WebSphere Application Server traditional.

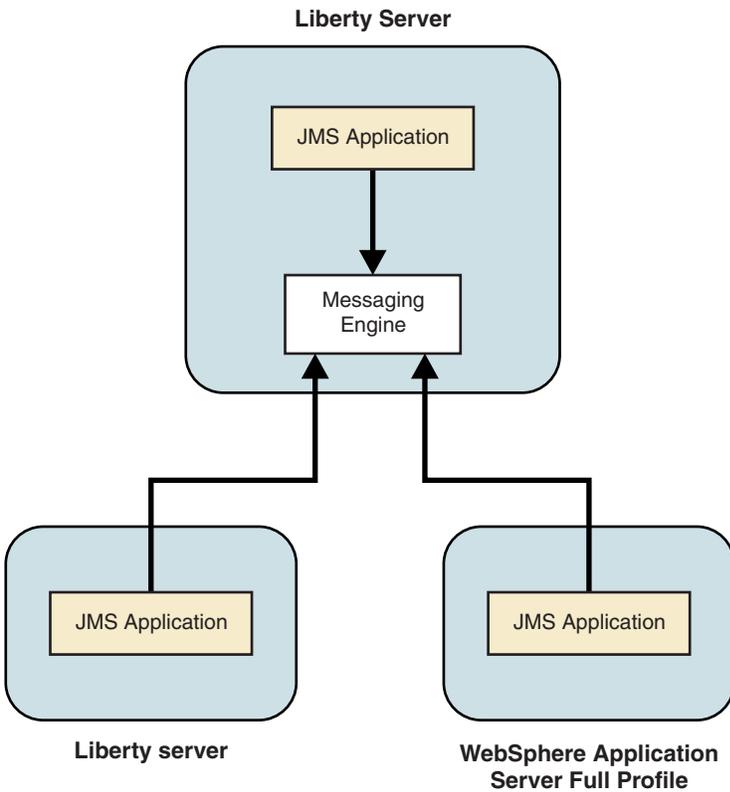

Figure 16. Application deployment model

Liberty messaging supports both *in-process* and *network TCP/IP* connectivity for applications. When the JMS application is deployed in the same JVM where the messaging engine is running, the application can communicate with the *in-process* messaging engine, without going over the TCP/IP layer. This provides significant performance benefits for the applications to send and receive messages.

JMS applications that are running on Liberty that is not hosting the messaging engine must connect over TCP/IP in order to communicate with the messaging engine.

## Message handling

Destinations (queues or topics) are always localized to the messaging engine where the destinations are defined. If the application needs to send or receive a message from a destination, it must always connect to the messaging engine that localizes the destination.

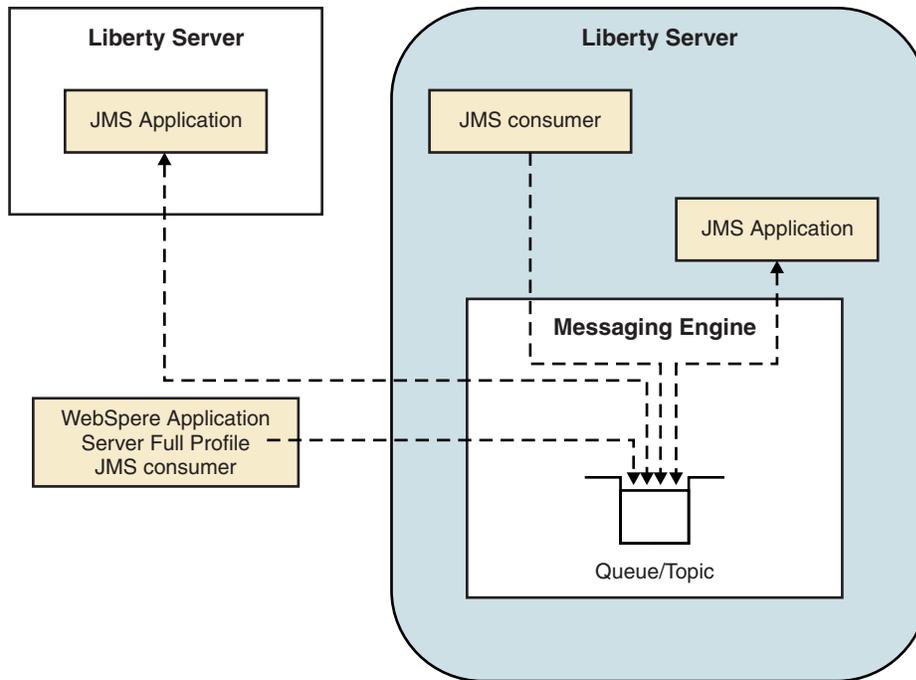

Figure 17. Message handling in Liberty messaging

## Service integration bus messaging provider

8.5.5.6

A service integration bus is a group of one or more application servers or server clusters in a WebSphere Application Server cell that cooperate to provide asynchronous messaging services. The application servers or server clusters on a bus are known as bus members. In the simplest case, a service integration bus consists of a single bus member, which is one application server.

The service integration bus messaging provider uses service integration functions and is part of the WebSphere Application Server runtime environment. To use the default messaging provider, your applications must connect to a service integration bus. You can assign JMS queues (for point-to-point messaging) or JMS topics (for publish/subscribe messaging) as destinations on the service integration bus.

The default messaging provider is characterized as follows:

- A service integration bus consists of messaging engines that run in WebSphere Application Server processes and dynamically connect to one another by using dynamic discovery. A messaging application connects to the bus through a messaging engine.
- Messaging engines use WebSphere Application Server clustering to provide high availability and scalability, and they use the same management framework as the rest of WebSphere Application Server.
- Bus client applications can run from within WebSphere Application Server (JMS), or run as stand-alone Java clients (using the J2SE Client for JMS) or run as clients that are not Java based (XMS).

## IBM MQ messaging provider

8.5.5.6

Through the IBM MQ messaging provider in Liberty, Java Message Service (JMS) messaging applications can use your IBM MQ system as an external provider of the JMS messaging resources. IBM MQ is both JMS 1.1 and JMS 2.0 specifications compliant.

You can configure IBM MQ resources for applications (for example queue connection factories) and manage messages and subscriptions that are associated with JMS destinations in Liberty. You can administer security through IBM MQ. Additional configuration might be required in IBM MQ, depending on the resources that are used by your application.

IBM MQ is characterized as follows:

- Messaging is handled by a network of queue managers, each running in its own set of processes and having its own administration.
- Features such as shared queues (on IBM MQ for z/OS) and IBM MQ clustering simplify the administration and provide dynamic discovery.
- Many IBM products and IBM partner products support IBM MQ with monitoring and control, high availability, and clustering.
- IBM MQ clients can run within WebSphere Application Server (JMS), or almost any other messaging environment by using various APIs.
- IBM MQ clients can run within a wide range of environments, platforms, and operating systems that are using various APIs. Integration through the IBM MQ resource adapter provides connectivity to other Java EE systems.

**Notes:**  The IBM MQ feature that is deployed within Liberty has the following restrictions:

- The IBM MQ classes for Java are not supported in Liberty. They must not be used with either the IBM MQ Liberty messaging feature or with the generic JCA support. For more information, see Using WebSphere MQ Java Interfaces in J2EE/JEE Environments.
-  The IBM MQ resource adapter has a transport type of BINDINGS\_THEN\_CLIENT. This transport type is not supported within the IBM MQ Liberty messaging feature.
-  The Advanced Messaging Security (AMS) feature is not included in the IBM MQ Liberty messaging feature.

## Practical example

The “Connecting WebSphere Application Server Liberty to IBM MQ” scenario provides a worked example of using WebSphere Application Server Liberty and IBM MQ connected together. The scenario description contains the instructions to implement a solution in a business context, and to learn as you go, without needing to make use of other information resources. You can find the Connecting WebSphere Application Server Liberty to IBM MQ scenario in the product documentation.

## JMS messaging (wasJmsClient-2.0) behavior changes

 8.5.5.6

If you are using the wasJmsClient-1.1 feature in your JMS messaging applications, then you can continue to use wasJmsClient-1.1 to avoid migrating the applications. If you are creating new JMS messaging applications, then you can use the wasJmsClient-2.0 feature to take advantage of the new capabilities available. If you want to migrate your existing applications to use the wasJmsClient-2.0 feature, be aware of behavior changes that affect some of the APIs in Java Platform, Enterprise Edition 7.

The following table shows some of the differences in the behavior of the APIs between the two versions:

Table 10. Behavior differences between *wasJmsClient-1.1* and *wasJmsClient-2.0*

Interface names	Condition for exceptions	wasJmsClient-1.1	wasJmsClient-2.0
Session.createDurableSubscriber	ClientID is not set	InvalidClientIDException	IllegalStateException
TopicSession.createDurableSubscriber	ClientID is not set	InvalidClientIDException	JMSEException
Connection.setClientID	Another connection with the same ClientID is already active	IllegalStateException	InvalidClientIDException

## Java Persistence API (JPA)

8.5.5.6

Data Persistence is a means for an application to persist and retrieve information from a non-volatile storage system. Persistence is vital to enterprise applications because of the required access to relational databases. Applications that are developed for this environment must manage persistence themselves or use third-party solutions to handle database updates and retrievals with persistence. The Java Persistence API (JPA) provides a mechanism for managing persistence and object-relational mapping and functions since the EJB 3.0 specifications.

The JPA specification defines the object-relational mapping internally, rather than relying on vendor-specific mapping implementations. JPA is based on the Java programming model that applies to Java Enterprise Edition (Java EE) environments, but JPA can function within a Java SE environment for testing application functions.

JPA represents a simplification of the persistence programming model. The JPA specification explicitly defines the object-relational mapping, rather than relying on vendor-specific mapping implementations. JPA standardizes the important task of object-relational mapping by using annotations or XML to map objects into one or more tables of a database. To further simplify the persistence programming model:

- The EntityManager API can persist, update, retrieve, or remove objects from a database.
- The EntityManager API and object-relational mapping metadata handle most of the database operations without requiring you to write JDBC or SQL code to maintain persistence.
- JPA provides a query language, extending the independent EJB querying language (also known as JPQL), that you can use to retrieve objects without writing SQL queries specific to the database that you are working with.

JPA is designed to operate both inside and outside of a Java Enterprise Edition (Java EE) container. When you run JPA inside a container, the applications can use the container to manage the persistence context. If there is no container to manage JPA, the application must handle the persistence context management itself. Applications that are designed for container-managed persistence do not require as much code implementation to handle persistence, but these applications cannot be used outside of a container. Applications that manage their own persistence can function in a container environment or a Java SE environment.

Java EE containers that support the EJB 3.x programming model must support a JPA implementation, also called a persistence provider. A JPA persistence provider uses the following elements to enable easier persistence management in an EJB 3.x environment:

### Persistence unit

Defines a complete Object-Relational Model mapping Java classes (entities + supporting structures) with a relational database. The EntityManagerFactory uses this data to create a persistence context that can be accessed through the EntityManager.

### EntityManagerFactory

Used to create an EntityManager for database interactions. The application server containers

typically supply this function, but the `EntityManagerFactory` is required if you are using JPA application-managed persistence. An instance of an `EntityManagerFactory` represents a Persistence context.

### Persistence context

Defines the set of active instances that the application is manipulating currently. You can create the persistence context manually or through injection.

### EntityManager

The resource manager that maintains the active collection of entity objects that are being used by the application. The `EntityManager` handles the database interaction and metadata for object-relational mappings. An instance of an `EntityManager` represents a Persistence context. An application in a container can obtain the `EntityManager` through injection into the application or by looking it up in the Java component name-space. If the application manages its persistence, the `EntityManager` is obtained from the `EntityManagerFactory`.

### Entity objects

A simple Java class that represents a row in a database table in its simplest form. Entities objects can be concrete classes or abstract classes. They maintain states by using properties or fields.

## Java Persistence API (JPA) feature overview

8.5.5.6

There are two JPA features that you can use for your application. `jpa-2.0` is built on the Apache OpenJPA open source project. `jpa-2.1` is built on the EclipseLink open source project.

- `jpa-2.0`
- `jpa-2.1`
- JPA feature compatibility

### jpa-2.0

Java Persistence API (JPA) 2.0 for WebSphere Application Server is built on the Apache OpenJPA 2.2.x open source project.

Apache OpenJPA is a compliant implementation of the JPA 1.0 and 2.0 specifications. Using OpenJPA as a base implementation, WebSphere Application Server employs extensions to provide more features and utilities for WebSphere Application Server customers. Because JPA for WebSphere Application Server is built from OpenJPA, all OpenJPA function, extensions, and configurations are unaffected by the WebSphere Application Server extensions. You do not need to make changes to OpenJPA applications to use these applications in WebSphere Application Server.

JPA for WebSphere Application Server provides more than compatibility with OpenJPA. JPA for WebSphere Application Server contains a set of tools for application development and deployment. Other features of JPA for WebSphere Application Server include support for DB2<sup>®</sup> Optim pureQuery Runtime, DB2 optimizations, JPA Access Intent, enhanced tracing capabilities, command scripts, and translated message files. The provider of JPA for this product is `com.ibm.websphere.persistence.PersistenceProviderImpl`.

Apache OpenJPA supports the use of properties to configure the persistent environment. You can specify JPA for WebSphere Application Server properties with either the `openjpa` or `wsjpa` prefix. You can mix the `openjpa` and `wsjpa` prefixes as you want for a common set of properties. Exceptions to the rule are the `wsjpa` specific configuration properties, which use the `wsjpa` prefix. When a JPA for WebSphere Application Server-specific property is used with the `openjpa` prefix, a warning message is logged indicating that the offending property is treated as a `wsjpa` property. The reverse does not hold true for the `openjpa` prefix. In that case, the offending property is ignored.

## jpa-2.1

Java Persistence API (JPA) 2.1 for WebSphere Application Server is built on the EclipseLink open source project. EclipseLink is the reference implementation for all version of the JPA specification. The provider of JPA for this product is `org.eclipse.persistence.jpa.PersistenceProvider`.

The JPA 2.1 specification added new features that are not available in the JPA 2.0 specification. These features include:

- Schema generation
- Type conversion methods
- Entity graphs in queries and find operations
- Unsynchronized persistence contexts
- Stored procedure invocation
- Injection into Entity listener classes
- JPQL enhancements
- Criteria API enhancements
- Mapping of native queries

Refer to the JPA 2.1 specification for more details on these features. This product also provides a subset of the EclipseLink APIs. See the Liberty feature page, Java Persistence API 2.1, for details.

**Note:** JPA 2.1 is backwards compatible with JPA 2.0.

## JPA feature compatibility

### jpa-2.0

The `jpa-2.0` feature is the JPA 2.0 specification implementation and is backed by Apache OpenJPA. This feature is a part of the Java Platform, Enterprise Edition (Java EE) 6 family of technologies, but it is special as it is compatible with other Java EE 7 features. For example, the `servlet-3.1` feature, an Java EE 7 feature, is used with the `jpa-2.0` feature. This enables applications to stay with the existing JPA provider, but also use new Java EE 7 features.

### jpa-2.1

The `jpa-2.1` feature is the JPA 2.1 specification implementation and is backed by EclipseLink. This feature is only compatible with other Java EE 7 features. If the `jpa-2.1` feature is used with other Java EE 6 features, the following error is emitted into the `message.log` file.

```
CWWKF0033E: The singleton features com.ibm.websphere.appserver.javaeeCompatible-7.0 and com.ibm.websphere.appserver
```

## Java Persistence API 2.1 behavior changes

8.5.5.6

If you already use the `jpa-2.0` feature for your applications, you are encouraged to continue using the `jpa-2.0` feature for your existing applications to avoid any migration issues. For new applications, you are encouraged to use the `jpa-2.1` feature, which enables you to take advantage of the new features available in the JPA 2.1 specification. If you want to change your existing applications to use the `jpa-2.1` feature instead of the `jpa-2.0` feature, you might need to adjust your application in the migration process.

### Differences between `jpa-2.0` and `jpa-2.1`

There are a few major differences between the `jpa-2.0` and `jpa-2.1` features that you need to be aware of:

#### PersistenceProvider class name

`jpa-2.0`

- IBM provider: `com.ibm.websphere.persistence.PersistenceProviderImpl`
  - OpenJPA provider: `org.apache.openjpa.persistence.PersistenceProviderImpl`
- jpa-2.1
- `org.eclipse.persistence.jpa.PersistenceProvider`

### Caching behavior

jpa-2.0: Caching is disabled by default. If your application needs to take advantage of a L2 cache, you must explicitly enable it.

jpa-2.1: By default, the EclipseLink provider has the L2 cache and QueryCache enabled. You must ensure that this setting is the best option for your applications. If you are running in a distributed environment, like a cluster, you need to disable the cache, or understand that different nodes can have different data.

### Enhancement / weaving differences

jpa-2.0: OpenJPA requires entities to be enhanced. See the documentation on the enhancement of JPA entities for more information.

jpa-2.1: EclipseLink works with unenhanced entities. WebSphere Application Server supports static enhancement.

Some features might be unavailable, such as lazy loading and some performance gains.

- If entities classes are statically enhanced for use with the jpa-2.0 (OpenJPA) provider, the classes must be recompiled before you use the jpa-2.1 provider.

### Data source usage differences

The jpa-2.0 feature sparingly uses the non-jta-datasource, so few non-jta-datasource connections are required when you are tuning an application.

The jpa-2.1 uses a non-jta-datasource connection when reading data and a transaction is not active. This means that non-jta-datasource connection pools need to be larger when you use this feature.

See the OpenJPA -> EclipseLink migration guide page for more differences between the two JPA providers.

## JPA 2.1 features available in OpenJPA

OpenJPA, the JPA 2.0 provider, has features that function similarly to the new JPA 2.1 features. This means that if you have an existing application that uses the jpa-2.0 feature and want to use some of the JPA 2.1 new features, you do not have to switch to the jpa-2.1 feature. Instead, you can use the equivalent of the new feature that is provided by OpenJPA. Some of the key JPA 2.1 features that are available in OpenJPA are:

### Schema Generation

This feature enables you to generate DDL or interact directly with the database to define table schemas based on JPA entity definition. For more information, refer to section 9.4 of the JPA 2.1 Specification.

OpenJPA equivalent feature: Schema Mapper

### Entity Graphs

This feature enables you to specify fetching or processing of a graph of entity objects. For more information, refer to section 3.7 of the JPA 2.1 Specification.

OpenJPA equivalent feature: FetchPlan and FetchGroup

### Stored Procedure Queries

This feature enables you to invoke procedures stored in databases. For more information, refer to section 3.10.17 of the JPA 2.1 Specification.

OpenJPA equivalent feature: Query invocation

### Basic Attribute Type Conversion

This feature enables you to convert between an attribute entity representation and database representation for basic type attributes. For more information, refer to section 3.8 of the JPA 2.1 Specification.

OpenJPA equivalent feature: Externalizer feature

### @Index and @ForeignKey annotations

Refer to sections 11.1.19 and 11.1.23 of the JPA 2.1 Specification.

OpenJPA equivalent feature: OpenJPA's @Index and @ForeignKey

### Unwrap utility methods for EntityManager, Cache

Refer to sections 3.1.1 and 7.10 of the JPA 2.1 Specification.

OpenJPA equivalent features: EntityManagerImpl.unwrap() and OpenJPAPersistence.cast()

### Object construction when mapping results from native SQL

Refer to Section 3.10.16.2.2 of the JPA 2.1 Specification.

OpenJPA equivalent feature: ResultShape object

---

## Liberty profile: Process types on z/OS

z/OS

For the Liberty runtime environment on the z/OS platform, there are two types of process: the server process and the angel process.

### Server process (bbgzsrv)

The server process is a Java virtual machine (JVM) running the Liberty code in much the same way as it does on any other operating system. You can start the server process either from the MVS operator console by using the angel process or from the shell. How a user identity is associated and validated depends on how you start the server:

- If you start the server from an operator console, the identity that is associated with the STARTED profile created by using a z/OS security product such as RACF<sup>®</sup> is used to control server access: `start bbgzsrv,parms='defaultServer'`
- If you start the server from the shell, you must also stop the server from the shell. The identity of the shell is used for the server:

```
server start
server stop
```

The JVM start options for the server process can come from three sources:

- If you define a file name in the JAVA\_OPTS DD in the proc for the server process, Java command-line arguments are read from this file.
- If you do not define a file name in the JAVA\_OPTS DD, Java command-line arguments are read from the `jvm.options` file in the server configuration directory.
- If the `jvm.options` file does not exist, the JVM uses the value of the `IBM_JAVA_OPTIONS` environment variable.

### Angel process (bbgzangl)

The angel process runs in an authorized key and provides facilities to server process to load and

access system services in a way that protects the integrity of the operating system. You start the angel process from the MVS console by using a proc.

The angel does not need any configuration and exists independently of the server. All Liberty servers that are running on a z/OS image can share a single angel, regardless of the level of code that the servers are running.

Use the MODIFY command to give a list of all the servers that are using the angel process.

```
MODIFY [jobname.]identifier,display,servers
```

If no z/OS system authorized services are enabled for any server on a system, the angel does not need to be active. The angel process is not required for the command processing services (the command processing services uses unauthorized z/OS services for command support).

If the server is configured to attempt to use authorized services but either the angel is not available, or if the effective owner of the process is not authorized to use the angel, the authorized service is not available to be used on that server. In some cases, an unauthorized service might be used instead. See “Liberty: Unauthorized services used by the SAF registry” on page 1946.

For more information, see “Administering Liberty on z/OS” on page 1731

## IBM z/OS Connect overview

8.5.5.2

The IBM z/OS Connect offering is a Liberty feature that encapsulates calling z/OS target applications using REST (Representation State Transfer) calls.

z/OS Connect is designed to provide a fast, secure, reliable connector to reach any z/OS asset. z/OS Connect provides a standard way to identify these assets and reach the assets using REST technology. Where these assets run is specified in the z/OS Connect configuration, relieving clients applications in the cloud, mobile, and web worlds of the need to understand the details about how to reach them and how to convert payloads to and from the formats that the applications require.

### Benefits of using z/OS Connect

z/OS Connect adds value for z/OS customers by enabling users to consolidate multiple client connect pathways into a single common gateway or concentrator for synchronous calls to reach business assets and data on z/OS operating systems. Virtually any z/OS asset, applications and data, can be reached by using standard REST HTTP calls. This feature also provides the ability to inquire about, or discover, all assets that are defined in the z/OS Connect configuration repository. The following is a summary of the benefits of z/OS Connect:

- Provides RESTful access to identify and invoke z/OS-based business assets in CICS®, IMS™, UNIX System Services, and traditional batch environments, opening up these assets to cloud and mobile-based system of engagement environments.
- Functionality that is based on Liberty server technology, is lightweight and easily configurable, and provides z/OS differentiation with System Authorization Facility (SAF) security integration, z/OS Workload Manager (WLM), and Resource Recovery Services (RRS) integration. WLM integration means different URIs can have varying levels of priority and performance criteria.
- As a feature in the Liberty server on z/OS, you can integrate z/OS Connect with z/OS standard system management, which can run as a started task and integrate with z/OS automated operations.
- Provides the ability to secure individual or groups of z/OS Connect services with SAF security in which only specific users or groups can have access to specific services.
- Provides the ability to uniformly track requests from cloud, mobile, and web environments by using z/OS System Management Facility (SMF) services. This tracking means that z/OS customers can use their existing processes for auditing and chargeback for requests from these environments.

- Enables the ability to do an automatic conversion of the request payload from JavaScript Object Notation (JSON) form on input to binary form consumable by z/OS applications such as Cobol, PL/I, and C. The reverse for the response from the z/OS application, converting the output from binary to JSON form is also true.

## **z/OS Connect terminology**

8.5.5.2

Become familiar with terms used with z/OS Connect that include Systems of Engagement (SoE), Systems of Record (SoR), and REST concepts.

### **Systems of Engagement and Systems of Record**

The terms Systems of Engagement (SoE) and Systems of Record (SoR) have replaced the older client and server terminology when describing how different systems are classified in the cloud environment. IBM® z/OS® Connect provides the tools that are needed to transform requests from SoE environments to applications that are running on SoR servers on the z/OS operating system.

### **RESTful services**

REST is an acronym for Representational State Transfer, or the pattern that is most commonly used for web requests today that run over the HTTP protocol. The REST protocol relies solely on the HTTP GET/PUT/POST/DELETE methods. A concrete implementation of a RESTful service must provide the following:

- Explicit use of HTTP
- Stateless functionality
- Displays directory structure-like URIs
- Support Transfer XML, JavaScript Object Notation (JSON), or both

IBM z/OS Connect provides a set of RESTful services that offer discovery and linkage from external cloud, mobile, and web environments to business assets on z/OS systems. Use a RESTful HTTP GET request to return a list of services that the target z/OS Connect server has under its management and another GET request to return the information about a single service, such as the service provider that it uses, like WOLA, and the other artifacts that are needed to invoke, or call, the asset. An HTTP POST or PUT request is used to invoke the asset, by passing a request payload to the asset and returning a response.

## **z/OS Connect scenarios**

8.5.5.2

IBM® z/OS Connect offers REST-based access to applications and data with JSON-based payloads. This access pattern has gained great favor in the industry.

The following business scenarios describe various benefits of using z/OS Connect:

### **Consolidating or grouping separate requests (Financial services company scenario)**

A financial services firm that recently completed a merger with another firm is looking for a way to provide a secure and fast way to open up several critical business applications and tie them together to form a single result and make the result available from inside a web application. One z/OS application, called ACCTINFO runs in the CICS® environment and provides access to internal account data for customers. A second application, ACCTHSTY, runs in the IMS™ environment. The data managed by the CICS application is stored in Virtual Storage Access Method (VSAM) files. The IMS data is in DL/I tables.

The company has a requirement to unify the security for accessing these applications and be able to identify when and how many calls to these two applications occur, the number of bytes received and returned, as well as the response time.

z/OS Connect offers a simple solution that hides the complexity of these environments behind its configuration. The solution provides the ability to contact a single server running on a z/OS operating system to call in to both applications using REST-based calls and JSON for the message payloads. The data transformation support that is provided in z/OS Connect handles the mapping both to and from JSON and byte arrays for each request. In addition, z/OS Connect provides the single point for security checking to ensure any ID systems requesting access are authorized to reach these applications and it records each REST call in the z/OS system management facility (SMF). For unifying these requests, z/OS Connect service definitions use the `serviceGroupName` string when each of these services are defined in the z/OS Connect configuration. You can set up the `serviceGroupName` data to be common for each service, such as 'ACCOUNT\_INFO\_HISTORY' and the result appears in the z/OS SMF records for each request enabling them to be correlated together for analysis or chargeback purposes.

### **Separating mobile or web requests scenario (Retail scenario)**

A retailer wants to separate web requests to applications on z/OS systems out from requests that are coming from their new mobile platforms. You can easily accomplish this task by defining and configuring distinct z/OS Connect service definitions to use the same service provider configuration which enables multiple REST services to call the same assets, but the calls are recorded and secured with different criteria. Requesters from mobile platforms are authorized to use one set of services using REST, while calls from non-mobile, web-based requesters are authorized to use a separate set, both accessing the same assets but tracked separately. All the data is recorded in the z/OS Connect SMF 120 subtype 11 records and are accessible by using standard z/OS auditing and tracking mechanisms.

### **Reaching traditional z/OS batch assets by using REST and JSON (Insurance company scenario)**

A large insurance firm wants to reach a set of Cobol batch applications that contains some sophisticated business logic that was developed over many years. Conversion of this application to a newer language and runtime environment would be costly and high risk. A solution to access the business logic in this application from mobile and web-based requesters is much less risk and enables other business systems to take advantage of the established applications.

With the WebSphere® Optimized Local Adapters support in Liberty and the z/OS Connect WOLA feature activated, this application can be reached using REST calls and JSON content with little effort. The target Cobol application program requires updates to use the WOLA APIs to register with the Liberty server and start accepting requests. A z/OS Connect service definition is required, as well as the binding file that contains the information about the data it expects to receive. You must copy the return data to the path of the binding file of the z/OS Connect server. After enabling the use of the z/OS Connect and the WOLA APIs, this batch asset is effectively online and available for authorized z/OS Connect REST clients.

### **Discovery of z/OS assets and information about request and response payloads**

You want your cloud provisioning or API management tool needs to generate a catalog of assets that are published on a specific z/OS system. This tool needs to inquire about these assets and store them, along with some context associated with each asset. The tool also must include information about what is required to create request data that is passed to the service and information about what the service returns as the response.

z/OS Connect offers a way to discover all the services in its configuration with a simple REST call. When an HTTP GET request arrives for `https://host:port/zosConnect/services`, a list in JSON form is returned and contains all the services that the current authenticated user is permitted to see. From this

list, you can retrieve the URLs for each service and query each service by using an HTTP GET to return the request and response JSON schema information. You can save the service reference (URL for the service), service textual description, and the JSON request and response schemas in the tool's catalog for retrieval at a later time. Enabling access to the JSON schema means that the tool might easily be configured to generate a REST call to pass to z/OS Connect, with an appropriate JSON-based parameter list, for use by the target z/OS Connect service.

---

## Liberty:Binary logging

8.5.5.0

Binary logging is a high performance log and trace facility based on the High Performance Extensible Logging (HPEL) technology in WebSphere Application Server traditional.

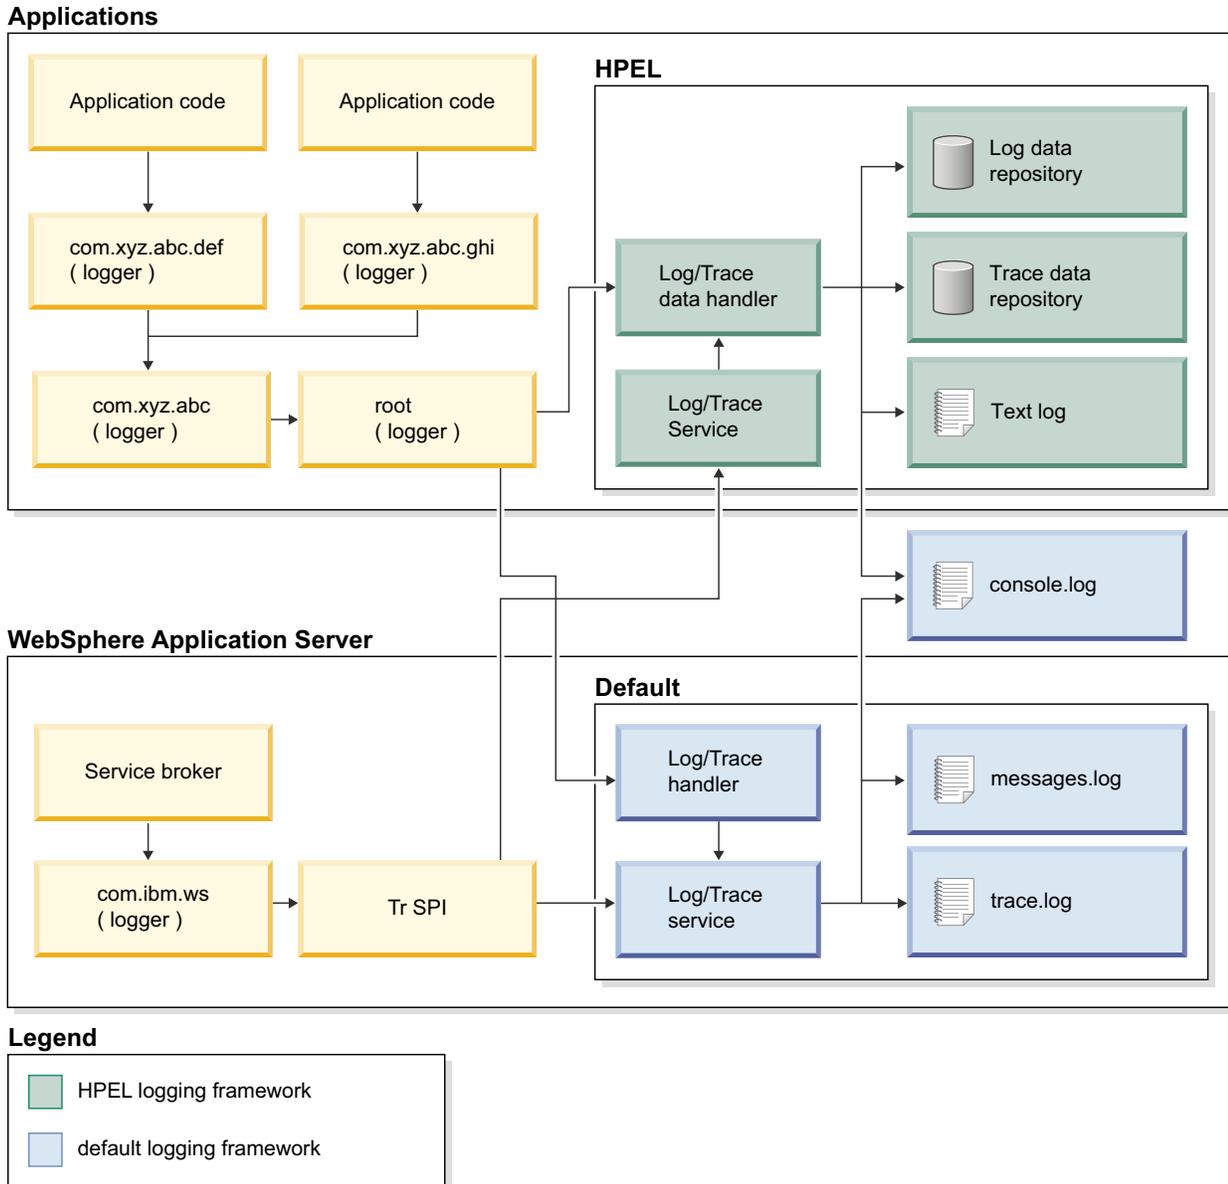

### Overview

**Note:** You must enable the binary logging facility to use it.

Binary logging provides a convenient mechanism for storing and accessing log, trace, System.err, and System.out information produced by the application server or your applications. It is an alternative to the default log and trace facility, which provides the JVM logs and diagnostic trace files commonly named messages.log and trace.log.

### Log and trace storage

Binary logging provides a log data repository and a trace data repository. See the following figure to understand how applications and the application server store log and trace information.

### Log data repository

The log data repository is a storage facility for log records. Log data is typically intended to be reviewed by administrators. This includes any information applications or the server write to System.out, System.err, OSGi logging service at level LOG\_INFO or higher (including LOG\_INFO, LOG\_WARNING, and LOG\_ERROR), or java.util.logging at level Detail or higher (including Detail, Config, Info, Audit, Warning, Severe, Fatal, and any custom levels at level Detail or higher).

### Trace data repository

The trace data repository is a storage facility for trace records. Trace data is typically intended for use by application programmers or by the WebSphere Application Server support team. This includes any information applications or the server write to the OSGi logging service at level LOG\_DEBUG or java.util.logging at levels below level Detail (including Fine, Finer, Finest, and any custom levels below level Detail).

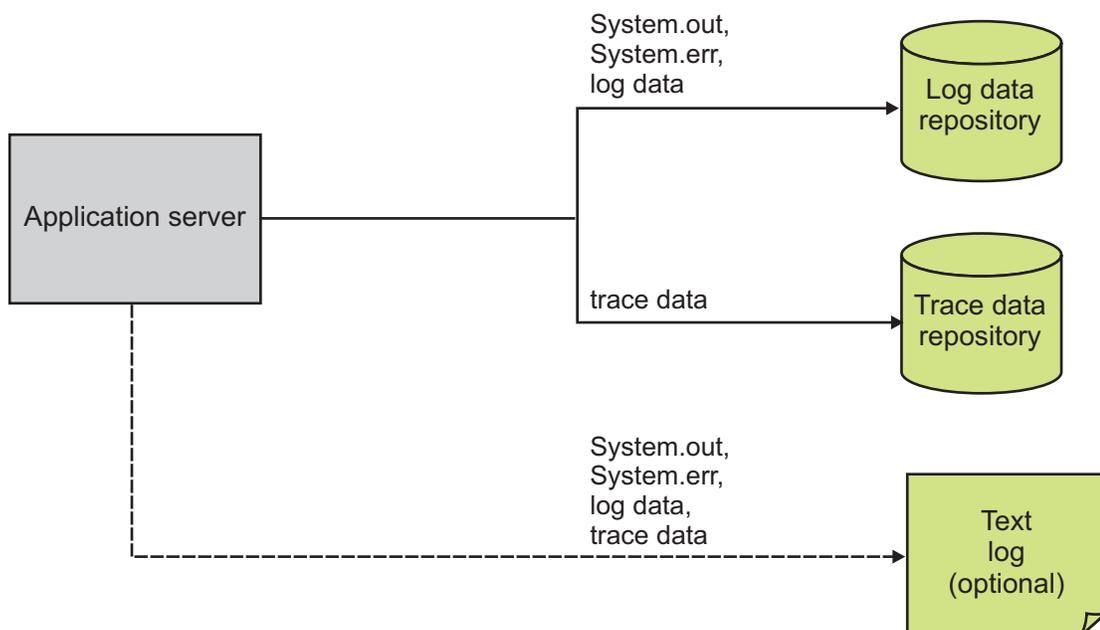

## Log and trace performance

Binary logging has been designed and tested to significantly outperform the default log and trace facility. One result is that the application server can run with trace enabled while causing less impact to performance than tracing the same components using the default log and trace framework. Another result is that applications that frequently write to the logs can run faster when using binary logging.

### Log and trace events are each stored in only one place

Log events, System.out, and System.err are stored in the log data repository. Trace events are stored in the trace data repository. Storing each type of event in only one place ensures that performance is not wasted on redundant data storage.

**Note:** The console log should be disabled in cases where logging performance is important. Any content written to the console log will already be stored in the log data repository.

### Data is not formatted unless it is needed

Formatting data for a user to read uses processor time. Rather than format log event and trace event data at run time, log and trace data are stored more rapidly in a proprietary binary representation. This improves the performance of the log and trace facility. By deferring log and trace formatting until the `binaryLog` command is run, sections of the log or trace that are never viewed are never formatted.

### Log and trace data are buffered before being written to disk

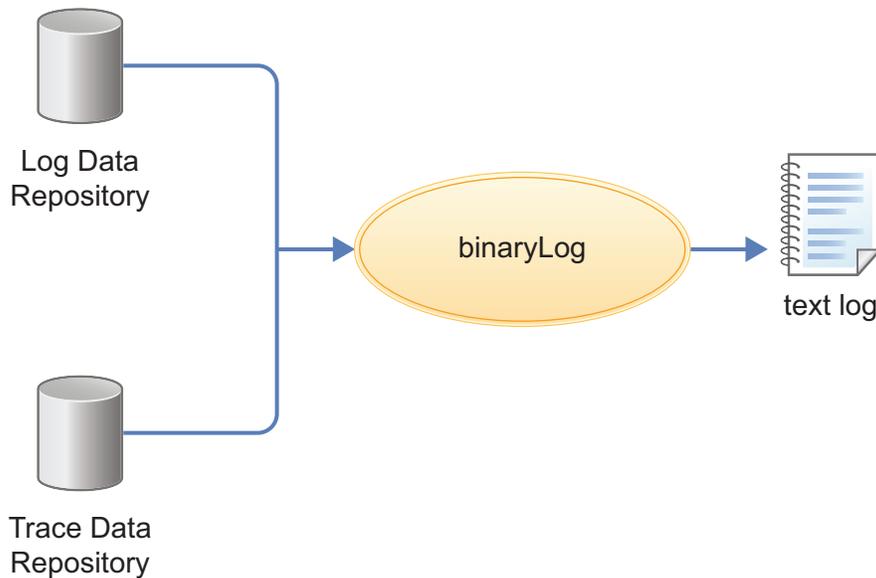

Writing large blocks of data to a disk is more efficient than writing the same amount of data in small blocks. The binary logging facility provides the capability to buffer log and trace data before writing it to disk. By default, log and trace data are stored in an 8 KB buffer before being written to disk. If the buffer is filled within 10 seconds, the buffer is written to disk. If the buffer is not filled within that time it is automatically written to disk to ensure that the logs have the most current information.

## Administration of log and trace

Binary logging has been designed to be easy to configure and understand. For example, administrators can easily configure how much disk space to dedicate to logs or trace, or how long to retain log and trace records, and leave the management of log and trace content up to the server. As another example all log, trace, System.out, and System.err content can be accessed using one easy-to-use command (`binaryLog`), avoiding any possible confusion over which file to access for certain content.

### Reading from the log data and trace data repositories

The log data and trace data repositories are stored in a WebSphere Application Server proprietary format and cannot be read using text file editors such as Notepad or VI. You can copy the log data and trace data repositories in to a plain text format using the `binaryLog` command.

### `binaryLog` command

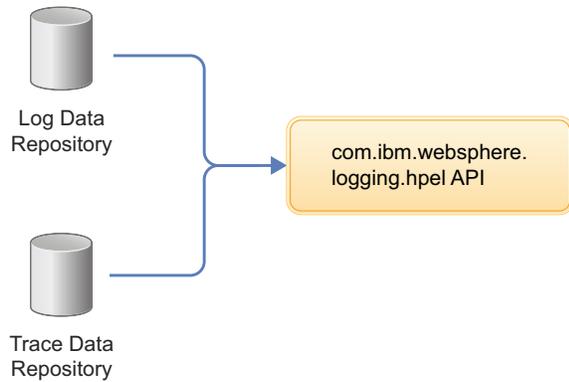

`binaryLog` is an easy-to-use command-line tool provided for users to work with the log data and trace data repositories. `binaryLog` provides filtering and formatting options that make finding important content in the log data and trace data repositories easy. For example, a user might filter any errors or warnings, then filter all log and trace entries that occurred within 10 seconds of a key error message on the same thread.

### Filtering using log and trace record extension content

The binary logging facility provides the capability for developers to add custom extensions to log and trace records using a log record context API (`com.ibm.websphere.logging.hpel.LogRecordContext`). You can use the `binaryLog` command-line tool to filter records based on the content of log and trace record extensions.

## Development resources

Binary logging has been designed to make working with log and trace content more flexible and effective than the default logging facility. Log and trace content can be easily filtered to show only the records that are of interest. You can use the command line (see the description of the `binaryLog` command), or developers can create powerful log handling programs using the HPEL API.

### Reading the log data and trace data

An API has been provided to make it easy for developers to develop tools to consume content from the binary log and trace repositories. For example, a developer might write a Java program to search the log and trace content to find any messages with message IDs that match a known list of important message IDs. This API is in the `com.ibm.websphere.logging.hpel` package. Refer to the API documentation for details on the HPEL log reading API.

### Log and trace record extensibility

Developers can add custom extensions to log and trace records through a log record context API (`com.ibm.websphere.logging.hpel.LogRecordContext`). When binary logging stores log and trace records, it includes any extensions present in the log record context on the same thread. For example, a developer might write a servlet filter to add important HTTP request parameters to the log record context. While that servlet runs, HPEL API adds those extensions to any log and trace records created on the same thread.

As with other log and trace record fields, developers can access the record extensions using the HPEL API. This is useful when writing tools to read from log and trace repositories. Developers can also make use of the log record context API to access extensions in custom log handlers, filters, and formatters at run time.

## BinaryLog command options

**8.5.5.0**

Use the **binaryLog** command to view or copy the contents of a binary logging repository, or list the available server process instances in the repository. The **binaryLog** command is equivalent to the **logViewer** command in the profile bin directory of the traditional application server.

The binary log and trace facility writes to a repository in a binary format. You can view, query and filter the repository using the **binaryLog** command. The **binaryLog** command provides options for quickly converting repository contents into a text file in various formats, such as basic and advanced formats. The command also provides options to make getting the data you need from the logs easier; for example, allowing you to filter what log records you want by level, logger name, or date and time.

### Syntax

The command syntax is as follows:

```
binaryLog action {serverName | repositoryPath} [options]
```

The value of **options** is different based on the value of **action**.

## Parameters

The following actions are available for the binaryLog command:

### view

Read a repository, optionally filter it, and create a version that users can read.

The command syntax is as follows:

```
binaryLog view {serverName | repositoryPath} [options]
```

*serverName*

Specify the name of a Liberty server with a repository to read from.

*repositoryPath*

Specify the path to a repository to read from. This is typically the directory that contains both the logdata and tracedata directories.

**Note:** If neither a *serverName* nor a *repositoryPath* is specified on the command line, the task is performed against the default server instance, `defaultServer`, if it exists.

Filter options:

All filters are optional. When multiple filters are used, they are logically ANDed together.

- `--minDate=value`  
Filter based on minimum record creation date. Value must be specified as either a date (for example `--minDate="2/20/13"`) or a date and time (for example `--minDate="2/20/13 16:47:21:445 EST"`).
- `--maxDate=value`  
Filter based on maximum record creation date. Value must be specified as either a date (for example `--maxDate="2/20/13"`) or a date and time (for example `--maxDate="2/20/13 16:47:21:445 EST"`).
- `--minLevel=value`  
Filter based on minimum level. Value must be one of FINEST | FINER | FINE | DETAIL | CONFIG | INFO | AUDIT | WARNING | SEVERE | FATAL.
- `--maxLevel=value`  
Filter based on maximum level. Value must be one of the following: FINEST | FINER | FINE | DETAIL | CONFIG | INFO | AUDIT | WARNING | SEVERE | FATAL.
- `--includeLogger=value[,value]*`  
Include records with specified logger name. Value may include \* or ? as a wildcard.
- `--includeMessage=value`  
Filter based on message name. Value may include \* or ? as a wildcard.
- `--includeThread=value`  
Include records with specified thread id. Values must be in hexadecimal (for example, `--includeThread=2a`).
- `--includeExtension=name=value[,name=value]*`  
Include records with specified extension name and value. Value may include \* or ? as a wildcard. To include a comma in the value, you must use "\",
- `--includeInstance=value`  
Include records from the specified server instance. Value must either be "latest" or be a valid instance ID. Run this command using the `listInstances` action to see a list of valid instance IDs.

Monitor option:

--monitor

Continuously monitor the repository and output new content as it is generated.

Output options:

- --format={basic | advanced | CBE-1.0.1}  
Specify the output format to use. "basic" is the default format.
- --encoding=*value*  
Specify the character encoding to use for output.

## copy

Read a repository, optionally filter it, and write the contents to a new repository.

The command syntax is as follows:

```
binaryLog copy {serverName | repositoryPath} targetPath [options]
```

*serverName*

Specify the name of a Liberty server with a repository to read from.

*repositoryPath*

Specify the path to a repository to read from. This is typically the directory that contains the logdata and tracedata directories.

*targetPath*

Specify the path at which to create a new repository. The *targetPath* must be specified.

**Note:** Either *serverName* or *repositoryPath* must be specified, as well as the *targetPath*.

Filter options:

All filters are optional. When multiple filters are used, they are logically ANDed together.

- --minDate=*value*  
Filter based on minimum record creation date. Value must be specified as either a date (for example --minDate="2/20/13") or a date and time (for example --minDate="2/20/13 16:52:32:808 EST").
- --maxDate=*value*  
Filter based on maximum record creation date. Value must be specified as either a date (for example --maxDate="2/20/13") or a date and time (for example --maxDate="2/20/13 16:52:32:808 EST").
- --minLevel=*value*  
Filter based on minimum level. Value must be one of the following: FINEST | FINER | FINE | DETAIL | CONFIG | INFO | AUDIT | WARNING | SEVERE | FATAL.
- --maxLevel=*value*  
Filter based on maximum level. Value must be one of the following: FINEST | FINER | FINE | DETAIL | CONFIG | INFO | AUDIT | WARNING | SEVERE | FATAL.
- --includeLogger=*value*[,*value*]\*  
Include records with specified logger name. Value may include \* or ? as a wildcard.
- --excludeLogger=*value*[,*value*]\*  
Exclude records with specified logger name. Value may include \* or ? as a wildcard.
- --includeMessage=*value*  
Filter based on message name. Value may include \* or ? as a wildcard.
- --includeThread=*value*  
Include records with specified thread id. Values must be in hexadecimal (for example, --includeThread=2a).
- --includeExtension=*name=value*[,*name=value*]\*

Include records with specified extension name and value. Value may include \* or ? as a wildcard. To include a comma in the value, you must use "\",

- `--includeInstance=value`

Include records from the specified server instance. Value must either be "latest" or be a valid instance ID. Run this command using the listInstances action to see a list of valid instance IDs.

## listInstances

List the IDs of server instances in the repository. A server instance is the collection of all log/trace records written from the time a server is started until it is stopped. Server instance IDs can be used with the `--includeInstance` option of the binaryLog view action.

The command syntax is as follows:

```
binaryLog listInstances {serverName | repositoryPath}
```

*serverName*

Specify the name of a Liberty server with a repository to read from.

*repositoryPath*

Specify the path to a repository to read from. This is typically the directory that contains the logdata and tracedata directories.

**Note:** If *serverName* or *repositoryPath* are not specified on the command line, the task is performed against the default server instance, `defaultServer`, if it exists.

Be aware of binaryLog filtering optimizations. The binaryLog tool is able to filter log and trace data most efficiently when used with the following filter options:

- `--minDate`
- `--maxDate`
- `--includeThread`
- `--minLevel`
- `--maxLevel`

## Example usage

See the following examples of binaryLog commands.

- Display all events in the `defaultServer` repository between July 19th, 2013 and August 2nd, 2013.  

```
binaryLog view --minDate=07/19/13 --maxDate=08/02/13
```
- Display new events from server `myServer`, whose specified level is `WARNING` or higher, using the advanced format as the server writes them to the log repository.  

```
binaryLog view myServer --monitor --minLevel=WARNING --format=advanced
```
- Write log messages from a repository at `/apps/server1/logs`; include only those that were written to the error stream of a specific repository.  

```
binaryLog view /apps/server1/logs --includeLogger=SystemErr
```
- View events from the `defaultServer` repository that occurred before September 14th, 2012 4:28 PM eastern daylight time.  

```
binaryLog view --maxDate="09/14/12 16:28:00:000 EDT"
```
- Write events from the `defaultServer` repository that contain a 'thread' extension with value 'Default Executor-thread-4'  

```
binaryLog view --includeExtension=thread="Default Executor-thread-4" --format=advanced
```
- View the list of server instances in the `defaultServer` repository:  

```
binaryLog listInstances
```

Using `D:\wlp\usr\servers\defaultServer\logs` as repository directory.

Instance ID	Start Date
1358809441761	1/21/13 18:04:01:761 EST
1358864476191	1/22/13 9:21:16:191 EST

1358869523192	1/22/13 10:45:23:192 EST
1358871281166	1/22/13 11:14:41:166 EST
1358879829000	1/22/13 13:37:09:000 EST
1358892222067	1/22/13 17:03:42:067 EST

- View events from the defaultServer using one of the instance IDs from the previous example:

```
binaryLog view --includeInstance=1358871281166
```

- Copy events from the defaultServer, whose specified level is WARNING or higher, from the latest server instance to a new repository at d:\toSupport directory.

```
binaryLog copy defaultServer d:\toSupport --minLevel=warning --includeInstance=latest
```

## Configuring binary logging in Liberty

8.5.5.0

Use this information as a guide for configuring binary logging in your Liberty.

### About this task

Binary logging provides faster log and trace handling capabilities and more flexible ways to use log and trace content than the default Liberty log and trace framework.

A server configuration consists of a `bootstrap.properties` file, a `server.xml` file, and any (optional) files that are included with those files. The `bootstrap.properties` file specifies properties that need to be available before the main configuration is processed, and are kept to a minimum. The `server.xml` file is the primary configuration file for the server.

The `server.xml` file and its associated files use a simple xml format that is suitable for most text editors.

**Distributed operating systems** A richer editing experience is provided by the eclipse server adapter for Liberty (WAS4D+ adapter), which uses a generated schema to provide drop-down lists of available choices, auto-completion, and other editing tools. For a description of the eclipse server adapter for Liberty, see “Editing the Liberty configuration by using developer tools” on page 1556.

The `bootstrap.properties` file specifies whether the server uses binary logging as the log and trace framework, or the default log and trace framework. A server restart is required to switch between binary logging and the default log and trace framework.

You can modify the configuration of binary logging through the server configuration or the `bootstrap.properties` file.

- **Server configuration:** To get logging from your own code, which is loaded after server configuration processing, use the server configuration to configure binary logging.
- **bootstrap.properties file:** You might need to set logging properties to take effect before the server configuration files are processed. For example, if you need to analyze problems that occur early in server start or configuration processing. In this case, you can configure binary logging in the `bootstrap.properties` file.

You can set Logging properties in either the `bootstrap.properties` or the `server.xml` file. Use attributes in the `server.xml` file, or use equivalent properties in the `bootstrap.properties` file. Any settings in the `bootstrap.properties` file are used from the time the server reads the `bootstrap.properties` file until the time the `server.xml` file is processed. If the logging properties in the `bootstrap.properties` file are not replaced or reset in the `server.xml` file, the property values in the `bootstrap.properties` file continue to be used.

When binary logging is enabled, the `maxFileSize`, `maxFiles`, `messageFileName`, `traceFileName`, and `traceFormat` logging element attributes are ignored (since binary logging runs without `trace.log` and

messages.log files). The **traceSpecification**, **consoleLogLevel**, and **logDirectory** attributes continue to be used to set the trace specification, the level for the console log, and the placement of the log and trace files.

If you set logging or binary logging attributes in the server.xml file, you can avoid changes in configuration between startup time and runtime by setting the corresponding properties in the bootstrap.properties file to the same value. If no logging or binary logging properties are set in the bootstrap.properties file, the server uses the default logging settings.

## Procedure

- Enable binary logging for the server by updating the bootstrap.properties file. In the bootstrap.properties file, add the following text on a line by itself:  
websphere.log.provider=binaryLogging-1.0
- Use the following parameters to configure binary logging. All subelements that are listed are subelements of the logging element in the server.xml file. The following table lists the attributes that are configurable in the server.xml file and the equivalent properties that can be set in the bootstrap.properties file:

*Table 11. Binary logging attributes that are configurable in server.xml and the equivalent properties that can be set in bootstrap.properties*

Logging subelement	Attribute	Equivalent bootstrap.properties property
binaryLog	purgeMaxSize	com.ibm.hpel.log.purgeMaxSize
	purgeMinTime	com.ibm.hpel.log.purgeMinTime
	fileSwitchTime	com.ibm.hpel.log.fileSwitchTime
	bufferingEnabled	com.ibm.hpel.log.bufferingEnabled
	outOfSpaceAction	com.ibm.hpel.log.outOfSpaceAction
binaryTrace	purgeMaxSize	com.ibm.hpel.trace.purgeMaxSize
	purgeMinTime	com.ibm.hpel.trace.purgeMinTime
	fileSwitchTime	com.ibm.hpel.trace.fileSwitchTime
	bufferingEnabled	com.ibm.hpel.trace.bufferingEnabled
	outOfSpaceAction	com.ibm.hpel.trace.outOfSpaceAction

The following example shows a bootstrap.properties file that is configured to enable binary logging:  
websphere.log.provider=binaryLogging-1.0

The following example shows a server.xml file with the binary logging subelements. The log content is set to expire after 96 hours and the trace content is set to retain a maximum of 1024MB:

```
<server description="new server">
  <logging>
    <binaryLog purgeMinTime="96"/>
    <binaryTrace purgeMaxSize="1024"/>
  </logging>
</server>
```

For the full logging configuration reference, see the logging, binaryLog, and binaryTrace elements in the .

## Results

After you restart the server, binary logging is enabled and configured.

---

## Liberty: Session Initiation Protocol (SIP)

8.5.5.7

Session Initiation Protocol (SIP) is a control protocol for many interactive services, including audio, video, and peer-to-peer communication. SIP, and the standards for SIP, provide the mechanisms to look up, negotiate, and manage connections to peers on any network over any other protocol.

With the sipServlet-1.1 feature, Liberty includes support for SIP Servlet Specification 1.1, also referred to as Java Specification Request (JSR) 289. The SIP Servlet Specification provides the Java API standards for Session Initiation Protocol (SIP). JSR 289 is an update to the existing SIP Servlet specification that addresses new requirements that were determined by industry users. This product continues to support the SIP Servlet 1.0 specification.

This product complies with the following SIP standards:

- IETF
- JCP

For a complete list of the supported Internet Engineering Task Force (IETF) and Java Community Process (JCP) industry standards, see the “SIP industry standards compliance on Liberty” on page 1035.

In the Liberty server, the web container and SIP container are converged and are able to share session management, security and other attributes. In this model, an application that includes SIP servlets, HTTP servlets, and portlets can seamlessly interact, regardless of the protocol. The tight integration of HTTP and SIP in the Liberty server means that these converged applications are highly available.

### Session Initiation Protocol (SIP) applications on Liberty

A *SIP application* is a Java program that uses at least one Session Initiation Protocol (SIP) servlet.

A SIP servlet is a Java application component that is managed by a SIP servlet container and that performs SIP signaling. Like other Java components, servlets are platform-independent Java classes that are compiled to platform-neutral bytecode that can be loaded dynamically into and run by a Java-enabled SIP application server such as a Liberty profile server. Containers, sometimes called servlet engines, are server extensions that handle servlet interactions. SIP servlets interact with clients by exchanging request and response messages through the servlet container.

SIP is used to establish, modify, and terminate multimedia IP sessions, including IP telephony, presence, and instant messaging. “Presence” in this context refers to user status such as “Active,” “Away,” or “Do not disturb.” The standard that defines a programming model for writing SIP-based servlet applications is JSR 289. The idea behind the specification is to provide a Java application programming interface (API) similar to HTTP servlets that provides an easy-to-use SIP programming model. Like the HTTP servlet programming model, some flexibility is limited to optimize ease-of-use and time-to-value.

However, the SIP Servlet API is different in many ways from HTTP servlets because the protocol is so different. While SIP is a request-response protocol, there is not necessarily only one response to every one request. This complexity and a need for a high-performing solution meant that it was easier to make the SIP servlets natively asynchronous. Also, unlike HTTP servlets, the programming model for SIP servlets sought to make client requests easy to create alongside the other logic because many applications act as a client or proxy to other servers or proxies.

### SipServlet requests

Like HTTP servlets, each SIP servlet extends a base `javax.servlet.sip.SipServlet` class. All messages come in through the service method, which you can extend. However, because there is not a one-to-one

mapping of requests to responses in SIP, the suggested practice is to extend the `doRequest` or `doResponse` methods instead. When you extend the `doRequest` or `doResponse` methods, it is important to call the extended method for the processing to complete.

Each request method, which the specification must support, has a `doxxx` method just like HTTP. In HTTP, methods such as `doGet` and `doPost` exist for GET and POST requests. In SIP, `doInvite`, `doAck`, `doOptions`, `doBye`, `doCancel`, `doRegister`, `doSubscribe`, `doNotify`, `doMessage`, `doInfo`, and `doPrack` methods exist for each SIP request method.

Unlike an HTTP servlet, SIP servlets have methods for each of the response types that are supported. So, SIP servlets include the `doProvisionalResponse`, `doSuccessResponse`, `doRedirectResponse`, and `doErrorResponse` responses. Specifically, the provisional responses (1xx responses) are used to indicate status, the success responses (2xx responses) are used to indicate a successful completion of the transaction, the redirect responses (3xx responses) are used to redirect the client to a moved resource or entity, and the error responses (4xx, 5xx, and 6xx responses) are used to indicate a failure or a specific error condition. These types of response messages are similar to HTTP, but because the SIP Servlet programming model includes a client programming model, responses must be handled programmatically as well.

## JSR 289 overview

8.5.5.7

With the `sipServlet-1.1` feature, Liberty includes support for SIP Servlet Specification 1.1, also referred to as Java Specification Request (JSR) 289. SIP is a signaling protocol that is used for creating, modifying, and terminating IP communication sessions, such as telephony, presence, and multimedia applications.

The SIP Servlet Specification provides the Java API standards for Session Initiation Protocol (SIP). JSR 289 is an update to the existing SIP Servlet specification that addresses new requirements that were determined by industry users.

The JSR 289 specification adds the following features:

- Application router for application selection  
Application routing enables developers to build complex services out of smaller applications. On initial requests the container calls the application router to determine which application to invoke based on the type of request. The application router is the central hub for selecting application order. For more information, see “SIP application router on Liberty” on page 1035 and “Administering Session Initiation Protocol (SIP) on Liberty” on page 1728.
- Annotation-based programming  
Annotations provide a fast way to develop applications by embedding metadata directly in applications. For example, you can use the `@SipServlet` annotation to indicate that a class is a SIP servlet. The `@SipApplication` is a package level annotation. All servlets in the package belong to the same application unless the servlet uses `@SipServlet(applicationName)`. For more information on annotations, see section 18 of the JSR 289.
- Converged applications  
JSR 289 provides a new, standardized mechanism for building converged applications. A converged application contains SIP servlet components and other Java EE components such as HTTP servlets and enterprise beans. The specification includes two new classes to support convergence.
  - `ConvergedHttpSession` is an extension to `HttpSession` for converged applications.
  - `SipSessionUtil` handles session management for converged applications.For more information on converged applications, see section 13 of the JSR 289.
- Back-to-back user agent (B2BUA) APIs  
JSR 289 simplifies the B2BUA pattern in applications with the use of the B2BUA helper class. The B2BUA is a frequently used application pattern. The B2BUA acts as an endpoint for two or more

dialogs and forwards requests and responses between those dialogs. The B2BUA helper can create a copy of an incoming request. It also automatically maintains links between sessions on both sides of the B2BUA. For more information on B2BUAs, see section 12 of the JSR 289.

## SIP application router on Liberty

8.5.5.7

The Session Initiation Protocol (SIP) container uses the SIP application router to select the order in which applications are run within the container.

The SIP container can invoke multiple applications to deploy a complete service or function. This modular and compositional approach makes it easier for application developers to develop new applications. The modular applications can be more easily combined and managed, while individual application implementations remain independent.

The application router is responsible for selecting the correct applications in the correct order to service an incoming message. An application router is required for a container to function, but it is a separate logical entity from the container. The application router is based on the JSR 289 specification. See the specification for more details about the application router function.

The default application router (DAR) can be configured with a standard configuration file, which is supplied to the SIP container as defined in JSR 289.

Application routing, also referred to as application composition, can be handled in a number of ways:

- Configure a custom application router (CAR) by specifying the path of the Java™ archive (JAR) file that contains the application router implementation and provider to the `library` element and add the `bell` element to refer to this library in the `server.xml` file. A specific provider is defined on the `carProvider` attribute of the `sipApplicationRouter` element. For an example see the documentation for “Administering Session Initiation Protocol (SIP) on Liberty” on page 1728.
- Configure the DAR by providing its location on the `sipDarConfiguration` attribute of the `sipApplicationRouter` element in the `server.xml` file.

## Session Initiation Protocol (SIP) container on Liberty

8.5.5.7

A *SIP container* is a web application server component that invokes the Session Initiation Protocol (SIP) action servlet and that interacts with the action servlet to process SIP requests.

The servlet container provides the network services over which requests and responses are received and sent. It decides which applications to invoke and in what order. The container also contains and manages servlets through their lifecycle.

A SIP servlet container manages the network listener points on which it listens for incoming SIP traffic. A listener point is a combination of transport protocol, IP address, and port number. The SIP servlet container supports the following transport protocols:

- User Datagram Protocol (UDP)
- Transmission Control Protocol (TCP)
- Transport Layer Security (TLS) over TCP

## SIP industry standards compliance on Liberty

8.5.5.7

Session Initiation Protocol (SIP) on Liberty complies with industry standards for both the SIP container and SIP applications.

## SIP container

Liberty complies with the following SIP standards:

IETF

JCP

Liberty also complies with the Internet Engineering Task Force (IETF) and Java Community Process (JCP) industry standards for SIP. The following table contains a list of the IETF and JCP standards.

*Table 12. Liberty complies with these SIP standards*

Standard	Description
JR116	SIP: SIP Servlet API
JR289	SIP: SIP Servlet API v1.1
RFC 2543	SIP: Session Initiation Protocol
RFC 3261	SIP: Session Initiation Protocol
RFC 3262	Reliability of provisional responses in SIP
RFC 3263	Locating SIP servers
RFC 3265	SIP-specific event notification
RFC 3311	The SIP UPDATE Method
RFC 3325	Private Extensions to the SIP for asserted identity within trusted networks
RFC 3326	The Reason Header field for the SIP
RFC 3515	The SIP Refer method
RFC 3581	The SIP Extension for Symmetric Response Routing
RFC 3824	Using E.164 numbers with the SIP
RFC 3891	The SIP Replace header
RFC 3903	SIP Extension for event state publication
RFC 3911	The SIP Join header
RFC 4475	SIP torture test messages
RFC 5057	Multiple dialog usages in SIP
RFC 5626	Managing Client-Initiated Connections in SIP <b>Note:</b> The SIP server can act as a proxy or registrar as specified in sections, 5, 6, and 7 of RFC 5626. RFC 5626 is an extension to RFC 3261. The SIP server has full support for RFC 3261. However, support for RFC 5626 comes with the following limitations: <ul style="list-style-type: none"><li>• The SIP server can act as a User Agent, as defined in RFC 3261; however, it cannot act as a User Agent as defined in section 4 of RFC 5626.</li><li>• The SIP server does not support STUN keepalives, as specified in RFC 5626.</li></ul>
RFC 5658	Addressing Record-Route issues in SIP

## SIP applications

Liberty complies with standards for SIP applications.

*Table 13. Compliance with standards for SIP applications.*

Standard	Description
RFC 2848	The PINT Service Protocol: Extensions to SIP and Session Description Protocol (SDP) for internet protocol (IP) access to telephone call services
RFC 2976	The SIP INFO method

Table 13. Compliance with standards for SIP applications (continued).

Standard	Description
RFC 3050	Common gateway interface for SIP
RFC 3087	Control of service context using SIP request-URI
RFC 3264	An offer and answer model with SDP
RFC 3266	Support for IPv6 in SDP
RFC 3312	Integration of resource management and SIP
RFC 3313	Private SIP extensions for media authorization
RFC 3319	Dynamic Host Configuration Protocol (DHCPv6) options for SIP servers
RFC 3327	SIP Extension Header field for registering non-adjacent contacts
RFC 3372	SIP for telephones (SIP-T): context and architectures
RFC 3398	Integrated Services Digital Network (ISDN) User Part (ISUP) to SIP mapping
RFC 3428	SIP extension for instant messaging
RFC 3455	Private Header (P-Header) extensions to the SIP for the 3rd-Generation Partnership Project (3GPP)
RFC 3578	Mapping of Integrated Services Digital Network (ISDN) User Part (ISUP) overlap signaling to the SIP
RFC 3603	Private SIP proxy-to-proxy extensions for supporting the PacketCable distributed call signaling architecture
RFC 3608	SIP Extension Header field for service route discovery during registration
RFC 3665	SIP basic call flow examples
RFC 3666	SIP Public Switched Telephone Network (PSTN) call flows
RFC 3680	A SIP event package for registrations
RFC 3725	Best current practices for third-party call control (3pcc) in the SIP
RFC 3840	Indicating user agent capabilities in the SIP
RFC 3842	A message summary and message waiting indication event package for the SIP
RFC 3856	A presence event package for the SIP

RFC 4508	Conveying feature tags with the SIP REFER method

## Liberty: Real-Time Communications

8.5.5.7

The Liberty Real-Time Communications feature `rtcomm-1.0` enables a highly scalable signaling infrastructure that you can use to connect WebRTC clients and other types of Internet of Things (IoT) nodes into real-time audio, video, or data interactions.

The feature supports both registrations of clients, as well as the exchange of signaling that is needed to create a WebRTC peer connection between two endpoints.

WebRTC is an emerging HTML5 standard set of JavaScript APIs that enable developers to add real-time communications to their web applications by using only JavaScript with no browser plug-ins. To learn more about WebRTC go to [WebRTC](#) and to learn more about the IBM solutions for WebRTC, see [WebSphere Liberty Real-Time Communications and WebRTC](#). While WebRTC encompasses things such as audio and video codecs, echo cancellation, and Interactive Connectivity Establishment (ICE) for firewall traversal of media streams, it does not include support for the call signaling needed to set up the media streams between endpoints that want to communicate. The new `rtcomm-1.0` feature provides a call signaling connector that runs on Liberty and also includes a client-side JavaScript library that encapsulates both call signaling and a wrapper for WebRTC. The library exposes a simple API for rapid integration of audio, video, or data communications into new and existing web applications.

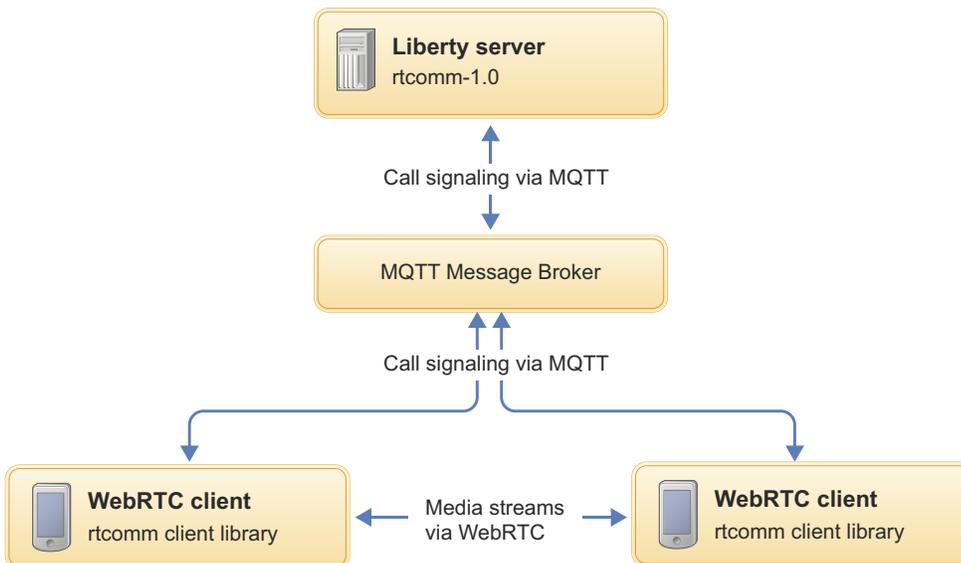

Figure 18. Components that make up the Rtcomm Feature

As the diagram shows, the WebRTC clients communicate with the backend Liberty server via the Message Queue Telemetry Transport (MQTT). MQTT is a machine-to-machine (M2M)/"Internet of Things" connectivity protocol. This protocol is a lightweight publish and subscribe messaging transport. MQTT is an open standard and open source clients exist for JavaScript, Java, and many other languages; see [MQTT](#) for details. The `rtcomm` client library is built on top of the Eclipse Paho JavaScript client that uses `WebSocket` as its underlying transport; see [Paho](#) for details.

Many options of MQTT message brokers exist in the market today. For development purposes, IBM MessageSight for Developers can be downloaded from the following URL, IBM MessageSight for Developers. Here is a list of some of the more commonly used MQTT message brokers:

- IBM MessageSight
- WebSphere MQ Telemetry
- Mosquitto (open source MQTT broker)

**Attention:** Public, cloud-based MQTT brokers like MQTT Dashboard should not be used for anything more than testing. There is no way to predict when public servers will go up and down and many public servers periodically delete their open connections and subscriptions. Production deployments must always rely on a secure server such as a deployment of IBM MessageSight.

**Note:** Make sure that the MQTT message broker you are using supports WebSocket, otherwise, the WebRTC clients cannot connect to it.

## Configuring Liberty Real-Time Communications

8.5.5.7

Configuring the Real-Time Communications feature consists of updates to the `server.xml` file.

### About this task

To configure a Liberty server to run an application that is enabled for Real-Time Communications, you must set the `rtcomm-1.0` feature. You can also enable several other configurations and options to work with an application that is using Real-Time Communications.

**Note:** The `Rtcomm` Feature does not currently support Liberty collectives or clustering. Only a single Liberty instance per `rtcommTopicPath` is currently supported.

### Procedure

1. To enable the `rtcomm-1.0` feature after downloading the Liberty server, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<featureManager>
  <feature>rtcomm-1.0</feature>
</featureManager>
```

If you would like to modify the default settings you need to add the `Rtcomm` Feature to the Liberty server configuration. To do this, you can either use the WDT tool or manually add the following configuration line to the `server.xml` file:

```
<rtcomm/>
```

The default settings include:

- `Rtcomm` MQTT Broker Connection Details: (host: localhost and port: 1883)
- `Rtcomm` root topic path: `/rtcomm/`
- SSL is disabled

**Note:** For the default settings to work, an MQTT Broker needs to be installed and enabled on the same machine as the Liberty server.

If you would like to change the default settings for the MQTT Broker, you will need to edit the `server.xml` file with the following:

```
<rtcomm messageServerHost="<brokerhostname>" messageServerPort="<brokerportname>" />
```

2. Configure the Rtcomm topic path. The `rtcommTopicPath` is used with other Rtcomm topic names. This topic path provides a unique name space to avoid collisions with other developers that use the same message broker. To set this path, add the following configuration line to the `server.xml` file:

```
<rtcomm rtcommTopicPath="/rtcomm/" />
```

You must pass the name and path you configured into the `rtcomm` client library on initialization along with the message broker address. The server creates the topic name and appends it to the topic path.

**Note:** The `rtcommTopicPath` must be unique per the Liberty server whenever multiple Liberty servers are configured to use the same MQTT broker, otherwise there is no way to predict the behavior.

3. You can configure the shared subscription path that is prepended to the `rtcommTopicPath`. This path is required by message brokers when using shared subscriptions. To set this path, add the following configuration line to the `server.xml` file:

```
<rtcomm sharedSubscriptionPath="$SharedSubscription/rtcomm/" />
```

Shared subscriptions must be configured when using call queues. Call queues rely on shared subscriptions to distribute messages across all the queue listeners. For example, if multiple help-desk agents are all listening on a single queue, shared subscriptions are used to distribute calls to one agent at a time.

**Note:** Shared subscription support is a non-standard in MQTT brokers. The previous configuration shows how to properly setup the `rtcomm-1.0` Feature to work with IBM MessageSight. Refer to your broker's product documentation regarding configuring shared subscriptions.

4. **Optional:** Configure more options when using the Rtcomm Feature.

#### Configuring backend services with the Rtcomm Feature

The Rtcomm Feature supports a number of backend services that include the following:

- Interactive Connectivity Establishment (ICE) server configuration: Specifies URLs that are sent to and used by the Rtcomm WebRTC clients when negotiating peer media sessions.
- Call Queue support: Rtcomm can be configured to support shared call queues, and enables the user to create a shared call queue where many agents can subscribe to a specific call queue and respond to customer calls. For example, you can dial into customer support for a specific product. Many agents can subscribe to the queue, but only one agent is chosen to respond to each call.
- Rtcomm Gateway: Adds the capability for connecting Session Initiation Protocol (SIP) with Rtcomm WebRTC endpoints for the exchange of audio and video streams. For further details on configuring an Rtcomm Gateway, see [Configuring a Rtcomm Gateway](#).
- Alternate Endpoint Routing: Specifies that the user wants to route new sessions through an alternative endpoint.

#### Interactive Connectivity Establishment (ICE) Server Configuration

ICE is a technique that is used in computer networking that involves NATs (Network Address Translators) in Internet applications, such as, Voice over Internet Protocol (VoIP), peer-to-peer communications, video, instant messaging and other interactive media. In such applications, NAT traversal is an important component to facilitate communications that involve hosts on private network installations, often located behind firewalls.

The Node Controller provides ICE server configuration as a way to notify Rtcomm client nodes which ICE servers they can use when setting up peer-to-peer sessions with another client. WebRTC relies heavily on ICE servers to traverse firewalls, and being in production deployments it is critical to include support for ICE to ensure the highest possible probability for connecting endpoints.

The ICE server configuration is accessed through a service query request that is published to the connector topic name associated with a Rtcomm Feature. For more information about the Rtcomm service query, see the protocol details, [GitHub lib.rtcomm.clientjs](#).

To configure various types of ICE servers, add the following property to the `rtcomm` configuration line in your `server.xml` file:

```
<rtcomm>
  <iceServerURL>stun:example1.hostname.com:8880</iceServerURL>
  <iceServerURL>stun:example2.hostname.com:8881</iceServerURL>
</rtcomm>
```

### Third-Party Call Control

You can find all protocol details that define the message formats that are related to third-party call control in the GitHub repository. The `lib.rtcomm.node-red` and `lib.rtcomm.node` related open source components are used to interact with these services.

### Call Queue Support

Call queues provide a round robin style interaction where many users can subscribe to a queue and another user can call the queue. Only one of the subscribed users will receive the call. This feature is enabled by defining queues and enabling Shared Subscriptions as previously shown in step two.

In order to configure call queues, configure the shared subscription path that is prepended to the `rtcommTopicPath`. This path is required by message brokers when using shared subscriptions. You can define the `callQueues` that are supported by adding the following configuration lines to the `server.xml` file:

```
<rtcomm sharedSubscriptionPath="$SharedSubscription/rtcomm/">
  <callQueue description="refrigerator" callQueueID="callQueueID2" timeout="500s"></callQueue>
</rtcomm>
```

The user can create as many unique call queues as they need. When configured, the shared subscription path plus the `rtcomm` topic path plus the topic name ("`$SharedSubscription/rtcomm//rtcomm/callQueue`") is subscribed to by agents to receive call requests from the server.

The following configuration items are available for each queue:

- **Configure description:** Specifies the verbal description of this call queue instance. This verbal description is returned in service query responses and can be used to better inform the client about the queue.
- **Configure callQueueID:** The endpoint ID that is associated with the call queue topic name, and that is the destination endpoint ID that a caller uses to call into a specific queue.
- **Configure timeout:** The number of seconds to wait before terminating a call that is waiting in a queue.

### Alternate Endpoint Routing

Specifies that the user wants to route new sessions through an alternative endpoint. Using this option, you can subscribe to the `alternateEndpointRouting` topic name, such as `/rtcomm/alternateEndpointRouting` and are able to route new sessions to the proper endpoint. To enable this capability, add the following configuration line to the `server.xml` file:

```
<rtcomm alternateEndpointRoutingEnabled="true"/>
```

### SSL configuration for Rtcomm

Make sure the environment is configured to use SSL between the `Rtcomm` Feature and the MQTT broker.

The SSL reference is the ID of the SSL configuration that is used to connect to the SSL-enabled MQTT Broker.

**Note:** In order for the `Rtcomm` Feature to use SSL, the `SSL` Feature must be enabled. To enable the `SSL` Feature, add the following configuration to the `server.xml` file.

```
<rtcomm sslEnabled="true" sslRef="mySSLConfig" />
```

For further details on the `sslRef` configuration attribute, see [Liberty: SSL configuration attributes](#).

## Using the rtcomm-1.0 WebRTC JavaScript client and services

8.5.5.7

The Liberty `rtcomm-1.0` feature relies on an open signaling protocol that is used to establish real-time multimedia sessions over MQTT between Rtcomm endpoints, which support WebRTC.

Open source implementations of the `rtcomm-1.0` protocol are released on the GitHub repository and include the following:

### **lib.rtcomm.clientjs**

This GitHub repository contains a client library and sample code that uses the Rtcomm signaling protocol to simplify using WebRTC in the browser. The library is written in JavaScript and gives the application developer a simple interface to create WebRTC connections between two browsers. The library documentation, including how to install and its API, are in the GitHub repository. See GitHub `lib.rtcomm.clientjs`.

For a sample mobile application using `lib.rtcomm.clientjs`, see `sample.rtcomm.mobile`.

### **lib.angular-rtcomm**

This GitHub repository contains the Rtcomm `Angular.js` module that exposes a set of real-time communication features in the form of a service and a number of Angular directives and controllers. See `lib.angular-rtcomm`.

### **lib.rtcomm.node**

This GitHub repository contains a `node.js` module that provides service functionality to monitor events by using selective filters and initiate a third-party call between two clients. This module can be used independently or with the `lib.rtcomm.node-red` nodes in Node-RED. The module documentation, including how to install and its API are in the GitHub repository. See GitHub `lib.rtcomm.node`.

### **lib.rtcomm.node-red**

This GitHub repository contains a set of `node-red` nodes that use the `lib.rtcomm.node` module. One of the Node-RED nodes enables the consumption of `rtcomm-1.0` events in the Node-RED environment and outputs these events to other nodes using filters. This repository also includes a Node-RED node that can instantiate a third-party call that is based on inputs from other nodes. The node documentation, including how to install and its API are in the GitHub repository. See GitHub `lib.rtcomm.node-red`.

For more information about the `rtcomm-1.0` protocol, see the Rtcomm Signalling Protocol specification on GitHub. The `rtcomm-1.0` feature also provides a service interface that allows for the monitoring of Rtcomm related events and third-party call control. For more information, see the Rtcomm Service Protocol specification on GitHub. Protocol version numbers are listed in the title of these documents and define the version number for the included implementation. GitHub releases are used to tag all the repository files related to a protocol version number.

## Configuring a Rtcomm Gateway

8.5.5.7

The Rtcomm Gateway adds the capability for connecting Session Initiation Protocol (SIP) with Rtcomm WebRTC endpoints for the exchange of audio and video streams.

## About this task

The Rtcomm Gateway (GW) is useful when you require federating between the Rtcomm network and different vendors' networks. The other network can be a network of WebRTC endpoints, which is using a different method for signaling, or it can also be a different network of Voice over IP (VOIP) devices or even the Public switched telephone network (PSTN). Such federation is possible as long as the other network provides an edge GW element that supports the widely adopted SIP protocol.

The Rtcomm Gateway supports both Interactive Connectivity Establishment (ICE) for SIP (based on RFC 5245) and trickle ICE for SIP (based on the IETF draft). This draft is still marked as a “work in progress” so this implementation might change in the future in accordance to this draft progress.

## Procedure

1. Add the `rtcommGateway-1.0` feature in the `server.xml` file to enable the Rtcomm Gateway capability.

```
<featureManager>
  <feature>rtcommGateway-1.0</feature>
</featureManager>
```

The Rtcomm Gateway is configured in the `rtcomm` section. This configuration enables you to define the following:

- a. Instructs the GW on where to direct the SIP message that is translated from an incoming Rtcomm signaling message. There are three options:
    - Nothing is configured (default): The GW tries to resolve the destination based on the SIP address that was provided as the target on the Rtcomm WebRTC client.
    - `sipContainer=true`: The GW sends the message to the internal Liberty SIP servlet container port. This message gets routed to a JSR 289 application that is installed on the Liberty server, according to the standard application router rules. For further details, see Session Initiation Protocol (SIP) applications on Liberty.
    - `ExternalPR=host:port`: Tells the GW to route the translated SIP message to an external destination of a SIP Proxy or Registrar.
  - b. Define the SIP endpoint for incoming SIP messages. Messages coming on the SIP endpoint get translated to Rtcomm signaling and delivered by the GW to the WebRTC endpoint, that is resolved from the SIP initial message `requestURI` header.
2. Review the following additional considerations for implementing Rtcomm Gateway.
    - a. Sending messages from Rtcomm WebRTC to SIP.
      - REGISTER: When sending an Rtcomm register message from the WebRTC client that is using the DOCUMENT message, it is possible to use a SIP address of record (AOR) as the client topic. If such a SIP URI is registered, the GW converts that to a SIP REGISTER request and tries to route it according to the rules defined by the configuration. The Contact header is constructed from a Rtcomm Gateway SIP endpoint address, as configured for the Liberty server, and the user name as set in the AOR.
      - Rtcomm START\_SESSION message can be directed to a SIP address as well. In this case, the START\_SESSION `toEndpointID` field is populated by a URI, which starts with either of 'sip', 'sips', or 'tel' scheme prefixes, then the message is translated to a SIP INVITE and sent according to the rules configured. All subsequent messages in the dialog are translated to SIP according to the signaling scenario defined and the relevant Request For Comments (RFC). This rule applies to both the Interactive Connectivity Establishment (ICE) and trickle ICE signaling scenarios.
    - b. Sending messages from SIP to Rtcomm WebRTC.

The GW currently supports only INVITE dialogs. A SIP INVITE that is coming into one of the configured GW SIP endpoints is translated to an Rtcomm START\_SESSION message and sent to the resolved WebRTC endpoint. The WebRTC endpoint is resolved according to the following rules:

      - Look for the INVITE `requestURI` SIP address. If the endpoint was registered as a client topic by a previous Rtcomm DOCUMENT message, then this is where the START\_SESSION message is directed

to. For example; if the Rtcomm endpoint was registered as "sip:bob@x.y.z.w" as a DOCUMENT topic, then any INVITE with "sip:bob@x.y.z.w requestURI" is converted to START\_SESSION and directed to that MQTT topic.

- If the previous step did not resolve a destination, look for only the user part in the SIP requestURI. If the endpoint was registered, the START\_SESSION is directed to that topic. For example; if the Rtcomm endpoint was registered as "bob", then for any <domain> in the requestURI is bob@domain.

**Note:** Unsupported SIP requests return with a 405 error response.

c. Transcoding and advanced media server functionality.

- The Rtcomm Gateway does not support handling the media plane and will not perform actions such as transcoding between SIP V0IP and WebRTC endpoints codecs. This means that at its basic use, the GW allows only federation between different WebRTC endpoints, or endpoints that use similar codecs and streaming protocols, such as the WebRTC standard.
- To make full use of the Rtcomm Gateway capabilities, it is possible to augment the Liberty server with a feature that provides APIs for a media server connector based on the JSR 309 standard. With this feature, you can create and install an application on the Liberty server that uses a media server for transcoding and streaming protocol translation, in addition to many other advanced features such as recording, announcements playback, stream mixing for multi-party A/V conferences and many more. Details can be found in the JSR 309 specification.
- See WASdev to find a sample application that uses JSR 289 and 309 to connect a SIP soft phone and the Rtcomm WebRTC endpoint using a media server as a mediator and translator for the media.
- The application is using SIP Servlets (JSR 289) with JSR 309 and mediates between the SIP network and the Rtcomm WebRTC network. This application only requires the configuration of internal routing in the server.xml file; for example:

```
<rtcomm messageServerHost="<brokerhostname>" messageServerPort="<brokerhostport>"
      <gateway sipContainer="true"></gateway>
</rtcomm>
```

**Note:** Make sure that the SIP ports where incoming SIP messages are directed to are those of the SIP Servlets container endpoints and not the GW endpoint. See Administering Session Initiation Protocol (SIP) on Liberty.

## Example

In this example, the incoming WebRTC messages are directed to an external SIP endpoint that might be a proxy or registrar, such as 1.2.23.2:5063.

```
<rtcomm messageServerHost="<brokerhostname>" messageServerPort="<brokerhostport>"
      <gateway sipContainer="false" externalPR="1.2.23.2:5063" allowFromSipEndpointRef="webrtc2, webrtc"></gateway>
</rtcomm>
```

Incoming SIP messages can be on the "webrtc" and "webrtc2" SIP endpoints. In the following example, "webrtc" is using the default ports that are 5060 and localhost.

```
<sipEndpoint id="webrtc"></sipEndpoint>
<sipEndpoint id="webrtc2" sipTCPport="5067" sipUDPport="5067" sipTLSport="5068" host="*"></sipEndpoint>
```

## Configuring Security for the rtcomm-1.0 Feature

8.5.5.7

This topic describes the many aspects of securing the rtcomm-1.0 Feature.

## About this task

The following steps describe how to enable security for the rtcomm-1.0 Feature.

### Procedure

1. Configure SSL.

#### SSL between the rtcomm-1.0 Feature and the MQTT Broker

This function is enabled for the rtcomm-1.0 Feature by setting the `sslEnabled="true"` attribute for `Rtcomm` in the `server.xml` file, and this often requires a different port for SSL (default 8883) to connect to the broker.

#### SSL between the Rtcomm JavaScript Client and the MQTT Broker

If the `rtcomm.js` client is served over `https`, then it will enable SSL by default (and will try to use port 8883) otherwise SSL needs to be enabled in the configuration when initializing the `EndpointProvider`. The configuration resembles the following:

```
var providerConfig = {
    server: mqttbroker server,
    port: mqttbroker SSL Port,
    useSSL: true};
```

The previous steps ensure that the communication between the clients, the MQTT Broker, and the Liberty server that is running the rtcomm-1.0 Feature is encrypted.

2. Configure authentication.

#### Authentication and Authorization of the JavaScript Client with the MQTT Broker

Typically, an application that is implementing Real-Time Communications authenticates a user. For further details, see [Authenticating users in Liberty](#).

Many external MQTT Brokers can require authentication but will not use the same authentication as the application without a specific configuration.

An external MQTT Broker can use similar authentication mechanisms and offer ways to use LTPA Tokens to verify identity. IBM MessageSight supports LTPA and when the LTPA Keys are shared with the MessageSight MQTT Broker they are members of the same domain (`servername.domainname.com`), and they both are using the same LDAP resource for identifying users, then an LTPA Token can be used to pass the original authentication to IBM MessageSight. Other MQTT Brokers can work similarly. For further details on using LTPA with IBM MessageSight, see [Lightweight Third Party Authentication \(LTPA\)](#).

The Liberty server must be configured by using the following information, [Configuring LTPA in Liberty](#).

**Note:** Use the `ssoDomainNames` attribute to define the common domain between servers:

```
<webAppSecurity logoutOnHttpSessionExpire="true" singleSignonEnabled="true" ssoDomainNames="domainname.com" />
```

Authentication that uses LTPA is separate from authorization or authorization in IBM MessageSight, and it is necessary to follow the directions at this [URL](#), [Authorization](#).

This configuration only works if the original authenticator that is providing the LTPA token and the MessageSight server share the same LDAP configuration.

#### Client authentication without LTPA

If LTPA cannot be configured, the `rtcomm.js` client provides an API that allows a user and password to be provided for authentication with the MQTT Broker, and is done in the configuration that is passed to the `EndpointProvider` during the `init()`:

```
var providerConfig = {
    server: servername,
    port: port,
    useSSL: true,
```

```
credentials: {
  username: "username",
  password: "password" }
};
```

This configuration passes the identity and password to the MQTT client to authenticate the connection to the MQTT Broker.

## Configuring the Media Server Control Feature

8.5.5.8

JSR 309 (Media Server Control) controls Media Resource Functions (MRFs) which are server-side media processing servers.

### About this task

The Liberty Media Server Control feature (`mediaServerControl-1.0`) enables the ability to access media servers through the JSR 309 API. For applications to use this API, a driver implementation of JSR 309 must be installed. For more information about JSR 309, see JSR 309: Media Server Control API.

### Procedure

To enable the `mediaServerControl-1.0` feature, add the following element declaration inside the `featureManager` element in your `server.xml` file:

```
<featureManager>
  <feature>mediaServerControl-1.0</feature>
</featureManager>
```

---

## Multimedia

## Setting up and configuring

-  Configure session cache management with Liberty and WebSphere eXtreme Scale (InterConnect 2015 and eXtreme Scale V8.6.0.6) [Transcript]
-  Setting up Admin Center (V8.5.5.4) [Transcript]
-  Comparing collectives and cells (V8.5.5) [Transcript]
-  Introduction to creating a Liberty collective (V8.5.5) [Transcript]
-  Configuring a Liberty auto-scalable cluster for JVM elasticity (V8.5.5.4) [Transcript]
-  Health management for Liberty collectives (V8.5.5.8) [Transcript]

## Administering

-  Touring Admin Center (V8.5.5.7) [Transcript]
-  Getting started with the Server Configuration Tool for WebSphere Liberty (V8.5.5.8) [Transcript]

## Securing

-  OpenID Connect on Liberty (InterConnect 2015) [Transcript]
-  Google OpenID Connect for applications on WebSphere Liberty (InterConnect 2015) [Transcript]

## Developing applications

-  Creating a Hello World Java application (V8.5.5.2) [Transcript]
-  Introduction to WebSphere Application Server Patterns 1.0 [Transcript]

## End-to-end scenarios

- Develop, build, and deploy an application with Liberty server DevOps and some open-source tools.
  -  Demo - DevOps with WebSphere Liberty Server (InterConnect 2015) [Transcript]
- Enable highly available clusters with Liberty collectives.
  1. Configure a collective controller.
  2. Join a server to the collective controller as a member server.
  3. Set up dynamic auto-scalable cluster members with JVM elasticity. The scaling controller can start or stop cluster members based on resource use and scaling policies.
  4. Enhance the dynamic auto-scalable cluster members with Liberty elasticity. Enable the scaling controller to also install Liberty software onto a registered host and create a new server.
    -  Configuring an auto-scalable cluster for Liberty elasticity (V8.5.5.7) [Transcript]

## Video: Comparing collectives and cells

The following transcript is for the “Comparing collectives and cells” video, which describes the similarities and differences between WebSphere Application Server traditional cells and Liberty collectives. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content shown in the video.

-  Comparing collectives and cells

Table 14. Demo creating a Liberty collective. Show commands and server.xml changes.

Scene	Audio	Onscreen Action
1	<p>Hi, I'm Mike Thompson. I'm going to take you today through a comparison between the WebSphere Liberty administrative domain and the WebSphere traditional administrative domain.</p> <p>The first difference is the terminology. The administrative domain in Liberty is called a <i>collective</i>, which is in comparison to the traditional administrative domain known as a <i>cell</i>.</p>	Show the developer talking on camera.
2	<p>Another key difference in terminology is the name given to the administrative server. In a cell environment, the administrative server is called a <i>deployment manager</i>, or "Dmgr" for short. In the collective, the administrative server is called the <i>collective controller</i>, or "controller" for short.</p>	<p>Show lists that compare a deployment manager (Dmgr) to a collective controller:</p> <p>Admin server: Deployment Manager (Dmgr)</p> <ul style="list-style-type: none"> <li>- Dedicated process</li> <li>Federation (tightly coupled)</li> <li>Agents</li> <li>Centralized config control</li> <li>- Dmgr owns all configuration</li> <li>Single administrative server</li> <li>Management API</li> <li>- MBean &amp; wsadmin</li> <li>- wsadmin scripting (via jython/jacl)</li> </ul> <p>Admin server: Collective Controller</p> <ul style="list-style-type: none"> <li>- Liberty feature</li> <li>Join (loosely coupled)</li> <li>Agentless</li> <li>Decentralized config control</li> <li>- Each server owns its configuration</li> <li>Highly available administrative server</li> <li>Management API</li> <li>- MBean, no wsadmin</li> <li>- jython scripting</li> </ul>
3	<p>There is an important difference between these two processes. In the cell, the Dmgr is a dedicated process, which means it is unable to run an end user workload. In the collective, the controller is actually enabled as a Liberty feature, which means that it can be enabled with any other Liberty feature, allowing the controller to run end user workloads.</p>	<p>Show lists that compare a deployment manager (Dmgr) to a collective controller and highlight:</p> <ul style="list-style-type: none"> <li>- Dedicated process</li> <li>- Liberty feature</li> </ul>
4	<p>There is also a difference in the way entities become part of the administrative domain. In the cell, the process is known as <i>federation</i>. It is a tightly coupled process whereby servers federate into the cell and give up a lot of their autonomy. In the collective, servers join the collective and become collective members. The process of joining is very lightweight and allows the members to be loosely coupled to the collective so that members can join collectives and leave collectives very easily.</p>	<p>Show lists that compare a deployment manager (Dmgr) to a collective controller and highlight:</p> <ul style="list-style-type: none"> <li>Federation (tightly coupled)</li> <li>Join (loosely coupled)</li> </ul>

Table 14. Demo creating a Liberty collective (continued). Show commands and server.xml changes.

Scene	Audio	Onscreen Action
5	The cell environment uses agents to facilitate management activities. The node agent process acts as a middleman between the deployment manager and the targets of management, the application servers. In the collective environment, there are no administrative agents. It is a completely agentless model. When a collective controller takes actions against a target member, it's taking those actions directly.	Show lists that compare a deployment manager (Dmgr) to a collective controller and highlight: Agents Agentless
6	Another key distinction between cells and collectives is the way the configuration is controlled. In the cell, the deployment manager owns all configuration of all the entities within the cell. In the collective, each server owns its own configuration. So, even when members join and leave the collective, they retain complete control over their configuration.	Show lists that compare a deployment manager (Dmgr) to a collective controller and highlight: Centralized config control - Dmgr owns all configuration Decentralized config control - Each server owns its configuration
7	The administrative server for a cell is a singleton. There is only one instance of a deployment manager active at any given time within a cell. We've recognized the need for the administrative environment to become more robust and resilient. As such, the collective controller was designed with high availability in mind, and multiple collective controllers can be running concurrently within the same collective.	Show lists that compare a deployment manager (Dmgr) to a collective controller and highlight: Single administrative server Highly available administrative server
8	Lastly, there's a difference between the management API of a cell and a collective. Both the cell and collective provide MBeans to provide management activities but only a cell provides wsadmin. The collective environment does not support wsadmin. It a design principle that the collective's management activities be exposed only via MBeans. While the cell exposes its wsadmin scripting via Jacl and Jython, the collective currently only supports Jython scripting. However, additional languages are possible.	Show lists that compare a deployment manager (Dmgr) to a collective controller and highlight: Management API - MBean & wsadmin - wsadmin scripting (via jython/jacl) Management API - MBean, no wsadmin - jython scripting

For more information, see “Liberty: Collective architecture” on page 1450 and “Configuring a Liberty collective” on page 1136.

## Video: Configure session cache management with Liberty and WebSphere eXtreme Scale

8.5.5.5

The following transcript is for the “Configure session cache management with Liberty and WebSphere eXtreme Scale” video, which describes how to improve the performance of your applications by off loading your current application server and data access processes to an in-memory cache using session cache management with Liberty and WebSphere eXtreme Scale. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content shown in the video.

 Configure session cache management with Liberty and WebSphere eXtreme Scale

Table 15. Introduction. Describe the benefits of session management with Liberty and WebSphere eXtreme Scale.

Scene	Audio	Onscreen Action
1	<p>Caching sessions in your applications is one of the most beneficial and easy-to-do configurations to improve performance and availability of your web applications. If you have an application server, store your information in sessions, then can offload your current process to an in-memory cache to help your applications run at super fast speeds. This video will help you do that by demonstrating how to set up session management quickly and simply with Liberty and WebSphere eXtreme Scale.</p> <p>Liberty is a fast, lightweight and simple Java web application container that application developers can use to develop, test and deploy applications easily.</p>	<p>Show the video title, "HTTP Session Failover for WebSphere Liberty leveraging WebSphere eXtreme Scale".</p>
2	<p>WebSphere eXtreme Scale provides distributed in-memory data storage that is replicated across different machines.</p>	<p>Show IBM Corporation notices and disclaimers.</p>
3	<p>This video includes an overview of session caching with eXtreme Scale. It also includes quick steps to download the Liberty and WebSphere eXtreme Scale for developers. You will also learn how to configure WebSphere eXtreme Scale in Liberty. And finally, a sample web application is included that demonstrates HTTP session failover to an in-memory datagrid that is hosted by WebSphere eXtreme Scale.</p>	<p>List video contents:</p> <p>Show Quick Demo, Set-Up, and Sample of Liberty with WXS</p> <p>Overview of Session and Data Caching in WXS</p> <p>Quick Steps to Download Liberty &amp; WXS</p> <p>How to Configure WXS in Liberty</p> <p>Sample Web Application demonstrating HTTP Session Failover to an In-</p>

Table 15. Introduction (continued). Describe the benefits of session management with Liberty and WebSphere eXtreme Scale.

Scene	Audio	Onscreen Action
4	<p>Why is HTTP Session Persistence important? Without HTTP session persistence, you will lose the session data if an application instance fails or becomes unresponsive. For example, in a retail scenario where a user adds items to a shopping cart, that user will most likely have to log in again and rebuild their shopping list if the application fails and session failover is not enabled. Usually that experience creates an unhappy customer.</p> <p>Developers have 3 options to persist HTTP session data:</p> <p>First option: Developers can store sessions locally in the application server memory space, but other application server instances will not share the common user session for web applications. If the instance fails, the session is lost and the user experience is less than desirable.</p> <p>Second option: Developers can persist sessions in a relational database that is shared among instances, but the architecture of relational databases have inherent scalability concerns and reading or writing to a disk is slower than on an in-memory data grid.</p> <p>The third and best option is what this video highlights, where Liberty uses a shared persistence engine to store HTTP session data in the memory of an elastic, scalable architecture, which is known as WebSphere eXtreme Scale. Using Liberty with WebSphere eXtreme Scale allows two or more independent Liberty instances to share a common user session for web applications. When one instance fails, the remaining instances can continue to serve user requests as if no failure had occurred.</p> <p>If maintaining HTTP session high availability is a priority, then use WebSphere eXtreme Scale. Even if a runtime instance fails, the customer session is maintained. The customer is unaware of the failure or maintenance activity, which allows a consistent customer experience without interruption or data loss.</p>	<p>Show information about HTTP session failover: Hands-On Demo: Session Cache HTTP Session Failover for Liberty</p> <p>Customer has an enterprise web application on Liberty, but they w</p>

Table 15. Introduction (continued). Describe the benefits of session management with Liberty and WebSphere eXtreme Scale.

Scene	Audio	Onscreen Action
5	<p>Using WebSphere eXtreme Scale with Liberty offers several benefits to developers:</p> <ul style="list-style-type: none"> <li>• Distributed data access for high availability</li> <li>• In-memory access with rapid retrieval</li> <li>• Scalability built in over traditional methods like relational databases or memory-to-memory session replication</li> <li>• Remote access to eliminate single points of failure</li> <li>• The benefit of a quick configuration in a Liberty environment</li> </ul>	<p>Show information about Liberty data caching: Liberty Data Caching with WXS</p> <p>Supports distributed caching scenarios for web and mobile applications.</p> <p>Store key and value objects in memory for fast access.</p> <p>Provides linear scalability, predictable performance, and fault tolerance. Replicates data so that cache components may be restarted without data loss.</p> <p>Caching is an example of a composable element that can be used to build...</p>

Table 16. Demo installing Liberty and WebSphere eXtreme Scale for Developers Liberty. Show commands and server.xml changes.

Scene	Audio	Onscreen Action
6	<p>To experience this capability, you can quickly install Liberty and WebSphere eXtreme Scale for Developers Liberty on your development machine:</p> <ol style="list-style-type: none"> <li>1. Go to WASdev.net.</li> <li>2. Download Liberty.</li> <li>3. Download WebSphere eXtreme Scale for Developers Liberty.</li> <li>4. Install the JAR files into the "hands on" directory, which is the example directory for this demo.</li> </ol>	<p>Show the steps:</p> <ol style="list-style-type: none"> <li>1. Go to the WASdev website.</li> <li>2. Select <b>Want to try the Beta?</b></li> <li>3. From <b>Liberty Repository</b>, select <b>WebSphere eXtreme Scale for Developers Liberty</b>.</li> <li>4. Install the JAR files in my c:\hands-on&gt; directory.</li> </ol>
7	<p>To demonstrate the capabilities of WebSphere eXtreme Scale as a shared, remote HTTP session data grid, you will see a sample application (from the displayed URL) that is deployed locally in the dropin directory of the Liberty web instances, which shows you some examples of placing and retrieving session objects to a data grid.</p>	<p>Show illustrations of the WebSphere eXtreme Scale HTTP session sample and the http://ibm.co/1umQ7iy URL.</p>
8	<p>You will learn how to configure Liberty instances to act as two Liberty web instances that are clients to a WebSphere eXtreme Scale data grid.</p> <p>You will set up a WebSphere eXtreme Scale server as a HTTP session store running on a separate Liberty JVM.</p> <p>And finally, you will configure the two Liberty web instances to store HTTP session data in the data grid of a WebSphere eXtreme Scale container.</p>	<p>Show information about HTTP session failover: Hands-On Demo: Session Cache</p> <p>HTTP Session Failover for Liberty</p> <p>Customer has an enterprise web application on Liberty, but they want...</p> <p>A graphic shows ServerA and ServerB in Liberty connected to a session cache.</p>

Table 17. Demo configuring Liberty to connect to the data grid. Show server configuration and testing in a browser.

Scene	Audio	Onscreen Action
9	<p>Now, you will learn to configure Liberty to connect to the data grid. By installing WebSphere eXtreme Scale with Liberty, you get access to features that you can use to manage HTTP session applications that are installed in Liberty.</p> <p>For the remote WXS_Session_Server Liberty instance, the server feature will be set. The server feature contains the capability for running an eXtreme Scale server, which means that both the eXtreme Scale catalog and container are running. Add the server feature when you want to run a catalog server in Liberty or when you want to deploy a data grid application into Liberty.</p> <p>The webGrid feature is to host a session management data grid in the WXS_Session_Server Liberty instance. A Liberty server can host a data grid that caches and then replicates HTTP session data for fault tolerance of applications.</p> <p>Use the webApp feature to enable session management for ServerA and ServerB Liberty instances. The webApp feature contains the capability to extend the Liberty application. Add the webApp feature when you want to replicate HTTP session data for fault tolerance. Remember to set the catalogHostPort to the host and port of the WXS_Session Server Liberty instance.</p>	<p>Show information about configuring a Liberty server.xml to run WXS:</p> <p>The server feature contains the capability for running an eXtreme Scale server, both catalog and container.</p> <pre data-bbox="850 405 1349 457">&lt;feature&gt;eXtremeScale.server-1.1&lt;/feature&gt; &lt;xsServer isCatalog="true"/&gt;</pre> <p>A Liberty server can host a data grid that caches data for applications to replicate HTTP session data for fault tolerance.</p> <pre data-bbox="850 579 1360 611">&lt;feature&gt;eXtremeScale.webGrid-1.1&lt;/feature&gt; &lt;xsWebGrid objectGridName="session" catalogHostPort="remoteHost:2600"&gt;</pre> <p>The webApp feature contains the capability to extend the Liberty web application. Add the webApp feature when you want to replicate HTTP session data for fault tolerance.</p> <pre data-bbox="850 785 1349 858">&lt;feature&gt;eXtremeScale.webApp-1.1&lt;/feature&gt; &lt;httpSession idReuse="true"/&gt; &lt;xsWebGrid objectGridName="session" catalogHostPort="localhost:2600"&gt;</pre>
10	<p>The Session Sample Application is now launched on both ServerA and ServerB instances.</p> <p>Now check that the session attribute in ServerA named Loc is empty.</p> <p>Also check that the same attribute for ServerB is empty as well.</p>	<p>Show a browser open on localhost:9080/ HttpSessionWAR/ and a browser open on localhost:9081/HttpSessionWAR/. Both browsers display the WebSphere eXtreme Scale Http Session Sample with no attribute values set.</p> <p>In the browser open on localhost:9080/ HttpSessionWAR/, show typing Loc for <b>Attribute</b> in <b>Getting an attribute</b> and clicking <b>Get Attribute</b>. The browser displays <b>Welcome back. Session attribute retrieved.</b> with the Loc attribute set to null. Then show clicking <b>Main Page</b> to return to the previous page.</p> <p>Show these same steps repeated in the browser open on localhost:9081/HttpSessionWAR/.</p>

Table 17. Demo configuring Liberty to connect to the data grid (continued). Show server configuration and testing in a browser.

Scene	Audio	Onscreen Action
11	<p>Now, specify NC as the value for the Loc session attribute in the data grid through Server A's application, and verify that it was set.</p> <p>Now let's go to the ServerB Session Application and retrieve the Session attribute Loc from the data grid.</p>	<p>In the browser open on localhost:9080/ HttpSessionWAR/, show typing Loc for <b>Attribute</b> and NC for <b>Value</b> in <b>Setting an attribute</b> and clicking <b>Set Attribute</b>. The browser displays <b>Welcome back. Session attribute set.</b> with the Loc attribute set to NC. Then show clicking <b>Main Page</b> to return to the previous page. Finally, show clicking <b>Get Attribute</b> and show that the Loc attribute is set to NC, and show clicking <b>Main Page</b> to return to the previous page.</p> <p>Show in the browser open on localhost:9081/ HttpSessionWAR/ clicking <b>Get Attribute</b> and show that the Loc attribute is set to NC. Then show clicking <b>Main Page</b> to return to the previous page.</p>
12	<p>Now you can test this configuration with a simulated, unplanned outage on ServerA by stopping the Liberty instance for ServerA and verifying that ServerB can still retrieve the Loc session attribute from the session cache of the data grid.</p>	<p>Show information about HTTP session failover: Hands-On Demo: Session Cache</p> <p>HTTP Session Failover for Liberty</p> <p>Demonstration of Server failure but Customer Experience is maintained</p> <p>A graphic shows ServerA and ServerB in Liberty. ServerA is crossed out and ServerB is connected to a session cache.</p>
13	<p>ServerA is still running. But the Server A Liberty Instance will be manually stopped using the command line.</p> <p>Now let's go to the browser that was hosting ServerA Session and refresh to show the unavailable Liberty instance.</p>	<p>Show the browser open on localhost:9080/ HttpSessionWAR/. Also show entering a command to stop ServerA at a command line at C:\hands-in\wlp\bin: server stop ServerA</p> <p>Show refreshing the browser open on localhost:9080/HttpSessionWAR/. The message This webpage is not available displays.</p>
14	<p>Now that Server A is down you can verify that ServerB can still detect the Session data in the data grid. To do so, change the Loc session attribute to the value, MD.</p>	<p>Show the browser open on localhost:9081/ HttpSessionWAR/ clicking <b>Get Attribute</b> and show that the Loc attribute is set to NC. Then show clicking <b>Main Page</b> to return to the previous page.</p> <p>Show typing Loc for <b>Attribute</b> and MD for <b>Value</b> in <b>Setting an attribute</b> and clicking <b>Set Attribute</b>. The browser displays <b>Welcome back. Session attribute set.</b> with the Loc attribute set to MD. Then show clicking <b>Main Page</b> to return to the previous page. Finally, show clicking <b>Get Attribute</b> and show that the Loc attribute is set to MD, and show clicking <b>Main Page</b> to return to the previous page.</p>

Table 17. Demo configuring Liberty to connect to the data grid (continued). Show server configuration and testing in a browser.

Scene	Audio	Onscreen Action
15	<p>Now you can simulate ServerA coming back online with the ability to retrieve the new Session value, MD, for attribute Loc, which was just set through ServerB.</p> <p>Now, the browser has been refreshed and points to Server A, where the value for the Loc attribute from the data grid is retrieved.</p>	<p>Show the browser open on localhost:9081/HttpSessionWAR/. Also show entering a command to start ServerA at a command line at C:\hands-in\wlp\bin:</p> <pre>server start ServerA</pre> <p>Show refreshing the browser open on localhost:9080/HttpSessionWAR/. The browser displays the WebSphere eXtreme Scale Http Session Sample with no attribute values set.</p> <p>Finally, show clicking <b>Get Attribute</b> for the Loc attribute to show that it is set to MD, and show clicking <b>Main Page</b> to return to the previous page.</p>

Table 18. Conclusion. Summarize the video content and point viewers to more information.

Scene	Audio	Onscreen Action
16	<p>Congratulations. You've just created your first Liberty cluster with two instances pointing to a shared in-memory data grid for HTTP session storage.</p>	<p>Show information about HTTP session failover:</p> <p>Hands-On Demo: Session Cache</p> <p>HTTP Session Failover for Liberty</p> <p>Demonstration of Server Recovery or additional Liberty Instances</p> <p>A graphic shows ServerA and ServerB in Liberty with both servers connected to a session cache.</p>
17	<p>In this video, you learned the benefits of using a cache for session persistence.</p> <p>No code changes are need to the application to leverage the WebSphere eXtreme Scale data grid.</p> <p>Data for each session persists even with a server outage.</p> <p>And WebSphere eXtreme Scale is scalable up to terabytes of data and can replicate data to thousands of nodes for fault tolerance and high availability.</p>	<p>Show information about Liberty session management:</p> <p>Liberty Session Management with WXS</p> <p>Special purpose elastic in memory cache for storing HTTP session</p> <p>Stores and persists HTTP session objects to the data grid so that</p> <p>No code change to applications using the J2EE standard HTTP sessi</p> <p>Data for each HTTP session survives on a server outage for an app</p> <p>Requires no developer effort to manage</p> <p>Replicates the session data to avoid a single point of failure.</p> <p>Provides low latency data access, transactional semantics.</p>

## Video: Configuring a Liberty auto-scalable cluster for JVM elasticity

The following transcript is for the “Configuring a Liberty auto-scalable cluster for JVM elasticity” video, which demonstrates how to configure a collective to support Java virtual machine (JVM) elasticity. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content shown in the video.

 Configuring a Liberty auto-scalable cluster for JVM elasticity

*Table 19. Title page.* Show title and then animation that illustrates autonomic starting and stopping of servers based on resource use.

Scene	Audio	Onscreen Action
1	This video shows how to configure a Liberty collective to support Java virtual machine (or JVM) elasticity.	Show title <i>Configuring a Liberty auto-scalable cluster for JVM elasticity</i> .
2	With JVM elasticity, a Liberty scaling controller can start or stop cluster members based on resource use. When resource use goes up, the scaling controller starts cluster members. When resource use goes down, the scaling controller stops cluster members. The IBM Java development kits (or JDKs) on the computers that host the cluster members provide the data on resource use.	Show animation of scaling controller stopping and starting cluster member servers. When resource use goes up, the scaling controller starts member servers. When resource use goes down, the scaling controller stops member servers.

*Table 20. Demo configuring the scaling controller.* Show adding the scalingController-1.0 feature to the server.xml file of a collective controller.

Scene	Audio	Onscreen Action
3	To set up an auto-scalable cluster, you need at least one collective controller with at least two member servers joined to the controller. I have a collective controller with three member servers.  What you see here is my collective controller and member servers in the Explore tool of the Liberty Admin Center.  You also can see the server.xml file of the collective controller. I added the adminCenter-1.0 feature to the server.xml to view the collective's servers in Admin Center.	Show the four servers in the Explore tool of Admin Center.  Also show an editor open on the server.xml file of the collective controller, which has: <pre>&lt;featureManager&gt;   &lt;feature&gt;jsp-2.2&lt;/feature&gt;   &lt;feature&gt;adminCenter-1.0&lt;/feature&gt; &lt;/featureManager&gt;</pre>
4	To make my collective controller a scaling controller, I add the scalingController-1.0 feature to its server.xml file. You can add the scalingController-1.0 feature to either feature manager. My preference is to add it below the collectiveController-1.0 feature.  Save the file.	In the editor open on the controller server.xml file, add the scalingController-1.0 feature to a feature manager: <pre>&lt;featureManager&gt;   &lt;feature&gt;collectiveController-1.0&lt;/feature&gt;   &lt;feature&gt;scalingController-1.0&lt;/feature&gt; &lt;/featureManager&gt;</pre> Then, save the file.
5	After adding the feature, I want to ensure the scaling controller feature is installed and activated. Before I enable auto scaling for the members, I want to see the message This server is elected to be the primary scaling controller in the controller's message log.	Open an editor on the controller messages.log file and scroll to the end of the log.

Table 20. Demo configuring the scaling controller (continued). Show adding the scalingController-1.0 feature to the server.xml file of a collective controller.

Scene	Audio	Onscreen Action
6	myController is now the primary scaling controller so I can enable its members to be dynamic cluster members.	In the controller messages.log file, highlight the message: CWWKV0102I: This server is elected to be the primary scaling cont

Table 21. Demo configuring a member server for auto scaling. Show adding the clusterMember-1.0 and scalingMember-1.0 features to the server.xml file of a collective member.

Scene	Audio	Onscreen Action
7	To make a collective member a <i>dynamic cluster member</i> , I add the clusterMember-1.0 feature and the scalingMember-1.0 feature to a feature manager of the collective member. I can add the features below the jsp-2.2 feature or below the collectiveMember-1.0 feature. I am adding the features below the collectiveMember-1.0 feature.	In an editor open on the server.xml file of the myMember collective member, add the clusterMember-1.0 and scalingMember-1.0 features to a feature manager: <pre>&lt;featureManager&gt;   &lt;feature&gt;collectiveMember.0&lt;/feature&gt;   &lt;feature&gt;clusterMember-1.0&lt;/feature&gt;   &lt;feature&gt;scalingMember-1.0&lt;/feature&gt; &lt;/featureManager&gt;</pre>
8	I also add a hostSingleton element to the server.xml file. I specify a hostSingleton name of ScalingMemberSingletonService and a port number of 5164. You can specify any port number, but the port number must be unique on the host computer.  All scaling members on the same host must use the same hostSingleton port.	In the editor open on the myMember server.xml file, add the hostSingleton element: <pre>&lt;hostSingleton name="ScalingMemberSingletonService" port="5164" /&gt;</pre>
9	I save the file.  For the scaling controller to recognize these changes to a member configuration, the member must be running.	Save the myMember server.xml file.  The auto scaling icon displays on the myMember card in the Explore tool.
10	To make sure that the scaling member feature is activated, I look at the member messages.  The messages show that the scaling member feature is activated, ScalingMemberSingletonService is elected the host leader, and the messenger connection goes to my scaling controller.	Open an editor on the myMember messages.log file and highlight the messages: CWWKV0200I: The ScalingMember feature is activated. ... CWWKV0203I: Server host=wasid.raleigh.ibm.com; userdir=C:/wlp/usr

Table 21. Demo configuring a member server for auto scaling (continued). Show adding the clusterMember-1.0 and scalingMember-1.0 features to the server.xml file of a collective member.

Scene	Audio	Onscreen Action
11	<p>I now copy the changes that I've made to myMember's server.xml file and make similar changes to the server.xml files of the other collective members.</p> <p>Notice that after I save the changes, an auto scaling icon displays on the member cards in the Explore tool.</p>	<p>In the editor open on the myMember server.xml file, copy the following elements:</p> <pre>&lt;featureManager&gt;   &lt;feature&gt;collectiveMember.0&lt;/feature&gt;   &lt;feature&gt;clusterMember-1.0&lt;/feature&gt;   &lt;feature&gt;scalingMember-1.0&lt;/feature&gt; &lt;/featureManager&gt;</pre> <p>&lt;hostSingleton name="ScalingMemberSingletonService" port="5164" /&gt;</p> <p>Then, highlight the second feature manager in the myMember2 server.xml file:</p> <pre>&lt;featureManager&gt;   &lt;feature&gt;collectiveMember.0&lt;/feature&gt; &lt;/featureManager&gt;</pre> <p>Paste the copied elements into the file, and save the changes.</p> <p>The auto scaling icon displays on the myMember2 card in the Explore tool. Position the cursor over the auto scaling icon on the myMember and MyMember2 cards.</p> <p>Repeat this scene for myMember3.</p>
12	<p>Because I did not specify a cluster name, the dynamic cluster members are added to the defaultCluster.</p> <p>I now have three dynamic cluster members joined to my scaling controller.</p>	<p>The name of the cluster, defaultCluster, displays on the member cards in the Explore tool.</p>

Table 22. Demo changing a default scaling policy. Mention the default scaling policies and demo changing a scaling policy.

Scene	Audio	Onscreen Action
13	<p>One of the default scaling policies requires that at least two dynamic cluster members be running.</p> <p>The other default scaling policies control when a dynamic cluster member is started or stopped. A member is started when the average members' resource use exceeds 90%. And a member is stopped when the average resource use is less than 30%.</p> <p>I'm going to change the first default scaling policy to require that only one to two dynamic cluster members be running. Because I have three members, one of the members should stop.</p>	<p>List information about the default scaling policies:</p> <p>Default scaling policies</p> <p>At least two cluster members are active</p> <p>Another cluster member starts when the average CPU, process memory u</p> <p>A cluster member stops when the average CPU, process memory, and hea</p>

Table 22. Demo changing a default scaling policy (continued). Mention the default scaling policies and demo changing a scaling policy.

Scene	Audio	Onscreen Action
14	I go to the scaling controller server.xml file and add a scaling definition that sets minimum equal to 1 and maximum equal to 2 for the default scaling policy.  Save the changes.	In the editor open on the server.xml file of the collective controller, add:  <pre>&lt;scalingDefinitions&gt;   &lt;defaultScalingPolicy enabled="true" min="1" max="2"/&gt; &lt;/scalingDefinitions&gt;</pre> Then, save the file changes.
15	The Explore tool shows that the scaling controller stopped one of the dynamic cluster members because of my change to the default scaling policy.  I have configured an auto-scalable cluster with JVM elasticity.	In the Explore tool, the number of stopped servers changes from 0 to 1. The status of myMember3 goes from running, to stopping, to stopped.

Table 23. Conclusion. Show where to find more information about auto scaling with JVM elasticity.

Scene	Audio	Onscreen Action
16	For more information about Liberty auto scaling and changing the default scaling policies, see WASdev.net and the WebSphere Application Server Liberty documentation on IBM Knowledge Center. ## Video: Configuring an auto-scalable cluster for Liberty elasticity

8.5.5.7

The following transcript is for the “Configuring an auto-scalable cluster for Liberty elasticity” video, which demonstrates how to configure a collective to support Liberty server elasticity. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content shown in the video.

### Configuring an auto-scalable cluster for Liberty elasticity

Table 24. Title page. Show title and then animation that illustrates autonomic provisioning and then starting and stopping of servers based on resource use.

Scene	Audio	Onscreen Action
1	This video shows how to configure an auto-scalable cluster for Liberty elasticity.	Show title <i>Configuring an auto-scalable cluster for Liberty elasticity</i> .

Table 24. Title page (continued). Show title and then animation that illustrates autonomic provisioning and then starting and stopping of servers based on resource use.

Scene	Audio	Onscreen Action
2	<p>With Liberty elasticity, you have autonomic starting and stopping of cluster members based on scaling policies and resource use, just like with JVM elasticity.</p> <p>But you also have autonomic provisioning of new cluster members to other hosts.</p> <p>Even if a host doesn't have Liberty installed, Liberty elasticity can autonomously install on that host what's called a <i>stack</i> of Liberty software--the Liberty runtime, an IBM JRE, and a Liberty server with your applications--and then autonomously start and stop those installed Liberty servers and their applications. This gives you greater capacity to handle spikes in resource demand.</p> <p>What you see here is a scaling controller provisioning a stack group of Liberty software to hosts registered with the controller when resource use goes up, and then stopping or starting the provisioned cluster member servers and their applications in response to resource demands. You determine what Liberty software needs to be in a stack group based on what Liberty software is available on a registered host.</p>	<p>Show heading <i>Liberty elasticity auto scaling</i>.</p> <p>Show information <i>Autonomic starting and stopping of cluster members based on scaling policies and resource use (JVM elasticity)</i>. Show animation of a scaling controller starting and stopping Liberty server cluster members on a registered host computer. When an arrow representing resource use points upward, show scaling member servers on the registered host going from stopped to running. Then, when the arrow representing resource use points downward, show scaling member servers on the registered host going from running to stopped.</p> <p>Show information + <i>Autonomic provisioning of new cluster members to other hosts</i>. Show animation of a scaling controller provisioning new scaling members to two registered hosts and then starting and stopping those member servers based on the position of an arrow representing resource use.</p> <p>Show information <i>What's in a stack group?</i>. Show animation of a stack of Liberty software moving to two registered hosts. The registered host without an IBM JRE that supports Liberty servers in JAVA_HOME path receives:</p> <ul style="list-style-type: none"> <li>• Liberty runtime (wlp)</li> <li>• IBM JRE (wlp.jre)</li> <li>• Liberty server package (wlp.usr)</li> </ul> <p>The registered host with an IBM JRE that supports Liberty servers in JAVA_HOME path receives:</p> <ul style="list-style-type: none"> <li>• Liberty runtime (wlp)</li> <li>• Liberty server package (wlp.usr)</li> </ul>

Table 25. Demo configuring a scaling controller. Show configuring a scaling controller.

Scene	Audio	Onscreen Action
3	I begin by creating a server. At the wlp/bin directory of my Liberty installation, I run the server <b>create</b> command and name the server myController.	<p>Show heading <i>1 Configure a scaling controller</i>.</p> <p>Show a command window open at wlp/bin, and run a command that creates a server:</p> <pre>server create myController</pre> <p>Then show the message Server myController created.</p>
4	To make this server a collective controller, I run the collective <b>create</b> command. The command, by default, writes output to a console screen. You can specify the --createConfigFile option to write the output to a file instead.	In the command window open at wlp/bin, run a command that makes the server a collective controller:
5	I copy the output and paste it into the server.xml file of myController.	Show the generated controller configuration. Then, show marking and copying the configuration in the command window. And finally, show opening an editor on the wlp/usr/servers/myController/server.xml file and pasting the configuration into the file above the </server> tag.

Table 25. Demo configuring a scaling controller (continued). Show configuring a scaling controller.

Scene	Audio	Onscreen Action
6	<p>I specify adminUser and adminPassword for the controller administrative user name and password.</p> <p>I add host="*" to the httpEndpoint element. This is optional.</p> <p>To make myController a scaling controller, I add the scalingController-1.0 feature to a featureManager element.</p> <p>I also add the adminCenter-1.0 feature so I can view my collective in Admin Center. And finally, add a scaling policy. I begin with a scaling policy that is disabled and has a minimum and maximum of one server.</p>	<p>In the editor, show the following changes to the controller server.xml file:</p> <ol style="list-style-type: none"> <li>1. Add an administrative user name and password.  <code>&lt;quickStartSecurity userName="adminUser" userPassword="adminPassword"/&gt;</code>                      Show information <i>Add an administrative user name and password.</i></li> <li>2. Add host="*" to the httpEndpoint element.</li> <li>3. Add features to make myController a scaling controller and to enable administration of myController in Admin Center to a featureManager element.  <code>&lt;feature&gt;scalingController-1.0&lt;/feature&gt;</code>  <code>&lt;feature&gt;adminCenter-1.0&lt;/feature&gt;</code>                      Show information <i>The scalingController-1.0 feature is required for a scaling controller and then The adminCenter-1.0 feature is optional for a scaling controller but needed for this example to use Admin Center.</i></li> <li>4. Add a scaling policy that is disabled and has a minimum and maximum of one server.  <code>&lt;scalingDefinitions&gt;</code>  <code>  &lt;defaultScalingPolicy enabled="false" min="1" max="1"/&gt;</code>  <code>&lt;/scalingDefinitions&gt;</code>                      Show information <i>Add a scaling policy. Start with the scaling policy disabled.</i></li> <li>5. Save the file.</li> </ol>
7	<p>To start myController, run the server <b>start</b> command at a wlp/bin command line.</p>	<p>At an SSH service command line, enter commands that move to the wlp/bin directory and then start the controller.</p> <pre>cd /cygdrive/c/wlp/bin ./server start myController</pre> <p>Show information <i>On Windows computers, using an SSH service to start servers enables a controller to connect to member servers with SSH. The command runs and messages in the command window show myController started.</i></p>

Table 26. Demo going to the Servers page of the Admin Center Explore tool. Show opening a browser on Admin Center, logging in, and displaying the Servers page of the Explore tool.

Scene	Audio	Onscreen Action
8	<p>To view myController in Admin Center, open a browser on the <code>https://controller_host_name:controller_port_number/adminCenter/</code> URL.</p> <p>If your browser prompts you to confirm that the connection is trusted, specify an exception or otherwise enable the connection to Admin Center. Go to the Explore tool Servers page.</p>	<p>Show heading <i>Optional: View servers in Admin Center.</i></p> <p>In a web browser:</p> <ol style="list-style-type: none"> <li>1. Open the browser on the <code>https://controller_host_name:9443/adminCenter/adminCenter/</code> URL.</li> <li>2. Select to trust the connection.</li> <li>3. On the Admin Center login page, enter adminUser for the user name and adminPassword for the password. In the editor, highlight the user name and password in the scaling controller server.xml file at the same time to show needed login values.</li> <li>4. On the Toolbox page, select .</li> <li>5. In the Explore tool, select the Servers panel. The Explore tool shows one running server, myController.</li> </ol>

Table 27. Demo configuring a scaling member. Show creating a server, joining it as a member server to the controller, and then configuring it to be a scaling member.

Scene	Audio	Onscreen Action
9	I now make a scaling member. At a wlp/bin command prompt, I run the server <b>create</b> command and name the server myMember.	Show heading 2 <i>Configure a scaling member</i> .  Show command window open at wlp/bin, and run: server create myMember  Then show the message Server myMember created.
10	To join this server to the collective, I run the collective <b>join</b> command. You can get the --host, --port, --user and --password values from the controller server.xml file. For --keystorePassword, set a value to use for the member keystore password. The --hostName parameter is optional.	In command window open at wlp/bin, run: collective join myMember --host=controller_host_name --hostName=host_name --port=9443 --use  After a message asking whether to accept the certificate chain displays, enter y.
11	I now copy the output and paste it into the myMember server.xml. You can specify the --createConfigFile option to write the output to a file instead.	Show marking and copying the generated configuration in the command window. Then, show opening an editor on the wlp/usr/servers/myMember/server.xml file and pasting the configuration into the file above the </server> tag.

Table 27. Demo configuring a scaling member (continued). Show creating a server, joining it as a member server to the controller, and then configuring it to be a scaling member.

Scene	Audio	Onscreen Action
12	<p>In the member server.xml file, I set the RPC user and password, which are the user name and password that I enter to log on to this Windows computer. The user must have administrative privileges on the computer.</p> <p>In this example, the controller and member are on the same host, so I need to change the port numbers. If your member server is on a different host from the controller, ensure the ports are unique on that host.</p> <p>Add the scalingMember-1.0 feature to make the member server a scaling member.</p> <p>Add a hostSingleton element and set its port to a number that is unique on the host. The host singleton port is used by all Liberty servers on the same host to elect a leader. The job of the leader is to report aggregated scaling metrics for all servers on the host. If the leader stops running, another leader is elected.</p>	<p>In the editor, show the following changes to the member server.xml file:</p> <ol style="list-style-type: none"> <li>1. Set the RPC user and password, which is the user name and password that you enter to log on to the computer. The user must have administrative privileges on the computer.  <pre>&lt;hostAuthInfo rpcUser="admin_user_id"               rpcUserPassword="admin_user_password" /&gt;</pre> </li> <li>2. Change the port numbers from 9080 to 9081 and 9443 to 9444 so that the member ports are different from the controller ports and from other ports used on the computer.  <pre>&lt;httpEndpoint id="defaultHttpEndpoint"               httpPort="9081"               httpsPort="9444" /&gt;</pre> </li> <li>3. Make myMember a scaling member by adding scalingMember-1.0 to a featureManager element.  <pre>&lt;feature&gt;scalingMember-1.0&lt;/feature&gt;</pre> <p>Show information <i>The scalingMember-1.0 feature is required for a scaling member. You can add both clusterMember-1.0 and scalingMember-1.0 or add only scalingMember-1.0. You don't need clusterMember-1.0 because the scalingMember-1.0 feature enables the clusterMember-1.0 feature.</i></p> </li> <li>4. Add a hostSingleton element and set its port to 5164 or any other port that is unique on the computer.  <pre>&lt;hostSingleton name="ScalingMemberSingletonService" port="5164" /&gt;</pre> <p>Show information <i>A scaling member server.xml file must define a hostSingleton element with a port. All scaling members on the same host must use the same port. You can specify any port number, but the port number must be unique on the host computer. This example uses port number 5164.</i></p> </li> <li>5. Save the file.</li> </ol> <p>On the Admin Center Explore tool Servers page, myMember is shown as stopped.</p>
13	<p>Start myMember.</p>	<p>At an SSH service command line on the wlp/bin directory, start the scaling member.</p> <pre>./server start myMember</pre> <p>The command runs and the messages showing myMember started display in the command window. On the Admin Center Explore tool Servers page, myMember is shown as started.</p>

Table 28. Demo verifying that JVM elasticity auto scaling is working. Show enabling the scaling policy, with the auto scaling icon displaying on the Servers page of the Admin Center Explore tool, and then disabling the scaling policy.

Scene	Audio	Onscreen Action
14	I want to test the auto scaling. In the controller server.xml file, I enable the scaling policy and save the file.	<p>Show heading <i>Optional: Test the scaling configuration.</i></p> <p>In the editor open on the controller server.xml file, enable auto scaling. Change:  <code>&lt;defaultScalingPolicy enabled="false" min="1" max="1"/&gt;</code>                      to:  <code>&lt;defaultScalingPolicy enabled="true" min="1" max="1"/&gt;</code></p> <p>On the Admin Center Explore tool Servers page, the auto scaling icon  displays on the myMember card, indicating that the scaling policy is enabled. Show information <i>When scaling policies are enabled, scaling members have an auto scaling icon in Admin Center.</i></p>
15	At this time, the configuration has JVM elasticity. The scaling controller can start and stop scaling members based on scaling policies and resource use.	<p>To verify that JVM elasticity auto scaling is working, change the min value to 0 in the editor:  <code>&lt;defaultScalingPolicy enabled="true" min="0" max="1"/&gt;</code></p> <p>Show information <i>Setting the minimum to 0 (zero) stops the scaling member.</i> On the Admin Center Explore tool Servers page, myMember status changes from started to stopped, indicating that JVM elasticity auto scaling is working.</p>
16		<p>In the editor open on the controller server.xml file, change the min value back to 1:  <code>&lt;defaultScalingPolicy enabled="true" min="1" max="1"/&gt;</code></p> <p>Show information <i>Setting the minimum to 1 (one) restarts the scaling member.</i> On the Admin Center Explore tool Servers page, myMember status changes from stopped to started, indicating that JVM elasticity auto scaling is working.</p>
17	Because I haven't yet set up the configuration for Liberty elasticity, I disable the scaling policy.	<p>In the editor open on the controller server.xml file, disable auto scaling.  <code>&lt;defaultScalingPolicy enabled="false" min="1" max="1"/&gt;</code></p> <p>Show information <i>Testing confirms that auto scaling is working. For this example, temporarily disable scaling policies until the stack group and its installables and packages are defined.</i> On the Admin Center Explore tool Servers page, the auto scaling icon  is no longer shown on the myMember card, indicating that scaling policies are disabled.</p>

Table 29. Demo adding a stack group cluster name to the member server.xml file. Show assigning the member to myStackGroup.cluster1. By default, cluster members are in defaultCluster.

Scene	Audio	Onscreen Action
18	<p>In the member server.xml file, I add a statement that puts the member in a cluster named myStackGroup.cluster1. I am going to make the myStackGroup directory and put installables and packages for Liberty elasticity auto scaling into it. You can use the default stack group name, defaultStackGroup. cluster1 is the name of the server package that I'm going to make.</p> <p>If your collective has other dynamic cluster members, add the same statement to the other member server.xml files so they belong to the same cluster.</p>	<p>Show heading 3 <i>Add the scaling member to a cluster named stack_group_name.provisionable_cluster_name.</i></p> <p>In the editor open on the member server.xml file, add a statement that puts the member in a cluster named myStackGroup.cluster1:  <code>&lt;clusterMember name="myStackGroup.cluster1"/&gt;</code></p> <p>Show information <i>myStackGroup is the name of the stack group directory that will hold installables and packages for Liberty elasticity auto scaling and cluster1 is the name of the server package that the scaling controller will provision to registered hosts.</i> On the Admin Center Explore tool Servers page, the name of the cluster for myMember changes from defaultCluster to myStackGroup.cluster1.</p>

Table 30. Demo registering a target host. Show running the registerHost command to register a target host with the collective controller.

Scene	Audio	Onscreen Action
19	<p>I want Liberty elasticity auto scaling to install cluster1 on a different host.</p> <p>I run the collective <b>registerHost</b> command and specify a Linux machine for the target host. You can run additional <b>registerHost</b> commands and register more than one target host.</p>	<p>Show heading 4 <i>Register a host, to which the scaling controller will provision servers based on scaling policies.</i></p> <p>Show a command window open at wlp/bin, and then run a command to register the target host:  <code>collective registerHost target_host_name --host=controller_host_name --port=9443 --user=</code></p> <p>After a message asking whether you want to accept the certificate chain displays, enter y. Then show a message confirming the host registered successfully.</p>
20		<p>In Admin Center, select , the Dashboard icon, to return to the Explore tool Dashboard, select the Hosts panel, show that the registered host has been added, and then return to the Servers page.</p>
21	<p>If the registered host has no Liberty software, which is the case here, then the stack group needs to contain a Liberty runtime, IBM JRE, and a Liberty server package with applications.</p>	<p>Show the file system of the registered host.</p> <p>Show information <i>For this example, the registered host does not have Liberty or an IBM JRE that supports Liberty installed. Liberty elasticity auto scaling will need to provision to the registered host:</i></p> <ul style="list-style-type: none"> <li>• Liberty runtime installable (wlp)</li> <li>• JRE installable (wlp.jre)</li> <li>• Server package (wlp.usr)</li> </ul>

Table 31. Demo creating the stackGroups/myStackGroup directories. Show creating the wlp/usr/shared/stackGroups/myStackGroup directory with its installables and packages subdirectories.

Scene	Audio	Onscreen Action
22	<p>I'm now going to create the myStackGroup directory. This directory name is the same as what's in the cluster name.</p> <p>I copy the defaultStackGroup directory, and rename it.I'll be putting Liberty software that I want the scaling controller to install on the registered host in the installables and packages subdirectories.</p>	<p>Show heading <i>Optional: Create your own stack group subdirectories if you don't want to use the default stack group.</i></p> <p>Show a file system browser and move to the wlp/usr/shared/stackGroups directory. Copy the defaultStackGroup directory, paste it into the stackGroups directory, and rename the pasted directory myStackGroup. Then show the installables and packages subdirectories.</p>

Table 32. Demo creating the Liberty runtime installable and adding it to the stackGroups/myStackGroup/installables directory. Show running a **package** command to create wlp.855.zip and then adding the file to the wlp/usr/shared/stackGroups/myStackGroup/installables directory.

Scene	Audio	Onscreen Action
23		<p>Show heading <i>5 Create a Liberty runtime installable named the wlp.name.zip naming convention.</i></p> <p>Show a file system browser and move to the wlp_installable directory. Show that the directory is empty.</p>
24	<p>To create a Liberty runtime archive, I run the server <b>package</b> command with the --include=wlp option. This creates an archive that contains the wlp directory, but does not contain the usr directory. The archive name, wlp.855.zip, follows the naming convention.</p>	<p>Show a command window open at wlp/bin, and then run a <b>package</b> command to create a Liberty runtime installable named wlp.855.zip to go in the wlp_installable empty directory:</p> <pre>server package --include=wlp --archive=c:\wlp_installable\wlp.855.zip</pre> <p>The command runs and the messages show c:\wlp_installable\wlp.855.zip packaging completed.</p>
25	<p>Copy the archive to the stack group installables directory.</p>	<p>In the file system browser, copy wlp.855.zip and paste it into the wlp/usr/shared/stackGroups/myStackGroup/installables directory.</p>

Table 33. Demo creating the JRE installable and adding it to the `stackGroups/myStackGroup/installables` directory. Show compressing the contents of the `java` directory of a Liberty JRE installation to create `jre.17.zip` and then adding the file to the `wlp/usr/shared/stackGroups/myStackGroup/installables` directory.

Scene	Audio	Onscreen Action
26	<p>To create an IBM JRE that supports Liberty servers, zip up the contents of the <code>java</code> directory of the JRE used for Liberty.</p> <p>Move the archive to the stack group <code>installables</code> directory.</p>	<p>Show heading 6 <i>Create a JRE installable named with the <code>jre.name.zip</code> naming convention if the registered host doesn't have or use an IBM JRE that supports Liberty servers.</i></p> <p>Show a file system browser and move to the <code>java</code> directory of a Liberty JRE installation. Show compressing the contents of the <code>java</code> directory to create <code>jre.17.zip</code>. Then copy the file and paste it into the <code>wlp/usr/shared/stackGroups/myStackGroup/installables</code> directory.</p> <p>Show information: <i>The JRE installable must be appropriate for the operating system of the registered hosts</i></p>

Table 34. Demo creating the `cluster1` server package and adding to the `myStackGroup/packages` directory. Show running the `create` command to create a server named `cluster1`, pasting an application into the `dropins` directory of `cluster1`, running a `package` command to create `cluster1.zip`, and then adding the file to the `wlp/usr/shared/stackGroups/myStackGroup/packages` directory.

Scene	Audio	Onscreen Action
27	<p>To create the <code>cluster1</code> server package, create a server named <code>cluster1</code>.</p>	<p>Show heading 7 <i>Create a server package, which the scaling controller will provision to the registered host based on scaling policies. This example packages a server named <code>cluster1</code> that has an application in its <code>dropins</code> directory..</i></p> <p>Show a command window open at <code>wlp/bin</code>, and run:  <code>server create cluster1</code></p> <p>Then show the message <code>Server cluster1 created.</code></p>
28	<p>Add one or more applications to it.</p>	<p>In a file system browser, paste an application into <code>wlp/usr/servers/cluster1/dropins</code> to add an application to the server.</p>
29	<p>And run the <b>server package cluster1</b> command with the <code>--include=usr</code> option. This creates a server package that contains the <code>usr</code> directory, but does not contain all the Liberty runtime files.</p>	<p>In the command window at <code>wlp/bin</code>, run:  <code>server package cluster1 --include=usr</code></p> <p>Then show the message confirming package creation and its location.</p> <p>Show information: <i>For Windows registered hosts, create a <code>server.env</code> file that sets <code>JAVA_HOME</code> to the JRE location on the registered hosts. Place the <code>server.env</code> in the same directory as the <code>server.xml</code> in the server package ZIP. Example <code>server.env</code> file contents: <code>JAVA_HOME=C:\wlp\jre\jre.17.zip\jre</code></i></p>
30	<p>Copy the zip file to the stack group <code>packages</code> directory.</p>	<p>In the file system browser, copy <code>wlp/usr/servers/cluster1/cluster1.zip</code> and paste it into the <code>wlp/usr/shared/stackGroups/myStackGroup/packages</code> directory.</p>

Table 35. Demo setting a user name and password for the stack manager in the scaling controller server.xml file. Show adding a stackManager element with the administrative user name and password to the scaling controller server.xml file.

Scene	Audio	Onscreen Action
31	In the controller server.xml file, add a statement that sets the user name and password for the stack manager.	Show heading 8 Add a stackManager element to the scaling controller configuration.  In the editor open on the scaling controller server.xml file, add a statement that sets the administrative user name and password for the stack manager: <code>&lt;stackManager controllerUser="adminUser" controllerUserPassword="adminPassword" /&gt;</code>  Then, save the file.

Table 36. Demo changing the scaling policy to force the scaling controller to provision a new server on the registered host. Show changing the scaling policy in the scaling controller server.xml file to enable auto scaling and require a minimum of two servers. Then show a server added to the Admin Center Explore tool Servers page.

Scene	Audio	Onscreen Action
32	I'm now ready to test the Liberty elasticity auto scaling. I can force the scaling controller to provision the Liberty software to the registered host by increasing the min and max values and enabling the scaling policy.  After I save the changes, I wait for Admin Center to display the provisioned member server. As you can see, the scaling controller installed a cluster1 member on the registered host then started the member and its application.	Show heading 9 Set scaling policy min and max values that force the scaling controller to provision a new server, and enable scaling policies.  In the editor open on the scaling controller server.xml file, increase the min and max values from 1 to 2 and enable auto scaling by changing enabled from false to true: <code>&lt;scalingDefinitions&gt;   &lt;defaultScalingPolicy enabled="true" min="2" max="2"/&gt; &lt;/scalingDefinitions&gt;</code>  Then, save the changes.  Show information Provisioning installables and a server package to a registered host can take several minutes. The Admin Center Explore tool Servers page shows a cluster1 server provisioned on the registered host. Its status changes from stopped to started.
33	Liberty elasticity auto scaling is working so I set the min and max values to what I want for the auto scaling. The provisioned member will start and stop based on scaling policies and resource use.	In the editor open on the scaling controller server.xml file, decrease the min value from 2 to 1: <code>&lt;scalingDefinitions&gt;   &lt;defaultScalingPolicy enabled="true" min="1" max="2"/&gt; &lt;/scalingDefinitions&gt;</code>  Then, save the changes.  Show information This example sets min=1 and max=2 for the minimum and maximum number of member servers available for auto scaling. You can set a higher maximum, such as max=4, to enable additional cluster1 member servers to be provisioned on the registered host. The scaling controller can start provisioned member servers when resource use increases and stop the member servers when resource use decreases. The Admin Center Explore tool Servers page shows the provisioned cluster1 server status change from started to stopped, or from stopped to started, indicating that Liberty elasticity auto scaling is working.

*Table 37. Show new directories and files on the registered host. Show that the registered host now has the wlp, wlp.jre, and wlp.usr directories for the Liberty runtime and JRE installables and cluster1 server package on the registered host.*

Scene	Audio	Onscreen Action
34		Show heading <i>Registered host before auto scaling</i> with a screen capture of a file system browser on the registered host, which has no wlp directories. Show heading <i>Registered host after auto scaling</i> with a screen capture of the file system browser on the registered host with the wlp, wlp.jre, and wlp.usr directories.
35	The registered host now has the wlp, wlp.jre, and wlp.usr directories for the Liberty runtime and JRE installables and cluster1 server package.	Show heading <i>Registered host after auto scaling</i> . Show a screen capture of the file system browser on the registered host with the wlp, wlp.jre, and wlp.usr directories for the Liberty runtime and JRE installables and cluster1 server package highlighted. Show information <i>Liberty runtime installable, IBM JRE installable, and cluster1 server package</i> .

*Table 38. Conclusion. Show where to find more information about auto scaling with Liberty elasticity.*

Scene	Audio	Onscreen Action
36	For more information about auto scaling in Liberty, see WASdev.net and the Liberty documentation on IBM Knowledge Center.	Show the following text:  For more information about Liberty auto scaling, see:  <b>WASdev</b> <a href="http://developer.ibm.com/wasdev">http://developer.ibm.com/wasdev</a>  <b>WebSphere Application Server Liberty documentation on IBM Knowledge Center</b> <a href="http://www.ibm.com/support/knowledgecenter/">http://www.ibm.com/support/knowledgecenter/</a>

For more information, see “Configuring provisionable clusters for Liberty elasticity” on page 1506.

## Video: DevOps with WebSphere Liberty Server

8.5.5.5

The following transcript is for the “DevOps with WebSphere Liberty Server” video, which demonstrates how to develop, build and deploy an application with Liberty server DevOps and some open source tools. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content that is shown in the video.

### Demo - DevOps with WebSphere Liberty Server

*Table 39. Title page. Show title and then a basic overview of building, updating, testing, and deploying an application.*

Scene	Audio	Onscreen Action
1	This demo will show you how to provide the capability for building and deploying your application with WebSphere Liberty Server and a set of common open source tools.	Show title <i>Demo - DevOps with WebSphere Liberty Server</i> .
2	You will use Git for source control, use WebSphere Application Server Developer Tools to develop your application, and use Maven for build.	Show image of <i>1. Develop and Build Application</i> that uses the following options <ul style="list-style-type: none"> <li>• Git</li> <li>• WebSphere Developer Tools (WDT)</li> <li>• Maven</li> </ul>

Table 39. Title page (continued). Show title and then a basic overview of building, updating, testing, and deploying an application.

Scene	Audio	Onscreen Action
3	You will also make changes to your web application running in Liberty and push changes from Eclipse IDE to production environment.	Show image of 2. <i>Update Application</i> that uses WDT.
4	You will use Apache Maven together with the WebSphere Liberty Maven plug-in to run integration test to verify your changes.	Show image of 3. <i>Test Application</i> with the Liberty Maven plug-in.
5	You will also use Jenkins for continuous integration.	Show image of 4. <i>Continuous Integration</i> that uses Jenkins.
6	You will use Chef to push a new build to the production environment.  Liberty will be the Java Platform, Enterprise Edition run time for all the above DevOps scenarios. We will use an Airline application - AcmeAir as a sample in this demo. It will demonstrate a controllable and highly repeatable DevOps practice.	Show image of 5. <i>Continuous Deploy</i> that uses Chef.

Table 40. Demo of Developing and Building an Application

Scene	Audio	Onscreen Action
7	<p>Now lets start the first scenario: develop and build your application.</p> <p>Open Eclipse, which has WDT already preinstalled.</p> <ol style="list-style-type: none"> <li>1. We will set the workspace preference for use with Maven.</li> <li>2. Then we will clone a Git repository containing the AcmeAir application, specify the Git repository URI.</li> <li>3. Then we will import the set of Maven based AcmeAir projects: There are 5 Maven-based projects in this repository.</li> <li>4. Now we can run the Maven build to build the projects and create application artifacts. Make sure the build is successful when it finishes.</li> <li>5. Now we can create a Liberty server to run our application from Eclipse: So specify the Liberty install directory.</li> <li>6. And also name the Liberty server.</li> <li>7. Then we can open the server.xml to config the server to run our AcmeAir application. <ul style="list-style-type: none"> <li>• First we will specify the &lt;httpEndpoint&gt; endpoint.</li> <li>• And we will also add the database configuration, which refers to a Derby database for application data.</li> </ul> </li> <li>8. Start the WebSphere Liberty server and the AcmeAir application.</li> <li>9. Now login to the application and experience it.</li> <li>10. You can select your destination and the city from which you depart. Check those available airline tickets and book it.</li> </ol>	<p>Show title <i>Step 1 Develop and Build Application</i>.</p> <p>Demo showing the following steps to develop and build an application that uses WDT.</p> <p>Open Eclipse, which has WDT preinstalled.</p> <ol style="list-style-type: none"> <li>1. Set the workspace preferences for use with Maven. Click the <b>Set all Maven values</b> button.</li> <li>2. We will clone a Git repository containing the AcmeAir application by specify the Git repository URI.</li> <li>3. Import the set of Maven-based AcmeAir projects: The acmeair repository contains 5 Maven-based projects.</li> <li>4. Now run Maven to build the projects and create the application artifacts. Make sure that the build is successful when it finishes.</li> <li>5. Now we can create a WebSphere Liberty server to run the application from Eclipse: Specify the Liberty install directory.</li> <li>6. Name the server AcmeAirDemo and add the acmeair-webapp application into it.</li> <li>7. Open the server configuration server.xml file to configure the Liberty server for service. <ul style="list-style-type: none"> <li>• Replace the &lt;httpEndpoint&gt; element and add further configuration.</li> <li>• Add the database configuration, which refers to a Derby database for application data.</li> </ul> </li> <li>8. Start the WebSphere Liberty server and AcmeAir application.</li> <li>9. Click the <b>application URL</b> to verify that the application is active. Initialize the application by loading the flight data set.</li> <li>10. Now AcmeAir is ready for use. <ul style="list-style-type: none"> <li>• Logins to the application and click the <b>Flights</b> action and type in New York under <b>Leave From</b> and Paris under <b>Arrive At</b>.</li> <li>• Click the <b>Find Flights</b> or <b>Browse Flights</b> button.</li> <li>• Pick any outbound flight and select it by clicking it.</li> <li>• Pick any return flight and select it by clicking it.</li> <li>• Click the <b>Book Select Flights</b> button.</li> </ul> </li> </ol>

Table 41. Demo updating application

Scene	Audio	Onscreen Action
8	In scenario 2 we will make a quick change to our application and show how to do a continuous delivery with that. To simplify the scenario we will just make a very small change to our indexed page. To replace some highlighted content with ""Welcome to Acme Air"". Now after you save these changes, you can refresh to see that the change is in effect.	Show title <i>Step 2 Update Application</i>  Demo showing the Index page that is being updated in the application.

Table 42. Demo testing the application

Scene	Audio	Onscreen Action
9	<p>Next we will use Maven and the Liberty Maven plug-in for integration tests.</p> <ol style="list-style-type: none"> <li>1. The AcmeAir application has a acmeair-itests project that contains integration tests.</li> <li>2. To enable of the integration tests we will need to edit our pom.xml file. There are a few changes we need to make here, but the most important one is that we will enable and config the Liberty Maven plug-in to start the Liberty server before our integration tests and to stop the server after the tests are done.</li> <li>3. We will create a run Configuration for AcmeAir integration tests. <ul style="list-style-type: none"> <li>• Click the <b>Run</b> button to run the integration tests. It will take a few minutes to allow the tests to complete. So its build successfully.</li> <li>• Examine the console output to see the Liberty Maven plug-in starting the server before the tests run and to stop it after the test.</li> </ul> </li> <li>4. You can view the test report and make sure there is no error in the result.</li> <li>5. Next we will push the pom.xml change to Git so that the itests can be run in a Jenkins build.</li> </ol>	<p>Demo testing the application, that uses the following steps</p> <ol style="list-style-type: none"> <li>1. The AcmeAir application has a acmeair-itests project that contains integration tests.</li> <li>2. Enable activation of integration tests by editing the acmeair-itests/pom.xml file.</li> <li>3. Enable the Build Helper Maven plug-in to find an available network port.</li> <li>4. Enable and configure the Liberty Maven plug-in to start the Liberty server before integration tests are executed and stop the server after the tests are done.</li> <li>5. Enable and configure the Maven Failsafe plug-in to execute the integration tests. The tests exercise the REST API of the application.</li> <li>6. Create a run Configuration for AcmeAir integration tests. <ul style="list-style-type: none"> <li>• Click the <b>Run</b> button to run the integration tests. The tests should complete successfully.</li> <li>• Examine the console output to see the Liberty Maven plug-in starting the server before the tests run.</li> <li>• Examine the console output to see the Liberty Maven plug-in stopping the server after the tests.</li> </ul> </li> <li>7. View the test reports under target/failsafe-reports/ directory.</li> <li>8. Push the pom.xml change to Git so the itests can be run in a Jenkins build.</li> </ol>

Table 43. Demo showing continuous integration with Jenkins

Scene	Audio	Onscreen Action
10	<ol style="list-style-type: none"> <li>1. In the next scenario we will use Jenkins to create and run a build job for the AcmeAir application. The job will check out the application code from Git, compile the application, execute the tests, and publish the build artifacts. With the configuration in Schedule, the job will poll the Git repository every two minutes and automatically start a build if any changes are detected. <ul style="list-style-type: none"> <li>• Specify the Liberty install directory.</li> <li>• We will also add a <b>post-build action</b> and choose <b>Archive the artifacts</b>.</li> <li>• After a minute or 2 the build should automatically start.</li> </ul> </li> <li>2. Once the build completes and is successful, examine the build job results. The <b>Test Result</b> should indicate there is no failure.</li> <li>3. Switch back to Eclipse and commit the changes made on the Index page.</li> <li>4. Switch back to Jenkins and you will see within 2 minutes a new build should appear under the <b>Build History</b> table.</li> </ol>	<p>Show title <i>Step 4 Continuous Integration</i></p> <p>Demo showing continuous integration with Jenkins using the following steps:</p> <ol style="list-style-type: none"> <li>1. We will use Jenkins to create and run a build job for the AcmeAir application. The job will check out the application code from Git, compile the application, execute the tests, and publish the build artifacts. With the configuration in Schedule, the job will poll the Git repository every two minutes and automatically start a build if any changes are detected. <ul style="list-style-type: none"> <li>• We will click the <b>Add post-build actions</b> button and choose <b>Archive the artifacts</b>.</li> <li>• After a minute or 2 a build should automatically start.</li> </ul> </li> <li>2. Once the build completes and is successful, examine the build job results. The acmeair-webapp-1.0-SNAPSHOT.war file should appear under <b>Build Artifacts</b> and <b>Test Result</b> should indicate no failures.</li> <li>3. Switch back to Eclipse and commit the changes that are made on the Index page.</li> <li>4. Switch to Firefox and go to <code>http://server:9080/jenkins/job/AcmeAir tests/</code> address. Within 2 minutes a new build should appear under the <b>Build History</b> table. <ul style="list-style-type: none"> <li>• Click the new build and verify that the right commit message appears under <b>Changes</b>.</li> </ul> </li> </ol>

Table 44. Demo showing continuous deployment with Chef

Scene	Audio	Onscreen Action
11	<p>1. In the last scenario we will do a continuous deployment with Chef.</p> <ul style="list-style-type: none"> <li>• Open a terminal window.</li> <li>• Create an empty cookbook</li> <li>• Edit the metadata file of the cookbook</li> <li>• Edit the recipe file</li> <li>• Upload the AcmeAir cookbook to the Chef server</li> </ul> <p>2. Also register the template node with the Chef server.</p> <p>3. You can config the template node configuration on the Chef server.</p> <p>4. Then you can populate the Chef node. This will cause the <b>chef-client</b> command to run on the template node. The AcmeAir application should be fully deployed and running on the template node. To verify that, switch to Firefox and open the template application server to check the results.</p> <p>5. Then we will create a new Jenkins build job to invoke <b>chef-client</b> on the template node to update it, only after all the integration tests pass.</p> <ul style="list-style-type: none"> <li>• On the Jenkins console, edit the AcmeAir tests job.</li> <li>• Under <b>Post-build Actions</b> click on <b>Add post-build action</b> and choose <b>Build other projects</b>.</li> <li>• Under <b>Projects to build</b> type in AcmeAir-Chef.</li> <li>• Verify that the AcmeAir tests job triggers the AcmeAir-Chef job by requesting a AcmeAir tests build.</li> </ul> <p>We just demonstrate DevOps practice with Liberty and common open source tools. You can now try the full End to End DevOps scenarios all together repeatedly. While in this demo we choose Chef, WDT, Maven, and Jenkins, these technologies can easily be interchangeable with other DevOps tools like uDeploy®, Puppet, etc,, Thanks for watching.</p>	<p>Show title <i>Step 5 Continuous Deploy</i></p> <p>Demo showing continuous deployment with Chef that uses the following steps:</p> <ol style="list-style-type: none"> <li>1. Create a cookbook to deploy AcmeAir <ul style="list-style-type: none"> <li>• Open a terminal window.</li> <li>• Create an empty cookbook</li> <li>• Edit the metadata file of the cookbook</li> <li>• Edit the default.rb recipe file</li> <li>• Upload the AcmeAir cookbook to the Chef server</li> </ul> </li> <li>2. Bootstrap the Chef node and register the template node with the Chef server.</li> <li>3. Configure the template node configuration on the Chef server.</li> <li>4. Populate the Chef node. Execute the <b>knife ssh name:template sudo chef-client</b> command. This will cause the <b>chef-client</b> command to run on the template node. <b>chef-client</b> will execute a set of cookbooks on the node. The AcmeAir application should be fully deployed and running on the template node. To verify, switch to Firefox and open the http://template:9081/acmeair/ address.</li> <li>5. Populate the Chef node automatically with Jenkins. We will create a new Jenkins build job that will invoke <b>chef-client</b> on the template node to update it, only after all the integration tests pass. <ul style="list-style-type: none"> <li>• On the Jenkins console, edit the AcmeAir tests job.</li> <li>• Under <b>Post-build Actions</b> click <b>Add post-build action</b> and choose <b>Build other projects</b>.</li> <li>• Under <b>Projects to build</b> type in AcmeAir-Chef.</li> <li>• Verify that the AcmeAir tests job triggers the AcmeAir-Chef job by requesting a new AcmeAir tests build.</li> </ul> </li> </ol>

## Video: Enabling IHS for Liberty Dynamic Routing

8.5.5.5

The following transcript is for the “Enabling IHS for Liberty Dynamic Routing” video, which demonstrates how to install IBM HTTP Server (IHS), install the Web Server Plug-in for WebSphere Application Server, and apply the interim fix for Dynamic Routing. You must enable IHS first before

setting up the Dynamic Routing feature or using auto scaling with Liberty collectives. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content shown in the video.

## Enabling IHS for Liberty Dynamic Routing

*Table 45. Demo installing IBM Installation Manager.* Show installing IBM Installation Manager.

Scene	Audio	Onscreen Action
1	This video shows how to install and enable IHS for Dynamic Routing using the IBM Installation Manager.	Show title Enabling IHS for Liberty Dynamic Routing.
2	Download and install the latest version of the IBM Installation Manager. You can use the Installation Manager to access online product repositories to install the Web Server Plug-in for WebSphere Application Server and the needed interim fix for the Dynamic Routing feature.	Direct user to the IBM Installation Manager and begin installing the latest version.
3	Once I select the latest version to install I click <b>Download package</b> from the installation menu. I then selected the platform I wanted to download and the appropriate fix for my machine. In this demo I will be installing the IBM Installation Manager Kit for Windows 64. You will be prompted for your IBM user ID and password before you can proceed with the download.	Show the user how to install the appropriate IBM Installation Kit from the IBM support site.
4	Select your download options. In this demo I will download the IBM Installation Manager using my browser (HTTPS). Click <b>Continue</b> . Download the provided zip file to your machine. You can locate this zip file in your downloads folder. Right click on the zip file in your downloads folder and click <b>Extract Files...</b> You must then select the location where you want to install the contents of the zip file.	Show the user how to download the IBM Installation Manager using a browser. Show the user how to download the zip file to their machine and extract the content to a new designated location.
5	When all of the files have been extracted successfully, open the folder containing the files and click <b>install.exe</b> The IBM Installation Manager will open and begin downloading. Accept the terms in the license agreements, and click <b>Next</b> . Verify that the install package is downloading in the appropriate directory, and click <b>Next</b> . Click <b>Install</b> . The IBM Installation Manager will now be installed.	Show the user how to run the install from the <code>install.exe</code> file. The user must accept the terms and license agreements to proceed with the install. Once they click Install the IBM Installation Manager will begin installing.
6	You will see a confirmation window when the install has been completed successfully. On this Window click <b>Restart Installation Manager</b> . Once the restart is complete, you can begin using the IBM Installation Manager.	Show the user the confirmation window that confirms the IBM Installation Manager was successfully downloaded. Show the user how to restart the IBM Installation Manager prior to using.

Table 46. Demo Set preferences for repository locations. Show how to set preferences for repository locations.

Scene	Audio	Onscreen Action
7	Start the Installation Manager and click <b>File</b> . Then click <b>Preferences</b> . Then click <b>Add Repository</b> to add the repository URL to the product. You can access repository URLs for the product via the Passport Advantage Online. Follow the same steps to add the repository URL needed to install the Web Server Plug-in for WebSphere Application Server	<p>Show user how to start the Installation Manager and add repository URLs. Users can gain access to repository URLs via the Passport Advantage Online. For more information on how to download repository URLs from Passport Advantage, go to the IBM Support Portal.</p> <p><b>IBM Support Portal-</b>  <a href="http://www-01.ibm.com/support/docview.wss?uid=swg27038625">http://www-01.ibm.com/support/docview.wss?uid=swg27038625</a></p> <p>Show the user how to add the following repository URL for installing the Web Server Plug-in.</p> <p><b>Web Server Plug-in for WebSphere Application Server</b> <a href="http://www.ibm.com/software/repositorymanager/com.ibm.websphere.PLGILAN.v85">http://www.ibm.com/software/repositorymanager/com.ibm.websphere.PLGILAN.v85</a></p>

Table 47. Demo installing IBM HTTP Server. Show installing IBM HTTP Server.

Scene	Audio	Onscreen Action
8	Start the Installation Manager and click <b>Install</b> . In the <b>Install Packages</b> window select the appropriate version of <b>IHS</b> . Click <b>Next</b> . Accept the terms in the license agreements, and click <b>Next</b> .	Show users how to start the Installation Manger and locate IHS in the <b>Install Packages</b> window. Show them how to begin the installation and accept terms in the license agreements.
9	On the install packages window, specify the installation directory where you would like to install IHS. Click <b>Next</b> . On the next window IHS will already be selected for you. Click <b>Next</b> .	<p>Show the user an example of how to specify the installation directory. Note the following restrictions:</p> <ul style="list-style-type: none"> <li>• Deleting the default target location and leaving an installation-directory field empty prevents you from continuing. Do not use symbolic links as the destination directory.</li> <li>• Symbolic links are not supported.</li> <li>• Be careful on using spaces in the name of the installation directory. Some operating systems allow spaces in the specification of the installation directory. Other operating systems do not allow spaces.</li> <li>• Do not use a semicolon in the directory name. IBM HTTP Server cannot install properly if the target directory includes a semicolon.</li> </ul>
10	On the Configuration for IHS panel, specify your web server configuration. Specify a port number on which IHS will communicate. The default port is 80. Choose whether to use a Windows service to run IHS. Click <b>Next</b> .	Show users how to specify the web server configuration and specify the port number for IHS.
11	Review the summary information, and click <b>Install</b> . You will see a confirmation window if the installation was successful. Click <b>Finish</b> . <b>Note:</b> You don't have to start IHS until you're ready to use the Dynamic Routing or Auto Scaling features.	Show the user an example of summary information and the final step of installation. If the installation is successful, a message appears indicating the installation completed successfully.

Table 48. Demo installing Web Server Plug-in for WebSphere Application Server. Show installing Web Server Plug-in for WebSphere Application Server using IBM Installation Manager.

Scene	Audio	Onscreen Action
12	You already added the repository URL needed to install the Web Server Plug-in. Start the Installation Manager and click <b>Install</b> . In the <b>Install Packages</b> window select the appropriate version of the <b>Web Server Plug-in for WebSphere Application Server</b> . Click <b>Next</b> . Accept the terms in the license agreements, and click <b>Next</b> .	Show users how to start the Installation Manger and locate IHS in the <b>Install Packages</b> window. Show them how to begin the installation and accept terms in the license agreements.
13	On the install packages window, specify the installation directory where you would like to install the Web Server Plug-in. Click <b>Next</b> . On the next window the Web Server Plug-in will already be selected for you. Click <b>Next</b> .	Show the user an example of how to specify the installation directory. Note the following restrictions: <ul style="list-style-type: none"> <li>• Deleting the default target location and leaving an installation-directory field empty prevents you from continuing. Do not use symbolic links as the destination directory.</li> <li>• Symbolic links are not supported.</li> <li>• Be careful on using spaces in the name of the installation directory. Some operating systems allow spaces in the specification of the installation directory. Other operating systems do not allow spaces.</li> <li>• Do not use a semicolon in the directory name. IBM HTTP Server cannot install properly if the target directory includes a semicolon.</li> </ul>
14	Review the summary information, and click <b>Install</b> . You will see a confirmation window if the installation was successful. Click <b>Finish</b> .	Show the user an example of summary information and the final step of installation. If the installation is successful, a message appears indicating the installation completed successfully.

Table 49. Demo how to update the IBM HTTP Server. Updating the IBM HTTP Server

Scene	Audio	Onscreen Action
15	Start the Installation Manager. Click <b>Update</b> . Select the package group to update. Click <b>Next</b> . Select the version you want to update under <b>IHS</b> .	Show users how to locate and apply the interim fix for Dynamic Routing using the Installation Manager and IHS.
16	Review the summary information, and click <b>Update</b> . You will see a confirmation window if the installation was successful. Click <b>Finish</b> .	Show the user an example of summary information and the final step of installation. Done successfully a message will appear indicating a successful installation.

Table 50. Conclusion. Show where to find more information about Dynamic Routing and auto scaling.

Scene	Audio	Onscreen Action
17	For information on configuring clustered Liberty collectives for use with Dynamic Routing or Auto Scaling, see WASdev and the WebSphere Application Server Liberty documentation on IBM Knowledge Center.	Show information on documentation: <p><b>WASdev</b>  <a href="https://developer.ibm.com/wasdev/">https://developer.ibm.com/wasdev/</a></p> <p><b>WebSphere Application Server Liberty documentation on IBM Knowledge Center</b>  <a href="http://www-01.ibm.com/support/knowledgecenter/">http://www-01.ibm.com/support/knowledgecenter/</a></p>

For more information, see “Setting up dynamic routing for Liberty collectives” on page 1493.

# Video: Getting started with the Server Configuration Tool for WebSphere Liberty

8.5.5.8

The following transcript is for the “Getting started with the Server Configuration Tool for WebSphere Liberty” video, which demonstrates how to enable and use the Liberty Admin Center Server Config tool. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content that is shown in the video.

## Getting started with the Server Configuration Tool for WebSphere Liberty

Table 51. Title page. Show title and describe the video contents.

Scene	Audio	Onscreen Action
1	This video demonstrates the new web-based WebSphere Liberty server configuration tool. This tool makes it possible to view and edit server configuration files from a web browser.	Show title “Getting started with the Server Configuration Tool for WebSphere Liberty”.

Table 52. Demo enabling the Server Config tool. Show how to enable the Server Config tool.

Scene	Audio	Onscreen Action
2	To enable it, simply add the adminCenter-1.0 feature, keyStore, and quickStartSecurity elements to your server.xml file.  Optionally, if you are planning to use the tool to make changes to the server configuration, add the remote file access element.	Show a server.xml file with elements needed to enable the Server Config tool and enable editing: <pre>&lt;server&gt;   &lt;featureManager&gt;     &lt;feature&gt;adminCenter-1.0&lt;/feature&gt;   &lt;/featureManager&gt;    &lt;keyStore password="samplePassword"/&gt;    &lt;quickStartSecurity userName="sampleUser" userPassword="samplePassword"/&gt;    &lt;remoteFileAccess&gt;     &lt;writeDir&gt;\${server.config.dir}&lt;/writeDir&gt;   &lt;/remoteFileAccess&gt; &lt;/server&gt;</pre>
3	After saving these changes, a URL will appear in the server console.  Open this URL with your favorite web browser.	Show a console message and selecting the URL to the tool: Starting server configuration update Web application available: http://localhost:9080/ibm/adminCenter/serverConfig-1.0/ The server is ready to run a smarter planet.
4	Log in with the quickStartSecurity credentials.	Show entering sampleUser and samplePassword on the login page of Admin Center.

Table 53. Demo using the Server Config tool. Show how to view and edit server configuration files with the Server Config tool.

Scene	Audio	Onscreen Action
5	The file selection screen shows all of the configuration files available on the server. If nested include files are found, these will be hierarchically shown in the form of a tree.	Show the Configuration Files page of the Server Config tool.  Show expanding the primary list of files under server.xml.

Table 53. Demo using the Server Config tool (continued). Show how to view and edit server configuration files with the Server Config tool.

Scene	Audio	Onscreen Action
6	<p>To edit a file simply click on its name. This brings up the main editing screen.</p> <p>The tree shows all of the configuration elements in the document. Clicking on a tree node displays all of its associated values.</p> <p>Values can be edited by typing on the text fields or using the selection buttons. If a mistake is made, automatic validation provides instant feedback.</p>	<p>Show selecting <code>server.xml</code> to display the contents of the <code>server.xml</code> file in <b>Design</b> mode.</p> <p>Show selecting the <b>HTTP Endpoint</b> element to display its values.</p> <p>Show selecting a new value, the display of a warning message, and selecting <b>x</b> to delete the value change.</p>
7	Adding new elements is very easy. Simply click on the <b>Add child</b> button and select the element to be added.	Show selecting <b>Add child</b> , an element, and <b>Add</b> .
8	Removing elements is just as easy. Simply click on the <b>Remove</b> button and provide confirmation.	Show selecting <b>Remove</b> and then <b>Remove</b> to confirm the removal.
9	The order of the elements can be changed at any time using drag-and-drop gestures.	Show dragging an element to a different location in the tree.
10	The source of the document can be accessed by clicking the <b>Source</b> tab.	Show selecting the <b>Source</b> tab to display the <code>server.xml</code> source.
11	Syntax highlight, hover information, and content assist features are available.	Show hovering a cursor over an element value in the source to display information about the value.
12	After changes are complete, click on the <b>Save</b> button to persist them on the server.	Show selecting <b>Save</b> .

Table 54. Conclusion. State that the video is now ending.

Scene	Audio	Onscreen Action
13	This concludes the WebSphere Liberty server configuration tool video. Thanks for watching!	Show Copyright 2015 IBM Corporation. Voice over provided by Colleen Anderson. and then Thanks for watching!

For more information, see “Editing server configuration files in Admin Center” on page 1748.

## Video: Google OpenID Connect for applications on WebSphere Liberty

8.5.5.5

The following transcript is for the “Google OpenID Connect for applications on WebSphere Liberty” video, which demonstrates how to set up an OpenID Connect web single-sign-on on WebSphere Application Server Liberty with a Google OpenID Connect provider. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content that is shown in the video.

 Google OpenID Connect for applications on WebSphere Liberty

Table 55. Title page. Show title and then a basic Google OpenID Connect scenario.

Scene	Audio	Onscreen Action
1	This video will show you how to set up OpenID Connect web single-sign-on on WebSphere Application Server Liberty with a Google OpenID connect provider.	Show title <i>OpenID Connect Quick Setup with Google</i> .
2	Here you can see an “OpenID Connect” flow from an end user to an application on the Liberty server and the Google OpenID provider. When a user first attempts to access a Google OpenID Connect-protected application on a Liberty server, the user is redirected to the Google OpenID Provider. By using the Google account, the user is authenticated to access the protected web application on the Liberty server. In this video, we call a Liberty server, the “Relying party” or RP, and call “Google OpenID Connect provider” the OP.	Show a basic Google OpenID Connect scenario, that includes a Relying Party (RP), Google OpenID Connect provider (OP), and an End-User.

Table 56. Demo registering Liberty in Google

Scene	Audio	Onscreen Action
3	<p>To set up the Liberty RP with Google OP, first, we will register the Liberty server as an OpenID Connect client in the Google OP.</p> <p>To do so, we will</p> <ul style="list-style-type: none"> <li>• Log in to the Google developers console and create a project</li> <li>• Then in the project, we will create a “Client ID” for the Liberty server</li> <li>• Write down the Client ID and Client Secret for when we set up Liberty</li> </ul> <p>Let's try these steps now.</p>	<p>Show title <i>Register Liberty in Google</i>.</p> <ol style="list-style-type: none"> <li>1. On Google developer's console, create a project <a href="https://console.developers.google.com">https://console.developers.google.com</a>.</li> <li>2. In the project, create a Client ID from the <b>Credential</b> menu.</li> <li>3. Write down the following information for the Liberty setup <ul style="list-style-type: none"> <li>• Client ID</li> <li>• Client Secret</li> </ul> </li> </ol> <p>For more information, please refer to this page <a href="https://developers.google.com/accounts/docs/OpenIDConnect">https://developers.google.com/accounts/docs/OpenIDConnect</a>.</p>
4	In the Google Developers Console, create a new Project.	<p>In the Google Developers Console, we show a demo creating a new project.</p> <ul style="list-style-type: none"> <li>• Project name- WebSphereLibertyOpenIDConnect</li> <li>• Project ID- astute-tome-859</li> </ul>
5	In the project that you just created, go to <b>APIs &amp; auth</b> , then <b>Credentials</b> , and <b>Create new Client ID</b> . First, you will have to configure a consent screen.	Show the Google Developers Console screen where the <b>Create new Client ID</b> is selected.

Table 56. Demo registering Liberty in Google (continued)

Scene	Audio	Onscreen Action
6	The consent screen is shown to users when they authenticate with the Google OpenID provider. Configure your consent screen as needed and continue creating your Client ID. For the application type, select <b>Web application</b> . Then, enter a redirect URI for the Liberty server. (pointing to <code>https://rp-example.rtp.raleigh.ibm.com:7778/oidcclient/redirect/oidcRP</code> on the screen) This redirect URI comes from the configuration for your Liberty server, which we will cover later. If you don't know the redirect URI for your server, you can leave the default value and update it later.	Show the Google Developers Console screen where the <b>Web Application</b> is selected. <ul style="list-style-type: none"> <li>Authorized JavaScript Origins is set to <code>https://www.example.com</code></li> <li>Authorized Redirect URIs is set to <code>https://www.example.com/oauth2callback</code></li> </ul>
7	After the Client ID is created, you can see the Client ID and Client Secret. Make note of these values, because they are needed in the next step, configuring the Liberty server.	Show the Google Developers Console screen where the Client ID and Client Secret values can be seen.

Table 57. Demo configuring WebSphere Liberty

Scene	Audio	Onscreen Action
8	To set up Liberty to work with a Google OP, you will need to: <ul style="list-style-type: none"> <li>Install Version 8.5.5.5 or later of Liberty</li> <li>Install the OpenID Client feature</li> <li>Create a Liberty server</li> <li>Edit the <code>server.xml</code> configuration file with Google information</li> <li>Install the application that will use the Google account for authentication</li> <li>And finally, import the Google certificate into the keystore for SSL communication</li> </ul>	Show the WebSphere Liberty setup overview. <ol style="list-style-type: none"> <li>Install WebSphere Liberty 8.5.5.5 or latest beta &gt; <b>java -jar wlp-developers-runtime-8.5.5.5.jar</b></li> <li>Install OpenID Client feature (No download necessary) &gt; <b>bin/featureManager install openidConnectClient-1.0 --when-file-exists=ignore</b></li> <li>Create a Liberty server &gt; <b>server create GoogleRP</b></li> <li>Edit the <code>server.xml</code> with more configurations (Sample downloadable) <ul style="list-style-type: none"> <li>Required features</li> <li>SSL keystore</li> <li>OpenID Client</li> <li>Application</li> </ul> </li> <li>Install application that will use Google account for authentication &gt; Copy application ear/war file under app directory.</li> <li>Import Google certificate into keystore for SSL communication.</li> </ol>
9	First, we will install Version 8.5.5.5 of Liberty.  Then, we will install the OpenID Client feature, and create a server with the name GoogleRP.  You can find the <code>server.xml</code> configuration file under the <code>wlp\usr\servers\GoogleRP\</code> directory.	Demo with command prompt that is being used to update <code>server.xml</code> file.
10	Here is the default <code>server.xml</code> file. Now, we will compare it to a <code>server.xml</code> file that has a Google configuration.	Show a default <code>server.xml</code> file.

Table 57. Demo configuring WebSphere Liberty (continued)

Scene	Audio	Onscreen Action
11	<p>You can see that the necessary features are added. In the OpenID Connect Client configuration, the Client ID and Client Secret that we obtained from Google are added. You can obtain the other values by going to Google OP's discovery endpoint. (<a href="https://accounts.google.com/.well-known/openid-configuration">https://accounts/google.com/.well-known/openid-configuration</a> is shown on the video). Then we add an SSL configuration and end-point configuration with the host name, HTTP port, and HTTPS port.</p> <p>The configuration file also includes configuration for applications that rely on Google to perform authentication.</p> <p>That's all the configuration we need for Liberty.</p> <p>The Liberty RP uses this pattern <code>https://&lt;hostname&gt;:&lt;sslport&gt;/oidcclient/redirect/&lt;openidConnectClient id&gt;</code> to generate its own redirect URL. For example, the server that we configured has the following URI, <code>https://rp-example.rtp.raleigh.ibm.com:7778/oidcclient/redirect/oidcRP</code>. This is the URI that we entered earlier in the Google console.</p>	<p>Show a <code>server.xml</code> file that contains the Client ID and Client Secret that were obtained from Google. Also an SSL configuration and end-point configuration with the host name, HTTP port, and HTTPS port. The <code>server.xml</code> file also includes configuration for applications that rely on Google to perform authentication.</p>
12	<p>Next, we will install our application in the app directory.</p> <p>We will start and stop the Liberty server to get the keystore in the server resources and make sure that the Liberty server keystore has a Google certificate for SSL communication.</p> <p><b>Note:</b> We are not going to show cert steps in this video and include instruction in reference page</p> <p>Then we will start the Liberty server again.</p>	<p>Show title <i>How to import Google certificate here.</i></p>

Table 58. Demo testing the setup

Scene	Audio	Onscreen Action
13	<p>Now we will test our configuration to see if it works.</p> <ul style="list-style-type: none"> <li>In a browser, we will go to the application URL.</li> <li>When prompted, we will enter our Google account information.</li> <li>We will see the application redirecting to Google to perform authentication.</li> <li>After the user is authenticated, the RP will show an application page to the user.</li> <li>Let's try that now.</li> </ul>	<p>Demo testing the setup.</p> <ol style="list-style-type: none"> <li>Start the WebSphere Liberty server &gt; <b>server start oidcRP</b></li> <li>In a browser, point to the application login page on the Liberty Server &gt; <code>http://rp-example.rtp.raleigh.ibm.com:7777/testpage</code></li> <li>When prompted, enter the Google user ID and password &gt; <code>xxx.yyy@gmail.com / mypassword</code></li> <li>Application relies on Google to perform authentication</li> <li>User is successfully authenticated</li> </ol>

Table 58. Demo testing the setup (continued)

Scene	Audio	Onscreen Action
14	In the browser, we will type in the URL of the application that is running on the Liberty server. Notice that we are prompted by the Google OP server because the Liberty relying party is delegating the authentication to the OP. We will enter the credentials for the Google account. After accepting the consent screen, we are successfully logged in to the application on the RP using the OP account.	Demo with a browser login that shows a successful login into the application on the RP using the OP account.

Table 59. Conclusion. Show where to find more information about OpenID Connect that uses Google.

Scene	Audio	Onscreen Action
15	For more information, visit these online resources.	<p>Show information on documentation:</p> <p><b>WebSphere Liberty download page</b>  <a href="https://developer.ibm.com/wasdev/downloads/liberty-profile-using-non-eclipse-environments/">https://developer.ibm.com/wasdev/downloads/liberty-profile-using-non-eclipse-environments/</a></p> <p><b>OpenID Connect feature installation</b>            Server: <a href="https://developer.ibm.com/wasdev/downloads/#asset/features-com.ibm.websphere.appserver.openidConnectServer-1.0">https://developer.ibm.com/wasdev/downloads/#asset/features-com.ibm.websphere.appserver.openidConnectServer-1.0</a>            Client: <a href="https://developer.ibm.com/wasdev/downloads/#asset/features-com.ibm.websphere.appserver.openidConnectClient-1.0">https://developer.ibm.com/wasdev/downloads/#asset/features-com.ibm.websphere.appserver.openidConnectClient-1.0</a></p> <p><b>IBM Knowledge Center - OpenID Connect main page</b>  <a href="http://www-01.ibm.com/support/knowledgecenter/api/content/nl/en-us/SSAW57_8.5.5/com.ibm.websphere.wlp.nd.multipatform.doc/ae/rwlp_using_oidc.html">http://www-01.ibm.com/support/knowledgecenter/api/content/nl/en-us/SSAW57_8.5.5/com.ibm.websphere.wlp.nd.multipatform.doc/ae/rwlp_using_oidc.html</a></p> <p><b>All OpenID Connect attributes are discussed here</b>  <a href="http://www-01.ibm.com/support/knowledgecenter/SSEQTP_8.5.5/com.ibm.websphere.wlp.doc/ae/twlp_config_oidc_rp.html?cp=SSEQTP_8.5.5%2F1-3-11-0-4-2-9-2">http://www-01.ibm.com/support/knowledgecenter/SSEQTP_8.5.5/com.ibm.websphere.wlp.doc/ae/twlp_config_oidc_rp.html?cp=SSEQTP_8.5.5%2F1-3-11-0-4-2-9-2</a></p> <p><b>IBM DeveloperWorks OpenID Connect article</b>  <a href="http://www.ibm.com/developerworks/websphere/library/techarticles/1502_odonnell/1502_odonnell.html">http://www.ibm.com/developerworks/websphere/library/techarticles/1502_odonnell/1502_odonnell.html</a></p> <p><b>WebSphere Liberty OpenID Connect setup video on YouTube</b>  <a href="http://youtu.be/fuajCS5bG4c">http://youtu.be/fuajCS5bG4c</a></p> <p><b>Google setup "OpenID Connect (OAuth 2.0 for Login)"</b> <a href="https://developers.google.com/accounts/docs/OpenIDConnect">https://developers.google.com/accounts/docs/OpenIDConnect</a></p>

## Video: Health management for Liberty collectives

8.5.5.7

The following transcript is for the “Health management for Liberty collectives” video, which demonstrates the benefits of using health management in your Liberty environment. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content shown in the video.

### Health management for Liberty collectives

*Table 60. Introduction and overview. Show title and introduce health management.*

Scene	Audio	Onscreen Action
1	Do your applications use too much memory, have memory leaks or slow response time? Health management in Liberty can help find and mitigate problems in your applications as they occur.	Show title <i>Health management for Liberty collectives</i> .
2	Health management in a Liberty collective can prevent the disruption of service by detecting common problems and generating diagnostic actions based on configured health policies.	Show words:  Prevent disruption of service  Use policies to detect app health concerns: <ul style="list-style-type: none"> <li>• Excessive memory usage</li> <li>• Memory leaks</li> <li>• Excessive request timeout</li> <li>• Excessive average response time</li> </ul>
3	You can target health policies at individual servers, all servers in a cluster, or all servers on a host.	Show diagram of server clusters with hosts and highlight each section.
4	To diagnose and manage errors, health policies can capture heap or thread dumps, restart servers, and force servers to enter maintenance mode.	Show words:  Health policies can: <ul style="list-style-type: none"> <li>• Capture heap and thread dumps</li> <li>• Restart servers</li> <li>• Force servers into maintenance mode</li> </ul>

*Table 61. Feature and JVM configuration for health management.. Show the process for configuring health management.*

Scene	Audio	Onscreen Action
5	You can add support for health management to your Liberty collectives through the healthManager-1.0 and healthAnalyzer-1.0 features. After you set up a collective, add the healthManager-1.0 feature to a collective controller. If you want to monitor excessive memory usage or memory leaks, add the healthAnalyzer-1.0 feature to a collective member server.	Show code for adding healthManager-1.0 to a collective controller server.xml file and adding healthAnalyzer-1.0 to a collective member server.xml file.

Table 62. Health policy configuration for health management.. Show an example of a health policy configuration for health management.

Scene	Audio	Onscreen Action
6	<p>To configure a health policy, add a healthPolicy element to the collective controller server.xml file. You can configure multiple policies by adding additional healthPolicy elements.</p> <p>Each health policy has one or more targets, one condition, and one or more actions.</p> <p>The target can be a cluster, a host, or a server. This healthPolicy element targets a single server.</p> <p>The condition that triggers corrective action is excessive average response time of at least 10 seconds. When this condition exists, the affected server is put into maintenance mode. If you specify multiple actions, the actions run in the order that they are specified in the policy.</p>	<p>Show a controller server.xml file with the example healthPolicy element highlighted.</p> <pre data-bbox="846 352 1450 485">&lt;healthPolicy id="myPolicy"&gt;   &lt;server hostName="Host" wlpUsrDirectory="ibm/liberty/wlp" serv   &lt;excessiveResponseTime responseTime="10s"/&gt;   &lt;action action="enterMaintenanceMode"/&gt; &lt;/healthPolicy&gt;</pre>
7	<p>Let's take a look at this policy in action.</p> <p>The healthManager-1.0 feature is enabled in a collective controller that is configured for dynamic routing and auto-scaling.</p>	<p>Show a controller server.xml file with the example healthPolicy element highlighted.</p> <pre data-bbox="846 877 1450 1266">&lt;featureManager&gt;   &lt;feature&gt;jsp-2.2&lt;/feature&gt;   &lt;feature&gt;collectiveController-1.0&lt;/feature&gt;   &lt;feature&gt;dynamicRouting-1.0&lt;/feature&gt;   &lt;feature&gt;scalingController-1.0&lt;/feature&gt;   &lt;feature&gt;healthManager-1.0&lt;/feature&gt; &lt;/featureManager&gt;  ...  &lt;healthPolicy id="myPolicy"&gt;   &lt;server hostName="Host" wlpUsrDirectory="ibm/liberty/wlp" serv   &lt;excessiveResponseTime responseTime="10s"/&gt;   &lt;action action="enterMaintenanceMode"/&gt; &lt;/healthPolicy&gt;</pre>
8	<p>The Intelligent Management IBM HTTP Server plug-in detects average response times of over 10 seconds for Server 1. In accordance with the health policy, the controller forces Server 1 into maintenance mode, and IBM HTTP Server stops routing new requests to that server.</p> <p>As Server 1 goes into maintenance mode, the scaling controller simultaneously detects that fewer than two servers are running and starts Server 3. IBM HTTP Server begins routing requests to that server.</p>	<p>Show animation of a server being put into maintenance mode, another server starting, and traffic being routed to the newly started server.</p>

Table 63. Conclusion. Show where to find more information about health management.

Scene	Audio	Onscreen Action
9	For more information about health management and Liberty collectives, see the Knowledge Center documentation or WASdev.net.	Show information on documentation:  <b>IBM Knowledge Center</b> <a href="http://www-01.ibm.com/support/knowledgecenter/">http://www-01.ibm.com/support/knowledgecenter/</a>  <b>WASdev.net</b> <a href="http://developer.ibm.com/wasdev">http://developer.ibm.com/wasdev</a>

For more information, see “Configuring health management for Liberty” on page 1519.

## Video: Installing Liberty from a ZIP file

8.5.5.6

The following transcript is for the “Installing Liberty from a ZIP file” video, which describes how you can quickly install Liberty from a ZIP archive file, start the server and add applications, and upgrade to a supported installation. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content that is shown in the video.

### Installing Liberty from a ZIP file

Table 64. Installing and upgrading Liberty. Show how you can quickly install IBM WebSphere Application Server Liberty from a ZIP archive file, start the server and add applications, and upgrade to a supported installation.

Scene	Audio	Onscreen Action
1	Installing WebSphere Application Server Liberty can be as easy as extracting a ZIP file!	Show words, “Installing Liberty from a ZIP file”
2	To start, download one of the Liberty runtime ZIP files from IBM Fix Central or WASdev.net. You can choose from several prepackaged archives according to your needs, from just the Liberty kernel, which has a download size of less than 15 megabytes, to the Java Platform, Enterprise Edition 7 full platform or Web Profile, which you can optionally download with IBM Java 8.	Show the ZIP files on IBM Fix Central and WASdev.net.
3	After you download a ZIP file, just extract it to a local directory to install Liberty.	Show extracting the wlp-webProfile7-8.5.5.6 ZIP archive file to the C:\wlp-webProfile7-8.5.5.6 directory.

Table 64. Installing and upgrading Liberty (continued). Show how you can quickly install IBM WebSphere Application Server Liberty from a ZIP archive file, start the server and add applications, and upgrade to a supported installation.

Scene	Audio	Onscreen Action
4	This example shows the Java EE 7 Web Profile ZIP, which comes preconfigured with Liberty features that support the Java EE 7 Web Profile specification.	Show running the <b>productInfo featureInfo</b> command on the command line. A list of installed features is displayed.
5	You can install additional features and other content using the <b>installUtility</b> command. The <b>find</b> option displays a list of installable content.	Show running the <b>installUtility find</b> command on the command line. A list of installable features, addons, samples, and other content is displayed.
	Start the Liberty server with the <b>server start</b> command.	Show running the <b>server start</b> command on the command line. The default server, <code>defaultServer</code> , starts.
	<p>You can add an application at any time by placing the application WAR file in the <code>dropins</code> directory - no restart required!</p> <p>The Liberty server automatically starts the application when you add it to the directory.</p> <p>Standard server output and errors are captured in the <code>console.log</code> file; for example, this application outputs the URL of the web application, which can then be pasted into the browser.</p>	<p>Show copying the <code>planningpoker-1.0-SNAPSHOT.war</code> sample application into the <code>wlp\usr\servers\defaultServer\dropins</code> directory.</p> <p>Show opening the <code>console.log</code> file in the <code>wlp\usr\servers\defaultServer\logs</code> directory to copy the URL of the web application and pasting the URL into the browser. The web application loads successfully.</p>
	Installing from the ZIP files enables no-charge, unsupported, unlimited use of Liberty in development environments and unsupported limited use in small-scale test and production environments.	Show running the <b>productInfo version</b> command on the command line. The product name, version, and edition is displayed. Because the installation is an unsupported version, the edition is <code>BASE_ILAN</code> .

Table 64. *Installing and upgrading Liberty (continued)*. Show how you can quickly install IBM WebSphere Application Server Liberty from a ZIP archive file, start the server and add applications, and upgrade to a supported installation.

Scene	Audio	Onscreen Action
	<p>For access to guaranteed service levels and IBM support, you can later upgrade to a supported edition from your existing installation. After you purchase WebSphere Application Server, just download and run the self-extracting license JAR file from Passport Advantage®.</p> <p>Note that if you are already a WebSphere Application Server customer - for example, if you are running Network Deployment traditional - you do not need to purchase anything extra; the Liberty entitlement is included.</p>	<p>Show copying the <code>wlp-nd-license.jar</code> file into the <code>C:\wlp-webProfile7-8.5.5.6</code> directory.</p> <p>Show running the <code>java -jar wlp-nd-license.jar</code> command on the command line to run the self-extracting JAR file. The command updates the license.</p> <p>Show running the <code>productInfo version</code> command, which now displays the ND edition.</p>
	<p>For more information about installing and upgrading Liberty, see the Knowledge Center documentation or WASdev.net.</p>	<p>Show words, "For more information about installing and upgrading Liberty, see:"</p> <ul style="list-style-type: none"> <li>• IBM Knowledge Center</li> <li>• WASdev.net</li> </ul>

For more information, see "Installing Liberty by extracting a ZIP archive file" on page 1381.

## Video: Introduction to creating a collective

The following transcript is for the "Introduction to creating a Liberty collective" video, which demonstrates how to create a collective of one controller and one member. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content shown in the video.

### Introduction to creating a Liberty collective

Table 65. *Demo creating a Liberty collective*. Show commands and `server.xml` changes.

Scene	Audio	Onscreen Action
1	<p>Hi, I'm Mike Thompson, a developer with WebSphere Liberty. I'm going to take you today through a brief introduction of Liberty's new administrative domain known as the collective.</p>	<p>Show the developer talking on camera.</p>

Table 65. Demo creating a Liberty collective (continued). Show commands and server.xml changes.

Scene	Audio	Onscreen Action
2	Starting with a Liberty Network Deployment install, we're going to create a simple collective. This can be done in about eight steps. The first step is creating a server to be the administrative server. I'm going to call that myController.	Show command window open at wlp/bin, run server create myController, and then show message Server myController created.
3	Once the server myController is created, we then need to establish the collective configuration necessary for the server to act as a controller. As part of that configuration, we're going to specify a keystore password. The keystore password is not predefined. We do not ship predefined user names or passwords. So, using the keystore password demoPassword will establish the configuration for a collective controller.	Show command window open at wlp/bin, and then run the command: collective create myController --keystorePassword=demoPassword

Table 65. Demo creating a Liberty collective (continued). Show commands and server.xml changes.

Scene	Audio	Onscreen Action
4	This takes about three seconds and essentially establishes some SSL certificates. We need to copy the configuration printed to the screen and update the server configuration file.	Show messages generated by the command, with the following messages marked for copying: <pre>&lt;featureManager&gt;   &lt;feature&gt;collectiveController-1.0&lt;/feature&gt; &lt;/featureManager&gt;  &lt;!-- Define the host name for use by the collective.   If the host name needs to be changed, the server should be   removed from the collective and re-joined or re-replicated. --&gt; &lt;variable name="defaultHostName" value="myhost.ibm.com" /&gt;  &lt;!-- TODO: Set the security configuration for Administrative access --&gt; &lt;quickStartSecurity userName="" userPassword="" /&gt;  &lt;!-- clientAuthenticationSupported set to enable bidirectional trust --&gt; &lt;ssl id="defaultSSLConfig"   keyStoreRef="defaultKeyStore"   trustStoreRef="defaultTrustStore"   clientAuthenticationSupported="true" /&gt;  &lt;!-- inbound (HTTPS) keystore --&gt; &lt;keyStore id="defaultKeyStore" password="{xor}OzoyMA8+LCwoMC07"   location="\${server.config.dir}/resources/security/key.jks" /&gt;  &lt;!-- inbound (HTTPS) truststore --&gt; &lt;keyStore id="defaultTrustStore" password="{xor}OzoyMA8+LCwoMC07"   location="\${server.config.dir}/resources/security/trust.jks" /&gt;  &lt;!-- server identity keystore --&gt; &lt;keyStore id="serverIdentity" password="{xor}OzoyMA8+LCwoMC07"   location="\${server.config.dir}/resources/collective/serverIdentity.jks" /&gt;  &lt;!-- collective trust keystore --&gt; &lt;keyStore id="collectiveTrust" password="{xor}OzoyMA8+LCwoMC07"   location="\${server.config.dir}/resources/collective/collectiveTrust.jks" /&gt;  &lt;!-- collective root signers keystore --&gt; &lt;keyStore id="collectiveRootKeys" password="{xor}OzoyMA8+LCwoMC07"   location="\${server.config.dir}/resources/collective/rootKeys.jks"/&gt;</pre>
5	We can do that using Notepad because this is very simple XML and we can essentially paste it right into the contents of the server.xml.	Show a Notepad editor open on the myController server.xml file, and then the copied messages pasted into the server.xml file before the ending tag, </server>.
6	In addition to pasting it in, we do need to specify an administrative name. So, I'm going to use admin, with adminpwd as the password.	In editor, set user name and password: <pre>&lt;quickStartSecurity userName="admin" userPassword="adminpwd" /&gt;</pre>
7	Once the server is configured, we can start it.	Show command window open at wlp/bin, run server start myController, and then show message: Starting server myController

Table 65. Demo creating a Liberty collective (continued). Show commands and server.xml changes.

Scene	Audio	Onscreen Action
8	<p>Now that the collective controller is running, I can create a server to join to the collective. I'm going to create a server called myMember and I'll join this server into the collective. This operation can be done using the collective <b>join</b> command. And, what needs to be specified is the host and port that the collective controller is listening on the HTTPS port, the administrative user name and password, and a keystore password. This password can be the same or different from the password used when we created the collective controller.</p>	<p>Show command window open at wlp/bin, run <code>server create myMember</code>, and show message            Server myMember created.</p> <p>Then run <code>collective join myMember --host=localhost --port=9443 --user=admin --password=adminpwd --keystorePassword=demoPassword</code>.</p>
9	<p>Because this is connecting over SSL to the collective controller, it will prompt us for SSL trust. The certificate presented here is from the collective controller, which we recognize. We will accept the certificate and what will happen in the background is that the collective controller will establish some SSL certificates that will be handed back and laid down in the file system for this particular member.</p>	<p>Show messages generated by the <b>collective join</b> command. The messages show that the Issuer DN is controllerRoot. After the message Do you want to accept the above certificate chain? (y/n), enter y to accept the certificate.</p>

Table 65. Demo creating a Liberty collective (continued). Show commands and server.xml changes.

Scene	Audio	Onscreen Action
10	<p>We copy the configuration, just like we did for the controller, and we update the member's configuration file.</p> <p><b>Important:</b> <span style="background-color: #0056b3; color: white; padding: 2px;">8.5.5.4</span> The generated configuration has a <code>hostAuthInfo</code> element that was added to the product after the video was made. Complete the <code>hostAuthInfo</code> element in either of two ways:</p> <ul style="list-style-type: none"> <li>Specify the operating system login user ID and password for an authorized user of the member host computer. For example, if you log in to the member computer using the user ID <code>user1</code> and password <code>user1pwd</code>, you can specify: <pre>&lt;hostAuthInfo rpcUser="user1" rpcUserPassword="user1pwd" /&gt;</pre> </li> <li>If the member host is registered with the collective controller, you can specify: <pre>&lt;hostAuthInfo useHostCredentials="true" /&gt;</pre> </li> </ul>	<p>Show messages generated about keystore and truststore references, with the following messages marked for copying:</p> <pre>&lt;featureManager&gt;   &lt;feature&gt;collectiveMember-1.0&lt;/feature&gt; &lt;/featureManager&gt;</pre> <pre>&lt;!-- Define the host name for use by the collective.   If the host name needs to be changed, the server should be   removed from the collective and re-joined or re-replicated. --&gt;</pre> <pre>&lt;variable name="defaultHostName" value="memberHostname" /&gt;</pre> <p><span style="background-color: #0056b3; color: white; padding: 2px;">8.5.5.4</span> <code>&lt;!-- Remote host authentication configuration --&gt;</code> <code>&lt;hostAuthInfo rpcUser="admin_user_id" rpcUserPassword="admin_user_password" /&gt;</code>  <code>&lt;!-- Connection to the collective controller --&gt;</code> <code>&lt;collectiveMember controllerHost="localhost" controllerPort="9443" /&gt;</code> <code>&lt;!-- clientAuthenticationSupported set to enable bidirectional trust --&gt;</code> <code>&lt;ssl id="defaultSSLConfig" keyStoreRef="defaultKeyStore" trustStoreRef="defaultTrustStore" clientAuthenticationSupported="true" /&gt;</code>  <code>&lt;!-- inbound (HTTPS) keystore --&gt;</code> <code>&lt;keyStore id="defaultKeyStore" password="yourPassword" location="{server.config.dir}/resources/security/key.jks" /&gt;</code> <code>&lt;!-- inbound (HTTPS) truststore --&gt;</code> <code>&lt;keyStore id="defaultTrustStore" password="yourPassword" location="{server.config.dir}/resources/security/trust.jks" /&gt;</code> <code>&lt;!-- server identity keystore --&gt;</code> <code>&lt;keyStore id="serverIdentity" password="yourPassword" location="{server.config.dir}/resources/collective/serverIdentity.jks" /&gt;</code> <code>&lt;!-- collective truststore --&gt;</code> <code>&lt;keyStore id="collectiveTrust" password="yourPassword" location="{server.config.dir}/resources/collective/collectiveTrust.jks" /&gt;</code></p>
11	<p>We can do that also using Notepad.</p>	<p>Show the command to open a Notepad editor, <code>notepad usr/servers/myMember/server.xml</code>, show a Notepad editor open on the <code>myMember</code> <code>server.xml</code> file, and then the copied messages pasted into the <code>server.xml</code> file before the ending tag, <code>&lt;/server&gt;</code>.</p>
12	<p>Once updated, the member server can be started and the member server will start publishing its information into the controller.</p> <p>And that's it. You now have a very basic collective. To add more members, you just repeat the join operation on any servers that you want to create. It's that easy. The members are added and the collective grows.</p>	<p>Show command window open at <code>wlp/bin</code>, run <code>server start myMember</code>, and then show messages:</p> <pre>Starting server myMember Server myMember started</pre>

For more information, see “Configuring a Liberty collective” on page 1136.

## Video: Java EE 7 in Liberty

8.5.5.6

The following transcript is for the “Java EE 7 in Liberty ” video, which describes Liberty support for the Java Platform, Enterprise Edition (Java EE) 7 specifications and highlights ways to enable your Liberty servers for Java EE 7. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content that is shown in the video.

 Java EE 7 in Liberty

Table 66. Title page and benefits of Java EE 7. Show title and then list the benefits of Java EE 7.

Scene	Audio	Onscreen Action
1	Liberty now complies with Java Platform, Enterprise Edition Version 7. This video tells you about Liberty support for Java EE 7 and shows how you can quickly configure your servers for it.	Show title <i>Java EE 7 in Liberty</i> and the Java Compatible Enterprise Edition logo. Also show <i>Java Platform, Enterprise Edition Version 7</i> instead of <i>Java EE 7</i> for a few seconds to give the full name for <i>Java EE 7</i> .
2	<p>With Java EE 7, you have an open framework that enables you to provide robust business solutions and leverage your Java programming.</p> <p>You can deliver HTML5 dynamic scalable applications for desktops, tablets, and smartphones.</p> <p>You can be more productive. The simplified application architecture reduces the amount of boilerplate code needed for business logic.</p> <p>And you can support more enterprise demands. You can write batch applications in Java that use a standard API and are portable across multiple runtimes. You also can break down batch jobs into manageable chunks for uninterrupted performance.</p>	<p>Show animation that describes Java EE 7 and illustrates its main benefits:</p> <ul style="list-style-type: none"> <li>• HTML5 dynamic scalable applications</li> <li>• Increased developer productivity</li> <li>• Enterprise technologies such as batch processing</li> </ul>

Table 67. Grouping of specifications into “Java EE 7 full platform” and “Java EE 7 Web Profile”. Show what specifications are available in the “Java EE 7 full platform” and “Java EE 7 Web Profile” groups.

Scene	Audio	Onscreen Action
3	Java EE 7 introduces the full platform. All Java EE 7 specifications (or JSRs) are in the full platform.	Show image that has the entire Java EE 7. Highlight “Full Platform” and then all specifications.

Table 67. Grouping of specifications into "Java EE 7 full platform" and "Java EE 7 Web Profile" (continued). Show what specifications are available in the "Java EE 7 full platform" and "Java EE 7 Web Profile" groups.

Scene	Audio	Onscreen Action																																																															
4	<p>Specifications for web applications are in the Web Profile, a subset of the full platform.</p> <p>Java EE 6 introduced Web Profile to assist developers of dynamic web applications, providing technologies such as EJB Lite, Java Persistence API, and Java Transaction API.</p> <p>For Java EE 7, Web Profile adds support for HTML5.</p> <p>Two new technologies, WebSocket and JSON, speed up data exchanges and simplify data parsing for portable applications. Updates to existing technologies, JAX-RS 2.0, Java Server Faces 2.2, and Servlet 3.1 enhance your ability to develop dynamic HTML5 applications.</p> <p>A more robust POJO development model enables broader use of annotations, such as in Interceptors and CDI. Bean Validation 1.1 offers method-level validation.</p>	<p>Show image that has the entire Java EE 7. Then show animation that lists the specifications in Web Profile and highlights the specifications named in the audio.</p> <p>Web Profile</p> <table border="1"> <thead> <tr> <th>Specification</th> <th>Java EE 6</th> <th>Java EE 7</th> </tr> </thead> <tbody> <tr><td>Bean Validation</td><td>1.0</td><td>1.1</td></tr> <tr><td>Common Annotations for the Java Platform</td><td>1.1</td><td>1.2</td></tr> <tr><td>Contexts and Dependency Injection (CDI)</td><td>1.0</td><td>1.2</td></tr> <tr><td>Debugging Support for Other Languages</td><td>1.0</td><td>1.0</td></tr> <tr><td>Dependency Injection for Java</td><td>1.0</td><td>1.0</td></tr> <tr><td>Enterprise JavaBeans (EJB) Lite</td><td>3.1</td><td>3.2</td></tr> <tr><td>Expression Language (JSP/EL)</td><td>2.2</td><td>3.0</td></tr> <tr><td>Interceptors</td><td>1.1</td><td>1.2</td></tr> <tr><td>Java API for JSON Processing (JSON-P)</td><td>n/a</td><td>1.0</td></tr> <tr><td>Java API for RESTful Web Services (JAX-RS)</td><td>n/a</td><td>2.0</td></tr> <tr><td>Java Database Connectivity (JDBC)</td><td>4.0</td><td>4.1</td></tr> <tr><td>Java Naming and Directory Interface (JNDI)</td><td>1.0</td><td>1.0</td></tr> <tr><td>Java Servlet</td><td>3.0</td><td>3.1</td></tr> <tr><td>JavaServer Faces (JSF)</td><td>2.0</td><td>2.2</td></tr> <tr><td>JavaServer Pages (JSP)</td><td>2.2</td><td>2.3</td></tr> <tr><td>Java Transaction API (JTA)</td><td>1.1</td><td>1.2</td></tr> <tr><td>Java Persistence API (JPA)</td><td>2.0</td><td>2.1</td></tr> <tr><td>Managed Beans</td><td>1.0</td><td>1.0</td></tr> <tr><td>Standard Tag Library for JavaServer Pages (JSTL)</td><td>1.2</td><td>1.2</td></tr> <tr><td>WebSocket</td><td>n/a</td><td>1.0, 1.1</td></tr> </tbody> </table>	Specification	Java EE 6	Java EE 7	Bean Validation	1.0	1.1	Common Annotations for the Java Platform	1.1	1.2	Contexts and Dependency Injection (CDI)	1.0	1.2	Debugging Support for Other Languages	1.0	1.0	Dependency Injection for Java	1.0	1.0	Enterprise JavaBeans (EJB) Lite	3.1	3.2	Expression Language (JSP/EL)	2.2	3.0	Interceptors	1.1	1.2	Java API for JSON Processing (JSON-P)	n/a	1.0	Java API for RESTful Web Services (JAX-RS)	n/a	2.0	Java Database Connectivity (JDBC)	4.0	4.1	Java Naming and Directory Interface (JNDI)	1.0	1.0	Java Servlet	3.0	3.1	JavaServer Faces (JSF)	2.0	2.2	JavaServer Pages (JSP)	2.2	2.3	Java Transaction API (JTA)	1.1	1.2	Java Persistence API (JPA)	2.0	2.1	Managed Beans	1.0	1.0	Standard Tag Library for JavaServer Pages (JSTL)	1.2	1.2	WebSocket	n/a	1.0, 1.1

Table 67. Grouping of specifications into "Java EE 7 full platform" and "Java EE 7 Web Profile" (continued). Show what specifications are available in the "Java EE 7 full platform" and "Java EE 7 Web Profile" groups.

Scene	Audio	Onscreen Action
6	<p>In all, Java EE 7 has over 20 new or changed specifications.</p> <p>The Liberty product supports the full platform specifications, while the Liberty Core product supports mainly the Web Profile specifications.</p>	Show image of the entire Java EE 7. Highlight the specifications supported by Liberty and then Liberty Core.

Table 68. Demo installing Liberty with Java EE 7 by extracting a compressed (ZIP) file. Show how to install a Liberty runtime with Java EE 7 by extracting a ZIP file downloaded from WASdev.

Scene	Audio	Onscreen Action
7	You can install Liberty with Java EE 7 technologies by downloading a compressed, or ZIP, file from the WASdev website to a temporary directory, and then extracting the ZIP file to an empty directory.	Show how to download a ZIP file with Liberty and Java EE technologies from the WASdev website to C:\wlp_temp on a workstation and then extract the ZIP file to C:\, resulting in installation of Liberty to C:\wlp.
8	It's that simple!	Show selecting the C:\wlp installation directory.

Table 69. Demo adding a Liberty runtime with Java EE 7 features in WebSphere Developer Tools for Eclipse. Show how to install a server with Java EE features in WebSphere Developer Tools.

Scene	Audio	Onscreen Action
9	<p>In WebSphere Developer Tools for Eclipse, you can add a Liberty runtime with Java EE technologies.</p> <p>Create a new server and select to download and install a Liberty runtime environment from <a href="http://ibm.com">ibm.com</a>.</p> <p>The runtime options with Java EE 7 technologies are for the full platform, Web Profile or client.</p> <p>You can add on individual features. Technologies that are in the selected runtime option are greyed out.</p>	<p>Show images that demo how to add a Liberty server that has Java EE technologies in WebSphere Developer Tools.</p> <ol style="list-style-type: none"> <li>1. Right-click in the Servers view and select <b>New &gt; Server</b>.</li> <li>2. In the New Server wizard: <ol style="list-style-type: none"> <li>a. Select the <b>WebSphere Application Server Liberty</b> server type and click the <b>Add</b> link.</li> <li>b. Select <b>Install from an archive or repository</b> and click <b>Next</b>.</li> <li>c. Specify the location to which to install Liberty, select <b>Download and install a new runtime environment from ibm.com</b>, select a Liberty product with Java EE 7 technologies, and click <b>Next</b>.</li> <li>d. Select any add-ons to install and click <b>Next</b>.</li> <li>e. Accept the license agreement and click <b>Finish</b>.</li> <li>f. After installation, click <b>Next</b>.</li> <li>g. Specify a server name and click <b>Next</b>.</li> <li>h. Click <b>Finish</b>.</li> </ol> </li> </ol> <p>To start the server, right-click the Liberty server in the Servers view and click <b>Start</b>.</p>

Table 70. Demo adding Java EE 7 features to a Liberty installation from a command line and Installation Manager. Show how to run an `installUtility` command to install Java EE features. Briefly show the Installation Manager option.

Scene	Audio	Onscreen Action
10	If you already have Liberty installed, you can add Java EE 7 features to your installation by running a <code>featureManager</code> or <code>installUtility</code> command.	Show running an <code>installUtility</code> command to install features into an existing installation of Liberty at C:\wlp. <ol style="list-style-type: none"> <li>From a command line at C:\wlp\bin, show running a command to install the <code>webProfile-7.0</code> feature:  <pre>installUtility install webProfile-7.0</pre> </li> <li>Enter 1 to agree to the terms of the license agreement.</li> </ol> <p>Command messages list the features installed.</p>
11	You also can use Installation Manager to install Java EE 7 features.	Show images that demo how to use Installation Manager to install Liberty with Java EE 7 features. <ol style="list-style-type: none"> <li>During installation of IBM WebSphere Application Server Liberty Network Deployment 8.5.5.6, under <b>Liberty Repositories</b> on the Install Packages page, select <b>Allow Installation Manager to connect to the IBM WebSphere Liberty Repository</b> and click <b>Next</b>.</li> <li>Under <b>Asset Selection</b> on the Install Packages page, click <b>Launch Asset Selection Wizard</b>.</li> <li>In the Asset Selection dialog: <ol style="list-style-type: none"> <li>Click the <b>Install</b> button to select a Java EE technology to install.</li> <li>After the <b>Install</b> button changes to the <b>Install Pending</b> button, click <b>Next</b>.</li> <li>Under <b>License Agreement</b>, select <b>I accept the terms in the license agreement</b> and click <b>Finish</b>.</li> </ol> </li> <li>Under <b>Asset Selection</b> on the Install Packages page, review the list of assets to install and click <b>Next</b>.</li> </ol>
12		Show a summary of the ways to install Java EE 7 technologies for Liberty: <ul style="list-style-type: none"> <li>ZIP file from the WASdev website</li> <li>WebSphere Application Server Developer Tools for Eclipse</li> <li><code>installUtility</code> or <code>featureManager</code> command</li> <li>IBM Installation Manager</li> </ul>

Table 71. Demo configuration of a Liberty server to add a Java EE 7 feature. Show how to add a Java EE 7 feature to a server configuration.

Scene	Audio	Onscreen Action
13	After Java EE 7 features are installed, adding support for a Java EE 7 specification to a Liberty server is as simple as adding a feature name to a <code>server.xml</code> file.	Under the heading <i>Configuration</i> , show a command line at C:\wlp\bin with the command <code>server run server1</code> and with messages indicating that <code>server1</code> is running. Also show a text editor open on the <code>server.xml</code> file of <code>server1</code> . Finally, show adding the <code>jaxrs-2.0</code> feature to a feature manager and the resulting <code>server1</code> messages that confirm the server configuration change.
14	Liberty provides the <code>javaee-7.0</code> , <code>webProfile-7.0</code> , and <code>javaeeClient-7.0</code> convenience features to make it easier to enable your servers to support a broad range of applications.	Show a list of the Liberty convenience features for Java EE 7: <ul style="list-style-type: none"> <li><code>javaee-7.0</code></li> <li><code>webProfile-7.0</code></li> <li><code>javaeeClient-7.0</code></li> </ul>

Table 71. Demo configuration of a Liberty server to add a Java EE 7 feature (continued). Show how to add a Java EE 7 feature to a server configuration.

Scene	Audio	Onscreen Action
15	Use the <code>javaee-7.0</code> feature to quickly add support for all specifications. The <code>webProfile-7.0</code> feature adds support for web applications. And the <code>javaeeClient-7.0</code> feature allows you to quickly configure an application client component.	Show sample configuration files for the <code>javaee-7.0</code> , <code>webProfile-7.0</code> , and <code>javaeeClient-7.0</code> convenience features.

Table 72. Some features require configuration or migration. Show where to find instructions about the needed configuration or migration.

Scene	Audio	Onscreen Action
16	<p>The IBM Knowledge Center has information about the features.</p> <p><i>Java EE 7 programming model support</i> lists the Java EE specifications, provides links to the JSRs and Liberty features, and tells you what products support the specifications. Note that not all Java EE specifications have their own Liberty feature.</p> <p>For some of the features, you'll need to do configuration beyond adding the feature name to a <code>server.xml</code>.</p> <p>If your server uses Java EE 6 features and you are considering adding Version 7 features, look at <i>Supported Java EE 6 and 7 feature combinations</i>. Also, look at <i>Java EE 7 behavior changes</i> to see whether moving from a Version 6 feature to a Version 7 feature would benefit your applications and environment.</p> <p>For details on features, see <i>Liberty features</i>.</p>	<p>Show topics in Knowledge Center that identify and cover feature configuration and migration:</p> <ul style="list-style-type: none"> <li>• <i>Java EE 7 programming model support</i></li> <li>• <i>Supported Java EE 6 and 7 feature combinations</i></li> <li>• <i>Java EE 7 behavior changes</i></li> <li>• <i>Liberty features</i></li> </ul>

Table 73. Conclusion. Show where to find more information about Java EE 7 in Liberty.

Scene	Audio	Onscreen Action
17	For how-to articles and videos on using Java EE 7 in your applications as well as information about configuring servers, see <code>WASdev.net</code> and the WebSphere Application Server Liberty documentation on IBM Knowledge Center.	<p>Show where to find information about Java EE 7 in Liberty:</p> <p><b>WASdev</b>  <a href="http://developer.ibm.com/wasdev">http://developer.ibm.com/wasdev</a></p> <p><b>IBM Knowledge Center</b>  <a href="http://www.ibm.com/support/knowledgecenter/">http://www.ibm.com/support/knowledgecenter/</a></p>

For more information, see “Java EE 7 in Liberty” on page 4.

## Video: OpenID Connect on Liberty

8.5.5.5

The following transcript is for the “OpenID Connect on Liberty” video, which demonstrates how to configure OpenID Connect on Liberty. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content that is shown in the video.

## OpenID Connect on Liberty

*Table 74. Title page.* Show title and then a basic OpenID Connect scenario, along with supported OpenID providers and benefits of using OpenID Connect.

Scene	Audio	Onscreen Action
1	This video will show you how to set up a simple OpenID Connect web single-sign-on scenario using WebSphere Application Server Liberty.	Show title <i>OpenID Connect Quick Setup</i> .
2	<p>Here you can see a basic "OpenID Connect" flow. When a user first attempts to access an OpenID Connect-protected web application, or relying party, the user is redirected to an OpenID Connect provider. The OpenID Connect provider authenticates the user and obtains the user's authorization, then responds with an authorization code. The application container then extracts the code from the response, sends the code back to the OpenID provider for verification, and receives ID and access tokens. As a result, the user is authenticated to access the protected web application. Using the access token, the application can request user information, such as an email address, from the OpenID Connect provider, or it can access any service that supports OpenID Connect. In this video, I will refer to the application as the "Relying Party" or RP and the "OpenID Provider" as OP.</p> <p>Let's take a look at the several supported OpenID providers.</p>	Show a basic OpenID Connect scenario, that includes a Relying Party (RP), OpenID Provider (OP), and an End-User.
3	You can configure IBM WebSphere Liberty either as an OpenID provider or a relying party. You can use IBM Security Access Manager, also known as ISAM, as an OP as well. Alternatively, you can use a number of supported third-party OpenID providers.	Show some of the supported OpenID providers. <ul style="list-style-type: none"><li>• IBM WebSphere</li><li>• IBM Security Access Manager</li><li>• Amazon</li><li>• Microsoft</li><li>• Okta</li><li>• Google</li></ul>

Table 74. Title page (continued). Show title and then a basic OpenID Connect scenario, along with supported OpenID providers and benefits of using OpenID Connect.

Scene	Audio	Onscreen Action
4	<p>OpenID Connect offers a number of benefits as an identity layer on top of OAUTH 2.0. With OpenID Connect, users have a single internet identity that they can use to authenticate across several servers, services, and applications, and it reduces the amount of maintenance work in applications because they no longer need their own user registry.</p> <p>For developers, it simplifies the task of authenticating users without taking on the responsibility of storing and managing passwords. OpenID Connect can also extend security services to cloud-based and mobile applications written in any language, such as JavaScript, Ruby, node.js, or Java, and it can function as a single security manager for provisioning hundreds of Liberty servers in a cloud environment. Because OpenID Connect combines the advantages of identity, authentication, and OAuth, OpenID Connect is a significant improvement over OAuth alone.</p>	<p>Show some of the benefits of using OpenID Connect.</p> <ul style="list-style-type: none"> <li>• OpenID Connect makes it easier for a user to use a single internet identity (user account), to authenticate across several servers, services, and applications.</li> <li>• Applications no longer need to maintain their own user registry.</li> <li>• OpenID Connect extends security services to cloud and mobile applications, accessible through languages such as JavaScript, Ruby, node.js, Java</li> <li>• Provisioning hundreds of Liberty servers in a cloud offers the ability to have a single security manager</li> <li>• OpenID Connect is a significant improvement over OAUTH 2.0</li> </ul>

Table 75. Demo configuring the OpenID Provider

Scene	Audio	Onscreen Action
5	<p>WebSphere Application Server Liberty can be configured as the OpenID provider, the relying party, or both. If you want to use Liberty as both an OP and RP, you must configure them on different Liberty server instances. We will set up Liberty servers as OP and RP and take a look at a simple web single-sign-on scenario between the Liberty OP and RP.</p>	<p>Show title <i>Setting up Liberty as OpenID Connect provider and relying party.</i></p>
6	<p>First, we will set up an OpenID provider.</p> <p>To do so, we will install WebSphere Liberty 8554 or later, which is required to use the OpenID Connect features. Install the OpenID Server feature</p> <p>Create a Liberty server and add an OP configuration to the server.xml file, which is available as a downloadable sample from IBM developerWorks.</p>	<p>Show OP setup overview.</p> <ol style="list-style-type: none"> <li>1. Install WebSphere Liberty 8.5.5.4 or above &gt; <b>java -jar wlp-developers-runtime-8.5.5.4.jar</b></li> <li>2. Install OpenID Server feature (No download necessary) &gt; <b>bin/featureManager install openidConnectServer-1.0 --when-file-exists=ignore</b></li> <li>3. Create a Liberty server &gt; <b>server create oidcServer</b></li> </ol> <ul style="list-style-type: none"> <li>• Edit server.xml with more configurations (Sample downloadable)</li> <li>• Required features</li> <li>• SSL keystore</li> <li>• User Registry</li> <li>• OpenID Server</li> </ul>

Table 75. Demo configuring the OpenID Provider (continued)

Scene	Audio	Onscreen Action
7	<p>First, unpack the Liberty JAR file. This creates the wlp directory. Go to the bin directory under wlp, and run the <b>featureManager install</b> command to install the OpenID Connect Server feature.</p> <p>In the same directory, run the <b>server create</b> command to create a Liberty OP server. We will name this one oidcServer.</p> <p>oidcServer is now created with the minimum configuration in the server.xml file. You can find the configuration in the wlp/usr/server/oidcServer directory.</p> <p>Here you can see the contents of the server.xml file that we just created. The configuration is very simple, just one feature and port information. We will replace it with a server.xml file that has the OP server configuration. (Screen splits and right-hand side OP config appears).</p> <p>(Going through updates in the server.xml file) In this OP server configuration,</p> <ul style="list-style-type: none"> <li>• Required features are added.</li> <li>• A host name is added.</li> <li>• Keystore configuration is included for the SSL feature.</li> <li>• The OP maintains user accounts, so a user registry is configured.</li> </ul> <p>The rest is OP configuration that uses OAuth technology. It includes information about the relying party that it performs authorization for.</p> <p>You can download the server.xml file that we just added from IBM DeveloperWorks. We will start the OP server. Now that we have set up the OpenID provider, we can set up the Liberty relying party.</p>	<p>Demo with a command prompt that is being used to update server.xml file.</p>

Table 76. Demo configuring the Relying Party

Scene	Audio	Onscreen Action
8	<p>To set up the relying party, just like the OP configuration, we need to have version 8.5.5.4 or later of the Liberty profile and we will install the OpenID Client feature.</p> <p>We will create a separate Liberty server and edit the server.xml file.</p> <p>Then we will install the application and exchange keys with the OpenID provider for SSL communication.</p>	<p>Show RP setup overview.</p> <ol style="list-style-type: none"> <li>1. Install WebSphere Liberty 8.5.5.4 &gt; <b>java -jar wlp-developers-runtime-8.5.5.4.jar</b></li> <li>2. Install OpenID Client feature (No download necessary) &gt; <b>bin/featureManager install openidConnectClient-1.0 --when-file-exists=ignore</b></li> <li>3. Create a Liberty server &gt; <b>server create oidcRP</b> <ul style="list-style-type: none"> <li>• Edit server.xml with more configurations (Sample downloadable)</li> <li>• Required features</li> <li>• SSL keystore</li> <li>• OpenID Client</li> <li>• Application</li> </ul> </li> </ol> <ol style="list-style-type: none"> <li>1. Install application (that uses OpenID Connect) &gt;&gt; Copy application ear/war file under app directory <ul style="list-style-type: none"> <li>• Exchange keys with OP for SSL communication</li> </ul> </li> </ol>
9	<p>Version 8.5.5.4 of Liberty is already configured on this machine. We will install the OpenID Client feature and create a server with the name oidcRP. Here is the default server.xml file. Now, we will compare it to a server.xml file with an RP configuration. These sections - features, endpoint host name, keystores - are the same updates that we previously saw with the OP.</p> <p>This time, we have an OpenID Client configuration instead of the OP server configuration. It specifies the OP URLs to send authentication requests to.</p> <p>The RP configuration also includes application configuration and these applications rely on the OP to perform authentication.</p> <p>Note that there is no user registry configuration on the RP. That is all the configuration needed for the RP. We will copy a test application into the app directory of the RP. Before you start the RP server, make sure that the RP and OP exchanged the keys in the keystore for SSL communication. In this demo, we will use the same keystore and same password.</p> <p>Now we will start the RP server to see if we are set up correctly.</p>	<p>Demo with a command prompt that is being used to update server.xml file.</p>

Table 77. Demo testing the OP/RP setup

Scene	Audio	Onscreen Action
10	The OP and RP servers are already started. In a browser, we will go to the application URL. When prompted, we will enter account information from the OP. We will see the RP relying on the OP to perform authentication. Once the user is authenticated, the RP will show an application page to the user. Let's try that now.	<p>Demo testing the OP/RP setup.</p> <ol style="list-style-type: none"> <li>1. Start both OP and RP servers, &gt; <b>server start oidcServer</b> &gt; <b>server start oidcRP</b></li> <li>2. In a browser, point to the application login page on RP &gt; <a href="https://oidc-rp.rtp.raleigh.ibm.com:9443/testpage">https://oidc-rp.rtp.raleigh.ibm.com:9443/testpage</a></li> <li>3. When prompted, enter the user ID and password that is maintained by the OP &gt; user1 / security</li> <li>4. RP relies on OP for authentication</li> <li>5. Upon successful authentication, RP serves application page with user information.</li> </ol>
11	<p>In the browser, we will type in the application URL that is on the RP server. It will prompt for a user name and password. Notice that we are being prompted by the OP server because the RP is delegating the authentication to the OP.</p> <p>We will enter user1 and security, which are the credentials for the OP account. Now we are successfully logged in to the application on the RP using the OP account.</p>	<p>Demo with a browser login that shows a successful login into the application on the RP that is using the OP account.</p>

Table 78. Conclusion. Show where to find more information about OpenID Connect.

Scene	Audio	Onscreen Action

For more information about OpenID Connect, see [8.5.5.5](#) Using OpenID Connect.

## Video: Setting up Admin Center

8.5.5.2

The following transcript is for the “Setting up Admin Center” video, which demonstrates how to configure a `server.xml` file to enable Admin Center. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content shown in the video.

### Setting up Admin Center

Table 79. Demo setting up Admin Center in Liberty. Show `server.xml` changes.

Scene	Audio	Onscreen Action
1	This video shows how to enable Liberty Admin Center and get to the login page. Enabling Admin Center is quick and easy.	Show Liberty Admin Center login page in web browser.
2	You need a Liberty Version 8.5.5.2 or later installation. Make a few changes to the <code>server.xml</code> file of a server and you can use the Admin Center.	In Windows Explorer, show <code>wlp/usr</code> Liberty installation directory with no server defined.
3	I have just installed Liberty. To add a server, I go to a command prompt at the <code>wlp/bin</code> directory and run:  <code>server create myServer</code>  This creates a server named <code>myServer</code> .	Show command window open at <code>wlp/bin</code> , run <code>server create myServer</code> , and then show message <code>Server myServer created</code> .
4	The <code>server.xml</code> file is in the <code>usr/servers/myServer</code> directory. I want to make 4 changes to this <code>server.xml</code> file.	In Windows Explorer, select <code>wlp/usr/servers/myServer</code> directory. Select <code>server.xml</code> .
5	First, I add the <code>adminCenter-1.0</code> feature to the feature manager.	In editor open on <code>server.xml</code> , add the <code>adminCenter-1.0</code> feature to the feature manager:  <pre>&lt;featureManager&gt;   &lt;feature&gt;jsp-2.2&lt;/feature&gt;   &lt;feature&gt;adminCenter-1.0&lt;/feature&gt; &lt;/featureManager&gt;</pre>
6	Second, I add a <code>quickStartSecurity</code> element and specify a user name and password to configure a secure login. My user name is <code>admin</code> and my password is <code>adminpwd</code> .	In editor, add user name and password:  <pre>&lt;quickStartSecurity userName="admin"   userPassword="adminpwd" /&gt;</pre>
7	Third, I add a <code>keyStore</code> element to protect keystore files that have server authentication credentials. I choose <code>defaultKeyStore</code> for the <code>id</code> attribute and <code>Liberty</code> for the <code>password</code> attribute.	In editor, add keystore:  <pre>&lt;keyStore id="defaultKeyStore"   password="Liberty" /&gt;</pre>
8	Fourth, I add a <code>host</code> attribute set to asterisk to the <code>httpEndpoint</code> element. Setting <code>host</code> to asterisk, or to a defined host name, lets me view Admin Center on a cell phone, tablet, and remote computer, and not just on this <code>localhost</code> computer.	In editor, press enter after <code>id="defaultHttpEndpoint"</code> in the <code>httpEndpoint</code> element and add <code>host="*"</code> to the new line:  <pre>&lt;httpEndpoint id="defaultHttpEndpoint"   host="*"   httpPort="9080"   httpsPort="9443" /&gt;</pre>
9	Save the <code>server.xml</code> changes.	In editor, save changes.

Table 79. Demo setting up Admin Center in Liberty (continued). Show server.xml changes.

Scene	Audio	Onscreen Action
10	<p>Make these server.xml changes for every Liberty server and collective controller that you want to be able to view in Admin Center.</p> <p>In a multiple-server environment, you only need to make these changes to the server.xml file of a collective controller. You do not need to change the server.xml files of members.</p>	In editor, continue to show server.xml.

Table 80. Displaying Admin Center. Show starting the server, highlighting the adminCenter URL, and pointing a browser at the URL.

Scene	Audio	Onscreen Action
11	<p>I am now ready to start myServer and see Admin Center. Because I want messages shown in the foreground, I use the <b>run</b> command. I enter:</p> <pre>server run myServer</pre> <p>To not show the messages, I would enter:</p> <pre>server start myServer</pre>	In command window on wlp/bin directory, enter server run myServer. The command runs and product messages display in the command window.
12	Liberty writes status messages to the command window. One message has the URL for the adminCenter web application.	Highlight <code>http://host_name:9080/adminCenter/</code> URL in messages.
13	I put this URL into a web browser, and press Enter. The URL changes to https and port 9443 because I specified a secure connection in the server.xml file.	Add URL <code>http://host_name:9080/adminCenter/</code> to browser, press Enter, show URL change to <code>https://host_name:9443/adminCenter/</code> .
14	You might need to add a browser exception to confirm that the connection is trusted.	Show Firefox dialog and button selections <b>Add Exception</b> , <b>Get Certificate</b> , and then <b>Confirm Security Exception</b> .
15	I am now ready to log in to Admin Center.	Show Liberty Admin Center login page.

Table 81. Conclusion. Show where to find more information about Admin Center.

Scene	Audio	Onscreen Action
16	For information on logging into and using Admin Center, and viewing your personal Toolbox, see WASdev.net and the WebSphere Application Server Liberty documentation on IBM Knowledge Center.	<p>Show Liberty Admin Center login page with login fields and title covered by information on documentation:</p> <p><b>WASdev</b>  <a href="http://developer.ibm.com/wasdev">http://developer.ibm.com/wasdev</a></p> <p><b>WebSphere Application Server Liberty documentation on IBM Knowledge Center</b>  <a href="http://www-01.ibm.com/support/knowledgecenter/">http://www-01.ibm.com/support/knowledgecenter/</a></p> <p>Fade the information on documentation and end by showing just the Liberty Admin Center login page.</p>

For more information, see “Administering Liberty using Admin Center” on page 1741.

## Video: Thoughts on Liberty: Interview with Alasdair Nottingham

The following transcript is for the “Thoughts on Liberty: Interview with Alasdair Nottingham ” video. Alasdair shares his perspectives as a lead developer of WebSphere Application Server Liberty on why Liberty is exciting for developers. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content that is shown in the video.

### Thoughts on Liberty: Interview with Alasdair Nottingham

*Table 82. Thoughts on Liberty: Interview with Alasdair Nottingham.* As lead developer for WebSphere Application Server Liberty, Alasdair Nottingham shares his perspectives on Liberty and its value for developers.

Scene	Audio	Onscreen Action
1	None	Show "IBM".
2	None	Show "Liberty".
3	None	Show the text:  Liberty is a new lightweight, easy to use version of WebSphere Application Server. We asked IBM developers to share their thoughts on what it means for developers ...
4	None	Show the question:  What do you find exciting about Liberty?
5	It's this really simple configuration that you can just go and edit with Notepad. I use Unix on a daily basis and being able to go in and edit it kinda completely breaks the expectation that people have of what WebSphere Application Server is. When we say, "Here is what Liberty is," the look of shock and disbelief of people seeing a runtime that starts in seconds, and is dynamic and flexible and has all the behaviors that Liberty has, I think is really exciting.	Show the developer, Alasdair Nottingham, talking on camera. Alasdair Nottingham is a lead developer for WebSphere Application Server Liberty.  Show words: <ul style="list-style-type: none"> <li>• Simple configuration</li> <li>• Breaks expectations</li> <li>• Dynamic</li> <li>• Flexible</li> </ul>
6	None	Show the question:  Tell us about a Liberty user experience?
7	We've got jazz.net which is a website hosting a whole lot of technologies around development. I got contacted one day by the jazz.net lead and he said, "I wanted you to that know we just got into production for our download application on jazz.net." He had not come and spoken to the development team or raised any issues. He had just gone ahead and taken an application that previously had been running elsewhere and got it up and running on jazz.net. All he was talking about what how great an experience it was. He said it was easy to tune and to get it to behave correctly. He was really excited.	Show the developer, Alasdair Nottingham, talking on camera.  Show words: <ul style="list-style-type: none"> <li>• Great experience</li> </ul>
8	None	Show the question:  What would you like to say to developers?

Table 82. *Thoughts on Liberty: Interview with Alasdair Nottingham (continued)*. As lead developer for WebSphere Application Server Liberty, Alasdair Nottingham shares his perspectives on Liberty and its value for developers.

Scene	Audio	Onscreen Action
9	<p>Well I think the important thing is to try it out. An awful lot of people have preconceptions on what proprietary software is like. Or what IBM software is like, in particular. I really think we have tried very hard to learn from the best examples of good usability.</p> <p>We've especially been focused around trying to make it good for developers. At the end of the day, I'm a developer. I work with a bunch of developers and we want to write something that is really good for developers to go and use. I think it really enables you to do a lot of thing that you couldn't do before.</p> <p>It runs in production just as easily. It's completely supported in production environments. That's something that people miss when we say it is a developer focused runtime. It's not to say we aren't trying to provide a runtime for production. It's just saying that by making sure we provide a great developer-friendly runtime, we get a great production-ready runtime at the same time.</p>	<p>Show the developer, Alasdair Nottingham, talking on camera.</p> <p>Show words:</p> <ul style="list-style-type: none"> <li>• Try it out</li> <li>• Good for developers</li> <li>• Completely supported in production</li> </ul>
10	None	<p>Show the text:</p> <p>To learn more: <a href="http://wasdev.net">http://wasdev.net</a></p>

## Video: Touring Admin Center

The following transcript is for the “Touring Admin Center” video, which briefly describes Admin Center features. This transcript is the video storyboard. The video does not have Audio text. Onscreen Action describes the images and words shown.

### Touring Admin Center

Table 83. *Touring Admin Center*. Show images of Admin Center and describe its features in on-screen text.

Scene	Audio	Onscreen Action
1	No narration. Background music.	Show title, <i>Touring Admin Center</i> .
2		Show words <i>Secure login</i> while showing the login page.
3		Show words <i>from a desktop, tablet and smartphone</i> while showing Admin Center login page in a web browser on a desktop monitor, then on a tablet, then on a smartphone.
4		Show words <i>Toolbox</i> and then <i>to hold tools and bookmarks of URLs to favorite websites</i> while showing the Toolbox.
5		Show words <i>customizable by each user</i> while showing Edit Toolbox page, Add Bookmark, and then Add Bookmark dialog.
6		Show words <i>Server Config tool</i> and then <i>to view and edit server.xml and configuration files</i> while showing Server Config tool open on a <i>server.xml</i> file.
7		Show words <i>Explore tool</i> and then <i>to browse applications, clusters, servers and hosts</i> while showing Explore tool Dashboard, then application details page, and then Servers page.

Table 83. *Touring Admin Center (continued).* Show images of Admin Center and describe its features in on-screen text.

Scene	Audio	Onscreen Action
8		Show words <i>to manage resources</i> while showing Start action on two selected resources on Servers page and then search for resources on Search page.
9		Show words <i>to monitor resource metrics</i> while showing charts for a servlet on Monitor page.
10		Show words <i>and to set and view administrative metadata</i> while showing Tags and Metadata dialog and then metadata on server details page.
11		Show words <i>Deploy tool</i> and then <i>to install Liberty server packages on hosts in a collective</i> while showing Deploy tool.
12		Show words <i>Background Tasks</i> and then <i>to check the status of Deploy Installation tasks</i> and then <i>and to view messages</i> while showing Background Tasks page.
13		Show words <i>An interface that informs and guides</i> while showing message for Add Bookmark pop-up dialog.
14		Show words <i>and has preference options</i> while showing Preferences page.

Table 84. *Conclusion.* Show where to get Admin Center.

Scene	Audio	Onscreen Action
15	No narration. Background music.	Show words <i>Available from</i> and then <i>WASdev</i> and <i>http://developer.ibm.com/wasdev</i> .

For more information, see “Administering Liberty using Admin Center” on page 1741.

## Video: Using the IBM WebSphere Liberty Repository to enhance Liberty environments

The following transcript is for the “Using the IBM WebSphere Liberty Repository to enhance Liberty environments” video, which briefly describes the Liberty Repository, its rich set of assets, and how to obtain the assets. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content shown in the video.

### Using the Liberty Repository to enhance Liberty environments

Table 85. *Using the IBM WebSphere Liberty Repository to enhance Liberty environments.* Show images of WASdev.net and other methods of obtaining Liberty features, and describe the Liberty Repository in on-screen text.

Scene	Audio	Onscreen Action
1	Using the IBM WebSphere Liberty Repository to easily enhance your Liberty environment	Show title, <i>Using the IBM WebSphere Liberty Repository to easily enhance your Liberty environment</i> .
2	The rapid evolution and adoption of cloud, mobile, and social media technologies are driving the demand for delivering applications faster and more frequently. IBM WebSphere Application Server is now delivering features for Liberty on a continual basis via the Liberty Repository. In this video, you will learn about the Liberty Repository, its rich set of resources, and how to get started to obtain the latest Liberty features that are available.	Images representing, cloud, mobile, and social media appear. The words “develop applications faster,” “IBM WebSphere Application Server,” “New Liberty features on a continual basis,” and “Liberty Repository” are shown.

Table 85. Using the IBM WebSphere Liberty Repository to enhance Liberty environments (continued). Show images of WASdev.net and other methods of obtaining Liberty features, and describe the Liberty Repository in on-screen text.

Scene	Audio	Onscreen Action
3	Building on the highly composable and modular nature of Liberty, we are making available new features on a continuous basis that you can use to easily extend or enhance your Liberty-based applications. The optional, production-ready features can be quickly and easily added to an existing WebSphere Liberty V8.5.5 installation. Simply choose the features that you want and then install the features to the applicable product service level. The features that you add inherit the same support of your existing installation.	Building blocks representing Liberty features drop down, building a stack of blocks. The word “Optional, production-ready features” and “Add to existing Liberty environment” are shown.
4	Some of the available features include: <ul style="list-style-type: none"> <li>• IBM WebSphere Liberty Administrative Center</li> <li>• IBM WebSphere Liberty Connector Architecture</li> <li>• IBM WebSphere Liberty Optimized Adapters for z/OS</li> <li>• IBM WebSphere Liberty z/OS Connect</li> </ul>	Show words: <ul style="list-style-type: none"> <li>• <i>IBM WebSphere Liberty Administrative Center</i></li> <li>• <i>IBM WebSphere Liberty Connector Architecture</i></li> <li>• <i>IBM WebSphere Liberty Optimized Adapters for z/OS</i></li> <li>• <i>IBM WebSphere Liberty z/OS Connect</i></li> </ul>
5	With the Liberty Repository, you can easily obtain these composable features, as well as enhancements and helpful development tools, from the Repository, rather than having to wait for new product releases. The Liberty Repository enables us to deliver these valuable assets to you faster so that you can more quickly produce, enhance, and deliver innovations and engaging applications.	Show the WASdev Downloads page and the entries for features. Each entry includes an icon, the type of asset, the name of the asset, the release date, a description, and a rating.
6	In addition to features, the repository also includes artifacts such as administration scripts, samples, configuration snippets as well as artifacts that integrate open source projects more quickly and effectively. These assets are specifically designed to encompass end-to-end integration and provide important business value for the entire life-cycle of your Liberty application.	Show the WASdev Downloads page and the entries for other assets on the page. Each entry includes an icon, the type of asset, the name of the asset, the release date, a description, and a rating.  Show a list of all possible asset types and their associated icons: <ul style="list-style-type: none"> <li>• Features</li> <li>• Product samples</li> <li>• Addons</li> <li>• Product runtimes</li> <li>• Admin scripts</li> <li>• Config snippets</li> <li>• Open source integration</li> <li>• Tools</li> </ul>
7	To get started, visit WASdev.net from your computer or mobile device. From the home page, click Downloads to browse and discover the variety of assets in the repository. You can search to find the assets you need. Also, you can use filtering to scope your search by asset type and edition. From WASdev.net, you can learn about the available features and how to install them using product installation tools, WebSphere Developer Tools or Rational® Application Developer.	Show the WASdev.net homepage. The cursor clicks on <b>Downloads</b> and scrolls through the asset listing. “MongoDB” is searched for, then the cursor clicks on the <b>Filter</b> menu and clicks <b>Feature</b> to filter the results to show only features.

Table 85. Using the IBM WebSphere Liberty Repository to enhance Liberty environments (continued). Show images of WASdev.net and other methods of obtaining Liberty features, and describe the Liberty Repository in on-screen text.

Scene	Audio	Onscreen Action
8	The Liberty Repository has been seamlessly integrated with the Liberty installation methods. You can easily add Liberty features that are located in the Liberty Repository using either IBM Installation Manager, when installing Liberty, or using the command line, if Liberty is already installed. Both installation methods automatically search for and install any dependencies that the selected features might require.	Show the Installation Manager GUI window where additional features can be installed. Show a command-line window with the featureManager command, displaying options you can use with the command.
9	Additionally, the repository has been integrated with WebSphere Developer Tools and Rational Application Developer so that you can browse, filter, and search assets for these assets. After you find the asset that you want, simply add it to your install cart.	Show the Install Add-ons window in WebSphere Developer Tools. Click <b>Install</b> and hover over the Liberty Repository assets that can be installed.

Table 86. Conclusion. Show where to get started with Liberty Repository

Scene	Audio	Onscreen Action
10	To learn more about the Liberty Repository and the newly added features and assets, go to WASdev.net. Ready to get started?	Show words <i>WASdev</i> and <i>https://www.ibmmdw.net/wasdev/</i> .

For more information, see “Liberty: Liberty Repository” on page 965.

## Video: Why Liberty? Performance that scales

8.5.5.6

The following transcript is for the “Why Liberty? Performance that scales” video, which describes how Liberty delivers optimal performance that easily scales. WebSphere Application Server Liberty is a lightweight, composable application server that is quick to start, easy to manage, and fast to deploy to, which enables rapid application development and availability in mobile, cloud, social, analytic, and enterprise production environments. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content that is shown in the video.

### Why Liberty? Performance that scales

Table 87. Why Liberty? Performance that scales. Show title and then describe how the lightweight and composable nature of Liberty results in a runtime that delivers high performance and scalability.

Scene	Audio	Onscreen Action
1	Why Liberty? Performance that scales	Show title, <i>Why Liberty? Performance that scales</i> .
2	What if your runtime could help you build killer apps that scale?	Show words: What if your runtime could help you build killer applications that scale?

Table 87. Why Liberty? Performance that scales (continued). Show title and then describe how the lightweight and composable nature of Liberty results in a runtime that delivers high performance and scalability.

Scene	Audio	Onscreen Action
3	<p>WebSphere Application Server Liberty is the runtime for IBM Watson® as well as the hybrid cloud solution that serves every Grand Slam Tennis event around the world.</p> <p>So why do Watson™ and the tennis majors use Liberty? Because Liberty delivers the scalability and performance required to support the unique needs of cognitive and analytic queries. Liberty easily scales to meet the demands of real-time major sporting events and analysis applications that can quickly spike to over 100 million web page views at peak match times.</p> <p>Liberty is a lightweight, yet powerful, and fast runtime that was designed and built to meet the needs of developers. Using Liberty, you can rapidly develop and employ applications into production environments that perform and easily scale, which enables you to more quickly transform your own innovative ideas into reality!</p> <p>What if your runtime could help you build killer applications that scale, like Watson or the hybrid cloud solution for Grand Slam Tennis events? It can!</p>	<p>Show words:</p> <ul style="list-style-type: none"> <li>• Australian Open</li> <li>• French Open</li> <li>• Wimbledon</li> <li>• U.S. Open</li> <li>• Liberty can!</li> </ul> <p>Show graphics of:</p> <ul style="list-style-type: none"> <li>• IBM Watson</li> <li>• Liberty</li> <li>• Resizing square scaling graphic for <i>scalability</i></li> <li>• Lightning graphic for <i>performance</i></li> <li>• Multiple pop-up window graphics that show a tennis ball and racquet for <i>web page views</i></li> <li>• Scale graphic for <i>lightweight</i></li> <li>• Speedometer graphic for <i>3-second startup</i></li> <li>• Developer using Liberty</li> <li>• Arrow pointing at the developer with the word <i>You</i> above it</li> <li>• Thought bubble above developer for <i>innovative ideas</i></li> <li>• Thought bubble transferred to the developer's computer screen for <i>reality</i></li> </ul>
4	<p>Liberty is extremely lightweight. With a small memory footprint and fast application startup time, you can be up and running in a matter of seconds. In fact, Liberty is much lighter than the competition!</p>	<p>Show words:</p> <ul style="list-style-type: none"> <li>• Lightweight <ul style="list-style-type: none"> <li>– &lt; 65 MB footprint</li> <li>– &lt; 3-second start up</li> <li>– 40% lighter than the leading competitor</li> </ul> </li> </ul> <p>Show graphic of scale for <i>lightweight</i></p>
5	<p>The installation of Liberty is composable.</p> <p>For a fast startup time, the Liberty installation provides the essential features. If you need more features to meet your application needs, you can easily and quickly install them from the Liberty Repository.</p>	<p>Show words: Composable</p> <p>Show graphics:</p> <ul style="list-style-type: none"> <li>• Show composable nature of Liberty with a foundation of blocks that is built up with more features, or blocks, added.</li> <li>• Show screen capture of Liberty repository and its assets.</li> </ul>

Table 87. Why Liberty? Performance that scales (continued). Show title and then describe how the lightweight and composable nature of Liberty results in a runtime that delivers high performance and scalability.

Scene	Audio	Onscreen Action
6	Liberty complies with the Java Platform Enterprise Edition (Java EE) 7 specification, for both the full platform and its subset, the Java EE 7 Web Profile. This support enables you to code without restrictions and use the latest Java EE 7 capabilities. You can pick and choose the Java EE 7 standard features that you want to use, or you can get all of the features in a convenience feature.	<p>Show words:</p> <ul style="list-style-type: none"> <li>• Fully Java EE 7 compliant               <ul style="list-style-type: none"> <li>– Full platform</li> <li>– Web Profile</li> <li>– Code without restrictions</li> <li>– Use the latest Java EE 7 capabilities</li> </ul> </li> </ul> <p>Show graphics:</p> <ul style="list-style-type: none"> <li>• Java logo</li> <li>• Rolling list of key supported Java EE 7 programming models.</li> <li>• List of Java EE 7 standard features</li> <li>• List of all Java EE 7 features</li> </ul>
7	Liberty can be deployed wherever, whenever and however. You have the flexibility to run in any environment and you can rapidly deploy to the cloud. This capability enables you to achieve even more performance in a short amount of time.	<p>Show words:</p> <ul style="list-style-type: none"> <li>• Whenever</li> <li>• Wherever</li> <li>• However</li> <li>• Rapidly deploy to cloud               <ul style="list-style-type: none"> <li>– On premises</li> <li>– Hosted</li> </ul> </li> </ul> <p>Show graphics:</p> <ul style="list-style-type: none"> <li>• Liberty graphic</li> <li>• Cloud with IBM Bluemix<sup>®</sup></li> <li>• Growing box for <i>performance</i></li> <li>• Shrinking box for <i>time</i></li> </ul>
8	Finally, with the new auto scaling capabilities, you can rapidly scale the number of instances of the run time.	<p>Show words:</p> <ul style="list-style-type: none"> <li>• Scalable               <ul style="list-style-type: none"> <li>– 5 JVMs to 5,000 in minutes</li> </ul> </li> </ul> <p>Show graphic of square graphs quickly multiplying</p>
9	It's not enough to just build a great application. It needs powerful performance and scalability behind it. With these capabilities, Liberty gives you the performance that excels and scalability to meet user demands with fewer hardware and license requirements.	<p>Show words:</p> <ul style="list-style-type: none"> <li>• Lightweight</li> <li>• Composable</li> <li>• Java EE 7</li> <li>• Cloud ready</li> </ul> <p>Show graphics:</p> <ul style="list-style-type: none"> <li>• Resizing square scaling graphic for <i>scalability</i></li> <li>• Lightning graphic for <i>performance</i></li> <li>• Graph for <i>application</i></li> <li>• Shrinking graphics for <i>hardware and license requirements</i></li> </ul>

Table 87. *Why Liberty? Performance that scales (continued)*. Show title and then describe how the lightweight and composable nature of Liberty results in a runtime that delivers high performance and scalability.

## Video: Why Liberty? Rapid deployment and powerful administration

8.5.5.6

The following transcript is for the “Why Liberty? Rapid deployment and powerful administration” video, which describes how Liberty provides a run time to deploy rapidly and easily manage your systems. WebSphere Application Server Liberty is a lightweight, composable application server that is quick to start, easy to manage, and fast to deploy to, which enables rapid application development and availability in mobile, cloud, social, analytic, and enterprise production environments. This transcript is the video storyboard. Audio describes narration and captions. Onscreen Action describes the content that is shown in the video.

 Why Liberty? Rapid deployment and powerful administration

Table 89. Why Liberty? Rapid deployment and powerful administration. Show title and then describe how Liberty is easy to manage and it integrates with open source frameworks.

Scene	Audio	Onscreen Action
1	Why Liberty? Rapid deployment and powerful administration	Show title, <i>Why Liberty? Rapid deployment and powerful administration.</i>
2	What if your runtime could speed up your application deployment?	Show words: What if your runtime could speed up your application deployment?
3	<p>Did you know that with WebSphere Application Server Liberty, you can deploy a large web application over 75% faster than the leading competitor? Not only does Liberty provide a single runtime that meets all of your Java EE needs, it also gives you rapid deployment and powerful administration capabilities.</p> <p>Liberty is a lightweight, but powerful and fast runtime that was designed and built to meet the needs of developers. Using Liberty, you can rapidly develop and deploy your applications into production environments, which enables you to more quickly transform your own innovative ideas into reality!</p> <p>What if your runtime could speed up your application deployment? It can!</p>	<p>Show words:</p> <ul style="list-style-type: none"> <li>• Rapid deployment</li> <li>• Powerful administration</li> <li>• Liberty can!</li> </ul> <p>Show graphics:</p> <ul style="list-style-type: none"> <li>• Liberty logo</li> <li>• Speedometer graphic for <i>75% faster</i></li> <li>• Java EE logo</li> <li>• Scale graphic for <i>lightweight</i></li> <li>• Speedometer graphic for <i>fast</i></li> <li>• Developer using Liberty</li> <li>• Arrow pointing at the developer with the word <i>You</i> above it</li> <li>• Thought bubble above developer for <i>innovative ideas</i></li> <li>• Thought bubble transferred to the developer's computer screen for <i>reality</i></li> </ul>
4	Liberty is easy to manage. Your servers, applications, and other resources are right at your fingertips. With Admin Center, which is accessible from your smartphone, tablet, or computer, you can manage and monitor servers and applications, deploy server packages, and view bookmarked information.	<p>Show words: Liberty is incredibly easy to manage</p> <p>Show graphics for:</p> <ul style="list-style-type: none"> <li>• Show graphic screen captures of using Admin Center.</li> <li>• Show graphic of mentioned devices</li> </ul>

Table 89. Why Liberty? Rapid deployment and powerful administration (continued). Show title and then describe how Liberty is easy to manage and it integrates with open source frameworks.

Scene	Audio	Onscreen Action
5	Liberty integrates seamlessly with open source software. You can take advantage of Spring, Maven, Arquillian, MongoDB, and Docker, just to name a few. You don't need to reinvent the wheel or your existing applications. By leveraging Liberty's flexibility and integrating Liberty into your current development environment, you can be more productive and save valuable time.	<p>Show words:</p> <ul style="list-style-type: none"> <li>• Liberty integrates seamlessly with open source software</li> <li>• Open Source Integration</li> <li>• Software: <ul style="list-style-type: none"> <li>– Tapestry</li> <li>– MongoDB</li> <li>– Cassandra</li> <li>– And more!</li> </ul> </li> <li>• Frameworks: <ul style="list-style-type: none"> <li>– Arquillian</li> <li>– Docker</li> <li>– Spring</li> <li>– Chef</li> <li>– Puppet</li> <li>– And more!</li> </ul> </li> </ul> <p>Show graphics:</p> <ul style="list-style-type: none"> <li>• Wheel and existing applications</li> <li>• Check marks appearing under the graphics</li> </ul>
6	Liberty also supports continuous integration and DevOps. Liberty's fast start up time, small footprint, and simple configuration supports the continuous integration of code into frequent builds and automated testing. With simple build tools for packing the runtime into a single archive, Liberty is easy to deploy in production environments. Additionally, you can use the Liberty Chef cookbooks, which support the use of the Chef DevOps framework.	<p>Show words:</p> <ul style="list-style-type: none"> <li>• Liberty supports continuous integration and DevOps</li> <li>• Simple packaging tools</li> </ul> <p>Show graphics:</p> <ul style="list-style-type: none"> <li>• Apps and codes on a conveyer belt</li> <li>• Check marks above the apps and codes</li> <li>• Screen capture of packaging tools being used</li> <li>• Liberty Chef cookbook on Git</li> </ul>
7	It's not enough to just build a great application, you need to be able to deploy rapidly and easily manage your systems.	<p>Show words:</p> <ul style="list-style-type: none"> <li>• It's not enough to just build a great application</li> <li>• Rapidly deployment</li> <li>• Powerful administration</li> </ul>
8	There's no better time than now to get started with Liberty -- and it's easy! To download Liberty, and access a wide variety of features, samples, and other tips about developing and extending your applications, visit WASdev.net.	<p>Show words:</p> <ul style="list-style-type: none"> <li>• Getting started is easy</li> <li>• Download Liberty and get features, samples, development tips from WASdev.net</li> </ul>

## Chapter 2. End-to-end paths for Liberty

### 8.5.5.0

Start here for a step-by-step guidance in working with the WebSphere Application Server Liberty. Identify the scenario that most closely matches with your own project goal, then follow one of the paths through the scenario to achieve your goal.

#### Procedure

- “Enabling JMS messaging for Liberty”
  - “Enabling JMS messaging for a single Liberty server” on page 1122
  - “Enabling JMS messaging between two Liberty servers” on page 1124
  - “Enabling secure JMS messaging for Liberty” on page 1126
  - “Enabling interoperability between Liberty and WebSphere Application Server traditional” on page 1130
  - “Securing JMS communications in Liberty by using SSL” on page 1133
- “Setting up the server-management environment for Liberty by using collectives” on page 1134
  - “Configuring a Liberty collective” on page 1136
  - “Registering host computers with a Liberty collective” on page 1142
  - Overriding server host information
  - “Setting the default host name of a Liberty server” on page 1439
  - “Setting the JAVA\_HOME variable for Liberty collective members” on page 1147
  - “Configuring Liberty collective replica sets” on page 1148
  - Setting up Liberty server clusters
- Setting up Liberty server clusters
  - “Configuring a Liberty server cluster” on page 1155
  - “Starting and stopping a Liberty server cluster” on page 1488
  - “Listing Liberty server clusters and cluster members” on page 1488
  - “Generating a Liberty server cluster plug-in configuration” on page 1489
  - “Managing a Liberty server cluster configuration” on page 1489

### Enabling JMS messaging for Liberty

#### 8.5.5.6

Using the `wasJmsServer-1.0` and `wasJmsClient-2.0` Liberty features, you can enable the Java Message Service (JMS) on a single server. To use the `wasJmsServer-1.0` feature in a secure mode, you must enable the `wasJmsSecurity-1.0` feature.

#### Before you begin

The `wasJmsClient-2.0` feature supports the features of both JMS 1.1 and JMS 2.0 specifications. However, you can choose to use the `wasJmsClient-1.1` feature if you want to use only the features that are compliant with JMS 1.1 specification.

## Enabling JMS messaging for a single Liberty server

8.5.5.6

In a development environment, if you want to run the JMS application and JMS messaging run time components on the same server, you can configure the `wasJmsServer-1.0` and `wasJmsClient-2.0` features on the same server. In this scenario, the application is deployed on the same server where the messaging engine and the JMS resources exist. When the application and the messaging engine are deployed on the same server, the application can connect to the messaging engine either over TCP/IP or in-memory API function calls. You can also configure the `wasJmsSecurity-1.0` feature to enable secure connection of the application to the messaging engine.

### Before you begin

The `wasJmsClient-2.0` feature supports the features of both JMS 1.1 and JMS 2.0 specifications. However, you can choose to use the `wasJmsClient-1.1` feature if you want to use only the features that are compliant with JMS 1.1 specification.

## Configuring point-to-point messaging for a single Liberty server

8.5.5.6

You can configure point-to-point messaging such as sending of messages to a queue or receiving of messages from a queue.

### Procedure

1. Configure the messaging features in the `server.xml` file. If you want to perform a JNDI lookup, then you must also add the `jndi-1.0` feature.

```
<featureManager>
  <feature>wasJmsServer-1.0</feature>
  <feature>wasJmsClient-2.0</feature>
  <feature>jndi-1.0</feature>
</featureManager>
```

2. Configure the messaging engine to create a queue, called *libertyQ*, as given in the following example.

```
<messagingEngine>
  <queue id="libertyQ"
    forceReliability="ReliablePersistent"
    maxMessageDepth="5000">
  </queue>
</messagingEngine>
```

3. Declare a queue connection factory resource to create a connection to the messaging engine as given in the following example.

```
<jmsQueueConnectionFactory jndiName="jms/libertyQCF" connectionManagerRef="ConMgr2">
  <properties.wasJms
    nonPersistentMapping="ExpressNonPersistent"
    persistentMapping="ReliablePersistent"/>
</jmsQueueConnectionFactory>
<connectionManager id="ConMgr2" maxPoolSize="2"/>
```

4. Declare a queue resource to create a Producer/Consumer session to the queue, *libertyQ*, as given in the following example.

```
<jmsQueue jndiName="jms/libertyQue">
  <properties.wasJms queueName="libertyQ"
    deliveryMode="Application"
    timeToLive="500000"
    priority="1"
    readAhead="AsConnection" />
</jmsQueue>
```

5. Declare an activation specification for the message-driven beans that are deployed on Liberty. The message-driven beans use the activation specification to asynchronously consume messages from the `jmsQueue` resource.

```
<jmsActivationSpec id="JMSSample/JMSApp/SampleMDB">
  <properties.wasJms destinationRef="jms/libertyQue" />
</jmsActivationSpec>
```

The ID value must be given in the following format: application name/module name/bean name format, where *application name* is the name of the application that is deployed, *module name* is the name of the module in which the bean is packaged, and *bean name* is the *ejb-name* of the enterprise bean. Ensure that the `destinationRef` attribute is pointing to a valid `jmsQueue` resource ID.

**Note:** The application name is applicable only if the bean is packaged within an EAR file.

6. Optional: You can configure the `wasJmsSecurity-1.0` feature to enable the `wasJmsServer-1.0` feature work in a secure mode. For more information, see “Enabling secure JMS messaging for Liberty” on page 1126. The point-to-point messaging is configured to send messages to a queue or to receive messages from a queue.

## Configuring publish and subscribe messaging for a single Liberty server

8.5.5.6

You can configure publish/subscribe messaging from a topic space on a single Liberty server.

### Procedure

1. Configure the messaging features in the `server.xml` file. If you want to perform a JNDI lookup, then you must also add the `jndi-1.0` feature.

```
<featureManager>
  <feature>wasJmsServer-1.0</feature>
  <feature>wasJmsClient-2.0</feature>
  <feature>jndi-1.0</feature>
</featureManager>
```

2. Configure the messaging engine to create a topic space, called *SPORTS*, as given in the following example.

```
<messagingEngine>
  <topicSpace id="SPORTS"
    forceReliability="ReliablePersistent"
    maintainStrictOrder="true"
    maxMessageDepth="5000">
  </topicSpace>
</messagingEngine>
```

3. Declare a topic connection factory resource to create a connection to the messaging engine as given in the following example.

```
<jmsTopicConnectionFactory jndiName="jms/libertyTCF" connectionManagerRef="ConMgr1">
  <properties.wasJms
    clientID="clientId"
    nonPersistentMapping="ExpressNonPersistent"
    password="password"
    persistentMapping="ReliablePersistent"/>
</jmsTopicConnectionFactory>
<connectionManager id="ConMgr1" maxPoolSize="2"/>
```

4. Declare a topic space resource to create a Publisher/Subscriber session to the TopicSpace, *SPORTS*.

```
<jmsTopic jndiName="jms/libertyTopic">
  <properties.wasJms topicName="Cricket"
    deliveryMode="Application"
    timeToLive="500000"
    priority="1"
    readAhead="AsConnection" />
</jmsTopic>
```

5. Declare an activation specification for the message-driven beans that are deployed on Liberty. The message-driven beans use the activation specification to asynchronously consume messages that are published to the `.jmsTopic` resource.

```
<jmsActivationSpec id="JMSSample/JMSApp/SampleMDB">
  <properties.wasJms destinationRef="jms/libertyTopic" />
</jmsActivationSpec>
```

The ID value must be given in the following format: *application name/module name/bean name* format, where *application name* is the name of the application that is deployed, *module name* is the name of the module in which the bean is packaged, and *bean name* is the *ejb-name* of the enterprise bean. Ensure that the `destinationRef` attribute is pointing to a valid `.jmsTopic` resource ID.

**Note:** The application name is applicable only if the bean is packaged within an EAR file.

6. Optional: You can configure the `wasJmsSecurity-1.0` feature to enable the `wasJmsServer-1.0` feature work in a secure mode. For more information, see “Enabling secure JMS messaging for Liberty” on page 1126. The publish/subscribe messaging is configured for a topic queue.

## Enabling JMS messaging between two Liberty servers

8.5.5.6

In a typical production scenario, users might want to run the `wasJmsServer-1.0` and the JMS applications on separate servers to distribute the workload. In such scenarios, you can configure the `wasJmsClient-2.0` Liberty feature on one server, which acts as the client, and configure the `wasJmsServer-1.0` feature on a different server. The JMS applications that are deployed on a remote server always use TCP/IP to connect to the messaging engine that is running on a different server. You can also configure the `wasJmsSecurity-1.0` feature to make your applications to connect securely to the messaging engine, and configure the `ssl-1.0` feature to enable the SSL communication between the two Liberty servers.

### Before you begin

The `wasJmsClient-2.0` feature supports the features of both JMS 1.1 and JMS 2.0 specifications. However, you can choose to use the `wasJmsClient-1.1` feature if you want to use only the features that are compliant with JMS 1.1 specification.

### Configuring the client for enabling JMS messaging between multiple Liberty servers

8.5.5.6

To enable JMS messaging on multiple servers, you must configure the `wasJmsClient-2.0` feature on a different Liberty server.

### Procedure

1. Enable the JMS client feature on the client. If you want to perform a JNDI lookup, then you must also add the `jndi-1.0` feature.

```
<featureManager>
  <feature>wasJmsClient-2.0</feature>
  <feature>jndi-1.0</feature>
</featureManager>
```

2. Configure the required JMS resources.

```
<jmsQueueConnectionFactory jndiName="myQCF" connectionManagerRef="ConMgr4">
  <properties.wasJms
    remoteServerAddress="meserver.ibm.com:7276:BootstrapBasicMessaging" />
</jmsQueueConnectionFactory>
<connectionManager id="ConMgr4" maxPoolSize="2"/>
```

```
<jmsQueue jndiName="myQ">
  <properties.wasJms queueName="libertyQ" />
</jmsQueue>
```

**Note:** To enable the JMS application to perform a remote TCP/IP connection with the remote messaging engine, configure the `<remoteServerAddress>` property of the connection factory. The `<remoteServerAddress>` property refers to the server that has to be contacted, where the messaging engine exists. The property declaration must be as follows:

```
remoteServerAddress="hostname:port:mode"
```

where the *hostname* is the name of the host where the messaging engine is running; *port* is the JMS inbound port that is configured at the server side; and *mode* is *BootstrapBasicMessaging* if SSL is not used, and *BootstrapSecureMessaging* if SSL is used.

If the `<remoteServerAddress>` is not specified, then the JMS application tries to connect to a local messaging engine by default in the same Liberty server.

### 3. Optional: Configure additional properties.

- When the clients are configured to connect remotely to the messaging engine, you can create custom channels, which the application can use to connect to the messaging engine. The two default channels are *BootstrapBasicMessaging* and *BootstrapSecureMessaging*. If you want to override these two channel definitions and use a custom channel, use the `<wasJmsOutbound>` element as follows:

```
<featureManager>
  <feature>wasJmsClient-2.0</feature>
  <feature>jndi-1.0</feature>
</featureManager>
```

```
<wasJmsOutbound id="CustomChain"/>
```

```
<jmsQueueConnectionFactory jndiName="myQCF" connectionManagerRef="ConMgr4">
  <properties.wasJms
    remoteServerAddress="meserver.ibm.com:7276: CustomChain" />
</jmsQueueConnectionFactory>
<connectionManager id="ConMgr4" maxPoolSize="2"/>
```

- When the application uses the *myQCF* connection factory, it uses *CustomChain* to connect to the remote messaging engine instead of using *BootstrapBasicMessaging*. Similarly, if you want to use a secured channel, then you can use the `<useSSL>` option in the `<wasJmsOutbound>` element as given in the following example.

```
<featureManager>
  <feature>wasJmsClient-2.0</feature>
  <feature>jndi-1.0</feature>
</featureManager>
```

```
<wasJmsOutbound id="CustomChainSecured" useSSL="true"/>
```

```
<jmsQueueConnectionFactory jndiName="myQCF" connectionManagerRef="ConMgr4">
  <properties.wasJms
    remoteServerAddress="meserver.ibm.com:7276: CustomChainSecured" />
</jmsQueueConnectionFactory>
<connectionManager id="ConMgr4" maxPoolSize="2"/>
```

The messaging engine is configured to run on the client.

## Configuring the server for enabling JMS messaging between multiple Liberty servers

8.5.5.6

To enable JMS messaging on multiple servers, you must configure the `wasJmsServer-1.0` feature on a different Liberty server.

## Procedure

1. On the Liberty server that is hosting the messaging engine, enable the `wasJmsServer-1.0` feature to initialize the messaging engine to accept the incoming requests.

```
<featureManager>
  <feature>wasJmsServer-1.0</feature>
</featureManager>
```

```
<messagingEngine>
  <queue id="libertyQ"/>
</messagingEngine>
```

2. Optional: Configure additional properties.

The messaging engine listens on port 7276 (unsecured) and 7286 (secured) by default. If you want to bind the messaging engine to a different port, you must use the `<wasJmsEndpoint>` element.

```
<featureManager>
  <feature>wasJmsServer-1.0</feature>
</featureManager>
```

```
<wasJmsEndpoint id="InboundJmsCommsEndpoint" host="*" wasJmsPort="9011" wasJmsSSLPort="9100" />
```

```
<messagingEngine>
  <queue id="libertyQ"/>
</messagingEngine>
```

The `<wasJmsEndpoint>` element defines an inbound JMS communication endpoint, to which the JMS client applications can connect by using the `<wasJmsPort>` element if SSL is not being used, and by using the `<wasJmsSSLPort>` element if SSL is being used. The port number is the one that you specified in the `<remoteAddressServer>` property on the client.

In the previous code example, the messaging engine listens on port 9011 (unsecured) and port 9100 (secured) for accepting the incoming requests.

3. Optional: You can make the `wasJmsServer-1.0` feature work in a secure mode. For more information, see “Enabling secure JMS messaging for Liberty.”
4. Optional: You can secure JMS communications by using SSL. For more information, see “Securing JMS communications in Liberty by using SSL” on page 1133.

For a detailed information about secure communications, see “Securing communications in Liberty” on page 1833. The messaging engine is configured on the Liberty server.

## Enabling secure JMS messaging for Liberty

**8.5.5.0**

Use the `wasJmsSecurity-1.0` Liberty feature to make the `wasJmsServer-1.0` feature work in a secure mode. Securing the messaging resources ensures that only authenticated and authorized users can access the messaging resources such as queues, topics, and messages.

### Authenticating users to connect to the messaging engine

**8.5.5.0**

You must validate the users credentials so that the user is authenticated to connect to the messaging engine.

## Procedure

### 1. Configure the user registry.

The following types of registry are supported in Liberty:

- QuickStartSecurity (supports only one user).

This option is the simplest way of specifying a username and password to authenticate the application connections. You can use the <quickStartSecurity> element to enable a simple (one user) security setup for Liberty. Define the following <quickStartSecurity> element in the server.xml file.

In the following example, the <quickStartSecurity> element is used to define a single user, named *liberty*, with a password of *liberty123*.

```
<quickStartSecurity userName="liberty" userPassword="liberty123"/>
```

**Note:** Ensure that the raw password is not specified (for example, *liberty123*) in the server.xml file. To encode the password, use the security utility tool available with Liberty.

```
<WLP_HOME>\wlp\bin>securityUtility encode "liberty123"
```

For more information about securing passwords, see “Liberty:securityUtility command” on page 1844.

- Basic user registry (supports multiple users and declaration of user groups).

You can configure Liberty to authenticate and authorize users by using the basic user registry. You can set up a basic user registry and configure multiple role mapping in the server.xml file for a Liberty server.

**Note:** The configuration of the <basicRegistry> overrides the <quickStartSecurity> registry.

```
<basicRegistry id="basic" realm="customRealm">
  <user name="user1" password="user1pwd" />
  <user name="user2" password="user2pwd" />
  <user name="user3" password="user3pwd" />
  <user name="user4" password="user4pwd" />
  <user name="user5" password="user5pwd" />
  <user name="user6" password="user6pwd" />
  <user name="user7" password="user7pwd" />
  <user name="user8" password="user8pwd" />
  <group name="Developers">
    <member name="user2" />
    <member name="user4" />
  </group>
  <group name="Testers">
    <member name="user8" />
    <member name="user7" />
  </group>
</basicRegistry>
```

- Lightweight Directory Access Protocol (LDAP) registries (external registries such as Microsoft Active Directory and IBM Directory Server).

You can configure an LDAP server with Liberty for authentication.

```
<ldapRegistry id="LDAP" realm="SampleLdapIDSRealm" host="ctldap1.austin.ibm.com" port="389"
  ignoreCase="true" baseDN="o=ibm,c=us"
  ldapType="IBM Tivoli Directory Server"
  idsFilters="ibm_dir_server"
  searchTimeout="8m">
  <failoverServers name="failoverLdapServers">
    <server host="ralwang.rtp.raleigh.ibm.com" port="389"/>
  </failoverServers>
</ldapRegistry>
```

#### Notes:

- Any user name and password that is specified in the LDAP registry can be specified in the connection factory.

- You can define only one registry type in the `server.xml` file (either a basic registry or an LDAP registry).

For more information about configuring registries, see “Configuring a user registry for Liberty” on page 1851.

## 2. Configuring the application authentication.

Based on the user registry that is specified in the `server.xml` file, you can configure your application in the following ways:

- Specify the user name and password in JMS resources (that is the connection factory and activation specification properties).

The application that uses the connection factory is authenticated against the user name and password specified in the connection factory.

```
<jmsQueueConnectionFactory jndiName="myQCF" connectionManagerRef="ConMgr4">
  <properties.wasJms userName="liberty" password="liberty123"
    remoteServerAddress="localhost:7276:BootstrapBasicMessaging">
  </properties>
</jmsQueueConnectionFactory>
<connectionManager id="ConMgr4" maxPoolSize="2"/>
```

In the previous example, the application that looks for the `myQCF` queue connection factory is automatically authenticated against the user name `liberty` and password `liberty123` that is defined for the configured registry.

- Specifying the user name and password in the JMS application.

**Note:** The user name and password that are specified in the JMS application overrides the user name and password defined in the connection factory.

The application looks up the connection factory property and passes the username and password to authenticate the credentials.

`server.xml`

```
-----
<jmsQueueConnectionFactory jndiName="myQCF" connectionManagerRef="ConMgr4">
  <properties.wasJms
    remoteServerAddress="localhost:7276:BootstrapBasicMessaging">
  </properties>
</jmsQueueConnectionFactory>
<connectionManager id="ConMgr4" maxPoolSize="2"/>
```

Application snippets

```
-----
QueueConnectionFactory qcf = (QueueConnectionFactory) new InitialContext().lookup("myQCF");
QueueConnection qCon = qcf.createQueueConnection("liberty", "liberty123");
```

- Specify the user name and password in the `<containerAuthDataRef>` element.

The default authentication data for the container managed authentication is applicable when bindings do not specify an authentication alias for the resource reference with `res-auth=CONTAINER`. The `<authData>` element must be defined and must be referenced by the service integration bus resources as follows:

```
<authData id="auth1" user="liberty" password="liberty123"/>
```

```
<jmsQueueConnectionFactory jndiName="myQCF"
  containerAuthDataRef="auth1" connectionManagerRef="ConMgr4">
  <properties.wasJms/>
</jmsQueueConnectionFactory>
<connectionManager id="ConMgr4" maxPoolSize="2"/>
```

- Specify the user name and password by using the container managed authentication.

The container managed authentication is applied when bindings specify an authentication alias for a resource reference of `CONTAINER` in the `<res-auth>` element. The following code example shows how the authentication can be specified.

```

server.xml
-----
<authData id="auth1" user="dbuser1" password="{xor}0z0vKDtu"/>

<jmsQueueConnectionFactory id="jndi/myQCF" jndiName="jndi/myQCF" connectionManagerRef="ConMgr4">
  <properties.wasJms/>
</jmsQueueConnectionFactory>
<connectionManager id="ConMgr4" maxPoolSize="2"/>

web.xml
-----
<resource-ref>
  <res-ref-name>jndi/myQCF</res-ref-name>
  <res-auth>Container</res-auth>
  <res-type>javax.jms.QueueConnectionFactory</res-type>
  <lookup-name>jndi/myQCF</lookup-name>
</resource-ref>

ibm-web-bnd.xml (web binding file)
-----
<resource-ref name="jndi/myQCF" binding-name="jndi/myQCF">
  <authentication-alias name="auth1"/>
</resource-ref>

```

After the configuration, the authenticated users need to be assigned the required roles in order to access the messaging resources securely. See “Authorizing users to connect to the messaging engine.”

## Authorizing users to connect to the messaging engine

### 8.5.5.0

You must validate if the authenticated users have sufficient permissions to access the messaging resources (that is queues or topic) to perform actions such as sending, receiving, or browsing messages.

### Procedure

1. Enable the wasJmsSecurity-1.0 feature in the server.xml file.

```

<featureManager>
  <feature>wasJmsServer-1.0</feature>
  <feature>wasJmsClient-2.0</feature>
  <feature>wasJmsSecurity-1.0</feature>
</featureManager>

```

2. Configure the <messagingSecurity> element in the server.xml file to define the role and permission for each user, which will identify the action that they can perform on the messaging resource.

The permissions for the destinations can be defined in the <messagingSecurity> element. The following is a sample configuration:

```

<messagingEngine>
  <queue id="QUEUE1"/>
  <topicSpace id="TopicSpace1"/>

  <messagingSecurity>
    <role name="developer">
      <queuePermission queueRef="QUEUE1">
        <action>SEND</action>
        <action>BROWSE</action>
