

Installing a configuration that uses IBM HTTP Server and IBM DB2 UDB on HP-UX--Typical Installation

The steps that follow describe the easiest way to install a configuration of WebSphere Application Server that uses the following--

- HP-UX 11.0
- Java 2 Software Development Kit (SDK) 1.3 (version supplied with WebSphere Application Server)
- IBM HTTP Server 1.3.19
- IBM DB2 Universal Database (UDB) 7.2
- A single node

Before installing, check the WebSphere Application Server Supported Hardware, Software, and APIs Web site at www.ibm.com/software/webervers/appserv/doc/latest/prereq.html to ensure that you have the correct prerequisites, including operating system patches.

Steps for installation

[Setting kernel parameters](#)

[Installing DB2 UDB 7.2](#)

[Configuring DB2 UDB 7.2](#)

[Installing WebSphere Application Server--Typical Installation option](#)

[Testing the installation](#)

[Testing with an enterprise bean](#)

Setting kernel parameters

This article describes how to change particular operating system kernel parameters on an HP machine to make WebSphere Application Server run effectively. To set kernel parameters, perform the following steps:

1. Ensure that you are logged into the host machine with superuser (root) privileges.
2. Determine the machine's physical memory by doing the following. You will need this value when configuring kernel parameters:
 - a. Start the HP-UX System Administration Manager (SAM) utility.
 - b. Select **Performance Monitors**, then **System Properties**.
 - c. Click the **Memory** tab and note the value for **Physical Memory**.
 - d. Click **OK** and exit from the SAM utility.
3. In order to set the maxfiles and maxfiles_lim parameters to at least 4096, you must first edit the file /usr/conf/master.d/core-hpux to allow values greater than 2048 to be set by using the SAM utility. Do the following:
 - a. Open the file /usr/conf/master.d/core-hpux in a text editor.
 - b. Change the line

```
*range maxfiles<=2048
```

```
to
```

```
*range maxfiles<=60000
```

- c. Change the line

```
*range maxfiles_lim<=2048
```

```
to
```

```
*range maxfiles_lim<=60000
```

- d. Save these changes and close the file. The old values for these parameters might still be stored in the file `/var/sam/boot.config`. To force the SAM utility to create a new `boot.config` file, do the following:
 1. Move the existing version of the `boot.config` file located in the directory `/var/sam` to another location (the `/tmp` directory, for instance).
 2. Start the SAM utility.
 3. Select **Kernel Configuration**, then **Configurable Parameters**. When the Kernel Configuration window opens, a new `boot.config` file exists.

Alternatively, you can enter the following command to rebuild the `boot.config` file:

```
# /usr/sam/sbin/getkinfo -b
```

4. Set the parameters listed in Table 1 to the values listed by doing the following:
 - a. Start the SAM utility.
 - b. Select **Kernel Configuration**, then **Configurable Parameters**.
 - c. Highlight a parameter that you want to change and select **Actions**, then **Modify Configurable Parameter**.
 - d. Type the new value for the parameter in the **Formula/Value** field and click **OK**.
 - e. Repeat these steps for each of the parameters listed in Table 1.
 - f. After you have set all of the parameters, select **Actions**, then **Process New Kernel**.
 - g. An information window opens, confirming your decision to restart the machine. Click **Yes**.

If other information windows open, requesting information particular to your installation, follow the on-screen instructions to restart your machine and to enable the new settings to take effect.

Alternatively, use the **HPjconfig** configuration utility available from the Java products for HP-UX Web site at www.hp.com/go/java. This pure Java application provides kernel parameter recommendations tailored to your specific Java enterprise services and HP-UX hardware platform. It supports only selected machine types, however. Refer to the information on this Web site to verify that your machine is supported and for instructions on downloading and installing the utility.

Table 1

Parameter	Value
<i>maxfiles</i>	4096
<i>maxfiles_lim</i>	4096
<i>max_thread_proc</i>	1024
<i>maxuprc</i>	512
<i>nproc</i>	1024
<i>nflocks</i>	8192
<i>ninode</i>	2048
<i>nfile</i>	4 * <i>ninode</i> value
<i>msgseg</i>	32767 (or less)
<i>msgmnb</i>	65 535
<i>msgmax</i>	65 535
<i>msgtql</i>	1024
<i>msgmap</i>	258
<i>msgmni</i>	256
<i>msgssz</i>	16
<i>semmni</i>	512

<code>semmap</code>	514
<code>semmns</code>	1024
<code>semmnu</code>	1020 (<i>nproc</i> value minus 4)
<code>shmmax</code>	483 183 821 (Ensure that this parameter is set to 483 183 821 or 90% of the physical memory (in bytes), whichever is higher. For example, if you have 512 MB of physical memory in your system, set <code>shmmax</code> to 483 183 821 ($512 * 0.9 * 1024 * 1024$)).
<code>shmseg</code>	16
<code>shmmni</code>	300

5. If you plan to redirect displays to non-HP machines, do the following before running applications that have a graphical user interface, such as the WebSphere Application Server applications that are started with the scripts **install.sh** or **adminclient.sh**:

- a. Enter the following command to obtain information on all public locales accessible to your application:

```
# locale -a
```

- b. Choose a value for your system from the output that is displayed and set the `LANG` environment variable to this value. Here is an example command that sets the value of `LANG` to `en_US.iso88591`:

```
# export LANG=en_US.iso88591
```

Installing DB2 Universal Database (UDB) 7.2

This article describes the following:

- How to install and configure DB2 on a local HP-UX machine
- How to apply a FixPak to the installation

These instructions assume the following:

- You do not have a previous version of DB2 already installed on your machine. If a previous version of DB2 is installed, you might need to migrate servers and instances, depending on the version installed. In this case, do not follow these instructions. Instead, refer to DB2 product documentation on the DB2 Online Support Web site at www.ibm.com/cgi-bin/db2www/data/db2/udb/win0s2unix/support/v7pubs.d2w/en_main.
- Your DB2 database server will reside on the same machine as WebSphere Application Server. This configuration and the use of default settings documented in these instructions are appropriate only for development and very small production environments. For larger environments where it is preferable to configure the DB2 server on a remote server, you must install and configure a DB2 client on the same machine on which you install WebSphere Application Server and verify the remote database connectivity. For information on this more complicated scenario, refer to the IBM Redbook *WebSphere V3.5 Handbook* at www.redbooks.ibm.com/redbooks/SG246161.html. Although this Redbook was written for the WebSphere Application Server Version 3.5 product, much of the conceptual information also pertains to the WebSphere Application Server 4.0 product.
- Your machine has enough memory and disk space for your installation. See the DB2 product documentation on the DB2 Online Support Web site at www.ibm.com/cgi-bin/db2www/data/db2/udb/win0s2unix/support/v7pubs.d2w/en_main for the necessary requirements.

Note: Install DB2 before installing WebSphere Application Server.

Installing DB2 UDB

The DB2 product CD-ROM contains the files necessary to install and configure DB2 on a local HP-UX machine.

Perform the following steps to install DB2:

1. Ensure that you are logged into the machine with superuser (root) privileges.
2. Ensure that you have set the necessary UNIX kernel parameters properly by viewing the file "[Setting kernel parameters](#)."

Refer to the *DB2 Quick Beginnings for UNIX* and related DB2 UDB documentation on the DB2 Online Support Web site at www.ibm.com/cgi-bin/db2www/data/db2/udb/winos2unix/support/v7pubs.d2w/en_main to obtain more information on the proper values for these parameters. It is recommended that you review these settings with your system administrator to ensure that they do not conflict with settings necessary for other software programs on your system.

3. Insert the DB2 UDB CD-ROM into the CD-ROM drive.
4. Mount the CD-ROM by following the instructions in the file "[Mounting a CD-ROM on HP-UX](#)." The following steps assume that the CD-ROM drive is mounted at /cdrom.
5. Navigate to the correct directory on the DB2 UDB CD-ROM by entering the following command:

```
# cd /cdrom
```

6. Look in this directory for a README file in your language and read the file.
7. Enter the following command to start the DB2 Setup Utility:

```
# ./db2setup
```

Note: The DB2 Setup Utility works with only the bash, Bourne, and Korn shells.

8. In the Install DB2 V7 window, select the products that you want to install by performing the following steps. (Press the Tab key to move among and highlight options and press the Enter key to select or deselect options.)
 - a. Select **DB2 Administration Client**, **DB2 UDB Enterprise Edition**, and **DB2 Application Development Client** by highlighting each option and pressing Enter.
 - b. Highlight the **Customize** option beside the **DB2 Product Library** option and press Enter.
 - c. In the **DB2 Product Library** section, highlight the option appropriate for your locale (**en_US** for U.S. English) and press Enter.
 - d. In the DB2 Product Library window, highlight **OK** and press Enter.
 - e. In the Install DB2 V7 window, highlight **OK** and press Enter.
9. In the Create DB2 Services window, accept the default values **Do not create a DB2 Instance** and **Do not create the Administration Server** by ensuring that **OK** is highlighted and pressing Return. (You will create a DB2 Instance and the Administration Server after the installation of any needed FixPak. Installation of FixPaks is discussed in the section "[Upgrading DB2 UDB with a FixPak](#).")
10. A warning window informs you that you are not creating a DB2 Instance. Ensure that **OK** is highlighted and press Return to exit from the warning window.
11. A warning window informs you that you are not creating an Administration Server. Ensure that **OK** is highlighted and press Return to exit from the warning window.
12. The Summary Report window lists the products that you have elected to install. DB2 software is installed into the directory /opt/IBMdb2/V7.2. Ensure that **Continue** is highlighted and press Return.
13. A warning window gives you a final chance to cancel the installation. Ensure that **OK** is highlighted and press Return to continue with the installation.
14. A notice window informs you whether the installation has been successful. Ensure that **OK** is highlighted and press Return to exit from this window.
15. The Status Report window verifies which software packages are installed. Ensure that **OK** is highlighted and press Return.
16. Ensure that **Close** is highlighted and press Return.
17. A warning window informs you that you are not creating a DB2 Instance. Ensure that **OK** is highlighted and press Return to exit from the warning window.
18. A warning window informs you that you are not creating an Administration Server. Ensure that **OK** is highlighted and press Return to exit from the warning window.
19. A notice window asks whether you want to exit from the DB2 Setup Utility. Ensure that **OK** is highlighted and press Return.
20. Unmount the CD-ROM before removing it from the CD-ROM drive by following the instructions in the file "[Mounting a CD-ROM on HP-UX](#)."
21. Determine whether you need to install a DB2 FixPak for your version of WebSphere Application Server by reviewing

the information on the WebSphere Application Server Supported Hardware, Software, and APIs Web site at www.ibm.com/software/webervers/appserv/doc/latest/prereq.html. If you need to update your DB2 UDB installation with a FixPak, note the FixPak level and proceed to the section "[Upgrading DB2 UDB with a FixPak](#)." If you do not have to update your DB2 UDB installation with a FixPak, proceed to the steps in "[Configuring DB2 Universal Database \(UDB\) 7.2 for use with WebSphere Application Server](#)."

Upgrading DB2 UDB with a FixPak

To upgrade DB2 with a FixPak, do the following:

1. If you have not already done so, see the WebSphere Application Server Supported Hardware, Software, and APIs Web site at www.ibm.com/software/webervers/appserv/doc/latest/prereq.html to learn whether you need to install a DB2 FixPak for your level of WebSphere Application Server. Note the required FixPak level.
2. Go to the DB2 Online Support Web site at www.ibm.com/cgi-bin/db2www/data/db2/udb/winix2unix/support/download.d2w/report, navigate to the download page for the needed FixPak, and download the appropriate file. Read the accompanying README file for installation suggestions.
3. Ensure that you are logged into the machine with superuser (root) privileges.
4. Navigate to the directory containing the downloaded file.
5. Uncompress and untar the file to extract the DB2 files.
6. Ensure that all DB2 processes are stopped.
7. Ensure that the group root exists on the machine. If it does not, add it by entering the following command:

```
# groupadd root
```

8. Use the **swinstall** command to install all fixes from the FixPak. See HP-UX documentation for more information on using the **swinstall** command.

After you install the FixPak, complete the steps in "[Configuring DB2 Universal Database \(UDB\) 7.2 for use with WebSphere Application Server](#)."

Configuring DB2 Universal Database (UDB) 7.2 for use with WebSphere Application Server

This article describes how to do the following:

- Create a DB2 instance and administration server
- Verify installation of DB2 UDB
- Create and configure a database named `was40`, which is used by WebSphere Application Server
- Verify connection to the `was40` database
- Configure WebSphere Application Server when dropping and reinstalling the `was40` administrative database

The procedures in this article assume that DB2 is installed in the default location `/opt/IBMdb2/V7.2` and that any required FixPak is installed.

Creating a database instance and administration server

1. Ensure that you are logged into the machine with superuser (root) privileges.
2. Create users for the DB2 Instance, DB2 Fenced user, and DB2 Administration Server. These user names must match the values for the **User Name** option that you designate when configuring the DB2 Instance, DB2 Fenced user, and DB2 Administration Server in the procedures listed under Steps [9](#), [10](#), and [14](#).
3. Create groups for the DB2 Instance, DB2 Fenced user, and DB2 Administration Server. These group names must match the values for the **Group Name** option that you designate when configuring the DB2 Instance, DB2 Fenced user, and DB2 Administration Server in the procedures listed under Steps [9](#), [10](#), and [14](#).
4. Modify the users that you created in Step [2](#) by doing the following:
 - Make the primary group for the DB2 Instance user the group that you created for the DB2 Instance in Step [3](#).
 - Make the primary group for the DB2 Fenced user the group that you created for the DB2 Fenced user in Step [3](#).
 - Make the primary group for the DB2 Administration Server user the group that you created for the DB2

Administration Server user in Step 3.

5. Navigate to the directory containing the DB2 Setup Utility by entering the following command:

```
# cd /opt/IBMdbs2/V7.2/install
```

6. Start the DB2 Setup Utility by entering the following command:

```
# ./db2setup
```

7. Highlight the **Create** button beside the option labeled **To create a DB2 Instance, an Administration Server, or a Data Links Manager Administrator select Create** and press Return.
8. In the Create DB2 Services window, highlight the **Create a DB2 Instance** option and press Return.
9. In the DB2 Instance window, perform the following steps, noting the values that you enter or accept for future reference:
 - a. Enter a user name or accept the default value for the **User Name** option. You will specify this user name when you configure WebSphere Application Server. This user name must match the one that you created for the DB2 Instance in Step 2.
 - b. Enter a user ID or accept the default user ID by ensuring that the **Use default UID** option has an asterisk (*) beside it.
 - c. Enter a group name or accept the default value for the **Group Name** option. This group name must match the one that you created for the DB2 Instance in Step 3.
 - d. Enter a group ID or accept the default group ID by ensuring that the **Use default GID** option has an asterisk (*) beside it.
 - e. Enter a home directory or accept the default value for the **Home Directory** option. You will specify this directory when you configure WebSphere Application Server. This home directory must match the one that you created for the DB2 Instance user in Step 2.
 - f. Type a password for the user in the **Password** and **Verify Password** options. DB2 requires a password of eight or fewer characters. You will specify this password when you configure WebSphere Application Server.
 - g. Highlight **OK** and press Return.
10. In the Fenced User window, perform the following steps, noting the values that you enter or accept for future reference:
 - a. Enter a user name or accept the default value for the **User Name** option. This user name must match the one that you created for the DB2 Fenced user in Step 2.
 - b. Enter a user ID or accept the default user ID by ensuring that the **Use default UID** option has an asterisk (*) beside it.
 - c. Enter a group name or accept the default value for the **Group Name** option. This group name must match the one that you created for the DB2 Fenced user in Step 3.
 - d. Enter a group ID or accept the default group ID by ensuring that the **Use default GID** option has an asterisk (*) beside it.
 - e. Enter a home directory or accept the default value for the **Home Directory** option. This home directory must match the one that you created for the DB2 Fenced user in Step 2.
 - f. Type a password for the user in the **Password** and **Verify Password** options. DB2 requires a password of eight or fewer characters.
 - g. Highlight **OK** and press Return.
11. In the DB2 Warehouse Control Database window, highlight the option labeled **Do not set up DB2 Warehouse Control Database** and press Return.
12. Highlight **OK** and press Return.
13. In the Create DB2 Services window, highlight the **Create the Administration Server** option and press Return.
14. In the Administration Server window, perform the following steps, noting the values that you enter or accept for future reference:
 - a. Enter a user name or accept the default value for the **User Name** option. This user name must match the one that you created for the DB2 Administration Server in Step 2.
 - b. Enter a user ID or accept the default user ID by ensuring that the **Use default UID** option has an asterisk (*) beside it.
 - c. Enter a group name or accept the default value for the **Group Name** option. This group name must match the one that you created for the DB2 Administration Server in Step 3.
 - d. Enter a group ID or accept the default group ID by ensuring that the **Use default GID** option has an asterisk (*) beside it.
 - e. Enter a home directory or accept the default value for the **Home Directory** option. This home directory must match the one that you created for the DB2 Administration Server user in Step 2.

- f. Type a password for the user in the **Password** and **Verify Password** options. DB2 requires a password of eight or fewer characters.
- g. Highlight **OK** and press Return.
- 15. A notice window informs you of the value being created for the DB2SYSTEM environment variable. Ensure that **OK** is highlighted and press Return.
- 16. In the Create DB2 Services window, highlight **OK** and press Return.
- 17. The Summary Report window summarizes the choices you have made so far. When you have determined that the information is correct, ensure that **Continue** is highlighted and press Return.
- 18. A warning window opens, giving you the option of canceling the processes. Ensure that **OK** is highlighted and press Return.
- 19. A notice window informs you when the processes are completed. Ensure that **OK** is highlighted and press Return.
- 20. The Status Report window informs you of process successes and failures. View the Log File for information on how to correct particular failures. To exit from this window, ensure that **OK** is highlighted and press Return.
- 21. In the DB2 Setup Utility window, highlight **Close** and press Return.
- 22. In the notice window, ensure that **OK** is highlighted and press Return.
- 23. Make the root user a member of the administrative group that you accepted or designated for the **Group Name** option during the creation of the Administrative Server in Step 14.
- 24. If you are developing or running applications and want to avoid specifying the full path to the product libraries and include files, consider creating symbolic links. Create symbolic links for the DB2 files to the /usr/lib directory and for the include files to the /usr/include directory by entering the following command:

```
# /opt/IBMDb2/V7.2/cfg/db2ln
```

- 25. Configure the instance owner (the value that you accepted or designated for the **User Name** option in Step 9, in this example, db2inst1) to run the **db2profile** script at login, by doing one of the following (assuming that /home/db2inst1 is the home directory of the example instance owner db2inst1):

- o If the instance owner uses the Korn shell, add the following line to the .profile file of the instance owner. Note the space between the period (.) and the first forward slash (/):

```
. /home/db2inst1/sqllib/db2profile
```

- o If the instance owner uses the C shell, add the following line to the .cshrc file of the instance owner:

```
source /home/db2inst1/sqllib/db2cshrc
```

Note: You might need to create the .profile or .cshrc file if it does not already exist. If the instance owner uses a shell other than the Korn shell or C shell, make appropriate changes to this information.

- 26. Configure the root user to run the **db2profile** script at login by adding the following line to the .profile or .dtpfile file for the user root (assuming that the user root uses the Korn or Bourne shell and that /home/db2inst1 is the home directory of the example instance owner db2inst1):

```
. /home/db2inst1/sqllib/db2profile
```

This action is required to install and run WebSphere Application Server. If the user root uses a shell other than the Korn shell or Bourne shell, make appropriate changes to this information.

- 27. Log out and then log back in for your changes to take effect.

Verifying the installation of DB2 UDB

To demonstrate that DB2 is functioning correctly, create a sample database and then compile and execute a Java application that accesses this database. To create a sample database and compile and run the Java application, perform the following steps:

- 1. Log in as the DB2 instance owner (the value that you accepted or designated for the **User Name** option in Step 9 in the procedure in the section "Creating a database instance and administration server"). Logging in as the instance owner places you automatically in the home directory of the instance owner. The command prompt changes in

appearance to indicate the change in your login identity.

2. Ensure that your DISPLAY and TERM environment variables are set properly.
3. To ensure that the DB2 environment has been set up correctly, search the environment for the value of the DB2INSTANCE environment variable by entering the following command. The value returned must be the instance owner name (the value that you accepted or designated for the **User Name** option in Step 9 in the procedure in the section "Creating a database instance and administration server"):

```
$ env | grep DB2INSTANCE
```

4. Create the sample database by executing the **db2sampl** script, as follows. This process can take several minutes to complete.

```
$ db2sampl
```

5. Ensure that you are in the home directory of the instance owner (in this example, /home/db2inst1) and compile an example Java application by using the **javac** command, as follows:

```
$ javac -d . sqllib/samples/java/DB2Appl.java
```

The resulting class file is created in the local directory.

6. Ensure that DB2 is running or start it by entering the following command:

```
$ db2start
```

7. Execute the sample by using the **java** command, as follows:

```
$ java DB2Appl
```

Your output appears like the following:

```
Retrieve some data from the database...
Received results:
empno= 000010 firstname= SHILI
empno= 000020 firstname= MICHAEL
empno= 000030 firstname= SALLY
. . .
Update the database...
Changed 1 row.
```

8. If you want to stop DB2, enter the following command:

```
$ db2stop
```

9. To log out as the DB2 instance owner, enter the following command:

```
$ exit
```

The DB2 server remains active unless you stop it as detailed in Step 8.

Creating and configuring a database for WebSphere Application Server

In order for WebSphere Application Server to store the administrative configuration, you must create a database on the database server node. The database name will be the same one (or alias) used for the JDBC URL entry name during the WebSphere Application Server installation. Perform the following steps to create a database named was40 and set the DB2 application heap size:

1. Log in as the DB2 instance owner (the value that you accepted or designated for the **User Name** option in Step 9 in the procedure in the section "Creating a database instance and administration server"). Logging in as the instance owner places you automatically in the home directory of the instance owner. The command prompt changes in appearance to indicate the change in your login identity.
2. Ensure that your DISPLAY and TERM environment variables are set properly.
3. To ensure that the DB2 environment has been set up correctly, search the environment for the value of the DB2INSTANCE environment variable by entering the following command. The value returned must be the instance owner name (the value that you accepted or designated for the **User Name** option in Step 9 in the procedure in the section "Creating a database instance and administration server"):

```
$ env | grep DB2INSTANCE
```

4. Ensure that DB2 is running or start it by entering the following command:

```
$ db2start
```

5. Enter the following command to create a database named was40. This process can take several minutes to complete.

```
$ db2 create database was40
```

6. Enter the following command to set the application heap size:

```
$ db2 update db config for WAS40 using applheapsz 256
```

7. In order for your changes to take effect, you must start and stop DB2. To do this, enter the following commands:

```
$ db2stop  
$ db2start
```

If an application heap size of 256 does not work for your system, increase the size to 512.

8. To log out as the DB2 instance owner, enter the following command:

```
$ exit
```

The DB2 server remains active unless you stop it by using the **db2stop** command.

Verifying connection to the was40 database

Perform the following steps to verify connection to the was40 database:

1. Log in as the DB2 instance owner (the value that you accepted or designated for the **User Name** option in Step 9 in the procedure in the section "Creating a database instance and administration server"). Logging in as the instance owner places you automatically in the home directory of the instance owner. The command prompt changes in appearance to indicate the change in your login identity.
2. Ensure that your DISPLAY and TERM environment variables are set properly.
3. To ensure that the DB2 environment has been set up correctly, search the environment for the value of the DB2INSTANCE environment variable by entering the following command. The value returned must be the instance owner name (the value that you accepted or designated for the **User Name** option in Step 9 in the procedure in the section "Creating a database instance and administration server"):

```
$ env | grep DB2INSTANCE
```

4. Ensure that DB2 is running or start it by entering the following command:

```
$ db2start
```

5. Connect to the was40 database by entering the following command:

```
$ db2 connect to was40
```

Your output appears like the following (assuming an instance name of db2inst1):

Database Connection Information

```
Database server          = DB2/HPUX 7.2.1
SQL authorization ID     = DB2INST1
Local database alias     = WAS40
```

6. If you want to stop DB2, enter the following command:

```
$ db2stop
```

7. To log out as the DB2 instance owner, enter the following command:

```
$ exit
```

The DB2 server remains active unless you stop it as detailed in Step 6.

Configuring WebSphere Application Server when dropping and reinstalling the was40 administrative database

If you drop and recreate the was40 database after you have installed and successfully started the WebSphere Application Server administrative server for the first time, you must reset the values of the `com.ibm.ejs.sm.adminServer.createTables` flag and the `install.initial.config` flag. These flags are found in the WebSphere Application Server `admin.config` file, which is located by default in the directory `/opt/WebSphere/AppServer/bin`.

You must reset the values of these flags because the WebSphere Application Server product automatically changes their values from `true` to `false` when the administration server is started successfully for the first time. The product changes the values of these flags so that the creation of the database tables and installation of the Default Server and sample applications are not repeated with subsequent starts of the administration server.

Perform the following steps to drop, recreate, and set the application heap size for the was40 database and to change the values for the `com.ibm.ejs.sm.adminServer.createTables` and `install.initial.config` flags:

1. Log in as the DB2 instance owner (the value that you accepted or designated for the **User Name** option in Step 9 in the section "Creating a database instance and administration server"). Logging in as the instance owner places you automatically in the home directory of the instance owner. The command prompt changes in appearance to indicate the change in your login identity.
2. Ensure that DB2 is running or start it by entering the following command:

```
$ db2start
```

3. Drop, recreate, and set the application heap size for the was40 database by entering the following commands:

```
$ db2 drop database was40
$ db2 create database was40
$ db2 update db config for WAS40 using applheapsz 256
```

4. In order for your changes to take effect, you must start and stop DB2. To do this, enter the following commands:

```
$ db2stop
$ db2start
```

If an application heap size of 256 does not work for your system, increase the size to 512.

5. Log out as the DB2 instance owner by entering the following command:

```
$ exit
```

The DB2 server remains active unless you stop it by using the **db2stop** command.

6. As user root, open the admin.config file in a text editor.
7. Change the value for the com.ibm.ejs.sm.adminServer.createTables flag from `false` to `true`.
8. Change the value for the install.initial.config flag from `false` to `true`.
9. Save the edited admin.config file.

Installing WebSphere Application Server 4.0--Typical Installation option

This article describes the quickest way to install WebSphere Application Server on a local HP machine. These instructions assume the following:

- Your machine has enough memory and disk space for your installation. See the WebSphere Application Server Supported Hardware, Software, and APIs Web site at www.ibm.com/software/webervers/appserv/doc/latest/prereq.html for the requirements.
- You do not have a previous version of WebSphere Application Server already installed. If you do have a previous version of WebSphere Application Server installed, do not follow these instructions. Instead, refer to the article "[Migration overview](#)."
- You have installed and configured your database.
- You will use IBM HTTP Server as your Web server and will install it at the same time and onto the same node as you install WebSphere Application Server. If you plan to use another supported Web server with WebSphere Application Server, do not follow these instructions. Instead, see the article [IBM WebSphere Application Server for HP-UX](#), which lists other installation guides available for the HP-UX platform.

Note: You must purchase and install any Web server except IBM HTTP Server *before* you install WebSphere Application Server. IBM HTTP Server is supplied with WebSphere Application Server and is installed automatically during installation of WebSphere Application Server.

To install WebSphere Application Server, do the following:

1. Ensure that you are logged onto the host machine with superuser (root) privileges.
2. Ensure that the **swagentd** daemon is running by entering the following command:

```
# ps -ef | grep swagentd
```

- If the **swagentd** daemon is running, output similar to the following is displayed:

```
root    10431    10128    0   10:43:33 pts/0    0:00   grep swagentd
root      1391         1    0    May  9   ?        0:00   /usr/sbin/swagentd -r
```

- If the **swagentd** daemon is not running, start it by entering the following command:

```
# swagentd -r
```

3. If a preexisting Web server on your system is running, stop the Web server. If you plan to install IBM HTTP Server 1.3.19 as part of the WebSphere Application Server installation and a version of IBM HTTP Server prior to 1.3.19 is already installed on your system, you must uninstall it in order for the WebSphere Application Server installation program to successfully install IBM HTTP Server 1.3.19.
4. Insert the WebSphere Application Server CD-ROM into the CD-ROM drive.
5. Mount the CD-ROM by following the instructions in the file "[Mounting a CD-ROM on HP-UX](#)." The following steps assume that the CD-ROM drive is mounted at /cdrom.

6. Navigate to the correct directory on the WebSphere Application Server CD-ROM by entering the following command:

```
# cd /cdrom/hp
```

7. If the supported Web server or database you plan to use with WebSphere Application Server is newer than the version currently required by WebSphere Application Server, you must update the `prereq.properties` file or disable the prerequisite checking functionality before installing WebSphere Application Server.

To obtain an updated `prereq.properties` file, download the latest version from the WebSphere Application Server Tools Web site at www.ibm.com/software/webservers/appserv/tools.html. Ensure that the updated `prereq.properties` file is downloaded or copied into the local `/tmp` directory.

To disable prerequisite checking functionality, perform the following steps:

- a. Copy the `prereq.properties` file from the `/cdrom/hp` directory to the `/tmp` directory on the machine on which you plan to install WebSphere Application Server.
 - b. Open the `prereq.properties` file in a text editor and disable prerequisite checking for an individual component by changing the value of the specific key from 1 to 0.
 - c. Save the edited `prereq.properties` file.
8. If you have *not* downloaded a new `prereq.properties` file or disabled the prerequisite checking functionality as detailed in Step 7, run the installation script file by entering the following command:

```
# /cdrom/hp/install.sh
```

If you *have* downloaded a new `prereq.properties` file or disabled the prerequisite checking functionality as detailed in Step 7, run the installation script file by entering the following command:

```
# /cdrom/hp/install.sh -prereqfile /tmp/prereq.properties
```

9. Click **Next** to pass the introductory page.
10. The Install Options window opens. Select **Typical Installation** and then click **Next**.
11. The Database Options window opens. From the information that is displayed, do the following:
 - a. For **Database Type**, select your database from the drop-down list.
 - b. Ensure that **Remote DB** is not selected. For this example, you will install WebSphere Application Server on the same node as the database.
 - c. For **Database Name (Database SID)**, enter the name of the database to use. This value is the name of the database that you created when you configured your database (for instance, **orcl** for Oracle or **was40** for DB2 UDB).
 - d. For **DB Home**, specify the path of the directory containing the database software.
 - e. For **DB URL**, specify the URL for accessing the database. In most cases, accept the default. (If you are using DB2, Sybase, Merant, or Informix, this field cannot be edited.)
 - f. For **Server Name**, specify the name of the host machine on which the database is located. In most cases, accept the default. (Do not edit this parameter if you are using DB2. To edit this parameter when using another database type, the database must be installed remotely and you must have clicked the **Remote DB** button.)
 - g. For **Port Number**, specify the port number of the host machine on which the database is located. In most cases, accept the default. (Do not edit this parameter if you are using DB2. To edit this parameter when using another database type, the database must be installed remotely and you must have clicked the **Remote DB** button.)
 - h. For **Database User ID**, specify the database user name. Ensure that you specify the same user name that you specified when configuring your database for use with WebSphere Application Server.
 - i. For **Database Password**, enter the database password. Ensure that you specify the same password that you specified when installing your database. If you are using DB2 UDB, your password must be eight or fewer characters in length.
 - j. Click **Next**.
12. The Select Destination Directory window opens. Specify the directory into which you want to install WebSphere Application Server. You can either accept the default destination directory or specify a different one by typing the full pathname or by clicking **Browse**. Note that since IBM HTTP Server is installed automatically, you cannot modify its destination directory. Click **Next** to continue.

13. A window opens that lists the options you have selected to install. Click **Install** to begin the installation.
14. The Setup Complete window opens. To view the ReadMe file, ensure that **Yes, I want to view the ReadMe File** is selected and click **Finish**; the ReadMe file is displayed in a default browser window. To view the ReadMe file at a later time, deselect **Yes, I want to view the ReadMe File** and click **Finish** to exit from the WebSphere Application Server installation program.
15. The WebSphere Application Server - First Steps window opens. You can use the GUI to access product information in the InfoCenter, start the administrative server, launch the administrative console, or launch the application assembly tool. Because you must first start and possibly configure your Web server, close this window for now. If you later want to access the First Steps window, do the following:
 - a. Navigate to the directory containing the **firststeps.sh** script (by default, /opt/WebSphere/AppServer/bin) by using the **cd** command, as follows:

```
# cd /opt/WebSphere/AppServer/bin
```

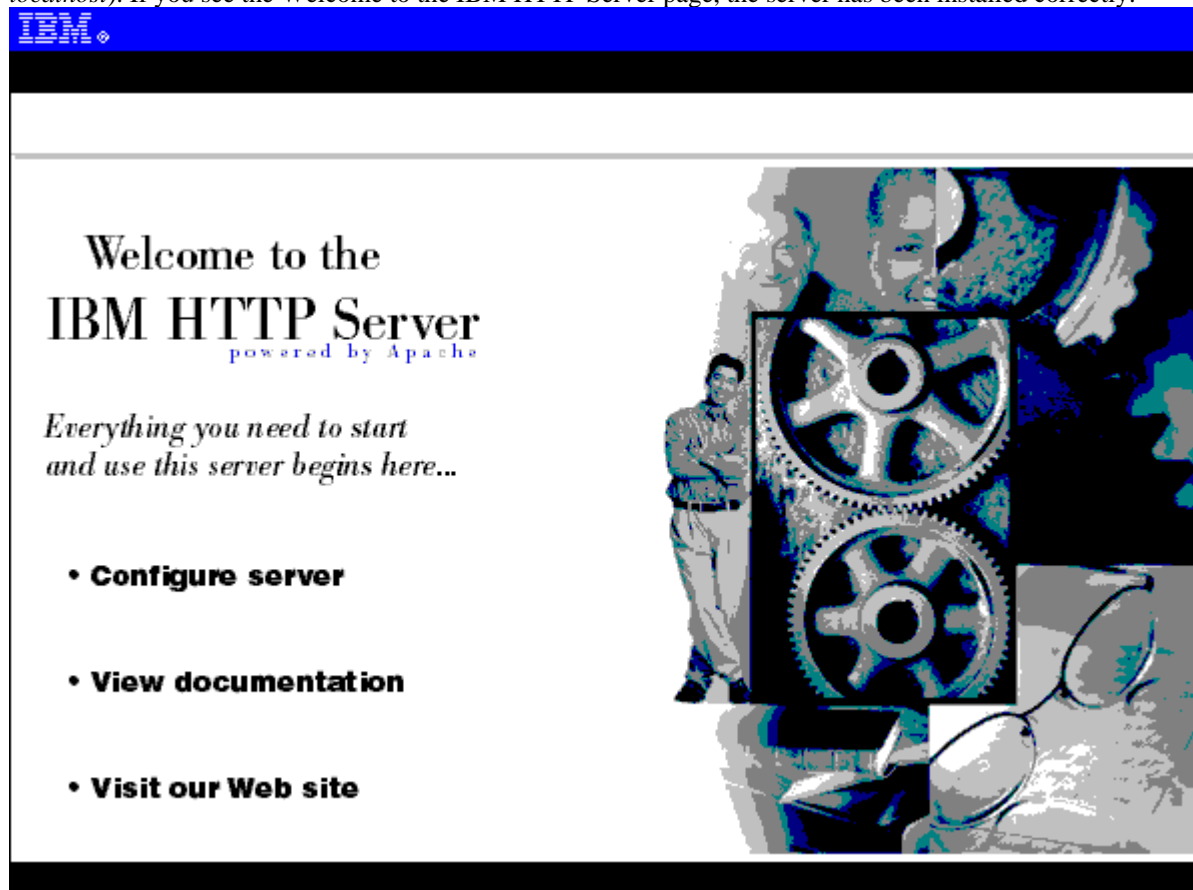

- b. Execute the **firststeps.sh** script, as follows:

```
# ./firststeps.sh
```

16. Unmount the CD-ROM before removing it from the CD-ROM drive by following the instructions in the file "[Mounting a CD-ROM on HP-UX.](#)"
17. You might need to configure IBM HTTP Server. Perform the following steps to verify that the IBM HTTP Server is installed correctly:
 - a. Ensure that the Web server is running or start it by entering the following command:

```
# /opt/HTTPServer/bin/apachectl start
```

- b. Open a Web browser window and type the name of the host machine as the URL (http://host_machine or localhost). If you see the Welcome to the IBM HTTP Server page, the server has been installed correctly.

Note that you might need to make configuration adjustments to the server in order to run it successfully on your system. See the IBM HTTP Server documentation at www.ibm.com/software/webservers/htpservers/library.html for more information.

To enable the Secure Sockets Layer (SSL) on IBM HTTP Server, see the IBM HTTP Server documentation at www.ibm.com/software/webservers/htpservers/doc/v1319/9atstart.htm for more information.

Testing the installation

This article describes how to test your installation and configuration of WebSphere Application Server. These instructions assume that you have installed a supported Web server, database, and WebSphere Application Server. Perform the following steps to test your WebSphere Application Server installation:

1. Ensure that you are logged onto the host machine with superuser (root) privileges.
2. Navigate to the directory containing the **startupServer.sh** script (located by default in the /opt/WebSphere/AppServer/bin directory) by using the **cd** command, as follows:

```
# cd /opt/WebSphere/AppServer/bin
```

3. Start the WebSphere Administrative Server by running the script **startupServer.sh**, as follows:

```
# ./startupServer.sh
```

Ensure that the server has started successfully by checking the file named tracefile located in the /opt/WebSphere/AppServer/logs directory. Use the **tail** command to check the file, as follows:

```
# tail -f tracefile
```

The message ...open for e-business appears in this file when the server has started successfully.

4. Navigate to the directory containing the **adminclient.sh** script (located by default in the /opt/WebSphere/AppServer/bin directory) by using the **cd** command, as follows:

```
# cd /opt/WebSphere/AppServer/bin
```

5. Start the administrative console by running the script **adminclient.sh**, as follows:

```
# ./adminclient.sh
```

6. When the console displays the message Console Ready, administer the application server by doing the following:
 - a. When the administrative console opens, a tree view is displayed. Click the plus sign (+) next to the **WebSphere Administrative Domain** entry to expand the view.
 - b. Click the plus sign (+) next to the **Nodes** entry to expand the view.
 - c. Identify the name of your host machine and expand the view of that entry.
 - d. Click the plus sign (+) next to the **Application Servers** entry to expand the view.
 - e. Select the **Default Server** entry and click the **Start** icon on the toolbar. An information window opens stating that the server has started. Click **OK** to close this window.

After the default server is started initially, it will start automatically if it stops or if you restart the machine. Even if the administrative server fails, the application server continues to run.

7. Test the server by doing the following:
 - a. Ensure that the Web Server is running. If it is not running, start it.
 - b. Open a Web browser window and enter the URL for the snoop servlet, which is a standard sample servlet installed by default, as follows:

```
http://machine_name/servlet/snoop
```

In this command, *machine_name* represents the name of the machine on which WebSphere Application Server is running. Information on /servlet/snoop is displayed.

8. To stop the Default Server, do the following:
 - a. Highlight the entry **Default Server** and click the **Stop** icon on the tool bar. An information window opens stating that the server has stopped.
 - b. Click **OK** to close this window.

Testing with an enterprise bean

This article describes how to test your WebSphere Application Server installation by using an enterprise bean and the Increment sample. These instructions assume that you have installed and tested your WebSphere Application Server system. Perform the following steps:

1. Ensure that you are logged into the host machine with superuser (root) privileges.
2. Navigate to the directory containing the **startupServer.sh** script (located by default in the /opt/WebSphere/AppServer/bin directory) by using the **cd** command, as follows:

```
# cd /opt/WebSphere/AppServer/bin
```

3. Start the WebSphere Administrative Server by running the script **startupServer.sh**, as follows:

```
# ./startupServer.sh
```

Ensure that the server has started successfully by checking the file named tracefile located in the /opt/WebSphere/AppServer/logs directory. Use the **tail** command to check the file, as follows:

```
# tail -f tracefile
```

The message ...open for e-business appears in this file when the server has started successfully.

4. Navigate to the directory containing the **adminclient.sh** script (located by default in the /opt/WebSphere/AppServer/bin directory) by using the **cd** command, as follows:

```
# cd /opt/WebSphere/AppServer/bin
```

5. Start the administrative console by running the script **adminclient.sh**, as follows:

```
# ./adminclient.sh
```

6. When the console displays the message **Console Ready**, administer the application server by doing the following:
 - a. When the administrative console opens, a tree view is displayed. Click the plus sign (+) next to the **WebSphere Administrative Domain** entry to expand the view.
 - b. Click the plus sign (+) next to the **Nodes** entry to expand the view.
 - c. Identify the name of your host machine and expand the view of that entry.
 - d. Click the plus sign (+) next to the **Application Servers** entry to expand the view.
 - e. Select the **Default Server** entry and click the **Start** icon on the toolbar. An information window opens stating that the server has started. Click **OK** to close this window.

After the default server is started initially, it will start automatically if it stops or if you restart the machine. Even if the administrative server fails, the application server continues to run.

7. Ensure that the Web Server is running. If the Web server is not running, start it.
8. Start a Web browser and specify the following URL:

```
http://machine_name/webapp/examples/HitCount
```

In this command, *machine_name* represents the name of the machine on which WebSphere Application Server is running. When the Web page opens, several selection options are displayed.

9. Under the heading **Generate hit count using**, click the radio button for the option **Enterprise Java Bean**.
10. Under the heading **Transaction Type**, click the radio button for the option **None**.
11. Click **Increment**.

If the number of hits is displayed, WebSphere Application Server is operating properly.

Mounting a CD-ROM on HP-UX

This article describes how to mount and unmount a CD-ROM on HP-UX. To mount a CD-ROM, as the user root, perform the following steps one time:

1. Determine the device address for the CD-ROM by entering the following command:

```
# ioscan -C disk -f -n
```

Output similar to the following is displayed. This output example indicates that the CD-ROM device file is /dev/dsk/clt2d0:

Class	I	H/W	Path	Driver	S/W	State	H/W	Type	Description
disk	0	8/0/19/0.6.0		sdisk	CLAIMED		DEVICE	IBM	DDRS-39130WS
							/dev/dsk/c0t6d0	/dev/rdisk/c0t6d0	
disk	1	8/16/5.2.0		sdisk	CLAIMED		DEVICE	TOSHIBA	CD-ROM XM-6201TA
							/dev/dsk/clt2d0	/dev/rdisk/clt2d0	

2. Create a new directory called /cdrom at the root of the file system. This directory becomes the CD-ROM mount point; all CD-ROM files appear under this directory.
3. Determine whether the **pfs** daemon is running by entering the following command:

```
# ps -ef | grep pfs
```

If the **pfs** daemon is running, output similar to the following is displayed:

```
root 1681 1651 0 11:39:20 pts/ta 0:00 /usr/sbin/pfs_mountd
root 1682 1681 0 11:39:20 pts/ta 0:00 pfs_mountd.rpc
```

If the **pfs** daemon is running, go to Step 6. If the **pfs** daemon is not running, complete Step 4 and Step 5 before trying to complete Step 6.

4. Edit the file /etc/pfs_fstab by adding a line similar to the following to indicate the hardware path for the CD-ROM:

```
/dev/dsk/c0t6d0 /cdrom pfs-rrip xlat=unix 0 0
```

5. Enter the following commands. You must reenter these commands any time that you restart your system.

```
# nohup /usr/sbin/pfs_mountd &
# nohup /usr/sbin/pfsd &
```

6. To physically mount the CD-ROM, place the CD-ROM in the machine and enter the following command:

```
# /usr/sbin/pfs_mount /cdrom
```

Unmounting a CD-ROM

After you finish using the CD-ROM, enter the following command to unmount it:

```
# /usr/sbin/pfs_umount /cdrom
```

You can now eject the CD-ROM.

Uninstalling WebSphere Application Server

Perform the following steps to uninstall WebSphere Application Server from a UNIX machine:

1. Ensure that you are logged into the machine with superuser (root) privileges.
2. If IBM HTTP Server or another Web server is running on your system, stop the Web server.

Note: Although IBM HTTP Server can be installed using the WebSphere Application Server installation program, it is not uninstalled when you uninstall WebSphere Application Server. It must be uninstalled separately. See the IBM HTTP Server Library Web site at www.ibm.com/software/webservers/httpservers/library.html for more information.

3. Ensure that your DISPLAY and TERM environment variables are set properly.
4. Navigate to the root installation directory (/opt/WebSphere/AppServer on HP-UX, Linux, and Solaris; /usr/WebSphere/AppServer on AIX) and execute the **uninstall.sh** script as follows:

```
# ./uninstall.sh
```

5. The uninstallation program starts and the Uninstall dialog box opens. Click **Uninstall** to remove WebSphere Application Server from the machine.
6. To ensure that subsequent installations of WebSphere Application Server do not conflict with files left on the machine from a previous installation, use the **rm -r** command to remove the WebSphere directory structure. Use caution when executing this command to prevent the unintentional removal of portions of the file system.
