IBM Application Performance Analyzer for z/OS, V11.1

Figure 1: Application Performance Analyzer environment

Highlights

- Provides easy-to-use function that facilitates isolation of performance problems in applications
- Helps pinpoint performance bottlenecks impacting online transaction-response times
- Assists in reducing batch application turnaround time
- Supports Assembler, C/C++, COBOL, PL/I, Java, CICS, DB2, IMS, WebSphere MQ, and WebSphere Application Server
- Increases application understanding during stress and regression testing
- Can be integrated with Fault Analyzer and Debug Tool with source mapping side files
- New workstation GUI interface

In an increasingly complex and competitive business environment with challenging business demands, managers, system programmers, application developers and performance specialists are under pressure to operate their systems at peak level.

Adopting on demand business strategies and implementing Web services, for example, create more-complex, business-critical applications, increasing the risk of you missing your service-level commitments.

To mitigate this risk, you must carefully consider performance and, ultimately, customer satisfaction as part of your business strategy. IBM® Application Performance Analyzer for z/OS®, V11.1 is an application performancemeasurement tool designed for use on IBM z/OS systems. The product's key function is to measure and report on how system resources are used by applications running in virtually any z/OS address space such as Time Sharing Option (TSO) and batch.

Application Performance Analyzer can also analyze transactions running under an online subsystem such as IBM IMS[™], IBM CICS[®], and WebSphere[®] Application Server, as well as DB2[®] stored procedures.

Using Application Performance Analyzer helps you maximize the performance of your existing hardware resources and helps you improve the performance of your applications and subsystems.

Application Performance Analyzer software aids application design, development and maintenance cycles. It helps you evaluate application prototypes in the design phase, review the impact of increased data volume or changes in business requirements on performance, and generate historical data and reports to analyze performance trends and evaluate program changes for cost-effectiveness. Application Performance Analyzer collects samples from the monitored address space and analyzes the system or resource application in the following categories:

- Control section (CSECT) usage within each load module
- Instruction or statement usage within each CSECT
- Assembler, COBOL and PL/I statement usage within each module or disassembly for modules without source
- Direct access storage device (DASD) statistics
- Processor usage
- IMS transactions and databases
- DB2 databases, including stored procedures, Structured Query Language (SQL), Distributed Data Facility(DDF) and detailed DB2 delay information
- CICS transactions and the multiplicity of relationships in those transactions from a

performance perspective

• IBM WebSphere MQ queue information

Robust features to help you meet your applicationperformance objectives

Application Performance Analyzer software includes a number of robust features designed to help you optimize the performance of your application resources.

Online analysis

This feature provides displays of overall system activity, enabling you to check on all jobs running online or to select a specific active job to monitor.

Flexible monitoring

The flexible monitoring capabilities of Application Performance Analyzer offer a wide variety of ways to help ensure that the performance of your applications meets your needs:

- Specify the number of times that Application Performance Analyzer should monitor a job's performance when that job or program becomes active.
- Enable DB2, IMS, CICS and WebSphere MQ applications to be monitored.
- Select how long to monitor selected applications — based on when the job ends, the duration of sampling or the number of samples to be taken.
- Invoke the monitoring capability from other programs such as IBM Tivoli® OMEGAMON®, IBM Tivoli Enterprise Portal and IBM Application Performance Analyzer Automation Assistant using the Application Performance Analyzer batch command interface.
- Compare two observation reports to see the relevant differences, to supplement threshold monitoring.

Figure 2: Application Performance Analyzer views and reports

• Use threshold monitoring to enable an observation request to monitor an application by specifying the processor-usage, execute channel program (EXCP) and job-duration thresholds. For jobs that have had problems, you can use this feature to initiate an observation without any direct involvement to permit analysis after the sampling is complete.

Reports

Reports generated by Application Performance Analyzer help you to identify key performance bottlenecks that need examination and resolution. This data is available in printed reports that you can choose to create as text files, Adobe® PostScript® files, or XML files, to view on your workstation.

Other monitoring information

As well as providing performance information about your application code, Application Performance Analyzer also delivers other important information. For example, you can use Application Performance Analyzer to track performance issues to a DASD problem.

Processing performance analysis shows processor usage by procedure, referred attribution, wait time by task, category and module, as well as multiple DASD statistics including EXCP, virtual storage access method (VSAM) statistics and input-output wait times.

Support for IBM Parallel Sysplex® Coupling Facility lets you monitor jobs and transactions on any logical partition (LPAR) image in the Parallel Sysplex environment you choose and also report how IBM Workload Manager for z/OS affects application performance.

Figure 3: Application Performance Analyzer provides detailed information about running CICS transactions

Sixty-four bit memory use is now reported in Application Performance Analyzer.

User Interface

With a single interface, you can monitor applications in test, as well as in production, and in multiple source languages, including Assembler, C/C++, COBOL and PL/I. Optimized code support for COBOL and PL/I is provided to enable you to monitor production applications.

Support for IBM subsystems

Application Performance Analyzer, a single tool, provides applicationmonitoring support for all of IBM's major subsystems:

CICS

Support for IBM CICS Transaction Server, including V4.1, enables you to monitor specific CICS transactions using wildcard transaction prefixes or by termed selection. With this support, you can trace transactions during critical situations, rather than waiting to review data collected periodically.

DB2

Support for DB2, including V10, delivers relevant information for performance analysis and tuning, including SQL statements and processor usage by SQL statement as well as for IBM DB2 stored procedures written in Java[™]. You can also choose to trace all DB2 calls.

IMS

Support for IMS applications, including V11, means you can have IMS application-performance data-on-call time and service-call time for DL/I. You can also choose to trace all IMS calls. Over 20 IMS reports are now provided, helping to improve your ability to analyze the influences of IMS on application performance.

WebSphere MQ

WebSphere MQ support provides information about CPU usage by queue, by request and by transaction in WebSphere MQ. Application Performance Analyzer also provides service time by queue, request and transaction, as well as wait time, for the same categories.

New in V11.1

Application Performance Analyzer for z/OS, V11.1 includes several new additions and enhancements, including:

- The GUI Plug-in is enhanced to support IMS Multiple Address Space measurements, source program mapping, and to display windows for details of the sample file and the module information, to make it consistent with the ISPF panels.
- 64-bit support for xplink.
- 64-bit Java support.
- CICS+ new CICS intercept extractor.
- New CICS reports to report mean and total service times by user, and to report CPU/service time by CICS transaction.
- New Java reports to report the Java heap usage timeline and Java CPU usage by thread.
- The "Variance Report" feature is improved by providing three new variance reports highlighting the main difference between the CICS, DB2, and IMS "summary reports." Up to 20 measurements can be selected for variance

reporting, providing the ability to evaluate the performance of specific jobs over an extended time period.

- The DB2 CPU/service time reports are enhanced to allow the developer to display the percentage used in place of the mean fields.
- Support for the natural language and ADABASE from Software AG.
- Recommendation to the developer that a VSAM reorganization be done when CI and CA splits are present. This is shown in the Application Performance Analyzer S09 report.
- Support for large block size (greater than 262K).
- A memory tracking exit that can include data about modules managed via directed load.
- Permit use of system symbols in SampleHLQ, and allow complete control of sample file naming convention via SampleDSN and DuplicateDSN configuration settings.
- C/C++ mapping time stamp interval is reduced.
- An option to load source and

then map it to the module (the inverse of usual C/C++).

- IMS Multiple Address Space Support that groups all IMS MPP region observations under a single parent observation in R02.
- IMS Multiple Address Space Support for IMSPlex.
- Support a shared source program mapping dataset list, called the Common Data Store.
- Support measuring Java jobs running in WebSphere V7.
- Currency support for DB2 V10.

IBM Application Performance Analyzer for z/OS, V11.1, at a glance Hardware requirements

• Any hardware configuration capable of running IBM z/OS

Software requirements

- IBM z/OS, V1.10 (5694-A01) or later
- Depending on the functions used in the product, other related products may be required. See the product Web site, listed below, for more detailed software requirements

Part of a leading-edge family of z/OS tools

Application Performance Analyzer is part of the IBM Problem Determination family of products. These include IBM Application Performance Analyzer for z/OS, IBM Debug Tool for z/OS, IBM Fault Analyzer for z/OS, IBM File Manager for z/OS, and IBM Workload Simulator for OS/390 and z/OS.

Designed to help you maximize your investment in IBM System z® products, these products are a robust suite of integrated development tools that enable you to improve IT operational efficiency and transform applications to achieve greater business flexibility.

The IBM Problem Determination tools help application developers to improve application delivery throughout the application life cycle. You can use these tools to help increase productivity and IT effectiveness across source code debugging, application ABEND analysis, data management and application performance analysis.

The IBM Problem Determination tools do much more than support traditional applications. They include capabilities that enable you to build SOA applications. They are tightly integrated with other tools in the IBM problem determination tools portfolio, as well as other tool sets. The tools also continue to support and make the most of the latest subsystem levels. These capabilities help make IBM problem determination tools an excellent choice for your business.
