

Vastera - Tom Bright

Vastera is a leading provider of solutions for global trade management, and has been aggressively adapting to the dynamic needs of B2B companies engaged in global trade. Vastera wanted to expedite the development of its next generation of Web-based applications called TradeSphere, and it also needed to Web-enable key components of its legacy application, Global Passport. Kanbay Web-enabled Vastera's Automated Broker Interface (ABI) to the U.S. Customs Department and developed the Web-based CustomHouse Brokerage capabilities within Vastera's Import Management System.

The technologies involved include: WebSphere Application Server 4.02 on Sun Solaris - IBM Visual Age Enterprise 3.02 - WebSphere Studio - DHTML, XML, Java Script - Internet Explorer 5.5's data islands technologies The data island technology allows client machines to store data in XML and reduce callbacks to Vastera's server, saving greatly on processing time. Because of the quality, team oriented Kanbay approach, Vastera continues to give Kanbay additional projects moving forward.
