f(z) = z*z

$$z = x + iy$$

$$f(z) = u(x,y) + iv(x,y)$$

$$f(z) = z^2 = (x+iy)^2 = (x^2 + i2xy - y^2)$$

$$= (x^2 - y^2) + i(2xy)$$

$$u(x,y) = (x^2 - y^2) \qquad v(x,y) = (2xy)$$

$$\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}$$

$$\frac{\partial v}{\partial x} = -\frac{\partial u}{\partial y}$$

$$\frac{\partial u}{\partial x} = 2x \qquad \frac{\partial v}{\partial x} = 2y$$

$$\frac{\partial u}{\partial y} = -2y \qquad \frac{\partial v}{\partial y} = 2x$$

$$f'(z) = \frac{\partial u}{\partial x} + i\frac{\partial v}{\partial x} = 2x + i2y$$

$$f'(z) = -i\frac{\partial u}{\partial y} + \frac{\partial v}{\partial y} = i2y + 2x$$

$$f'(z) = 2z = 2(x+iy)$$

f(z)=z
